While not required by the requirements in 690.11, the PV AFCI certification requirements will include additional requirements for parallel arc fault protection for manufacturers that choose to provide such protection.
Research into arcing faults has been the subject of work by UL, NREL, Sandia, Southwest Research and industry authorities. There is sufficient knowledge to advance PV DC AFCI topics in the code. The remaining technical details listed in the public comments relate to detection methods and are not withstanding to the recognized need for the safety improvements.

While series and parallel PV AFCI protection would be preferable, the series protection required by 690.11 provides a substantial increase in the level of protection over a system without PV AFCI protection.

Additionally, parallel PV AFCI protection cannot be added to 690.11 for the 2011 NEC, based upon the already received comments and proposals currently under review. Therefore, the panel recognizes "parallel arc detection" as a desirable feature, but not a requirement.

With regard to the comment on ground faults being parallel faults, most modern listed PV inverters include GFDI protection and will mitigate parallel arcing ground faults.

The future effective date method allows time for new technical developments. New system solutions will be forth coming to meet the intent of 690.11. This should not be a barrier to achieving the safety improvement that can be accomplished at this time.

The panel affirms that PV AFCI protection is necessary as soon as possible and that the safety benefits outweigh the potential challenges associated with an earlier implementation of the 690.11 requirements. This action will allow us to achieve the earliest possible fire safety improvement with the best protection available at the time and to allow for future improvements as technology permits.

The submitter is directed to 90.4 relative to his concerns regarding unavailability of appropriate products.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BOWER, W.: I agree with the comment that the proposal is incomplete and premature with possible areas of serious contention. Material was presented at the panel meeting that a device to detect arc faults is being tested and may be ready in time for the 2011 NEC, but the applicability of a single device in all types of PV systems is not likely! I agree with the author of the comment that the proposal appears to be intent on only series arc faults AND protection only at the output end of the PV system. There will likely be better and a multiplicity of ways to detect arc faults nearer to the fault location. Several panel members expressed confidence "out of past experience" that when no commercially available product is available then the mandatory language of the code is not enforced. But what about the scenario where the available device is not applicable to the system? This is huge gamble and could be harmful to the PV industry. Enforcement will be at the discretion of the AHJ and could result in multiple expensive delays, appeals and interpretation misunderstandings with each PV installation.

I agree that all interested parties should move ahead with development of reliable and consistent dc arc fault detection methodologies and devices, but also believe that language in the 2011 NEC would best be delayed until the 2014 edition in order to assure the PV industry that a single method for arc-fault detection not be imposed for all systems.

YOUNG, J.: See comments on 4-79.

4-81 Log #2143 NEC-P04 **Final Action: Reject**
(690.11 (New))

Submitter: Jim Eichner, Xantrex Technology, Inc.
Comment on Proposal No: 4-205
Recommendation: Reject this proposal.
Substantiation: We feel the proposal is incomplete and premature for the following reasons:

1. Basic research into PV arcing signatures is lacking or at least incomplete, and will be very difficult. For AC arc-fault detectors there are still problems in this area, and problems were caused due to the code requirement being in force before the technology was ready. PV arc signature research will be even harder in PV systems because, unlike AC appliances, inverters and charge controllers are not subject to conducted emissions requirements on the DC input circuit that the arc-fault detector would be monitoring and because DC arcs do not have the 120Hz signature that AC arcs have.

2. The development of a consensus standard for PV arc fault detectors is not very far along, and will take considerable time since that standard will have to answer all the questions in the remaining points below.

3. The proposal deals only with series arc faults, yet parallel arc faults, both line-to-line and line-to-ground (in grounded PV systems) are at least as significant in terms of the severity and likelihood of the hazard. Line-to-ground faults are a type of parallel fault and carry just as much possibility of arcing, and the number of locations for possible ground faults is very large - everywhere the ungrounded conductors are near or in contact with grounded metal such as conduit. Line-to-line parallel faults are also possible in a large number of locations: the terminal box on the back of each panel, any wire run where + and - are bundled and exposed to mechanical damage or rodents, etc.

4. The proposal seems intent on protection being on the output end of the PV system, where a single device can be used, rather than at the source, as is typically required for protective systems. Putting the protection at the source may be unpopular with panel manufacturers, but it's the right (only) way to provide protection against both series and parallel arc faults. A compromise might be to put protection against both series and parallel faults in the string combiners, which leaves a smaller portion of the system unprotected.

5. What action the protector should take isn't clear. Shorting the array may be the best approach to ensure the arc is extinguished. For a parallel arc fault, opening the circuit would unload the array and drive the voltage up, worsening the arc. It is even possible that opening the circuit could extinguish the series arc but cause a parallel arc to start.

We would like to see this proposal rejected for this code cycle, allowing time for further study of arc signatures and time for industry to come to some consensus on how and where to address parallel faults not just series faults.

We would also like to comment that relative to Proposal 4-204, this Proposal 4-205 is preferable in two ways:

a) 4-205 replaces the undefined term "series arcing faults" with a description that does not require defining ("arcing faults resulting from a failure in the intended continuity of…")

and

b) added flexibility in the location of the interrupting means - in 4-204 it is required to disable or disconnect the inverter or charge controller, but in 2-205 an allowance is made to disconnect the faulted component instead, opening the door to arc fault protection located in combiner boxes or upstream.

Panel Meeting Action: Reject

Panel Statement: There has been an alarming increase in the number of PV arc fault fires occurring worldwide. While PV AFCI technology is relatively new, the panel concludes it is critical and necessary to address this significant void in PV system protection. Research and development of PV arc fault products and certification requirements is progressing quickly. These efforts have resulted in a draft standard, and multiple functional prototypes from multiple manufacturers. The experience gathered from the growth and development of the AC AFCI will allow the PV AFCI to avoid similar pitfalls.

The 690.11 requirements provides protection for the most likely type of PV arc faults and allows for its implementation anywhere within a PV system. The requirements in 690.11 are written based upon the protection function and not the implementation method. While not required by the requirements in 690.11, the PV AFCI certification requirements will include additional requirements for parallel arc fault protection for manufacturers that choose to provide such protection.

Research into arcing faults has been the subject of work by UL, NREL, Sandia, Southwest Research and industry authorities. There is sufficient knowledge to advance PV DC AFCI topics in the code. The remaining technical details listed in the public comments relate to detection methods and are not withstanding to the recognized need for the safety improvements.

While series and parallel PV AFCI protection would be preferable, the series protection required by 690.11 provides a substantial increase in the level of protection over a system without PV AFCI protection.

Additionally, parallel PV AFCI protection cannot be added to 690.11 for the 2011 NEC, based upon the already received comments and proposals currently under review. Therefore, the panel recognizes "parallel arc detection" as a desirable feature, but not a requirement.

With regard to the comment on ground faults being parallel faults, most modern listed PV inverters include GFDI protection and will mitigate parallel arcing ground faults.

The future effective date method allows time for new technical developments. New system solutions will be forth coming to meet the intent of 690.11. This should not be a barrier to achieving the safety improvement that can be accomplished at this time.

The panel affirms that PV AFCI protection is necessary as soon as possible, and that the safety benefits outweigh the potential challenges associated with an earlier implementation of the 690.11 requirements.

This action will allow us to achieve the earliest possible fire safety improvement with the best protection available at the time and to allow for future improvements as technology permits.

The submitter is directed to 90.4 relative to his concerns regarding unavailability of appropriate products.

YOUNG, J.: See comments on 4-80.

4-82 Log #2530 NEC-P04 **Final Action: Reject**
(690.11 (New))

Submitter: Timothy P. Zgonena, Underwriters Laboratories Inc.
Comment on Proposal No: 4-205
Recommendation: Propose to accept the original proposal with a future effective date to be agreed upon at the ROC meeting.
Substantiation: Affirmative Comment on panel action for Proposal 4-205:

I would like to thank the panel for its support of this proposal. UL with the help of AFCI industry experts and PV industry experts has drafted 1699X, Photovoltaic (PV) DC Arc-Fault Circuit-Interrupters. During this time since the ROP meeting, there have been an increasing number of serious PV related fires. These fires could have been prevented if these systems included PV AFCI protection. With the permission of the CMP-4 chairman, I would appreciate a short period of time to provide a presentation on the PV AFCI status and test results. It is expected that these PV AFCI safety requirements will be published and Listed products will be commercially available by the time that the 2011 NEC is published. In the event that this process encounters delays, the proposal should be modified to allow for a future effective date so this crucial safety technology can be implemented as soon as the industry is ready.

Panel Meeting Action: Reject
Panel Statement: The panel concludes that a delay in the effective date is not required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ROGERS, J.: The Panel was correct in rejecting this comment and remaining with the language and implementation date that are found in the original proposal. There is documented evidence that PV systems are already beginning to encounter arcing faults and start fires. The technology may be new and there may even unforeseen problems when first using the product but that is the case with many new products that enter the NEC. There is no question from the technical data that has been presented that this product will reduce the likelihood of fires and thus increases the likelihood that it will also reduce injuries or deaths to either firefighters or building occupants. There are multiple hazards involved in fighting PV array fires so preventing the fire in the first place would obviously remove these hazards.

4-83 Log #2672 NEC-P04 **Final Action: Accept**
(690.11 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-205
Recommendation: Accept the proposal in principle.
In the first sentence, change "dc source and/or output circuits" to "dc source circuits, dc output circuits, or both". Revise list item (4) to read: "(4) The system shall have an annunciator that provides a visual indication that the circuit interrupter has operated. This indication shall not reset automatically."
Substantiation: This comment corrects two violations of the NEC Style Manual ("and/or" and "must") and provides a clearer description of how the annunciator should function.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOWER, W.: I would like to go on record to say that I believe that the detection of dc arc faults is not as simple as with the ac arc faults that are now covered by the code. The fact that it will be difficult to determine whether a dc arc fault is in series with the circuit or is a parallel arc fault is of major concern. The required actions to mitigate series and parallel arc faults are very different. If the wrong action is taken, the arc fault current will likely be worsened. It is likely that several types of arc-fault detectors will be developed out of need because of 690.11, but it is unlikely all will be covered by the requirements being included in the 2011 code.
I agree that all interested parties should move ahead with development of reliable and consistent dc arc fault detection methodologies and devices, but also believe that language in the 2011 NEC would best be delayed until the 2014 edition in order to assure the PV industry that a single method for arc-fault detection not be imposed for all systems.

(690.13)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 4-209
Recommendation: The PV Industry Forum requests that CMP 4 revisit this proposal and reject it for the reasons stated below.
Substantiation: The requirements of the *NEC* have been developed based on over 110 years of installing, inspecting, and using grounded electrical systems. Electricians, inspectors and other qualified people know that a properly identified, grounded conductor represents less of a safety hazard than an ungrounded conductor since the grounded conductor is supposedly always at earth/ground potential. Despite training and experience, these people do not always follow full safety procedures when dealing with grounded conductors. "They're safe because they are grounded at zero voltage aren't they?" is a common expression. Currently, we have normal and expected operating conditions and modes for utility-interactive inverters where the utility power may be interrupted, the inverter turned off, or a backfed breaker in a load center may be opened. This proposal, if accepted, will allow inverter manufacturers to save a few dollars in the cost of the inverter by allowing the normally grounded and marked grounded PV array conductors to become ungrounded from normal and expected actions that have nothing to do with a failure of the PV system. These array conductors operate up to 600 volts dc and higher and now, that marked, white, grounded array conductor is floating at hundreds of volts above ground. Normal and expected leakage paths to ground make this now ungrounded conductor a significant electric shock hazard. A warning sign on the inverter won't work because under these circumstances, no one has any motivation to look at the inverter since the system is in a normal operating mode. People working on the roof, repairing other electrical equipment on the roof, or even working on the PV systems are now unnecessarily exposed to an electric shock hazard that does not need to happen.
Previous code actions (690.5) have determined that ungrounding the grounded conductor under abnormal and unexpected ground-fault conditions to prevent fires was a valid action in the interests of life safety. Since a ground fault is an abnormal condition for the PV system and the system is automatically shut down, the warning sign/indicator on the inverter will be noticed.
Furthermore, the added term "(unground)" should not be added to the Code in this section because opening a grounded conductor during a ground fault event will not necessarily "unground" the conductor if it is the conductor faulted to ground. However, the disconnection of this conductor is one way to interrupt ground fault currents and that requirement should not be modified.
Panel Meeting Action: Accept

(690.16)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-217
Recommendation: Accept the proposal and revise as follows:
An approved means shall be provided to disconnect a fuse(s) from all sources of power. Such a fuse (in a photovoltaic circuit) shall have approved means for being disconnected independently of fuses in photovoltaic source circuits. A warning label shall be provided to indicate the fuse(s) may be back-fed. The disconnecting means shall be readily accessible and immediately adjacent to the fuse(s).
Substantiation: This provision should apply whether or not accessible to other than qualified persons. A warning label should be required similar to 404.6(C) Exception, and 690.17.
Panel Meeting Action: Reject
Panel Statement: The comment does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Additionally, the use of line and load terminals for fuses is technically incorrect.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-89 Log #1265 NEC-P04 **Final Action: Accept**
(690.16(A) and (B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 4-218
Recommendation: 690.16 Fuses.
(A) Disconnecting means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions ~~and is accessible to other than qualified persons~~. Such a fuse in a photovoltaic source circuit shall be capable of being disconnected independently of fuses in other photovoltaic source circuits.
(B) Fuse Servicing. Disconnecting means shall be installed on PV output circuits where overcurrent devices (fuses) must be serviced that cannot be isolated from energized PV circuits. The disconnecting means shall be within sight and accessible to the location of the fuse or integral with fuse holder and shall comply with 690.17. Where the disconnecting means are located more than 1.8 m (6 ft) from the overcurrent device, a directory showing the location of each disconnect shall be installed at the overcurrent device location. Non-load-break rated disconnecting means shall be marked "Do not open under load."
Substantiation: The new-labeled Paragraph (A) appears to be in conflict with the new Paragraph (B). On large solar photovoltaic systems, it is common to see 200 amp to 400 amp 600 volt dc fuses without disconnection means. These systems are fusing at the module level to a combiner box, and there may be disconnects there, then taking a substantial feeder to another "feeder combiner box" where a high amperage bus then goes into the inverter. The "feeder combiner box" is not provided with disconnects for the individual feeders entering from the various arrays or disconnects to separate a feeder from the other arrays in order to change a fuse. This is requiring the service person to potentially remove and reinstall a fuse energized and very possibly under load which presents an unacceptable hazard. The only other alternative is to de-energize the whole system, which is not necessary, practical or even possible. Designers are using the words "accessible to other than qualified persons" as the justification not to install disconnects in these feeder circuits. The New Paragraph (B) would require the disconnection means to provide users a means to safely replace these fuses, yet paragraph (A) seems to negate this important safety requirement. Removing the words ~~and is accessible to other than qualified persons~~ will resolve the conflict between paragraphs (A) and (B). Qualified or not, it is unsafe work practice to change fuses in these high energy circuits while energized and the installation per the NEC should allow for a safe work practice to be executed.
Panel Meeting Action: Accept

4-92 Log #689 NEC-P04 **Final Action: Reject**
(690.31)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-221
Recommendation: Accept the proposal and revise as follows:
(A) Wiring Methods. Wiring methods included in this Code that are identified for the use shall be employed. Other approved systems and associated fittings shall be permitted. The wiring method shall be of a length and flexibility to permit necessary movement and replacement of equipment (remainder unchanged).
Delete exception.
(B) No change
(C) Flexible Cords and Cables. Flexible cords and cables shall comply with 400.3 and shall be extra-hard usage or hard usage types that are water resistant and sunlight resistant, and contain an equipment grounding conductor. (remainder unchanged).
Substantiation: All wiring methods are not suitable. This section may be perceived as amending "uses permitted" and "uses not permitted". Section 690.31(A) does not require raceways or any other wiring method, but merely permits them. Flexible cords and cables should comply with 400.3; this provision may be deemed to permit extra-hard usage and hard service type cords or cables not suitable, e.g. TypeEV, EVJ, EVE, etc. All hard service cords are extra-hard usage types. Article 400 does not require listing; Table 400.4 can be used for unlisted cords, but what table is to be used that covers listed cords?
Panel Meeting Action: Reject
Panel Statement: The addition of the word "identified" and the reference to 690.31(C) is redundant and unnecessary.
The deletion of the ampacity correction is unsubstantiated. Wiring methods to be utilized are adequately covered in Chapter 3 of the NEC.
The application of other wiring methods specific to PV installations are covered by 110.3 of the NEC.

TCC Action: The Technical Correlating Committee notes that the comment does not comply with 4.4.5(c) of the NFPA Regulations Governing Committee Projects in that it does not provide a recommendation.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 4-223
Recommendation: The PV Industry Forum respectfully asks the Panel how the PV industry should comply with the requirements of this section as written.
Substantiation: PV modules manufactured today have NO provisions for the attachment of raceways. Effectively, ground-mounted PV systems, which have exposed wiring between the modules, cannot be installed. Most of the new multi-megawatt PV systems installed in California (on the 2005 NEC) will be prohibited under the 2008 NEC.

It is practical and absolutely necessary to render this wiring not readily accessible or it will not be possible to install these large ground mounted systems.
While fences can be used to make the wiring not readily accessible, unqualified people inside the fence will do grounds maintenance and they would be subject to the potential shock hazards this section was intended to eliminate.

Attaching a barrier such as wire mesh (hardware cloth) to the rack behind the modules makes them not readily accessible. A PV array *is not* listed and this action does not touch or affect the listed modules. The PV Industry Forum respectfully requests that the Fine Print Note be approved as submitted.
Panel Meeting Action: Reject
Panel Statement: No specific text is proposed and, therefore, this comment does not comply with 4.3.3(B) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12

(690.31(B), FPN (New))

Submitter: Larry Cross, Local Union #98 IBEW
Comment on Proposal No: 4-225
Recommendation: Revise as follows:

FPN: See 310.13 FPN Conductor Construction and Applications for Thermoplastic Insulation where used on DC circuits in wet locations.
Substantiation: Would it not be a better code practice to help the photovoltaic installer, and let the installer be aware of a condition that could exist if they were to use a wiring method that may result in failure under an installation in wet location with DC circuits? The likelihood of this condition could happen in 690.3(B) and in 310.13 due to the overwhelming demand in the solar photovoltaic industry. The electrical industry MUST BE WARE that this condition does exist with DC circuits and wet locations.
Panel Meeting Action: Reject
Panel Statement: Fine Print Notes are not allowed to contain requirements as indicated in the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

ROGERS, J.: This comment should have been accepted. The informational note that the submitter is recommending is only a reference and considering that many PV installers are somewhat new to the NEC they may not be aware of this information. It is rather contradictory that the Panel chose to accept adding a code requirement referencing clearances to telecommunications and yet chose not to accept this informational note. If the Panel is concerned with the mandatory language they could change to Accept in Principle and add the words “For further information” before the word “See”. In my opinion it is not mandatory language, instructing someone to see something does not mandate a change in installation practice.

4-96 Log #1945 NEC-P04 **Final Action: Reject**
(690.31(E))

Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 4-228
Recommendation: Revise text to read as follows:

(E) Direct-Current Photovoltaic Source and Output Circuits Inside a Building.

Where flexible metal conduit (FMC) or metal clad cable (MC) smaller than metric designator 21 (trade size 3/4) containing PV power circuit conductors is installed across ceilings or floor joists, the raceway or cable shall be protected by substantial guard strips that are at least as high as the cable. Where run exposed, other than within 1.8 m (6 ft) of their connection to equipment, these wiring methods shall closely follow the building surface or be protected from physical damage by an approved means. Cable with aluminum interlocking armor shall not be permitted.
Substantiation: Cables with aluminum interlocking armor can be damaged quite easily if not installed properly and not protected from physical damage. Allowing this cable in areas that might be used for storage (residential attics, etc.) will be problematic after installation.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical rationale for the proposed change.

Other code requirements and product standards adequately address the installation of this wiring method.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-228
Recommendation: I. In 690.31(E) first paragraph revise the 690.14 reference to say “…690.14(A), (B), and (D). Add “The wiring methods shall comply with the additional installation requirements in (1) through (4).”

II Assign the number “(1)” to the second paragraph and add a title “Beneath Roofs”

III. In this second paragraph [to become (1)] change “vertically from” to “perpendicular to”.

IV. Assign the number “(2)” to the fourth paragraph (the one after the note) and add a title “Flexible Wiring Methods.”

V. In this paragraph [to become (2)] change “Where flexible metal conduit (FMC) or metal clad cable (MC) smaller than metric designator 21 (trade size ¾) containing” to “Where flexible metal conduit (FMC) smaller than metric designator 21 (trade size ¾) or Type MC cable smaller than 25 mm (1 in.) in diameter containing.”

VI. In the paragraph identified with a (1) in the ROP, change the number to (3) and assign a title of “Marking or Labeling Required.”

VII. In the paragraph identified with a (2) in the ROP, change the number to (4) and assign a title of “Marking and Labeling Methods and Locations.” Change “labels and/or markings” to “labels or markings, or between a label and a marking”.
Substantiation: I. The references to 690.14(E) through (I) cannot be correct because 690.14 has no such subsections.

II. As worded this section needs systematic subdivisions with titles in order for users to find what they need to know.

III. A roof that is other than flat will need the poke-through wiring run perpendicular to the deck and not up and down in order to minimize the exposure, as seems to be the intent of this requirement.

IV. Another title, for readability.

V. Type MC cable does not come in trade sizes. The wording here uses a comparable diameter, slightly smaller because MC cable is stiffer than Greenfield.

VI. This is another title for readability.

VII. This is another title for readability. The other change corrects a NEC Style Manual violation because the form “and/or” is not permitted.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

ROGERS, J.: I agree with the Panel in accepting this comment as it adds some clarity to the original proposal. I remain firm in my opinion that the original proposal should never have been accepted and even with the changes remains unenforceable. The proposal was accepted with no technical substantiation and no demonstrated problem, just feel good language about firefighters and homeowners. Properly installed electrical installations that are placed inside of buildings are already required to meet the installation criteria of their respective article based upon the wiring method employed.

4-98 Log #276 NEC-P04 **Final Action: Accept**
(690.31(F))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-231
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 1-149.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel reconsidered Proposal 4-231 and changes its action from “Reject” to “Accept in Principle” and revised 690.31(F) to read as follows:
690.31 Methods Permitted.

(F) Flexible, Fine-Stranded Cables. Flexible, fine-stranded cables shall be

terminated only with terminals, lugs, devices, or connectors in accordance with 110.14(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-99 Log #277 NEC-P04 **Final Action: Accept**
(690.47(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-234
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing more description related to the words "identified for the purpose."

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Add the following second paragraph to 690.47(B).
A common dc grounding-electrode conductor shall be permitted to serve multiple inverters. The size of the common grounding electrode and the tap conductors shall be in accordance with 250.166. The tap conductors shall be connected to the common grounding-electrode conductor by exothermic welding or with connectors listed as grounding and bonding equipment in such a manner that the common grounding electrode conductor remains without a splice or joint.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-100 Log #1944 NEC-P04 **Final Action: Accept**
(690.47(C))

TCC Action: The Technical Correlating Committee understands that the comment recommendation is revising text in the third paragraph with the intent to continue to accept the entire corrected text in Proposal 4-235.
Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 4-235
Recommendation: Revise text to read as follows:

690.47(C) Systems with Alternating and Direct Current Grounding Requirements.

When using the methods of (2) or (3), ~~a visual inspection shall be made to ensure that~~ the existing ac grounding-electrode system shall meet~~s~~ the applicable requirements of Article 250, Part III.
Substantiation: "A visual inspection" is not consistent with a requirement of the NEC. The ac grounding-electrode system shall meet Article 250 or should not be included in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-101 Log #1943 NEC-P04 **Final Action: Reject**
(690.47(C)(3))

Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 4-235
Recommendation: Revise text to read as follows:

690.47(C) Systems with Alternating and Direct Current Grounding Requirements.

~~(3) Combined DC Grounding Electrode Conductor and AC Equipment Grounding Conductor. An unspliced, or irreversibly spliced, combined grounding conductor shall be run from the marked dc grounding electrode conductor connection point along with the ac circuit conductors to the grounding bus bar in the associated ac equipment. This combined grounding conductor shall be the larger of the size specified by 250.122 or 250.166 and shall be installed in accordance with 250.64(E).~~
Substantiation: This configuration violates 250.64(C) that requires the grounding electrode conductor to be continuous to grounding electrode.

If the "associated ac equipment" (service panel or feeder panel) is removed for service or replacement, the grounding electrode conductor would no longer be continuous and the PV system would no longer be grounded. Furthermore, this configuration would depend on the equipment grounding conductor feeding the "associated ac equipment" that equipment grounding conductor might not be of sufficient size for grounding of the PV system.
Panel Meeting Action: Reject
Panel Statement: The submitter is correct that removal of the subpanel, however unlikely it may be, will interrupt the common grounding electrode conductor connection, however, this will also shut down the PV output through the inverter.

It is unclear what the submitter is referencing as a violation of 250.64(C) and the sizing requirements are included in the referenced section.

The proposal does maintain the continuity of the grounding electrode conductor.

Section 690.49 covers the situations when service removes ac equipment, such as panels.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-102 Log #1728 NEC-P04 **Final Action: Accept**
(690.47(D))

TCC Action: The Technical Correlating Committee understands that the comment recommendation is to Accept Proposal 4-238 to delete 690.47(D).
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 4-238
Recommendation: The PV Industry Forum respectfully suggests that the Panel review its decision that this section should remain in the Code. Additional substantiation for its removal has been placed below based on inputs from PV installers and electrical inspectors around the country attempting to use this section of the *2008 NEC*.
Substantiation: The PV Industry Forum proposed this addition to the *2008 NEC* as a permissive, optional grounding of the PV array for enhanced lightning protection. The proposal was based on 250.54. CMP 13 adopted the submission, but made it mandatory, revised the submission, and did not reference 250.54, which does not require that these optional electrodes be bonded to the existing electrodes.

Inspectors and installers reading the existing Code have no information to go on with respect to bonding.
There is no guidance or specificity to the term "as close as practical" with respect to where this new grounding electrode is to be located.

In the Exceptions: (1) As written, in the *2008 NEC*, it is unclear what "integral" means and some installers and inspectors have interpreted it as meaning that the inverter must be mounted on the array rack like the new micro inverters or other remotely located inverters near the PV array. Other inspectors have interpreted the word "integral" to mean that the inverter is in/on the same building as the PV array.

It is also not clear from the exceptions, whether or not the grounding-electrode conductor is still required when a new grounding electrode is not required. To meet the intent of the original submission in the 2008 NEC, the lightning protection function would require the array grounding electrode conductor in all situations.

(2) The distance of six feet has no reference since there is no prescriptive detail on how the grounding electrode is to be routed to the array.

The PV Industry again requests that Section 690.47 be removed from the Code due to its lack of clarity, the fact that it is related to equipment damager prevention and not directly to safety, and to the fact that 250.54 will address the requirement for those desiring to install these grounding electrodes.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

BOWER, W.: Comment 4-102 correctly cites 690.47(D) but the substantiation incorrectly requests that Article 690.47 be removed. The "Accept" of the proposal correctly removes 690.47(D).

STAFFORD, T.: This panel member wants to ensure that by our action on this comment, no text is altered or deleted in 690.47(D) as the comment of submitter requested a review by the panel only.

WILLS, R.: Comment 4-102 correctly cites 690.47(D) but the substantiation incorrectly requests that Article 690.47 be removed. The "Accept" of the proposal correctly removes 690.47(D).

(690.71 (New))

Submitter: Robert H. Wills, Intergrid, LLC / Rep. American Wind Energy Association
Comment on Proposal No: 4-247
Recommendation: Move common language on Storage Batteries (Section VIII) in Articles 690, 692 & 694 to a new common Article 69X.
Rename this article "Energy Storage Systems":
Article 69X – Energy Storage Systems
70X.1 Scope. The provisions of this article apply to energy storage systems such as batteries, ultra-capacitors, flywheels, etc. Energy storage systems can be ac or dc devices, and can include inverters and converters to transform from one form to the other.
70X.3 Other Articles. Whenever the requirements of other articles of this *Code* and Article 69X differ, the requirements of Article 69X shall apply.
690.11 Installation.
(A) General. Storage batteries in an energy storage system shall be installed in accordance with the provisions of Article 480. For photovoltaic power sources, the storage system shall be considered to be grounded when the connected power source is installed in accordance with 690.41.
(B) Dwellings.
(1) Operating Voltage. Energy storage systems for dwellings shall be configured so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).
Exception: Where live parts are not accessible during routine battery maintenance, an energy storage system voltage in accordance with the maximum permitted for the connected energy source shall be permitted.
(2) Guarding of Live Parts. Live parts of energy storage systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or type.
Informational Note: Batteries in energy storage systems are subject to extensive charge–discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.
(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the energy storage system where the available short-circuit current from a source exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 69x.20.
(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases. This requirement shall not apply to any type of valve regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.
(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where more than twenty four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.
(F) Battery Maintenance Disconnecting Means. Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the photovoltaic electrical system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.
(G) Battery Systems of More Than 48 Volts. On energy storage systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:
~~(1) The photovoltaic array source and output circuits shall comply with 690.41.~~
(1) The dc and ac load circuits shall be solidly grounded.
(2) All main ungrounded energy storage system input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.
(3) A ground-fault detector and indicator shall be installed to monitor for ground faults in the system.
69X.20 Fuses. Means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Switches, pullouts, or similar devices that are rated for the application shall be permitted to serve as a means to disconnect fuses from all sources of supply.
69X.30 Charge Control.
(A) General. Equipment shall be provided to control the charging process of the energy storage system. Charge control shall not be required where the design of the energy source is matched to the voltage rating and charge current requirements of the energy storage system. For battery systems, this requirement can be met if the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer. All adjusting means for control of the charging process shall be accessible only to qualified persons.
Informational Note: Certain battery types such as valve regulated lead acid or nickel cadmium can experience thermal failure when overcharged.
(B) Diversion Charge Controller.
(1) Sole Means of Regulating Charging. An energy storage system employing a diversion charge controller as the sole means of regulating charging shall be equipped with a second independent means to prevent overcharging.
(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load. Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:
(1) The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum energy storage system voltage. The power rating of the diversion load shall be at least 150 percent of the power rating of the energy source.
(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.
(3) Energy Storage Systems Using Utility-Interactive Inverters. Systems using utility-interactive inverters to control energy storage state-of-charge by diverting excess power into the utility system shall comply with (1) and (2):
(1) These systems shall not be required to comply with 69X.30(B)(2). ~~The charge regulation circuits used shall comply with the requirements of 690.8.~~ Energy system currents shall be considered to be continuous.
(2) These systems shall have a second, independent means of controlling the energy storage system charging process for use when the utility is not present or when the primary charge controller fails or is disabled.
(C) Buck/Boost dc Converters. When buck/boost charge controllers and other dc power converters that increase or decrease the output current or output voltage with respect to the input current or input voltage are installed, the following requirements must be met:
(1) The ampacity of the conductors in output circuits shall be based on the maximum rated continuous, output current of the charge controller or converter

for the selected output voltage range.

(2) The voltage rating of the output circuits shall be based on the maximum voltage output of the charge controller or converter for the selected output voltage range.

690.74 Battery Interconnections. Flexible cables, as identified in Article 400, in sizes 2/0 AWG and larger shall be permitted within the battery enclosure from battery terminals to a nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard-service use and identified as moisture resistant. Flexible, fine-stranded cables shall only be used with terminals, lugs, devices, and connectors that are listed and marked for such use.

Substantiation: The same language for stand-alone systems is included in the three renewable energy Articles (690, 692 and 694).

It makes sense to eliminate redundancy and to move it to a general Article so that common language can serve all three.

In this code cycle, we are already seeing significant divergence in the requirements for energy storage systems for PV, fuel cells and wind as it is difficult to coordinate the proposals for all of the technologies.

It is possible to write a generic Article that addresses the issues raised in the existing Articles.

Further, energy storage in renewable energy systems has gone beyond storage batteries. Ultracaps are commonly used for example.

By creating a new Article in Chapter 6 titled "Energy Storage Systems", we have a place to address emerging technologies such as home energy storage, ultra-capacitors, bi-directional electric vehicle charging (V2G) etc.

The language above is based on that of Article 690.71-74, but with the specific references to changed to the generic term "energy storage system". The language was also changed to make it compliant with the NEC Style Manual.

This proposal was originally rejected for not being presented as a complete article. I trust that this revision meets the panel's requirements.

Panel Meeting Action: Hold

Panel Statement: The panel reports this comment as "Hold" as it is new material.

The panel notes that Proposal 4-247 remains Rejected.

The Chair of Code-Making Panel 4 will establish a Task Group to review this issue and take the appropriate action for during the 2014 NEC Proposal stage.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

BOWER, W.: I agree with the panel action to hold the proposal/comment. The proposal is a significant change and it should not be taken lightly. It will take serious word by word examination and agreement from a task group that includes members of the industry as well as CMP members to correctly move the relevant parts from Article 690 to a new section. I would like to emphasize that there is likely a need to insure that all PV unique areas remain in Article 690.

WILLS, R.: Common language in Articles 690, 692 and 694 should be moved to a common location. Issues specific to PV (if any) can still be dealt with explicitly in 690. A task group should be assigned to this topic prior to the next code cycle.

4-107 Log #281 NEC-P04 **Final Action: Accept**
(690.72(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-250

Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal and comply with the NEC Style Manual 3.1 regarding the use of the wording "must be met" and use mandatory language.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel agrees that the wording in Proposal 4-250 as it relates to 690.72(C) should be revised as follows:

At the end of 690.72(C) change "the following requirements must be met", with "...the requirements shall comply with 690.72(C)(1) and 690.72(C)(2).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-108 Log #282 NEC-P04 **Final Action: Accept**
(690.74)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-251

Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 1-149.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel reconsidered the action taken on Proposal 4-251, and changed its action from "Reject" to "Accept in Principle", and revises the wording as follows:

690.74 Battery Interconnections. Flexible cables, as identified in Article 400, in sizes 2/0 AWG and larger shall be permitted within the battery enclosure from battery terminals to a nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard-service use and identified as moisture resistant.

Flexible, Fine-Stranded Cables. Flexible, fine-stranded cables shall be terminated only with terminals, lugs, devices, or connectors ~~that are identified and listed for such use.~~ in accordance with 110.14(A).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 692 — FUEL CELL SYSTEMS

4-109 Log #1784 NEC-P04 **Final Action: Accept**
(692.4(C))

TCC Action: Technical Correlating Committee directs that the Informational Note be revised to read as follows:

"Informational Note: See Article 100 for the definition of "qualified person"."

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 4-252

Recommendation: Accept the proposal in principle and revise as follows:

692.4(C) System Installation. Fuel Cell Systems including all associated wiring and interconnections shall be installed by only qualified persons. ~~with documented training and experience in the installation of and NEC requirements applicable to such equipment. the name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. Records of qualified persons must be furnished upon request to the local authority having jurisdiction.~~

Informational Note: The defined term qualified person indicates that knowledge related to construction and operation of equipment and installations is necessary along with safety training to recognize and avoid hazards to persons and property.

Substantiation: There were several key points made by the submitter that members of CMP-4 agreed with as indicated in the ballot statements. In fact the panel statement indicates that the "panel supports installations of these systems by qualified workers." The NEC is an installation Code and defines the term "qualified person" which is definitely necessary for these types of installations as indicated in the submitter's substantiation. This is specialized work and requires significant training and knowledge (including basic NEC knowledge). This comment attempts to preserve the points made by the submitter by retaining the concepts proposed while addressing the concerns of CMP-4 expressed in the panel statement. The NEC should require more specific qualifications for special equipment and systems requiring highly trained and knowledgeable workers and draw specific attention to it again within this article. Knowledge of the general requirements in the NEC (Chapters 1-4) is essential in addition to any specialty certification for installers of this type of equipment, yet in the field more of these installations and systems qualify for the expertise of trained electrical workers and contractors that also obtain specialty certifications beyond the minimum requirements to satisfy the criteria of qualified persons as defined in Article 100. Including the requirement that only qualified workers perform and be responsible for such installations as an NEC requirement supports what is anticipated as a general provision in the Code anyway, while at the same time helps support local regulation of qualified persons and contractors whether or not the electrical worker and contractor licensing and qualifications is regulated at the state and local levels.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

BOWER, W.: I agree with the panel action to strike the language "and be installed by qualified persons with documented training and experience in the installation of and NEC requirements applicable to such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. Records of qualified persons must be furnished upon request to the local authority having jurisdiction." as proposed for 692.4(C). That was an overzealous proposal to begin with, and would set a precedent that every section of the code dealing with installations has similar requirements for qualified installation personnel spelled out.

Note that this code is written to cover installations from a few watts to multi-megawatts. Per Article 90.1(C) stating "This code is not intended as a design specification or an instruction for untrained persons," implies trained (qualified) or supervised persons are doing the work. I can't imagine AHJ personnel running around every small fuel cell installation to be assured qualified persons are making every electrical connection and running every inch of wire.

The proposed language for 692.4(C) is **"System Installation**. Fuel Cell

Systems including ALL ASSOCIATED WIRING AND INTERCONNECTIONS SHALL BE INSTALLED by only qualified persons." The addition of 692.4(C) as accepted by the panel may appear to improve the safety of installed fuel cell systems, and I agree safety is paramount, but this is a dangerous precedent. NOWHERE ELSE IN THE NEC IS THERE SUCH UNENFORCEABLE LANGUAGE FOR INSTALLATION OF HARDWARE BY QUALIFIED PERSONNEL. NOT FOR THE INSTALLATION OF BATTERIES, EMERGENCY SYSTEMS, EQUIPMENT IN HAZARDOUS LOCATIONS, BULK STORAGE FACILITIES, X-RAY INSTALLATIONS, AMBULATORY CARE UNITS, FIREPUMPS, SERVICE PANELS, SERVICE CONDUCTORS, TRANSFORMERS, MOTOR GENERATORS, UNINTERRUPTIBLE POWER SUPPLIES, ELEVATORS, COORDINATION EQUIPMENT, COMMUNICATIONS EQUIPMENT AND MANY MORE. Note: I recognize there are many instances in the code where equipment shall be accessible ONLY by qualified personnel or be serviced IN INDUSTRIAL SETTINGS OR THEATERS by qualified personnel, but nowhere is the installation of equipment or systems by qualified personnel CALLED OUT! **THIS PROPOSAL SHOULD BE REJECTED.** FUEL CELL INSTALLATIONS ARE NO MORE COMPLEX THAN INSTALLATIONS SUCH AS ELEVATORS WITH REGENERATIVE BRAKING, UPS SYSTEMS TO BACK UP CRITICAL LOADS and in the future to interact with the Smart Grid, OR THE MANY OTHERS MENTIONED ABOVE. The "Informational Note" proposed in the comment DOES NOT meet the requirements of the style manual for the NEC. This could have been a fine print note and no mandatory language should have been included. The "Informational Note" should not be allowed and the proposal/comment should be "REJECTED".

If this proposal is not rejected then ONLY QUALIFIED personnel should be called out for the installation of ALL electrical equipment. The current language in Article 692.6 already covers the requirement for hardware to be identified and listed for the application, and that does not need to change. Mechanisms to assure good workmanship and assuring hardware meets all the physical requirements of the code are already in place.

WILLS, R.: This language falls outside the scope of the NEC.

ZINNANTE, V.: While I agree that "qualified persons" should install these systems, I do not feel it is necessary to redefine the term "qualified person" as an informational note in this article. The definition is clearly defined in Article 100 and needs no further clarification.

Comment on Affirmative:

ROGERS, J.: The submitter has presented a very good and workable solution to referencing a requirement for "Qualified Persons" performing work on fuel cell systems. There was much discussion about adding these words in Article 690 even though the term is already used in five locations within the article. Some are viewing this as a restriction for those already performing these installations, it clearly is not, it is just a baseline statement that workers should be safe for their own good and for the good of the people whose property they are working on. This basic minimum level of competency goes to the very basic purpose of the NEC, the practical safeguarding of people and property. This basic premise starts with protecting the worker by making sure they are qualified to recognize and avoid any hazards they may encounter while performing their work. Fuel cell systems have their own unique installation requirements and hazards and like PV systems require training that is different from standard electrical training. Having qualified persons perform these installations is the minimum assurance that the industry owes to the consumers who own the properties where these installations are being made.

4-110 Log #1785 NEC-P04 **Final Action: Accept**
(692.4(C))

TCC Action: The Technical Correlating Committee directs that the proposed language be moved to 694.7 and be revised to read as follows:

" 694.7 Installation. Systems covered by this Article shall be installed only by qualified persons."

In addition, the Technical Correlating Committee directs that the Informational Note be revised to read as follows:

"Informational Note: See Article 100 for the definition of "qualified person"."

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 4-253
Recommendation: 692.4(C) Equipment Installation. Equipment covered in Article 692 shall be installed only by qualified persons. ~~with documented training and experience in the installation of and NEC requirements applicable to such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. Records of qualified persons must be furnished upon request to the local authority having jurisdiction.~~

Informational Note: The defined term qualified person indicates that knowledge related to construction and operation of equipment and installations is necessary along with safety training to recognize and avoid hazards to persons and property.

Substantiation: There were several key points made by the submitter that members of CMP-4 agreed with as indicated in the ballot statements. In fact, the panel statement indicates that the "panel supports installations of these systems by qualified workers." The NEC is an installation Code and defines the term "qualified person" which is definitely necessary for these types of installations as indicated in the submitter's substantiation. This is specialized work and requires significant training and knowledge (including basic NEC knowledge). This comment attempts to preserve the points made by the submitter by retaining the concepts proposed while addressing the concerns of CMP-4 expressed in the panel statement. The NEC should require more specific qualifications for special equipment and systems requiring highly trained and knowledgeable workers and draw specific attention to it again within this article. Knowledge of the general requirements in the NEC (Chapters 1-4) is essential in addition to any specialty certification for installers of this type of equipment, yet in the field more of these installations are being performed by workers and firms without the minimum qualifications of an electrician. The evidence is mounting. These types of installations and systems qualify for the expertise of trained electrical workers and contractors that also obtain specialty certifications beyond the minimum requirements to satisfy the criteria of qualified persons as defined in Article 100. Including the requirement that only qualified workers perform and be responsible for such installations as an NEC requirement, supports what is anticipated as a general provision in the Code anyway, while at the same time helps support local regulation of qualified persons and contractors whether or not the electrical worker and contractor licensing and qualifications is regulated at the state and local levels.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

ZINNANTE, V.: While I agree that "qualified persons" should install these systems, I do not feel it is necessary to redefine the term "qualified person" as an informational note in this article. The definition is clearly defined in Article 100 and needs no further clarification.

Comment on Affirmative:

ROGERS, J.: The submitter has presented a very good and workable solution to referencing a requirement for "Qualified Persons" performing work on fuel cell systems. There was much discussion about adding these words in Article 690 even though the term is already used in five locations within the article. Some are viewing this as a restriction for those already performing these installations, it clearly is not, it is just a baseline statement that workers should be safe for their own good and for the good of the people whose property they are working on. This basic minimum level of competency goes to the very basic purpose of the NEC, the practical safeguarding of people and property. (692.59)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-255
Recommendation: Accept the proposal in principle.

Instead of rewording the final sentence as proposed, simply replace the word "When" with the word "Where."

Substantiation: If the Part V of Article 230 reference is simply to accommodate the service equipment suitability issue, then CMP 4 is correct. However, we are still left with condition of time instead of place, and in this case it is a very misleading wording because the relative position of a transfer switch is very definitely a condition of time. The wired connection to the transfer switch, however, is permanent and only a condition of place. Changing the first word makes the sentence read correctly, and comply with the NEC Style Manual.

ARTICLE 694 — SMALL WIND ELECTRIC SYSTEMS

4-116 Log #286 NEC-P04 **Final Action: Accept**
(694 (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-263
Recommendation: The Technical Correlating Committee directs that the panel reconsider the proposal relative to technical inconsistencies and NEC Style Manual issues.

The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee directs that the new Article Scope be modified to read as follows:

"**694.1 Scope**. The provisions of this article apply to small wind (turbine) electric systems that consisting of one or more wind electric generators with individual systems up to and including 100 kW. These systems can include generators, alternators, inverters, and controllers.

FPN: See FPN Figure 694.1 No. 1 and FPN Figure 694.1 No. 2

FPN: These systems can be interactive with other electrical power production sources or may be stand-alone systems. These systems can have ac or dc output, with or without electrical energy storage, such as batteries.

FPN Figure 694.1 No. 1 Identification of Small Wind Electric System Components – Interactive System.

FPN Figure 694.1 No. 2 Identification of Small Wind Electric System Components – Stand-Alone System."
This action shall be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the panel action Comment 4-121.

The panel acknowledges that the scope of this article is the responsibility of the Technical Correlating Committee, however, the panel requests that the Technical Correlating Committee consider changing 694.1 (Scope) as follows:

1. Add the term "rated power" in the scope to indicate that the definition value should be used.

2. Change "systems" to "generators" to remove the ambiguity that a system could be one or more generators. The use of the term "system" might be interpreted to limit the size of a wind farm to 100 kw total which is not the intent.

3. Fix a typographical error that would change "consist" to "consisting".

4. In the Informational Note change the word "These" to "Small wind electric systems".

5. Revise the Informational Notes and figure captions to simplify and clarify the language.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-117 Log #1020 NEC-P04 **Final Action: Hold**
(694 (New))

Submitter: Glenn A. Soles, Clark County Department of Development Services
Comment on Proposal No: 4-263
Recommendation: Create new text in new section (F).

(F) Metal or Nonmetallic Poles Supporting Wind Turbines.

Metal or nonmetallic poles shall be permitted to be used to support wind turbines and used as a raceway to enclose supply conductors, provided the following conditions are met:

(1) A pole shall have a handhole not less than 50 mm x 100 mm (2 in. x 4 in.) with a cover suitable for use in wet locations to provide access to the supply terminations within the pole or pole base.

Exception No. 1: No handhole shall be required in a pole 2.5 m (8 ft) or less in height above grade where the supply wiring method continues without splice or pull point, and where the interior of the pole and any splices are accessible by removing the wind turbine cover(s).

Exception No. 2: No handhole shall be required in a pole 6 m (20 ft) or less in height above grade that is provided with a hinged base.

(2) Where raceway risers or cable is not installed within the pole, a threaded fitting or nipple shall be brazed, welded, or attached to the pole opposite the handhole for the supply connection.

(3) A metal pole shall be provided with an equipment grounding terminal as follows:

a) A pole with a handhole shall have the equipment grounding terminal accessible from the handhole.

b) A pole with a hinged base shall have the equipment grounding terminal accessible within the base.

Exception No. 1: No grounding terminal shall be required in a pole 2.5 m (8 ft) or less in height above grade where the supply wiring method continues without splice or pull, and where the interior of the pole and any slices are accessible by removing the wind turbine cover(s).

(4) A metal pole with a hinged base shall have the hinged base and pole bonded together.

(5) Metal raceways or other equipment grounding conductors shall be bonded to the metal pole with an equipment grounding conductor recognized by 250.118 and sized in accordance with 250.122.

(6) Conductors in vertical poles used as raceway shall be supported as provided in 300.19.
Substantiation: Some wind turbines are mounted on poles. There needs to be language in Article 694 to address these installations. The language used was lifted from Article 410.30(B) with some minor terminology word changes to use wind turbines instead of luminares.
Panel Meeting Action: Hold
Panel Statement: The comment introduces a new concept, that while having merit, has not had public review and falls under 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.

The proposal will stand.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-118 Log #1214 NEC-P04 **Final Action: Accept in Principle**
(694 (New))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 4-263
Recommendation: This proposal should continue to be Accept in Principle and Part. Proposed section 694.31(B) should be revised to read as follows:
(B) Flexible Cords and Cables. Flexible cords and cables, when used to connect the moving parts of turbines or used to permit ready removal for maintenance and repair, shall comply with Article 400 and shall be of a type identified as a hard service cord or portable power cable; they shall be suitable for extra-hard usage, listed for outdoor use, and water resistant. Cables exposed to sunlight shall be sunlight resistant. Flexible, fine-stranded cables shall be terminated only with terminals, lugs, devices, or connectors that are identified and listed for such use.
Substantiation: This comment adds the language used in 690.31(F) for Flexible, fine-stranded cables, that is used with Solar Photovoltaic Systems to section 694.31(B) for Small Wind Turbines. There is a history with wind turbines of these types of cables disconnecting from their terminations because the termination used was never evaluated for flexible fine-strand cables.
Panel Meeting Action: Accept in Principle
Revise 694.30(B) to read as follows:
"…sunlight resistant. Terminals used for flexible, fine-stranded conductors and cables shall comply with 110.14(A).
Panel Statement: The panel revised the proposed language to a reference to 110.14(A) that now includes a similar section which applies to the entire Code.
The allowance of recognized as well as listed inverters was originally included to allow for inverters integrated into turbine nacelles, and before any standards for overall turbine listing were available. The panel has been informed that Listing of integrated inverters is now possible, and, therefore, the additional allowance for recognized inverters can be removed.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
YOUNG, J.: The panel action is incorrect. It reads that 694.30(B) is being revised. This should be 694.31(B).

4-119 Log #1766 NEC-P04 **Final Action: Accept**
(694)

TCC Action: The Technical Correlating Committee understands that the comment recommendation is to revise 694.7(B).
Submitter: Marvin Hamon, Hamon Engineering
Comment on Proposal No: 4-263
Recommendation: Revise text as follows:
(B) Equipment. Inverters or motor generators intended for use in small wind electric systems shall be identified and ~~either~~ listed ~~or recognized~~ for the application.
Substantiation: Recognized components are for use in complete UL listed products and are not suitable for field installation. Because of this they should not be referenced in this
paragraph.
Panel Meeting Action: Accept
Panel Statement: The allowance of recognized as well as listed inverters was originally included to allow for inverters integrated into turbine nacelles, and before any standards for overall turbine listing were available. The panel has been informed that Listing of integrated inverters is now possible, and, therefore, the additional allowance for recognized inverters can be removed.

(694 (New))

TCC Action: The Technical Correlating Committee directs that Article 694 be revised to read as follows to comply with the NEC Style Manual:
"Article 694 - Small Wind Electric Systems
I. General.
694.1 Scope. The provisions of this article apply to small wind (turbine) electric systems that consist of one or more wind electric generators with individual generators having a rated power up to and including 100 kW. These systems can include generators, alternators, inverters, and controllers.
Informational Note: Small wind electric systems can be interactive with other electrical power production sources or might be stand-alone systems. Small wind electric systems can have ac or dc output, with or without electrical energy storage, such as batteries. See Informational Note Figures 694.1 and 694.2.

*****Insert Figure 694.1 Here (not shown)*****

Informational Note Figure 694.1 Identification of Small Wind Electric System Components – Interactive System.

*****Insert Figure 694.2 Here (not shown)*****

Informational Note Figure 694.2 Identification of Small Wind Electric System Components – Stand-Alone System.
694.2 Definitions.
Charge Controller. Equipment that controls dc voltage or dc current, or both, that is used to charge a battery or other energy storage device.
Diversion Charge Controller. Equipment that regulates the charging process of a battery or other energy storage device by diverting power from energy storage to dc or ac loads, or to an interconnected utility service.
Diversion Load. A load connected to a diversion charge controller or diversion load controller, also known as a dump load.
Diversion Load Controller. Equipment that regulates the output of a wind generator by diverting power from the generator to dc or ac loads or to an interconnected utility service.
Guy. A cable that mechanically supports a wind turbine tower.
Inverter Output Circuit. The conductors between an inverter and an ac panelboard for stand-alone systems, or the conductors between an inverter and service equipment or another electric power production source, such as a utility, for an electrical production and distribution network.
Maximum Output Power. The maximum 1 minute average power output a wind turbine produces in normal steady-state operation (instantaneous power output can be higher).
Maximum Voltage. The maximum voltage the wind turbine produces in operation including open circuit conditions.
Nacelle. An enclosure housing the alternator and other parts of a wind turbine.
Rated Power. The wind turbine's output power at a wind speed of 11 m/s (24.6 mph). If a turbine produces more power at lower wind speeds, the rated power is the wind turbine's output power at a wind speed less than 11 m/s that produces the greatest output power.
Informational Note: The method for measuring wind turbine power output is specified IEC 61400-12-1, Power Performance Measurements of Electricity Producing Wind Turbines.
Tower. A pole or other structure that supports a wind turbine.
Wind Turbine. A mechanical device that converts wind energy to electrical energy.
Wind Turbine Output Circuit. The circuit conductors between the internal components of a small wind turbine (which might include an alternator, integrated rectifier, controller, and/or inverter) and other equipment.
Wind Turbine System. A small wind electric generating system. Informational Note: See also definitions for interconnected systems in Article 705.
694.3 Other Articles. Wherever the requirements of other articles of this Code and Article 694 differ, the requirements of Article 694 shall apply. Where the system is operated in parallel with primary sources of electricity, the requirements of Article 705 shall apply.
Exception: Small wind electric systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with the applicable requirements of Articles 500 through 516.
694.7 Installation.
(A) Small Wind Electric Systems. Small wind electric system(s) shall be permitted to supply a building or other structure in addition to any services of another electricity supply system.
(B) Equipment. Inverters used in small wind electric systems shall be identified and either listed or identified for the application.
(C) Diversion Load Controllers. A small wind electric system, employing a diversion load controller as the primary means of regulating the speed of a wind turbine rotor, shall be equipped with an additional, independent,

reliable means to prevent over-speed operation. An interconnected utility service shall not be considered to be a reliable diversion load.

(D) Surge Protective Devices (SPD). A surge protective device shall be installed between a small wind electric system and any loads served by the premises electrical system. The surge protective device shall be permitted to be a Type 3 SPD on a dedicated branch circuit serving a small wind electric system or a Type 2 SPD located anywhere on the load side of the service disconnect. Surge protective devices shall be installed in accordance with Part II of Article 285.

(E) Receptacles. A receptacle shall be permitted to be supplied by a small wind electric system branch or feeder circuit for maintenance or data acquisition use. Receptacles shall be protected by an overcurrent device with a rating not to exceed the current rating of the receptacle.

II. Circuit Requirements.

694.10 Maximum Voltage.

(A) Wind Turbine Output Circuits. For wind turbines connected to one- and two-family dwellings, turbine output circuits shall be permitted to have a maximum voltage up to 600 volts. Other installations with a maximum voltage over 600 volts shall comply with Part IX of Article 694.

(B) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall comply with 210.6.

(C) Circuits over 150 Volts to Ground. In one- and two-family dwellings, live parts in circuits over 150 volts to ground shall not be accessible to other than qualified persons while energized.

Informational Note: See 110.27 for guarding of live parts and 210.6 for branch circuit voltage limitations.

694.12 Circuit Sizing and Current.

(A) Calculation of Maximum Circuit Current. The maximum current for a circuit shall be calculated in accordance with 694.12(A)(1) through (A)(3).

(1) Turbine Output Circuit Currents. The maximum current shall be based on the circuit current of the wind turbine operating at maximum output power.

(2) Inverter Output Circuit Current. The maximum output current shall be the inverter continuous output current rating.

(3) Stand-Alone Inverter Input Circuit Current. The maximum input current shall be the stand-alone continuous inverter input current rating of the inverter producing rated power at the lowest input voltage.

(B) Ampacity and Overcurrent Device Ratings.

(1) Continuous Current. Small wind turbine electric system currents shall be considered to be continuous.

(2) Sizing of Conductors and Overcurrent Devices. Circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum current as calculated in 694.12(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).

Exception: Circuits containing an assembly, together with its overcurrent devices, listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

694.15 Overcurrent Protection.

(A) Circuits and Equipment. Turbine output circuits, inverter output circuits, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 694.12(B) where the maximum current from all sources do not exceed the ampacity of the conductors.

Informational Note: Possible backfeed of current from any source of supply, including a supply through an inverter to the wind turbine output circuit, is a consideration in determining whether adequate overcurrent protection from all sources is provided. Some small wind electric systems rely on the turbine output circuit to regulate turbine speed. Inverters may also operate in reverse for turbine startup or speed control.

(B) Power Transformers. Overcurrent protection for a transformer with sources on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer where the current rating on the side connected to the inverter output, which is not less than the rated continuous output current rating of the inverter, shall not be required to have overcurrent protection at the inverter.

(C) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc circuit of a small wind electric system shall be listed for use in dc circuits and shall have appropriate voltage, current, and interrupting ratings.

694.18 Stand-Alone Systems. The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this Code, except as modified by 694.18(A) through (D).

(A) Inverter Output. The ac output from stand-alone inverters shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of a wind energy source shall be not less than the load of the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.

(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply. The inverter output of a stand-alone small wind electric system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING.
SINGLE 120-VOLT SUPPLY.
DO NOT CONNECT.
MULTIWIRE BRANCH CIRCUITS!.

(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies shall not be required.

III. Disconnecting Means.

694.20 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a small wind electric power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, either ac or dc, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.

Exception: A wind turbine that uses the turbine output circuit for regulating turbine speed shall not require a turbine output circuit disconnecting means.

694.22 Additional Provisions. Disconnecting means shall comply with 694.22(A) through (D).

(A) Disconnecting Means. The disconnecting means shall not be required to be suitable for use as service equipment. The disconnecting means for ungrounded conductors shall consist of manually operable switches or circuit breakers complying with all of the following requirements:

(1) They shall be located where readily accessible .

(2) They shall be externally operable without exposing the operator to contact with live parts.

(3) They shall plainly indicate whether in the open or closed position.

(4) They shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.

Where all terminals of the disconnecting means are capable of being energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means.
The sign shall be clearly legible and shall have the following words or equivalent:

WARNING.
ELECTRIC SHOCK HAZARD.
DO NOT TOUCH TERMINALS.
TERMINALS ON BOTH THE LINE
AND LOAD SIDES MAY BE
ENERGIZED IN THE OPEN POSITION.

(B) Equipment. Equipment such as rectifiers, controllers, output circuit isolating and shorting switches, and overcurrent devices shall be permitted on the wind turbine side of the disconnecting means.

(C) Requirements for Disconnecting Means.

(1) Location. The small wind electric system disconnecting means shall be installed at a readily accessible location either on or adjacent to the turbine tower, on the outside of a building or structure or inside, at the point of entrance of the wind system conductors.

Exception: Installations that comply with 694.30(C) shall be permitted to have the disconnecting means located remotely from the point of entry of the wind system conductors.

A wind turbine disconnecting means shall not be required to be located at the nacelle or tower.

The disconnecting means shall not be installed in bathrooms.

(2) Marking. Each wind turbine system disconnecting means shall be permanently marked to identify it as a small wind electric system disconnect. A plaque shall be installed in accordance with 705.10.

(3) Suitable for Use. Turbine system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the appropriate requirements of Articles 500 through 517.

(4) Maximum Number of Disconnects. The turbine disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

(D) Equipment that is Not Readily Accessible. Rectifiers, controllers, and inverters shall be permitted to be mounted in nacelles or other exterior areas that are not readily accessible.

694.24 Disconnection of Small Wind Electric System Equipment. Means shall be provided to disconnect equipment, such as inverters, batteries and charge controllers, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified.

A single disconnecting means in accordance with 694.22 shall be permitted for the combined ac output of one or more inverters in an interactive system.

A shorting switch or plug shall be permitted to be used as an alternative to a disconnect in systems that regulate turbine speed using the turbine output circuit.

Exception: Equipment housed in a turbine nacelle shall not be required to have a disconnecting means.

694.26 Fuses. Means shall be provided to disconnect a fuse from all sources of supply where the fuse is energized from both directions and is accessible to other than qualified persons. Switches, pullouts, or similar devices that are rated for the application shall be permitted to serve as a means to disconnect fuses from all sources of supply.

694.28 Installation and Service of a Wind Turbine.

Open circuiting, short circuiting, or mechanical brakes shall be used to disable a turbine for installation and service.

Informational Note: Some wind turbines rely on the connection from the alternator to a remote controller for speed regulation. Opening turbine output circuit conductors may cause mechanical damage to a turbine and create excessive voltages that could damage equipment or expose persons to electric shock.

IV. Wiring Methods.

694.30 Permitted Methods.

(A) Wiring Systems. All raceway and cable wiring methods included in this Code, and other wiring systems and fittings specifically intended for use on wind turbines, shall be permitted. In readily accessible locations, turbine output circuits that operate at voltages greater than 30 volts shall be installed in raceways.

(B) Flexible Cords and Cables. Flexible cords and cables, where used to connect the moving parts of turbines or where used for ready removal for maintenance and repair, shall comply with Article 400 and shall be of a type identified as hard service cord or portable power cable; shall be suitable for extra-hard usage, shall be listed for outdoor use, and shall be water resistant. Cables exposed to sunlight shall be sunlight resistant.

(C) Direct-Current Turbine Output Circuits Inside a Building. Direct-current turbine output circuits, installed inside a building or structure, shall be enclosed in metal raceways or installed in metal enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means.

V. Grounding.

694.40 Equipment Grounding.

(A) General. Exposed non–current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be connected to an equipment grounding conductor in accordance with 250.134 or 250.136(A), regardless of voltage. Attached metal parts, such as turbine blades and tails that have no source of electrical energization, shall not be required to be connected to an equipment grounding conductors.

(B) Guy Wires. Guy wires used to support turbine towers shall not be required to be connected to an equipment grounding conductor or to comply with the requirements of 250.110.

Informational Note: Guy wires supporting towers that are adequately grounded are unlikely to become energized. Grounding of metallic guy wires may be required by lightning codes. See 694.40 (C)(4).

(C) Tower Grounding.

(1) Auxiliary Electrodes. A wind turbine tower shall be connected to one or more auxiliary electrodes to limit voltages imposed by lightning. Auxiliary electrodes shall be permitted to be installed in accordance with 250.54. Electrodes that are part of the tower foundation and meet the requirements for concrete encased electrodes in accordance with 250.52(A)(3) shall be acceptable. A grounded metal tower support shall be considered acceptable where meeting the requirements of 250.136(A). Where installed in close proximity to galvanized foundation or tower anchor components, galvanized grounding electrodes shall be used.

Informational Note: Copper and copper-clad grounding electrodes, where used in highly conductive soils, can cause electrolytic corrosion of galvanized foundation and tower anchor components.

(2) Equipment Grounding Conductor. An equipment grounding conductor shall be required between a turbine and the premises grounding system in accordance with 250.110.

(3) Tower Grounding Connections. Equipment grounding conductors and grounding electrode conductors, where used, shall be connected to the metallic tower by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Devices, such as connectors and lugs, shall be suitable for the material of the conductor and the structure to which the devices are connected. Where practicable, contact of dissimilar metals shall be avoided anywhere in the system to eliminate the possibility of galvanic action and corrosion. All mechanical elements used to terminate these conductors shall be accessible.

(4) Lightning Protection Systems. Auxiliary electrodes and grounding electrode conductors shall be permitted to act as lightning protection system components where meeting applicable requirements. If separate, the tower lightning protection system grounding electrodes shall be bonded to the tower auxiliary grounding electrode system. Guy wires used as lightning protection system grounding electrodes shall not be required to be bonded to the tower auxiliary grounding electrode system.

Informational Note: See NFPA 780-2008, Standard for the Installation of Lightning Protection Systems, Informative Annex N, Wind Turbine Generator Systems, for information on lightning protection of wind turbines.

VI. Marking.

694.50 Interactive System Point of Interconnection. All interactive system points of interconnection with other sources shall be marked at an accessible location at the disconnecting means and with the rated ac output current and the nominal operating ac voltage.

694.52 Power Systems Employing Energy Storage.

Small wind electric systems employing energy storage shall be marked with the maximum operating voltage, any equalization voltage, and the polarity of the grounded circuit conductor.

694.54 Identification of Power Sources.

(A) Facilities with Stand-Alone Systems. Any structure or building, with a stand-alone system and not connected to a utility service source, shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location. The plaque or directory shall indicate the location of system disconnecting means and shall indicate that the structure contains a stand-alone electrical power system.

(B) Facilities with Utility Services and Small Wind Electric Systems. Buildings or structures with both utility service and small wind electric systems shall have a permanent plaque or directory providing the location of the service disconnecting means and the small wind electric system disconnecting means.

694.56 Instructions for Disabling Turbine. A plaque shall be installed at or adjacent to the turbine location providing basic instructions for disabling the turbine.

VII. Connection to Other Sources.

694.60 Identified Interactive Equipment. Only inverters listed and identified as interactive shall be permitted in interactive systems.

694.62 Installation. Small wind electric systems, where connected to utility electric sources, shall comply with the requirements of Article 705.

694.64 Ampacity of Neutral Conductor.

A conductor used solely for instrumentation, voltage detection, or phase detection and connected to a single-phase or three-phase utility-interactive inverter, shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor.

Informational Note: See also 705.95.

694.66 Operating Voltage Range. Small wind electric systems connected to dedicated branch or feeder circuits shall be permitted to exceed normal voltage operating ranges on these circuits provided the voltage at any distribution equipment supplying other loads remains within normal ranges.

Informational Note: Wind turbines might use the electric grid to dump energy from short-term wind gusts. Normal operating voltages are defined in ANSI C84.1-2006, Voltage Ratings for Electric Power Systems and Equipment (60 Hz).

694.68 Point of Connection. Points of connection to interconnected electric power sources shall comply with 705.12.

VIII. Storage Batteries.

694.70 Installation.

(A) General. Storage batteries in small wind electric systems shall comply with the provisions of Article 480.

(B) Dwellings.

(1) Operating Voltage. Storage batteries shall have the cells connected to operate at less than 50 volts nominal. Lead-acid storage batteries shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 694.10 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

Informational Note: Batteries in small wind electric systems are subject to extensive charge/discharge cycles and typically require frequent maintenance, such as checking the electrolyte and cleaning of connections.

(C) Current Limiting. A listed, current-limiting overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 694.26.

(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells

connected in series (48 volts nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where rack material is not located within 150 mm (6 in.) of the tops of the nonconductive cases. This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries requiring steel or other conductive material cases for proper operation.

(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing,
with more than twenty-four 2-volt cells connected in series (48 volts nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(F) Battery Maintenance Disconnecting Means. Battery installations, with more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductors in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductors for the remainder of the small wind electric system. A non– load-break-rated switch shall be permitted to be used as the disconnecting means.

(G) Battery Systems of More Than 48 Volts. Where the battery system for a small wind electric system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The dc and ac load circuits are solidly grounded.

(2) All main ungrounded battery input/output circuit conductors are provided with
switched disconnects and overcurrent protection.

(3) A ground-fault detector and indicator is installed to monitor for ground faults in the battery bank.

694.75 Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery.
Charge control shall not be required where the design of the small wind electric source is matched to the voltage rating and charge current requirements of the interconnected battery cells, and the maximum charging current, multiplied by 1 hour, is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer. All adjusting means for control of the charging process shall be accessible only to qualified persons.

Informational Note: Certain battery types, such as valve regulated lead-acid or nickel-cadmium, can experience thermal failure when overcharged.

(B) Diversion Charge Controller.

(1) Sole Means of Regulating Charging. A small wind electric system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with two, reliable, independent means to prevent overcharging of the battery. An interconnected utility service shall not be considered as a reliable diversion load.

(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load.
Circuits containing a dc diversion charge controller and a dc diversion load shall comply
with the following:

(1) The current rating of the diversion load shall not be greater than the current rating of
the diversion load charge controller. The voltage rating of the diversion load shall be
greater than the maximum battery voltage. The power rating of the diversion load shall be
not less than 150 percent of the maximum power output rating of the small wind electric system.

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall
be at least 150 percent of the maximum current rating of the diversion charge controller.

IX. Systems over 600 Volts.

694.80 General. Small wind electric systems with a maximum system voltage exceeding
600 volts ac or dc shall comply with Article 490 and all other requirements applicable to
installations rated over 600 volts.

694.85 Cable and Equipment Ratings. For the purposes of Part IX of this article, the
voltages used to determine cable and equipment ratings shall be as specified in 694.85(A)
and (B):

(A) Battery Circuits. In battery circuits, the voltage used shall be the highest voltage
experienced under charging or equalizing conditions.

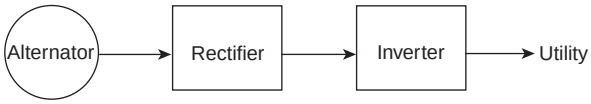
(B) Other Circuits. In other circuits, the voltage used shall be the maximum voltage
experienced in normal operation."

Submitter: Robert H. Wills, Intergrid, LLC / Rep. American Wind Energy Association
Comment on Proposal No: 4-262
Recommendation: Revise proposed text as follows:
~~ARTICLE~~ Article 694 -Small Wind Electric Systems
I. General.

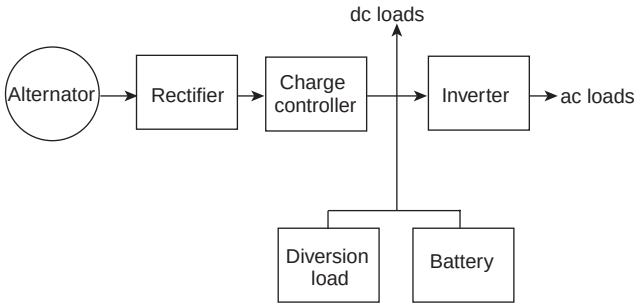
694.1 Scope.

The provisions of this article apply to small wind (turbine) electric systems that consisting of one or more wind electric generators with individual ~~systems~~ generators having a rated power up to and including 100kW. These systems can include generators, alternators, inverters, and controllers.

Informational Note: ~~These Systems~~ Small wind electric systems can be interactive with other electrical power production sources or might be stand-alone systems. These systems can have ac or dc output, with or without electrical energy storage, such as batteries. See Informational Note Figures 694.1 and 694.2.



Informational Note Figure 694.1~~(A)~~ Identification of Small Wind Electric System Components – Interactive System.



Informational Note Figure 694.~~1(B)~~2 Identification of Small Wind Electric System Components – Stand-Alone System.

694.2 Definitions.

[Editorial Note that these have been re-ordered alphabetically]

Charge Controller. Equipment that controls dc voltage or dc current, or both, and that is used to charge a battery or other energy storage device.

Diversion Charge Controller. Equipment that regulates the charging process of a battery or other energy storage device by diverting power from energy storage to ~~direct current or alternating current~~ dc or ac loads, or to an interconnected utility service.

Diversion Load. A load connected to a diversion charge controller or diversion load controller. ~~A~~, also known as a dump load.

Diversion Load Controller. Equipment that regulates the output of a wind generator by diverting power from the generator to ~~direct current or alternating current~~ dc or ac loads or to an interconnected utility service.

Guy. A cable that mechanically supports a wind turbine tower.

Inverter Output Circuit. ~~C~~ The conductors between an inverter and an ac panelboard for stand-alone systems, or the conductors between an inverter and service equipment or another electric power production source, such as a utility, for an electrical production and distribution network.

Maximum Output Power. The maximum 1 ~~one~~-minute average power output a wind turbine ~~will~~ produces in normal steady-state operation (instantaneous power output can be higher).

Maximum Voltage. The maximum voltage the wind turbine ~~will~~ produces in operation including open circuit conditions.

Nacelle. An enclosure housing the alternator and other parts of a wind turbine.

Rated Power:. The wind ~~turbine's power~~ turbine's output power at a wind

speed of 11.0 m/s (24.6 mph) when measured in accordance with IEC 61400-12-1,). If a turbine produces more power at lower wind speeds, the rated power shall be is the wind turbine's output power at a wind speed less than 11 m/s that produces the greatest output power.

Informational Note: The method for measuring wind turbine power output is specified IEC 61400-12-1, *Power Performance Measurements of Electricity Producing Wind Turbines.*

Tower. A pole or other structure that supports a wind turbine.
Wind Turbine. A mechanical device that converts wind energy to electrical energy.
Wind Turbine Output Circuit. Circuit The circuit conductors between the internal components of a small wind turbine (which may might include an alternator, integrated rectifier, controller, and/or inverter), and other equipment.
Wind Turbine System. A small wind electric generating system.

FPN Informational Note: See also definitions for Interconnected Systems interconnected systems in Article 705 [or Article 100 if they are moved there].

694.3 Other Articles
Wherever, Whenever the requirements of other articles of this *Code* and Article 694 differ, the requirements of Article 694 shall apply and, if. If the system is operated in parallel with a primary source(s) of electricity, the requirements in of Article 705 shall apply.
Exception: Small wind electric systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with the applicable portions of Articles 500 through 516.
694.4 7 Installation.
(A) Small Wind Electric System. A small**s**. Small wind electric system(s) shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).
(B) Equipment. Inverters or motor generators intended for use used in small wind electric systems shall be identified and either listed or recognized for the application.
(C) Diversion Load Controllers. A small wind electric system employing a diversion load controller as the sole primary means of regulating the speed of a wind turbine rotor shall be equipped with two reliable an additional, independent, reliable means to prevent over-speed operation. An interconnected utility service shall not be considered to be a reliable diversion load.
(D) Surge Protective Devices. A surge protective device shall be installed between a small wind electric system and any loads served by the premises electrical system. The surge protective device is permitted to be a Type 3 device located on a dedicated branch circuit serving a small wind electric system, or a Type 2 device located anywhere on the load side of the service disconnect. Surge protective devices shall be installed in accordance with Article 285 Part II.
(E) Receptacles. A receptacle is permitted to be attached to a small wind electric system branch or feeder circuit for maintenance or data acquisition use. Receptacles shall be protected with an overcurrent device that is rated at no greater than with a rating not to exceed the current rating of the receptacle.
II. Circuit Requirements.
694.7 10 Maximum Voltage.
(A) Turbine Output Circuits. For wind turbines connected to one- and two-family dwellings, turbine output circuits shall be permitted to have a maximum voltage up to 600 volts. Other installations with a maximum voltage over 600 volts shall comply with Article 694, Part IX.
(B) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall conform to 210.6.
(C) Circuits over 150 Volts to Ground. In one- and two-family dwellings, live parts in circuits over 150 volts to ground shall not be accessible to other than qualified persons while energized.

FPN Informational Note: See 110.27 for guarding of live parts, and 210.6 for branch circuit voltage to ground and between conductors limitations.

694.812 Circuit Sizing and Current.
(A) Calculation of Maximum Circuit Current. The maximum current for the specific a circuit shall be calculated in accordance with 694.812(A)(1) through (A)(3).
(1) Turbine Output Circuit Currents. The maximum current shall be the circuit current when the wind turbine is operating at Maximum Output Power *maximum output power*.
(2) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.
(3) Stand-Alone Inverter Input Circuit Current. The maximum current shall be the stand-alone continuous inverter input current rating when the inverter is producing rated power at the lowest input voltage.
(B) Ampacity and Overcurrent Device Ratings.
(1) Continuous Current. Small wind electric system currents shall be considered to be continuous.
(12) Sizing of Conductors and Overcurrent Devices. The circuit Circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 694.812(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).
Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized used at 100 percent of its rating.
694.915 Overcurrent Protection.
(A) Circuits and Equipment. Turbine output circuits, inverter output circuits, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.
Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 694.812(B) and located where one of when the following apply: (a) There are no external sources such as batteries or backfeed from inverters. (b) The maximum currents from all sources do not exceed the ampacity of the conductors

FPN Informational Note: Possible backfeed of current from any source of supply, including a supply through an inverter *in*to the *alternator* wind turbine output circuit, is a consideration in determining whether adequate overcurrent protection from all sources is provided *for conductors and modules*. Some small wind electric systems rely on the turbine output circuit to regulate turbine speed. *In systems of this type, manufacturers instructions should be followed* .Inverters may also operate in reverse for turbine startup or speed control.

(B) Power Transformers. Overcurrent protection for a transformer with a source(s) sources on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.
Exception: A power transformer with a current rating on the side connected toward the small wind electric power source, to the inverter output, which is not less than the short-circuit rated continuous output current rating of the inverter, shall be permitted without overcurrent protection from that source .the inverter.
(C) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a small wind electric system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupting ratings.
[Note: The following common language to **694**, 692 and 694 should move to a common Article – perhaps a new one near 705, but focused on stand-alone rather than interconnected systems. A separate proposal has been submitted to this effect. If this proposal is accepted, 694.10 could be deleted]
694.1018 Stand-Alone Systems.
The premises wiring system shall be adequate to meet the requirements of this *Code* for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this *Code*, except as modified by 694.1018(A) through (D).
(A) Inverter Output. The ac output from a stand-alone inverter(s) shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate a wind energy source shall be equal to or greater not less than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.
(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from over currents overcurrent in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.
(C) Single 120-Volt Supply. The inverter output of a stand-alone small wind electric system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING, SINGLE 120-VOLT SUPPLY.
DO NOT CONNECT.
MULTIWIRE BRANCH CIRCUITS!

(D) Energy Storage or Backup Power System Requirements.
Energy storage or backup power supplies are shall not be required.
III. Disconnecting Means.
694.1320 All Conductors.
Means shall be provided to disconnect all current-carrying conductors of a small wind electric power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, either ac or dc, shall not be installed in a grounded
conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.
Exception: A wind turbine that uses the turbine output circuit for regulating turbine speed does shall not require a turbine output circuit disconnecting means.

694.~~14~~22 Additional Provisions.
Disconnecting means shall comply with 694.~~14~~22(A) through (D).
(A) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment ~~and shall comply with the following:~~ . The disconnecting means for ungrounded conductors shall consist of ~~a~~ manually operable switch~~(es)~~ or circuit breaker~~(s)~~ complying with all of the following requirements:
(1) ~~Located~~ They shall be located where readily accessible.
(2) ~~Externally~~ They shall be externally operable without exposing the operator to contact with live parts.
(3) ~~Plainly indicating~~ They shall plainly indicate whether in the open or closed position.
(4) ~~Having~~ They shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment. ~~Where~~ When all terminals of the disconnecting means ~~may be~~ are capable of being energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and have the following words or equivalent:

WARNING.
ELECTRIC SHOCK HAZARD
DO NOT TOUCH TERMINALS
TERMINALS ON BOTH THE LINE
AND LOAD SIDES MAY BE
ENERGIZED IN THE OPEN POSITION.

(B) Equipment. Equipment such as rectifiers, controllers, output circuit isolating and shorting switches, and over-current devices shall be permitted on the wind turbine side of the disconnecting means.
(C) Requirements for Disconnecting Means.
(1) Location. The small wind electric system disconnecting means shall be installed at a readily accessible location either on or adjacent to the turbine tower, on the outside of a building or structure or inside ~~nearest~~, at the point of entrance of the wind system conductors.
Exception: Installations that comply with 694.~~31(E~~30(C) shall be permitted to have the disconnecting means located remotely from the point of entry of the wind system conductors.
A turbine disconnecting means shall not be required to be located at the nacelle or tower. The disconnecting means shall not be installed in bathrooms.
(2) Marking. Each turbine system disconnecting means shall be permanently marked to identify it as a small wind electric system disconnect. A plaque shall be installed in accordance with 705.10.
(3) Suitable for Use. ~~Each turbine~~ Turbine system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the appropriate requirements of Articles 500 through 517.
(4) Maximum Number of Disconnects. The turbine disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.
~~**(5) Grouping.** The turbine disconnecting means shall be grouped with other disconnecting means for the system to comply with 694.14(C)(4). A turbine disconnecting means shall not be required at the nacelle or tower location.~~
(D) Equipment ~~Mounted in~~ that is Not-Readily-Accessible ~~Locations~~.
Rectifiers, controllers, and inverters shall be permitted to be mounted in nacelles or other exterior areas that are not readily accessible.
694.~~15~~24 Disconnection of Small Wind Electric System Equipment.
Means shall be provided to disconnect equipment, such as inverters, batteries, and charge controllers, ~~and the like,~~ from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified. A single disconnecting means in accordance with 694.~~17~~22 shall be permitted for the combined ac output of one or more inverters in an interactive system. A shorting switch or plug shall be permitted to be used as an alternative to a disconnect in systems that regulate turbine speed using the turbine output circuit.
Exception: Equipment housed in a turbine nacelle ~~is~~ shall not be required to have a disconnecting means.
694.~~16~~26 Fuses. Means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Switches, pullouts, or similar devices that ~~have suitable ratings may~~ are rated for the application shall be permitted to serve as a means to disconnect fuses from all sources of supply. ~~A shorting plug shall be permitted to be used as an alternative to a disconnect in systems that regulate turbine speed using the turbine output circuit.~~
694.~~18~~28 Installation and Service of a Wind Turbine. Open circuiting, short circuiting, or mechanical brakes shall be used to disable a turbine for installation and service.

~~FPN~~ Informational Note: Some wind turbines rely on the connection from the alternator to a remote controller for speed regulation. Opening turbine output circuit conductors may cause mechanical damage to a turbine and create excessive voltages that could damage equipment or expose persons to electric shock.

~~**694.20 Disconnection of Wind Turbine Alternators.**~~
IV. Wiring Methods.
694.~~31~~ 30 ~~Methods Permitted~~ Permitted Methods.
(A) Wiring Systems. All raceway and cable wiring methods included in this *Code*, and other wiring systems and fittings specifically intended for use on wind turbines, shall be permitted. ~~Where turbine~~ Turbine output circuits ~~operating~~ in readily accessible locations that operate at ~~maximum~~ voltages greater than 30 volts ~~are installed in readily accessible locations, circuit conductors~~ shall be installed in raceways.
(B) Flexible Cords and Cables. Flexible cords and cables, where used to connect the moving parts of turbines or used to allow ready removal for maintenance and repair, shall comply with Article 400 and shall be of a type identified as ~~a~~ hard service cord or portable power cable; they shall be suitable for extra-hard usage, listed for outdoor use, and shall be water resistant. Cables exposed to sunlight shall be sunlight resistant.
(C) Direct-Current Turbine Output Circuits Inside a Building. When direct-current turbine output circuits are run inside a building or structure, they shall be contained in metal raceways or metal enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means.
V. Grounding.
694.~~43~~40 Equipment Grounding.
(A) General. Exposed non–current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A), regardless of voltage. Attached metal parts, such as turbine blades and tails that have no source of electrical energization ~~are not~~, shall not be required to be grounded.
(B) Guy Wires. Guy wires used to support turbine towers shall not be required to be grounded or to comply with the requirements of 250.110.

~~[FPN]~~ Informational Note: Guy wires supporting towers that are adequately grounded are ~~not~~ unlikely to become energized ~~and so are not subject to the requirements of 250.110~~. Grounding of metallic guy wires may be required by ~~lighting~~ lightning codes. See 694.40 (C)(4).

(C) Tower Grounding.
(1) Auxiliary Electrode(s). A wind turbine tower shall be grounded with one or more auxiliary electrode(s) to limit voltages imposed by lightning. Auxiliary electrodes ~~are~~ shall be permitted to be installed in accordance with 250.54. Electrodes that are part of the tower foundation and that meet the requirements for concrete encased electrodes (250.52(A)(3)) ~~are~~ shall be considered to be acceptable. A grounded metal tower support ~~is~~ shall be considered to be acceptable if it meets the requirements of 250.136(A). Where installed in close proximity to galvanized foundation or tower anchor components, galvanized grounding electrodes shall be used.

Informational Note: Copper and copper-clad grounding electrodes, when used in highly conductive soils, can cause electrolytic corrosion of galvanized foundation and tower anchor components.

(2) Equipment Grounding Conductor. An equipment grounding conductor shall be required between a turbine and the premises grounding system ~~grounded conductor~~ in accordance with 250.110.
(3) Tower Grounding Connections. The equipment grounding conductor, and grounding electrode conductors ~~(~~, if used~~)~~, shall be , shall be connected to a metallic tower by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Devices such as connectors and lugs shall be suitable for the material of the conductor and the structure to which they connect. ~~Where~~ When practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action and corrosion. All mechanical elements used to terminate these conductors shall be accessible.
(4) Lightning Protection Systems. Auxiliary electrodes and grounding electrode conductors shall be permitted to act as lightning protection system components if they meet ~~the~~ applicable requirements ~~of NFPA 780~~. If separate, the tower lightning protection system grounding electrodes shall be bonded to the tower auxiliary grounding electrode system. Guy lightning protection system ground electrodes shall not be required to be bonded to the tower auxiliary grounding electrode system.

~~FPN~~ Informational Note: See NFPA 780-2008, *Standard for the Installation of Lightning Protection Systems*, *Informative Annex N, Wind Turbine Generator Systems*, for information on lightning protection of wind turbines.

VI. Marking.
694.~~54~~50 Interactive System Point of Interconnection. All interactive system~~(s)~~ points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source and with the rated ac output current and the nominal operating ac voltage.
694.~~55~~52 Power Systems Employing Energy Storage. Small wind electric systems employing energy storage shall be marked with the maximum operating voltage, including any equalization voltage and the polarity of the grounded circuit conductor.
694.~~56~~ 54 Identification of Power Sources.
(A) Facilities with Stand-Alone Systems. Any structure or building with a power system that is not connected to a utility service source and is a stand-alone system shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location. The plaque or

directory shall indicate the location of system disconnecting means and that the structure contains a stand-alone electrical power system.

(B) Facilities with Utility Services and Small Wind Electric Systems. Buildings or structures with both utility service and a small wind electric system systems shall have a permanent plaque or directory providing the location of the service disconnecting means and the small wind electric system disconnecting means if not located at the same location.

694.56 Instructions for Disabling Turbine. A plaque shall be installed at or adjacent to a turbine location providing basic instructions for disabling the turbine.

VII. Connection to Other Sources.

[This section should be coordinated with similar language in 694 and 692 that indicates that the requirements of Article 705 apply.]

694.60 Identified Interactive Equipment. Only inverters listed or recognized, and identified as interactive shall be permitted in interactive systems.

694.62 Installation. Small wind electric systems, when connected to other electric sources, shall comply with the requirements of article Article 705.

694.62 64 Ampacity of Neutral Conductor.

If a single-phase, 2-wire inverter output is connected to the neutral conductor and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral conductor and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

A conductor used solely for instrumentation, voltage detection, or phase detection, and connected to a single-phase or 3-phase utility-interactive inverter, shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor. See also 705.95.

694.6366 Operating Voltage Range. Systems Small wind electric systems operating on dedicated branch or feeder circuits may shall be permitted to exceed normal voltage operating ranges at the end of these circuits provided that the voltage at any general distribution equipment supplying other loads remains within these normal ranges.

> Informational Note: Wind turbines might use the electric grid to dump energy from short-term wind gusts. This may result in the voltage at the turbine exceeding the limits set out Normal operating voltages are defined in ANSI C84.1-2006, *Voltage Ratings for Electric Power Systems and Equipment (60 Hz)*, however the voltage at the distribution equipment must stay within the C84.1 range.]).

694.64 68 Point of Connection. See 705.12 Point of Connection.

[Note – this section may be deleted if Article 705 has equivalent language]

The output of a utility-interactive inverter shall be connected as specified in 694.64(A) or (B).

(A) Supply Side. The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(B) Load Side. The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment, including switchboards and panelboards, is fed simultaneously by a primary source(s) of electricity and one or more utility-interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders, or both, the interconnecting provisions for the utility-interactive inverter(s) shall comply with (B)(1) through (B)(7).

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Bus or Conductor Rating. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed 120 percent of the rating of the busbar or conductor. In systems with panelboards connected in series, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors.

(3) Ground-Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

(4) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.

(5) Suitable for Backfeed. Circuit breakers, if backfed, shall be suitable for such operation.

FPN: Circuit breakers that are marked "Line" and "Load" have been evaluated only in the direction marked. Circuit breakers without "Line" and "Load" have been evaluated in both directions.

(6) Fastening. Listed plug-in-type circuit breakers backfed from utility-interactive inverters complying with 694.60 shall be permitted to omit the additional fastener normally required by 408.36(D) for such applications.

(7) Inverter Output Connection. Unless the panelboard is rated not less than the sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall be sized for the loads connected in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment with the following or equivalent marking:

WARNING
INVERTER OUTPUT CONNECTION
DO NOT RELOCATE
THIS OVERCURRENT DEVICE

VIII. Storage Batteries.

[This common language should move to 480 or another common article]

694.7170 Installation.

(A) General. Storage batteries in small wind electric systems shall be installed in accordance with the provisions of Article 480.

(B) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: Where When live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 694.710 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

> FPN Informational Note: Batteries in small wind electric systems are subject to extensive charge–/discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where when the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 694.1626.

(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where when no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel or other conductive material cases for proper operation.

(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where when more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(F) Battery Maintenance Disconnecting Means. Battery installations, where when there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the small wind electric system. A non– load-break-rated switch shall be permitted to be used as the disconnecting means.

(G) Battery Systems of More Than 48 Volts. On small wind electric systems where when the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The dc and ac load circuits shall be solidly grounded.

(2) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(3) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

694.7275 Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where when the design of the small wind electric source is matched to the voltage rating and charge current requirements of the interconnected battery cells, and the maximum charging current, multiplied by 1 hour, is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer. All adjusting means for control of the charging process shall be accessible only to qualified persons.

~~FPN~~ Informational Note: Certain battery types, such as valve-regulated lead -acid or nickel–cadmium, can experience thermal failure when overcharged.

(B) Diversion Charge Controller.

(1) Sole Means of Regulating Charging. A small wind electric system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with two, reliable, independent means to prevent overcharging of the battery. An interconnected utility service shall not be considered to be a reliable diversion load.

(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load.

Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

(1) The current rating of the diversion load shall not be ~~less~~ greater than ~~or equal to~~ the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be ~~at least~~ not less than 150 percent of the maximum power output rating of the ~~turbine~~ small wind electric system.

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

IX. Systems over 600 Volts.

694.80 General. Small wind electric systems with a maximum system voltage ~~over~~ exceeding 600 volts ac or dc shall comply with Article 490 and other requirements applicable to installations rated over 600 volts.

694.85 ~~Definitions~~ Cable and Equipment Ratings. For the purposes of Part IX of this article, the voltages used to determine cable and equipment ratings ~~are~~ shall be as ~~follows.~~ specified in 694.85(A) and (B)**:**

(A) Battery Circuits. In battery circuits, the voltage used shall be the highest voltage experienced under charging or equalizing conditions~~.~~ , or

(B) Other Circuits. In other circuits, the voltage used shall be the maximum voltage experienced in normal operation.

Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-122 Log #2526 NEC-P04 **Final Action: Accept**
(694 (New))

Submitter: Timothy P. Zgonena, Underwriters Laboratories Inc.
Comment on Proposal No: 4-263
Recommendation: Propose to delete terms as follows.
(B) Equipment. Inverters or motor generators intended for use in small wind electric systems shall be identified and either listed (~~or recognized~~) for the application.
Substantiation: While I understand and appreciate the concerns of the author, recognition certifications vary greatly and are accompanied by conditions of acceptability. Conditions of acceptability appear in the individual recognition reports that are only available from the manufacturer. These conditions of acceptability contain the specific limitations of the product and /or certification. These limitations can include limited testing or construction evaluations. Recognized components are incomplete and are not eligible for an overall product certification like a Listing or Classification. Recognitions often exclude critical aspects that need to be further evaluated or accounted for in the end application.
The "recognized" verbiage in this proposal resulted from the lack of a US wind turbine certification program. This is no long the case since UL published Subject 6140, Outline Of Investigation For Wind Turbine Generating Systems and Subject 6141 Outline Of Investigation For Wind Turbine Converters And Interconnection Systems. These documents will allow for certifications of wind turbines and wind turbine components so these products can be certified as a complete product that can be readily accepted by AHJs in the field.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: The comment should be accepted but the word "either" between the words "and" and "listed" should be removed.

4-123 Log #2675 NEC-P04 **Final Action: Accept in Principle in Part**
(694 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-263
Recommendation: Accept the proposal in principle.
In addition to addressing the TCC note, make the following additional changes:
I. In 694.2, Diversion Load, make the definition into a single sentence by removing the period the precedes the final sentence fragment and inserting a comma ("… load controller, also known as …")
II. In 694.3, delete the first sentence. Begin the remaining sentence "Where the system …".
III. In 694.4(A) Change "in addition to any services of another electricity supply system." to "in addition to other sources of supply, whether through a service, or through other separately derived systems, or both."
IV. In 694.4(B), revise the product acceptance criterion to read "shall be identified for the application."
V. In 694,4(E), change "to be attached to" to read "to be connected to".
VI. In 694.9(A), change "requirements of Article 240" to "requirements of Parts I and II of Article 240."
VII. In 694.9(A) Exception, change "when" to "where."
VIII. In 694.9(A) Informational Note, in the first sentence, delete "adequate" and add at the end of the sentence "in accordance with the provisions of this Code." In the third sentence, delete "to". In the fourth sentence, change "should be followed" to "contain the procedures to be followed." Also, add an apostrophe after "manufacturers."
IX. In. 694.10, delete the first sentence.
X. In 694.10(B), insert "Parts I and II of" ahead of "Article 240."
XI. In 694.10(D), change "are not" to "shall not be".
XII. In Part III, renumber all sections (694.13 through 694.18) by adding ten to the section numbers (694.23 through 694.28, respectively.)
XIII. In 694.14(C)(3) {will be 694.24(C)(3)}, delete the last sentence.
XIV. In 694.14(C)(4 and 5) {will be 694.24(C)(3)}, Change "group" to "set of grouped" near the end of (4) and delete (5).
XV. In 694.15 {will be 694.25} Exception, change "is not" to "shall not be."
XVI. Reword the title of Part IV to "Wiring Methods and Grounding." Incorporate both Section 694.31 and 694.43 in this part, with 694.31 renumbered as 694.41. Entitle this section as "Wiring Methods Permitted" and to correlate with this renumbering, change the reference in 694.14(C)(1) Exception from "694.31(C)" to "694.41(C)."
XVII. In 694.31(B) {will be 694.41(B)}, change "when" to "where" and change "Article 400" to "400.4".
XVIII. In 694.31(C) {will be 694.41(C)}, revise to read as follows:
694.41(C). Direct-Current Turbine Output Circuits Inside a Building. Where direct-current turbine output circuits are run inside a building or structure, they shall be contained in metal raceways, Type MC metal-clad cable that complies with 250.118(10), or metal enclosures, from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 694.24(A), (B) and (D). The wiring methods shall comply with the additional installation requirements of (1) through (4).
(1) Beneath Roofs. Wiring methods shall not be installed within 25 cm (10 in.) of the roof decking or sheathing. Circuits shall be run perpendicular to the roof penetration point to supports a minimum of 25 cm (10 in.) below the roof decking.
Informational Note: The 25 cm (10 in.) requirement is to prevent accidental damage from saws used by firefighters for roof ventilation during a structure fire.
(2) Flexible Wiring Methods. Where flexible metal conduit (FMC) or smaller than metric designator 21 (trade size ¾) or Type MC cable smaller than 25 mm (1 in.) in diameter containing direct-current turbine output circuit conductors is installed across ceilings or floor joists, the raceway or cable shall be protected by substantial guard strips that are at least as high as the raceway or cable. Where run exposed, other than within 1.8 m (6 ft) of their connection to equipment, these wiring methods shall closely follow the building surface or be protected from physical damage by an approved means.
(3) Marking or Labeling Required. The following wiring methods and enclosures that contain photovoltaic power source conductors shall be marked with the wording "DC Turbine Output Power Source" by means of permanently affixed labels or other approved permanent marking:
(1) Exposed raceways, cable trays, and other wiring methods.
(2) The covers or enclosures of pull boxes and junction boxes.
(3) Conduit bodies in which any of the available conduit openings are unused.
(4) Marking or Labeling Methods and Locations. The labels or markings shall be visible after installation. The power circuit labels shall appear on every section of the wiring system that is separated by enclosures, walls, partitions, ceilings, or floors. Spacing between labels or markings, or between a label and a marking, shall not be more than 3 m (10 ft). Labels required by this section shall be suitable for the environment where they are installed.
XIX. In 694.43(A), change "are not" to "shall not be". Change "grounded in accordance with 250.134 or 250.136(A) regardless of voltage" to "bonded to the system bonding jumper for dc systems and to the supply-side bonding jumper for ac systems, regardless of voltage."
XX. Combine 694.43(B) and (C) as follows:
(B) Tower Grounding.
(1) Auxiliary Grounding Electrodes and Grounding Electrode Conductors. A wind turbine tower shall be connected to one or more auxiliary grounding electrodes to limit voltages imposed by lightning. The auxiliary grounding electrodes shall comply with 250.52(A) in form and 250.54 for connections using a grounding electrode conductor that complies with 250.166 for dc systems and 250.62 through 250.70 for ac systems.
(2) System Bonding Jumper. A system bonding jumper or supply-side bonding jumper shall connect the turbine to the first system disconnecting means, sized and run in accordance with 250.168 for dc systems and 250.30(A)(2) for ac systems, respectively.

(3) Lightning Protection. Where a lightning protection system is present, its ground terminals shall be bonded to the tower grounding electrode system as required by 250.106. Where the tower is remote from the building or structure served, the tower grounding electrode system shall be permitted to be made a part of the lightning protection system.

Informational Note: See NFPA 780-2008, *Standard for the Installation of Lightning Protection Systems*, Informative Annex N, Wind Turbine Generator Systems, for information on lightning protection of wind turbines.

(4) Guy Wires. Guy wires used to support turbine towers shall not be required to be connected to the system bonding jumper or to a grounding electrode. Where included in a lightning protection system, the ground terminals for the guy wires shall not be required to be bonded to the one or more auxiliary grounding electrodes for the tower.

XXI. In 694.62, replace the proposal language with the following text:

The ampacity of the neutral conductors shall comply with either (A) or (B).

(A) Inverter Outputs Connected Between Neutral Conductor and Ungrounded Conductor(s). Where the outputs of single or multiple single-phase inverter(s) are connected between the neutral conductor and one or more of the ungrounded conductors of a 3-phase 4-wire, wye-connected system or a 120/240V single-phase system, the ampacity of the neutral conductor shall be no less than the greater of (1) or (2).

(1) 125 percent of the continuous load plus 100% of the non continuous load on that neutral conductor or

(2) 125 percent of the sum of the rated output current of all inverters considering worst-case imbalance.

(B) Used for Instrumentation, Voltage Detection or Phase Detection. A conductor used solely for instrumentation, voltage detection, or phase detection, and connected to a single-phase or 3-phase utility-interactive inverter, shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor.

XXII. In 694.64 Revise to read as follows: "The output of a utility-interactive inverter shall be permitted to be connected to either the supply or the load side of the service disconnecting means in accordance with 705.12(A) or 705.12(D) as applicable."

Substantiation: General note: It is recognized that many of the sins corrected in the following items were copied from other related articles, and that those comparable issues will remain uncorrected in the source material. Where the source of the concern is the NEC Style Manual, that is abbreviated here as "NECSM".

I. The final sentence is not a sentence; this is a simple fix.

II. This is fully covered by 90.3. This process is taking place all over Chapter 6; see, for example, Proposal 12-165 in Article 665. The remaining sentence describes a condition of place.

III. Only a utility can supply a service. This wording is the most technically correct way to cover the additional sources.

IV. Apparently the intent is to recognize an inverter that is not necessarily listed (hence the undefined term "recognized." The correct terminology for this type of criterion is "identified" in its unmodified meaning as set forth in Article 100. If CMP 4 believes the standard should be "listed" the so be it. If CMP 4 wants the inverter to state in a visible way that it is for use with small wind electric systems, then this should say either "identified and marked" or "listed and marked" depending on CMP 4's preference.

V. This provision describes an electrical connection, not a mechanical attachment.

VI. This eliminates a violation of the whole-article-reference prohibition, NECSM at 4.1.1.

VII. This is a condition of place and not time.

VIII. "Adequate" is a word to be avoided (NECSM at 3.2.1). The word "to" in this case is an apparent typo. Recommendations are to be avoided in the NEC, and the missing apostrophe is an apparent typo.

IX. The first sentence hangs on the word "adequate" and since it does not add any real meaning to the code as a whole it should be deleted. Both its provisions (implicitly) and the second sentence are both modified by the three lettered subsections following, ending up in the same place.

X. This will eliminate a whole-article-reference violation of the NECSM at 4.1.1.

XI. The panel wording is not the correct way to frame a requirement, as covered in the NECSM at 3.1.1.

XII. This will preserve the spirit of the decade rule (NECSM at 2.4.2.1). It is understood that the proposal submitters were presumably attempting to maintain continuity with comparable material in related articles, with which this commenter is in full sympathy. The approach here retains the units digits and the relative order of material in order to respect the original numbering objective and still leave room for future additions.

XIII. The hazardous location rules apply as written unless this article attempts, with the approval of the TCC, to modify them. No such modification is contemplated here, so the sentence can be deleted, taking with it another violation of the whole-article-reference prohibition.

XIV. This makes the section simpler. By saying "set of grouped enclosures" the grouping requirement is fully covered in (4), and (5) is no longer necessary.

XV. This is the appropriate wording for a requirement (NECSM at 3.1.1).

XVI. Article parts are intended to help organize complicated articles and normally comprise more than a single section (NECSM at 2.1.4); in this case we have two successive parts with only a single section each, which is certainly not the intent of the Style Manual. Since they are adjacent to each other, the fix is simple: preserve the order of sections and make one part from the two. To make this work and leave space after694.18 (now to become 694.28), 694.31 becomes 694.41, which has, again, the same units digit. Normally this would be 694.40, but the intent with respect to correlating information with similar articles also has support (NECSM at 2.4.1).

XVII. This avoids a whole-article-reference violation and points to the section where the cord characteristics are detailed. Other provisions of Article 400 apply whether or not cited because they are not further amended in this article. The word "when" should not be used because it describes a condition of place.

XVIII. This is 690.31(E) (the obvious model for the proposal wording) as it has been changed during the ROP period by Proposal 4-228, and as it is recommended to be editorially modified in a companion comment by this submitter, all as modified to apply to small wind turbine sources. This wording assumes that a turbine might be placed on a roof, and therefore retains most of the roof provisions added to 690.31(E).

XIX. This is correct code language for a requirement (NECSM at 3.1.1). The second change is major and correlates with a decision to approach these connections as bonding connections on the supply side of a point-source separately derived system. Refer to the discussion in the next topic at item (2) for the full substantiation.

XX. The tower grounding rules are far more complicated than those for guy wires, and in addition the guy wire rules (as modified in this comment) depend on references to the tower they support. Since the tower rules can be simplified by appropriate references to other code material, it makes sense to combine the two subsections. The specific substantiation follows:

(1) This is essentially the same as proposed but better correlated with the work now ongoing in CMP 5 for this code cycle, and with Article 250 in general. Specifically, the actual electrodes must qualify under 250.52(A) and any such electrode should be suitable in this case. Note that as proposed the tower support reference to 250.136(A) is incorrect and should be to 250.52(A)(8), but this comment uses generic language that avoids this problem. This comment also adds appropriate dc system references as they will frequently apply. The notes made a part of the article scope clearly indicate both system types are covered. It also adds requirements for the grounding electrode conductors that were missing in the proposal.

(2) This is an interesting point of departure from Article 690. PV arrays are typically large in area and not thought of in the sense of a point source such as a generator, although everyone will agree they are separately derived systems. In addition, there is usually some form of overcurrent protection at the arrays. Therefore, Article 690 is generally organized around the terminology of an equipment grounding conductor. A wind turbine is a point source, and so it seemed more user-friendly to organize this portion of the article around system bonding jumpers. Where a generator is outside a building and the first disconnect is at the building, Article 250 has highly evolved terminology for the grounding connections between the two locations, and "equipment grounding conductors" are not used, because they are on the line side of any overcurrent protection. That is the case here, so the approach in this comment is the more technically correct. Note that the citation of 250.30(A)(2) is the new location for this conductor, now named for ac systems as a "supply-side bonding jumper." For dc systems the reference is in Part VIII of Article 250. The reference to 250.168 is particularly robust, since it brings in parts of 250.28 that in turn bring in 250.8.

(3) This part is somewhat troublesome because lightning protection systems are outside of the scope of the NEC, however, there is a precedent for limited coverage in 675.15. The second sentence accomplishes the submitter's objective of allowing the auxiliary grounding system to be a lightning protection system electrode, however, only for remote towers. This Chapter 6 amendment of 250.60 should not apply to a tower on the roof of the supplied premises

(4) This part is intended to meet the submitter's objectives. The informational note that came with this is deleted because it contained mandatory language as well is impermissible terminology ("adequately grounded"). It also is unnecessary because the NEC doesn't need to comment on whether they might be part of a lightning protection system, it is enough to say what to do in terms of the wiring system in the event they are so included. The implicit Chapter 6 waiver of 250.106 for ground terminal bonding on these items is retained. The informational note on NEPA 780 is also proper and has been retained.

XXI. This wording is that accepted for the same provision in 690.62 for what is electrically a comparable arrangement (see Proposal 4-242).

XXII. The text has been corrected to comply with the NEC Style Manual and the TCC Note on Proposal 4-246.

Panel Meeting Action: Accept in Principle in Part

The panel takes the following actions on the recommended text:

I. Accept

IIa. Accept

IIb. Accept in Principle: "Where" is changed to "If" in Comment 4-121.

III. Accept in Part: The panel accepted the first part of this change, however, considered the second part to be redundant.

IV. Accept in Principle: This is addressed in Comments 4-119, 4-120 and 4-122.

V. Accept

VI. Accept

VII. Reject: This is not a location reference and the NEC Style Manual in

3.3.4 states: Not permitted "Where" (in the sense of "when" or if) — Use "when" or "if" instead.
VIIIa. Accept
VIIIb. Reject : The panel prefers the existing text.
VIIIc. Accept in Principle: The sentence was deleted by the action taken on Comment 4-121.
VIIId. Accept in Principle: The sentence was deleted by the action taken on Comment 4-121.
IX. Reject: The sentence adds clarity.
X. Accept
XI. Accept
XII. Accept in Principle: The Article was renumbered by the action taken on Comment 4-121.
XIII. Accept
XIV. Accept
XV. Accept
XVI. Accept
XVIIa. Accept
XVIIb. Accept
XVIIIa. Accept in Part: The panel Accepts the first change, and Rejects the addition of the last sentence referring to 694.24 as it is unnecessary. The addition of "Type MC" is new material and is Rejected.
XVIIIb. Hold: The comment introduces a concept that has not had public review.
XIXa. Accept
XIXb. Reject: Unlike PV systems, the turbine output circuit is typically not grounded. The requirements for bonding (either ac or dc), therefore, do not apply. The grounding system conductor to the turbine is an equipment grounding conductor, not a bonding jumper.
XX. Reject: The panel Rejects the proposed language as it does not add clarity. Grounding system conductors are not bonding jumpers.
XXI. Reject: The action taken on Comment 4-121 moves the first part of 694.62 [new 64] into Article 705.
The action taken on Comment 4-133 moves the second part of 694.62 [new 64] into Article 705.
XXII. Reject: The text for 694.68 has been moved to 705.12 by the action taken on Comment 4-121.
Panel Statement: I. Accept
IIa. Accept
IIb. Accept in Principle: "Where" is changed to "If" by the action taken on Comment 4-121.
III. Accept in Part: The panel Accepted the first part of this change, however, considered the second part to be redundant.
IV. Accept in Principle: This issue is addressed by the actions taken in Comments 4-119, 4-120 and 4-122.
V. Accept
VI. Accept
VII. Reject: This is not a location reference and 3.3.4 of the NEC Style Manual 3.3.4 states: Not permitted: Where (in the sense of "when" or "if") — Use "when" or "if" instead.
VIIIa. Accept
VIIIb. Reject: The panel prefers the existing text.
VIIIc. Accept in Principle: The sentence has been deleted by the action taken on Comment 4-121.
VIIId. Accept in Principle: The sentence has been deleted by the action taken on Comment 4-121.
IX. Reject: The sentence improves clarity.
X. Accept

XIV. Accept
XV. Accept
XVI. Accept
XVIIa. Accept
XVIIb. Accept
XVIIIa. Accept in Part: The panel Accepts the first proposed change, and Rejects the addition of the last sentence referring to 694.24 as it is unnecessary. The addition of Type MC is new material and is Rejected.
XVIIIb. Hold: The comment introduces a concept that has not had public review.
XIXa. Accept
XIXb. Reject: Unlike PV systems, the turbine output circuit is typically not grounded. The requirements for bonding (either ac or dc), therefore, do not apply. The grounding system conductor to the turbine is an equipment grounding conductor, not a bonding jumper.
XX. Reject: The panel Rejects the proposed language as it does not add further clarity. Grounding system conductors are not bonding jumpers.
XXI. Reject: Comment 4-121 moves the first part of 694.62 [new 64] into Article 705. Comment 4-133 moves the second part of 694.62 [new 64] into Article 705.
XXII. Reject: The text for 694.68 has been moved to 705.12 by the action taken on Comment 4-121.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-124 Log #2874 NEC-P04 **Final Action: Reject**
(694.4(D))

Submitter: Tom Baker, Puget Sound Electrical Training
Comment on Proposal No: 4-263
Recommendation: See comment on proposal 5-321
Substantiation: Comment 5-321, which was rejected, was to require Surge Protective Devices (SPDs) for dwelling units. Many dwelling units have the same exposure to lightning as wind turbines and SPDs should be installed. If the rationale is not the same, then the requirement in 694.4(D) should be deleted.
Panel Meeting Action: Reject
Panel Statement: There is no text or action requested.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 695 — FIRE PUMPS

13-74 Log #2374 NEC-P13 **Final Action: Reject**
(695.1(B)(2))

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 13-53
Recommendation: Revise text of 695.(B)(2) as follows:
(2) Pressure maintenance (jockey or makeup) pumps, when these pumps are connected to a source of supply that is separate from the fire pump's supervised supply circuit(s).
Substantiation: Although the panel clearly stated at the ROP that the proposed language is unnecessary, it is the submitter' opinion that the addition of this language will make the code clearer to a first time user. The language has been changed from the ROP to take advantage of the proposed language for 695.4.
Panel Meeting Action: Reject
Panel Statement: The added text implies that Article 695 covers jockey pumps, other than when these pumps are connected to a source of supply that is separate from the fire pump's supervised supply circuit and that definitely is not the case. The added text would cause more confusion than leaving the text as presently written.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-75 Log #453 NEC-P13 **Final Action: Reject**
(695.2)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 13-58
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:
Fault-Tolerant External Control Circuits. Those control circuits either entering or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump from all other internal or external means and ~~may~~ is capable of causeing the controller to start the pump under these conditions.
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.
However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Since the use of the term "may" in this section does not meet either of these criteria, it should be changed.
Panel Meeting Action: Reject
Panel Statement: The text, as changed by the comment, would denote mandatory text. The word "may" cannot be used in text where mandatory is used but can be used in a definition where mandatory language is not permitted.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-76 Log #2361 NEC-P13 **Final Action: Reject**
(695.3)

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-60a
Recommendation: Reject this proposal.
Substantiation: This section is in the scope of NFPA-20 (FIM-AAA); but, this wording does not agree with either the 2007, nor the 2010 Edition of NFPA-20 as required by the Rules Governing Committee Projects; and, as required by Article 90. 9(C) (2).

The proposed verbiage is totally different from that in NFPA-20. There is no way for inspectors to enforce the two totally different wordings for fire pump power supply requirements. This is critical to the expected degree of life safety and property protection.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any specific problems with the NFPA extract policy. CMP 13 fully understands that NFPA 20 has primary purview over electric fire pumps. The NFPA extract policy permits Technical Committees to modify the style of the text to conform an individual code or standard provided the requirement is not modified. While the verbiage used in this action may be slightly different that seen in the body of NFPA 20, the requirements are concisely conveyed in this proposed revision of Article 695.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-77 Log #2362 NEC-P13 **Final Action: Reject**
(695.3 and 695.4)

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-50
Recommendation: Delete Aritcles 695.3 and 695.4.

Also, reject all proposals on these two Articles.
Substantiation: These two sections cover power supplies for fire pumps, which is covered in NFPA-20 (FIM-AAA) Chapter 9; and, is in the scope of NFPA-20. These sections were extract text; but, are not coordinated with either the 2007, nor the 2010 Edition of NFPA-20 as required by the Rules Governing Committee Projects; and, as required by Article 90.9(C)(2).

The proposed verbiage is totally different from that in NFPA-20. There is no way for inspectors to enforce the two totally different wordings for fire pump power supply requirements. This is critical to the expected degree of life safety and property protection.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-76.

Ballot Results: Affirmative: 18

13-78 Log #443 NEC-P13 **Final Action: Accept**
(695.3 and 695.5(C))

Submitter: James W. Wilson, III, Consulting Electrical Engineer
Comment on Proposal No: 13-60a
Recommendation: Revise text to read as follows:

Change the first sentence of 695.5(C) as follows: "Where a feeder is provided in accordance with ~~695.3(B)(2)~~ 695.3(C),...".
Substantiation: 695.5(C) is affected by Proposal 13-60a changes to 695.3. To maintain the same intent, the reference to 695.3(B)(2), in 695.5(C), should be changed to 695.3(C).
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-79 Log #818 NEC-P13 **Final Action: Reject**
(695.3(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-60a
Recommendation: Revise text to read as follows:

(A) Individual Sources. Where approved by the authority having jurisdiction, and where capable of carrying indefinitely the sum...(remainder unchanged).
Substantiation: Reliability should be determined by the AHJ.
Panel Meeting Action: Reject
Panel Statement: Reliability of the power source for a fire pump is typically determined through a multiple disciplinary assessment including the authority having jurisdiction.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-80 Log #2273 NEC-P13 **Final Action: Reject**
(695.3(B)(1))

Submitter: Harold F. Willman, Colorado Code Consulting
Comment on Proposal No: 13-72
Recommendation: Revise as follows:

(1) Generator Capacity. An onsite generator(s) used to comply with this section shall be of sufficient capacity to indefinitely carry the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment ~~allow normal starting and running of the motor(s) driving the fire pump(s)~~ while supplying all other simultaneously operated load.
Substantiation: The panel did not address my question in the substantiation. Why would the capacity of the generator not be at least equal to the overcurrent protective device requirements? The generator for the fire pump is not normally considered a standby generator. The generator is considered an emergency generator. See 700.1, FPN No. 3. The concern is that if the fire pump has a locked rotor or has other problems, it will cause the generator to fail. This event would cause all of the emergency systems in the structure to fail.
Panel Meeting Action: Reject
Panel Statement: The suggested revision in Proposal 13-72, as well as this comment are outside of the purview of CMP 13. This requirement is extracted from NFPA 20 and is modified in the NEC style. The submitter is encouraged to address the NFPA 20 technical committee. The requirement in NFPA 20 exists in Section 9.6.1. The alternate power source is not required to be installed in accordance with Article 700. The overcurrent protective device between an on-site standby generator and the fire pump controller is required to be sized in accordance with 430.62 and not at the locked rotor current of the fire pump motor.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-81 Log #1801 NEC-P13 **Final Action: Accept in Principle**
(695.3(B)(1), FPN (New))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-60a
Recommendation: Add text to read as follow:

FPN: NFPA 20.9.3.3 indicates that a second source of electric power is not required if a back-up engine driven or back-up steam turbine drive fire pump is installed.
Substantiation: Problem: As the revision to 695.3 is currently rewritten in Proposal 13-60a, the code requires a direct utility connection, or on-site production, or multiple sources or feeders to be considered reliable. Another alternative, as indicated in NFPA 20.9.3.3 is to provide a redundant pump with a diverse power source, other than an electrical source. This knowledge needs to be considered in reviewing fire pump installations. The limitation in the language of 695.3 is prescriptive, and without knowledge of the NFPA 20 allowance, is overly restrictive. As indicated by Ms. L. Little in the Comment on Affirmative Vote for Proposal 13-70, "This information should be inserted in Article 695 as a fine print note for clarity and usability. Users of the NEC do not necessarily own a copy of NFPA 20, nor are they familiar with this document. Users of the NEC including the enforcement community, rely on Article 695 for all prescriptive electrical requirements necessary. We believe that it is necessary to inform the user of the NEC that an alternate source of electrical power is not required if a back-up engine driven or back-up steam turbine drive fire pump is installed in accordance with NFPA 20."
Panel Meeting Action: Accept in Principle

Revise the recommendation as an exception to 695.3(B)(1) and (B)(2) as follows:

Exception to 695.3(B)(1) and (B)(2): An alternate source of power shall not be required where a back-up engine-driven or back-up steam turbine-driven fire pump is installed. [20:9.3.3]
Panel Statement: The panel action provides a direct correlation between NFPA 20 and NFPA 70, Article 695 on the conditions where an alternate source of power is not required.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-82 Log #2363 NEC-P13 **Final Action: Reject**
(695.3(B)(2))

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-77
Recommendation: Reject this proposal.
Substantiation: This section is in the scope of NFPA-20 (FIM-AAA); but, this wording does not agree with either the 2007, nor the 2010 Edition of NFPA-20 as required by the Rules Governing Committee Projects; and, as required by Article 90. 9(C) (2).

The proposed verbiage is totally different from that in NFPA-20. There is no way for inspectors to enforce the two totally different wordings for fire pump power supply requirements. This is critical to the expected degree of life safety and property protection.

Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-76.

Ballot Results: Affirmative: 18

13-83 Log #1802 NEC-P13 **Final Action: Accept in Principle**
(695.3(C))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-60a
Recommendation: Revise text to read as follow:
...feeder sources shall be permitted if approved by the authority having jurisdiction and installed in accordance with (C)(1) through (C)(3). Either (C)(1) or C(2) shall apply.
Substantiation: The revised rewording of Proposal 13-60a has changed the original intent of the equivalent 2008 Edition Section 695.3(B)(2). The original wording allowed two or more feeder sources to act as one power source, or as more than one power source where the feeders "are connected to or derived from separate utility services". The current rewording in the new 695.3(C) indicates that multi-building campus-style complexes installed in accordance with (C)(1) through (C)(3) inclusive, which would require feeder sources to comply with both conditions of 695.3(C)(1) and 695.3(C)(2), where the 2008 Edition requires either 695.3(C)(1) or 695.3(C)(2).
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(C) Multibuilding Campus-Style Complexes. If the sources in 695.3(A) are not practicable and the installation is part of a multibuilding campus style complex, feeder sources shall be permitted if approved by the authority having jurisdiction and installed in accordance with either (C)(1) and (C)(3) or C(2) and (C)(3).
Panel Statement: For a multibuilding complex, there must either be two or more feeders as covered in (C)(1) or a feeder and an alternate source as covered in (C)(2). Whether (C)(1) or (C)(2) is used, compliance with (C)(3) for selective coordination is necessary.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-84 Log #1800 NEC-P13 **Final Action: Reject**
(695.3(C) Exception (New))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-60a
Recommendation: Add text to read as follows:
"Exception: In industrial establishments, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where multiple fire pumps operate into a common firewater system, a fire pump controller shall be permitted to be supplied power by a single feeder from a disconnect dedicated to the fire water pump, meeting the requirements of 695.4(B). The industrial establishment shall have an interconnected power distribution system utilizing multiple electrical sources.
Substantiation: The intent of this change is to address the needs of large industrial complexes that fall under the requirements for multibuilding campus-style complexes which utilize feeders for fire pumps. This exception outlines the conditions in these industrial complexes on which a single feeder to a fire pump can be considered reliable in accordance with NFPA 20. These industrial complexes typically purchase power at a high voltage and have inherently reliable configuration from multiple utility sources. The IEEE Red Book (IEEE Std 141), IEEE Recommended Practice for Electric Power Distribution for Industrial Plants, illustrates the type of reliable industrial power distribution configuration typically found. This proposal permits these large industrial complexes to provide reliable service to multiple fire water pumps, each with a single dedicated feeder in a manner allowed by 695.3(A), without the need of providing an electrical utility service connection or multiple feeders (in accordance with 695.3(C)(I) or 695.3(C)(2)) dedicated to each fire pump.
Panel Meeting Action: Reject
Panel Statement: The recommendation proposes a fire pump power source that is not currently recognized in Section 9.2.2 of NFPA 20. The NFPA 20 committee is responsible for power sources to fire pumps and this proposal should be submitted to that technical committee for consideration.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-85 Log #2364 NEC-P13 **Final Action: Reject**
(695.4)

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-77a
Recommendation: Reject this proposal.
Substantiation: This section is in the scope of NFPA-20 (FIM-AAA); but, this wording does not agree with either the 2007, nor the 2010 Edition of NFPA-20 as required by the Rules Governing Committee Projects; and, as required by Article 90. 9(C) (2).
The proposed verbiage is totally different from that in NFPA-20. There is no way for inspectors to enforce the two totally different wordings for fire pump power supply requirements. This is critical to the expected degree of life safety and property protection.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any specific problems with the NFPA extract policy. CMP 13 fully understands that NFPA 20 has primary purview over electric fire pumps. The NFPA extract policy permits Technical Committees to modify the style of the text to conform an individual code or standard provided the requirement is not modified. While the verbiage used in this action may be slightly different that seen in the body of NFPA 20, the requirements are concisely conveyed in this proposed revision of Article 695.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-86 Log #1776 NEC-P13 **Final Action: Reject**
(695.4(B))

Submitter: Richard Schneider, Lancaster, SC
Comment on Proposal No: 13-82
Recommendation: Add to 695.4(B)(1)... And shall comply with 700.27 based on the following:
(a) The circuit breaker in the FPC set @ 20 × MFLC (Ref. 10.4.3.3.1(6), NFPA 20.
(b) The motor LRC = 8 times MFLC
(c) Re-start transient = 24 × MFLC
(d) No trip within 3 minutes @ 300 percent MFLC (cold start)
Substantiation: Overcurrent protective devices within the fire pump controller are set per NFPA 20 rather than Article 430. Locked rotor currents are based on actual field experiences.
Panel Meeting Action: Reject
Panel Statement: The parameters specified in (b) and (c) of the recommendation are not currently part of the requirements for coordination contained in the 2010 edition of NFPA 20. This material needs to be first reviewed by the NFPA 20 committee before it can be extracted into the NEC.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-87 Log #1803 NEC-P13 **Final Action: Reject**
(695.4(B)(3)(3) Exception (New))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-77a
Recommendation: Add text to read as follow:
"Exception: In industrial establishments, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, metal-enclosed power switchgear disconnecting means, rated greater than 1000V and located in a dedicated vertical section, may be located adjacent to and interconnected with equipment that feeds loads other than the fire pump if the other provisions of 695.4(3) are met.
Substantiation: The intent of the exception is to provide a more reliable disconnecting means for the fire pump, as compared with separate switchgear and connection bus or cable as would be required without the exception. These industrial establishments typically use medium-voltage (rated greater than 1000V) metal-enclosed power switchgear. This switchgear is used to provide switching devices that have inherent design characteristics to prevent the expansion of a failure in one device into an adjacent section serving another load or source. Adjacent sections are connected by the manufacturer using bus bar connections. To meet the existing requirement for the disconnecting means to "not located within equipment that feeds other loads.. ", independent switchegear would be required. The connection of the indpendent switchgear would require some interconnection including cable-bus, six cable terminators and bus connections. Adjacent section of one switchgear are connected with bus bar connections that are more reliable than the cable-bus, six cable terminators and bus connections, needed to connect independent switchgear. Metal-enclosed power switchgear, as defined in Article 100, and built for medium-voltage is specified using well established industry standards such as C37.20.02 for metal-clad switchgear and ANSI C27.30.3 for metal-enclosed interrupter switchgear.
Panel Meeting Action: Reject
Panel Statement: This requirement to which the exception is based is extracted from Section 9.2.3.1 in NFPA 20 and the technical content of that section is the responsibility of the NFPA 20 committee. The submitter is encouraged to submit this material to the NFPA 20 committee for action.

Comment on Proposal No: 13-77a
Recommendation: Change the reference from 695.3(B)(2) to 695.3(C).
Substantiation: The provision is intended to apply to the multi-building campus style arrangements. These were moved from 695.3(B)(2) to 695.3(C) in the ROP draft.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-93 Log #1649 NEC-P13 **Final Action: Reject**
(695.4(B)(1)(b))

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-77a
Recommendation: Revise (b) as follows:
(b) *Multiple* ~~*Feeder*~~ *Sources.* For systems with two or more feeders as required to comply with other provisions of this *Code*, ~~installed under the provisions of 695.3(B)(2) only~~, additional disconnecting means and associated overcurrent protective device(s) shall be permitted provided each of the disconnecting means meets the requirements of 694.4(B)(2) and 695.4(B)(3). ~~as required to *comply* with other provisions of this Code.~~
Substantiation: The Article, as written, only allows 2 or more feeders for systems installed per 695.3(B)(2), however, 695.3(C) has additional applications where multiple feeders are required. "Feeder Sources" is changed to "Multiple Sources" due to the fact that the entire section, 695.4(B) is referring to feeders, so "Multiple Sources" is a more appropriate heading. The proposed rewrite also clarifies that multiple disconnecting means are allowed and each disconnecting means must then meet the requirements of 695.4(B)(2) alld695.4(B)(3)
Panel Meeting Action: Reject
Panel Statement: The requirements of 695.4(B)(1)(b) address only those installations covered by "695.3(C) Multibuilding Campus Style Complexes", not all feeders installed per the requirements of the NEC. The proposed revision is in direct conflict with NFPA 20 9.2.3. Confusion may have been caused by the incorrect reference to 695.3(B)(2) in Proposal 13-77a and in the ROP Draft.

Comment on Proposal No: 13-77a
Recommendation: Revise the 695.3 reference in the revised wording of 695.4(B)(1)(b) from "695.3(B)(2)" to "695.3(C)(1) and 695.3(C)(2)".
Substantiation: The reference in the Proposal 13-77a is incorrect with respect to the revision to 695.3 as provided in Proposal 13-60a. In the revised wording, the correct reference, as intended in the original wording, in the 2008 Edition is "695.3(C)(1) and 695.3(C)(2)".
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Comment 13-92 addresses the recommendation of this comment.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-95 Log #817 NEC-P13 **Final Action: Reject**
(695.4(B)(2), (3), and (4))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-92
Recommendation: Revise as follows:
(B)(2) Be provided with integral permanent means for locking in the closed (ON) position.
(3) not be located within equipment that supplies other load(s).
(4) Be located remote from other premises disconnecting means except snap switches and the like, such that simultaneous operation by one person cannot be accomplished.
Substantiation: Locking means should be permanent and integral. The closed position should be designated "ON", since covers and doors can be locked closed.
Panel Meeting Action: Reject

Panel Statement: There was insufficient technical substantiation for the recommended changes. Changes in the 2008 NEC have addressed disconnecting means lock off provisions with standardized language, none of which was used within this comment. No substantiation was provided for deleting "other than the fire pump," deleting the word "sufficiently" as it applies to the remote location of the fire pump disconnecting means, or adding the phrase "except snap switches and the like."
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-96 Log #592 NEC-P13 **Final Action: Reject**
(695.4(B)(3)(a))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" as it is extracted material from NFPA 20, and is under the purview of the NFPA 20 Technical Committee.
Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-77a
Recommendation: Add text to read as follows:
(3) Disconnecting Means. All disconnecting devices that are unique to the fire pump loads shall comply with items (a) through (d) [20:9.2.3.1]
(a) *Features and Location.* The disconnecting means shall comply with all of the following:
(1) Be identified as suitable for use as service equipment
(2) Be lockable in the closed position
(3) Not be located within equipment that feeds loads other than the fire pump
(4) Be located sufficiently remote from other building or other fire pump source disconnecting means such that inadvertent operation at the same time would be unlikely
Exception to (B)(3)(a)(4): Where a fire pump has an On-Site Standby GeneratorM as the alternate source o(power, the alternate. source disconnecting means shall be permitted to be located within equipment that teeds other Article 700 loads. [20:9.3.6l].
Substantiation: The proposed exception provides relief to the requirements in 695.4(B)(3)(a)(4) for disconnecting means derived from an on-site standby generator where the generator serves other Emergency Systems. Emergency power for egress lighting, smoke control systems, etc. is just as essential to safeguard life and property as a fire pump, therefore the requirements of Article 700 should be the basis for emergency power to a fire pump. The proposed 2010 version of NFPA 20 (9.3.6) indicates that conductors and disconnecting means from a second source of power (such as an on-site standby generator) are not required to meet the stricter requirements of 20.9.2. Also, this exception provides additional validity to Fine Print Note No. 3 of Article 700.1 which references fire pumps as equipment that emergency systems normally serve.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(3) Disconnecting Means. All disconnecting devices that are unique to the fire pump loads shall comply with items (a) through (d). [~~**20**:9.2.3.1~~]
(a) Features and Location
(1) The disconnecting means for the normal power source shall comply with all of the following [**20**:9.2.3.1]:
a. Be identified as suitable for use as service equipment
b. Be lockable in the closed position
c. Not be located within equipment that feeds loads other than the fire pump
d. Be located sufficiently remote from other building or other fire pump source disconnecting means such that inadvertent operation at the same time would be unlikely
(2) The disconnecting means for an on-site standby generator(s) used as the alternate power source shall be installed in accordance with 700.9 (B)(5) for emergency circuits and shall be lockable in the closed position.
No changes to (b), (c), and (d) in Proposal 13-77a.
Panel Statement: The intent of the recommendation has been satisfied, in that, the disconnecting means from an on-site standby generator used as the alternate source no longer must comply with the requirements for the normal power disconnecting means. The panel has separated the alternate standby generator source disconnect from the requirements for the normal disconnect to correlate with NFPA 20 Section 9.2.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17 Negative: 1
Explanation of Negative:
ODE, M.: The Section of Article 695 being affected by this Comment is extracted from Section 9.2.3.1 of NFPA 20. Such extract text is under the jurisdiction of the NFPA 20 Committee. The comment should be rejected to be consistent with the panel action on other Comments affecting extract material such a 13-80, 13-86 and 13-87.

(695.6(A))

Submitter: James W. Wilson, III, Consulting Electrical Engineer
Comment on Proposal No: 13-95a
Recommendation: Revise text to read as follows:
In the proposed new 695.6(A)(3), change the first sentence as follows: "Where a fire pump is wired under the provision of ~~695.3(B)(2)~~ 695.3(C), all supply...".
Substantiation: This proposed addition is affected by Proposal 13-60a's changes to 695.3 in which provisions for "Multi-building Campus-Style Complexes" are placed under 695.3(C).
Panel Meeting Action: Reject
Panel Statement: The panel action to accept Comment 13-100 negates the need to revise the reference.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-99a Log #CC1300 NEC-P13 **Final Action: Accept**
(695.6(A)(2)(d))

Submitter: Code-Making Panel 13,
Comment on Proposal No: 13-95a
Recommendation: Revise 695.6(A)(2)(d) as to read:
Inside of a Building. ~~When~~ Where routed through a building, the conductors shall be installed using one of the following methods:
Substantiation: This recommendation makes editorial corrections to the recommended text of Proposal 13-95a.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-100 Log #593 NEC-P13 **Final Action: Accept**
(695.6(A)(3))

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-95a
Recommendation: Delete the following text:
~~(3) Multi Building Campus Style Complexes. Where a fire pump is wired under the provisions of 895.3(B)(2), all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).~~
~~Exception to (A)(3): Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point of automatic connection between sources.~~

Substantiation: In multi-building campus style complexes, where the normal power source(s) to a fire pump is a feeder as allowed in 695.3(C), the language in 695.6(A)(3) is unnecessarily restrictive and contradictory. It should be deleted for the following reasons:

1. 695.6(A)(3) requires the normal power feeder to be encased in concrete from the disconnecting device all the way to the fire pump controller. In many situations, this would require a concrete ductbank to be installed within a building (as opposed to buried in the ground) which is extremely difficult.
2. 695.3(C) allows connections to fire pumps to be feeders and, in addition, requires that 2 or more feeders be provided. Since there are at least 2 independent feeder sources provided to the fire pump, there is no added benefit of making one or both of these feeders encased in concrete.
3. The requirements in 695.6(A)(2) are sufficient for the feeder conductors.
4. The exception states "Where there are multiple sources of power... " which is always the case as the Article specifically references 695.3(B)(2), so the exception always applies.
5. The exception states that the requirement is for the feeder on the load side of the transfer switch. In almost all applications, the fire pump transfer switch is part of the fire pump controller and NFPA 20 requires (basically) the controller to be in the same room as the fire pump. So this is referring to a very small length of cable.
6. The exception to 695.6(A)(2)(d) states that the feeder within the fire pump room is exempt from fire rating requirements, so the Code has already acknowledged that this part of the cable does not need to meet the fire rating in other applications.

Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17 Negative: 1
Explanation of Negative:
ODE, M.: The proposed deletion of (3) for multi-building campus-style introduces new material that has not had public review. The submitter's comment on Affirmative did not mention deleting the entire subsection as a recommended fix to his problem. This Comment should be held for the 2014 NEC cycle.

13-101 Log #811 NEC-P13 **Final Action: Reject**
(695.6(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-103
Recommendation: Accept the proposal and revise text to read as follows:
They shall be permitted to be routed through a building(s) or other structure(s) only if using one or more of the following methods:
(1) be encased in a minimum of 50 mm (2 in) of cement concrete.
Substantiation: "Permitted" without a conditional "only" does not impose a requirement per 90.5(B). More than one method should be permitted. Cement concrete should be specified; asphalt concrete is flammable.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to justify this proposed change. The introductory text provides sufficient limitation on the alternative methods of routing conductors through a building. Concrete is a well understood term and is used throughout the NEC. The recommended text does not improve understanding of the material that is required.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-102 Log #1642 NEC-P13 **Final Action: Hold**
(695.6(B))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Hold" as it introduces new material and is not in accordance with 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.
The concept of 4 inches of concrete equated to a 2 hour fire-rating has not had public review.
Submitter: Thomas Guida, TJG Services, Inc.
Comment on Proposal No: 13-102
Recommendation: Accept proposal 13-102 with the following additional fine print note:
695.6(B) Circuit Conductors. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) shall be kept entirely independent of all other wiring. They shall supply only loads that are directly associated with the fire pump system, and they shall be protected to resist potential damage by fire, structural failure, or operational accident. They shall be permitted to be routed through a building(s) using one of the following methods:
(1) Be encased in a ~~minimum 50 mm (2 in.) of~~ concrete with a sufficient thickness to achieve a minimum 2 hour fire rating.
FPN 1: A typical 2-hour construction is 100 mm (4 in.) thick concrete.
FPN 2: See section 19 of the NFPA Fire Protection Handbook 20th edition for minimum slab thickness for fire resistance ratings. This provides thickness for various types of concrete.
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and dedicated to the fire pump circuit(s).
(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating
FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Exception: The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.
Substantiation: Although 2 inches of concrete served the industry well for a 1 hour fire rating, the requirement is now for a 2 hour fire rating. To satisfy the panels request for more prescriptive information on the thickness of the concrete, fine print note 1 has been added. The NEC currently has fine print notes that state typically 150 mm (6 inch) thickness of concrete is used for a 3-hour rating in section 450.42. This note was also added to 110.31A. Since 2 inches of concrete was previously used as acceptable for 1-hour, 100 mm (4 inches) was added in the fine print note for the requirement of 2-hours.
Additionally since concrete thickness may vary based on the type of concrete, fine print note 2 was added to provide information on this.
Panel Meeting Action: Accept in Principle
Revise existing code text as follows:
695.6(B) Circuit Conductors. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) shall be kept entirely independent of all other wiring. They shall supply only loads that are directly associated with the fire pump system, and they shall be protected to resist potential damage by fire, structural failure, or operational accident. They shall be permitted to be routed through a building(s) using one of the following methods:
(1) Be encased in a minimum of ~~50~~ 100 mm (~~24~~ in.) of concrete.
Panel Statement: The panel action provides a prescriptive value for the thickness of concrete that allows for objective enforcement.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 2
Explanation of Negative:
ODE, M.: The Panel statement did not provide any technical substantiation for the change from 2 inches of concrete in the existing NEC text to 4 inches of concrete. There are many different factors that can affect heat transfer, other than the thickness of concrete. Pre-stressed concrete has a different heat transfer ratio than lightweight concrete, steel reinforcement within concrete will affect heat transfer, and the type of aggregate used within the concrete will also affect heat transfer. The NFPA Fire Protection Handbook states the following: "Reinforcing steel can also affect the amount of heat transfer that can occur within the concrete floor or wall." Concrete has a low thermal conductivity and a low thermal capacity. One of the more significant factors in determining the thermal characteristics of reinforced concrete is the type of aggregate used in the concrete and the type of aggregate used in the concrete can vary throughout the United States. Concrete in direct contact with earth will have a different heat transfer than concrete installed as a wall or floor ceiling installation for multiple floor locations. Moisture content of the concrete will affect heat transfer. Furthermore, lightweight concrete has much different heat transfer rates than regular, reinforced, or pre-stressed concrete. The submitter should have provided a Fact Finding Study on the different types of concrete that could be used, the recommended thickness, and addressed the variables with the amount of heat transfer for each application so the Panel could act on the technical merits for this change, rather than just guessing at a depth of concrete. The 2-inch concrete thickness has been used for many NEC cycles and should not be changed without proper technical substantiation for this change.
SPINA, M.: Although information was received with these comments this information was new material which has not had opportunity for adequate public review and comment.

13-103 Log #2459 NEC-P13 **Final Action: Accept in Principle**
(695.6(B)(3))

Submitter: Edward Walton, WC Services
Comment on Proposal No: 13-105
Recommendation: Revise wording as follows:
695.6(B)(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating.
Electrical circuit protective system installation shall comply with any restrictions provided by the manufacturer's instructions or in the listing of the electrical circuit protective system used ~~and~~ or the following:
(1) As required by NFPA-20, a junction box shall be installed ahead of the fire pump controller a minimum of 12 in. beyond the fire-rated wall or floor bounding the fire zone.
~~(2) The raceway between the junction box and the fire pump controller shall be sealed at the junction box end with an identified compound in accordance with the instructions of the manufacturer of the electrical circuit protective system.~~
(2) Where required by the manufacturer of a listed electrical circuit protective system or by the listing, or as required elsewhere in this Code, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and in accordance with the instructions of the manufacturer.

(3) Standard wiring between the junction box and the controller is acceptable.
Substantiation: 1. Manufacturer's instructions should be part of any installation procedure.

2. Per NFPA-20, a separate junction box only applies where single conductors (individual conductors) are used because single conductors (individual conductors) shall not enter the fire pump enclosure separately.

3. (a), As written, the raceway seal would be required by this paragraph even though it is not required by the manufacturer or the electrical circuit protective system or anywhere else in the code. The revised writing is the same as other accepted proposals addressing this requirement.

(b) Prior attempts to require a seal for non MI cables (2005 NEC) were rejected for lack of substantiation beyond the above referenced manufacturer or electrical circuit protective system requirements.
Panel Meeting Action: Accept in Principle
Panel Statement: The intent of the recommendation is met by the panel action on Proposal 13-97 in the 2011 NEC ROP.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:

ODE, M.: The action on this Comment should have been to accept in part since the text in the Comment in (2) is exactly word for word with the accepted text in the Action in Proposal 13-97 so any further revision is unnecessary. Inserting the phrase "by the manufacturer's instructions or" is unnecessary since this is already located in 110.3(B) and inserting the phrase "As required by NFPA 20" does not comply with Section 4.2 of the NEC Style Manual which prohibits references to other standards in NEC mandatory text.

13-104 Log #2779 NEC-P13 **Final Action: Accept**
(695.6(D))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 13-111
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-105 Log #692 NEC-P13 **Final Action: Reject**
(695.6(D) Exception No. 1)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-112
Recommendation: Accept the proposal and revise as follows:

Conductors supplying battery power for starting of fire pump engines shall be protected only against short-circuit.
Substantiation: "Shall not require" does not prohibit overcurrent protection in accordance with conductor ampacity, where starting current may cause opening of the overcurrent device and prevent starting. Without short-circuit protection a short circuit could cause fire and disfunction of fire pumps.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation to support his recommendation. See the panel statement on Proposal 13-112.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:

ODE, M.: There was no technical substantiation provided to take the text from permissive to mandatory. Section 240.21(H) text in the 2008 NEC is non-mandatory or permissive text for overcurrent protection for battery cables that permits but does not require overcurrent protection of the cables.

13-106 Log #691 NEC-P13 **Final Action: Reject**
(695.6(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-117
Recommendation: Accept the proposal.
Substantiation: "Impervious" as used in 330.10(A)(1) has nothing to do with physical damage; it relates to moisture, whereas used in this section implies the cable is not capable of sustaining damage, which is covered by 330.12.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the original panel action on Proposal 13-117. The panel disagrees that "impervious" used in this section implies not capable of sustaining damage. Two types of liquidtight flexible conduit are also permitted by this section making it clear that "impervious" as used in this section is with regard to protection from corrosion and other deleterious effects.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:

ODE, M.: MC cable for applications relating to fire pump wiring must be impervious to moisture similar to the requirements in 430.11 for dripping oil or spraying oil, water, or other liquids in the fire pump room. If the area is considered a wet location and a corrosive area, compliance with 330.10(A)(11) and 330.12(2) must apply. Section 90.3 states that Chapters 1 through 4 apply generally, with Chapters 5, 6 and 7 supplementing or amending the requirements in the general chapters. Section 695.6(E) provides the acceptable wiring methods from the fire pump controller to the fire pump and, unless amended or supplemented, all the requirements in 330.10 and 330.12 also apply.

13-107 Log #2368 NEC-P13 **Final Action: Reject**
(695.6(E))

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-115
Recommendation: Reject this proposal
Substantiation: EMT (electrical metallic tubing) is not adequate protection for the critical path wiring to the fire pump motor in the pump room. It does not provice the physical protection nor does it adequately protect the motor and the controller from water entering into the raceway. Most pump rooms are sprinklerd and are also subject to splashing and spraying water. Also, the motor conduit (raceway) may be overhead or run across the floor. Serviceing the motor, the pump and associated hydraulic components (valves and etc.) do regularly subject the motor raceway to stress due to the weight of the components involved (hundreds of pounds, if not tons).

Any cost savings are small, especially compaired to the installationi and the risk (live and property) being protected.
Panel Meeting Action: Reject
Panel Statement: Section 358.10 permits the use of EMT in wet locations and typically the sprinkling of the room or splashing and spraying water do not warrant classification as a wet location. The proposal submitter correctly stated that Article 358 allows the use of electrical metallic tubing in areas where it is not exposed to severe physical damage whereas MC cable, which is allowed in 695.6(E), is not allowed where subject to any physical damage. The physical properties of EMT are more robust than those of MC cable so if MC can withstand the pump room environment, EMT should be sufficient.
Number Eligible to Vote: 18

(695.7)

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-121a
Recommendation: Delete the 2nd exception.
Substantiation: The 5% maximum allowed motor voltage drop absolutely does apply whether or not the Mechanical Manual (Emergency) Operator is used or not. This requirement is covered by Clause 9.4.4 (Old 9.4.3) with no exceptions. The exceptions apply only to the 15% Starting Voltage Drop.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the exception applies only to 695.7(A) shown in the panel action on Proposal 13-121a and should be moved to follow 695.7(A).
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-112 Log #690 NEC-P13 **Final Action: Reject**
(695.12(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-124
Recommendation: Accept the proposal and revise as follows:
Storage batteries used for fire pump engine drives shall be supported above the floor, secured against displacement and vibration, and located where there are no likely to be subject to physical damage, flooding with water, and temperatures for which they are not approved.
Substantiation: If located in the same area as fire pump system piping, it is always possible batteries can be flooded, especially if located underground. If secured to the mounting base of engine drives, they will not be subject to excessive (not defined) vibration due to shock-absorbing mountings for the engines. "Excessive" temperatures are not defined. "Likely" is a term used in many sections of the NEC and was accepted fin Proposal 4-272, 705.22(4) FPNs 2 through 4 in the 2010 ROP.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action and statement. The recommended text does not provide additional clarity and the substantiation has no technical merit.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:
ODE, M.: The section reference in the Comment is incorrect and should be 695.12(C), not 695.12(E).

13-113 Log #813 NEC-P13 **Final Action: Reject**
(695.12(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-125
Recommendation: Accept the proposal and revise text to read as follows:
Fire pump controllers, transfer switches, and other associated controls, and other wiring and equipment shall be located or enclosed by approved means so as to be protected from damage or malfunction due to escaping water from fire pumps or piping.
Substantiation: Other controls than those of the fire pump system that can malfunction or be damaged should be included.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action and statement. The recommended text does not provide additional clarity and the substantiation has no technical merit. Multiple changes have been recommended within the text with any supporting substantiation.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:
ODE, M.: The Panel statement for this Comment should have been as follows: "The Panel reaffirms its original action and statement. The recommended text does not provide additional clarity and the substantiation has no technical merit. Multiple changes have been recommended within the text with no supporting substantiation."

13-114 Log #1643 NEC-P13 **Final Action: Accept in Principle in Part**
(695.14(F))

Submitter: Thomas Guida, TJG Services, Inc.
Comment on Proposal No: 13-131
Recommendation: Accept 695.14(F)(1)with the additional fine print notes. Continue to accept the balance of the proposal.
695.14(F) Generator Control Wiring Methods**.** Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) using one of the following methods:
(1) Be encased in 50 mm (2 in.) of concrete with a sufficient thickness to achieve a minimum 2 hour fire rating.
FPN 1: A typical 2-hour construction is 100 mm (4 in.) thick concrete.
FPN 2: See section 19 of the NFPA Fire Protection Handbook 20th edition for minimum slab thickness for fire resistance ratings. This provides thickness for various types of concrete.
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and ~~or within enclosed construction~~ dedicated to the fire pump circuits ~~and having a minimum 1-hour fire resistance rating~~,
(3) Be a listed electrical ~~or~~ circuit protective systems with a minimum of **2**~~1~~-hour fire rating resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.
FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Substantiation: Although 2 inches of concrete served the industry well for a 1 hour fire rating, the requirement is now for a 2 hour fire rating. To satisfy the panels request for more prescriptive information on the thickness of the concrete, fine print note 1 has been added. The NEC currently has fine print notes that state typically 150 mm (6 inch) thickness of concrete is used for a 3-hour rating in section 450.42. This note was also added to 110.31A. Since 2 inches of concrete was previously used as acceptable for 1-hour, 100 mm (4 inches) was added in the fine print note for the requirement of 2-hours.
Additionally, since concrete thickness may vary based on the type of concrete, fine print note 2 was added to provide information on this. **.**
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
695.14(F) Generator Control Wiring Methods**.** Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) using one of the following methods:
(1) Be encased in a minimum of ~~50~~ 100 mm (~~2~~ 4 in.) of concrete ~~with a sufficient thickness to achieve a minimum 2 hour fire rating.~~
~~FPN 1: A typical 2-hour construction is 100 mm (4 in.) thick concrete.~~
~~FPN 2: See section 19 of the NFPA Fire Protection Handbook 20th edition for minimum slab thickness for fire resistance ratings. This provides thickness for various types of concrete.~~
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and ~~or within enclosed construction~~ dedicated to the fire pump circuits. ~~and having a minimum 1-hour fire resistance rating~~,
(3) Be a listed electrical ~~or~~ circuit protective systems with a minimum of **2**~~1~~-hour fire rating. ~~resistance.~~ The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.
FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Panel Statement: The panel action provides a prescriptive value for the thickness of concrete that allows for objective enforcement and has made editorial revisions for consistency with similar requirements. The panel rejects the addition of the term "resistance" in (3) as this was changed to "fire rating" by the panel action on Proposal 13-131. In comparing this action to the ROP Draft, the panel notes that there is an omission of text in (F)(2) and it is necessary to restore the words "dedicated to the fire pump circuit" accepted by the panel action on Proposal 13-131.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 2

Explanation of Negative:

ODE, M.: The Panel Action should have been to reject the Comment and continue accepting the proposal in part. See my negative statement in Comment 13-102.

SPINA, M.: Although information was received with these comments this information was new material which has not had opportunity for adequate public review and comment.

ARTICLE 700 — EMERGENCY SYSTEMS

13-115 Log #1866 NEC-P13 **Final Action: Accept in Principle**
(700)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 13-138
Recommendation: Accept the Proposal.
Substantiation: The proposal has merit and should be accepted. The present inclusion of the definition of "Emergency System" in the scope of Article 700 is a violation of the NEC Style Manual Section 2.2.2.2 which reads as follows: **"2.2.2.2 Definitions in Other Articles.** If an article contains one or more definitions, the definition(s) shall be in the second section, shall be listed in alphabetical order, and shall be styled as shown in the following examples.

Examples:

280.2 Definition.
Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.
318.2 Definition.
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a rigid structural system used to securely fasten or support cables and raceways."

Following the NEC Style Manual with consistent organization and numbering should make this article more "User Friendly" and show wisdom on the part of CMP-13.

The Panel's statement in rejecting the proposal that there are too many definitions of "emergency systems" makes no sense. Let's face it – the definition of "emergency system" resides in 700.1 and is misplaced according to the NEC Style Manual. Other articles can contain a definition that suits their purpose without creating a conflict in the NEC. See 90.3. After all, we can't pretend the definition of "emergency system" is not in 700.1 It's there for all to see!

Article 701 includes the definition of "Legally Required Standby System" in the appropriate Section 701.2. Why not a similar definition location for Article 700? Article 702 includes the definition of "Optional Standby Systems" in 702.2. Why not a similar definition location for Article 700?
Panel Meeting Action: Accept in Principle

Revise the recommendation in Proposal 13-138 as follows:

700.2 Emergency Systems. ~~Emergency systems are~~ Those systems legally required and classed as emergency by municipal, state, federal, or other codes, or by any governmental agency having jurisdiction. These systems are intended to automatically supply illumination, power, or both, to designated areas and equipment in the event of failure of the normal supply or in the event of accident to elements of a system intended to supply, distribute, and control power and illumination essential for safety to human life.

Panel Statement: The panel action to the definition of emergency system is for compliance with the NEC Style Manual. No other changes in the original recommendation are deemed necessary relative to the arrangement and organization of Article 700.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-116 Log #2456 NEC-P13 **Final Action: Accept**
(700.2.Relay, Automatic Load Control (New))

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Comment on Proposal No: 13-145
Recommendation: Add a new FPN after the proposed new definition as follows:

FPN: For requirements covering automatic load control relays, see ANSI/UL 924, Emergency Lighting and Power Equipment.
Substantiation: The addition of the new FPN will provide guidance for Code users regarding requirements for automatic load control relays.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-117 Log #809 NEC-P13 **Final Action: Reject**
(700.5)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-148
Recommendation: Accept the proposal.
Substantiation: Conductors, terminals, overcurrent devices, switches, don't have capacity, they have ampacity or ratings. "Rating" covers ampacity, voltage, temperature, current, wet conditions, etc.
Panel Meeting Action: Reject
Panel Statement: The provisions of this section apply to the entire emergency system which includes the alternate source and all equipment and conductors supplying emergency loads. The terms "capacity" and "rating" are correctly used in 700.5(A).
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-118 Log #814 NEC-P13 **Final Action: Reject**
(700.8(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-155
Recommendation: Accept the proposal.
Substantiation: The panel statement states that all sources other than emergency are "normal" sources. 701.1 indicates a legally required standby system is not a normal source. Storage batteries and generator sets for emergency systems are not normal sources. A generator for a fire pump system is not a normal source. A fuel cell system grounded per 624.42 is not a normal source. A solar photovoltaic system grounded per 692.41 is not a normal source. Normal sources in the NEC usually refer to utilities.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not clarify the current requirement. See the panel action and statement on Comment 13-119.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:

ODE, M.: Normal sources could include photovoltaic systems, generators, fuel cell systems, wind turbines, utility supplied sources, or any other normal source of power that is not emergency. There are emergency sources and then there are all other sources. The suggested change in text is unnecessary.

13-119 Log #2676 NEC-P13 **Final Action: Accept in Principle**
(700.8(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 13-156
Recommendation: Accept the proposal.
Substantiation: The requirement is clearly stated, and the need for the clarification is compelling. The existing wording is being commonly read to require the sign at the point of connection of the grounding electrode conductor to the grounding electrode, because that is certainly a "grounding location" on the premises. The NFPA NEC Handbook explanation for this section uses the wording "requires a sign at the grounding location" to explain this requirement, which can be taken the same way. I happen to know that NFPA staff is aware of the intent and this is not literally an error, but it can be easily taken that way. The supportive comment in the voting came from someone who has to explain this to electricians, so her comments deserve special consideration.
Panel Meeting Action: Accept in Principle

Revise 700.8(B) to read as follows:

Where removal of a grounding or bonding connection in normal power source equipment interrupts the grounding electrode conductor connection to the alternate power source(s) grounded conductor, a warning sign shall be installed at the normal power source equipment stating:

Warning: Shock Hazard Exists if Grounding Electrode Conductor or Bonding Jumper Connection in this Equipment is Removed while Alternate Source(s) is Energized.

Panel Statement: The panel recognizes the need to clarify the requirement of this section and to also provide prescriptive wording on what the sign should convey.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-120 Log #2379 NEC-P13 **Final Action: Reject**
(700.9(B))

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 13-160
Recommendation: The panel should accept my original proposal.
Substantiation: The panel's statement in reply to my proposal appears to be unjustified.

The language of 700.9(B)(5) began with ROP A2007 13-118, the substantiation for ROP A2007 13-118 was as follows:

"Substantiation: The separation of emergency system wiring from all other wiring is required by NEC 700.9, and is clearly understood. Just where the separate emergency, legally required standby, or optional standby systems feeders originate at or near the generator is less well defined. The supply tap box on generators equipped with disconnects with or without overcurrent protection is not generally designed or manufactured for installation of multiple devices to serve separate circuits for emergency loads, fire pumps, legally required standby loads, and optional standby loads, although AHJs have interpreted the mandated separation of wiring to require just that. In addition, such an interpretation does not consider parallel operation of multiple generators, which require some type of distribution to separate the systems downstream of the paralleling bus. The recommended revisions clarify that, for both single generator and parallel generator installations, separation of the circuits served by an emergency generator(s) source may be accomplished using a single feeder from the generator to separately mounted enclosed overcurrent devices or a distribution switchboard that separates emergency circuits in different vertical sections from other loads. Separately enclosed overcurrent devices or overcurrent devices mounted in separate vertical sections of a distribution switchboard will provide physical separation of the different systems or branches and define that the origin of the emergency, legally required standby, and optional standby systems is at the feeder overcurrent protection device, not the generator terminals. This proposal was developed by the Task Group directed by the TCC to consider comments 13-6 and 13-71 and if appropriate to develop proposals for the 2008 NEC. The task group consisted of the following: Thomas H. Wood; Chair (Chair NFPA-70, panel 13), Hugh O. Nash; (Chair NFPA 99), Douglas S. Erickson; (Chair NFPA 110), James Costley; and Herb Whittall.**"**

I have contacted Nash and Erickson, and they both deny any involvement in the subcommittee. I have contacted NFPA, and they have verified that there is no other backup substantiation associated with the original A2007 proposal. In short, CMP 13's statement that the A2007 subcommittee (exactly what subcommittee?) substantiated an issue with feeders supplying a switchboard cannot be verified.

There is no data from industry resources such as IEEE Std 493(Gold Book) or the Up Time Institute that indicates there is a reliability problem with devices in a common vertical section.

Until it can be verified that 700.9(B)(5) increases reliability it should be deleted, as the present language suffers from the following shortcomings:

1. Between 700.9 and 700.9(B)(5)(a) "from' appears three times and "to" twice. B says from emergency source to emergency load, 5 says from emergency source to a combination of loads. The first two "from, to" pairs are congruous, however (a) is supposed to be a subset of 5 and it says "from switchboard" so is 'from switchboard" the same as "from emergency source" or is it intended to be from emergency source "to" a switchboard? Or?

2. In 5(b) "common bus", "separate sections of the switchboard", and "the individual enclosures" are each separated by "or" making them a list of three items, hence what is meant by "The common bus" is not clear, as there is no previous discussion of a common bus. The text may have require a comma after "switchboard", but that begets the question: How(or why) would you supply separate sections of a switchboard with a single feeder, and is this possible within UL 891? There's also the possibility that the individual disconnects could be served by a bussed gutter that is a "common bus" but that leads to additional confusion that is not explainable.

3. (5)b Exception: If (5) b's "shall be permitted" is permissive language per 90.5, then why is an exception needed? The exception says that you can supply OCP at the source if it is selectively coordinated, but 700.27 would require selective coordination in any case. I think this exception could be deleted and the code wouldn't change.

4. (5)c Says "…panelboard enclosure…" how does "panelboard enclosure" play into this when it's not previously mentioned in (5)? (5) identifies this as from source to "any combination" if you have a combination going to the panelboard how are the branches suppose to "not originate" there?

5. Many large campus facilities with multiple buildings such as medical centers, colleges/universities, prisons, shopping malls, etc rely on central generation of emergency power. The present language does not make it clear that feeders serving combinations of emergency, legally required standby, and optional standby loads can run from a central plant to a building, and then be separated at individual buildings into the appropriate load types. Discussion of this common design practice is conspicuously absent from the substantiation, the language only discusses feeders from an emergency source to terminate at a switchboard or group of disconnects. Consideration of design issues with hospitals and central generating plants challenge the logic behind the requirement for separate vertical sections:

a. Most emergency power systems fail because of problems at the generator: fail to start, poor fuel, loss of support systems, etc. The frequency of failures and subsequent loss of life that can be prevented by placing overcurrent devices into separate sections is very, very small, if it even exists. The cost to accomplish separate vertical sections is significant. If remodels are considered, the cost of adding additional vertical sections to existing central plants is very, very large, and may result in canceling projects that would otherwise be able to offer significant benefit to the public welfare.

b. If a central plant serves multiple building is it acceptable to put the life safety feeder to each building in the same vertical section? The code answer to this question appears to be yes, but if it is unacceptable to have a LRS device affect an adjacent emergency device, why is it acceptable to have one emergency device affect another?

c. Consider hospitals. If placing overcurrent devices in a separate vertical section improves reliability, and a patient bed is fed by two critical transfer switches and feeders, the feeder overcurrent devices should be in separate vertical sections not the same! It becomes clear that if a hospital central plant is serving multiple wings and many transfer switches (some hospitals have over twenty) that separate vertical sections becomes impractical.

d. Consider hospitals again: If there is a statistically significant number of failures that would benefit from placing overcurrent devices into separate vertical sections, why stop at the feeders to the ATSs? The code requirement would logically extend to panels serving operating rooms. If there was failure data associated with the original code proposal the logical stopping point could be assessed, but none is available. Where should this stop? It probably should have never started!

Panel Meeting Action: Reject

Panel Statement: The recommendation of this comment and the associated proposal completely eliminates valuable installation/separation requirements for emergency systems that helps delineate where the main requirement of 700.9(B) applies. This recommendation will result in confusion in the industry on how and where to apply 700.9(B) in electrical distribution systems.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 17 Negative: 1

Explanation of Negative:

DEGNAN, J.: There is no substantiation supporting the 2008 addition of 700.9(B)(5) into the NEC. Prior to requiring this additional construction expense there should be some effort to obtain field records that demonstrate that not placing overcurrent devices in separate enclosures or in separate vertical sections creates a hazard.

13-121 Log #2371 NEC-P13 **Final Action: Hold**
(700.9(B)(5))

Submitter: James E. Degnan, Sparling

Comment on Proposal No: 13-160

Recommendation: Revise (5) to read as follows:

(5) Wiring from an emergency source shall be permitted to supply any combination, legally required, or optional loads. A feeder supplying combinations of emergency and legally required or optional loads is an emergency feeder. A feeder serving a combination of emergency and legally required or optional loads shall separate the loads at a switchboard or at taps from the feeder to individual disconnects mounted in separate enclosures. Legally required and optional standby circuits shall not originate from the same vertical switchboard section, or individual disconnect enclosure as emergency circuits.

Substantiation: I have submitted another comment suggesting that 700.9(B)(5) be deleted and replaced with: "It shall be permissible to utilize single or multiple feeders to supply distribution equipment between an emergency source and the point where the combination of emergency, legally required, or optional loads are separated." I prefer that the panel accept that comment over this one, however if the panel finds statistically significant substantiation to retain the requirements for separate vertical sections and is interested in improving the language, this comment provides the appropriate opportunity.

Many large campus facilities with multiple buildings such as medical centers, colleges/universities, prisons, shopping malls, etc rely on central generation of emergency power. The present code language does not make it clear that feeders serving combinations of emergency, legally required standby, and optional standby loads can run from a generator switchboard to a remote building, and then be separated into the appropriate load types at the building. The statement "From separate vertical switchboard sections, with or without common bus, or from individual disconnects mounted in separate enclosures." can be interpreted to require separation of emergency, legally required standby and options standby systems at the first switchboard downstream of the generators. If applied to campus type power systems this interpretation would triple the amount of feeders run around a site, and double the amount of manholes. It would also ignore the common use of medium voltage system designs such as primary selective systems or loops with sectionalizing provisions. It would require complete rebuilding of many substantial and reliable emergency power distribution systems across the country.

Panel Meeting Action: Hold

The panel action holds only Comment 13-121.

Panel Statement: The panel concludes that the issues associated with eliminating the exception currently contained in 700.9(B)(5) cannot be resolved within the time frame allotted to the panel and therefore has made the decision to hold this recommendation for the 2014 NEC revision cycle.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-122 Log #2373 NEC-P13 **Final Action: Accept**
(700.9(B)(5))

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 13-162
Recommendation: Revise text as follows:

(5) Wiring from an emergency source to supply any combination of emergency, legally required, or optional loads in accordance with (a), (b), & (c,) & (d):

a. From separate vertical switchboard sections, with or without a common bus, or from individual disconnects mounted in separate enclosures.

b. The common bus or separate sections of the switchboard or the individual enclosures shall be permitted to be supplied by single or multiple feeders without overcurrent protection at the source.

Exception to (5)b: Overcurrent protection….at the source.

c. Legally required and optional standby circuits shall not originate from the same vertical switchboard section, panelboard enclosure, or individual disconnect enclosure as emergency circuits.

d. It shall be permissible to utilize single or multiple feeders to supply distribution equipment between an emergency source and the point where the combination of emergency, legally required, or optional loads are separated.

Substantiation: I submitted two other comments on proposals to 700.9(B), which I would prefer to see the panel accept instead of this comment. If the panel does not agree with the other comments please consider this one, I think it is entirely in agreement with the panel's statement on the original proposal.

This code language makes it clear that feeders serving combinations of emergency, legally required standby, and optional loads can run from a source to one or more remote buildings, and then be separated into the appropriate load types at the building.

Many large campus facilities with multiple buildings such as medical centers, colleges/universities, prisons, shopping malls, etc rely on central generation of emergency power. Without this change, the statement "From separate vertical switchboard sections, with or without common bus, or from individual disconnects mounted in separate enclosures." can be interpreted to require separation of emergency, legally required standby and optional standby systems at the first switchboard downstream of the generators. If applied to campus type power systems this interpretation would triple the amount of feeders run around a site, and double the amount of manholes. It would also ignore the common use of medium voltage system designs such as primary selective systems or loops with sectionalizing provisions. It could require complete rebuilding of many extensive and reliable emergency power distribution systems across the country.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17 Negative: 1
Explanation of Negative:

ODE, M.: The Comment action should have been a hold since it introduces new material that has not had public review.

Comment on Affirmative:

DEGNAN, J.: Paragraph 700.9(B)(5)(d) makes it clear that feeders serving combinations of emergency, legally required standby, and optional loads can run from a source to one or more remote buildings, and then be separated into the appropriate load types at the building.

OLSON, G.: The changes in this comment and those in 13-13 greatly clarify long-standing questions relating to generator applications. In particular, where multiple generators serve a common bus, there have often been questions as to how rules associated with feeders, taps, disconnects, and separation requirements should be applied. As noted in the substantiation, strictly interpreted, previous rules result in unnecessary overbuilding of a system that does not improve reliability. In essence, the revised requirement leaves the designer open to understanding the bus of a multiple generator system to be the source, rather than the individual machines.

13-123 Log #2378 NEC-P13 **Final Action: Reject**
(700.9(B)(5))

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 13-164
Recommendation: The submitter's proposal should be accepted in part, recognizing the panel statement noting that separation of legally required standby and optional loads is not required.
Substantiation: . The submitter's proposal will provide a more reasonable construction alternative and achieve substantially the same end result as separate vertical sections.

The panel has asked for technical substantiation from the submitter. I have requested substantiation from NFPA documenting the need for separate vertical sections in the original proposal to the 2008 NEC and have received nothing. NFPA has not provided any data identifying failures, or more specifically a statistically significant number of failures, that justifies this magnitude of a change in the 2008 NEC. It is unreasonable of CMP 13 to request that modifications to this Section be supported by technical data when there is none justifying its original placement in the code! Because there is no data detailing the specific nature of the failures it cannot be determined that separate vertical sections will solve whatever the original problem was thought to be.

The conceptual justification for vertical sections is that if an overcurrent protective device is in the same vertical section as other overcurrent protective devices, its failure can cause adjacent devices to fail. Devices in adjacent, but separate vertical sections will not fail or at least be less likely to fail.

My conversations with peers in the industry indicate that if there is a problem regarding reliability of distribution equipment in emergency systems it is probably related to propagation of failures among group mounted circuit breakers. Typically a cable lug is loose, overheats and the heating leads to a fault. In group mounting of circuit breakers, phase A of one circuit breaker is immediately adjacent to phase C of another circuit breaker, and there is a chance that the fault will propagate from one circuit breaker to another. If this is the original problem, prevention of propagation will be solved by the submitter's proposal. Note that a loose lug is an installation problem, not a code mandated design problem, and superior construction diligence and yearly maintenance could do more to prevent reliability issues in the first place and thereby stop them from propagating.
Panel Meeting Action: Reject
Panel Statement: The comment does not comply with Section 4.4.5(c) of the NFPA Regulations Governing Committee Projects because the submitter has not provided a clear recommendation containing proposed text.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:

DEGNAN, J.: I look forward to future discussions that will determine if there is merit behind utilizing separate vertical sections to separate emergency, standby, and optional standby loads.

13-124 Log #2372 NEC-P13 **Final Action: Hold**
(700.9(B)(5)(b))

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 13-163
Recommendation: Delete the exception to 700.9(B)(5)(b).

~~Exception: Overcurrent protection….at the source.~~

Substantiation: 700.9(B)(5)(b) contains the phrase "shall be permitted". According to 90.5 (B) the phrase "shall be permitted" makes 700.9(B)(5)(b) an action that is allowed, but not required. Therefore an Exception is not needed for a rule that is not a mandatory rule. Additionally, an Exception that refers to another part of Article 700 is not necessary, because the complete requirements of Article 700 are always applicable.
Panel Meeting Action: Hold

The panel action is to hold only Comment 15-124.

Panel Statement: The concept of completely eliminating this exception was not discussed in any of the panel's actions on this section in the ROP phase of 2011 NEC revision. This concept needs to be subjected to public review and input, hence the action to hold this comment.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-125 Log #1644 NEC-P13 **Final Action: Hold**
(700.9(D)(1))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Hold" as it introduces new material and is not in accordance with 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.

The concept of 4 inches of concrete equated to a 2 hour fire-rating has not had public review.

Submitter: Thomas Guida, TJG Services, Inc.
Comment on Proposal No: 13-172
Recommendation: Accept 700.9 (D)(1)(5) with the additional fine print notes. Continue to accept the balance of the proposal.

(5) Be embedded in ~~not less than 50 mm (2 in.) of~~ concrete with a sufficient thickness to achieve a minimum 2 hour fire rating
FPN 1: A typical 2-hour construction is 100 mm (4 in.) thick concrete.
FPN 2: See section 19 of the NFPA Fire Protection Handbook 20th edition for minimum slab thickness for fire resistance ratings. This provides thickness for various types of concrete.

Substantiation: Although 2 inches of concrete served the industry well for a 1 hour fire rating, the requirement is now for a 2 hour fire rating. To satisfy the panels request for more prescriptive information on the thickness of the concrete, fine print note 1 has been added. The NEC currently has fine print notes that state typically 150 mm (6 inch) thickness of concrete is used for a 3-hour rating in section 450.42. This note was also added to 110.31A. Since 2 inches of concrete was previously used as acceptable for 1-hour, 100 mm (4 inches) was added in the fine print note for the requirement of 2-hours.

Additionally, since concrete thickness may vary based on the type of concrete, fine print note 2 was added to provide information on this.
Panel Meeting Action: Accept in Principle
Revise existing 700.9(D)(1)(5)as follows:
(5) Be ~~embedded~~ encased in a minimum of ~~not less than 50~~ 100 mm (~~24~~ in.) of concrete

Panel Statement: The panel action provides a prescriptive value for the thickness of concrete that allows for objective enforcement and has made editorial revisions for consistency with similar requirements in Articles 695 and 708.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 2
Explanation of Negative:
ODE, M.: See my negative statement in Comment 13-102.
SPINA, M.: Although information was received with these comments this information was new material which has not had opportunity for adequate public review and comment.

13-126 Log #2381 NEC-P13 **Final Action: Accept in Part**
(700.12, FPN (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 13-177
Recommendation: Accept the Proposal in Principal in Part. Consolidate Fine Print Notes 2 with Proposed Note 3 as shown below:
~~FPN No. 2: Assignment of degree of reliability of the recognized emergency supply system depends on the careful evaluation of the variables at each particular installation.~~
FPN No. 2: Assignment of degree of reliability of the recognized emergency supply system depends on the careful evaluation of the variables at each particular installation. Quantitative methods provide more consistent results in reliability studies. For further information see ANSI/IEE Standard 493: Recommended Practice for the Design of Reliable Industrial and Commercial Power Systems.
Substantiation: The electrical industry has evolved from a point where the presence of electricity was a fire hazard, to a point where the greater hazard lies in the absence of electricity. Friends of the NEC need a broader vocabulary to discuss our safety choices and that vocabulary needs to be "numerate" i.e., probabilistically/statistically, informed. The comprehensiveness of the phrase "degree of reliability…careful evaluation of the variables…" needs to be expanded into a realm in which variables are no longer variables, where variables are constants and vice-versa, and where we argue about whether the Weibull or log-normal distribution is the most appropriate hazard function to use. Way out there where the buses don't run yet.
For the convenience of the panel, I have provided one of the failure rate tables from the IEEE Gold Book.
While it may be too early for tables like these to show up in the NEC, we ought to at least reference the document that contains them. With gathering pace, information like this ought to inform decisions such as the following:
- whether designers select fuses, molded case breakers, or steel frame breakers;
- whether a bus tie made in the field with cable is more reliable than a factory assembled duct;
- whether the second source of power to a fire pump ought to be provided by a utility overhead line or an on-site generator.
- - how we develop the last mile of distribution to residential and small commercial districts, if, for example, our mass personal transportation system can morph into a backup power system because electric vehicles and the utility can transfer energy bi-directionally
IEEE Gold Book data will help our electrical and safety professionals assess and scale risk based upon quantitative information that might challenge design approaches that are built upon anecdotes rather than statistical likelihoods. The Owner will have data that will determine whether the electrical professionals are overbuilding in one area (because the voices are more numerous and louder) and under-building in another.
I do not think we can avoid failure rate data in the next leg of development of our industry. The airline and automobile industries, informed by Total Quality Management practices and the reliability methods NASA used for the space program, increased product and mission reliability by rolling in new failure rate data on a near-continual basis. The electrical industry needs to be doing this, too; and it has already started with most state public utility commissions now requiring annual system, momentary, and customer outage data. Chapter 7 would be a natural place to see the first footprint of this document because it is in Chapter 7 where the all the big ideas about the relationship between the normal and backup power system come to be discussed.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Part
Revise Fine Print Note No. 2 in the 2008 NEC to read:
FPN No. 2: Assignment of degree of reliability of the recognized emergency supply system depends on the careful evaluation of the variables at each particular installation. For further information see ANSI/IEEE Standard 493-2007: *Recommended Practice for the Design of Reliable Industrial and Commercial Power Systems.*
Panel Statement: Adding only the reference to the IEEE standard is sufficient to augment the usefulness of this fine print note. The recommended second sentence is not necessary information.

(700.12(B)(6))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because the submitter has failed to provide proposed text in compliance with 4.4.5(c) of the NFPA Regulations Governing Committee Projects.
Submitter: Joseph A. Ross, Ross Electrical Assessments
Comment on Proposal No: 13-180
Recommendation: Accept Proposal No. 13-180 in Principle using the common sense logic of panelist Mr. C. Mouton's Negative Vote.
Substantiation: See Mr. C. Mouton's Negative Comment on Page 945, 2010 ROP.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 13-129.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17 Negative: 1
Explanation of Negative:
ODE, M.: The Panel Action should have been to reject since the submitter did not provide a recommendation based on Section 4.4.5(C) of the NFPA Regulations Governing Committee Projects.

13-128 Log #469 NEC-P13 **Final Action: Hold**
(700.12(B)(6), 701.11(B)(5), 702.11, 225.36, and 225.38)

Submitter: Lawrence W. Forshner, Cummins Northeast, Inc.
Comment on Proposal No: 13-180
Recommendation: Recommendation: Delete existing text and Replace 700.12(B)(6); 701.11(B)(5); and 702.11 as follows:
Where an outdoor housed generator set is equipped with a readily accessible disconnecting means meeting the requirements of 445.18, and the installation meets the requirements of 250.32(D), an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure served. All installations permitted by this section, unless meeting the requirements of 225.32 Exceptions 1, 2, 3, or 4, shall have the generator disconnecting means located within sight of the building or structure served.
Recommendation: Add exception to 225.36 and 225.38 as follows:
Exception: Outdoor housed generator set disconnecting means shall meet the requirements of 445.18.
Substantiation: Also submit the recommendations to CMP 4 for consideration, and information.
Also submit to CMP 5 for information.
I believe these recommendations are consistent with the panel statement and address the concerns identified by the submitter.
The construction requirements of the disconnecting means should be consistent with those recognized in 445.18., and described in UL2200. If 445.18 describes an acceptable disconnecting means for a generator, it should be acceptable when applying 700.12(B)(6); 701.11(B)(5); and 702.11. A "break glass" lockable mushroom button, for example, serving as the disconnect for the generator and the feeder, meets the requirements of all the rules, in that it is recognized per 445.18 and described in UL2200 section 11.
With the new rule changes to 250.32(D) in the last two code cycles, the grounding requirements and conditions specified in 250.32(D) are what are important. Listed generators have provisions for installing bonding jumpers and a neutral disconnecting means in the generator terminal box if required and as described in UL2200 section 14. Suitable for use as service equipment has become a moot point, and has created confusion in the field when referring to the disconnecting means at the generator location. ((see 2001 ROP 4-30 that was accepted and later rejected via ROC, 4-13 Log #1769), the substantiation for the rejection did not address disconnects at a generator, it only referred to the disconnect inside or outside of a building that had to be constructed to open under load, and also referenced the confusion the rule change would create with other rules, such as, how to apply the "two to six disconnect rule" at the building.) When AHJs are asking for additional NEMA 3 fused disconnects or breaker enclosures at the generator, it adds cost and reduces reliability. When the generator is shut down via its own controls, annunciation and fire alarm supervision as required per NFPA 110 and NFPA 72 alert the building occupants of an inoperable life safety system, or essential electrical system in a health care application. Additional breakers hinder coordination and create a single point of failure, without required annunciation. Isolating the generator feeder also gives someone working on or around a generator, a false assurance, that the generator cannot start.
Allowing 225.32 Exceptions No. 1 and No. 2 address the submitter's concerns and provides the relief he is asking for. Why should a generator source have different rules than those of a feeder from a building or structure? Is an "Integrated Electrical System" requiring an "Orderly shutdown"... with "Effective safeguards acceptable to the AHJ", not to incorporate onsite generators?
In summary, my comments keep the disconnecting means in sight, defines the construction of the feeder disconnect, when located at the generator, consistent with the rules in Article 445 and UL2200, and provides needed relief by allowing the existing rules as to the location of the generator/disconnect to be applied when applicable.

Panel Meeting Action: Hold
The panel action holds only Comment 13-128.
Panel Statement: The proposed exception introduces new material that has not had public review by adding requirements in 700.12(B)(6), 701.11(B)(5), 702.11, 225.36, and 225.38. This Comment is held for the 2014 NEC cycle and should also be submitted to CMP 4 because they have responsibility for Article 225.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-129 Log #1805 NEC-P13 **Final Action: Accept**
(700.12(B)(6) Exception)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-180
Recommendation: The panel action on this proposal should have been to accept the proposal in principle and include only the exception revised as indicated below:
Exception: For installations under single management, where conditions of maintenance and supervision ensure that only qualified persons will monitor and service the installation and where documented safe switching procedures are established and maintained for disconnection, the generator set disconnecting means shall not be required to be located within sight of the building or structure served.
Substantiation: This comment is a modification to the original Proposal 13-180, which intends to provide the same exception for installations under single management to outdoor housed generator sets, as provided by Exception 1 of 225.32 for other types of outside feeders. The proposed exception should have been accepted in principle and modified to replace the wording "generator set" in the Exception with "generator disconnecting means". This change will correctly identify the exception as applying to the disconnecting means and not the generator set. As indicated in the panel statement, the intent of the referenced 700.12(B)(6) is for the disconnecting means to be in line of sight of the building. As allowed by Exception 1 of 225.32, the additional disconnecting means should not be required to be within site of the building or structure served, and can be located " elsewhere on the premises". The application of this exception to an outdoor housed generator set is technically no different than any other type of outside feeder to the building. The exception provides the condition upon which the installation can be operated and maintained safely, i.e., the use of qualified persons for the maintenance and supervision and documented safe switching procedures are established and maintained. Similar installations of outdoor feeders serving a building or structure, without the installation of a disconnect device installed either inside or outside of the building or structure and not within site of the building or structure, are operated and maintained safely when the conditions stated in the exception are present.
Panel Meeting Action: Accept
Number Eligible to Vote: 18

(700.17)

Submitter: Mark R. Hilbert, State of New Hampshire
Comment on Proposal No: 13-187
Recommendation: Accept the proposal in principle and revise 700.17 as follows:
700.17 Circuits for Emergency Lighting.
(A) System. ~~Branch circuits~~ Circuits that supply emergency lighting shall be installed to provide service from a source complying with 700.12 when the normal supply for lighting is interrupted. Such installations shall provide either of the following:
(1) An emergency lighting supply, independent of the ~~general~~ normal lighting supply, with provisions for automatically transferring the emergency lights upon the event of failure of the ~~general~~ normal lighting system supply.
(2) Two or more separate and complete systems with independent power supply, each system providing sufficient current for emergency lighting purposes. Unless both systems are used for regular lighting purposes and are both kept lighted, means shall be provided for automatically energizing either system upon failure of the other. Either or both systems shall be permitted to be a part of the ~~general~~ normal lighting system of the protected occupancy if circuits supplying lights for emergency illumination are installed in accordance with other sections of this article.
(B) Branch Circuits. Branch Circuits supplying emergency lighting shall by installed so the failure of an individual branch circuit cannot leave in total darkness any area that requires emergency illumination. They shall be arranged in accordance with either of the following:
(1) To automatically transfer the emergency lights in the event of a failure of the normal lighting branch circuit; or,
(2) To consist of two or more branch circuits supplied from separate systems with independent sources. One of the two branch circuits shall be part of the emergency system and the other shall be permitted to be part of the normal lighting system.
Substantiation: As I reviewed and discussed Proposal 13-187, I realized the section as currently written has language on how the "system" is intended to operate. That is, to provide a system that will either act automatically when the normal system fails or to provide two independent systems. I am afraid the basic requirements for the "emergency system" operation will be lost as proposed at the ROP stage. Accepting the proposal in principle and revising 700.17 as proposed in this comment will carry over the original intent to clarify the installation of branch circuits supplying emergency lighting while retaining the language on how the emergency system is to be arranged.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 13-187 meets the intent of this recommendation without requiring multiple levels of redundancy.

Ballot Results: Affirmative: 18

13-132 Log #1572 NEC-P13 **Final Action: Accept**
(700.26)

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 13-191
Recommendation: Continue to reject this proposal
Substantiation: This proposal should continue to be rejected because it jeopardizes life-safety. The reasons for utilizing ground-fault protection of equipment in certain applications are well documented. The damage than can result from a ground fault on such a system may render a substantial portion of the system inoperative, resulting in a lengthy outage potentially worse than that envisioned by the submitter, or worse yet start a life threatening fire. Further, restraint of the GFPE may increase the downstream arc flash hazard for maintenance workers.
The late J.R. Dunki-Jacobs, a recognized authority on ground-fault protection, stated in his book *Industrial Power System Grounding Design Handbook* (pages 186, 189) that, "If an arcing line-to ground fault is initiated in a solidly grounded system on one of three bare buses in a metal enclosure, the hot ionized gases that are developed by the fault can be expected to cause escalation to an arcing multi-phase fault within 1 or 2 cycles (0.0167 to 0.033 sec) of time." He went on to state, "Escalating arcing-ground faults have shown themselves to be extremely devastating…" and "Unquestionably then, engineering attention to their immediate suppression must be proactive and immediate, rather than reactive. Not only for reason of minimizing the released arc energy to maximize personnel safety, but also to avert arcing-fault escalation." The suggestion that an audible and visual signal device would be of any value is ludicrous.
System reliability and blackout prevention can be achieved by proper system design, equipment selection and coordination. The GFPE restraint called for in this proposal is unnecessary and a potential threat to life-safety.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-133 Log #1614 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: Christopher G. Walker, Eaton Corp.
Comment on Proposal No: 13-190
Recommendation: (A) Alternate Power Source. The alternate source for emergency systems shall not be required to have ground-fault protection of equipment.
(B) Normal Power Source. For the normal source of emergency systems, where ground-fault protection has been provided for the operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load.
Such protection shall consist of overcurrent devices, current transformers, or other equivalent protective equipment that shall cause the feeder disconnecting devices to open.
The additional levels of ground-fault protection shall NOT be installed as follows:

1. On electrical systems that are not solidly grounded wye systems with greater that 150 volts to ground, but not more than 600 volts phase-to-phase.
2. On electrical systems where a non-orderly shutdown of power will introduce additional or increased hazards.

Substantiation: While the Panel's response was to point out that 700.26 permits the alternate source for Emergency Systems to not have ground-fault protection of equipment with automatic disconnecting means, and that Emergency Systems remain selectively coordinated for all fault conditions, it is evident that the intent of this proposal was not clear originally. The intent of this proposal relates only to the Normal source of Emergency Systems, and the proposal is focused on requiring an additional step of ground-fault protection in all next level feeder disconnecting means downstream toward the load, when connected to the Normal source. I have modified the wording to help clarify this important distinction.

Ground faults are typically believed to be the most common type of fault experienced in operating energized electrical systems, per ANSI/IEEE Std 242-1986 Buff book, Chapter 7. Professional design engineers tell of experiences with ballast or small motor failures that have caused main or feeder devices to open. Why is this so? In some instances, a ground fault condition existed that went undetected and precipitated the protective device to open. In other cases, ground fault protective devices were improperly set, or not set at all. In others yet, a selective coordination study may not have been done, or may have been done improperly.

The NEC has for many years required ground fault protection of equipment, but only at the service disconnect level (with noted special exceptions), per 230.95. With a goal in mind of maximizing the reliability and up-time of electrical systems, and giving consideration that the most common types of faults are ground fault related, it becomes a reasonable approach that the requirements for ground fault protection of equipment are extended to all appropriate areas in the electrical system, beyond just the service level.

This Proposal is therefore to require additional levels of ground fault protection of equipment below the service level on the normal source of an electrical system. This Proposal's language mirrors a similar requirement for ground fault protection of equipment that currently exists in NEC 708.52 for Critical Operations Power Systems (COPS). This proposal therefore recommends enhancing the reliability of the electrical system by requiring ground fault protection of equipment in all appropriate levels of the system.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation to justify requiring an additional level of ground fault protection on the feeder downstream from the normal service main. The reason for an emergency system is to provide power within 10 seconds whenever the utility source or other source of power is lost.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-134 Log #2226 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association

Comment on Proposal No: 13-191

Recommendation: Modify the proposed text by adding a new second paragraph to read as follows:

Normal Source ground fault protection on the line side of a transfer switch supplying emergency systems shall be permitted to be restrained for ground faults on the loadside of the transfer switch, provided that audible and visual signal devices indicate whenever a ground fault relay has been restrained, and instructions on the course of action to be taken in the event of an indicated ground fault are located at or near the sensor location.

Substantiation: The designer may be required by 230.95 and 210.15 to use ground fault protection on the main or feeder on the normal side of a transfer switch feeding emergency systems. A ground fault relay sensor can be put at the transfer switch, which, when a ground fault occurs on the load side of the transfer switch, sends a signal to the normal side ground fault relay to restrain the operation of the disconnecting means.

This additional text allows designers to be able to utilize ground fault protection for the normal source, and provide selective coordination for emergency devices and all overcurrent devices on their line side, without endangering any equipment protection on the normal source side of the transfer switch. This can best be accomplished by allowing the normal side ground fault protection to be restrained for ground faults on the load side of the transfer switch (on the emergency system side). While 700.26 permits ground fault protection to be totally omitted on the alternate source side of emergency systems, this text simply allows the ground fault protection on the normal source side to be restrained for ground faults on the load side of the transfer switch for the emergency systems. The requirement for indication is included to correlate with the requirement found in 700.7(D).

Panel Meeting Action: Reject

Panel Statement: The substantiation associated with this comment does not provide the panel with any additional technical justification for the recommended provision. The panel reaffirms its action and statement on Proposal 13-191.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-135 Log #608 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC

Comment on Proposal No: 13-203

Recommendation: Revise text to read as follows:

700.27 Coordination. Emergency system(s) overcurrent protective devices shall be coordinated in accordance with 700.27(A) or (B):

(A) Coordination to 0.01 seconds. Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

(B) Engineering Supervision. For new and existing installations, where the emergency system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the extent practicable. The design shall be documented, stamped by the professional engineer and made available for review by the authority having jurisdiction.

Exception: Selective coordination shall not be required between two overcurrent devices located in series if no loads are connected in parallel with the downstream device.

FPN: Overcurrent protective devices used for emergency system circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs. increase overall reliability of the system.

Substantiation: Panel 13 is urged to reevaluate their decision regarding selective coordination. Proposal 203 was accepted in principal, in part during the ROP, but was overturned in the final vote by less than 1/2, of the panel members.

The proposed rewording of Proposal 203 above, reflects the Panel discussions during the ROP that preferred positive code language vs. an additional exception. "Coordination to 0.01 seconds" was added to clarify that the instantaneous portion of the overcurrent time/current curve must also be considered when coordinating devices. The title "Engineering Supervision" was added to reflect similar instances in the NEC, such as 240.86 and is used extensively in the National Electrical Code in no less than 20 other instances.

The panel also rejected the word "practicable" stating it "....is not defined and subjective." However, this same Panel defended the term "practicable" in Proposal 13-151 stating "'Where practicable' leaves the decision up to the authority having jurisdiction...." The word "practicable" appears in the National Electrical Code in no less than 70 other instances.

Authors of Proposal 10-82, who also defend selective coordination as currently written, have, apparently recognized that a selectively coordinated system increases arc-flash energy, thus the proposal to require a means of reducing arc flash energy will be required in the proposed 240.87.

A system that is coordinated by an Engineer engaged in the business of designing these systems, understands the balance required between coordination, arc flash energy, safety and reliability. The idea that Engineers are opposed to coordinated power systems is incorrect. Engineers are opposed to the strict interpretation that system coordination takes precedence over all other issues within a power system design. The engineering community has been balancing coordination and safety in electrical distribution systems quite effectively for decades. There is little justification to defend the strict requirement for selective coordination.

In many situations, it is impossible to add to an existing distribution system and achieve full coordination without jeopardizing the existing system. The proposed language provides some relief to the strict interpretation, while maintaining a safe and reliable system.

The NEC seeks to provide a nationally recognized standard. Proposal 203, as originally written, is part of the 2008 Massachusetts Electrical Code. Relief to this strict requirement is being granted, in varying forms, in many other jurisdictions.

Panel Meeting Action: Reject

Panel Statement: "Coordinate to the extent practicable" or "coordinate to the level required" are not needed since selective coordination for the full range of overcurrents is achievable. The proposed language "Coordinate to the extent practicable" or "coordinate to the level required" do not provide sufficient specificity as to what constitutes an acceptable selectively coordinated installation and would permit systems to cascade overcurrent protective devices for any level of overcurrent for any reason, such as cost, effort, expertise, or space. Selective coordination for the full range of overcurrents is required.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 16 Negative: 2

Explanation of Negative:

CARON, D.: An electrical distribution system, for an emergency power system (as well as a normal power system), should take into account all of the factors that result in properly designed, coordinated, safe and reliable system including coordination, component selection, arc flash energy, efficiency, etc. Although coordination is achievable, as indicated in the Panel Statement, in many instances, especially larger systems where the use of circuit breakers is preferred, additional components (such as 1:1 transformers) and/or oversized components are required, thus compromising the reliability and efficiency of the system, as the additional components result in additional points of potential

failure and consume more energy.

This Comment should have been Accepted as it addresses the concerns in the ROP Panel Response to the original Proposal 203.

-It revises the original Proposal into positive Code language (vs. an exception).

-It defends the term "practicable" (and "impracticable") as it is used extensively throughout the code and includes potential safety concerns such as 450.41 where a transformer vault is not required to be ventilated where it is not practicable.

Since the inception of selective coordination in the 2005 NEC, many facilities that do not meet the letter of the code based on the current definition of selective coordination in Article 100 have been issued occupancy permits. An overwhelming majority of these facilities however, do meet the requirement to the extent practicable. In general, AHJ's are either not enforcing or ignoring this requirement, or are relying on the Engineer's design judgment. This practice (non-enforcement) shows no signs of reversing. In addition, many jurisdictions, including Massachusetts and Florida have recognized that this requirement is too strict and have responded with local rulings that provide relief. The non-enforcement and application of inconsistent regional rulings could result in undermining the integrity of the NEC.

DEGNAN, J.: See my reply to comment 13-140.

13-136 Log #1084 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: James H. Costley, Jr., Newcomb & Boyd Consultants & Engineers
Comment on Proposal No: 13-195
Recommendation: Accept the proposal.
Substantiation: The submitter's substantiation is sound and correct. The blanket requirement for complete selectivity is impossible to design using available engineering tools for generic devices. Specific manufacturer's test data for uniquely specified equipment is required, and even then any one manufacturer's options are limited. The number of sequential overcurrent protection devices in any design must be minimized, reducing the segmentation and isolation capabilities of distribution systems, which also reduces operational safety and reliability that multiple switching levels affords. In order to provide selectivity, upstream devices must be intrinsically slower in operation, or be substantially oversized for the actual load. Paradoxically, since one of the reasons often quoted for selective coordination is safety in an accident, the arc flash energy for a given point in a system will increase in almost every system design because of the mandate to selectively coordinate every level of the overcurrent protection.
Panel Meeting Action: Reject
Panel Statement: This comment and associated proposal reduces the level of safety and is not needed because selective coordination for the full range of overcurrents is achievable. Selective coordination only "for faults with duration of 0.1 seconds and longer" permits installations where overcurrent protective devices would be coordinated for primarily overloads and a few low-level phase-phase and phase-ground faults. Arc flash hazards are not necessarily greater for selectively coordinated systems. For circuit breakers, there are circuit breaker options whereby selective coordination can be achieved without increased arc flash hazards, such as arc reduction maintenance switches and zone selective interlocking.
In addition, there are other design options that can be used to achieve selective coordination and acceptable levels of incident energy.
Number Eligible to Vote: 18

DEGNAN, J.: See my reply to comment 13-140.

13-137 Log #1806 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-194
Recommendation: The panel action on this proposal should have been to accept the proposal in principle and revise the proposed text as follows:
Overcurrent devices shall be selected by a qualified person to optimize selective coordination between equipment protection, service continuity, and arc flash protection.
Substantiation: The recommended wording for the balance of the first two sometimes opposing criteria is taken from Chapter 15 of IEEE 242 (the Buff Book), the IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems. As stated in IEEE 242 on page 607 in Section 15.7.1, "complete selective coordination may not be achieved in all systems". The current language of 700.27, 701.18, and 708.54 does not allow the flexibility for a qualified person to make the compromise between these two criteria, which has been the common practice in selective protective device coordination for decades. Additional substantiation for this rewording of the proposal comes from NFPA 110 which says in Article 6.5.1 that "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protection devices when a short circuit occurs". The current language in these NEC Articles for 100% coordination has had the affect of inappropriately restricting the options available for a qualified person, and has led to the use of a limited set of options to achieve 100% coordination, giving a windfall advantage to a certain specific class of equipment. The recommended change would make the necessary adjustment in the language to allow more flexible coordination in accordance with the methodology recommended in IEEE 242. In addition, the addition of the wording "a qualified person" will incorporate the panel judgment from Proposal 13-203 which was to accept in principle in part, additional language to indicate the qualifications of persons performing the coordination.
Panel Meeting Action: Reject
Panel Statement: This comment and associated proposal reduces the level of safety. "Optimize selective coordination" is not needed since selective coordination for the full range of overcurrents is achievable. The proposed language does not provide sufficient specificity as to what constitutes an acceptable selectively coordinated installation and would permit systems to cascade overcurrent protective devices for any level of overcurrent for any reason such as cost, effort, expertise, or space.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 15 Negative: 3
Explanation of Negative:
CARON, D.: See my response to Comment 13-135.
DEGNAN, J.: See my reply to comment 13-140.
MOUTON, C.: The panel action for this Comment should have been Accepted in Principle. The proposal would not reduce the level of safety. Quite to the contrary, several comments indicated that actually the current language will in some cases reduce the level of safety. As stated in other Comments (13-136 and 13-148), 100% selective coordination is achievable, but at the cost of overly restrictive selection of equipment, and to the detriment of arc flash protection. The language selected is similar to other language provide in NFPA 110 and in technical guidelines of IEEE 242. The check and balance for integrity of optimized protective device coordination is the same as it has been done for decades. 100% coordination is the new and overly specified requirement.

13-138 Log #2237 NEC-P13 **Final Action: Accept**
(700.27)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association
Comment on Proposal No: 13-198
Recommendation: The Panel should continue to reject this proposal.
Substantiation: Continue to reject this proposal since the Panel Action and Panel Statement clarifies that the existing 700.27 text already requires selective coordination **for the full range** of overcurrents. The first sentence of the Panel Statement reads: "The existing text of 700.27 already requires selective coordination for the full range of overcurrents, from overloads through the available short-circuit current, with all upstream devices."

By the nature of business, many systems are merely designed and installed to the minimum required by the Code. If the requirement for selective coordination were to be changed to only times greater than 0.1 second, then the effective result is that many systems will be designed and installed per the Code minimum and yet the coordination will essentially only be for overloads (and some low level faults). With a requirement for only times greater than 0.1 second and designed to the minimum, then low level to high level faults will be permitted to cascade (trip or open) multiple levels of overcurrent protective devices(branch, feeder, and main). The result will be emergency loads being unnecessarily interrupted due to a lack of selective coordination even though compliant with a requirement for times only greater than 0.1 second.

To illustrate this, Graphs have been provided that depict the time-current curves of the same 30A, 200A, and 800A systems.

Note: Supporting material is available for review at NFPA Headquarters.

13-139 Log #2265 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Greg Batie, Sparling
Comment on Proposal No: 13-195
Recommendation: The original proposal 13-195 should be accepted by the panel.
Substantiation: The proposed change is closely aligned with NFPA 70-2008 comment #13-187 which proposed a similar modification to NFPA 70's requirements for selective coordination. The comment received a vote to accept by a majority of the panel members, however the vote was overruled by the TCC because it fell short of the 2/3 requirements for implementation.

In healthcare facilities it is often necessary to work on energized equipment

to avoid power shutdowns in the hospital. The proposed language would make these systems safer to work on by reducing the amount of arc flash energy that is delivered to a fault.

There has not been any substantiation that a selectively coordinated system improves the level of safety by reducing the extent of the power outage to the closest protective device. By defining the requirement for selective coordination to 0.1 seconds and longer would allow engineers to design systems with balance between the potential extent of a power outage and increased arc flash hazard.

Panel Meeting Action: Reject

13-140 Log #2377 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 13-195
Recommendation: My original proposal 13-195 should be accepted by the panel.
Substantiation: It is irresponsible of the panel to ignore the increasing arc flash hazard associated with selectively coordinated systems.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-136.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 2
Explanation of Negative:
CARON, D.: See my response to Comment 13-135.
DEGNAN, J.: Reducing arc flash hazards is a more viable safety concern than improving the reliability of emergency distribution systems through selective coordination. While there are no records of lives being lost because of a lack of complete selective coordination there are numerous records of injuries from arc flash hazards. The panel's statement cites ZSI as a means to mitigate arc flash hazards, but this technology has limited applications in multi panel distribution systems and is not reasonable to apply to when the downstream panel has thirty or more circuits. Any of the 2011 NEC proposals that permitted consideration of arc flash hazards on an equal or better basis with selective coordination have merit.

13-141 Log #1573 NEC-P13 **Final Action: Reject**
(700.27, FPN)

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 13-201
Recommendation: Accept this proposal
Substantiation: A lack of coordination between standard overcurrent protective devices and ground fault protection for equipment (GFPE) may be one of the most frequent coordination errors made by engineers. A FPN would help in pointing out the need to consider coordination between these devices as well. While it is true that Article 700 does not require GFPE, it does not prohibit it either. Indeed, coordination may actually be enhanced by the use of GFPE at lower levels in the system and can improve life safety by preventing catastrophic equipment burn-downs, ignition of combustible materials and reduction in the arc flash hazard.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 13-201.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 2
Explanation of Negative:
CARON, D.: See my response to Comment 13-135.
CZARNECKI, N.: NEMA disagrees with the panel action. The panel did not address the concerns presented by the proposal submitter as noted in the NEMA ROP ballot. Guidance in the methods and selection of devices to ensure selective coordination is critical to a selective system. The proposal would simply remind the designer to include ground fault protective devices in the device analysis.

13-142 Log #2692 NEC-P13 **Final Action: Reject**
(700.27 Exception and FPN (New))

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 13-203
Recommendation: Accept the proposal as submitted.
Substantiation: When CMP 13 removed the word "practicable" it gutted the proposal. The entire concept was that under the conditions specified in an exception, and it absolutely should be an exception, an alternate procedure could be followed. This procedure invoked the word "practicable", and because that involves considerable technical judgment, the requirement was for a professional engineer to be involved. In a sense we agree with the comment in the voting that the PE is excessive, but only because the panel continued to leave the requirement totally prescriptive. In the real world these applications cannot be made completely prescriptive, and the approach followed in Massachusetts comports with NFPA 110.

CMP 13 need not go very far to find one of the some 70 instances of the use of a "where practicable" provision. It appears in 700.7, in the very same article as this proposal addresses. As noted in the voting, CMP 13 not only knows about this provision, it declined to remove it in this very code cycle. After extensive conversations with all interests involved, it is increasingly clear to us that this proposal would go a very long way towards building a consensus around one of the most contentious code issues in recent memory. CMP 13 should take this opportunity to create that consensus.

(700.27 Exception No. 2 and FPN (New))

Submitter: James H. Costley, Jr., Newcomb & Boyd Consultants & Engineers
Comment on Proposal No: 13-203
Recommendation: Support the TCC Action of "Reject" for the Proposal as AIPIP by the CMP 13.

I agree with the original submitter's proposal, but disagree with the CMP 13 amended version of the proposal.
Substantiation: The design and specification of electrical construction work is typically done by or under the supervision of a Professional Engineer, and sealed and signed when submitted for construction permit. Final provision of selectively coordinated overcurrent protection devices is accomplished by a Contractor in most cases, and is based on the specific testing and published certification by the manufacturer of those products in the absence of an industry standard testing procedure. The Engineer (and ultimately the owner) must rely on the manufacturer's certification of performance, and such certifications cannot be stamped or further certified by the Engineer when such product testing is outside of his supervision.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-135. The panel recognizes that this recommendation is confusing and affirms that this reject action also rejects Proposal 13-203 as amended by CMP 13.

(700.27 Exception No. 2 and FPN (New))

Submitter: Thomas A. Domitrovich, Eaton Corp.
Comment on Proposal No: 13-203
Recommendation: Accept the proposal
Substantiation: There are relatively simple electrical power systems that can meet the requirements for selective coordination by simply using the basic information readily available from equipment manufacturers. However, more involved electrical systems, which typically include complicated sub-systems, are best designed by a professional engineer.

Therefore, depending on the complexity of the design, this proposal provides the option that the design of safe and reliable power systems may be done by a licensed professional engineer. The National Electrical Code recognizes the capabilities of the professional engineer, and being able to meet the requirements of selective coordination demonstrates the capabilities of professional engineers.

Allowing this exception in this section provides the opportunity for the licensed professional engineer to design a safe and reliable power system and ensures the electrical inspector has the clear direction for approval.

(700.27 Exception No. 2 and FPN (New))

Submitter: Thomas A. Domitrovich, Eaton Corp. / Rep. American Circuit Breaker Manufacturers Assoc.
Comment on Proposal No: 13-203
Recommendation: Accept the proposal as submitted.
Substantiation: The American Circuit Breaker Manufacturers Association (ACBMA), headquarters in Washington, D.C., is an association of American manufacturers of circuit breakers to represent and promote the mutual interests of American circuit breaker manufacturers in areas of codes and standards, applications, safety, and education. Members of the Association include Eaton Corporation, General Electric Company, Siemens Industry, Inc., and Square D/ Schneider Electric.

To address the panel's objection to the word "practicable" as not being defined and being subjective, we offer the fact that this word, the word Practicable, is used throughout many NFPA documents as follows:

NFPA 70 "National Electrical Code", 2008 edition: Practicable appears 71 times. The phrase "where practicable" is used 22 times in this same document.

NFPA 99 "Standard for Healthcare Facilities", 2005 Edition: Practicable appears 6 times. The phrase "extent practicable" is used once.

NFPA 110 "Standard for Emergency and Standby Power Systems", 2010 Edition: Practicable appears 3 times.

The panel, in other areas of the code, supports the use of the word "Practicable" as in 700.7. Also, this panel has demonstrated the acceptance of this word through supporting its use as part of Proposals 13-151, 13-60a, 13-63 and 13-214.

Accepting the original proposal provides the option to enable the licensed professional engineer to engineer a solution.

13-147 Log #1912 NEC-P13 **Final Action: Reject**
(700.27 Exception No. 2 and FPN (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 13-203
Recommendation: Accept the proposal in principle, revising the exception as follows:

Exception No. 2: Where the emergency system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the ~~extent practicable~~ level required. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.
Substantiation: This proposal should be accepted in principle for a number of reasons:

1. The objective of the proposal has been completely missed and text has been inserted with an entirely different meaning.

2. Achieving selective coordination has been made even more difficult for no substantive reason. A PE license is not necessary to determine if two overcurrent protective device (OCPD) time-current curves cross or overlap one another, nor is a license required to determine if two OCPDs will coordinate by reading a manufacturer's coordination table. No longer will a contractor, for example, be able to call an OCPD manufacturer to find out what size upstream OCPD he needs to coordinate a small emergency power system. The manufacturer will not be able to answer the question unless they are a licensed PE in that state.

3. It is suggested that where a PE license is necessary is to optimize protection and coordination as recommended in the various IEEE *Color Books* that address the issue of coordination and as is allowed in NFPA 110, Phoenix, Wisconsin and Massachusetts,

4. The actions of the panel seem inconsistent. In the revised text of this proposal, only licensed professional engineers are allowed to design selectively coordinated emergency power systems, but unlicensed facility operators are allowed to defeat that coordination at will while live work is performed, a time when the likelihood of a power disrupting incident occurring is probably at its highest (see the panel statement on ROP 13-199 and the statements of other panels on ROPs 10-26 and 12-37).

5. The use of an incident energy reduction system (see ROP 13-199) requires engineering. A maintenance switch type system requires a second coordination study to determine if the system can still operate properly at the lower instantaneous trip setting. If it is acceptable for an engineer to coordinate the system to the level required under maintenance conditions, why is it not also permitted under normal operating conditions?

Finally, the panel should note that the text of this exception is similar to that in 240.86(A).
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-135. The phrase "level required" is not clear as to the desired result.
Number Eligible to Vote: 18

Comment on Affirmative:
DEGNAN, J.: I agree with the panel's statement that the proposed language lacked clarity. See my reply to comment 13-140.

13-148 Log #2453 NEC-P13 **Final Action: Reject**
(700.27 Exception No. 2 and FPN (New))

Submitter: Paul Konz, RG Vanderweil Engineers
Comment on Proposal No: 13-203
Recommendation: Accept Proposal 13-203.
Substantiation: Selective coordination in emergency systems presents several competing compromises which have a negative impact on overall system design, reliability, and safety. Overcurrent protection device coordination is a complex set of decisions where the design engineer must analyze the benefits of each decisions. Acceptance of this proposal gives the design engineer the flexibility to analyze the application and select the solution which best applies. Mandating selective coordination introduces compromises to the design of the emergency system which may actually cause more harm than intended by mandating complete coordination.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-135.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 15 Negative: 3
Explanation of Negative:
CARON, D.: See my response to Comment 13-135.
CZARNECKI, N.: The comment should be accepted in principle and revised to be worded similarly to the panel ROP action.
Exception No.2: The selection of overcurrent protection devices, in order to achieve selective coordination, shall be permitted by a licensed professional engineer engaged primarily in the design and maintenance of electrical installations. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction." The NEMA ROP Ballot Comment - "The Panel should revisit this proposal and consider the merits of wording in an Exception versus a main rule.
DEGNAN, J.: See my reply to comment 13-140.

ARTICLE 701 — LEGALLY REQUIRED STANDBY SYSTEMS

13-149 Log #1867 NEC-P13 **Final Action: Accept**
(701)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 13-205
Recommendation: Accept the Proposal.
Substantiation: This proposal makes a lot of sense and should be accepted.

There does not seem to be any logical reason for not having parallel numbering, to the extent practicable, for Articles 700, 701 and 702. Other Code Panels have done so with other articles and the Code users enjoy the improved "User Friendliness."
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-150 Log #816 NEC-P13 **Final Action: Reject**
(701.6)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-210
Recommendation: Accept the proposal and revise text to read as follows:
A legally required standby system shall have ratings not less than required for the supply of all equipment intended to be operated simultaneously, and to withstand available fault current at its terminals.
Substantiation: "At one time" can be 1 pm on Monday and 1 pm on Tuesday. "Simultaneously" is the term usually used in the NEC. "Ratings" include current, voltage, conductor ampacity, overcurrent devices, and other components.
Panel Meeting Action: Reject
Panel Statement: The intent of 701.6 addresses the "legally required standby system" and is not limited to devices and switches etc. The submitter has not provided adequate technical substantiation to support the proposed revision.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-151 Log #815 NEC-P13 **Final Action: Reject**
(701.7(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-213
Recommendation: Accept the proposal and revise text to read as follows:
(A) Transfer equipment shall be designed and installed to prevent the unintended transfer of normal and alternate sources of supply in any operation of the transfer equipment.
(B) Bypass Operation Switching. Approved means to bypass and isolate the transfer equipment shall be permitted. Where such bypass isolation switching is provided, approved means to prevent unintentiaonal parallel operation shall be provided.
Substantiation: Devices other than switches, e.g., circuit breakers may be used.
Panel Meeting Action: Reject
Panel Statement: The proposed revision does not add clarity or improve usability.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:
ODE, M.: Legally required standby power sources can be connected to the utility company power grid as interconnected electric power production sources in accordance with Article 705. The word "inadvertent" emphasizes that the power source must not be inadvertently connected in a parallel with the normal source, unless the system is designed as an interconnected electric power production source. Bypass switches are specifically listed as transfer switch accessories and are intended for use in conjunction with transfer switches but are not intended to modify the function or construction of the transfer switch itself. A circuit breaker is not listed as a transfer switch accessory. "Approved identified means" is unnecessary since 110.2 requires approval and 110.3(A) requires compliance with all of the suitability requirements for strength, durability, and similar conformity issues.

13-152 Log #805 NEC-P13 **Final Action: Reject**
(701.9(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-220
Recommendation: Accept the proposal.
Substantiation: The panel statement for Proposal 13-155 states that all sources other than legally required standby systems are "normal". Generator sets, batteries, separate sources for emergency systems are not "normal" sources which is usually applied to the lighting and power services. Individual dedicated services and generators for fire pumps are not "normal" sources. Location of other sources grounded at the location should be noted.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not clarify the current requirement. See the panel action and statement on Comment 13-153.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:
ODE, M.: There are legally required standby sources and other sources supplying the transfer switch are considered normal sources. Normal sources could include photovoltaic systems, utility supplied sources, or any other normal source of power that is not legally required. The suggested change in text is unnecessary.

13-153 Log #2677 NEC-P13 **Final Action: Accept in Principle**
(701.9(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 13-221
Recommendation: Accept the proposal.
Substantiation: The requirement is clearly stated, and the need for the clarification is compelling. The existing wording is being commonly read to require the sign at the point of connection of the grounding electrode conductor to the grounding electrode, because that is certainly a "grounding location" on the premises. The NFPA NEC Handbook explanation for this section uses the wording "requires a sign at the grounding location" to explain this requirement, which can be taken the same way. I happen to know that NFPA staff is aware of the intent and this is not literally an error, but it can be easily taken that way. The supportive comment in the voting came from someone who has to explain this to electricians, so her comments deserve special consideration.
Panel Meeting Action: Accept in Principle
Revise 701.9(B) to read:
Where removal of a grounding or bonding connection in normal power source equipment interrupts the grounding electrode conductor connection to the alternate power source(s) grounded conductor, a warning sign shall be installed at the normal power source equipment stating:
Warning: Shock Hazard Exists if Grounding Electrode Conductor or Bonding Jumper Connection in this Equipment is Removed while Alternate Source(s) is Energized.
Panel Statement: The panel recognizes the need to clarify the requirement of this section and to also provide prescriptive wording on what the sign should convey.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-154 Log #804 NEC-P13 **Final Action: Reject**
(701.11(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-225
Recommendation: Accept the revised text as follows:
The legally required standby service shall be separated from all other services to minimize simultaneous interruption of supply...
Substantiation: The proposed wording is sufficient to include inadvertent, simultaneous operation by personnel, accident, physical damage; locations cannot prevent interruption by fire or other occurrences whether or not in buildings or other structures, or outside. Interruptions can be minimized, but not prevented when due to utility power outage.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the recommended editorial changes. Section 701.11(E) covers the allowance for a connection ahead of the normal supply service disconnecting means where not located in the same cabinet, enclosure, or vertical switchboard section as the normal service disconnect. The existing text is clear that from this connection point the legally required standby source must be separated from the normal service disconnect. The recommended text would imply that the legally required standby service must be separated from the normal service which would prevent the connection allowed by this section.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-155 Log #1574 NEC-P13 **Final Action: Accept**
(701.17)

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 13-232
Recommendation: Continue to reject this proposal
Substantiation: This proposal should continue to be rejected because it jeopardizes life-safety. The reasons for utilizing ground-fault protection of equipment in certain applications are well documented. The damage than can result from a ground fault on such a system may render a substantial portion of the system inoperative, resulting in a lengthy outage potentially worse than that envisioned by the submitter, or worse yet start a life threatening fire. Further, restraint of the GFPE may increase the downstream arc flash hazard for maintenance workers.
The late J.R. Dunki-Jacobs, a recognized authority on ground-fault protection, stated in his book *Industrial Power System Grounding Design Handbook* (pages 186, 189) that, "If an arcing line-to ground fault is initiated in a solidly grounded system on one of three bare buses in a metal enclosure, the hot ionized gases that are developed by the fault can be expected to cause escalation to an arcing multi-phase fault within 1 or 2 cycles (0.0167 to 0.033 sec) of time." He went on to state, "Escalating arcing-ground faults have shown themselves to be extremely devastating…" and "Unquestionably then, engineering attention to their immediate suppression must be proactive and immediate, rather than reactive. Not only for reason of minimizing the released arc energy to maximize personnel safety, but also to avert arcing-fault escalation." The suggestion that an audible and visual signal device would be of any value is ludicrous.

System reliability and blackout prevention can be achieved by proper system design, equipment selection and coordination. The GFPE restraint called for in this proposal is unnecessary and a potential threat to life-safety.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-156 Log #1615 NEC-P13 **Final Action: Reject**
(701.17)

Submitter: Christopher G. Walker, Eaton Corp.
Comment on Proposal No: 13-229
Recommendation: (A) Alternate Power Source. The alternate source for legally required standby systems shall not be required to have ground-fault protection of equipment.

(B) Normal Power Source: For the normal source of legally required standby systems, where ground-fault protection has been provided for the operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load.

Such protection shall consist of overcurrent devices, current transformers, or other equivalent protective equipment that shall cause the feeder disconnecting devices to open.

The additional levels of ground-fault protection shall NOT be installed as follows:

1. On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground, but not more than 600 volts phase-to-phase.

2. On electrical systems where a non-orderly shutdown of power will introduce additional or increased hazards.

Substantiation: While the Panel's response was to point out that 700.26 permits the alternate source for Legally RequiredEmergency Systems to not have ground-fault protection of equipment with automatic disconnecting means, and that Legally Required Emergency Systems remain selectively coordinated for all fault conditions, it is evident that the intent of this Proposal was not clear originally. The intent of this Proposal relates only to the Normal source of Emergency Systems, and the proposal is focused on requiring an additional step of ground-fault protection in all next level feeder disconnecting means downstream toward the load, when connected to the Normal source. I have modified the wording to help clarify this important distinction.

Ground faults are typically believed to be the most common type of fault experienced in operating energized electrical systems, per ANSI/IEEE Std 242-1986 Buff book, Chapter 7. Professional design engineers tell of experiences with ballast or small motor failures that have caused main or feeder devices to open. Why is this so? In some instances, a ground fault condition existed that went undetected and precipitated the protective device to open. In other cases, ground fault protective devices were improperly set, or not set at all. In others yet, a selective coordination study may not have been done, or may have been done improperly.

The NEC has for many years required ground fault protection of equipment, but only at the service disconnect level (with noted special Exceptions), per 230.95. With a goal in mind of maximizing the reliability and up-time of electrical systems, and giving consideration that the most common types of faults are ground fault related, it becomes a reasonable approach that the requirements for ground fault protection of equipment are extended to all appropriate areas in the electrical system, beyond just the service level.

This proposal is, therefore, to require additional levels of ground fault protection of equipment below the service level on the normal source of an electrical system. This Proposal's language mirrors a similar requirement for ground fault protection of equipment that currently exists in NEC 708.52 for Critical Operations Power Systems (COPS). This Proposal, therefore, recommends enhancing the reliability of the electrical system by requiring ground fault protection of equipment in all appropriate levels of the system.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation to justify requiring an additional level of ground fault protection on the feeder downstream from the normal service main. The reason for an emergency system is to provide power within 10 seconds whenever the utility source or other source of power is lost.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:

ODE, M.: The Panel Statement was inadvertently cut and pasted from a comment dealing with emergency systems and should have been as follows: "The submitter has not provided any technical substantiation to justify requiring an additional level of ground fault protection on the feeder downstream from the normal service main. The reason for a legally required standby system is to provide power within 60 seconds whenever the normal source of power is lost."

13-157 Log #2231 NEC-P13 **Final Action: Reject**
(701.17)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association
Comment on Proposal No: 13-232
Recommendation: Modify the proposed text by adding a new second paragraph to read as follows:
Normal Source ground fault protection on the line side of a transfer switch supplying legally required standby systems shall be permitted to be restrained for ground faults on the loadside of the transfer switch, provided that audible and visual signal devices indicate whenever a ground fault relay has been restrained, and instructions on the course of action to be taken in the event of an indicated ground fault are located at or near the sensor location.
Substantiation: The designer may be required by 230.95 and 210.15 to use ground fault protection on the main or feeder on the normal side of a transfer switch feeding a legally required standby system. A ground fault relay sensor can be put at the transfer switch, which, when a ground fault occurs on the load side of the transfer switch, sends a signal to the normal ground fault relay to restrain the operation of the disconnecting means.

This additional text allows designers to be able to utilize ground fault protection for the normal source, and provide selective coordination for legally required standby devices and all overcurrent devices on their line side, without endangering any equipment protection on the normal source side of the transfer switch. This can best be accomplished by allowing the normal side ground fault protection to be restrained for ground faults on the load side of the transfer switch (on the legally required standby system side). While 701.17 permits ground fault protection to be totally omitted on the alternate source side of legally required standby systems, this comment simply allows the ground fault protection on the normal source side to be restrained for ground faults on the load side of the transfer switch for legally required standby systems.

13-158 Log #609 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-240
Recommendation: Revise text to read as follows:

701.18 Coordination. Legally required standby system(s) overcurrent protective devices shall be coordinated in accordance with 701.18(A) or (B):
(A) Coordination to 0.01 seconds. Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

(B) Engineering Supervision. For new and existing installations, where the legally required standby system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the extent practicable. The design shall be documented, stamped by the professional engineer and made available for review by the authority having jurisdiction.

Exception: Selective coordination shall not be required between two overcurrent devices located in series if no loads are connected in parallel with the downstream device.

FPN: Overcurrent protective devices used for legally required standby system circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system.
Substantiation: Panel 13 is urged to reevaluate their decision regarding selective coordination. Proposal 240 was accepted in principal, in part during the ROP, but was overturned in the final vote by less than 1/2, of the panel members.

The proposed rewording of Proposal 240 above, reflects the Panel discussions during the ROP that preferred positive code language vs. an additional exception. "Coordination to 0.01 seconds" was added to clarify that the instantaneous portion of the overcurrent time/current curve must also be considered when coordinating device,s. The title "Engineering Supervision" was added to reflect similar instances in the NEC, such as 240.86 and is used extensively in the National Electrical Code in no less than 20 other instances.

The panel also rejected the word "practicable" stating it "....is not defined and subjective." However, this same Panel defended the term "practicable" in Proposal 13-151 stating "'Where practicable' leaves the decision up to the authority having jurisdiction...." The word "practicable" appears in the National Electrical Code in no less than 70 other
instances.

Authors of Proposal 10-82, who also defend selective coordination as currently written, have, apparently recognized that a selectively coordinated system increases arc-flash energy, thus the proposal to require a means of reducing arc flash energy will be required in the proposed 240.87.

A system that is coordinated by an Engineer engaged in the business of designing these systems, understands the balance required between coordination, arc flash energy, safety and reliability. The idea that Engineers are opposed to coordinated power systems is incorrect. Engineers are opposed to the strict interpretation that system coordination takes precedence over all other issues within a power system design. The engineering community has been balancing coordination and safety in electrical distribution systems quite effectively for decades. There is little justification to defend the strict requirement for selective coordination.

In many situations, it is impossible to add to an existing distribution system and achieve full coordination without jeopardizing the existing system. The proposed language provides some relief to the strict interpretation, while maintaining a safe and reliable system.

The NEC seeks to provide a nationally recognized standard. Proposal 240, as originally written, is part of the 2008 Massachusetts Electrical Code. Relief to this strict requirement is being granted, in varying focus, in many other jurisdictions.

(701.18)

Submitter: James H. Costley, Jr., Newcomb & Boyd Consultants & Engineers
Comment on Proposal No: 13-233
Recommendation: Accept the proposal.
Substantiation: The submitter's substantiation is sound and correct. The blanket requirement for complete selectivity is impossible to design using available engineering tools for generic devices. Specific manufacturer's test data for uniquely specified equipment is required, and even then any one manufacturer's options are limited. The number of sequential overcurrent protection devices in any design must be minimized, reducing the segmentation and isolation capabilities of distribution systems, which also reduces operational safety and reliability that multiple switching levels affords. In order to provide selectivity, upstream devices must be intrinsically slower in operation, or be Paradoxically, since one of the reasons often quoted for selective coordination is safety in an accident, the arc flash energy for a given point in a system will increase in almost every system design because of the mandate to selectively coordinate every level of the overcurrent protection.

13-160 Log #1807 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-230
Recommendation: The panel action on this proposal should have been to accept the proposal in principle and revise the proposed text as follows:
Overcurrent devices shall be selected by a qualified person to optimize selective coordination between equipment protection, service continuity, and arc flash protection.
Substantiation: The recommended wording for the balance of the first two sometimes opposing criteria is taken from Chapter 15 of IEEE 242 (the Buff Book), the IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems. As stated in IEEE 242 on page 607 in Section 15.7.1, "complete selective coordination may not be achieved in all systems". The current language of 700.27, 701.18, and 708.54 does not allow the flexibility for a qualified person to make the compromise between these two criteria, which has been the common practice in selective protective device coordination for decades. Additional substantiation for this rewording of the proposal comes from NFPA 110 which says in Article 6.5.1 that "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs". The current language in these NEC Articles for 100% coordination has had the affect of inappropriately restricting the options available for a qualified person, and has led to the use of a limited set of options to achieve 100% coordination, giving a windfall advantage to a certain specific class of equipment. The recommended change would make the necessary adjustment in the language to allow more flexible coordination in accordance with the methodology recommended in IEEE 242. In addition, the addition of the wording "a qualified person" will incorporate the panel judgment from Proposal 13-203 which was to accept in principle in part, additional language to indicate the qualifications of persons performing the coordination.

(701.18)

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 13-240
Recommendation: Accept the proposal as submitted.
Substantiation: When CMP 13 removed the word "practicable" it gutted the proposal. The entire concept was that under the conditions specified in an exception, and it absolutely should be an exception, an alternate procedure could be followed. This procedure invoked the word "practicable", and because that involves considerable technical judgment, the requirement was for a professional engineer to be involved. In a sense we agree with the comment in the voting that the PE is excessive, but only because the panel continued to leave the requirement totally prescriptive. In the real world these applications cannot be made completely prescriptive, and the approach followed in Massachusetts comports with NFPA 110.

CMP 13 need not go very far to find one of the some 70 instances of the use of a "where practicable" provision. It appears in 700.7, in the very same article as this proposal addresses. As noted in the voting, CMP 13 not only knows about this provision, it declined to remove it in this very code cycle. After extensive conversations with all interests involved, it is increasingly clear to us that this proposal would go a very long way towards building a consensus around one of the most contentious code issues in recent memory. CMP 13 should take this opportunity to create that consensus.

13-162 Log #1575 NEC-P13 **Final Action: Reject**
(701.18, FPN)

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 13-238
Recommendation: Accept this proposal
Substantiation: A lack of coordination between standard overcurrent protective devices and ground fault protection for equipment (GFPE) may be one of the most frequent coordination errors made by engineers. A FPN would help in pointing out the need to consider coordination between these devices as well. While it is true that Article 701 does not require GFPE, it does not prohibit it either. Indeed, coordination may actually be enhanced by the use of GFPE at lower levels in the system and can improve life safety by preventing catastrophic equipment burn-downs, ignition of combustible materials and reduction in the arc flash hazard.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-141.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 15 Negative: 3
Explanation of Negative:
CARON, D.: See my response to Comment 13-135.
CZARNECKI, N.: NEMA disagrees with the panel action. The panel did not address the concerns presented by the proposal submitter as noted in the NEMA ROP ballot. Guidance in the methods and selection of devices to ensure selective coordination is critical to a selective system. The proposal would simply remind the designer to include ground fault protective devices in the device analysis.
DEGNAN, J.: See my reply to comment 13-140.

13-163 Log #1087 NEC-P13 **Final Action: Reject**
(701.18 Exception No. 2 and FPN (New))

Submitter: James H. Costley, Jr., Newcomb & Boyd Consultants & Engineers
Comment on Proposal No: 13-240
Recommendation: Support the TCC Action of "Reject" for the Proposal as AIPIP by the CMP 13.

I agree with the original submitter's proposal, but disagree with the CMP 13 amended version of the proposal.

Substantiation: The design and specification of electrical construction work is typically done by or under the supervision of a Professional Engineer, and sealed and signed when submitted for construction permit. Final provision of selectively coordinated overcurrent protection devices is accomplished by a Contractor in most cases, and is based on the specific testing and published certification by the manufacturer of those products in the absence of an industry standard testing procedure. The Engineer (and ultimately the owner) must rely on the manufacturer's certification of performance, and such certifications cannot be stamped or further certified by the Engineer when such product testing is outside of his or her supervision.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-135. The panel recognizes that this recommendation is confusing and affirms that this reject action also rejects Proposal 13-240 as amended by CMP 13.
Number Eligible to Vote: 18

Explanation of Negative:
CARON, D.: See my response to Comment 13-135.
DEGNAN, J.: See my reply to comment 13-140.

13-164 Log #1764 NEC-P13 **Final Action: Reject**
(701.18 Exception No. 2 and FPN (New))

Submitter: Thomas A. Domitrovich, Eaton Corp. / Rep. American Circuit Breaker Manufacturers Assoc.
Comment on Proposal No: 13-240
Recommendation: Accept the proposal as submitted.
Substantiation: The American Circuit Breaker Manufacturers Association (ACBMA), headquarters in Washington, D.C., is an association of American manufacturers of circuit breakers to represent and promote the mutual interests of American circuit breaker manufacturers in areas of codes and standards, applications, safety, and education. Members of the Association include Eaton Corporation, General Electric Company, Siemens Industry, Inc., and Square D/ Schneider Electric.

To address the panel's objection to the word "practicable" as not being defined and being subjective, we offer the fact that this word, the word Practicable, is used throughout many NFPA documents as follows:

NFPA 70 "National Electrical Code", 2008 edition: Practicable appears 71 times. The phrase "where practicable" is used 22 times in this same document.

NFPA 99 "Standard for Healthcare Facilities", 2005 Edition: Practicable appears 6 times. The phrase "extent practicable" is used once.

NFPA 110 "Standard for Emergency and Standby Power Systems", 2010 Edition: Practicable appears 3 times.

The panel, in other areas of the code, supports the use of the word "Practicable" as in 700.7. Also, this panel has demonstrated the acceptance of this word through supporting its use as part of Proposals 13-151, 13-60a, 13-63 and 13-214.

Accepting the original proposal provides the option to enable the licensed professional engineer to engineer a solution.
Panel Meeting Action: Reject

Explanation of Negative:
CARON, D.: See my response to Comment 13-135.
DEGNAN, J.: See my reply to comment 13-140.

13-165 Log #1913 NEC-P13 **Final Action: Reject**
(701.18 Exception No. 2 and FPN (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 13-240
Recommendation: Accept the proposal in principle, revising the exception as follows:

Exception No. 2: Where the legally required standby system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the ~~extent practicable~~ level required. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.
Substantiation: This proposal should be accepted in principle for a number of reasons:

1. The objective of the proposal has been completely missed and text has been inserted with an entirely different meaning.

2. Achieving selective coordination has been made even more difficult for no substantive reason. A PE license is not necessary to determine if two overcurrent protective device (OCPD) time-current curves cross or overlap one another, nor is a license required to determine if two OCPDs will coordinate by reading a manufacturer's coordination table. No longer will a contractor, for example, be able to call an OCPD manufacturer to find out what size upstream OCPD he needs to coordinate a small emergency power system. The manufacturer will not be able to answer the question unless they are a licensed PE in that state.

3. It is suggested that where a PE license is necessary is to optimize protection and coordination as recommended in the various IEEE *Color Books* that address the issue of coordination and as is allowed in NFPA 110, Phoenix, Wisconsin and Massachusetts,

4. The actions of the panel seem inconsistent. In the revised text of this proposal, only licensed professional engineers are allowed to design selectively coordinated emergency power systems, but unlicensed facility operators are allowed to defeat that coordination at will while live work is performed, a time when the likelihood of a power disrupting incident occurring is probably at its highest (see the panel statement on ROP 13-199 and the statements of other panels on ROPs 10-26 and 12-37).

5. The use of an incident energy reduction system (see ROP 13-199) requires engineering. A maintenance switch type system requires a second coordination study to determine if the system can still operate properly at the lower instantaneous trip setting. If it is acceptable for an engineer to coordinate the system to the level required under maintenance conditions, why is it not also permitted under normal operating conditions?

Finally, the panel should note that the text of this exception is similar to that in 240.86(A).
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-135. The phrase "level required" is not clear as to the desired result.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 2
Explanation of Negative:
CARON, D.: See my response to Comment 13-135.

CZARNECKI, N.: The comment should be accepted in principle and revised to be worded similarly to the panel ROP action.
Exception No.2: The selection of overcurrent protection devices, in order to achieve selective coordination, shall be permitted by a licensed professional engineer engaged primarily in the design and maintenance of electrical installations. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction." The NEMA ROP Ballot Comment - "The Panel should revisit this proposal and consider the merits of wording in an Exception versus a main rule."
Comment on Affirmative:
DEGNAN, J.: See my reply to comment 13-147.

ARTICLE 702 — OPTIONAL STANDBY SYSTEMS

13-166 Log #1868 NEC-P13 **Final Action: Accept**
(702)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 13-241
Recommendation: Accept the Proposal.
Substantiation: This proposal makes a lot of sense and should be accepted.

There does not seem to be any logical reason for not having parallel numbering, to the extent practicable, for Articles 700, 701 and 702. Other Code Panels have done so with other articles and the Code users enjoy the improved "User Friendliness."
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-167 Log #1259 NEC-P13 **Final Action: Reject**
(702.5)

Submitter: Chris Turner, Generac Power Systems
Comment on Proposal No: 13-247
Recommendation: 702.5 (B) System Capacity. ~~The calculations of load on the standby source shall be made in accordance with Article 220 or by another approved method.~~ An optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. The user of the optional standby system shall be permitted to select the load connected to the system.
~~**(1) Manual Transfer Equipment**. Where manual transfer equipment is used, an optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. The user of the optional standby system shall be permitted to select the load connected to the system.~~

~~**(2) Automatic Transfer Equipment**. Where automatic transfer equipment is used, an optional standby system shall comply with (2)(a) or (2)(b).~~
~~(a) Full Load. The standby source shall be capable of supplying the full load that is transferred by the automatic transfer equipment.~~
~~(b) Load Management. Where a system is employed that will automatically manage the connected load, the standby source shall have a capacity sufficient to supply the maximum load that will be connected by the load management system.~~
(1) Automatic Transfer Systems. Where automatic transfer equipment is used, it is recommended required that the optional standby system incorporate internal protective systems that monitor prevent against overload conditions. These systems shall either automatically manage the load or shutdown the system. Systems that do not incorporate overload protections prevention, must be sized per article 220.
Substantiation: The code panel rejection of this proposal refers to the safety provisions for Feeders and Branch circuits in Articles 210, 215 & 240. The rejection also suggests that in an automatic transfer of the building load to the generator there in an intentional overload of the generator and the feeder circuit.
In no way shape or form did we propose an intentional overload of the generator. Instead we provided data from utilities across the country showing the max power demand in typical residential homes is very low. This information was summarily dismissed by the panel and yet no data contradicting our claims was provided.
It should be taken into account that optional stand by generators are exactly that "STANDBY" they run and provide backup power in the event of a utility loss. This happens very infrequently and usually for short periods of time.
The NEC accepts the occasional and unintentional overload of a branch circuit because you cannot control the equipment a home owner may apply to a single branch circuit. The branch circuit is protected by a circuit breaker that when sufficiently overloaded will trip. The consequence of that will be for the user to reset the breaker. If no load had been removed the breaker will likely trip again. This is the indication the user needs to remove some load from the circuit in order for the breaker to stay reset.
In the unlikely and unintentional event that an optional stand by generator becomes overloaded the circuit breaker will trip or the overload prevention systems will shut the unit down. As with the branch circuit the user can reset the breaker or restart the unit but if no load has been removed the same result will occur. Again this is the indication to the user to manage the load such that the generator is no longer overloaded.
If the home owner is not home at the time of the power outage the connected load to the generator will be minimal at best. In the unintentional event that the home owner left all possible connected loads on the circuit breaker on the generator will trip or the overload prevention systems will shut the unit down eliminating any overload situation.
In both instances there is no inherent risk of electrocution or fire hazard created by this occasional and unintentional event.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the recommendation based on the lack of substantiation and loss of clarity. The system capacity reference to Article 220 is valid regardless of the choice of manual, automatic, or automatic with load management transfer equipment. Nowhere in the NEC is it permissible to intentionally overload a feeder or a branch circuit.

Feeder circuits supplying panelboards and branch circuits supplying loads of all kinds must be calculated based on their anticipate usage based on Parts I and II of Article 220 (for branch circuits) and Parts I and III of Article 220 (for feeders) or the optional calculations based on Parts I and IV of Article 220. Section 90.3 requires compliance with Chapters 1 through 4 unless specifically modified by Chapter 7 (Article 702) in this case. Even if the existing first sentence was deleted as indicated in the recommendation, feeders and branch circuits must still comply with Article 220 as the proposal text is written.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-168 Log #803 NEC-P13 **Final Action: Reject**
(702.6)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-249
Recommendation: Accept the revised text as follows:

Transfer equipment shall be approved for the intended use and designed and installed so as to prevent unintentional interconnection of other sources of supply in any operation of the transfer equipment.
Substantiation: The proposed wording is sufficient to include inadvertent connection to other sources whether "normal" or emergency, fire pump systems, etc.
Panel Meeting Action: Reject
Panel Statement: The submitter has not addressed any of issues raised by the Panel in the panel statement in the proposal. Optional standby power sources can be connected to the utility company power grid as interconnected electric power production sources in accordance with Article 705. The word "inadvertent" emphasizes that the power source must not be inadvertently connected in a parallel with the normal source, unless the system is designed as an interconnected electric power production source. In addition, the submitter has introduced new material that has not had public review.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-169 Log #2678 NEC-P13 **Final Action: Accept in Principle**
(702.8(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 13-252
Recommendation: Accept the proposal.
Substantiation: The requirement is clearly stated, and the need for the clarification is compelling. The existing wording is being commonly read to require the sign at the point of connection of the grounding electrode conductor to the grounding electrode, because that is certainly a "grounding location" on the premises. The NFPA NEC Handbook explanation for this section uses the wording "requires a sign at the grounding location" to explain this requirement, which can be taken the same way. I happen to know that NFPA staff is aware of the intent and this is not literally an error, but it can be easily taken that way. The supportive comment in the voting came from someone who has to explain this to electricians, so her comments deserve special consideration.
Panel Meeting Action: Accept in Principle

Revise 702.8(B) to read:

Where removal of a grounding or bonding connection in normal power source equipment interrupts the grounding electrode conductor connection to the alternate power source(s) grounded conductor, a warning sign shall be installed at the normal power source equipment stating:

Warning: Shock Hazard Exists if Grounding Electrode Conductor or Bonding Jumper Connection in this Equipment is Removed while Alternate Source(s) is Energized.

Panel Statement: The panel recognizes the need to clarify the requirement of this section and to also provide prescriptive wording on what the sign should convey.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-170 Log #2254 NEC-P13 **Final Action: Reject**
(702.11)

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 13-257
Recommendation: 702.11 Outdoor Housed Generator Sets

(A) Permanently Installed and Portable Generators Greater Than 15KW. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure. The disconnecting means shall meet the requirements of 225.36.

(B) Portable Generators 15 KW or Less. Where a portable generator that is rated 15 KW or less is installed using a flanged inlet or other cord and plug type connection, a disconnecting means shall not be required where ungrounded conductors serve or pass through a building or structure.
Substantiation: When portable generators was added to the scope of Article 702, consideration should have been given to whether a small portable generator that was connected by means of a flanged inlet a flexible cord requires a disconnecting means at the building or other structure. As noted in the panel's substantiation for Proposal 13-257, "A suitable disconnecting device is always available with a portable generator—the act of shutting it down." These portable generators typically are installed without a disconnecting means where a flanged inlet and flexible cord is used as the connection means. Revising this section as recommended will bring the requirements in line with typical installation practices and the panel statement.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the concern that the existing text does not address permanently installed and portable generators regardless of the generator size. The allowance in 702.11 is based on the general requirement in 225.32 and applies regardless of the generator used. The definition of a disconnecting means in Article 100 would allow for a cord and plug disconnect where the device was evaluated for such use. A disconnecting means is required when the generator is not in sight whether it is permanent or portable.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-171 Log #2413 NEC-P13 **Final Action: Reject**
(702.11)

Submitter: Brian E. Rock, Hubbell Inc.
Comment on Proposal No: 13-257
Recommendation: Revise Panel Statement on Proposal P13-257 to read:
A suitable disconnecting device is always available with a portable generator – the act of shutting it down. When the prime mover rolls to a stop, it is "off" more reliably than can be done with any other form of disconnect. Many plug and receptacle combinations are listed with horsepower ratings and are acceptable as disconnecting means for motors up to and including 60 amperes 3-phase at 120/208 volts. Pin and sleeve combination units are rated for much higher ampacities with at least one type that has an internal switch combination that switches the load off before the ~~twist-lock~~ locking-type cord cap can be removed. There are many different methods that can be utilized to disconnect the portable generator than the method suggested in the proposed recommendation.
Substantiation: "Twist-Lock" is a registered trademark (U.S. Patent & Trademark Office Nos. 565,872, 1,800,509, and 1,845,454) of Hubbell Incorporated for receptacles, attachment plugs, cable connectors, and inlets (motor attachment plug caps) of the locking-blade construction, and for enclosures employing similar. It shoyuld not be used as a generic adjective.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the comment because the recommendation does not concern new, revised or deleted text for the 2011 NEC. The panel understands the concern expressed in the submitter's recommendation and substantiation and will be cognizant about not using the cited term in future panel actions or statements.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-172 Log #1609 NEC-P13 **Final Action: Reject**
(702.11 and 702.12)

Submitter: Thomas A. Domitrovich, Eaton Corp.
Comment on Proposal No: 13-257
Recommendation: Accept this proposal
Substantiation: Based on the wording of the Panel Statement, it is evident that the intent of this proposal was not clear.
This proposal is not intended to address the generator, but rather the cabinet that is meant for portable generator connection. The portable generator may not be in close proximity to the connection cabinet where the danger resides. If a person at the cabinet cannot visibly see the generator to which it is connected, disconnecting the temporary cabinet connection under load can present a hazard.
This proposal acknowledges the fact that devices up to 60 Amps can be rated as disconnecting means.
The intent of this proposal was to add a level of protection for the installation of a cabinet for portable generator connections. Presently, these connection cabinets are being installed for the connection of portable generators up to 4000 amperes. These cabinets are being installed with cam-type connectors and others that are not load-break rates, and may not be within sight of the generator when the generator is connected. Moreover, these temporary connections have no safety interlocks to prevent access to the connection under load.
The intent of the proposal is to either require:
· Receptacles to be load break rated (product available as noted by the panel but not currently required to be used)
OR
· Require the connection cabinet to be interlocked with a disconnect to ensure that the disconnect is opened prior to accessing the receptacles. This would prevent someone from disconnecting the non load-break devices under load. This could be done with a mechanical or electrical interlock, or by installing devices available in the market from several manufacturers that accomplish the same function.
Since there is no present requirement to place these non load-break devices in an inaccessible environment, the current practice of simply making these connections accessible under load may result in injury or death.
The images I have provided will illustrate that the cabinets for connecting portable generators are typically found in public settings. Anyone has access to disconnect these connections as they are typically un-supervised and currently not required to be interlocked or rated as a disconnecting means.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement in rejecting Proposal 13-257. The submitter has not provided any technical documentation for the suggested changes or how the suggested text would be utilized. The substantiation submitted with the Comment alludes to connection cabinets without any explanation of the construction of a connection cabinet.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

ARTICLE 705 — INTERCONNECTED ELECTRIC POWER PRODUCTION SOURCES

4-124a Log #CC400 NEC-P04 **Final Action: Accept**
(705.2)

Submitter: Code-Making Panel 4,
Comment on Proposal No: 4-264
Recommendation: Include the following text in 705.2 Definitions.
Power Production Equipment. The generating source, and all distribution equipment associated with it, that generates electricity from a source other than a utility supplied service.
Substantiation: The term "Power Production Equipment" is used in 705.21. This is the only use of this term in the Code. This definition, if accepted, should be placed in Article 705 per NEC Style Manual 2.2.2.1 (In general, Article 100 shall contain definitions of terms that appear in two or more other articles of the NEC.).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-125 Log #1782 NEC-P04 **Final Action: Accept**
(705.6 (New))

TCC Action: The Technical Correlating Committee directs that the Informational Note be revised to read as follows:
"Informational Note: See Article 100 for the definition of "qualified person".
Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 4-266
Recommendation: Accept the proposal in principle and revise as follows:
705.6 System Installation. Installation of one or more electrical power production sources operating in parallel with a primary source(s) of electricity shall be installed only by qualified persons. ~~with documented training and experience in the installation of such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation.~~
Informational Note: The defined term qualified person indicates that knowledge related to construction and operation of equipment and installations is necessary along with a safety training to recognized and avoid hazards to persons and property.
Substantiation: There were several key points made by the submitter that members of CMP-4 agreed with as indicated in the ballot statements. In fact, the panel statement indicates that the "panel supports installations of these systems by qualified workers." The NEC is an installation Code and defines the term "qualified person" which is definitely necessary for these types of installations as indicated in the submitter's substantiation. This is specialized work and requires significant training and knowledge (including basic NEC knowledge). This comment attempts to preserve the points made by the submitter by retaining the concepts proposed while addressing the concerns of CMP-4 expressed in the panel statement. The NEC should require more specific qualifications for special equipment and systems requiring highly trained and knowledgeable workers and draw specific attention to it again within this article. Knowledge of the general requirements in the NEC (Chapters 1-4) is essential in addition to any specialty certification for installers of this type of equipment, yet in the field more of these installations are being performed by workers and firms without the minimum qualifications of an electrician. The evidence is mounting. These types of installations and systems qualify for the expertise of trained electrical workers and contractors that also obtain specialty certifications beyond the minimum requirements to satisfy the criteria of qualified persons as defined in Article 100. Including the requirement that only qualified workers perform and be responsible for such installations as an NEC requirement supports what is anticipated as a general provision in the Code anyway, while at the same time helps support local regulation of qualified persons and contractors whether or not the electrical worker and contractor licensing and qualifications is regulated at the state and local levels.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
BOWER, W.: I agree with the panel action to strike the language "with documented training and experience in the installation of such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation" as it was proposed for 705.6. That was an overzealous proposal to begin with, and would set a precedent that every section of the code dealing with installations has similar requirements for qualified installation personnel spelled out.
Note that this code is written to cover installations from a few watts to multi-megawatts. Per Article 90.1(C) stating "This code is not intended as a design specification or an instruction for untrained persons," implies trained (qualified) persons are doing the work. I can't imagine AHJ personnel running around every small utility interactive installation to be assured qualified persons are making every connection and running every inch of wire.

The proposed language for 705.6 is "**System Installation.** Installation of one or more electrical power production sources operating in parallel with a primary source(s) of electricity shall be installed only by qualified persons.

Informational Note: The defined term qualified person indicates that knowledge related to construction and operation of equipment and installations is necessary along with a safety training to recognized and avoid hazards to persons and property."

The addition of 705.6 as accepted by the panel may appear to improve the safety of installed utility interactive systems, and I agree safety is paramount, but this is a dangerous precedent. NOWHERE ELSE IN THE NEC IS THERE SUCH UNENFORCABLE LANGUAGE FOR INSTALLATION OF HARDWARE BY QUALIFIED PERSONNEL. NOT FOR THE INSTALLATION OF BATTERIES, EMERGENCY SYSTEMS, EQUIPMENT IN HAZARDOUS LOCATIONS, BULK STORAGE FACILITIES, X-RAY INSTALLATIONS, AMBULATORY CARE UNITS, FIREPUMPS, SERVICE PANELS, SERVICE CONDUCTORS, TRANSFORMERS, MOTOR GENERATORS, UNINTERRUPTIBLE POWER SUPPLIES, ELEVATORS, COORDINATION EQUIPMENT, COMMUNICATIONS EQUIPMENT AND MANY MORE.

Note: I recognize there are many instances in the code where equipment shall be accessible ONLY by qualified personnel or be serviced IN INDUSTRIAL SETTINGS OR THEATERS by qualified personnel, but nowhere is the installation of equipment or systems by qualified personnel CALLED OUT! **THIS PROPOSAL SHOULD BE REJECTED.** UTIILTY INTERACTIVE SYSTEM INSTALLATIONS ARE NO MORE COMPLEX THAN INSTALLATIONS SUCH AS ELEVATORS WITH REGENERATIVE BRAKING (ALSO INTERATIVE), UPS SYSTEMS TO BACK UP CRITICAL LOADS and in the future to interact with the Smart Grid, OR THE MANY OTHERS MENTIONED ABOVE.

The "Informational Note" proposed in the comment does not meet the requirements of the style manual for the NEC. This could have been a fine print note but no mandatory language should have been included. The "Informational Note" should not be allowed and the proposal/comment should be "REJECTED".

If this proposal is not rejected then ONLY QUALIFIED personnel should be called out for the installation of ALL electrical equipment. The current language in Article 705.4 already covers the requirement for hardware to be identified and listed for the application, and that does not need to change. Mechanisms to assure good workmanship and assuring hardware meets all the physical requirements of the code are already in place through licensing, permitting and inspections.

WILLS, R.: This language falls outside the scope of the NEC.

ZINNANTE, V.: While I agree that "qualified persons" should install these systems, I do not feel it is necessary to redefine the term "qualified person" as an informational note in this article. The definition is clearly defined in Article 100 and needs no further clarification.

Comment on Affirmative:

ROGERS, J.: The Panel should continue to accept this comment. The submitter has presented a very good and workable solution to referencing a requirement for "Qualified Persons" performing work on one or multiple power production sources and the interface to the serving utility if utilized. Each of these power production sources has their own unique installation criteria and associated hazards. When interfacing these systems with other systems and/or the serving utility the hazards increase and the requisite knowledge level must also increase. Some are viewing this as a restriction for those already performing these installations, it clearly is not, it is just a baseline statement that workers should be safe for their own good and for the good of the people whose property they are working on. This basic minimum level of competency goes to the very basic purpose of the NEC, the practical safeguarding of people and property. This basic premise starts with protecting the worker by making sure they are qualified to recognize and avoid any hazards they may encounter while performing their work. Having qualified persons perform these installations is the minimum assurance that the industry owes to the consumers who own the properties where these installations are being made.

4-126 Log #1727 NEC-P04 **Final Action: Reject**
(705.12(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 4-267
Recommendation: The PV Industry Forum requests that CMP 4 review the additional substantiation below and consider accepting the original proposal as written.
Substantiation: 705.12(A)(2) The service conductor connection shall comply with the requirements established for services in Article 230.
Section 230.2(A) and 230.82(6) allow the service entrance connection of parallel power production PV sources. There is no specific section of Art 230 that requires that these PV service entrance connections be treated a service entrance conductors. Section 240.21(D) points to the over current protection requirements of service entrances. This would seem to eliminate the common use of applying the load side "tap rules" of Art 240 to the service entrance tap, but frequently, does not in field installations. That connection is unprotected from high available fault currents from the utility, just as any service entrance conductor is, and should be treated accordingly as a service entrance conductor in all aspects—routing, overcurrent protection, cable type, etc. This proposal addresses that requirement.
705.12(A)(3) The Tap Rules of Section 240.21 shall not be applied.
The only part of Art 240 that deals with service entrance conductors is 240.21(D), which is a permissive requirement, suggesting that other parts of art 240 may be applied. This is not true and the specific prohibition should be in Section 705.12(A)(3) as proposed to highlight the danger of improperly using the tap rules on service entrance conductors.
705.12(A)(4) Where a main-lug-only main service panel is used, the sum of the ratings of all overcurrent devices in the panel connected to power production sources shall not exceed the rating of the service panel.
Panelboards usually have a defined supply side input and multiple load output circuits. A main-lug-only panelboard is assumed to have the supply connections made to the main lugs and Section 408.36 is written and interpreted with that assumption. Section 408.36 does not directly address the PV inverter connections where the normal load circuits may now be supply circuits. There is no other prohibition of this connection in either 480 or 705. This addition to the Code is required to prevent PV installations from potentially having overload main lug panels where these panelboads are used in electrical services with multiple main disconnects.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 4-267.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-127 Log #2679 NEC-P04 **Final Action: Reject**
(705.12(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-268
Recommendation: Accept the proposal.
Substantiation: The contents of (C) are indeed a list of items, all of which must be complied with. So should this fourth list item as proposed. It has the same safety function as 690.64 in the current code, particularly 690.64(B)(2) and (7). These rules are in the NEC because a second power source injecting current into a panel from a location other than the main creates the real possibility that the busbars will be overloaded. If this remains rejected, we are left with the anomalous condition that the typically low-power PV current injections will remain tightly controlled and limited by the 120% parameter, but a serious cogeneration facility producing in excess of 100 kW (the minimum size to access this subsection) will be free to inject that into any panel however the busbars are sized, and at any relative location on that bus. It is difficult to defend 705.12(D)(2) or 705.12(D)(7) when a power injection over 100 kW can proceed at any subpanel in the system with no limitations whatsoever.
Panel Meeting Action: Reject
Panel Statement: This section permits interconnection of power production systems at locations other than the service, where a high voltage service has been installed.

These systems are more likely to be engineered with short circuit studies and load flow studies being performed.

The panel reaffirms its action and statement on Proposal 4-268.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

ROGERS, J.: This comment should have been accepted. This is a very basic requirement that allows some review and enforcement criteria. To rest on the likelihood that these systems are performed under some undefined engineering supervision leaves the AHJ with no enforcement capabilities over these installations. I understand that many of these larger systems are installed with some type of cogeneration agreement with the serving utility and are installed under utility supervision, engineering supervision or both and that's fine. However, all this proposal does is to allow some set of installation criteria for installations that are not performed in this matter. The submitter is correct in his concerns and the Panel should accept the comment and referenced proposal. The issue of potential overheating of panelboard bussing needs to be addressed here as well by both manufacturers and testing agencies.

4-128 Log #1726 NEC-P04 **Final Action: Hold**
(705.12(D))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 4-269
Recommendation: The PV Industry Forum requests that CMP 4 revisit this proposal in its original form, consider the additional substantiation below, and accept it as submitted with a slight correction (with double underlines) in 705.12(D)(2) in the following section that is substantiated below. We have repeated the proposed language for Panel ease in reviewing the substantiations.
Substantiation: The PV Industry Forum offers the following additional substantiation: Please keep in mind that where Article 690 and another article conflicted, Article 690 took precedence (see Section 690.3). Aside from minor

changes in the *2008 NEC*, Section 690.64(B)(now 705.12(D)) has remained largely unchanged since 1984, the first year PV was in the code. The initial requirement was based on the principle submitted as 705.12(D)(2)(a) and the FPN below it. This is a solid, but overly restrictive requirement. If applied, it offers unrestricted protection for a busbar or conductor with any number and location of connected sources or loads. However, the requirement is not well understood by all PV installers, electricians, and electrical inspectors and these groups are sometimes mistakenly applying less restrictive interpretations to the requirements that have resulted in unsafe electrical systems.

For example, some systems are installed using the tap rules of Art 240, that were developed for load circuits with only one source (the utility), instead of applying the sum of the overcurrent devices required to the ampacity of the conductor. See definition of taps and that they apply only to load circuits in 240.2. Other systems are being installed and passing inspections in such a manner that loads could be added to panelboards that allow the internal busbar to be overloaded with no breakers tripping. The requirement needs revision for clarity (for example, read 705.12(D)(7) in the 2008 NEC) and safety.

705.12(S)(2) Bus or Conductor Ampere Rating. The continuous current output of the inverter(s) shall not exceed the ampere rating of the busbar or conductor to which they are connected. In systems where panelboards are connected in series, the ampere rating of the first overcurrent device connected directly to the inverter(s) shall be permitted to be used in the calculations for all busbars and conductors. The busbar or conductor shall be sized for the loads connected in accordance with Article 220. One of the methods in (a)-(e) shall be used to determine the ratings of busbars in panelboards or the ampacity of conductors:

705.12(D)(2). The addition of the permissive requirement in this sentence is to allow this requirement to be used optionally where panelboards are connected in series. In a new installation where PV ac combing panelboards (with no loads are connected), the downstream (toward the utility) overcurrent device actually provides better and lower overcurrent protection than an overcurrent device that would be calculated from the ratings of overcurrent devices connected directly to the inverter outputs. In either case, the calculations resulting from using or not using the ratings of the breakers connected directly to the inverters results in protected busbars and conductors.

Example:

A dwelling has a 200-amp main service panel with a 200-amp main breaker and there is an empty 2-pole breaker position at the bottom of the panel. The utility requires an external disconnect switch and it is desired to install a PV system that has a 3500-watt and a 4500-watt inverter. A PV ac panel will be used to combine the outputs of the two inverters and the output of that PV ac panel will be routed through the utility disconnect and then to a single backfed breaker in the main service panel.

The ratings of the output circuits of each inverter are:

3500/240 = 14.58 amps, 1.25 x 14.58 = 18.2 amps; use a 20-amp breaker and 12 AWG conductors.

4500/240 = 18.75 amps, 1.25 x 18.75 = 23.43 amps; use a 25-amp breaker and 10 AWG conductors.

The 20 and 25-amp breakers are mounted in the bottom of a PV main-lug only ac panel. Normally, no loads will be connected to this subpanel. It will be dedicated to the PV system.

The next step is to calculate the backfed breaker that must be placed in the main service panel to handle the combined output of both inverters from the PV ac subpanel and to protect the conductor carrying those combined outputs under fault conditions from high utility currents.

The combined currents from both inverters are: 14.58 + 18.75 = 33.33 and the overcurrent device (OCPD) should be 35 amps.

The ratings of OCPD ***supplying*** the conductor from the PV ac subpanel to the 35-amp breaker, the utility disconnect switch, and supplying that PV ac panel are now defined as 35, 20, and 25 amps.

The existing (as written) 705.12(D)(2) requires that the breakers connected directly to the inverter outputs (20 and 25 amps) be used in calculating the minimum size of the main panel. These total 45 amps, which exceeds the allowance of 40 amps (120% of the 200 amp panel rating =40 amps).

However, the proposed change to a permissive requirement for how the series panel connection requirements are calculated allows the 35-amp breaker to be used and this is less than 40 amps allowed by the 120% allowance.

The ac inverter panel rating and the ampacity of the conductor are controlled by 705.12(D)(2) and it would be incorrect to guess that the answer might be 35 amps as it would be a in a normal load subpanel.

35 + 20 + 25 <= 120% R where R is the panel rating or the ampacity of the conductors. 80 <= 1.2 R, R >= 80/1.2 = 66.67 amps.

The panel and conductor to the main panel must have at least this rating and this is an example of the restrictive nature of the first requirement in 705.12(D)(2)(a) that is addressed by the proposed 705.12(D)(2)(b).

705.12(D)(2)(a) The sum of the ampere ratings of the overcurrent devices supplying power to the busbar or conductor shall not exceed the ampacity of the busbar or conductor.

FPN: This general rule assumes no limitation in the number of the loads or sources applied to a busbar or their locations.

This is based on the original (1984) requirements and was the essence of D(2) in the 2008 NEC and no changes were proposed other than the addition of the FPN.

705.12(D)(2)(b) Where two sources are located at opposite ends of a conductor that contains no taps, the ampere rating of the largest overcurrent device supplying power to the conductor shall not exceed the rating of the conductor. Permanent warning labels shall be applied to conductor access points, and at 2.8m (10 ft) intervals along raceways, with the following or equivalent wording:

WARNING THIS EQUIPMENT FED BY MULTIPLE SOURCES DO NOT TAP CONDUCTOR.

If we apply the general requirement of (a) to a conductor with a source at each end protected by overcurrent devices, the ampacity of the conductor must be the sum of the two over current protective device (OCPD) ratings. See Figure 1 below. If the two OCPD were 50 amps connected to a PV inverter and 60 amps from the utility, the conductor would have to have an ampacity of 110 amps to comply with 705.12(D)(2)(a). It should be evident, that if the conductor has no other connected sources or load taps, the maximum current that can flow through it under fault conditions would be 60 amps, the higher of the two OCPD. This requirement modifies the more stringent requirement in 705.12(D)(2)(a) in a safe and understandable manner. It cannot be applied to a busbar in panelboards because numerous load/supply taps (breakers) are allowed.

705.12(D)(2)(c). Where two sources, one utility and the other an inverter, are located at opposite ends of a busbar or conductor that contains loads, the sum of the ampere ratings of the overcurrent protection supplying power to the busbar or conductor shall not exceed 120% the ampacity of the busbar or conductor. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:

WARNING INVERTER OUTPUT CONNECTION DO NOT RELOCATE THIS OVERCURRENT DEVICE

Exception: Panelboards with multiple ampacity buswork are not addressed by this provision.

This requirement (a combination of 705.12(D)(2) and 705.12(D)(7) for clarity) modifies 705.12(D)(2)(a) primarily for panelboard busbars, but can also be applied to conductors with taps. The total of load OCPD in a typical residential or commercial load center will normally be significantly larger than the rating of the busbar. The main breaker protects the busbar from over loads. This modification of (a) is based on the calculations and modifications done by CMP 5 for 690.64(B)/705.12(D) in the 2008 NEC. In Figure 2a below, the utility source breaker (100A) is located at one end of a panelboard and a PV source (50A) is located adjacent to it. There is no restriction on the number of load taps or the magnitude of the loads. If the loads were sufficient, the busbar at A (rated at 100A) could be carrying the sum of currents from both sources (150A) and no breaker would trip. The busbar would be overloaded.

In Figure 2b, the PV breaker is at the opposite end of the busbar from the main breaker. Since any one section of the bus bar or conductor can carry current from only one source or the other source, the two sources do not combine in any one section of the bus bar or conductor as they would if the two sources were side by side as shown in Figure 2a. CMP 5, using the diversity of residential and commercial loads, established that it was safe to allow the sum of the ratings of the two OCPD to not exceed 120% of the busbar or conductor ampacity. However, as shown on the left, if the two sources are not at opposite ends of the busbar or conductor, there is the possibility that the busbar at A can be overloaded if the loads exceed the rating of the busbar. In the case where the two sources cannot be placed at opposite ends of the busbar, then the requirement reverts back to the general requirement in (a).

The Exception indicates that multiple ampacity busworks are too complex to be handled with this simple provision.

705.12(D)(2)(d). The sum of the ampere ratings of all overcurrent devices on panelboards, both load and supply devices, excluding the main supply overcurrent device, shall not exceed the ampacity of the busbar. The ampere rating of the main supply overcurrent device shall not exceed the rating of the busbar. Permanent warning labels shall be applied to distribution equipment with the following or equivalent wording:

WARNING THIS EQUIPMENT FED BY MULTIPLE SOURCES
TOTAL RATING OF ALL OVERCURRENT DEVICES, EXCLUDINGMAIN SUPPLY OVERCURRENT DEVICE, SHALL NOT EXCEED AMPACITY OF BUSBAR.

This new requirement is based on the simple fact that as long as the sum of the ratings of all OCPD in panelboad, not counting the main breaker, do not exceed the rating of the busbar in the panelboard, then it is not possible to overload the panelboard. This requirement will be used to combine the ac outputs of several utility-interactive inverters in a single panelboard and not have the panelboard rated excessively high due to the general requirement. If we had a panelboard with six 50 amp breakers from utility-interactive inverters connected to the bus bar and a 300 amp main breaker, 705.12(D)(2)(a) would require the panelboard to be rated at 600 amps (6 x 50 + 300 = 600). If we assume no load breakers, the panel board busbar would be asked to handle no more than 300 amps and that 300 amps should be the rating. If the total of load and supply breakers (excluding the main breaker) does not exceed the panel busbar rating, then there is no positioning of load and PV breakers that can result in overloading

the panel. In all cases the main breaker would be rated no higher than the busbar rating. Another extreme example would be a 400-amp panel with a 400 amp main. 300 amps of load breakers are located near the bottom of the panel and this requirement would limit any installed source breaker to100 amps. Under full the full load of 300 amps, the busbar between the main breaker and the source breaker would see the 300 amps load current, well within its 400-amp rating. Note that this requirement would primarily apply to new panels used for combining the outputs of PV utility interactive inverters since existing panels are typically loaded (sum of the ratings of load breakers) above the bus bar rating.

705.12(D)**(3) Ground-Fault Protection.** The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, where, ~~provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals~~ those devices are identified and listed as suitable for backfeeding.

A recent (August 2009), unpublished study/survey by Salt River Project (SRP), a Phoenix, AZ area utility, was unable to identify any manufacturers of ground fault protection main circuit breakers (200A and up) that were willing or able to certify that the ground fault device attached to those circuit breakers was suitable and had been listed for back feeding. The breakers were not marked "Line and Load" and had been evaluated for current flow in both directions, but the action of the attached ground fault detectors is apparently uncertain. In utility-interactive PV applications, both the line and load terminals of a ground-fault breaker may be energized for a short period after the breaker has opened. The durability of the ground fault detector/device under these conditions does not seem to have been evaluated. UL has not responded to a query on this subject. As a minimum, the Code requirement, as written, to have these devices identified and listed for backfeed is necessary. Based on this uncertainty, Phoenix area utilities, both SRP and Arizona Public Service, are allowing only supply side connections (705.12(A)) to the service entrance where main ground fault breakers are involved.

The deleted text should be removed, because there is no clear understanding in the engineering community of how ground fault currents sourced from multiple supplies (utility and PV inverters) divide between the two sources and how the separate ground fault sensors will respond to that current division.

Examples and Figures for 4-269, 705.12(D)

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Hold

Panel Statement: The panel "Holds" this comment, and Proposal 4-269 remains Rejected, under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.

The panel notes that the Chair of Code-Making Panel 4 will appoint a Task Group to review the material, and take the appropriate actions, related to Comment 4-128 and Proposal 4-269 prior to the next code cycle.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BOWER, W.: It is extremely unfortunate that this comment to change the reject of the original proposal to accept with minor changes to clarify the existing code for connecting utility interactive inverters to the load side distribution equipment was put on hold. The panel was given a full detailed explanation of the changes proposed along with calculated maximum currents associated with each type of installation and should have at least attempted to better understand the material presented. The presenter was willing to answer questions about the presentation and the proposal/comment. PV systems are already being installed that are basically following the proposed changes. The proposal and comment should be reconsidered for inclusion at least in Principle in Part for the 2011 NEC with a task group continuing work on all details of both the proposal and the comment followed by suggestions to the voting panel.

The PV industry and commercial installations are growing at an exponential rate in the United States and today one single manufacturer has a giga-watt per year manufacturing capacity. With PV installation growth rates continuing to increase, with imports (sometimes substandard even with listings) from China and other aggressive exporters, the cumulative PV installation power ratings (by the time the next code is published (2014)) will likely number in the hundreds of giga-watts and this part of the code will provide totally inadequate interconnect requirements for the many of those installations.

Given that a task group will still LIKELY be appointed to study the proposal and comment, it is suggested that the task group include experts from outside the panel along with members of the PV and distributed generation industry.

WILLS, R.: While a technically complex subject, the suggestions of the working group at the ROC meeting should have been accepted. This is an important area for the interconnection of all forms of renewable energy. Open issues should not remain till the next code cycle.

Comment on Affirmative:

ROGERS, J.: The Panel made the correct decision in holding this comment and associated proposal the submitter and the presenter at the ROC meeting are correct in their concerns relative to clarifying these connection methods where power production systems interface with the premises electric supply system. During these discussions other concerns arose that could not be addressed due to the fact that they did not have any public review. These issues need to be addressed as these systems are being installed utilizing inventive techniques that are not adequately covered by the NEC. The Panel Chair has already committed to forming a task group to look at these issues and come back to the 2011 NEC cycle with a new proposal that addresses the additional concerns.

4-129 Log #2120 NEC-P04 **Final Action: Reject**
(705.12(D))

Submitter: Michael A. Anthony, University of Michigan
Comment on Proposal No: 4-269
Recommendation: Accept in Part. Retain the simplification of ground fault protection (the strikethrough) as suggested by the submitter. For the convenience of the Committee here is the part to retain:

(3) Ground-Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, where, ~~provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals~~ those devices are identified and listed as suitable for backfeeding.

Substantiation: This looks like the committee is throwing the baby out with the bath water. For the convenience of the Committee, the submitter's substantiation is reproduced below:

(3) The ground-fault requirement is modified to address the unique characteristics of utility-interactive inverters where the tripping of a ground fault protected main breaker will turn off, not only the connected loads, but also the load-side connected utility-interactive inverter. This automatically provides protection from ground-fault currents from all sources

The submitter has provided adequate substantiation in my view.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 4-128.

The panel notes that the revision shown in Proposal 4-269 is also shown in Comment 4-128 that was "held".

4-131 Log #801 NEC-P04 **Final Action: Hold**
(705.22)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-272
Recommendation: Accept the proposal with the following revisions:

The disconnecting means for ungrounded conductors shall be a manually or power operable switch(es) or circuit breaker(s) in accordance with the following:

(1) Readily accessible.
(2) Externally manually operable.
(3) Plainly marked with an open (off) and closed (on) position.
(4) Rated not less than the load and the available fault current at its terminals.
(5) If backfed, plainly and durably marked to indicate such connection.

FPN No.1 to (5): No change

FPN No. 2 to (4): No change

(6) Simultaneous disconnection of all ungrounded conductor of the circuit it controls.

(7) Having approved permanent integral means for locking in the open (off) position.

Substantiation: Externally manually operable should apply whether or not there is a power failure. "Backfed" is more specific than "both sides" (usual connections are at top and bottom not sides).

Panel Meeting Action: Hold

Panel Statement: The comment introduces new material that has not had public review.

The panel notes that Proposal 4-272 remains Accepted.

4-133 Log #2223 NEC-P04 **Final Action: Accept**
(705.95)

Submitter: Robert H. Wills, Intergrid, LLC / Rep. American Wind Energy Association
Comment on Proposal No: 4-242
Recommendation: Move text from 690.62 and 694.62 to 705.95 as follows:
705.95 Ampacity of Neutral Conductor. The ampacity of the neutral conductors shall comply with either (A) or (B).
(A) If a singlephase, 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.
(B) A conductor used solely for instrumentation, voltage detection, or phase detection and connected to a single-phase or 3-phase utility-interactive inverter, shall be permitted to be sized at less than the ampacity of the other current-carrying conductors and shall be sized equal to or larger than the equipment grounding conductor.
Delete text of 690.62 entirely.
Delete text of 694.62 entirely.
Substantiation: The first paragraph (A) in 690.62 and 694.62 is also stated in 705.95.
The second paragraph (B) is common to 690.62 and 694.62. It belongs in 705.95.
Both 690.62 and 694.62 (694.64 in re-numbered version) can then be deleted entirely as 690.61 and 694.61 (the section before) state that compliance with Article 705 is required.
Panel Meeting Action: Accept
Panel Statement: The panel understands that the titles as shown in the 2011 Draft will be retained.
The panel notes that the deletion of 694.62 is 694.64 in the renumbered version accepted by the panel action taken on Comment 4-121.

ARTICLE 708 — CRITICAL OPERATIONS POWER SYSTEMS (COPS)

13-173 Log #646 NEC-P13 **Final Action: Reject**
(708.2)

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.
Comment on Proposal No: 13-263
Recommendation: A gradient scale of "how critical" a critical facility is has been used very successfully in the data center industry for almost 20 years now (the Tier Classifications presented by the Uptime Institute). It proves a platform for both the end user and designers to work from and provides general guidelines that have been agreed upon. In this case, it would help the "municipal, state, federal, or other codes by any government agency" systemically determine not only which buildings they considered "critical," but also would give each a ranking so the most critical received the most resources.
Substantiation: Unlike the rest of the NEC, the text of Article 708 is too general for the engineer doing the design, the electrician performing the installation, or the AHJ to know whether the sections are being complied with or not. Article 310 does not say "ensure no conductors are overloaded," it specifies exactly how much load is acceptable for each type of conductor and each type of installation. I have spent many years now doing testing and maintenance, risk assessments, and commissioning of various types of facilities, both critical and non-critical. I have also spent many years working on the IEEE Color books on those subjects. What I proposed is in alignment with both what the data center industry already uses and what the IEEE Color Books for those areas would recommend.
Panel Meeting Action: Reject
Panel Statement: The comment does not comply with Section 4.4.5(c) of the NFPA Regulations Governing Committee Projects because the submitter has not provided a recommendation containing proposed text.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-174 Log #647 NEC-P13 **Final Action: Reject**
(708.4(A))

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.
Comment on Proposal No: 13-268
Recommendation: "Risk Assessment" means many different things to many different people. Annex F was inserted in the 2008 edition to provide some guidance as to what probabilistic risk assessment is, but as an Annex is unenforceable. With the current text in Article 708, a single sheet of paper documenting a cursory observation of the obvious complies with the requirements of 708.4.
Substantiation: Unlike the rest of the NEC, the text of Article 708 is too general for the engineer doing the design, the electrician performing the installation or the AHJ to know whether the sections are being complied with or not. Article 310 does not say "ensure no conductors are overloaded," it specifies exactly how much load is acceptable for each type of conductor and each type of installation. The information in the existing Annex F came from some of the same people who are part of the IEEE Power System Reliability Working Group which developed and revised IEEE Standard 493-2007, Recommended Practice for the Design of Reliable Industrial and Commercial Power Systems. I was the Chair for the "7X24 Continuous Power Facilities" chapter of IEEE 493-2007 and have been doing risk assessments for critical facilities for years now.
Panel Meeting Action: Reject
Panel Statement: The comment does not comply with Section 4.4.5(c) of the NFPA Regulations Governing Committee Projects because the submitter has not provided a recommendation containing proposed text.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-175 Log #1954 NEC-P13 **Final Action: Reject**
(708.4(A) and Annex F)

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facilities Professionals
Comment on Proposal No: 13-268
Recommendation: Accept in Principle. Use the core text of proposals 13-263, 13-268, 13-269 and 13-291 for a **new Section III of Annex F.** The text of the following have been taken from the submitter's original proposals
III. Risk Assessment and Commissioning based on the criticality of the facility. For critical operations power systems, risk assessment should be performed to identify hazards, the likelihood of their occurrence, and the vulnerability of the electrical system to those hazards. The thoroughness of the risk assessment should be appropriate to the level of criticality of the facility. One method, though not the only method for determining the criticality of the COPS to the protection of life and property is to group them into categories as follows:
(1) Definitions
Category I – Systems that have been designated to remain operational for emergency services to function. These facilities are required to remain operational during the event or be immediately restorable after the event. "Immediately restorable" is to means no significant repair required, just manual switching or similar operational procedures are required to restore the system to operation.
Category II – Systems that have been designated to significantly contribute to the delivery of emergency services or are essential for disaster recovery. These facilities are required to be restorable to operation within 4 hours after the event. Therefore any repair required to get the system back into service would have to be able to be accomplished by on-site personnel with on-site parts and equipment.
Category III – Systems that have significant impact on the protection of life and property, but are not immediately essential for providing emergency services. Category III systems are typically restorable to operation within 24 hours after the event. Repairs may require the assistance of off-site parts and service personnel.
Category IV – Critical systems that have significant impact on the protection of life and property, but are not immediately essential, as there are multiple facilities providing the same function. Category IV systems are typically restorable to operation within 24 hours of the time utility power, water and sewage disposal are available to the facility.
(2) Risk Assessments
(a) Category I risk assessment should include probabilistic modeling, such as fault tree or reliability block diagram (RBD) for the electrical power to the Category I systems to verify an availability of 0.9999 and a mean time to repair of less than 1.0 hours. The probabilistic modeling should also include naturally occurring hazards, such as earthquakes, floods, hurricanes and snow/ice storms

to the extent that weather data is available. For hazards listed in 708.4 (B) for which there is no data available, such as human-caused events, the risk assessment should include a systematic method analysis, such as a fault tree. The analysis should include what types of human-caused events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring.

(b) Category II risk assessment should include probabilistic modeling, such as fault tree or reliability block diagram (RBD) for the electrical power to the Category I systems to verify an availability of 0.9995 and a mean time to repair of 4.0 hours or less. The probabilistic modeling should also include naturally occurring hazards, such as earthquakes, floods, hurricanes and snow/ice storms to the extent that weather data is available. For hazards listed in 708.4 (B) for which there is no data available, such as human-caused events, the risk assessment should include a systematic method analysis, such as a fault tree. The analysis should include what types of human-caused events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring.

(c) Category III risk assessment should include probabilistic modeling, such as fault tree or reliability block diagram (RBD) for the electrical power to the Category I systems to verify an availability of 0.9973 and a mean time to repair of 24.0 hours or less. For hazards listed in 708.4 (B) the analysis should include what types of events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring.

(d) Category IV risk assessment should include what types of events are most likely to cause the COPS to be taken out of service with a mitigation strategy to minimize the probability of it occurring. Probabilistic modeling is not required.

(3) Commissioning

(a) Category I shall include the performance and documentation of electrical acceptance testing of the components in the critical electrical distribution system, startup and functional testing of the major subsystems such as generators, automatic transfer switches, UPS systems and the mechanical equipment for the cooling system of the critical load. An Integrated Systems Test shall also be performed in which load banks are connected to the critical distribution panels and the operation of the electrical and mechanical systems are verified under critical electrical design load conditions.

(b) Category II shall include the performance and documentation of electrical acceptance testing of the components in the critical electrical distribution system, startup and functional testing of the major subsystems such as generators, automatic transfer switches, UPS systems and the mechanical equipment for the cooling system of the critical load.

(c) Category III shall include the performance and documentation of startup and functional testing of the major subsystems such as generators, automatic transfer switches, UPS systems and the mechanical equipment for the cooling system of the critical load.

(d) Category IV shall include the performance and documentation of startup and functional testing of the major components in the critical electrical distribution system and the mechanical equipment for the cooling system of the critical load.

Substantiation: To make Article 708 a more effective tool, we need broaden the vocabulary and provide technical direction for the agencies who are responsible for its implementation.

The classifying governmental agency having jurisdiction would benefit from a gradient level of criticality for the facilities that has specific operation guidelines. It provides the framework by which the jurisdiction can evaluate the criticality of all of their facilities relative to each other and thus provides a means to ensure the most critical systems are recognized as such and have the resources allocated to them so that they are available when needed to deliver emergency services and provide for disaster recovery. Without a gradient scale, fewer resources would be available to the most critical systems because all of the critical facilities would require the same amount of resources.

The requirement for the various types of critical systems needs to align with the importance of the system to the protection of life and property. A set of specific operational requirements for the various levels of criticality is needed to provide design criteria and for consistent application. A gradient level of risk assessment with probabilistic modeling provides a quantitative method to ensure the most critical systems have been designed sufficiently robust so that they are available when needed to deliver emergency services and provide for disaster recovery.

Panel Meeting Action: Reject

Panel Statement: Nothing in the recommendation or the substantiation of the comment provided a technical reason to expand existing Annex F with the information from Proposals 13-263, 13-268, 13-269, and 13-291.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-176 Log #800 NEC-P13 **Final Action: Reject**
(708.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-270
Recommendation: Revise the panel action to read as follows:

On premises where COPS are present with other types of power systems described in other sections of this article, the covers and plates for the receptacles or the receptacles themselves shall be of a color different from other system receptacle covers or plates or receptacles or be permanently marked to clearly distinguish them from other systems.

Exception: If the COPS supplies power to a DCOA system that is a stand alone structure, the color or marking shall not be required.

Substantiation: Receptacle covers for boxes should be included. Various distinctive colors can be used on other systems which would be confusing.

Panel Meeting Action: Reject

Panel Statement: There was no technical substantiation provided in the comment to support the recommended action.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-177 Log #1321 NEC-P13 **Final Action: Reject**
(708.10(C)(1)(1))

Submitter: Robert Konnik, RSCC
Comment on Proposal No: 13-271
Recommendation: Recommendation: This proposal should be accepted.
Substantiation: Article 300.4 "Protection Against Physical Damage" states "Where subject to physical damage, conductors shall be protected." Type MI conductors is covered in Table 310.13(A) so must also be protected from physical damage.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation that MC cable affords the proper amount of protection for conductors, such as the protection provided by the existing wiring methods in 708.10(C)(1)(1). Section 330.12(1) does not permit MC cable to be installed where subject to physical damage, therefore, inserting this wiring method into 708.10(C)(1) is inappropriate.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-178 Log #1064 NEC-P13 **Final Action: Reject**
(708.10(C)(1)(3)(d) (New))

Submitter: Stephen McCluer, APC by Schneider Electric
Comment on Proposal No: 13-272
Recommendation: Revise text to read as follows:

708.10(C)(1)(3)(d) Where provisions must be made for flexibility at equipment connection, one or more of the following shall also be permitted.

(a) Flexible metal fittings

(b) Flexible metal conduit with listed fittings

(c) Liquidtight flexible metal conduit with listed fittings

(d) Wiring methods in accordance with ~~Article 645~~ 645.5(D)(2) when wiring under a raised floor is for a critical operations data system ~~is~~ within the DCOA.

Substantiation: The comment addresses the panel's objection that the proposal did not follow NEC Style Manual guidance to make references to specific clauses rather than to an entire Article. This comment amends the original proposal to specify that when a critical operations data system is within a DCOA, then 645.5(D)(2) wiring methods shall apply to wiring under a raised floor.

Panel Meeting Action: Reject

Panel Statement: The wiring methods listed in 645.5(D)(2) includes many wiring methods that do not provide protection against physical damage equivalent to the wiring methods specified in 708.10(C)(1). No technical substantiation was provided to include these wiring methods in 708.10(C).

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-179 Log #1641 NEC-P13 **Final Action: Hold**
(708.10(C)(2))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Hold" as it introduces new material and is not in accordance with 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.

The concept of 4 inches of concrete equated to a 2 hour fire-rating has not had public review.

Submitter: Thomas Guida, TJG Services, Inc.
Comment on Proposal No: 13-273
Recommendation: Accept proposed 708.10(C)(2)(3) with the additional fine print as shown. Continue to accept the balance of the proposal.

(3) Be embedded in ~~not less than 50 mm (2 in.) of~~ concrete with a sufficient thickness to achieve a minimum 2 hour fire rating

FPN 1: A typical 2-hour construction is 100 mm (4 in.) thick concrete.

FPN 2: See section 19 of the NFPA Fire Protection Handbook 20th edition for minimum slab thickness for fire resistance ratings. This provides thickness for various types of concrete.

Substantiation: Although 2 inches of concrete served the industry well for a 1 hour fire rating, the requirement is now for a 2 hour fire rating. To satisfy the panels request for more prescriptive information on the thickness of the concrete, fine print note 1 has been added. The NEC currently has fine print notes that state typically 150 mm (6 inch) thickness of concrete is used for a 3-hour rating in section 450.42. This note was also added to 110.31A. Since 2 inches of concrete was previously used as acceptable for 1-hour, 100 mm (4 inches) was added in the fine print note for the requirement of 2-hours.

Additionally since concrete thickness may vary based on the type of concrete, fine print note 2 was added to provide information on this.

Panel Meeting Action: Accept in Principle

Revise existing 708.10(C)(2)(3) as follows:

Be ~~embedded~~ encased in a minimum of ~~not less than 50~~ 100 mm (~~24~~ in.) of concrete

Panel Statement: The panel action provides a prescriptive value for the thickness of concrete that allows for objective enforcement and has made editorial revisions for consistency with similar requirements in Articles 695 and 700.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 16 Negative: 2

Explanation of Negative:

ODE, M.: See my negative statement in Comment 13-102.

SPINA, M.: Although information was received with these comments this information was new material which has not had opportunity for adequate public review and comment.

13-180 Log #808 NEC-P13 **Final Action: Accept in Principle in Part (708.10(C)(3))**

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 13-275

Recommendation: Accept the proposal and revise text to read as follows:

Where COPS feeders are installed below the level of the 100 year flood plain, the conductor insulation shall be listed for use in wet locations and be installed in a wiring method identified as suitable for the location.

Substantiation: Conductor insulation, not the conductor is listed for wet locations. "identified for the use" covers wet locations, physical damage, direct burial encasement, and other factors.

Panel Meeting Action: Accept in Principle in Part

Revise 708.10(C)(3) to read: "(3) Floodplain Protection. Where COPS feeders are installed below the level of the 100-year floodplain, the insulated circuit conductors shall be listed for use in a wet location and be installed in a wiring method that is permitted for use in wet locations." Reject the remainder of the comment.

Panel Statement: The submitter is correct that the insulation is listed for wet locations and not the conductor. The requirements for the wiring method in a flood plane concentrate on flooding and potential water damage so changing the phrase "a wiring method that is permitted for use in a wet location" to one "suitable for the location" so expanding the coverage to other conditions is unnecessary and not substantiated.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-181 Log #13 NEC-P13 **Final Action: Accept in Principle (708.14(7))**

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Accept in Principle" to correlate with the action to "Accept" Proposal 13-277.

The Technical Correlating Committee further directs that the text in 708.14(7) be revised to read as follows:

"(7) All cables for fire alarm, security, and signaling systems shall be riser rated and shall be a listed 2-hour electrical circuit protective system. Riser emergency communications cable shall be Type CMR-CI or shall be a listed 2-hour electrical circuit protective system."

Submitter: Stanley Kaufman, CableSafe Inc.

Comment on Proposal No: 13-284

Recommendation: Accept this proposal.

Substantiation: The panel statement that riser communications cables can be found in chapter 7 is wrong. All communications cables are covered in Chapter 8.

In the intent is to cover signaling cables such as a CL2R, the text should be changed to "signaling and communications cables".

Panel Meeting Action: Accept

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

13-182 Log #2403 NEC-P13 **Final Action: Reject (708.52)**

Submitter: Vincent J. Saporita, Cooper Bussmann

Comment on Proposal No: 13-294

Recommendation: Accept the original proposal (deleting the entire existing 708.52) and replace with the following:

708.52 Ground Fault Protection of Equipment. The alternate source for critical operations power systems shall not be required to have ground-fault protection of equipment with automatic disconnecting means. Ground fault indication of the critical operations power systems source shall be provided for solidly grounded wye critical operations power systems of more than 150 volts to ground and circuit-protective devices rated 1000 amperes and more. The sensor for the ground fault signal devices shall be located at, or ahead of, the main system disconnecting means for the critical operations power system source, and the maximum setting of the signal devices shall be for a ground fault current of 1200 amperes. In instructions on the course of action to be taken in event of indicated ground fault shall be located at or near the sensor location.

Substantiation: The Panel Statement to Proposal 13-294 suggested this approach as better solution to the original 13-294 proposal. Because the loads on critical operation power systems are so vital, ground fault protection should be permitted, but not required. This corellates with 700.26 for emergency systems.

Keeping the power on is vitally important. This revised text provides the option of ground fault protection or ground fault indication on the alternate source. If ground fault protection is chosen, then 230.95 and 215.10 along with 708.54 provide the requirements for ground fault protection and selective coordination for all overcurrents, including ground faults. If only ground fault indication is chosen, then this text provides the requirements for indication and 708.54 provides the requirements for selective coordination, including ground faults.

Panel Meeting Action: Reject

Panel Statement: Ground faults are much more likely to occur than any other type of fault. With indication only, a true ground fault will propagate into a much larger fault and, potentially damage critical equipment. The recommendation removes the requirement for the two levels of ground fault protection on the all COPS power source(s) equipment which compromises the intended high integrity of the power supply to the COPS.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 17 Negative: 1

Explanation of Negative:

OLSON, G.: The committee should have accepted this in principal, and put the ground fault text from article 700.26 into article 708. section IV. I don't believe it is the intent of any of the requirements of the NEC to require ground fault protection for a generator set, or any other source of power. The intent of ground fault equipment is to detect a fault in a load circuit and disconnect it to prevent a larger, more damaging event from occurring. In very critical systems, this protection is required to be provided in selectively coordinated levels. Accepting in principal and making the change for the alternate source as is indicated by the comment would have been more appropriate.

13-183 Log #610 NEC-P13 **Final Action: Reject (708.54)**

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC

Comment on Proposal No: 13-302

Recommendation: Revise text to read as follows:

708.54 Coordination. Critical operations power system(s) overcurrent protective devices shall be coordinated in accordance with 708.54(A) or (B):

(A) Coordination to 0.01 seconds. Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

(B) Engineering Supervision. For new and existing installations, where the critical operations power system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the extent practicable. The design shall be documented, stamped by the professional engineer and made available for review by the authority having jurisdiction.

Exception: Selective coordination shall not be required between two overcurrent devices located in series if no loads are connected in parallel with the downstream device.

FPN: Overcurrent protective devices used for critical operations power system circuit protection, where coordinated to optimize selective operation of the circuit overcurrent protective devices when a short circuit or ground fault occurs, increase overall reliability of the system.

Substantiation: Panel 13 is urged to reevaluate their decision regarding selective coordination. Proposal 302 was accepted in principal, in pad during the ROP, but was overturned in the final vote by less than 1/2 of the panel members.

The proposed rewording of Proposal 302 above, reflects the Panel discussions during the ROP that preferred positive code language vs. an additional exception. "Coordination to 0.01 seconds" was added to clarify that the instantaneous portion of the overcurrent time/current curve must also be considered when coordinating devices. The title "Engineering Supervision" was added to reflect similar instances in the NEC, such as 240.86 and is used extensively in the National Electrical Code in no less than 20 other instances.

The panel also rejected the word "practicable" stating it "....is not defined and subjective." However, this same Panel defended the term "practicable" in Proposal 13-151 stating "'Where practicable' leaves the decision up to the authority having jurisdiction...." The word "practicable" appears in the National Electrical Code in no less than 70 other instances.

Authors of Proposal 10-82, who also defend selective coordination as currently written, have, apparently recognized that a selectively coordinated system increases arc-flash energy, thus the proposal to require a means of reducing arc flash energy will be required in the proposed 240.87.

A system that is coordinated by an Engineer engaged in the business of designing these systems, understands the balance required between coordination, arc flash energy, safety and reliability. The idea that Engineers are opposed to coordinated power systems is incorrect. Engineers are opposed to the strict interpretation that system coordination takes precedence over all other issues within a power system design. The engineering community has been balancing coordination and safety in electrical distribution systems quite effectively for decades. There is little justification to defend the strict requirement for selective coordination.

In many situations, it is impossible to add to an existing distribution system and achieve full coordination without jeopardizing the existing system. The proposed language provides some relief to the strict interpretation, while maintaining a safe and reliable system.

The NEC seeks to provide a nationally recognized standard. Proposal 302, as originally written, is part of the 2008 Massachusetts Electrical Code. Relief to this strict requirement is being granted, in varying forms, in many other jurisdictions.

Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-135.

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 13-295
Recommendation: The panel action on this proposal should have been to accept the proposal in principle and revise the proposed text as follows:

Overcurrent devices shall be selected by a qualified person to optimize selective coordination between equipment protection, service continuity, and arc flash protection.

Substantiation: The recommended wording for the balance of the first two sometimes opposing criteria is taken from Chapter 15 of IEEE 242 (the Buff Book), the IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems. As stated in IEEE 242 on page 607 in Section 15.7.1, "complete selective coordination may not be achieved in all systems". The current language of 700.27, 701.18, and 708.54 does not allow the flexibility for a qualified person to make the compromise between these two criteria, which has been the common practice in selective protective device coordination for decades. Additional substantiation for this rewording of the proposal comes from NFPA 110 which says in Article 6.5.1 that "The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs". The current language in these NEC Articles for 100% coordination has had the affect of inappropriately restricting the options available for a qualified person, and has led to the use of a limited set of options to achieve 100% coordination, giving a windfall advantage to a certain specific class of equipment. The recommended change would make the necessary adjustment in the language to allow more flexible coordination in accordance with the methodology recommended in IEEE 242. In addition, the addition of the wording "a qualified person" will incorporate the panel judgment from Proposal 13-203 which was to accept in principle in part, additional language to indicate the qualifications of persons performing the coordination.

(708.54 Exception and FPN (New))

Submitter: Thomas A. Domitrovich, Eaton Corp. / Rep. American Circuit Breaker Manufacturers Assoc.
Comment on Proposal No: 13-302
Recommendation: Accept the proposal as submitted.
Substantiation: The American Circuit Breaker Manufacturers Association (ACBMA), headquarters in Washington, D.C., is an association of American manufacturers of circuit breakers to represent and promote the mutual interests of American circuit breaker manufacturers in areas of codes and standards, applications, safety, and education. Members of the Association include Eaton Corporation, General Electric Company, Siemens Industry, Inc., and Square D/ Schneider Electric.

To address the panel's objection to the word "practicable" as not being defined and being subjective, we offer the fact that this word, the word Practicable, is used throughout many NFPA documents as follows:

NFPA 70 "National Electrical Code", 2008 edition: Practicable appears 71 times. The phrase "where practicable" is used 22 times in this same document.

NFPA 99 "Standard for Healthcare Facilities", 2005 Edition: Practicable appears 6 times. The phrase "extent practicable" is used once.

NFPA 110 "Standard for Emergency and Standby Power Systems", 2010 Edition: Practicable appears 3 times.

The panel, in other areas of the code, supports the use of the word "Practicable" as in 700.7. Also, this panel has demonstrated the acceptance of this word through supporting its use as part of Proposals 13-151, 13-60a, 13-63 and 13-214.

Accepting the original proposal provides the option to enable the licensed professional engineer to engineer a solution.

Panel Meeting Action: Reject

Explanation of Negative:
CARON, D.: See my response to Comment 13-135.

13-187 Log #1915 NEC-P13 **Final Action: Reject**
(708.54 Exception and FPN (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 13-240
Recommendation: Accept the proposal in principle, revising the exception as follows:

Exception No. 2: Where the legally required standby system design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the ~~extent practicable~~ level required. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.

Substantiation: This proposal should be accepted in principle for a number of reasons:

1. The objective of the proposal has been completely missed and text has been inserted with an entirely different meaning.

2. Achieving selective coordination has been made even more difficult for no substantive reason. A PE license is not necessary to determine if two overcurrent protective device (OCPD) time-current curves cross or overlap one another, nor is a license required to determine if two OCPDs will coordinate by reading a manufacturer's coordination table. No longer will a contractor, for example, be able to call an OCPD manufacturer to find out what size upstream OCPD he needs to coordinate a small emergency power system. The manufacturer will not be able to answer the question unless they are a licensed PE in that state.

3. It is suggested that where a PE license is necessary is to optimize protection and coordination as recommended in the various IEEE *Color Books* that address the issue of coordination and as is allowed in NFPA 110, Phoenix, Wisconsin and Massachusetts,

4. The actions of the panel seem inconsistent. In the revised text of this proposal, only licensed professional engineers are allowed to design selectively coordinated emergency power systems, but unlicensed facility operators are allowed to defeat that coordination at will while live work is performed, a time when the likelihood of a power disrupting incident occurring is probably at its highest (see the panel statement on ROP 13-199 and the statements of other panels on ROPs 10-26 and 12-37).

5. The use of an incident energy reduction system (see ROP 13-199) requires engineering. A maintenance switch type system requires a second coordination study to determine if the system can still operate properly at the lower instantaneous trip setting. If it is acceptable for an engineer to coordinate the system to the level required under maintenance conditions, why is it not also permitted under normal operating conditions?

Finally, the panel should note that the text of this exception is similar to that in 240.86(A).

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 13-135. The phrase "level required" is not clear as to the desired result.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 16 Negative: 2

Explanation of Negative:

CARON, D.: See my response to Comment 13-135.

CZARNECKI, N.: The comment should be accepted in principle and revised to be worded similarly to the panel ROP action.

Exception No.2: The selection of overcurrent protection devices, in order to achieve selective coordination, shall be permitted by a licensed professional engineer engaged primarily in the design and maintenance of electrical installations. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction." The NEMA ROP Ballot Comment - "The Panel should revisit this proposal and consider the merits of wording in an Exception versus a main rule."

13-188 Log #2691 NEC-P13 **Final Action: Reject**
(708.54 Exception and FPN)

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee

Comment on Proposal No: 13-302

Recommendation: Accept the proposal as submitted.

Substantiation: When CMP 13 removed the word "practicable" it gutted the proposal. The entire concept was that under the conditions specified in an exception, and it absolutely should be an exception, an alternate procedure could be followed. This procedure invoked the word "practicable", and because that involves considerable technical judgment, the requirement was for a professional engineer to be involved. In a sense we agree with the comment in the voting that the PE is excessive, but only because the panel continued to leave the requirement totally prescriptive. In the real world these applications cannot be made completely prescriptive, and the approach followed in Massachusetts comports with NFPA 110.

CMP 13 need not go very far to find one of the some 70 instances of the use of a "where practicable" provision. It appears in 700.7, in the very same family of article as this proposal addresses. As noted in the voting, CMP 13 not only knows about this provision, it declined to remove it in this very code cycle. After extensive conversations with all interests involved, it is increasingly clear to us that this proposal would go a very long way towards building a consensus around one of the most contentious code issues in recent memory. CMP 13 should take this opportunity to create that consensus.

Panel Meeting Action: Reject

ARTICLE 720 — CIRCUITS AND EQUIPMENT OPERATING AT LESS THAN 50 VOLTS

3-90 Log #1822 NEC-P03 **Final Action: Hold**
(720)

TCC Action: The Technical Correlating Committee directs that Code-Making Panel 3 will have primary jurisdiction over a new article dealing with this concept.

The Technical Correlating Committee directs the Chair of Code-Making Panel 3 to appoint a Task Group, including members from other applicable Code-Making Panels, to address this issue.

Submitter: John Lamprinakos, Worthington Armstrong Venture

Comment on Proposal No: 3-144

Recommendation: ***NO NEW, REVISED, OR DELETED TEXT—JUST SUBSTANTIATION FOR EXISTING PROPOSAL ***

Substantiation: The current code has specific requirements for power distribution at 30 volts or less for listed lighting devices and their associated listed components (ref. article 411), but there is no similar requirements for power distribution at 30 volts or less for listed non-lighting systems and their associated listed components, such as listed low voltage (30 volts or less) sensors, IT equipment. AV equipment, daylighting equipment, HVAC actuators, etc. Therefore the code is silent on the requirements for power distribution at 30 volts or less when non-lighting and lighting devices are connected in the same 30 volts or less power distribution system. Thus, the current code implies (although it does not specifically demand) that separate power distribution systems must be deployed in order to perform the identical task of low voltage power distribution at 30 volts or less. Due to equipment, wiring and overall system redundancy, this can be extremely wasteful from both an energy and economy standpoint.

In order to remedy this situation, I, John Lamprinakos, on behalf of the Worthington Armstrong Venture, a recognized provider of ceiling suspension systems and a registered member of the EMerge Alliance, do enthusiastically endorse the adoption of proposal 3-144 which calls for the optimization of Article 720 by including specific language as proposed in 3-144 to recognize and appropriately guide the installation of power distribution systems at 30 volts or less, such as those used in conjunction with alternative energy sources (e.g. photovoltaics, wind turbines, batteries, fuel cells, etc.) and that can provide safe and efficient power to a wide variety of listed low voltage devices which are increasingly being used in commercial buildings.

In response to growing industry demand, energy saving systems and system components that employ low voltage power distribution are currently being developed and deployed by members of the EMerge Alliance. This open, non-discriminatory, non-profit (501c6) alliance of leading companies in the commercial building industry was specifically established to promote the rapid adoption of safe low-voltage DC power distribution and use in commercial building interiors. The Alliance has recently published an open standard that integrates interior infrastructures, power, controls, and a wide variety of peripheral devices in a common platform. The first embodiment of an EMerge system is via Class 224VDC distribution through a suspended ceiling grid. This system is UL Listed (CCN = IFFA, IFFA2, IFFC, IFFC2) and has been installed at several locations in the U.S. (USGBC Headquarters, PNC Headquarters. Southern California Edison, Los Angeles Community College District, etc.)

In short we believe inclusion of the explicit language proposed in 3-144 would better describe industry safety requirements and better assure article 720's functional safety mission.

The current EMerge Alliance membership includes: 3am Systems, Ltd., Acuity Brands, Inc., APEX Consulting, Armstrong World Industries, AVP, BACnet, Turner Construction, Brinjac Engineering, CABA, Clean Technology Commercialization, Configura, lnc., Convia, lnc., Crestron Electronics. Inc., Delta Products Corp., Eden Park Illumination, Energy Solutions lntl, Inc., the EnergyPeak Alliance, the EnOcean Alliance. Finelite, lnc., PNC Financial Services Group, Inc., Green Plug, Inc., Herman Miller Corporation, Houston Advanced Research Center, JB Electrical Design, Darnell Group, Johnson Controls, Kanepi Innovations, University of California—California Institute for Energy and the Environment (ClEE), LA Community College District, Lighting Science Group. Lutron Electronics, MCV Technologies, Inc., Metropolitan Lifelong Learning Center LLC, Naomi Miller Lighting Design, Nextek Power Systems, Northwire, Inc,. OneSource Building Technologies, lnc., Osram Sylvania, Paladino and Company, Philips NY, Sensor Switch, Inc,. Southern California Edison, Steelcase lnc., Tyco Electronics, Watt Stopper/Legrand, Webcor Builders, Worthington Armstrong Venture, ZigBee Alliance, and Zumtobel.

Panel Meeting Action: Hold

Panel Statement: The panel concludes that the Proposal 3-144 and Comment 3-90 may have merit, but has held the proposal and comment for further study in accordance with 4.4.6.2.2(c) of NFPA Regulations Governing Committee Project because the proposal and comment would propose something that could not be properly handled within the time frame for processing the report. The proposed text does not comply with the style manual. The panel requests more detailed technical information in order to make a more informed decision. The panel requests that the technical correlating committee review the proposal and comment to consider whether Article 720 or another Article (new or existing) is more appropriate and possibly assign a technical correlating committee task group to prepare a proposal for next cycle.

Submitter: Sean Browne, Armstrong World Industries, Inc.

Comment on Proposal No: 3-144

Recommendation: No new, revised, or deleted text. This is just additional substantiation for existing proposal.

Substantiation: The current code has specific requirements for power distribution at 30 volts or less for listed lighting devices and their associated listed components (ref. article 411), but there is no similar requirements for power distribution at 30 volts or less for listed non-lighting systems and their associated listed components, such as listed low voltage (30 volts or less) sensors, IT equipment, AV equipment, daylighting equipment, HVAC actuators, etc. Therefore the code is silent on the requirements for power distribution at 30 volts or less when non-lighting and lighting devices are connected in the same 30 volts or less power distribution system. Thus the current code implies (although it does not specifically demand) that separate power distribution systems must be deployed in order to perform the identical task of low voltage power distribution at 30 volts or less. Due to equipment, wiring and overall system redundancy, this can be extremely wasteful from both an energy and economy standpoint.

In order to remedy this situation, proposal 3-144 calls for the optimization of Article 720 by including specific language to recognize and appropriately guide the installation of power distribution systems at 30 volts or less, such as those used in conjunction with alternative energy sources (e.g. photovoltaics, wind turbines, batteries, fuel cells, etc.) and a wide variety of listed low voltage devices which are increasingly being used in commercial buildings. In response to growing industry demand, energy saving systems and system components that employ low voltage power distribution are currently being developed and deployed by members of the EMerge Alliance. This open, non-discriminatory, non-profit (501c6) alliance of leading companies in the commercial building industry was specifically established to promote the rapid adoption of safe, low-voltage DC power distribution and use in commercial building interiors. The Alliance has recently published an open standard that integrates interior infrastructures, power, controls and a wide variety of peripheral devices in a common platform. The first embodiment of an EMerge system is via Class 2 24VDC distribution through a suspended ceiling grid. This system is UL Listed (CCN = IFFA, IFFA2, IFFC, IFFC2) and has been installed at several locations in the U.S. (USGBC Headquarters, PNC Headquarters, Southern California Edison, Los Angeles Community College District, etc.).

In short, we believe inclusion of the explicit language proposed in 3-144 would better describe industry safety requirements and better assure article 720's functional safety mission.

The current EMerge Alliance membership includes: 3am Systems, Ltd., Acuity Brands, Inc., APEX Consulting, Armstrong World Industries, AVP, BACnet, Turner Construction, Brinjac Engineering, CABA, Clean Technology Commercialization, Configura, Inc., Convia, Inc., Crestron Electronics, Inc., Delta Products Corp., Eden Park Illumination, Energy Solutions Intl, Inc., the EnergyPeak Alliance, the EnOcean Alliance, Finelite, Inc., PNC Financial Services Group, Inc., Green Plug, Inc., Herman Miller Corporation, Houston Advanced Research Center, JB Electrical Design, Darnell Group, Johnson Controls, Kanepi Innovations, University of California – California Institute for Energy and the Environment (CIEE), LA Community College District, Lighting Science Group, Lutron Electronics, MCV Technologies, Inc., Metropolitan Lifelong Learning Center LLC, Naomi Miller Lighting Design, Nextek Power Systems, Northwire, Inc., OneSource Building Technologies, Inc., Osram Sylvania, Paladino and Company, Philips NV, Sensor Switch, Inc., Southern California Edison, Steelcase Inc., Tyco Electronics, Watt Stopper/ Legrand, Webcor Builders, Worthington Armstrong Venture, ZigBee Alliance, and Zumtobel.

ARTICLE 725 — CLASS 1, CLASS 2, AND CLASS 3 REMOTE-CONTROL, SIGNALING, AND POWER-LIMITED CIRCUITS

3-96 Log #1625 NEC-P03 **Final Action: Reject**
(725 and 760)

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 3-196
Recommendation: Revise various sections of Article 725 to accommodate the UL scope change for cable routing assemblies as follows:

725.133 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, ~~and~~ Raceways, and Cable Routing Assemblies for Class 2 and Class 3 Circuits. Conductors and equipment for Class 2 and Class 3 circuits shall be installed in accordance with 725.136 through 725.143…..

725.139 Installation of Conductors of Different Circuits in the Same Cable, Enclosure, Cable Tray, ~~or~~ Raceway, or Cable Routing Assembly.

(A) Two or More Class 2 Circuits. Conductors of two or more Class 2 circuits shall be permitted within the same cable, enclosure, ~~or~~ raceway, or cable routing assembly.

(B) Two or More Class 3 Circuits. Conductors of two or more Class 3 circuits shall be permitted within the same cable, enclosure, ~~or~~ raceway, or cable routing assembly.

(C) Class 2 Circuits with Class 3 Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, ~~or~~ raceway, or cable routing assembly with conductors of Class 3 circuits, provided the insulation of the Class 2 circuit conductors in the cable, enclosure, ~~or~~ raceway, or cable routing assembly is at least that required for Class 3 circuits.

(D)…

(E) Class 2 or Class 3 Cables with Other Circuit Cables. Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure, cable tray, ~~or~~ raceway, or cable routing assembly with jacketed cables of any of the following:

(1) Power-limited fire alarm systems in compliance with Parts I and III of Article 760
(2) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770
(3) Communications circuits in compliance with Parts I and IV of Article 800
(4) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820
(5) Low-power, network-powered broadband communications in compliance with Parts I and IV of Article 830

(F) Class 2 or Class 3 Conductors or Cables and Audio System Circuits. Audio system circuits described in 640.9(C), and installed using Class 2 or Class 3 wiring methods in compliance with 725.133 and 725.154, shall not be permitted to be installed in the same cable, ~~or~~ raceway, or cable routing assembly with Class 2 or Class 3 conductors or cables……

725.154 Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in 725.154(A) through (H).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Type CL2P or CL3P cable shall be permitted to be installed in these raceways.

(B) Riser. Cables installed in risers shall be as described in any of (B)(1), (B)(2), or (B)(3):

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways, and ~~listed~~ plenum signaling raceways, and riser cable routing assemblies shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways or routing assemblies……

725.179 Listing and Marking of Class 2, Class 3, ~~and~~ Type PLTC Cables, Signaling Raceways, and Cable Routing Assemblies. Class 2, Class 3, and Type PLTC cables, ~~and nonmetallic~~ signaling raceways, and cable routing assemblies installed as wiring methods within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.179(A) through ~~(K)~~ (M) and shall be marked in accordance with 725.179 ~~(L)~~ (N).

(A)…
(B)…
(C)…
(D)…
(E)…(F)…
(G)…
(H)…(I)…(J)…(K)…..

725.179(L) Riser Cable Routing Assemblies. Riser cable routing assemblies shall be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
Informational Note: One method of defining resistance to the spread of fire is that cable routing assemblies pass the requirements in the test for flame propagation (riser) in *Subject 2024A, UL Outline of Investigation for Cable Routing Assemblies*.

725.179(M) General-Purpose Cable Routing Assemblies. General-purpose cable routing assemblies shall be listed as being resistant to the spread of fire.
Informational Note: FPN: One method of defining resistance to the spread of fire is that cable routing assemblies pass the requirements in the vertical tray-flame test (general use) in *Subject 2024A, UL Outline of Investigation for Cable Routing Assemblies*.

~~(L)~~ (N) Marking……

Revise various sections or Article 760 to accommodate the UL scope change for cable routing assemblies as follows:

760.133 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, ~~and~~ Raceways, and Cable Routing Assemblies for Power-Limited Circuits. Conductors and equipment for power-limited fire alarm circuits shall be installed in accordance with 760.136 through 760.143.

760.139 Installation of Conductors of Different PLFA Circuits, Class 2, Class 3, and Communications Circuits in the Same Cable, Enclosure, Cable Tray, ~~or~~ Raceway, or Cable Routing Assembly.

(A) Two or More PLFA Circuits. Cable and conductors of two or more power-limited fire alarm circuits, communications circuits, or Class 3 circuits shall be permitted within the same cable, enclosure, cable tray, ~~or~~ raceway, or cable routing assembly.

(B) Class 2 Circuits with PLFA Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, cable tray, ~~or~~ raceway, or cable routing assembly with conductors of power-limited fire alarm circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, ~~or~~ raceway, or cable routing assembly is at least that required by the power-limited fire alarm circuits.

(C) Low-Power Network-Powered Broadband Communications Cables and PLFA Cables. Low-power network-powered broadband communications circuits shall be permitted in the same enclosure, cable tray, ~~or~~ raceway, or cable routing assembly with PLFA cables.

(D) Audio System Circuits and PLFA Circuits. Audio system circuits described in 640.9(C) and installed using Class 2 or Class 3 wiring methods in compliance with 725.133 and 725.154 shall not be permitted to be installed in the same cable, cable tray, ~~or~~ raceway, or cable routing assembly with power-limited conductors or cables…….

760.154 Applications of Listed PLFA Cables. PLFA cables shall comply with the requirements described in either 760.154(A), (B), or (C) or where cable substitutions are made as shown in 760.154(D).

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(B) Riser. Cables installed in risers shall be as described in either (1), (2), or (3):

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.
(2) Other cables shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.
(3) Type FPL cable shall be permitted in one- and two family dwellings.
Informational Note: See 300.21 for firestop requirements for floor penetrations.

(C) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 760.154(A)or (B) shall be as described in either (C)(1), (C)(2), (C)(3), or (C)(4). Type FPL-CI cable shall be permitted to be installed as described in either (C)(1), (C)(2), (C)(3), or(C)(4) to provide a 2-hour circuit integrity rated cable.

(1) General. Type FPL shall be permitted.

(2) In Raceways and Cable Routing Assemblies. Cables shall be permitted to be installed in raceways and cable routing assemblies.

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayer and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

This comment provides correlation with the comments developed by the P3 and P16 Task Group.

UL has changed the title and has expanded the scope of Outline of Investigation Subject 2024A and its associated Guide Information Page (White Book, QBAA). The title of the UL Outline has been changed from "Optical Cable Routing Assemblies" to "Cable Routing Assemblies" and the title of the QBAA Guide Information Page has been changed from "Optical Fiber/ Communications Cable Routing Assemblies for Use in Telecommunications Installations" to "Cable Routing Assemblies." The scope has been broadened to include the application of cable routing assemblies with communications wires and Class 2, Class 3, power-limited fire alarm, and low-power network-powered broadband communications cables.

To incorporate the UL scope changes of cable routing assemblies into Article 725 of the NEC, the task group has revised Section 725.133 and 725.139 Installation requirements, 725.154 Applications, and 725.179 Listing requirements.

To incorporate the UL scope changes of cable routing assemblies into Article 760, the task group has revised similar sections with the exception of Section 725.179.

Since "Cable Routing Assemblies" was added to the title of Section 725.179, an editorial change was made to add "Signaling Raceways" as well to accurately reflect all wiring methods contained in 725.179. The "nonmetallic" term describing signaling raceways was removed from the section since signaling raceways are not manufactured in any other type beyond non-metallic and would lead the user of the code to think that metallic signaling raceways were available.

Panel Meeting Action: Reject

Panel Statement: The comments have broadened the scope of cable routing assembly with no indication of any changes of requirements for the product. No provisions have been included in the Code to address installation requirements/limitations for this product. It is recommended that this proposed change be referred to CMP 8 for informational purposes. In addition it is brought to the attention of the technical correlating committee that CMP 16 has accepted changes that will allow the use of cable routing assemblies for the installation of Class 2 & 3 circuits and power-limited fire alarm circuits. It is recommended that the technical correlating committee review the actions taken by CMP 16 for correlation.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 10 Negative: 5

Explanation of Negative:

AYER, L.: Panel 16 voted to accept cable routing assemblies and Panel 3 did not. While I can understand some of the reasons put forth by the panel, at the end of the day there needs to be communication by both Panel 3 and 16 of some sort to either accept or reject the cable routing assembly language.

EGESDAL, S.: It is important that Articles 725, 760, 770, 800, 820, and 830 correlate. The Panel 16 action on articles under their jurisdiction permits Class 2 and Class 3 cables and power-limited fire alarm cables to be installed in a cable routing assembly, while Article 725 and Article 760 do not. This comment should be accepted, or the Panel 16 action should be revised to exclude Class 2 and Class 3 cables from being installed in a cable routing assembly.

KAHN, S.: The panel should have accepted this Comment as submitted by the Joint Task Group. Since CMP-16 accepted a similar comment, the requirements for identical types of wiring differ for systems covered by Articles 770, 800, 820, and 830 differ from those for systems covered by Articles 725 and 760. It is important that the requirements of the NEC be consistent. The substantiation included with the Task Group comment is sound. I agree with the actions taken by Panel 16. CMP-3 should have accepted this comment as submitted by the Joint Task Group. It is important that the requirements of the NEC be consistent for similar installations.

SEPULVEDA, M.: We need to review these important Articles 725, 760, 770, 800, 820, & 830 to make sure that they correlate. There are differences in the way that Panel 16 actions on the articles under their jurisdiction permits, Class 2, Class 3 cables & power-limited fire alarm cables to be installed in a cable routing assembly. However Article 725 and Article 760 don't. This comment needs to be accepted, or the Panel 16 action should be revisited and revised to exclude Class 2 and Class 3 cables from being installed in a cable routing assembly.

A cable routing assembly is not a cable tray as defined. A cable routing assembly is for all intents and purposes a continuous linear cable strap or hanger, and is not a cable tray.

STENE, S.: This comment should have been accepted since the text for the Comment was developed by an NEC TCC Task Group with Panel 3 and 16 members.

The original proposal only dealt with the appropriate applications within Article 725 for Class 2 and Class 3 circuits, however, Proposal 3-196 also provided permission to install Class 2 and 3 cables with power-limited fire alarm cables within cable routing assemblies so the same application applies to 760.133, 760.139, and 760.154 so applying these same requirements in Article 760, based on agreement by the NEC Technical Correlating Committee, would not constitute new material.

As noted in the Comment substantiation, Underwriters Laboratories has changed the title from "Optical Cable Routing Assemblies" to "Cable Routing Assemblies"and expanded the scope of the Outline of Investigation Subject 2024A from "optical fiber/Communications cable routing assemblies for use in telecommunications facilities" to just "cable routing assemblies." Section 725.139(D)(1) permits Class 2 and Class 3 conductors to be installed in the same cable as communications conductors, in which case, the Class 2 and 3 circuits shall be classified as communications circuits and shall be installed in accordance with the requirements in Article 800. Where the Class 2 and 3 conductors are reclassified as communications conductors, the entire cable could already be installed in the cable routing assembly. There is absolutely no safety issue in permitting a cable routing assembly to provide support and protection for Class 2, Class 3, and power-limited fire alarm conductors, as well as communications conductors.

3-97 Log #1624 NEC-P03 **Final Action: Reject**
(725.2)

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 3-151
Recommendation: Accept Proposal 3-151 in Principle and revise the definition of a Cable Routing Assembly as follows:
Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support, route and protect high densities of wires and cables, typically communications wires and cables, optical fiber and data (Class 2 and Class 3) cables associated with information technology and communications equipment.
Substantiation: The panel should accept in principle Proposal 3-151 and add the new proposed definition of "cable routing assembly" to 725.2.

At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayer and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

This comment provides correlation with the comments developed by the P3 and P16 Task Group. The submitter of the proposal stated that these routing assemblies are used for data (class 2) cables. In recognition of the use of these routing assemblies beyond optical fiber and communications cables and the UL scope change (explained below), a revised definition is being resubmitted for inclusion in Article 725.

UL has changed the title and has expanded the scope of Outline of Investigation Subject 2024A and its associated Guide Information Page (White Book, QBAA). The title of the UL Outline has been changed from "Optical Cable Routing Assemblies" to "Cable Routing Assemblies" and the title of the QBAA Guide Information Page has been changed from "Optical Fiber/ Communications Cable Routing Assemblies for Use in Telecommunications Installations" to "Cable Routing Assemblies." The scope has been broadened to include the application of cable routing assemblies with communications wires and Class 2, Class 3, power-limited fire alarm, and low-power network-powered broadband communications cables.

Panel Meeting Action: Reject

Panel Statement: The proposed definition is not needed. See the committee action and statement of Comment 3-96.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 10 Negative: 5

Explanation of Negative:

AYER, L.: Panel 16 voted to accept the definition of cable routing assembly and Panel 3 did not. While I can understand some of the reasons put forth by the panel at the end of the day there needs to be communication by both Panel 3 and 16 of some sort to either accept or reject the definition.

EGESDAL, S.: See Explanation of negative vote on comment 3-98

KAHN, S.: See my Explanation of Negative Vote on Comment 3-96.

SEPULVEDA, M.: Please see the negative vote on comments 3-96, log 1625.

STENE, S.: See my negative statement in Comment 3-96.

3-98 Log #2013 NEC-P03 **Final Action: Reject**
(725.2)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-150
Recommendation: Accept Proposal 3-150.
Substantiation: Other documents, such as NFPA 13 use "concealed space." A "concealed space" has a different meaning than the NEC use of "concealed." The NEC uses the term "concealed space."

The definition of concealed space is in the NFPA Glossary. NFPA 96 is the controlling document, but any NFPA standard can use the definition.

Panel Meeting Action: Reject

Panel Statement: NEC Article 100 definition for "Concealed Space" first sentence addresses the submitter's concern, which is "Rendered inaccessible by the structure or finish of a building." ROP 3-150 is more, not less, restrictive. The comment does not provide any additional substantiation to address the panel's reason for rejecting the proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

STENE, S.: The title of NFPA 96 is the Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. The scope of the document states that it applies to minimum fire safety requirements for cooking

operations as follows:
1.1 Scope.
1.1.1* This standard shall provide the minimum fire safety requirements (preventative and operative) related to the design, installation, operation, inspection, and maintenance of all public and private cooking operations.
1.1.2 This standard shall apply to residential cooking equipment used for commercial cooking operations.
1.2 Purpose. The purpose of this standard shall be to reduce the potential fire hazard of cooking operations, irrespective of the type of cooking equipment used and whether used in public or private facilities.
The submitter has not provided any technical substantiation to link a cooking ventilation standard and its definitions to the requirements in Article 725 for remote control, power limited and signaling circuits. The submitter also points out that "non-concealed space" is used in 725.154(E)(3), however, the phrase is used to describe installations of CL2X cable as an exposed wiring method, rather than the concealed wiring method as defined in Article 100. Adding an additional definition for "concealed" would be confusing for the user of the NEC since there are many other places in the NEC, such as in 250.52(A)(1), Exception where the term "exposed" permits the grounding electrode conductor to be installed in a suspended ceiling with removable ceiling tiles. Based on the proposed definition, this grounding electrode conductor would be a violation since above a suspended ceiling would be considered to be a concealed space.

(725.2)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-151
Recommendation: Accept in Principle Proposal 3-151 changing the title to "Cable Routing Assembly" to correlate with the change made by Panel 16.
Substantiation: A cable routing is a linear product that holds cable, similar to the function of multiple J hooks, cable ties, or clamps. A cable routing assembly is listed, but not listed as a raceway.
Panel Meeting Action: Reject
Panel Statement: The change to the title is not needed. See the committee action and statement of Comment 3-96.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
STENE, S.: See my negative statement in Comment 3-96.

3-100 Log #18 NEC-P03 **Final Action: Accept**
(725.2 and 760.2)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 3-147
Recommendation: Continue to reject these proposals.
Substantiation: The current definitions abandoned cables are based on proposals and comments submitted for the 2002 and 2008 NEC. The table below shows the definitions of abandoned cables currently in the NEC and their genesis.

Genesis of Abandoned Cable Definitions

Article	Definition	Comment	Proposal
640	**Abandoned Audio Distribution Cable.** Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.	2002 NEC Comment 16-3 by Carson	2002 NEC Proposal 16-1a by CMP 16
645	**Abandoned Supply Circuits and Interconnecting Cables.** Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.		2008 NEC Proposal 12-106 by Trout
725	**Abandoned Class 2, Class 3, and PLTC Cable.** Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.	2002 NEC Comment 16-21 by Jensen	2002 NEC Proposal 16-32 by Jensen
760	**Abandoned Fire Alarm Cable.** Installed fire alarm cable that is not terminated at equipment **other than a connector** and not identified for future use with a tag.	2002 NEC Comment 16-131 by Jensen	2002 NEC Proposal 16-109 by Jensen
770	**Abandoned Optical Fiber Cable.** Installed optical fiber cable that is not terminated at equipment **other than a connector** and not identified for future use with a tag.	2002 NEC Comment 16-190 by Jensen	2002 NEC Proposal 16-154 by Jensen
800	**Abandoned Communications Cable.** Installed communications cable that is not terminated **at both ends at a connector or other equipment** and not identified for future use with a tag.	2002 NEC Comment 16-247 by Jensen	2002 NEC Proposal 16-189 by Jensen
820	**Abandoned Coaxial Cable.** Installed coaxial cable that is not terminated at equipment **other than a coaxial connector** and not identified for future use with a tag.	2002 NEC Comment 16-314 by Jensen	2002 NEC Proposal 16-273 by Jensen
830	**Abandoned Network-Powered Broadband Communications Cable.** Installed network-powered broadband communications cable that is not terminated at equipment **other than a connector** and not identified for future use with a tag.	2002 NEC Comment 16-370a by Kaufman	2002 NEC Proposal 16-364 by Hirschler

A single definition of "abandoned cable" is inappropriate to cover signaling, fire alarm, optical fiber, communications, CATV and network-powered broadband because each of these cable types has its own installation practices that must be accommodated in the definition of "abandoned cable" to avoid inappropriate and unnecessary removal.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

3-101 Log #1985 NEC-P03 **Final Action: Reject**
(725.3)

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 3-154
Recommendation: Proposal should be accepted.
Substantiation: 90.3 says that the rules in Chapters 1 through 4 apply to the Chapter 7 Articles except as amended by the Chapter 7 rules. If it is the panels intent to limit the application of the rules in Chapter 1 though 4 for Article 725 installations it must say so directly. Just putting a statement that says "Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through (G)." does not accomplish the objective. The first part of the rule should be worded like the second part that says "Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits." The code wording is not consistent and is not clear what the actual intent of the first part of the rule is.
Panel Meeting Action: Reject
Panel Statement: The proposed text would indicate that the rule in 90.3 does not apply which is incorrect.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: Acceptance of the suggested text would exclude compliance with any other part of the NEC. The intent of 725.3 is to bring attention to very specific sections of the NEC that are especially applicable but not to exclude other requirements.

3-102 Log #806 NEC-P03 **Final Action: Reject**
(725.3(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-156
Recommendation: Accept the proposal.
Substantiation: This provision provides that an AGA approved gas furnace with Class 2 thermostat control requires the control circuit to be classified as Class 1 if failure to operate introduces a fire hazard. If equipment such as a high-limit temperature control and the controlling thermostat fail to open and de-energize the gas valve, the temperature rise introduces a fire hazard which this provision then requires the (Note: This is where the submitter ended the text).
Panel Meeting Action: Reject
Panel Statement: The comment does not address the issues raised in the proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: Section 725.3(A) only applies to the number and size of conductors in a raceway (the fill requirements) and has nothing to do with thermostat control and fire hazard. The substantiation is more appropriate for application to 725.31 for safety control equipment.

3-103 Log #2016 NEC-P03 **Final Action: Reject**
(725.3(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-156
Recommendation: Accept Proposal 3-156.
Substantiation: The proposal is editorial and removes redundant text.
Panel Meeting Action: Reject
Panel Statement: The comment adds no new information to the actions taken by the committee on the proposal. The reference to 725.3 is necessary for the AHJ.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: Section 300.17, as referenced in 725.3(A), applies to Class 1, Class 2, and Class 3 conductors, and where installed Class 2 or Class 3 cables containing conductors, not just Class 1 as alluded to in the substantiation. Section 725.3 does not exempt compliance with any Chapter 3 wiring methods, including wire fill for raceways that may be used where installing Class 2 or 3 circuits.

3-103a Log #CC301 NEC-P03 **Final Action: Accept**
(725.3(C))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 3-151
Recommendation: Revise 725.3(C) Exception to read as follows:
Exception: As permitted in 725.154(A).
Substantiation: The revised exception provides correlation with 725.154(A), which permits plenum cable in ducts, plenums, and other spaces used for environmental air.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
STENE, S.: Since Proposal 3-151 is addressing a definition in 725.2, this Comment should be more appropriately applied to Proposal 3-157. The existing exception to 725.3(C) in the 2008 NEC reads as follows: "Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air in accordance with 725.154(A)." and limits the installation of plenum rated Class 2 and 3 cables, as well as listed plenum signaling raceways to just the other spaces used for environmental air. This existing exception does not permit individual cables, conductors, and signaling raceways to be installed in fabricated ducts. Cables and raceways installed in fabricated ducts can vibrate due to the high velocity of air through the duct, cause problems where dampers may be used to turn on or off air to a certain area, and may be damage at turning vanes and similar sharp edges within the duct. In addition, Section 725.154(A) limits the installation of cables and conductors to the requirements in 300.22 as follows: "Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C)." Limiting the installation to the requirements in 300.22(B), for instance, would only permit the individual conductors and cables to be installed in metal raceways or cables with this new exception misleading many installers into believing individual cables and conductors could be installed in the fabricated duct without any enclosure. This reference to 300.22 is necessary in 725.3 to ensure that Class 1, 2, and 3 conductors and cables comply with the requirements in environmental air ducts and other spaces used for environmental air (plenums). As can be seen in 300.22(B), only metallic wiring methods can be used in a fabricated environmental air duct and then only long enough to connect to electrical equipment that directly acts upon or sensing of the contained air. The second sentence in 725.154(A) also requires compliance with 300.22 for listed wires and cables, reinforcing the text in 725.3(C). Both references to 300.22 compliance, one in 725.3(C) and one in 725.154(A), make it totally clear that metal encasement of conductors and cables in a fabricated duct is necessary.
Section 3.1.4.1 of the NEC Style Manual requires exceptions to be written in complete sentences so making this change would be an NEC style issue.

3-104 Log #2017 NEC-P03 **Final Action: Reject**
(725.3(C))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-157
Recommendation: Accept Proposal 3-157 to delete 725.3(C).
Substantiation: 725.3(C) restricts Class 2 and Class 3 cables to 300.22(C) spaces, and does not correlate with 725.154(A), which permits CL2P and CL3P in 300.22(B) & (C) spaces.
Panel Meeting Action: Reject
Panel Statement: Refer to the recommendation and substantiation in Comment 3-103a, which meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: This reference to 300.22 is necessary in 725.3 to ensure that Class 1, 2, and 3 conductors and cables comply with the requirements in environmental air ducts and other spaces used for environmental air (plenums). As can be seen in 300.22(B), only metallic wiring methods can be used in a fabricated environmental air duct and then only long enough to connect to electrical equipment that directly acts upon or sensing of the contained air. The second sentence in 725.154(A) also requires compliance with 300.22 for listed wires and cables, reinforcing the text in 725.3(C). Both references to 300.22 compliance, one in 725.3(C) and one in 725.154(A), make it totally clear that metal encasement of conductors and cables in a fabricated duct is necessary.

3-105 Log #1920 NEC-P03 **Final Action: Accept in Principle**
(725.3(H) (New))

Submitter: Thomas Guida, TJG Services, Inc.
Comment on Proposal No: 3-159
Recommendation: Accept in Principle the Panel Action with the additional wording as shown:
725.3(H) "Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables <u>installed in a raceway</u> and conductors or cables of electrical circuit protective systems shall be in accordance with 300.19(B)."
Substantiation: The additional phrase, "installed in a raceway", aligns the wording of 725.3(H) with the wording of 300.19(B).
Panel Meeting Action: Accept in Principle
Revise 725.3(H) to read as follows:
(H) Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables and conductors installed in a raceway or conductors and cables of electrical protective systems shall be installed in accordance with 300.19.
Panel Statement: The text was changed to make it clear that circuit integrity cables and conductors are permitted to be installed in a raceway and must comply with various subsections of 300.19.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: The text should be further modified by inserting "where applicable" after "300.19" to read as follows: Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables and conductors installed in a raceway or conductors and cables of electrical protective systems shall be installed in accordance with 300.19<u>, where applicable.</u>" Compliance with 300.19 is not always required in all vertical installations so adding "where applicable" will provide the engineer/installer/inspector with the choice of applying the requirement or not, without requiring it for all applications and installations.

3-106 Log #2018 NEC-P03 **Final Action: Reject**
(725.3(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-159
Recommendation: Reject Proposal 3-159.
Substantiation: Installation requirements are part of manufacturer's instructions, UL has detailed installation requirements for electrical circuit protection systems, but nothing specific for cable.
Panel Meeting Action: Reject
Panel Statement: This added text and the reference to 300.19 provides appropriate requirements for Class 1, Class 2 and Class 3 circuit integrity cables installed in a raceway, in addition to the conductors and cables installed in electrical circuit protective systems.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-107 Log #807 NEC-P03 **Final Action: Reject**
(725.24)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-167
Recommendation: Accept the proposal and revise text to read as follows: Mechanical Execution of Work. Class 1, Class 2, and Class 3 cables and conductors shall be secured to approved supports by means of straps, staples, hangers, cable ties, or other approved means designed and installed so as not to damage the cables and conductors.

Exception: That portion of cables and conductors fished between access points through concealed spaces in existing buildings or other structures and supporting is impractical.
Substantiation: 300.4(D) and other sections already apply unless amended. An exception for fished conductors is warranted. If all applicable NEC provisions are complied with, what does "neat and workmanlike" have to do with safety? 90.1 states the NEC purpose is protection from hazards. "Workmanlike" is a term not to be used per the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: Section 300.4 (D) does not apply unless referenced. Section 110.12 applies to Chapters 1-4 generally and by inference to Article 725. Repeating this phrase within Article 725 provides clarity to the user, and allows flexibility to accommodate the Class 1, Class 2 or Class 3 wiring methods as provided for in 725.1 and FPN. No documentation of a problem has been provided or technical substantiation of a problem to be solved.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

STENE, S.: Section 110.12 has been in the NEC for many, many Code cycles and it gives the inspector some control over what manner of installation of electrical equipment and wiring must be adhered to for the final application. The second sentence modification is unacceptable since the intent of the existing text is to ensure that exposed Class 1, Class 2, and Class 3 conductors and cables not be installed on the surface of the building or structure where the conductors or cable could be damaged during normal building use. For example, installing a Class 2 cable used for fan shutdown during fire alarm activation must not be installed tight into the building truss such that flexing of the building would cause damage to the cable and affect the operation of the fire alarm system and its ability to shut air circulation down during a fire.

3-108 Log #622 NEC-P03 **Final Action: Accept**
(725.25)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-173
Recommendation: Continue to reject this proposal.
Substantiation: Panel 1 rejected similar Proposals 1-139 and 1-146 with the statement "The submitter has not substantiated that a problem exists, or that the problem would be alleviated by removing abandoned cables and equipment neatly. Rather, the panel concludes, that in some cases, abandoned cables and equipment are best left abandoned. The proposed text is unnecessary as the section more appropriately applies to "Requirements for Electrical Installations" and "Mechanical Execution of Work.""

Panel 12 rejected similar Proposals 12-114, 12-146 with the statement. "The requirement is unenforceable. Disposition of removed materials is not a code responsibility. The remaining installation is required to be in accordance with 110.3, which is enforceable."

Panel 16 rejected similar Proposals 16-24, 16-122, 16-241 and 16-305 with the statement. "This is an unenforceable requirement. Removing abandoned cable involves pulling unused cable and wiring from conduit, raceways, ducts, shafts and drop ceilings. The objective of the original text is directed at the final installation, that it be "neat and workmanlike", not necessarily the installation (in this case, removal) process. The submitter has provided no substantiation for additional requirements during the removal process."
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-109 Log #1044 NEC-P03 **Final Action: Accept**
(725.43)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 3-176
Recommendation: Revise text to read as follows:

Overcurrent protection for conductors 14 AWG and larger shall be provided in accordance with the conductor ampacity, without applying the ampacity adjustment and correction ~~derating~~ factors of 310.15 to the ampacity calculation. Overcurrent protection shall not exceed 7 amperes for 18 AWG conductors and 10 amperes for 16 AWG.
Exception: Where other articles of this Code permit or require other overcurrent protection.
FPN: For example, see 430.72 for motors, 610.53 for cranes and hoists, and 517.74(B) and 660.9 for X-ray equipment.
Substantiation: The revised text clarifies that both the adjustment factors and the correction factors identified in 310.15 are applicable. The term "derating" needs to be replaced since it is not defined in the NEC and it is not the terminology used in 310.15 to apply factors to change the ampacity of conductors due to some conditions. It is important to use terminology consistently throughout the Code. This proposal was one of many submitted to replace the term "derating", which is not defined with the term "adjustment" as applied to the number of conductors in a raceway or cable and "correction" as applied to temperature. This was done as applicable wherever the term "derating" was used in the NEC to provide that consistency. See panel action and comment in proposal 3-145 in the ROP.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-110 Log #1596 NEC-P03 **Final Action: Reject**
(725.43 Exception No. 2 (New))

Submitter: James C. Missildine, Jr., Southern Company Services, Inc.
Comment on Proposal No: 3-178
Recommendation: Proposal 3-178 should have been "Accept in Principle' and should read "Exception No.2: Where the Class I circuit is an extension of a manufacturer ~~vendor~~ supplied circuit breaker control circuit for solenoid operation, ~~device or circuit~~ provided with integral short circuit and ground fault protection, and the current normally present is lower than the ampacity of the wiring, conductors sized #14 AWG and larger shall be permitted to be protected at not more than 300 percent of ampacity.
Substantiation: Power circuit breakers latch in the open or closed position and are operated by a charged spring mechanism which is released by a solenoid. The only current normally present in the 'close' or 'trip ' circuit unless an operation is initiated would be for an indicating lamp or computer voltage input used to monitor the integrity of the close or trip solenoid. This normal operating current present in the circuits is much lower than the ampacity of the remote control circuit. These circuits require only short circuit and ground fault protection since the main service on them is momentary.

Many of these breakers have 35A fuses in the trip circuit to allow for a large inrush on the solenoid without blowing the fuse. The breaker internal control wiring provided by the manufacturer is commonly #12 or #14. If the trip circuit is treated as a branch circuit, a #8 conductor would be required for the remote control circuits. These circuits are typically wired to computer I-O which will not accept a #8 conductor. This exception would allow a #12 conductor to be applied.

This will bring the requirement for these circuits into agreement with IEEE C37.20.2 (IEEE Standard for Metal-Clad Switchegar). Section 7.3 Control and secondary circuits and devices requires only short-circuit protection. Overcurrent protection may be provided, but is not required.
Panel Meeting Action: Reject
Panel Statement: Proposal 3-178 does not provide technical substantiation for the proposed 300% multiplier.
This comment appears to be attempting to resolve a design issue, which does not require revision to the Code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

STENE, S.: The Class 1 circuit may be a branch circuit based on the definition of branch circuit in Article 100 but modifications to the requirements of Articles 210 and 240 can be readily seen in Part II of Article 725. Section 725.43 provides a modification of the requirements for the conductors, based on 310.15, not requiring derating of the conductors in 310.15(B)(2)(a) or the ambient temperature derating in the ampacity tables, such as Table 310.16. Section 725.45, as well as 430.72, Table 450.3(B), 240.21(B) and (C), 240.4(D), and 210.19(A)(4), Exception No. 1 would permit conductors smaller

than the overcurrent device under special circumstances. The existing exception in 725.43 already permits these applications as noted above.

3-111 Log #799 NEC-P03 **Final Action: Reject**
(725.48)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-179
Recommendation: Accept the proposal with the following revisions:
(B) Class I Circuits with Power and Lighting Circuits. Class 1 circuit conductors shall only be permitted to be installed with power and lighting circuit conductors in accordance with the following:
(1) In the same cable, flexible cord or cable, raceway trench, or other enclosure where the conductors are functionally associated, except as permitted in 725.48(B)(2), (3), and (4).
(2) In factory or field-assembled control centers.
(3) In a manhole, handhole enclosure, cable tray, box or enclosure that complies with the Exception for 314.29 in accordance with one or more of the following:
(a) The Class 1 circuit conductors or the power and lighting circuit conductors are in a raceway, metal-covered cable, or Type UF cable. Where Type UF cable is employed for the Class 1 circuits and power or lighting circuits, the cables shall be grouped and identified as to their system.
(b) Class 1 circuit conductors are effectively separated from the power and lighting circuit conductors by a nonconductor such as flexible tubing in addition to the conductor insulation.
(c) Where installed in manholes, the Class 1 circuit conductors are permanently and effectively separated from the power and lighting circuit conductors and securely fastened to racks, insulators, or other approved supports.
Substantiation: "Power" may be deemed not to include lighting circuits. Flexible cords and cables should be included as they are permitted for flexible connections. Class 1 and power/lighting circuit conductors should be permitted in the same trench or handhole enclosure in compliance with this section. Where installed in handhole enclosures, separation of systems should be required as in manholes. Cable trays should be included in the provisions.
Panel Meeting Action: Reject
Panel Statement: Section 725.48 applies very specifically to Class 1 conductors installed with the power supply circuits associated with the Class 1 circuit and has nothing to do with power and lighting circuits as alluded to in both the proposal and the comment. The submitter has not provided any technical substantiation in his comment to address the panel statement in the proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-112 Log #2680 NEC-P03 **Final Action: Reject**
(725.48(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-180
Recommendation: Accept the proposal.
Substantiation: The panel statement is only partially responsive. To maintain the argument that all the control wiring in the conduit must be related to the same process is inconsistent with the plain truth that none of the power circuits need to have any functional relationship whatsoever. With respect to the comment in the voting, which is appreciated, no common scenario I can think of, as a working electrician, would cause the result mentioned. A ground fault might take out another control circuit, but not likely energize it in a way that would cause it to operate. Further, any ground-fault or short circuit would open the overcurrent device and also cause a shut down. Either each raceway is entirely reserved for a single process, or it isn't. Many engineers make that specification for these very reasons, but that is a design question, not a matter of fundamental safety. The NEC does have segregated raceway requirements where a safety concern logically follows, such as 700.9(B), but not here.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the section. The purpose of the text in 725.48(B)(1) is to provide separation for Class 1 conductors and other power-supply circuits.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-113 Log #2019 NEC-P03 **Final Action: Reject**
(725.52)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-184
Recommendation: Accept Proposal 3-184.
Substantiation: Class 1 circuits and non-power-limited circuits are permitted to be installed together. If both circuits enter a building, the fire alarm circuit will have transient protection if installed in accordance with NFPA 72. The Class 1 circuit is not required to have transient protection. If both circuits connect to a combination fire alarm/security panel, a transient (from lightning) could destroy the fire alarm/security panel.
Panel Meeting Action: Reject
Panel Statement: The present text is adequate. No new technical substantiation has been provided to alter the position of the panel and its statement on Proposal 3-184.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-114 Log #2816 NEC-P03 **Final Action: Reject**
(725.121(A)(4), FPN)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 3-185
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that this "information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: There has been no technical reason submitted for creating an additional annex for reference information other than Annex A. Putting this information into an annex in the back will tend to make the Code less user friendly and make it more difficult for the user to access the information in a timely fashion.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-115 Log #2020 NEC-P03 **Final Action: Accept in Principle**
(725.130(J) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-191
Recommendation: Reconsider Proposal 3-191 and insert 725.139(J) as new text.
Substantiation: Article 300 does not apply unless reference. The proposed text correlates with the requirements of 300.16(B), which follows.
300.16(B) Bushing. A bushing shall be permitted in lieu of a box or terminal where the conductors emerge from a raceway and enter or terminate at equipment, such as open switchboards, unenclosed control equipment, or similar equipment. The bushing shall be of the insulating type for other than lead-sheathed conductors.
Panel Meeting Action: Accept in Principle
Add new 725.3(J) to read as follows:
(J) Bushing. A bushing shall be installed where cables emerge from raceway used for mechanical support or protection in accordance with 300.15(C).
Panel Statement: Placing text here eliminates unnecessary cross referencing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
STENE, S.: The submitter did not provide any technical substantiation that cables were being damaged where installed as open cables with a transition into a raceway. In addition, Section 300.15(C) requires a fitting be used where the cable enters into a raceway or a sleeve without a transition box but the accepted text in the Comment requires a bushing. Bushings only apply where the conductors emerge from a raceway and enter or terminate at equipment, such as open switchboards, unenclosed control equipment, or similar equipment as noted in Section 300.16(B). A bushing at the end of a raceway may not be appropriate for an installation where EMT is stubbed up through a wall and then used as a sleeve for the cable to enter from the drop ceiling.

Based on 300.15(C), a fitting is required where a box is not installed at the transition point, not a bushing.

3-116 Log #2681 NEC-P03 **Final Action: Reject**
(725.136(I)(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-195
Recommendation: Accept the proposal.
Substantiation: The panel statement is very interesting, and excellent information. However, this issue still needs attention, partially due to formal recognition of this construction in some form in 334.116(C). In addition, CMP 3 (and 16) will have on its ROC agenda, courtesy of CMP 9 and the TCC sending it there, Proposal 9-8 which covers a form of tray cable with this type of separation. This section and 334.116(C) need to be correlated.
Panel Meeting Action: Reject
Panel Statement: Section 334.116(C) requires NMS cable to have an outer sheathing where the power part of the NM cable can be split from the signaling part of the NM cable so that the power part of the cable can be inserted into a separate part of a box that has a barrier between the power and the signaling part of the box. One manufacturer produced that type of cable and associated box in the latter part of the 1980s and this text applied to this type of cable sheathing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(725.139(E))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-196
Recommendation: Accept the comment from the P3/P16 Task Group.
Substantiation: AFAA supports the comment from the P3/P16 task group chaired by Craig Sato, UL.
Panel Meeting Action: Reject
Panel Statement: See the committee action and statement of Comment 3-96.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-118 Log #2022 NEC-P03 **Final Action: Reject**
(725.141)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-197
Recommendation: Accept Proposal 3-197.
Substantiation: Because Class 2 & 3 circuits are permitted to be installed with fire alarm circuits, it is important that both circuits have the same requirements for transient protection. The National Fire Alarm Code requires power-limited circuits to have transient protection where the circuit leaves/enters a building.
Panel Meeting Action: Reject
Panel Statement: The present text is adequate. No new technical substantiation has been provided to alter the position of the panel and its statement on Proposal 3-197.
To require transient protection for all Class 2 and 3 circuits installed outside a building, simply because power-limited fire alarm conductors must have transient protection, is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: To require transient protection for all Class 2 and 3 circuits installed outside a building simply because power-limited fire alarm conductors must have transient protection is unnecessary. Not all Class 2 or Class 3 circuits installed beyond the building of origin of the circuit need to have over-voltage protection or lightning protection. For example, a Class 2 circuit installed in an underground installation in rigid metal conduit, IMC, or nonmetallic conduit is isolated from exposure to lightning and from electric light and power circuits. Where there is exposure to these hazards, Section 725.141 already adequately provides the appropriate section references for the extra protection necessary for the circuit. There was no technical substantiation provided in the comment for this change.

3-119 Log #619 NEC-P03 **Final Action: Accept**
(725.154(A))

Submitter: Jarrett Shinoski, CommScope, Inc. / Rep. Insulated Cable Engineers Association, Inc.
Comment on Proposal No: 3-199
Recommendation: Continue to accept Proposal 3-199 in principle by the actions the panel took to permit the use of metal cable trays and metal cable tray systems in other space used for environmental air.
Substantiation: The Insulated Cable Engineers Association supports the panel action clarify that metal cable trays and metal cable tray systems are permitted to be used in other space used for environmental air. These cable trays are commonly used in ceiling plenums and underfloor plenums.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-120 Log #2023 NEC-P03 **Final Action: Reject**
(725.154(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-200
Recommendation: Accept Proposal 3-200.
Substantiation: NFPA 90 does not permit signaling raceways.
Panel Meeting Action: Reject
Panel Statement: The submitter has referred to NFPA 90 (the Panel understands the reference should have been to NFPA 90A) which in turn refers back to NFPA 70, thus creating a circular reference.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: NFPA 90(A) does not recognize signaling raceways, as used in Article 725 for Class 2 and Class 3 conductors and cables, but 725.179(I) does not recognize communications raceways as a replacement for plenum, riser and general purpose signaling raceways. The same listing standard, UL 2024, is used for optical fiber cable, communications cable, signaling cable, or coaxial cable but the manufacturer can mark the outside of the raceway with "signaling raceway" or "coaxial raceway" depending upon the end use of the raceway.

3-121 Log #624 NEC-P03 **Final Action: Reject**
(725.154(B)(1))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-201
Recommendation: Reconsider and accept this proposal.
Substantiation: The Communications Cable & Connectivity Association requests that the panel reconsider and accept this proposal.
This proposal in one of a group of similar proposals that were submitted to Panels 3 and 16. The ROP actions were.

Proposal No.	Section	Action
3-201	725.154(B)(1)	Reject
3-278	760.53(B)(3)	Reject
16-62	770.154(B)(1)	Accept in Principle
16-179	800.154(B)(1)	Accept in Principle
16-282	820.154(B)(1)	Accept in Principle
16-338	830.151(B)	Accept in Principle
16-341	830.154(B)(1)	Accept in Principle

We agree with Jerry Dorna's ballot comment:
The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".
Section 770.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.
Panel Meeting Action: Reject
Panel Statement: The current wording adequately expresses the intent of the Panel. No new substantiation has been provided.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
KEDEN, R.: My negative vote pertains to the committee actions on the comments 3-121, 3-122, 3-186, 3-187, 3-200 and 3-201. The proposals and comments to the issue included the technical substantiations and the discussions in CMP-3 have not convinced me or changed my vote.
The panel statement noted that CMP 3 actions to reject proposals 3-201, 3-278 and 3-301, as well as the aforementioned comments result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the

purview of CMP3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16).

Different wiring rules in Articles 725 and 760 versus Articles 770,800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to that time, CMP 16 was responsible to Article 725, 760, 770, 800, 810, 820 and 830. Today, there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820 and 830).

However, this issue does not warrant different treatment in my opinion; CMP-3 should have accepted this Comment.

OWEN, S.: My negative vote pertains to the committee action on comments 3-121, 3-122, 3-186, 3-187, 3-200, 3-201 and proposals 3-201, 3-278, 3-301. The panel statement noted that CMP 3 actions to reject these comments and proposals result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP 3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16). Different rules in Articles 725 and 760 versus Articles 770, 800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to the time, CMP 6 was responsible to Article 725, 760, 770, 800, 810, 820, and 830. Today there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820, and 830). I do not believe that this issue warrants different treatment.

Comment on Affirmative:

STENE, S.: There was no technical substantiation submitted with the proposal, just a question about whether this was what was intended. The text is not complicated since it requires a riser cable where the cable penetrates more than one floor. If the cable goes from the first floor to the third floor, then a riser cable is required. If the cable is installed in a metal raceway, then riser cable is not required but the metal raceway would normally require fire proofing at each floor.

The submitter could initiate a fact finding study for the 2014 NEC to determine if there is any validity of requiring a riser cable be used for every floor penetration, rather than multiple floor penetrations. The fire test for riser cables is located in UL 1666, The Standard for Safety Test for Flame Propagation Height of Electrical and Optical Fiber Cables Installed Vertically in Shafts.

The following is the Scope of UL 1666: 1 Scope

1.1 This is a fire test for determining values of flame propagation height for electrical and optical-fiber cables that are for installation vertically in shafts or in vertical runs that penetrate more than one floor.

1.2 The purpose of this test is to determine whether the flame propagation characteristics of these "riser" cables are in accordance with the National Electrical Code.

1.3 This test does not investigate the toxicity or corrosivity of the products of combustion or decomposition.

1.4 This test does not cover the construction requirements for any cable or the electrical, optical, and other performance requirements for any cable.

3-122 Log #921 NEC-P03 **Final Action: Reject**
(725.154(B)(1))

Submitter: Ray R. Keden, ERICO, Inc. / Rep. BICSI
Comment on Proposal No: 3-201
Recommendation: We ask Panel 3 to re-consider their rejection of the following revision: "Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways and listed plenum signaling raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways."
Substantiation: Our recommendation will prohibit the installation of non-riser or non-plenum rated cables between floors. Following is additional substantiation:

- One argument for rejection in the Panel 3 discussion was that it should be possible to use General Use Cable in one- and two-family dwellings (e.g., to connect the basement with the ground floor). 800.154 (B)(3) permits this in risers by stating: "Type CM and CMX cable shall be permitted in one- and two-family dwellings".
- The current Code language theoretically permits that a 10-story building is cabled completely with General Use Cable in the riser if the cable is terminated in every floor. Then each cable only connects two floors.
- Panel 16 has accepted a similar proposal (16-179).

Panel Meeting Action: Reject
Panel Statement: The current wording adequately expresses the intent of the Panel. No new substantiation has been provided that alters the position of the panel.

The Code requires a riser cable where the cable penetrates more than one floor. If the cable goes from the first floor to the third floor, then a riser cable is required.

A fact finding study should be initiated for the 2014 NEC to determine scientifically if there is any validity of requiring a riser cable be used for every floor penetration rather than multiple floor penetrations. The fire test for riser cables is located in UL 1666, The Standard for Safety Test for Flame Propagation Height of Electrical and Optical Fiber Cables Installed Vertically in Shafts.

It is recommended that the technical correlating committee take note that Panel 16 has accepted this change and correlation may be needed.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

CASPARRO, P.: This comment should have been accepted. Requiring the use of riser-rated cable between any number of floors would simplify the code.

KEDEN, R.: My negative vote pertains to the committee actions on the comments 3-121, 3-122, 3-186, 3-187, 3-200 and 3-201. The proposals and comments to the issue included the technical substantiations and the discussions in CMP-3 have not convinced me or changed my vote.

The panel statement noted that CMP 3 actions to reject proposals 3-201, 3-278 and 3-301, as well as the aforementioned comments result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16).

Different wiring rules in Articles 725 and 760 versus Articles 770,800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to that time, CMP 16 was responsible to Article 725, 760, 770, 800, 810, 820 and 830. Today, there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820 and 830).

However, this issue does not warrant different treatment in my opinion; CMP-3 should have accepted this Comment.

OWEN, S.: My negative vote pertains to the committee action on comments 3-121, 3-122, 3-186, 3-187, 3-200, 3-201 and proposals 3-201, 3-278, 3-301. The panel statement noted that CMP 3 actions to reject these comments and proposals result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP 3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16). Different rules in Articles 725 and 760 versus Articles 770, 800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to the time, CMP 6 was responsible to Article 725, 760, 770, 800, 810, 820, and 830. Today there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820, and 830). I do not believe that this issue warrants different treatment.

3-123 Log #441 NEC-P03 **Final Action: Accept in Principle in Part**
(725.154(D))

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Comment on Proposal No: 3-202
Recommendation: The Panel Action should be to Accept in Principle the following modified text that was included with Susan Stene's ballot on this proposal.

~~**725.154(D) Hazardous (Classified) Locations.** Cables installed in hazardous locations shall be as described in 725.154(D)(1) through (D)(4).~~
~~**(1) Type PLTC.** Cables installed in hazardous (classified) locations shall be Type PLTC. Where the use of Type PLTC cable is permitted by 501.10(B), 502.10(B), and 504.20, the cable shall be installed in cable trays, in raceways, supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means. The cable shall be permitted to be directly buried where the cable is listed for this use.~~
~~**(2) Intrinsically Safe Circuits and Nonincendive Field Wiring.** Wiring for nonincendive circuits as permitted by 501.10(B)(3), and wiring for intrinsically safe circuits as permitted by 504.20, shall be permitted for circuits derived from Class 2 sources.~~
~~**(3) Thermocouple Circuits.** Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.~~
~~**(4) In Industrial Establishments.** In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation,~~
~~Type PLTC cable shall be permitted in accordance with either (1) or (2):~~
~~(1) Type PLTC cable, with a metallic sheath or armor in accordance with 725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).~~
~~(2) Type PLTC cable, without a metallic sheath or armor, that complies with the crush and impact requirements of Type MC cable and identified for such use with the marking PLTC-ER, shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).~~
725.154(E) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 725.154(A) through (D) shall be as described in any of (E)(1) through (E)(7).
(7) Industrial Establishments. In industrial establishments where the

conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type PLTC cable, that complies with the crush and impact requirements of Type MC cable, is identified for such use with the marking PLTC-ER, shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).

725.154(I) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

Note – 725.154 will need to be renumbered.

Substantiation: The intent of the submitter was to move the requirements for the type of cable permitted in hazardous locations out of Article 725, while still permitting the use of Type PLTC-ER in industrial applications. Section 725.154(E)(7) states "Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device." The appropriate identification is Type PLTC-ER in accordance with the listing requirements; therefore, the submitter is not adding or expanding the use of PLTC-ER in industrial applications as it is already permitted. The '-ER' marking was not specifically called out in 725.154(E)(7) in the 2008 NEC but there is no reason to exclude it. If Type PLTC-ER can be used in a Class I, Division 2, Class II, Division 2, or in an intrinsically safe hazardous location, it certainly could be used for limited applications within an industrial facility. The proposed text indicates that the identification shall be 'PLTC-ER'

Panel 14 has accepted proposals to move the requirements that were contained in 725.154(D)(1) and (D)(2) into 501.10, 502.10, 503.10, 504.10, 505.15, 506.15. Installation requirements such as support, mounting and direct burial is found in Article 336. The requirements for thermocouple circuits currently located in 725.154(D)(3) should be relocated as 725.154(I) (new).

Accepting in Principle the text proposed in the comment will remedy a potential correlation problem with the requirements in Chapter 5.

Panel Meeting Action: Accept in Principle in Part

1. Revise 725.154 lead-in paragraph to read as follows:

725.154 Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in

725.154(A) through (I).

2. Replace existing 725.154(D) with new 725.154(D) to read as follows:

(D) Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type PLTC cable shall be permitted in accordance with either (1) or (2):

(1) Where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified as PLTC-ER for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously

supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).

(2) Type PLTC cable, with a metallic sheath or armor in accordance with 725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).

3. Delete 725.154(E)(7) {now moved above in 725.154(D)(1)} and revise 725.154(E) lead-in paragraph to read as follows:

(E) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 725.154(A) through (D) shall be as described in any of (E)(1) through (E)(6).

4. Add new 725.154(I) {relocated from existing 725.154(D)(3)} to read as follows:

(I) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

Panel Statement: The panel accepts the deletion of existing 725.154(D) "Hazardous Location" subsection. The panel does not accept the deletion of Type PLTC cable with a metallic sheath or armor because it is used in industrial installations. The panel accepts the other parts of the recommendation but revised the location of some requirements to retain those requirements within the appropriate framework of this article.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-124 Log #802 NEC-P03 **Final Action: Reject**
(725.154(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-203
Recommendation: Accept the revised text as follows:

(D)(4) Maintenance and Supervision. On premises where the conditions of maintenance and supervision ensure that only qualified persons service the installation Type PLTC cable shall be permitted in accordance with either (1) or (2):

(1) Type PLTC in accordance with 725.179(E) shall be permitted to be installed exposed, the cable shall be securely fastened to approved supports at intervals not to exceed 1.8 m (6 ft) and protected by approved means where likely to be subject to physical damage.

(2) Type PLTC cable without a metallic covering that complies with the crush and impact requirements of Type MC cable and identified with the marking PLTC-ER shall be permitted to be installed exposed. The cable shall be secured to supports at intervals not to exceed 1.8 m (6 ft) and protected by approved means where likely to be subject to physical damage.

Exception: Support shall not be required for that portion of cable that is fished between access points in finished buildings or other structures and supporting is not practical.

(E) Other Locations. Where not covered in 725.54(A) through (D), cables shall be permitted in accordance with the following: 1, 2, 3, 4, 5, and 6. No change.

(7) Maintenance and Supervision. On premises where the conditions of maintenance and supervision ensure that only qualified persons install and service the installation....(remainder unchanged).

Substantiation: Maintenance and supervision should be the criteria, not type of occupancy. 408.20 does not specify type of occupancy. (E)(7) is already covered by (D)(4). (E) should also apply to locations that are not in "buildings." An exception should cover fished cables.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation to make the sweeping change to include all commercial and educational establishments where this section has limited the applications for industrial establishments only. Throughout the NEC, special consideration is given for industrial establishments where qualified personnel are used for installing and maintaining the equipment. Ladder type cable trays and similar cable trays provide continual support as required in 725.154(D) so the substantiation statement is incorrect. Since metallic sheathed or armored PLTC cable may be installed exposed in a Class 1, Division 2 location, protecting it from physical damage is a requirement and not just where it is likely to be exposed to physical damage.

These two subsections are dealing with exposed installations so adding the proposed exception permitting cables in concealed locations is unnecessary since concealed installations are already permitted.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-125 Log #1332 NEC-P03 **Final Action: Accept**
(725.154(H) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-204
Recommendation: *Continue rejecting this proposal.*
Substantiation: The proposal introduces terms that are associated with fire testing/fire performance and are not defined anywhere. Therefore, not only does no application exist (as CMP 3 correctly pointed out) but no organization has developed criteria for such fire performance.

Class 2 and Class 3 circuit cables in the NEC can be listed as complying with one of the following 4 categories: CL2P and CL3P (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), CL2R and CL3R (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), CL2 and CL3 (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581) and CL2X and CL3X (i.e. cables listed as resistant to flame spread and that comply with the requirements of the vertical wire test VW-1 in UL 1581).

Nowhere does a definition exist for "very-low-smoke producing cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.

Nowhere does a definition exist for "fire hazard cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.

3-126 Log #2024 NEC-P03 **Final Action: Reject**
(725.154(H))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-204
Recommendation: Revise 725.154(H)

(H) Class 2, Class 3, and PLTC Cables With Suffix Markings. Class 2, Class 3, or PLTC cables with single or multiple suffix markings shall be permitted and marked in accordance with the appropriate section of 725.179.

(~~H~~1) Class 2, Class 3, and PLTC Circuit Integrity (CI) Cables or Electrical Circuit Protective System. Circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in remote control, signaling, or power-limited systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.

(2) Class 2 or Class 3 Cables for Wet Locations. Class 2 or Class 3 cables installed in wet locations shall be Types CL2-WET, CL2R-WET, CL3P-WET, CL3-WET, CL3R-WET or CL3P-WET."

(3) Class 2 or Class 3 Cables Exposed to Direct Sunlight. Class 2 or Class 3 cables installed where exposed to direct sunlight shall be Types CL2-SR, CL2R-SR, CL2P-SR, CL3-SR, CL3R-SR or CL3P-SR.

(4) Class 2 and Class 3 Cables Exposed to Oil or Gas and Oil. Class 2 and Class 3 cables installed where exposed to oil shall be Types CL2-PR, CL2R-PR, CL2P-PR, CL3-PR, CL3R-PR, orCL3P-PR. Class 2 and Class 3 cables installed where exposed to gas and oil shall be Types CL2-GR, CL2R-GR, CL2P-GR, CL3-GR, CL3R-GR, or CL3P-GR.

(5) Class 2 and Class 3 Very-Low-Smoke Producing Cables. Class 2 or Class 3 very-low-smoke producing cables installed in locations to meet low flame spread and very-low-smoke emissions shall be Types CL2-50, CL2R-50, CLP2-50, CL3P-50, CL3R-50 or CL3P-50.

(6) Class 2 and Class 3 Fire Hazard Cables. Class 2 or Class 3 fire hazard cables installed in locations to meet low flame spread, very-low-smoke, and known potential heat release shall be Types CL2-FHC, CL2R-FHC, CLP2-FHC, CL3P-FHC, CL3R-FHC or CL3P-FHC.

Substantiation: This proposal details application requirements and permits cables identified in 725.154(A), (B), (D), and (E) to have suffix markings.

Installation requirements do not change, because 760.154 is referenced in 760.130.

725.130(B) Class 2 and Class 3 Wiring Methods. Conductors on the load side of the power source shall be insulated at not less than the requirements of 725.179 and shall be installed in accordance with 725.133 and 725.154.
Panel Meeting Action: Reject

(725.179)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-205
Recommendation: Accept the proposal with the following revisions:
Add "or other structures" after "buildings."
Substantiation: All buildings are structures, but all structures are not buildings. In the NEC, "or structures" is commonly added after "buildings."
Panel Meeting Action: Reject
Panel Statement: No new substantiation has been provided to alter the panel's action and statement on Proposal 3-205.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: The main text for the listing and marking of Class 2, Class 3 and PLTC cable very specifically references wiring methods that can be installed within a building that may not apply to other structures. For example, there would be no reason require low smoke cables or cables that are resistant to the spread of fire on a wooden platform installed outside adjacent to a building and designed to support an electrical service.

3-128 Log #625 NEC-P03 **Final Action: Accept**
(725.179(A), FPN)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-207
Recommendation: Continue to reject this proposal.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to reject this proposal and recommends that the panel continue to reject it.

A fine print note giving information on fire testing of plenum cable has been in the NEC since the 1984 edition. It has undergone only minor editorial changes since 1984. It provides extremely useful to cable manufacturers. The proposed change would remove essential information.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
EGESDAL, S.: It is important for cables to have marking that identify the intended application, similar to the marking on conductors in the Article 310 tables.
Panel rejected the proposal on this subject, citing poor application text. Not that the application text in the comment parallel other application text in this article, Panel 3 found a new reason to reject the proposed change. This type of panel action is unfair to submitters.

SEPULVEDA, M.: It is very important for cables to have markings on them, which identify the intended application(s), similar to the markings on conductors in the Article 310 tables.

The Panel discarded the proposal on this subject matter, due to citing poor submission text. Not that the application text in the comment, parallels other applications text in this same article. Panel 3 has now found a new reason to reject the proposed change. This type of panel action is not fair to submitters.

3-129 Log #626 NEC-P03 **Final Action: Accept**
(725.179(A), FPN)

3-130 Log #723 NEC-P03 **Final Action: Accept in Part**
(725.179(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 3-207
Recommendation: The Proposal should have been Accepted in Principle, revised and the following words "and Annex A Explanatory Material" added after "NFPA 262-2007" so the revised text reads as follows:
~~FPN~~ Informational Note: One method of defining low smoke-producing cable and fire-resistant cable is ~~by establishing an acceptable value of the smoke produced when tested in accordance with~~ described in NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, and Annex A Explanatory Material. ~~, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
Substantiation: The FPN does not provide "information on various methods of defining smoke producing cables or fire-resistant cables". It refers to a single test method and defines the maximum values, which are not specified in the body of NFPA 262. Inclusion of the maximum values in the FPN are requirements and this violates 3.1.3 of the NEC Style Manual.

NFPA 262 defines the Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces but it does not specify any pass/fail criteria.

While the values specified for maximum peak optical density, maximum average optical density, and maximum allowable flame travel distance in the FPN are not included in the body of NFPA 262, they are contained in Annex A Explanatory Material. Addition of the words "and Annex A Explanatory Material" will reference the maximum values that are in the FPN and the proposed revised FPN will comply with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.
Panel Meeting Action: Accept in Part
The panel accepts the change "FPN" to "Informational Note" and rejects the remainder of the recommendation..
Panel Statement: The text proposed for deletion can be used to support the requirement. The explanatory material in this informational note is one method and not the only method of defining this cable and therefor is not mandatory text. The submitter has provided new text that has not received public review.

Comment on Proposal No: 3-208
Recommendation: 725.179 Listing and Marking of Class 2, Class 3, and Type PLTC Cables.

Class 2, Class 3, and Type PLTC cables and nonmetallic signaling raceways installed as wiring methods within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.179(A) through (K) and shall be marked in accordance with 725.179(L).

(A) Types CL2P and CL3P. Types CL2P and CL3P plenum cable shall be listed as being suitable for use in ducts, plenums, and other space for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.
Substantiation: Retain the FPN as written by CMP 3, but only if the FPNs from CMP 16 are changed to the same language. This comment is being written just in case CMP 3 is unwilling to change to existing NEC language.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 3-132 which meets the intent of the submitter.
Number Eligible to Vote: 15

(725.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-208
Recommendation: 725.179 Listing and Marking of Class 2, Class 3, and Type PLTC Cables.

Class 2, Class 3, and Type PLTC cables and nonmetallic signaling raceways installed as wiring methods within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.179(A) through (K) and shall be marked in accordance with 725.179(L).

(A) Types CL2P and CL3P. Types CL2P and CL3P plenum cable shall be listed as being suitable for use in ducts, plenums, and other space for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

~~FPN: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.~~

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.
Substantiation: This comment is intended to bring consistency to the NEC. In Articles 770, 800, 820 and 830, the FPN is worded as this comment (and the original proposal) recommends. The original proposal was already made in the 2005 and 2008 NEC cycles, but was caught up in the "plenum cable moratorium" in the opinion of CMP 3 but not of CMP 16. This wording also follows the requirements of the preceding section, which requires that the cable be listed as having both "adequate fire-resistant and low smoke-producing characteristics". The wording of the panel (although adequate also) does not explain what is needed to define a cable that is a "low smoke-producing and fire-resistant cable" by omitting the words "a cable that is".

With regard to the comment by Mr. Ayers, I agree with him, but the (incorrect) use of the term "fire-resistant cable" is consistent in not just the FPNs in all 6 relevant articles (725, 760, 770, 800, 820 and 830) but is also consistent with the use in the charging paragraph.

If CMP 3 and CMP 16 would both like to eliminate the term "fire-resistant cable", consistently in all locations, and replace it by a term such as "low flame spread cable", that would be an excellent idea, but it does require consistency (and probably a task group of both panels). In the meantime the use of the term "fire-resistant cable" is necessary to correlate with the charging paragraph.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

(725.179(A), FPN)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 3-209
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that this "information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.

The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 3-114 which addresses the same issue.

(725.179(A), FPN)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 3-307
Recommendation: The panel should accept this proposal.
Substantiation: The submitter is correct by referring to 3.1.3 of the NEC Style Manual which states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language." Clearly, this FPN contains what could be determined to be mandatory language and could imply a requirement that goes well beyond the purpose of FPN's to simply inform.
Panel Meeting Action: Reject
Panel Statement: The panel understands from the submitter that correct reference proposal is 3-207 not 3-307.

The text proposed for deletion can be used to support the requirement. The explanatory material in this informational note is one method and not the only method of defining this cable and therefore is not mandatory text.

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 3-211
Recommendation: The Proposal should be Accepted in Principle in Part and the text revised as follows:
~~FPN~~ Informational Note: One method of defining resistant to the spread of fire is ~~that the cables do not spread fire to the top of the tray in~~ described in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing~~ described in the CSA "Vertical Flame Test — Cables in Cable Trays," ~~as described~~ in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.
Substantiation: Acceptance of the revised wording shown above will still provide the user with the references to two methods of defining "resistant to the spread of fire" and also comply with the NEC Style Manual that FPN's not contain requirements. The pass/fail criteria are already defined in those two standards.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.
Panel Meeting Action: Accept in Part
The panel accepts the change "FPN" to "Informational Note" and rejects the remainder of the recommendation.
Panel Statement: The text proposed for deletion can be used to support the requirement. The explanatory material in this informational note is one method and not the only method of defining this cable and therefor is not mandatory text. Recommendation: Accept proposal 3-227.
Substantiation: It is important for the industries using Article 725 to have temperature rating information.
Panel Meeting Action: Reject
Panel Statement: This information is found in the listing requirements per 110.3(B).

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-154 Log #2029 NEC-P03 **Final Action: Reject**
(725.179(P) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-228
Recommendation: Accept in Principle Proposal 3-228, revised as shown.

(P) Class 2 and Class 3 Conductors and Cables Exposed to Oil or Gas. Class 2 and Class 3 conductors and cables installed where exposed to gas or oil shall be listed as suitable for those locations. Cables specified in 725.154(A), (B), and (E), and installed locations exposed to oil or gas shall have the additional classification using the following suffixes: "-PR" for oil resistant, and "-GR" for gasoline and oil resistant.

FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*

Substantiation: Presently, there is no marking that identifies which Class 2, and Class 3 cables as being suitable for installation where exposed to oil or gas. It is important to have the correct cable for locations that have the potential to degrade cable and conductor insulation and cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: This information is found in the listing requirements per 110.3(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-155 Log #1335 NEC-P03 **Final Action: Accept**
(725.179(Q) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-229
Recommendation: *Continue rejecting this proposal.*
Substantiation: The proposal introduces a definition of a term that is associated with fire testing/fire performance and is not defined anywhere. Therefore, not only does no application exist (as CMP 3 correctly pointed out) but no organization has developed criteria for such fire performance.

Class 2 and Class 3 circuit cables in the NEC can be listed as complying with one of the following 4 categories: CL2P and CL3P (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), CL2R and CL3R (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), CL2 and CL3 (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581) and CL2X and CL3X (i.e. cables listed as resistant to flame spread and that comply with the requirements of the vertical wire test VW-1 in UL 1581).

Nowhere does a definition exist for "very-low-smoke producing cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable. The proposed fire properties recommended for such a listing do not correspond to any listing developed by a nationally recognized listing organization, even when optional listings are taken into account. UL has developed UL Subject 2424, "Outline of Investigation for Cable Marked "Limited Combustible", which contains a set of listing criteria for which no application exists, but this document requires that cables also be tested in accordance with NFPA 259.

Cables listed to UL 2424 are already allowed by NFPA 90A to be used anywhere that plenum cables are required.

Both NFPA 90A and the mechanical codes (the IMC, International Mechanical Code, and the UMC, Uniform Mechanical Code) have requirements of 25/50 (flame spread index/smoke developed index, in accordance with ASTM E 84) for materials in plenums other than wires and cables (and some other materials). NFPA 13 (sprinkler standard) also made it clear that the use of plenum cables in plenums does not even introduce a fire hazard sufficient to require installation of sprinklers.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-156 Log #2030 NEC-P03 **Final Action: Reject**
(725.179(Q) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-229
Recommendation: Accept Proposal 3-229.
Substantiation: There are cables available that would pass the UL 723 test, but it would be foolish for a manufacturer to submit a product for testing, as there is no marking available to differentiate a very low smoke cable from smoky cable.
Panel Meeting Action: Reject
Panel Statement: This information is found in the listing requirements per 110.3(B).

ARTICLE 727 — INSTRUMENTATION TRAY CABLE: TYPE ITC

3-159 Log #730 NEC-P03 **Final Action: Accept in Part**
(727.6, FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 3-231
Recommendation: The Proposal should be Accepted in Principle in Part and the text revised as follows:
~~FPN~~ Informational Note: One method of defining resistant to the spread of fire is ~~that the cables do not spread fire to the top of the tray in~~ described in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the~~ described in the CSA "Vertical Flame Test — Cables in Cable Trays," ~~as described~~ in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.
Substantiation: Acceptance of the revised wording shown above will still provide the user with the references to two methods of defining "resistant to the spread of fire" and also comply with the NEC Style Manual that FPNs not

contain requirements. The pass/fail criteria are already defined in those two standards.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Accept in Part

The panel accepts the change "FPN" to "Informational Note" and rejects the remainder of the recommendation.

Panel Statement: The text proposed for deletion can be used to support the requirement. The explanatory material in this informational note is one method and not the only method of defining this cable and therefor is not mandatory text. The submitter has provided new text that has not received public review.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-160 Log #2826 NEC-P03 **Final Action: Reject**
(727.6, FPN)

Submitter: T David Mills, T. David Mills Associates

Comment on Proposal No: 3-232

Recommendation: The Panel should accept this proposal.

Substantiation: The panel statement that this "information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.

The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.

Panel Meeting Action: Reject

Panel Statement: There has been no technical reason submitted for creating an additional annex for reference information other than Annex A. Putting this information into an annex in the back will tend to make the Code less user friendly and make it more difficult for the user to access the information in a timely fashion.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-162 Log #2032 NEC-P03 **Final Action: Reject**
(760.3(B))

TCC Action: The Technical Correlating Committee directs that the NFPA 72 Task Group on Wiring review this comment and Proposal 3-239 for correlation during the 2014 NEC Code cycle.

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Comment on Proposal No: 3-239

Recommendation: Accept Proposal 3-239.

Substantiation: 760.3(B) contains redundant text. Additionally, Ms. Stene's comment is in error regarding cable in air ducts. The first sentence of 760.154(A) requires Type FPLP in air ducts. The second sentence of 760.154(A) permits (an exception in the 1993 edition) Types FPL, FPLR, & FPLP in air ducts in compliance with 300.22.

Panel Meeting Action: Reject

Panel Statement: Section 300.22 provides basic requirements for all electrical wiring and equipment. Subsections 760.53 (B) and 760.154 (B) provide specific application information. Subsection 760.3(B) provides enforceable language.

Panel 3 requests that the NEC Technical Correlating Committee chair communicate with the NFPA 72 Technical Correlating Committee chair to form a task group on wiring made up of members of both NFPA 70 & 72 to look at the wiring issues of both documents to provide correlation between documents, particularly with Article 725 and 760. Panel 3 understands that there is already wiring task group for each project, but these task groups need to be combined to provide a more global correlation effort between the two documents.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

KAHN, S.: I repeat the reason for my Negative Vote on the Proposal: "The proposer's substantiation for Proposal No. 3-239 is correct - 760.3(B) is redundant...etc."

Comment on Affirmative:

EGESDAL, S.: The Automatic Fire Alarm Association is willing to serve on any task group related Article 725 installation requirements.

SEPULVEDA, M.: The Electronic Security Association (ESA) is willing to serve on any task group which is related to Article 725 installation requirements.

STENE, S.: The reference to 300.22 is necessary in 760.3 to ensure that non-power-limited and power-limited fire alarm conductors and cables comply with the requirements in environmental air ducts and other spaces used for environmental air (plenums). As can be seen in 300.22(B), only metallic wiring methods can be used in a fabricated environmental air duct and then only long enough to connect to electrical equipment that directly acts upon or sensing of the contained air. The second sentence in 760.154(A) also requires compliance with 300.22 for listed wires and cables, reinforcing the text in 760.3(B). Both references to 300.22 compliance, one in 760.3(B) and one in 760.154(A), make it totally clear that metal encasement of conductors and cables in a fabricated duct is necessary.

3-163 Log #434 NEC-P03 **Final Action: Accept in Part**
(760.3(H))

Submitter: Susan L. Stene, Underwriters Laboratories Inc.

Comment on Proposal No: 3-241

Recommendation: New/Revise text to read as follows:

The proposed text should be changed to indicate: (H) Cables, Raceways or Sleeves Exposed to Different Temperatures. Where portions of cables, raceways or sleeves are exposed to different temperatures and condensation is known to be a problem, fire alarm ~~I~~ installations shall comply with 300.7(A).

Substantiation: Panel 3 correctly accepted the concept of the proposal. However, further detail should be included to inform the user of the specific concerns which would require the application of 300.7(A). The text proposed above provides specific information for the user regarding the specific use of 300.7(A)

Panel Meeting Action: Accept in Part

Accept the added words "Or Sleeves" in the title and reject the remainder of the recommendation.

Panel Statement: The action taken on Comment 3-24a included the requirements that are being proposed by the submitter. Repeating the requirements in this section is not necessary. This should satisfy the intent of the submitter.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

STENE, S.: Not accepting the additional text, as suggested in the comment, leaves the user of this section of the NEC with the dilemma of determining what the Panel intends for this application. The raceway or sleeve could be exposed to different temperatures but condensation is clearly not a problem, however, the newly modified text would require compliance with 300.7 even when there is no problem with condensation. For example, a raceway enclosing

fire alarm conductors installed from the outside of the building to the inside of the building in Minnesota would be a problem, whereas the same installation in San Diego or Phoenix would not be a problem and would not require compliance with 300.7. The phrase "Where portions of raceways or sleeves are exposed to different temperatures and condensation is known to be a problem" should be added to eliminate this issue.

3-164 Log #1919 NEC-P03 **Final Action: Accept in Principle**
(760.3(H) (New))

Submitter: Thomas Guida, TJG Services, Inc.
Comment on Proposal No: 3-242
Recommendation: Accept in Principle the Panel Action with the additional wording as shown:
760.3(H) "Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables installed in a raceway and conductors or cables of electrical circuit protective systems shall be in accordance with 300.19(B)."
Substantiation: The additional phrase, "installed in a raceway", aligns the wording of 760.3(H) with the wording of 300.19(B).
Panel Meeting Action: Accept in Principle
Revise 760.3(H) to read as follows:
(H) Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables and conductors installed in a raceway or conductors and cables of electrical protective systems shall be installed in accordance with 300.19.
Panel Statement: The text was changed to make it clear that circuit integrity cables and conductors are permitted to be installed in a raceway and must comply with various subsections of 300.19.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: The text should be further modified by inserting "where applicable" after "300.19" to read as follows: Vertical Support for Fire Rated Cables and Conductors. Vertical installations of circuit integrity (CI) cables and conductors installed in a raceway or conductors and cables of electrical protective systems shall be installed in accordance with 300.19, where applicable." Compliance with 300.19 is not always required in all vertical installations so adding "where applicable" will provide the engineer/installer/inspector with the choice of applying the requirement or not, without requiring it for all installations and applications.

3-165 Log #2033 NEC-P03 **Final Action: Reject**
(760.3(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-242
Recommendation: Reject Proposal 3-242.
Substantiation: Installation requirements are part of manufacturer's instructions, UL has detailed installation requirements for electrical circuit protection systems, but nothing specific for cable.
Panel Meeting Action: Reject
Panel Statement: This added text and the reference to 300.19 provides appropriate requirements for fire alarm circuit integrity cables installed in a raceway, in addition to the conductors and cables installed in electrical circuit protective systems.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-166 Log #2034 NEC-P03 **Final Action: Reject**
(760.3(I) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-244
Recommendation: Reject Proposal 3-244.
Substantiation: The proposal introduces redundant text, because 300.17 is in 760.51.
Panel Meeting Action: Reject
Panel Statement: Section 300.17, as referenced in 760.3(I) (renumbered in the draft as 760.3(J)), applies to all conductors/cables covered by Article 760 where they are installed in raceway, not just 760.51. Section 760.3(I) does not exempt compliance with any Chapter 3 wiring methods, including wire fill for raceways that may be used where installing fire alarm circuits.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-167 Log #2035 NEC-P03 **Final Action: Reject**
(760.3(I) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-245
Recommendation: Accept Proposal 3-245.
Substantiation: While the panel statement is correct, it fail to address power-limited cables.
Panel Meeting Action: Reject
Panel Statement: This information is found in the listing requirements per 110.3(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: Individual conductors based on 760.46 and 760.49 must already comply with 310.8(D) making this reference unnecessary. Cables covered with a listed sunlight resistant material may change the flame rating of a cable and leave it unsuitable for the installation and may cause obscuration of other cable marking. Non-power-limited fire alarm cables must already comply with 760.53 and power-limited fire alarm cables must comply with 760.154 so this proposed reference is unnecessary.

3-168 Log #2012 NEC-P03 **Final Action: Reject**
(760.7 (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facilities Executives
Comment on Proposal No: 3-248
Recommendation: Accept in Principle with the following revision:
760.7 Mechanical Execution of Work.
Fire alarm circuits shall be installed in a neat workmanlike manner**.** Cables and conductors **not enclosed in raceway and** installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be
supported by straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D).
Substantiation: This revision to the original proposal highlights the concept that not all fire alarm wiring has to be installed in conduit. The committee's referral (in the substantiation of the original proposal rejection) to Sections II and III of this article does not reveal any explicit language indicating that raceway is optional in some applications. The term "It shall be permitted" is a strong hint at the more expensive wiring method; thus concealing the code minimum. Many fire alarm installations in our industry are being built with fire alarm wiring in conduit because of lack of understanding of NEC minimums.
Panel Meeting Action: Reject
Panel Statement: Installing non-power-limited or power-limited fire alarm cable without conduit is already accepted in Sections 760.46, 760.48, 760.49, and 760.127 in addition to other sections in Parts II and III of Article 760 so adding this information to a new section is unnecessary.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-169 Log #2036 NEC-P03 **Final Action: Reject**
(760.24)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-252
Recommendation: Accept Proposal 3-252.
Substantiation: The document proposed is not a 'workmanship" manual. Rather it provides guidance on job installation process and best practices.
Panel Meeting Action: Reject
Panel Statement: The panel maintains its original position on the proposal. Section 110.12, FPN already provides information on industry standards related to workmanship and doesn't just apply to mechanical execution of work. The phrase "and other ANSI-approved installation standards" will permit the user of the NEC to access other installation standards, such as NECA 301 for fire alarms.

Number Eligible to Vote: 15

3-172 Log #2037 NEC-P03 **Final Action: Reject**
(760.32)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-254
Recommendation: Accept Proposal 3-254.
Substantiation: There are 3 key changes in the proposal.

Change the "or" to "and".

Split the section, moving non-power-limited requirements to Part II and power-limited requirements to Part III.

Require all circuits entering a building to meet requirements of Article 800, Parts II, III, & IV.

There are transient protection devices available for various AC & DC circuits, which are not the typical communications system primary protectors.
Panel Meeting Action: Reject
Panel Statement: The submitter did not address any of the compliance and primary protector ratings issues in the proposal Panel Statement. Based on 760.41(A), the power source of non-power-limited fire alarm circuits shall have an output voltage not greater than 600-volts. Requiring non-power-limited fire alarm circuits extending beyond one building to comply with Parts II, III and IV of Article 800 would be a safety hazard at the very least, if not a potential fire hazard. Article 800 does not address circuits with voltages up to 600 volts. Compliance with Parts II and III of Article 800 would require primary and secondary protectors be installed on these non-power-limited conductors or cables where entering into the second building based on 800.50(C). Primary protectors are not rated for the permissible voltage of the non-power-limited circuit of up to 600 volts and with ampere ratings based on 310.15. There are plenty of transient protection devices available in the industry to provide protection for non-power, especially as covered in Article 285 but none in Article 800 that would apply. Article 800 is already referenced in 760.32 for power-limited fire alarm circuits.

Providing the information about fire alarm circuits extending to another building as indicated in 760.32 is much more user friendly than splitting it into two separate sections.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

EGESDAL, S.: The action of Panel 3 permits fire alarm systems having circuits extending outside of a building to be installed with no transient protection. All an installer has to do is meet any of the requirements of Article 300, Part I that apply to the installation…which may be no action required. NFPA 72-2007, National Fire Alarm Code requires installation of transient protection where a fire alarm circuit enters a building. This version of NFPA 72 is in-force in most jurisdictions in the USA.

The panel ignored the submitters substantiation that there are transient protection devices avail for AC voltages up to 600, and a wide range of DC voltages.

SEPULVEDA, M.: Panel 3 permits Fire Alarm Systems having circuits extending outside of a building to be installed with "no" transient protection. An installer doing the work only has to do is meet any of the requirements of Article 300, Part I, that apply to the installation…which may be no action necessary.

In most jurisdictions in the United States of America the NFPA 72-2007 edition National Fire Alarm Code (NFPA) requires the installation of transient protection where a Fire Alarm circuit is entering a building.

This version of NFPA 72 is in-force today and the panel has again ignored the submitter's proof that there are transient protection device purpose for A.C. voltages up to 600, and a very wide range of DC voltages as well.

3-173 Log #2038 NEC-P03 **Final Action: Reject**
(760.35)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-256
Recommendation: Accept Proposal 3-256.
Substantiation: Recently in a class taught by an AHJ, an installer asked why grounding was no longer required for fire alarm systems. The question was raised because Panel 3 removed the grounding reference from Article 760.
Panel Meeting Action: Reject
Panel Statement: Section 90.3 states Chapters 1 through 4 apply unless supplemented or modified by Chapters 5, 6, or 7.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-174 Log #2039 NEC-P03 **Final Action: Reject**
(760.37 (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-258
Recommendation: Accept Proposal 3-258.
Substantiation: The proposal provides minimal, but key requirements, necessary for proper installation of Class A circuits.
Panel Meeting Action: Reject
Panel Statement: No new substantiation has been provided to change the position of the panel.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-175 Log #1074 NEC-P03 **Final Action: Reject**
(760.41)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-259
Recommendation: Revise the accepted text to read: "A branch circuit that supplies only fire alarm equipment ~~An individual branch circuit~~ shall be required for the power source." (Remainder unchanged).
Substantiation: The panel statement includes a definition of an individual branch circuit and then says that this individual branch circuit can supply multiple pieces of the same equipment. If the panel interpretation on this point is correct, then I could use one individual branch circuit to supply more than one of anything as long as they are the same. This is a direct contradiction to the definition of individual branch circuit which says "only one utilization equipment." For example, where the fire alarm panel is in one enclosure and the battery charger or other auxiliary power supply or other related equipment is in another, they are often separate items of utilization equipment. A single circuit could be used according to the panel statement of intent, but this circuit is no longer an individual branch circuit. In fact, an identical requirement for

PLFA circuits was also accepted. Literally, since each power supply has to have an "individual branch circuit" many fire alarm panels would require two individual branch circuits since many appliance circuits are NPLFA while PLFA initiating circuits are supplied by the same panel. Apparently the panel is disregarding the definitions of "one" and "utilization equipment." As soon as more than one utilization equipment is connected, the circuit is no longer an individual branch circuit. The panel is correct that there is no definition of "dedicated circuit" even though many proposals have been made to add one. So the panel should say what they mean or accept the Exception in the original proposal to allow more than one item of fire alarm utilization equipment to be supplied by the same circuit. This comment is intended to have the code actually say what the panel said they meant. Alternatively, the panel should accept the revision as proposed in the comment on affirmative by Mr. Ayer. This would eliminate duplicated language in 760-41 and 760-121 and does not use the incorrect term individual branch circuit.

Panel Meeting Action: Reject

Panel Statement: The text as modified by the panel at the proposal stage addresses the panels intent.

See the revised text in the panel meeting action in Proposal 3-259 since it changes the existing text in 760.41(B) in the 2008 NEC to the following text: "The branch circuit supplying the fire alarm equipment(s) shall supply no other loads." The existing text stated "an individual branch circuit shall be required for the supply of the power source" (of the fire alarm panel) and was not intended to supply multiple pieces of equipment. The new text provides the requirement for the branch circuit to supply only the fire alarm equipment, but could have multiple pieces of equipment connected to the branch circuit.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

EGESDAL, S.: It is important that the power for a fire alarm system supply only fire alarm equipment. The submitter of this comment provided excellent wording to clarify application, installation, and inspection requirements.

SEPULVEDA, M.: It is extremely important that the power for a Fire Alarm System supply only fire alarm equipment (or dedicated circuit). The submitter of this comment provided exceptional wording to make clear the application, installation, and inspection requirements.

3-176 Log #1429 NEC-P03 **Final Action: Accept in Principle in Part**
(760.41)

Submitter: Mark Shapiro, Farmington Hills, MI

Comment on Proposal No: 3-259

Recommendation: Revise the panel's action as follows:

(A) Power Source. The power source of non-power-limited fire alarm circuits shall comply with Chapter 1 through 4, and the output voltage shall be not more than 600 volt, nominal. ~~Fire alarm disconnect shall be permitted to be secured in the "on" position.~~

(B) Branch Circuit. The branch circuit supplying the fire alarm equipment(s) shall supply no other loads. The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control panel. The circuit disconnecting means shall have a red marking, shall be accessible only to authorized personnel, and shall be identified as "FIRE ALARM CIRCUIT. This branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN: See 210.8(A)(5), Exception, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems."

Substantiation: NFPA 72 is included by reference in most building codes. This means that, unlike the pattern for referenced documents in the NEC, it is a mandatory part of those building codes. So, if the NEC "permits" fire alarm circuits to be locked on and other codes require it, there will be a direct code conflict.

Having enforced NFPA 72's locking and marking requirements for years, I have seen no problems with them and have found them to be a useful set of requirements. They help to locate the fire alarm circuit. They help keep other wiring off the circuit. They help to keep the vital circuit energized. And, help avoid unnecessary trouble signals.

Panel Meeting Action: Accept in Principle in Part

Revise the panel action of Proposal 3-259 to read as follows:

(A) Power Source. The power source of non-power-limited fire alarm circuits shall comply with Chapter 1 through 4, and the output voltage shall be not more than 600 volts, nominal. Fire alarm circuit disconnect shall be permitted to be secured in the "on" position.

(B) Branch Circuit. The branch circuit supplying the fire alarm equipment(s) shall supply no other loads. The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control unit. The circuit disconnecting means shall have red identification, shall be accessible only to qualified personnel, and shall be identified as "FIRE ALARM CIRCUIT." The red identification shall not damage the overcurrent protective devices or obscure the manufacturer's markings. This branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN: See 210.8(A)(5), Exception, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems."

Panel Statement: The panel rejected the deletion of the last sentence in 760.41(A) since this is permissive text and is not mandatory. Requiring the fire alarm circuit disconnecting means to have red identification was accepted. Information was also added to caution against degrading equipment due to identification. The panel accepted the phrase "is to be identified as FIRE ALARM CIRCUIT". The panel did not accept use of the term "authorized" and instead inserted "qualified" as a defined term.

Comment on Proposal No: 3-266

Recommendation: Support panel reject of this proposal.

Substantiation: Manufacturers are supplying 18 AWG circuit integrity cables qualified for 100 foot vertical applications which comply with 300.19(8) and table 300.19 (see UL FHlT.24). There is no need to limit AWG size.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-180 Log #787 NEC-P03 **Final Action: Reject**
(760.53)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 3-271

Recommendation: Accept the proposal with the following revisions:

A) NFPA Wiring Method. Multiconductor non-power limited fire alarm cables shall be installed in accordance with 760.53(A)(1), (A)(2), and (A)(3).

(1) Exposed in raceways or fished cables shall be installed in approved raceways or exposed. Cable splices and terminations shall in listed boxes, fittings, fire alarm device enclosures, utilization equipment enclosures, or other approved enclosures. Cables shall be secured to supports at intervals not greater than 1.8 m (6 ft) and protected against physical damage by approved means. Where exposed cables are located less than 2.1m (7 ft) above the floor or standing surface, that shall be securely fastened to approved supports in an approved manner at intervals not to exceed 450 mm (18 in.).

Exception: Support shall not be required for that portion of cables or raceways fished between access points through concealed spaces in finished buildings or other structures and supporting is impractical.

Substantiation: "Adequately" is subjective and a term not to be used per the NEC Style Manual, cables should be supported whether or not concealed, as is required for most wiring methods which may not be as critical for safety. The proposal covers protection by baseboards, door frames, etc. and elevation. The present text has no specific provisions for fastening/support for cables located

7ft 6 in. above the floor.
Panel Meeting Action: Reject
Panel Statement: The proposed text is incomplete. There was no technical substantiation provided to show "adequately supported" is the same as "securely supported" in the recommendation and that the existing text is a safety issue. The same applies to the recommended change "adequate protection can be afforded." The exception is not necessary since cables can be fished into concealed spaces based on the title and the existing first sentence in the Code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(760.53(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-272
Recommendation: Accept proposal 3-272.
Substantiation: The purpose is to provide a bushing for non-power-limited cable, where the cable emerges from race into space. 760.53 is covered in an exception to 760.46, so additional text is needed.

[760.46 Installation of non–power-limited fire alarm circuits shall be in accordance with 110.3(B), 300.7, 300.11, 300.15, 300.17, and other appropriate articles of Chapter 3.

Exception No. 1: As provided in 760.48 through 760.53.

Exception No. 2: Where other articles of this Code require other methods.]
Panel Meeting Action: Accept in Principle

Add new 760.3(K) to read as follows:

(K) Bushing. A bushing shall be installed where cables emerge from raceway used for mechanical support or protection in accordance with 300.15(C).
Panel Statement: Placing text here eliminates unnecessary cross referencing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

STENE, S.: The submitter did not provide any technical substantiation that cables were being damaged where installed as open cables with a transition into a raceway. In addition, Section 300.15(C) requires a fitting be used where the cable enters into a raceway or a sleeve without a transition box but the accepted text in the Comment requires a bushing. Bushings only apply where the conductors emerge from a raceway and enter or terminate at equipment, such as open switchboards, unenclosed control equipment, or similar equipment as noted in Section 300.16(B). A bushing at the end of a raceway may not be appropriate for an installation where EMT is stubbed up through a wall and then used as a sleeve for the cable to enter from the drop ceiling. Based on 300.15(C), a fitting is required where a box is not installed at the transition point, not a bushing.

3-182 Log #2042 NEC-P03 **Final Action: Reject**
(760.53(A))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-273
Recommendation: Accept proposal 3-273 or revise 760.53 to clarify requirements.
Substantiation: 760.53 is covered in an Exception to 760.46, so additional text is needed.

[760.46 Installation of non–power-limited fire alarm circuits shall be in accordance with 110.3(B), 300.7, 300.11, 300.15, 300.17, and other appropriate articles of Chapter 3.

Exception No. 1: As provided in 760.48 through 760.53.

Exception No. 2: Where other articles of this Code require other methods.]
Panel Meeting Action: Reject
Panel Statement: Section 760.46 requires compliance with the requirements in 110.3(B), 300.7, 300.11, 300.15, 300.17, and other appropriate articles in Chapter 3. Section 760.46, Exception No. 1 is providing additional requirements where multiconductor NPLFA cables are installed since the requirements in Article 300 and the other wiring method Articles in Chapter 3 do not specifically cover multiconductor NPLFA cables.

(760.53(B) and 760.53(C))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-276
Recommendation: 760.53(A) does not change.

760.53(B) Revise text as shown.

760.53(C).Add new text as shown.

760.53 Multiconductor NPLFA Cables.

Multiconductor non–power-limited fire alarm cables that meet the requirements of 760.176 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 760.53(A) and (B).

(B) Applications of Listed NPLFA Cables. The use of non–power-limited fire alarm circuit cables shall comply with 760.53(B)(1) through (B)(4) and shall be permitted to have suffixes in accordance with 760.53(C).

(1) Ducts and Plenums. Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts or plenums.

FPN: See 300.22(B).

(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type NPLFP.

Exception No. 1: Types NPLFR and NPLF cables installed in compliance with 300.22(C).

Exception No. 2: Other wiring methods in accordance with 300.22(C) and conductors in compliance with 760.49(C).

~~Exception No. 3: Type NPLFP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable~~.

(3) Riser. Cables installed in vertical runs and penetrating more than one floor or cables installed in vertical runs in a shaft shall be Type NPLFR. Floor penetrations requiring Type NPLFR shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type NPLF or other cables that are specified in Chapter 3 and are in compliance with 760.49(C) and encased in metal raceway.

Exception No. 2: Type NPLF cables located in a fireproof shaft having firestops at each floor.

FPN: See 300.21 for firestop requirements for floor penetrations.

~~Exception No. 3: Type NPLF-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~

(4) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 760.53(B)(1), (B)(2), and (B)(3) shall be Type NPLF.

Exception No. 1: Chapter 3 wiring methods with conductors in compliance with 760.49(C).

Exception No. 2: Type NPLFP or Type NPLFR cables shall be permitted.

~~Exception No. 3: Type NPLFR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable~~.

(C) Non-Power-Limited Cables With Suffix Markings. Non-power-limited cables with single or multiple suffix markings shall be permitted where required to meet special applications.

(1) Non-Power-Limited Cables or Electrical Circuit Protective System. Non-power-Limited circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in fire alarm systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.

(2) Non-Power-Limited Cables for Wet Locations. Non-power-limited cables installed in wet locations shall be Types NPLF-WET, NPLFR-WET, or NPLFP-WET.

(3) Non-Power-Limited Cables Exposed to Direct Sunlight. Non-power-limited Cables installed exposed to direct sunlight shall be Types NPLF-SR, NPLFR-SR, or NPLFP-SR.

(4) Non-Power-Limited Fire Hazard Cables. Non-power-limited fire hazard cables installed to provide low flame spread, very-low-smoke, and known

potential heat release shall be Types NPLF-FHC, NPLFR-FHC, or NPLFP-FHC.
(5) Non-Power-Limited Very-Low-Smoke Producing Cables. Non-power-limited very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be Types NPLF-50, NPLFR-50, or NPLFP-50.
(6) Non-Power-Limited Cables in Corrosive Locations. Non-power-limited cables installed where exposed to oil shall be Types NPLF-PR, NPLFR-PR, or NPLFP-PR. Non-power-limited cables installed where exposed to gas and oil shall be Types NPLF-GR, NPLFR-GR, or NPLFP-PR-GR.
Substantiation: This comment provides the application missing from the proposal, as noted by Panel 3.
Panel Meeting Action: Reject
Panel Statement: This information is found in the listing requirements for 110.3(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: None of the suggested changes in the proposal or the comment deal with applications; all are dealing with markings more appropriately covered in 760.176. This applications section is designed to provide information where a particular cable can be installed. For example, "a nonpower-limited fire alarm cable listed for wet locations shall be permitted to be installed in an underground installation." The marking requirement would then be located in 760.176 with the installation requirements located in Part II of Article 760. This proposal does not provide any application for any of the proposed cables and there are no installation requirements for these cables. Suffix markings are already permitted on cables based on the listing standards and the product marking guide for UL Category HNHT on page 154 of the 2009 UL White Book.

3-185 Log #2044 NEC-P03 **Final Action: Accept in Principle**
(760.53(B)(1))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-277
Recommendation: Accept Proposal 3-277 or clarify requirements.
Substantiation: Power-limited cable is permitted to use non-power-limited cable. Power-limited circuits are permitted in air ducts. Non-power-limited circuits installed using non-power-limited cable is prohibited from being installed in an air duct. The question: If a power-limited circuit is installed using non-power-limited cable, can the cable be installed in an air duct?
Panel Meeting Action: Accept in Principle
Revise 760.53(B)(1) as follows:
(1) Ducts ~~and Plenums~~**.** Multiconductor non–power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts ~~or plenums~~.
Panel Statement: The panel accepts Comment 3-185 in principle and revises 760.53(B)(1) to clarify that NPFLA Cables are not permitted to be installed in ducts and to correlate with the changes made to section 300.22 by Proposal 3-94.
The technical correlating committee should be aware that other sections of the code may be affected by the Proposal 3-94 changes.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-186 Log #628 NEC-P03 **Final Action: Reject**
(760.53(B)(3))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-278
Recommendation: Reconsider and accept this proposal.
Substantiation: The Communications Cable & Connectivity Association requests that the panel reconsider and accept this proposal.
This proposal in one of a group of similar proposals that were submitted to Panels 3 and 16. The ROP actions were.

Proposal No.	Section	Action
3-201	725.154(B)(1)	Reject
3-278	760.53(B)(3)	Reject
16-62	770.154(B)(1)	Accept in Principle
16-179	800.154(B)(1)	Accept in Principle
16-282	820.154(B)(1)	Accept in Principle
16-338	830.151(B)	Accept in Principle
16-341	830.154(B)(1)	Accept in Principle

Acceptance of this proposal will greatly simplify installations. We agree with the ballot comment Mr. Gerald Dorna submitted with his affirmative vote on Proposal 16-62. (He had similar affirmative ballot comments on all the companion proposals.) His statement was:
The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".
Section 770.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.
Panel Meeting Action: Reject
Panel Statement: The current wording adequately expresses the intent of the panel. No new substantiation has been provided.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
KEDEN, R.: My negative vote pertains to the committee actions on the comments 3-121, 3-122, 3-186, 3-187, 3-200 and 3-201. The proposals and comments to the issue included the technical substantiations and the discussions in CMP-3 have not convinced me or changed my vote.
The panel statement noted that CMP 3 actions to reject proposals 3-201, 3-278 and 3-301, as well as the aforementioned comments result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16).
Different wiring rules in Articles 725 and 760 versus Articles 770,800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to that time, CMP 16 was responsible to Article 725, 760, 770, 800, 810, 820 and 830. Today, there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820 and 830).
However, this issue does not warrant different treatment in my opinion; CMP-3 should have accepted this Comment.
OWEN, S.: My negative vote pertains to the committee action on comments 3-121, 3-122, 3-186, 3-187, 3-200, 3-201 and proposals 3-201, 3-278, 3-301. The panel statement noted that CMP 3 actions to reject these comments and proposals result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP 3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16). Different rules in Articles 725 and 760 versus Articles 770, 800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to the time, CMP 6 was responsible to Article 725, 760, 770, 800, 810, 820, and 830. Today there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820, and 830). I do not believe that this issue warrants different treatment. My negative vote pertains to the committee action on comments 3-121, 3-122, 3-186, 3-187, 3-200, 3-201, 3-278, 3-301. The panel statement noted that CMP 3 actions to reject these proposals result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP 3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16). Different rules in Articles 725 and 760 versus Articles 770, 800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to the time, CMP 6 was responsible to Article 725, 760, 770, 800, 810, 820, and 830. Today there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820, and 830). I do not believe that this issue warrants different treatment.
Comment on Affirmative:
STENE, S.: There was no technical substantiation submitted with the proposal, just a question about whether this was what was intended. The text is not complicated since it requires a riser cable where the cable penetrates more than one floor. If the cable goes from the first floor to the third floor, then a riser cable is required. If the cable is installed in a metal raceway, then riser cable is not required but the metal raceway would normally require fire proofing at each floor.
The submitter could initiate a fact finding study for the 2014 NEC to determine if there is any validity of requiring a riser cable be used for every floor penetration, rather than multiple floor penetrations. The fire test for riser cables is located in UL 1666, The Standard for Safety Test for Flame Propagation Height of Electrical and Optical Fiber Cables Installed Vertically in Shafts.
The following is the Scope of UL 1666: 1 Scope
1.1 This is a fire test for determining values of flame propagation height for

electrical and optical-fiber cables that are for installation vertically in shafts or in vertical runs that penetrate more than one floor.
1.2 The purpose of this test is to determine whether the flame propagation characteristics of these "riser" cables are in accordance with the National Electrical Code.
1.3 This test does not investigate the toxicity or corrosivity of the products of combustion or decomposition.
1.4 This test does not cover the construction requirements for any cable or the electrical, optical, and other performance requirements for any cable.

3-187 Log #922 NEC-P03 **Final Action: Reject**
(760.53(B)(3))

Submitter: Ray R. Keden, ERICO, Inc. / Rep. BICSI
Comment on Proposal No: 3-278
Recommendation: We ask Panel 3 to re-consider their rejection of the following revision: "Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~ or cables installed in vertical runs in a shaft shall be Type NPLFR." (No change to the remainder of the section).
Substantiation: Our recommendation will prohibit the installation of non-riser rated cables between floors. Following is additional substantiation:

- One argument for rejection in the Panel 3 discussion was that it should be possible to use General Use Cable in one- and two-family dwellings (e.g., to connect the basement with the ground floor). 800.154 (B)(3) permits this in risers by stating: "Type CM and CMX cable shall be permitted in one- and two-family dwellings".
- The current Code language theoretically permits that a 10-story building is cabled completely with General Use Cable in the riser if the cable is terminated in every floor. Then each cable only connects two floors.
- Panel 16 has accepted a similar proposal (16-179).

Panel Meeting Action: Reject
Panel Statement: The current wording adequately expresses the intent of the panel. No new substantiation has been provided that alters the position of the panel.
The Code requires a riser cable where the cable penetrates more than one floor. If the cable goes from the first floor to the third floor, then a riser cable is required.
A fact finding study should be initiated for the 2014 NEC to determine scientifically if there is any validity of requiring a riser cable be used for every floor penetration rather than multiple floor penetrations. The fire test for riser cables is located in UL 1666, The Standard for Safety Test for Flame Propagation Height of Electrical and Optical Fiber Cables Installed Vertically in Shafts.
It is recommended that the technical correlating committee take note that Panel 16 has accepted this change and correlation may be needed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

KEDEN, R.: My negative vote pertains to the committee actions on the comments 3-121, 3-122, 3-186, 3-187, 3-200 and 3-201. The proposals and comments to the issue included the technical substantiations and the discussions in CMP-3 have not convinced me or changed my vote.

The panel statement noted that CMP 3 actions to reject proposals 3-201, 3-278 and 3-301, as well as the aforementioned comments result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16).

Different wiring rules in Articles 725 and 760 versus Articles 770,800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to that time, CMP 16 was responsible to Article 725, 760, 770, 800, 810, 820 and 830. Today, there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820 and 830).

However, this issue does not warrant different treatment in my opinion; CMP-3 should have accepted this Comment.

OWEN, S.: My negative vote pertains to the committee action on comments 3-121, 3-122, 3-186, 3-187, 3-200, 3-201 and proposals 3-201, 3-278, 3-301. The panel statement noted that CMP 3 actions to reject these comments and proposals result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP 3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16). Different rules in Articles 725 and 760 versus Articles 770, 800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to the time, CMP 6 was responsible to Article 725, 760, 770, 800, 810, 820, and 830. Today there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820, and 830). I do not believe that this issue warrants different treatment.

WHISTLER, W.: By allowing general purpose cable to be daisy chained from floor to floor, we are circumventing the intended use of this cable, as I can terminate the cable on each floor and then go to the next floor forming a bundle of cables that now create the very thing we are trying to prevent. Riser cable is designed to minimize the spread of fire when penetrating floors and properly installed and general purpose cable was designed for horizontal cabling not vertical.

3-188 Log #1073 NEC-P03 **Final Action: Accept in Principle**
(760.121)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-280
Recommendation: The accepted text should be revised to read: "A branch circuit that is used only for fire alarm equipment ~~An individual branch circuit~~ shall be required for the power source." (Remainder unchanged).
Substantiation: The panel statement includes a definition of an individual branch circuit and then says that this individual branch circuit can supply multiple pieces of the same equipment. If the panel interpretation on this point is correct, then I could use one individual branch circuit to supply more than one of anything as long as they are the same. This is a direct contradiction to the definition of individual branch circuit which says "only one utilization equipment." For example, where the fire alarm panel is in one enclosure and the battery charger or other auxiliary power supply or other related equipment is in another, they are often separate items of utilization equipment. A single circuit could be used according to the panel statement of intent, but this circuit is no longer an individual branch circuit. In fact, an identical requirement for NPLFA circuits was also accepted. Literally, since each power supply has to have an "individual branch circuit" many fire alarm panels would require two individual branch circuits since many appliance circuits are NPLFA while PLFA initiating circuits are supplied by the same panel. Apparently the panel is disregarding the definitions of "one" and "utilization equipment." As soon as more than one utilization equipment is connected, the circuit is no longer an individual branch circuit. The panel is correct that there is no definition of "dedicated circuit" even though many proposals have been made to add one. So the panel should say what they mean or accept the Exception in the original proposal to allow more than one item of fire alarm utilization equipment to be supplied by the same circuit. This comment is intended to have the code actually say what the panel said they meant. Alternatively, the panel should accept the revision as proposed in the comment on affirmative by Mr. Ayer. This would eliminate duplicated language in 760-41 and 760-121 and does not use the incorrect term individual branch circuit.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 3-189 which meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-189 Log #1430 NEC-P03 **Final Action: Accept in Principle**
(760.121)

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 3-280
Recommendation: Revise the panel's action as follows:
(B) Branch Circuit. An individual branch circuit shall be required for the supply of the power source. The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control panel. The circuit disconnecting means shall have a red marking, shall be accessible only to authorized personnel, and shall be identified as "FIRE ALARM CIRCUIT.
Substantiation: NFPA 72 is included by reference in most building codes. This means that, unlike the pattern for referenced documents in the NEC, it is a mandatory part of those building codes. So, if the NEC "permits" fire alarm circuits to be locked on and other codes require it, there will be a direct code conflict.

Having enforced NFPA 72's locking and marking requirements for years, I have seen no problems with them and have found them to be a useful set of requirements. They help to locate the fire alarm circuit. They help keep other wiring off the circuit. They help to keep the vital circuit energized. And, help avoid unnecessary trouble signals.
Panel Meeting Action: Accept in Principle
Revise the panel action of Proposal 3-280 to read as follows:
(B) Branch Circuit. The branch circuit supplying the fire alarm equipment(s) shall supply no other loads. The location of the branch circuit overcurrent protective device shall be permanently identified at the fire alarm control unit. The circuit disconnecting means shall have red identification, shall be accessible only to qualified personnel, and shall be identified as "FIRE ALARM CIRCUIT." The red identification shall not damage the overcurrent protective devices or obscure the manufacturer's markings. This branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.
Panel Statement: Requiring the fire alarm circuit disconnecting means to have red identification was accepted. Information was also added to caution against degrading equipment due to identification. The panel accepted the phrase "is to be identified as FIRE ALARM CIRCUIT". The panel did not accept use of the term "authorized" and instead inserted "qualified" as a defined term.
Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-190 Log #2045 NEC-P03 **Final Action: Accept in Principle**
(760.130(B))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-286
Recommendation: Accept Proposal 3-286.
Substantiation: Jobs are being installed with no bushing on cut lengths of raceway. It is important to require a bushing to prevent damage to conductor insulation. While this may be a redundant requirement, it is a very important requirement.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 3-181.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
STENE, S.: The submitter did not provide any technical substantiation that cables were being damaged where installed as open cables with a transition into a raceway. In addition, Section 300.15(C) requires a fitting be used where the cable enters into a raceway or a sleeve without a transition box but the accepted text in the Comment requires a bushing. Bushings only apply where the conductors emerge from a raceway and enter or terminate at equipment, such as open switchboards, unenclosed control equipment, or similar equipment as noted in Section 300.16(B). A bushing at the end of a raceway may not be appropriate for an installation where EMT is stubbed up through a wall and then used as a sleeve for the cable to enter from the drop ceiling. Based on 300.15(C), a fitting is required where a box is not installed at the transition point, not a bushing.
Adding a requirement for a bushing in a new subsection 760.130(B)(4) is unnecessary since the base requirement in 760.130(B) in the existing NEC already requires compliance for installations of PLFA wiring with 300.15.

3-191 Log #2046 NEC-P03 **Final Action: Reject**
(760.130(B))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-287
Recommendation: Accept Proposal 3-287.
Substantiation: This section does not address raceway fill. The Panel needs to clarify that power-limited cables installed in a short length of raceway (e.g., EMT) used for mechanical support shall or shall not have to meet raceway fill requirements.
Panel Meeting Action: Reject
Panel Statement: Inserting the raceway fill requirement of 300.17 for power-limited cables and individual conductors in 760.3(J), based on the Panel Action in Proposal 3-244 text as amended, will help alleviate the issue of over-filling a raceway and the subsequent pull stress on conductor and cable insulation. Conductor insulation is often stressed during the process of pulling the conductors into the raceway causing ground faults that are registered in the fire alarm equipment as a ground trouble signal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: Text covering 300.17 is already in 760.46 for non-power-limited fire alarm circuits and in 760.130(A) for power-limited fire alarm systems where using non-power-limited fire alarm wiring methods and materials on the load side of PLFA power sources.

3-192 Log #784 NEC-P03 **Final Action: Reject**
(760.130(B)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-289
Recommendation: Accept the proposal with the following revisions:
(B)(1) In approved raceways, auxiliary gutters, or exposed. Splices and taps shall be made in fittings, boxes, fire alarm system device enclosures, or other approved enclosures. In accordance with 110.3, exposed cables shall be securely fastened to supports by staples, cable ties, straps, hangers or similar fittings designed and installed so as not to damage the cable, at intervals not to exceed 1.4 m (4 1/2 ft) and within 300 mm (12 in.) of terminations.
Where likely to be subject to physical damage, or where installed exposed less than 2.1m (7 ft) above the floor or other standing surface, cables shall be protected by approved means. Exception: Fire alarm cables shall not require intermediate support for that portion fished between access points in concealed locations in finished buildings or other structures and supporting is impractical.
Substantiation: Raceways should be approved for the use so as not to imply "Uses not permitted" is amended. Support requirements are usually specified for wiring methods less critical for safety. The present text says nothing about fished cables.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any substantiation for the questions and issues covered in the Panel Statement in the proposal. Exposed does not apply to individual conductors, only to cables so the proposed change is inappropriate for the application of individual conductors and cables are already covered. "Adequately supported," "adequately protected" and "equivalent" are all providing requirements that an AHJ can use to make a determination of compliance based on the installation. The proposed exception is not required since the existing text in (B)(1) already covers fished cables in a concealed location and fishing individual conductors would not be acceptable. There was no technical substantiation provided for the suggested changes in (B)(2) and standing surface is not explained in the mandatory text or in the substantiation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-300
Recommendation: Delete text from 760.154(A), 760.154(B), and 760.154(C).
Add new 760.154(E).
760.154(D) does not change.
760.154 Applications of Listed PLFA Cables.
PLFA cables shall comply with the requirements described in either 760.154(A), (B), or (C) or where cable substitutions are made as shown in 760.154(D) or have suffixes in accordance with 760.154(E) requirements.
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable ~~shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~
(B) Riser. Cables installed in risers shall be as described in either (1), (2), or (3):
(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a ~~2-hour circuit integrity rated cable.~~
(2) Other cables shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.
(3) Type FPL cable shall be permitted in one- and two-family dwellings.
FPN: See 300.21 for firestop requirements for floor penetrations.
(C) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 760.154(A) or (B) shall be as described in either (C)(1), (C)(2), (C)(3), or (C)(4). Type FPL-CI cable shall be permitted to be ~~installed as described in either (C)(1), (C)(2), (C)(3), or (C)(4) to provide a 2-hour circuit integrity rated cable.~~
(1) General. Type FPL shall be permitted.
(2) In Raceways. Cables shall be permitted to be installed in raceways.
(3) Nonconcealed Spaces. Cables specified in Chapter 3 and meeting the requirements of 760.179(A) and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).
(4) Portable Fire Alarm System. A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.
(E) Power-Limited Cables With Suffix Markings. Power-limited cables with single or multiple suffix markings shall be permitted where required to meet special applications.
(1) Power-Limited Cables or Electrical Circuit Protective System. Power-Limited circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in fire alarm systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.
(2) Power-Limited Cables for Wet Locations. Power-limited cables installed in wet locations shall be Types FPL-WET, FPLR-WET, or FPLP-WET.
(3) Power-Limited Cables Exposed to Direct Sunlight. Power-limited Cables installed exposed to direct sunlight shall be Types FPL-SR, FPLR-SR, or FPLP-SR.
(4) Power-Limited Fire Hazard Cables. Power-limited fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be Types FPL-FHC, FPLR-FHC or FPLP-FHC.
(5) Power-Limited Very-Low-Smoke Producing Cables. Power-limited very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be Types FPL-50, FPLR-50, or FPLP-50
(6) Power-Limited Cables in Corrosive Locations. Power-limited cables installed where exposed to oil shall be Types FPL-PR, FPLR-PR, or FPLP-PR. Power-limited cables installed where exposed to oil shall be Types FPL-GR, FPLR-GR, or FPLP-GR.
Substantiation: This comment provides the application data missing from the proposal, as noted by Panel 3.
Panel Meeting Action: Reject
Panel Statement: This information is found in the listing requirements for 110.3(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: None of the suggested changes in the proposal or the comment deal with applications; all are dealing with markings more appropriately covered in 760.179. This applications section is designed to provide information where a particular cable can be installed. For example, "a power-limited fire alarm cable listed for wet locations shall be permitted to be installed in an underground installation." The marking requirement would then be located in 760.179 with the installation requirements located in Part III of Article 760. This proposal does not provide any application for any of the proposed cables and there are no installation requirements for these cables. Suffix markings are already permitted on cables based on the listing standards and the product marking guide for UL Category HNIR on page 154 and 155 of the 2009 UL White Book.

3-200 Log #629 NEC-P03 **Final Action: Reject**
(760.154(B)(1))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-301
Recommendation: Reconsider and accept this proposal.
Substantiation: The Communications Cable & Connectivity Association requests that the panel reconsider and accept this proposal.
This proposal in one of a group of similar proposals that were submitted to Panels 3 and 16. The ROP actions were.

Proposal No.	Section	Action
3-201	725.154(B)(1)	Reject
3-278	760.53(B)(3)	Reject
16-62	770.154(B)(1)	Accept in Principle
16-179	800.154(B)(1)	Accept in Principle
16-282	820.154(B)(1)	Accept in Principle
16-338	830.151(B)	Accept in Principle
16-341	830.154(B)(1)	Accept in Principle

We agree with Jerry Dorna's ballot comment:

The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".

Section 770.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.

The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 3-186.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

KEDEN, R.: My negative vote pertains to the committee actions on the comments 3-121, 3-122, 3-186, 3-187, 3-200 and 3-201. The proposals and comments to the issue included the technical substantiations and the discussions in CMP-3 have not convinced me or changed my vote.

The panel statement noted that CMP 3 actions to reject proposals 3-201, 3-278 and 3-301, as well as the aforementioned comments result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16).

Different wiring rules in Articles 725 and 760 versus Articles 770,800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to that time, CMP 16 was responsible to Article 725, 760, 770, 800, 810, 820 and 830. Today, there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820 and 830).

However, this issue does not warrant different treatment in my opinion; CMP-3 should have accepted this Comment.

OWEN, S.: My negative vote pertains to the committee action on comments 3-121, 3-122, 3-186, 3-187, 3-200, 3-201 and proposals 3-201, 3-278, 3-301. The panel statement noted that CMP 3 actions to reject these comments and proposals result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP 3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16). Different rules in Articles 725 and 760 versus Articles 770, 800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to the time, CMP 6 was responsible to Article 725, 760, 770, 800, 810, 820, and 830. Today there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820, and 830). I do not believe that this issue warrants different treatment.

3-201 Log #923 NEC-P03 **Final Action: Reject**
(760.154(B)(1))

Submitter: Ray R. Keden, ERICO, Inc. / Rep. BICSI
Comment on Proposal No: 3-301
Recommendation: We ask Panel 3 to re-consider their rejection of the following revision:
"Cables installed in vertical runs and penetrating one or more floors ~~more than one floor~~, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable."
Substantiation: Our recommendation will prohibit the installation of non-riser rated cables between floors. Following is additional substantiation:

- One argument for rejection in the Panel 3 discussion was that it should be possible to use General Use Cable in one- and two-family dwellings (e.g., to connect the basement with the ground floor). 800.154 (B)(3) permits this in risers by stating: "Type CM and CMX cable shall be permitted in one- and two-family dwellings".
- The current Code language theoretically permits that a 10-story building is cabled completely with General Use Cable in the riser if the cable is terminated in every floor. Then each cable only connects two floors.
- Panel 16 has accepted a similar proposal (16-179).

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 3-187.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

KEDEN, R.: My negative vote pertains to the committee actions on the comments 3-121, 3-122, 3-186, 3-187, 3-200 and 3-201. The proposals and comments to the issue included the technical substantiations and the discussions in CMP-3 have not convinced me or changed my vote.

The panel statement noted that CMP 3 actions to reject proposals 3-201, 3-278 and 3-301, as well as the aforementioned comments result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16).

Different wiring rules in Articles 725 and 760 versus Articles 770,800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to that time, CMP 16 was responsible to Article 725, 760, 770, 800, 810, 820 and 830. Today, there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820 and 830).

However, this issue does not warrant different treatment in my opinion; CMP-3 should have accepted this Comment.

OWEN, S.: My negative vote pertains to the committee action on comments 3-121, 3-122, 3-186, 3-187, 3-200, 3-201 and proposals 3-201, 3-278, 3-301. The panel statement noted that CMP 3 actions to reject these comments and proposals result in different wiring rules for Types CL2R, CL3R, NPLFR and FPLR (which are under the purview of CMP 3), and OFNR, OFCR, CMR, CATVR, BLR and BMR (which are under the purview of CMP 16). Different rules in Articles 725 and 760 versus Articles 770, 800, 820 and 830 are to be expected, and presumably were anticipated when the TCC and the Standards Council, three code cycles ago, reassigned responsibility for Article 725 and 760 to CMP 3. Prior to the time, CMP 6 was responsible to Article 725, 760, 770, 800, 810, 820, and 830. Today there are numerous differences between CMP 3's articles (725 and 760) and CMP 16's articles (770, 800, 820, and 830). I do not believe that this issue warrants different treatment.

3-202 Log #1337 NEC-P03 **Final Action: Accept**
(760.154(E) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-300
Recommendation: *Continue rejecting this proposal.*
Substantiation: The proposal introduces terms that are associated with fire testing/fire performance and are not defined anywhere. Therefore, not only does no application exist (as CMP 3 correctly pointed out) but no organization has developed criteria for such fire performance.

Non power limited fire alarm cables in the NEC can be listed as complying with one of the following 3 categories: NPLFP (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), NPLFR (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), and NPLF (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581).

Nowhere does a definition exist for "very-low-smoke producing cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.

Nowhere does a definition exist for "fire hazard cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-203 Log #630 NEC-P03 **Final Action: Accept**
(760.176(C), FPN)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-304
Recommendation: Continue to reject this proposal.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to reject this proposal and recommends that the panel continue to reject it.

A fine print note giving information on fire testing of plenum cable has been in the NEC since the 1984 edition. It has undergone only minor editorial changes since 1984. It provides extremely useful to cable manufacturers. The proposed change would remove essential information.
Panel Meeting Action: Accept
Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

3-204 Log #631 NEC-P03 **Final Action: Accept**
(760.176(C), FPN)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-306
Recommendation: Continue to reject this proposal.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel that this FPN information is valuable for the user of the code and the user should not have to go back to an annex to find it.

We also support the panel in rejecting similar Proposals 3-308, 3-310, 3-311, 3-325, 3-327, 3-329, 3-330 and 3-332, all for Article 760.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-205 Log #731 NEC-P03 **Final Action: Accept in Part**
(760.176(C), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 3-304
Recommendation: The Proposal should have been Accepted in Principle, revised and the following words "and Annex A Explanatory Material" added after "NFPA 262-2007" so the revised text reads as follows:
~~FPN~~ Informational Note: One method of defining low smoke-producing cable and fire-resistant cable is ~~by establishing an acceptable value of the smoke produced when tested in accordance with~~ described in NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, and Annex A Explanatory Material. ~~, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
Substantiation: The FPN does not provide "information on various methods of defining smoke producing cables or fire-resistant cables". It refers to a single test method and defines the maximum values, which are not specified in the body of NFPA 262. Inclusion of the maximum values in the FPN are requirements and this violates 3.1.3 of the NEC Style Manual.

NFPA 262 defines the Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces but it does not specify any pass/fail criteria.

While the values specified for maximum peak optical density, maximum average optical density, and maximum allowable flame travel distance in the FPN are not included in the body of NFPA 262, they are contained in Annex A Explanatory Material. Addition of the words "and Annex A Explanatory Material" will reference the maximum values that are in the FPN and the proposed revised FPN will comply with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.
Panel Meeting Action: Accept in Part
The panel accepts the change "FPN" to "Informational Note" and rejects the remainder of the recommendation.
Panel Statement: The text proposed for deletion can be used to support the requirement. The explanatory material in this informational note is one method and not the only method of defining this cable and therefore is not mandatory text. The submitter has provided new text that has not received public review.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-206 Log #1328 NEC-P03 **Final Action: Accept in Principle**
(760.176(C), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-305
Recommendation: 760.176 Listing and Marking of NPLFA Cables.
Non–power-limited fire alarm cables installed as wiring within buildings shall be listed in accordance with 760.176(A) and (B) and as being resistant to the spread of fire in accordance with 760.176(C) through (F), and shall be marked in accordance with 760.176(G). Cable used in a wet location shall be listed for use in wet locations or have a moisture impervious metal sheath.

(C) Type NPLFP. Type NPLFP non–power-limited fire alarm cable for use in other space used for environmental air shall be listed as being suitable for use in other space used for environmental air as described in 300.22(C) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.
Substantiation: Retain the FPN as written by CMP 3, but only if the FPNs from CMP 16 are changed to the same language. This comment is being written just in case CMP 3 is unwilling to change to existing NEC language.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 3-207 which meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

3-207 Log #1329 NEC-P03 **Final Action: Accept**
(760.176(C), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-305
Recommendation: 760.176 Listing and Marking of NPLFA Cables.
Non–power-limited fire alarm cables installed as wiring within buildings shall be listed in accordance with 760.176(A) and (B) and as being resistant to the spread of fire in accordance with 760.176(C) through (F), and shall be marked in accordance with 760.176(G). Cable used in a wet location shall be listed for use in wet locations or have a moisture impervious metal sheath.

(C) Type NPLFP. Type NPLFP non–power-limited fire alarm cable for use in other space used for environmental air shall be listed as being suitable for use in other space used for environmental air as described in 300.22(C) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

~~FPN: One method of defining low smoke-producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.~~

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.
Substantiation: This comment is intended to bring consistency to the NEC. In Articles 770, 800, 820 and 830, the FPN is worded as this comment (and the original proposal) recommends. The original proposal was already made in the 2005 and 2008 NEC cycles, but was caught up in the "plenum cable moratorium" in the opinion of CMP 3 but not of CMP 16. This wording also follows the requirements of the preceding section, which requires that the cable be listed as having both "adequate fire-resistant and low smoke-producing characteristics". The wording of the panel (although adequate also) does not explain what is needed to define a cable that is a "low smoke-producing and fire-resistant cable" by omitting the words "a cable that is".

With regard to the comment by Mr. Ayers, I agree with him, but the (incorrect) use of the term "fire-resistant cable" is consistent in not just the FPNs in all 6 relevant articles (725, 760, 770, 800, 820 and 830) but is also consistent with the use in the charging paragraph.

If CMP 3 and CMP 16 would both like to eliminate the term "fire-resistant cable", consistently in all locations, and replace it by a term such as "low flame spread cable", that would be an excellent idea, but it does require consistency (and probably a task group of both panels). In the meantime the use of the term "fire-resistant cable" is necessary to correlate with the charging paragraph.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

(760.176(C), FPN)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 3-306
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that this "information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject

Comment on Affirmative:
STENE, S.: Marking requirements for cable temperatures in excess of 60 C is already covered by the UL product standard UL 1425, covering non-power-limited fire alarm cables. These cables are available based on the standard requirements for temperatures up to 250 C or 482 F. Where an application occurs with a temperature in excess of 140 F, a corresponding cable requirement would be to install a cable with a high enough temperature rating for the ambient temperature. Non-power-limited fire alarm cables would have very limited exposure to higher than normal ambient temperature and would certainly be installed in a very limited length in a metal wiring method within a fabricated duct based on 300.22(B)

Non-power-limited fire alarm cables are intended for use and tested for an operating temperature of 60 C, unless a higher temperature rating is marked on the cable. Section 1.1 of UL 1425 reads as follows: "This Standard states the construction, test, and marking requirements covering the safety of electrical and electrical/optical-fiber cables rated 60°C to 250°C and intended for 150-volt and lower-potential non-power-limited circuits that are controlled and powered by a fire-alarm system."

Where a high ambient temperature is encountered in the installation of non-power-limited fire alarm cables and conductors, higher temperature cables can be required, obtained, and installed. There was no technical substantiation provided to justify adding this requirement to the NEC.

Where a low ambient temperature is encountered, non-power-limited fire alarm cables can be purchased that have been subjected to a cold bend test to ensure bending capability for cold temperatures down to minus 70 C, however, this is not an installation temperature; it is an application temperature. Once the cable has been installed and connected, there would not normally be any bending of the conductor insulation. Again, the standard provides testing for this but there has been no substantiation provided to insert this into the NEC. In addition, the phrase the `lowest permitted temperature' does not have any meaning in an installation document such as the NEC.

(760.176(L) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-319
Recommendation: *Continue rejecting this proposal.*
Substantiation: The proposal introduces a definition of a term that is associated with fire testing/fire performance and is not defined anywhere. Therefore, not only does no application exist (as CMP 3 correctly pointed out) but no organization has developed criteria for such fire performance.

Non power limited fire alarm cables in the NEC can be listed as complying with one of the following 3 categories: NPLFP (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), NPLFR (i.e. cables listed as riser cables and that comply with the requirements of UL 1666) and NPLF (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581).

Nowhere does a definition exist for "very-low-smoke producing cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable. The proposed fire properties recommended for such a listing do not correspond to any listing developed by a nationally recognized listing organization, even when optional listings are taken into account. UL has developed UL Subject 2424, "Outline of Investigation for Cable Marked "Limited Combustible", which contains a set of listing criteria for which no application exists, but this document requires that cables also be tested in accordance with NFPA 259.

Cables listed to UL 2424 are already allowed by NFPA 90A to be used anywhere that plenum cables are required.

Both NFPA 90A and the mechanical codes (the IMC, International Mechanical Code, and the UMC, Uniform Mechanical Code) have requirements of 25/50 (flame spread index/smoke developed index, in accordance with ASTM E 84) for materials in plenums other than wires and cables (and some other materials). NFPA 13 (sprinkler standard) also made it clear that the use of plenum cables in plenums does not even introduce a fire hazard sufficient to require installation of sprinklers.

STENE, S.: Based on the lack of any applications provided in proposals for 760.154, other than marking requirements, for dry, damp, wet, sunlight resistance, corrosive locations, very low smoke producing cables, and fire hazard cables, acceptance of listing requirements for these cables cannot be accepted in 760.179. In addition, nothing has been added covering these different cable types to the installation requirements in Part III of Article 760. Previous proposals by this submitter were provided to 760.3 for dry, damp, wet, sunlight resistance, corrosive locations, very low smoke producing cables, and fire hazard cables, to require compliance with 760.154 without any application information and no installation requirements.

3-228 Log #735 NEC-P03 **Final Action: Accept in Part**
(760.179(D), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 3-323
Recommendation: The Proposal should have been Accepted in Principle, revised and the following words "and Annex A Explanatory Material" added after "NFPA 262-2007" so the revised text reads as follows:
~~FPN~~ Informational Note: One method of defining low smoke-producing cable and fire-resistant cable is ~~by establishing an acceptable value of the smoke produced when tested in accordance with~~ described in NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, and Annex A Explanatory Material. ~~, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
Substantiation: The FPN does not provide "information on various methods of defining smoke producing cables or fire-resistant cables". It refers to a single test method and defines the maximum values, which are not specified in the body of NFPA 262. Inclusion of the maximum values in the FPN are requirements and this violates 3.1.3 of the NEC Style Manual.

NFPA 262 defines the Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces but it does not specify any pass/fail criteria.

While the values specified for maximum peak optical density, maximum average optical density, and maximum allowable flame travel distance in the FPN are not included in the body of NFPA 262, they are contained in Annex A Explanatory Material. Addition of the words "and Annex A Explanatory Material" will reference the maximum values that are in the FPN and the proposed revised FPN will comply with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.
Panel Meeting Action: Accept in Part

The panel accepts the change "FPN" to "Informational Note" and rejects the remainder of the recommendation.
Panel Statement: The text proposed for deletion can be used to support the requirement. The explanatory material in this informational note is one method and not the only method of defining this cable and therefore is not mandatory text. The submitter has provided new text that has not received public review.

(D) Type FPLP. Type FPLP power-limited fire alarm plenum cable shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

~~FPN: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.~~

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.
Substantiation: This comment is intended to bring consistency to the NEC. In Articles 770, 800, 820 and 830, the FPN is worded as this comment (and the original proposal) recommends. The original proposal was already made in the 2005 and 2008 NEC cycles, but was caught up in the "plenum cable moratorium" in the opinion of CMP 3 but not of CMP 16. This wording also follows the requirements of the preceding section, which requires that the cable be listed as having both "adequate fire-resistant and low smoke-producing characteristics". The wording of the panel (although adequate also) does not explain what is needed to define a cable that is a "low smoke-producing and fire-resistant cable" by omitting the words "a cable that is".

With regard to the comment by Mr. Ayers, I agree with him, but the (incorrect) use of the term "fire-resistant cable" is consistent in not just the

FPNs in all 6 relevant articles (725, 760, 770, 800, 820 and 830) but is also consistent with the use in the charging paragraph.

If CMP 3 and CMP 16 would both like to eliminate the term "fire-resistant cable", consistently in all locations, and replace it by a term such as "low flame spread cable", that would be an excellent idea, but it does require consistency (and probably a task group of both panels). In the meantime the use of the term "fire-resistant cable" is necessary to correlate with the charging paragraph.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.

Ballot Results: Affirmative: 15

3-239 Log #2838 NEC-P03 **Final Action: Reject**
(760.179(G), FPN 2)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 3-330
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that this "information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. 3-241 Log #2059 NEC-P03 **Final Action: Reject**
(760.179(K) and FPN (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 3-334
Recommendation: Add new 760.179(K) and FPN as follows:
(K) Power-Limited Fire Alarm Cables Installed Exposed to Oil or Gas. Power-limited fire alarm cables installed where exposed to oil or gas and oil shall have the additional classification using the following suffixes "-PR" for oil resistant, and "-GR" for gasoline and oil resistant.
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: There is a companion comment to establish application requirements.
Panel Meeting Action: Reject
Panel Statement: This information is found in the listing requirements for 110.3(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
STENE, S.: Based on the lack of any applications provided in proposals for 760.154, other than marking requirements, for dry, damp, wet, sunlight resistance, corrosive locations, very low smoke producing cables, and fire hazard cables, acceptance of listing requirements for these cables cannot be accepted in 760.179. In addition, nothing has been added covering these different cable types to the installation requirements in Part III of Article 760. Previous proposals by this submitter were provided to 760.3 for dry, damp, wet, sunlight resistance, corrosive locations, very low smoke producing cables, and fire hazard cables, to require compliance with 760.154 without any application information and no installation requirements. There is no prohibition in the NEC for additional suffix marking so cables are already permitted to be marked to indicate their optional ratings.
Corrosive locations include more than gas or oil exposure without any technical information provided for the additional corrosive issues. The installer and inspector should rely on listing standard, UL1424 Cables for Power-Limited Fire Alarm Cable, to define markings with this information readily available in the UL White Book on page 30 and 31 in the Wiring and Cable Marking Guide.

3-245 Log #1341 NEC-P03 **Final Action: Accept**
(760.179(O) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-338
Recommendation: *Continue rejecting this proposal.*
Substantiation: The proposal introduces a definition of a term that is associated with fire testing/fire performance and is not defined anywhere. Therefore, not only does no application exist (as CMP 3 correctly pointed out) but no organization has developed criteria for such fire performance.

Power limited fire alarm cables in the NEC can be listed as complying with one of the following 3 categories: FPLP (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), FPLR (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), and FPL (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581).

Nowhere does a definition exist for "very-low-smoke producing cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable. The proposed fire properties recommended for such a listing do not correspond to any listing developed by a nationally recognized listing organization, even when optional listings are taken into account. UL has developed UL Subject 2424, "Outline of Investigation for Cable Marked "Limited Combustible", which contains a set of listing criteria for which no application exists, but this document requires that cables also be tested in accordance with NFPA 259.

Cables listed to UL 2424 are already allowed by NFPA 90A to be used anywhere that plenum cables are required.

Both NFPA 90A and the mechanical codes (the IMC, International Mechanical Code, and the UMC, Uniform Mechanical Code) have requirements of 25/50 (flame spread index/smoke developed index, in accordance with ASTM E 84) for materials in plenums other than wires and cables (and some other materials). NFPA 13 (sprinkler standard) also made it clear that the use of plenum cables in plenums does not even introduce a fire hazard sufficient to require installation of sprinklers.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 770 — OPTICAL FIBER CABLES AND RACEWAYS

16-2 Log #1267 NEC-P16 **Final Action: Accept in Principle**
(770)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 16-29
Recommendation: I highly encourage CMP-16 to accept this proposal in principle and accept the coordinated set of comments that provide the completed revisions throughout Article 770.
Substantiation: This comment responds to action by CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 770. The coordinated comments actually even correct misuse of grounding terms in a few locations that existed for a few cycles.

CMP-5 has responsibilities for defined grounding and bonding terms (Code wide). These proposed revisions are technically correct and result in grounding and bounding terms being used consistently with how they are defined. The term "grounding conductor" is too broad and has been part of a planned migration for removal since the 2005 edition. This planned revision is part of a larger plan implemented by the NEC-2008 TCC assigned grounding and bonding task group work. The grounding and bonding concepts are simple. If grounding happens, a connection is made to an electrode by use of a grounding electrode conductor. Bonding connected conductive parts to establish continuity and conductivity between them. The proposed revisions do not change anything technically in the article: they only make the use of grounding terms consistent with how they are defined, improving the current text. The only change proposed is in use of terms. All other rules such as sizing, installation and so forth remain as specified in this article as before.

Not accepting the proposed revisions shows a deliberate action to allow continued inconsistency and subjectivity to remain in the NEC. CMP-5 actions have deleted the term "grounding conductor" from Article 100 and revised the term "grounding electrode conductor" to work consistently with the requirements in Article 770. The term "grounding conductor" has been removed or replaced in Article 250 and other articles of the NEC. Not accepting the proposed revisions in the coordinated comments will result in the continued use of an orphaned term that is not specific and can lead to subjectivity. The proposed changes are technically correct and there have been no technical reasons brought forward to reject what is being proposed. I highly encourage CMP-16 to give strong consideration to the coordinated comments submitted that resolve these inconsistencies and improve clarity and usability within the limited energy articles with regards to grounding and bonding rules. The best approach in Code development is to look at the long range objectives and what would be best for the NEC. It needs to be practical, understandable, and enforceable. These proposed revisions are in the spirit of accomplishing all three of these objectives. It's not about who is right or wrong, it is about being successful and ending up with the best Code as a result.
Panel Meeting Action: Accept in Principle

OHDE, H.: See our affirmative comment for Comment 16-22.

16-3 Log #29 NEC-P16 **Final Action: Reject**
(770.2)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-10
Recommendation: Reject Proposal 16-10 and delete the definition of optical fiber raceway (including the FPN) in the current (2008) Code.
Substantiation: The purpose of the proposal was to distinguish between plenum, riser and general-purpose optical fiber raceway and a chapter 3 raceway that has an optical fiber cable in it.

CMP 16 has begun simplifying the types of raceways by eliminating CATV raceways and permitting communications raceways to substitute for optical fiber raceways. The logical next step (next code cycle) would be to eliminate optical fiber raceways and use communications raceways as multipurpose raceways.

An optical fiber raceway is one of three types of raceway, 1) plenum optical fiber raceway, 2) riser optical fiber raceway or 3) general-purpose optical fiber raceway.

If the proposed definition of an optical fiber raceway violates the style manual, an alternative approach is to delete the current definition, which is wrong, and simply use the longer terms plenum optical fiber raceway, riser optical fiber raceway and general-purpose optical fiber raceway.
Panel Meeting Action: Reject
Panel Statement: The definition is needed.
See panel action and statement on Comment 16-10.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-4 Log #31 NEC-P16 **Final Action: Accept in Principle**
(770.2)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-9
Recommendation: Accept this proposal in principle by revising the definition of Conductive Optical Fiber Cable as follows:

Conductive Optical Fiber Cable. A factory assembly of one or more optical fibers, having an overall covering containing non–current-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.
Substantiation: The recommended definition does not contain the term "optical fiber cable" as directed by the Technical Correlating Committee.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:

Conductive Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering and containing non–current-carrying conductive member(s) such as metallic strength member(s), metallic vapor barrier(s), metallic armor or metallic sheath.
Panel Statement: The comma following "fibers" is superfluous.

Other editorial changes were made to remove the implication that the metallic components are specifically contained in the "overall covering". These changes meet the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-5 Log #32 NEC-P16 **Final Action: Accept in Principle**
(770.2)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-11
Recommendation: Accept this proposal in principle by revising the definition of Nonconductive Optical Fiber Cable as follows:

Nonconductive Optical Fiber Cable. A factory assembly of one or more optical fibers, having an overall covering containing no metallic members and no other electrically conductive materials.
Substantiation: The recommended definition does not contain the term "optical fiber cable" as directed by the Technical Correlating Committee.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:

Nonconductive Optical Fiber Cable, A factory assembly of one or more optical fibers having an overall covering and containing no electrically conductive materials.
Panel Statement: The comma following "fibers" is superfluous.

The panel revised the submitter's text for simplicity and clarity. These changes meet the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-6 Log #462 NEC-P16 **Final Action: Reject**
(770.2)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 16-5
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:

Cable Sheath. A covering over the optical fiber assembly that includes one or more jackets and ~~may include~~ optionally includes one or more metallic members or strength members.
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also

expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term may in this Section does not meet these criteria, it should be changed.

Panel Meeting Action: Reject

Panel Statement: The submitter is referencing the wrong definition. Proposal 16-5 does not pertain to "Cable Sheath"; it pertains to "Exposed (to Accidental Contact)".

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-7 Log #533 NEC-P16 **Final Action: Accept in Principle**
(770.2)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)

Comment on Proposal No: 16-12

Recommendation: Revise the definition as follows: "**770.2. Cable Routing Assembly.** A structural system consisting of a single or multiple units and associated fittings used to support and protect optical fiber, communications and data cables."

Substantiation: As indicated in my affirmative ballot comment, the definition is incomplete. The Panel also needs to accommodate the TCC Action. The proposed revisions contained in this comment will complete the definition and satisfy the TCC's concerns. The 'requirement' that the assembly be listed can be included in the appropriate sections of the various Articles, e.g. 770.113(A).

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Comment 16-8.

The text meets the submitter's intent.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-8 Log #1626 NEC-P16 **Final Action: Accept**
(770.2)

Submitter: Craig Sato, Underwriters Laboratories Inc.

Comment on Proposal No: 16-12

Recommendation: Accept Proposal 16-12 in principle and revise the definition of a Cable Routing Assembly as follows:

Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support, route and protect high densities of wires and cables, typically communications wires and cables, optical fiber and data (Class 2 and Class 3) cables associated with information technology and communications equipment.

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The TCC also directed that the proposed definition be rewritten to remove mandatory language. Accordingly, the recommend text no longer contains the word "listed".

The task group supports the panel action to shorten the name of the assembly by dropping "optical fiber/communications" and simply defining a "Cable Routing Assembly". The task group agrees with the sentiment expressed in the voting that the panel action may have over-simplified the definition
T he recommended text uses the term "channel" in the definition in order to distinguish a cable routing assembly from a cable tray.

"Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways." (From 392.2)

725	**Abandoned Class 2, Class 3, and PLTC Cable.** Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.	2002 NEC Comment 16-21 by Jensen	2002 NEC Proposal 16-32 by Jensen
760	**Abandoned Fire Alarm Cable.** Installed fire alarm cable that is not terminated at equipment **other than a connector** and not identified for future use with a tag.	2002 NEC Comment 16-131 by Jensen	2002 NEC Proposal 16-109 by Jensen
770	**Abandoned Optical Fiber Cable.** Installed optical fiber cable that is not terminated at equipment **other than a connector** and not identified for future use with a tag.	2002 NEC Comment 16-190 by Jensen	2002 NEC Proposal 16-154 by Jensen
800	**Abandoned Communications Cable.** Installed communications cable that is not terminated **at both ends at a connector or other equipment** and not identified for future use with a tag.	2002 NEC Comment 16-247 by Jensen	2002 NEC Proposal 16-189 by Jensen
820	**Abandoned Coaxial Cable.** Installed coaxial cable that is not terminated at equipment **other than a coaxial connector** and not identified for future use with a tag.	2002 NEC Comment 16-314 by Jensen	2002 NEC Proposal 16-273 by Jensen
830	**Abandoned Network-Powered Broadband Communications Cable.** Installed network-powered broadband communications cable that is not terminated at equipment **other than a connector** and not identified for future use with a tag.	2002 NEC Comment 16-370a by Kaufman	2002 NEC Proposal 16-364 by Hirschler

A single definition of “abandoned cable” is inappropriate to cover signaling, fire alarm, optical fiber, communications, CATV and network-powered broadband because each of these cable types has its own installation practices that must be accommodated in the definition of “abandoned cable” to avoid inappropriate and unnecessary removal.

(770.3)

Submitter: Code-Making Panel 14,
Comment on Proposal No: 16-16
Recommendation: This proposal should be rejected.
Substantiation: The suitability of equipment and wiring in Hazardous (Classified) Locations is covered in Articles 500-516 and is the responsibility of Panel 14.
This comment was developed by a CMP-14 Task Group and balloted through the entire panel with the following ballot results:
14 Eligible to vote
12 Affirmative
2 Ballots Not Returned (T. Beall and D.W. Zipse (Voting Alternate))
1 Comment on Affirmative Vote was received as follows:
D. Batta, Jr. stated: “I agree that the suitability of equipment and wiring in Hazardous (Classified) Locations is covered in Articles 500-516 and is the responsibility of Code-Making Panel 14.
770.154(F) approves several optical fiber cables for use in Hazardous (Classified) Locations that are not addressed in Articles 500-516. To avoid conflicts like this, the suitability of equipment and wiring for use in Hazardous (Classified) Locations should remain the responsibility of Panel 14.”

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

770.3 Other Articles. Installations of optical fiber cables and raceways shall comply with 770.3(A) and 770.3(B). Only those sections of Chapter 2 and Article 300 referenced in this article shall apply to optical fiber cables and raceways.

(A) Hazardous (Classified) Locations.

Listed optical fiber cables shall be permitted to be installed in hazardous (classified) locations. The cables shall be sealed in accordance with the requirements of 501.15, 502.15, 505.16, or 506.16, as applicable.

(B) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable.

Panel Statement: CMP 16 understands the scope of CMP 14 relative to the suitability of equipment and wiring in Hazardous (Classified) Locations.

CMP 16 action on Proposal 16-16 moved the text of 770.154(F) to 770.3 (Other Articles). Acceptance of this comment would result in moving the requirement back to 770.154(F). The panel maintains relocation of the text to 770.3 and edits Section 770.3 to remove requirements for optical fiber raceway.

Number Eligible to Vote: 16

16-17 Log #795 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 16-21

Recommendation: Accept the proposal with the following revisions:

Mechanical Execution Of Work. Optical fiber cables installed in or on buildings and other structures and not in raceway or cable tray or direct-buried, shall be secured to supports at intervals not to exceed 1.8 m (6 ft) and protected against physical damage by approved means. Such cables shall be secured by straps, staples, cable ties, hangers, or other approved means designed and installed so as to not damage the cable. The installation shall also comply with applicable provisions of Article 300. Exception: Support shall not be required for that portion of cables fished between access points through concealed spaces in finished buildings or structures and supporting is impractical.

Substantiation: Securing and supporting should be provided at specified intervals, as is done with most wiring methods. Applicable provisions of Article 300 such as 300.5, 300.6(C)(1) and (2), 300.11(A)(1) and(2), (C). An exception for fishing is warranted.

Panel Meeting Action: Reject

Panel Statement: Applying the securing and supporting requirements for electrical installations to optical fiber cables is not appropriate because installations of optical fiber cables do not present the same hazard.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-21 Log #1397 NEC-P16 **Final Action: Reject**
(770.26)

Submitter: Russell LeBlanc, The Peterson School

Comment on Proposal No: 16-25

Recommendation: The proposal should be accepted in principal but modified as follows:

If a conduit or raceway of metric designator 53 (trade size 2 inch) or larger, penetrates a fire-resistance-rated wall, partition, floor, or ceiling, and that same conduit or raceway also enters an enclosure of the ventilated type, that conduit or raceway shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway or conduit into other areas of the building or structure.

Substantiation: I have modified the wording for clarity and so the application is more focused, and less of a "sweeping" change.

In my original proposal I provided a first hand eyewitness account of what happened.

This was NOT a second hand or third hand story. I saw it happen with my own eyes! I am not a novice. I have been in the trade for over 25 years. I have also been teaching electrician classes for over 10 years. I am OSHA certified. I am an instructor approved by the Mass. Dept. of Education, and The Board of Examiners of Electricians. I have authored several other code changes. I am a member of NFPA. No, I am not a Fire chief or fire science engineer, or some other Fire Dept. Official. But I know what I saw, and it just did NOT seem right to me. I am very concerned. The smoke simply should NOT have been able to spread through the building via the raceways. What more technical substantiation is needed than that?

Lets break it down to simple science and logic.

If I build a fire in a fireplace, the smoke will go up the chimney flue, if the flue damper is OPEN.

If I build a fire in a fireplace, the smoke will NOT go up the chimney flue, if

the flue damper is CLOSED!

Try it!

Apply logic here.

If I am wrong then maybe we don't need to seal the raceway ends. But this "chimney effect" of the unsealed pipes has already happened once. I have seen it. If it happens again, the occupants may not be as lucky as the first time I saw this phenomenon happen.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The recommended text is vague, unenforceable and lacks specificity. Insufficient data has been provided to justify such a change. Selection of conduit size requiring fire stopping is arbitrary. This may be more of a building Code issue rather than an electrical Code issue.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 14 Negative: 1

Ballot Not Returned: 1 Esemplare, R.

Explanation of Negative:

IVANS, R.: The submitter identifies a concern associated with conduit providing a bypass of firebreaks between floors that should not be ignored. Although there may be issues associated with the general nature of the original proposal or the seemingly arbitrary selection of 2" conduit, the solutions are not technically insurmountable. I am aware of installations where such sealing of conduit was required by local building codes and effectively implemented This item should have been put on hold for further study rather than rejected.

16-22 Log #1890 NEC-P16 **Final Action: Accept in Principle**
(770.100(A) and (B))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 16-29

Recommendation: Revise text to read as follows:

770.100 Entrance Cable Bonding and Grounding. Where grounded, the non–current-carrying metallic members of optical fiber cables entering buildings shall be bonded or grounded as specified in 770.100(A) through (D).

(A) Bonding Conductor and Grounding Electrode Conductor.

(1) Insulation. The bonding conductor and grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor and grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor and grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than that of the grounded metallic member(s). The bonding conductor and grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Run in Straight Line. The bonding conductor and grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.

(5) Physical Damage. Where necessary, the bonding conductor and grounding electrode conductor shall be guarded from physical damage. Where these ~~the grounding~~ conductors are installed ~~is run~~ in a metal raceway, both ends of the raceway shall be bonded to the contained ~~grounding~~ conductors or to the same terminal or electrode to which the ~~grounding~~ conductor(s) is (are) connected.

(B) Electrode. The bonding conductor and grounding electrode conductor shall be connected in accordance with 770.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding conductor or grounding electrode conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In Existing Buildings or Structures Without an Intersystem Bonding Termination ~~with Grounding Means~~. If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure

(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

(3) In Existing Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the existing building or structure served has no intersystem bonding termination or grounding means, as described in 770.100(B)(2), the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4).

(2) If the building or structure served has no grounding means, as described in 770.100(B)(2) or (B)(3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for non-current-carrying metallic members.

Substantiation: This Comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in Article 770 and the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." Conductors that connect from a grounding point for these systems to an intersystem bonding termination are bonding conductors or jumpers and should be described as such in the NEC articles. This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 770.

These comments address the changes suggested in several proposals in each section within Article 770 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in this comment the term "grounding conductor" is replaced with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. In some cases, both terms are suggested as how the conductor is connected determines what it is. The revisions to each section are intended to improve clarity, maintain their meaning, and be consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept. This includes adding "existing" to 770.100(B)(2) and (3). The provisions in these sections should properly apply to only existing installations to correlate with the rules in 250.94.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

770.100 Entrance Cable Bonding and Grounding. Where required ~~grounded~~, the non–current-carrying metallic members of optical fiber cables entering buildings shall be bonded or grounded as specified in 770.100(A) through (D).

(A) Bonding Conductor or ~~and~~ Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or ~~and~~ grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or ~~and~~ grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or ~~and~~ grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than that of the grounded metallic member(s). The bonding conductor or ~~and~~ grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Run in Straight Line. The bonding conductor or ~~and~~ grounding electrode conductor shall be run ~~to the grounding electrode~~ in as straight a line as practicable.

(5) Physical Damage. Where necessary, the bonding conductor and grounding electrode conductor shall be guarded from physical damage. Where these ~~the grounding~~ conductors are installed ~~is run~~ in a metal raceway, both ends of the raceway shall be bonded to the contained ~~grounding~~ conductors or to the same terminal or electrode to which the ~~grounding~~ conductor(s) is (are) connected.

(B) Electrode. The bonding conductor and grounding electrode conductor shall be connected in accordance with 770.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding conductor or grounding electrode conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In ~~Existing~~ Buildings or Structures ~~Without an Intersystem Bonding Termination with Grounding Means~~. If the ~~existing~~ building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94
(4) The nonflexible metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure of the power service, or
(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

(3) In ~~Existing~~ Buildings or Structures Without Intersystem Bonding Termination or Grounding Means. If the ~~existing~~ building or structure served has no intersystem bonding termination or grounding means, as described in 770.100(B)(2), the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4).

(2) If the building or structure served has no grounding means, as described in 770.100(B)(2) or (B)(3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for non-current-carrying metallic members.

Panel Statement: The panel agrees with the submitter's intent and edits the text for editorial clarification.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

BRUNSSEN, J.: 770.100(A)(5), first sentence, should state: "Where necessary, the bonding conductor or grounding electrode conductor …", for consistency with 770.100(A) (1) though (4). 770.100(A)(5), second sentence, should state: "Where the bonding conductor or grounding electrode conductor is installed in a metal raceway, both ends of the raceway shall be bonded to the contained conductor or to the same terminal or electrode to which the conductor is connected." "These conductors" is replaced by "the bonding conductor or grounding electrode conductor" for clarity. "Conductors" is made singular throughout the sentence as it is unlikely that there will be multiple bonding or grounding electrode conductors within the metal raceway. These changes provide correlation with 800.100(A)(6). 770.100(B)(1) should read: "If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding conductor shall be connected to the intersystem bonding termination." A grounding electrode conductor would not connect to a bonding termination but to a grounding electrode. 770.100(B)(3) should read as follows: "If the building or structure served has no intersystem bonding termination, or grounding means as described in 770.100(B)(2), …". The comma needs to be placed after "termination" and not after "means" to distinguish between buildings with an intersystem bonding termination as described in (B)(1) and buildings with grounding means as described in (B)(2).

OHDE, H.: As an electrical code instructor and as an advocate of good electrical code, it makes good code sense to agree with the submitter's intent and the panel action regarding this comment. The addition of the terms "grounding electrode conductor" and "bonding" and the deletion of the term "grounding conductor" provides consistency and correlation with remaining Code Articles regarding grounding. The term "grounding conductor" has been replaced with "grounding electrode conductor" or if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" was used.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 16-36
Recommendation: Accept Proposal 16-36.
Substantiation: The issue addressed by this Proposal is in specifying a technically sound grounding electrode for grounding non-current-carrying metallic members of optical fiber systems, that will assure such systems are connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines. This is the purpose of a grounding electrode regardless of the system.

The electrodes identified in 250.52(A)(4) through (A)(8) are intended as minimum required electrodes that are capable of limiting the voltage imposed on electric and electronic equipment by lightning, line surges, or unintentional contact with higher-voltage lines. The committee has seemingly sought to minimize the effects of such imposed faults by stating such faults or events such as lighting deal only in limited currents which is not necessarily true. In addition, limited currents have little to do with the adequacy of a grounding electrode and especially one with high resistance tendencies such as a 5 ft long ground rod. The claim by the committee that 5 ft long rods have "been used successfully and safely by the telecom industry for decades" is misrepresented as it is widely acknowledged that damage during thunderstorms often occurs to sensitive electronics that are connected to telecom wiring where grounding is often inadequate as lighting surges (direct or indirect) enter facilities on metallic carriers. The National Electrical Code is not about telecom the utility but is rather about protecting users from the consequences of lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. There is no justification in specifying inadequate grounding electrodes that have no independent record of performance and that are obviously technically inferior to those required by 250-52(A)(4) through (A)(8).

Utilizing a 5 ft long ground rod by a particular segment of industry, where that industry may be responsible for that electrode, does not provide technical substantiation as to the worth of that electrode. The "statement "very little resistance change will result from using larger sizes of electrodes" from *The ABCs of Grounding and Bonding* is misapplied in this context. One authoritative reference, the *Soares Book on Grounding* states that the diameter of a ground rod does not materially reduce the resistance of a ground rod but that rather that a ground rod's resistance is substantially reduced by extending the length of a ground rod into earth. By actual calculation this could be as much as a 40%+ reduction in resistance by doubling a 5 ft long ground rod's length to 10 ft. Therefore, the reference from *The ABCs of Grounding and Bonding*, when taken in context, agrees with Soares on the ineffectiveness of increasing the diameter of a ground rod, but the committee is negligent in not mentioning the effectiveness of increasing the length of a ground rod in the panel statement. Power utilities also realize the advantage of deeper, thus longer, electrodes when grounding distribution systems such as substations where sectional ground rods are commonly installed from 20 to 60 ft deep. In addition, it is unfathomable that the committee would indicate that requiring a minimum standard electrode would be too expensive when compared to the damage and expense a lightning strike could cause to a structure where inadequate grounding is installed and especially where any additional installation cost is negligible. It is also interesting to note that 820.100(B)(3)(2), as well as the inference in 810.21(F)(3), requires that a rod or pipe electrode shall meet the requirements of 250.52(A)(5) while 770.100(B)(3) allows the inferior12.7 mm by 5 ft rod or pipe electrode. This seems to be inconsistent concerning the various requirements between similar articles. Therefore it is difficult to understand the resistance of the Panel 16 members in not accepting Proposal 16-36 that would provide an acceptable minimum standard for grounding telecommunications systems that would help limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines.

There is no argument that bonding together the communications grounding electrode and power grounding electrode system is an important safety aspect. However that also is not the issue addressed by Proposal 16-36. The issue remains to be that ½ in. diameter by 5 ft long ground rods are not an adequate electrode for grounding telecommunication systems and that the electrodes utilized for systems installed as a part of the premise wiring system should meet the same minimum requirements as those in Article 250 as they serve the same purpose. The technical substantiation for this change was in Proposal 16-36 and is expanded in this Comment. Code-Making Panel 5 has the expertise on this subject and the users of the NEC as well as the public deserve a reliable minimum standard for grounding any and all telecommunications systems.

In addressing the last part of the panel statement, section 770.100(B)(3) addresses "In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means", and 770.100(B)(2) addresses "In Buildings or Structures with Grounding Means." What possibly could the panel mean when it states "must be taken in context?" 770.100(B)(3) addresses buildings and structures without electrodes, thus there are no grounding electrode means at the building or structure to be identified. Paragraph 770.100(B)(3)(1) states "To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)", but these are not in existence according to the title of 770.100(B)(3). Therefore, the only choice left is 770.100(B)(3)(2) and that states the electrode shall be an effectively grounded metal structure, which again, is not in existence, or "a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth." A 12.7 mm pipe? Also, please note no inch-pound number is provided in the NEC for the pipe or rod diameter. A 12.7 mm pipe is approximately a 3/8-inch trade size which is half the required diameter of a pipe electrode of 3/4-inch required by 250.52(A)(5) for a pipe electrode which is considered to be the minimum size for durability that goes back to the 1925 NEC edition. As to a 5 ft rod or pipe being driven into permanently damp earth – where in the US could this be consistently accomplished? Also, the word "effectively" was dropped by Code-Making Panel 5 as being subjective and inadequate in determining if a metal structure is grounded. So, why does it remain in 770.100(B)(3)? The problems in this section alone justify the acceptance of Proposal 16-36.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the part to delete the word "effectively" in 770.100(B)(3)(2). The panel rejects the remainder of the comment.
Panel Statement: See action and statement on Comment 16-30.

The panel reiterates its position as stated in the panel statement for the submitter's original proposal. The submitter has neither provided technical justification nor cited a safety issue to justify the elimination of the 5-foot communications ground rod that has been used successfully and safely by the communications industry for decades. It is unreasonable and unnecessary to require installation of such power-oriented grounding means as proposed by the submitter solely for communications applications where power fault and lightning currents are limited by the relatively fine gauge of communications conductors and cable shields.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:

BOYER, J.: Proposal 16-36 should be reconsidered and accepted as proposed. It is technically sound, reasonable and will aid in reducing losses from lightning, line surges and unintentional contact with higher-voltage lines. Furthermore, it would help stabilize the voltage to earth during normal operation.
Additionally, it is unclear as to what was Accepted in Principle in Part.

16-29 Log #297 NEC-P16 **Final Action: Accept (770.100(B)(3)(2))**

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 16-39
Recommendation: The Technical Correlating Committee directs the panel to reconsider the action on this proposal since the phrase "effectively grounded" is no longer defined in the NEC.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to reconsider the action on Proposal 16-39.

See panel action and statement on Comment 16-30.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-30 Log #535 NEC-P16 **Final Action: Accept (770.100(B)(3)(2))**

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-39
Recommendation: Revise the text of 770.100(B)(3)(2) as follows: "(2) If the building or structure served has no grounding means, as described in 770.100(B)(2) or (B)(3)(1), to ~~an effectively grounded metal structure~~ any one of the individual electrodes described in 250.52(A)(7) and (A)(8) or to a ground rod or pipe not less than …".
Substantiation: The Technical Correlating Committee has directed CMP16 to reconsider their panel action on this proposal as "effectively grounded" is no longer defined in the NEC. ATIS initially opposed elimination of this term as it is used in the NESC. However, the NESC usage is associated with an "effectively grounded cable sheath", not an effectively grounded metallic structure. This comment aligns 770.100(B)(3)(2) with similar requirements in 800.100(B)(3)(2) and 830.100(B)(3)(2) that do not mention "effectively grounded", and provides correlation between 770, 800 and 830.
Panel Meeting Action: Accept
Number Eligible to Vote: 16

Ballot Not Returned: 1 Esemplare, R.

16-31 Log #2323 NEC-P16 **Final Action: Accept in Principle**
(770.100(B)(3)(2))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 16-39
Recommendation: This proposal should have been accepted as submitted.
Substantiation: The term "effectively grounded" is no longer used in the NEC. The reason it is no longer used is that it is too vague and subjective—what is the difference between "grounded" and "effectively grounded." CMP-16 should follow the lead of CMP-5 in this endeavor.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-30.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-32 Log #1891 NEC-P16 **Final Action: Accept**
(770.106(A) and (B))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-42
Recommendation: Revise text to read as follows:
770.106 Grounding and Bonding of Entrance Cables at Mobile Homes.
(A) Grounding. Grounding shall comply with 770.106(A)(1) and (A)(2).
(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ~~ground for~~ non-current-carrying metallic members of optical fiber cables entering the mobile home shall be grounded in accordance with 770.100(B)(3).
(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ~~ground for~~ non-current-carrying metallic members of optical fiber cables entering the mobile home shall be grounded in accordance with 770.100(B)(3).
(B) Bonding. The grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home with a copper ~~grounding~~ conductor not smaller than 12 AWG under either of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 770.106(A)
(2) Where the mobile home is supplied by cord and plug
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." Other conductors are bonding jumpers or conductors. These revisions are made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 770.
These comments address the changes suggested in the noted proposal in each section within Article 770 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section are intended to improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.
There does not seem to be a valid reason to name the conductor in (A) or (B).
Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
BRUNSSEN, J.: Revise 770.106(A)(1) as follows for consistency with similar sections in Chapter 8: "(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the non-current-carrying metallic members of optical fiber cables entering the mobile home shall be connected to a grounding electrode in accordance with 770.100(B)(3).
Revise 770.106(A)(2) as follows for consistency with similar sections in Chapter 8: "(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the non-current-carrying metallic members of optical fiber cables entering the mobile home shall be connected to a grounding electrode in accordance with 770.100(B)(3).

(770.110(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-47
Recommendation: Revise panel action text as follows:
(A)(1) Chapter 3 Raceways. Optical fiber cables shall be permitted to be installed in any approved raceway wiring method of Chapter 3.
Substantiation: "Any raceway included in Chapter 3" literally amends the uses permitted and uses not permitted provisions. This article does not have a section referring to application of other articles, and per 90.3 modifies them.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel has prepared tables that address this issue. See action and statement in Comment 16-44.
The panel does not agree with the submitter's substantiation that the changes made amend other Articles of the Code.
Section 770.110(A)(1) requires the raceways to be installed in accordance with the requirements of Chapter 3.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-34 Log #326 NEC-P16 **Final Action: Accept in Principle**
(770.113)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-48
Recommendation: Revise text to read as follows:
770.113 Installation of Optical Fiber Cables and Raceways, and Cable Routing Assemblies. Installation of optical fiber cables and raceways, and cable routing assemblies shall comply with 770.113 (A) through (J). Installation of raceways shall also comply with 770.12 and 770.110.
(A) Listing. Optical fiber cables and raceways, and cable routing assemblies installed in buildings shall be listed.
Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.
(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums, as described in 300.22(B) if they are directly associated with the air distribution system:
(1) Up to 1.22m (4 ft) of Types OFNP and OFCP
(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(B).
Informational Note: See sections 4.3.4 & 4.3.11.3.3 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wires and cables in air ducts and apparatus casings plenums. See section 3.3.22 for the definition of an apparatus casing plenum.
(C) Other Spaces Used For Environmental Air (Plenums). The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):
(1) Types OFNP and OFCP
(2) Plenum optical fiber raceway
(3) Types OFNP and OFCP installed in plenum optical fiber raceway or plenum communications raceway
(4) Types OFNP and OFCP supported by metallic cable trays or cable tray systems
(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(C).
Informational Note: See sections 4.3.11.2, 4.3.11.4 & 4.3.11.5 of NFPA 90A-2009 *Standard for the Installation of Air-Conditioning and Ventilation Systems* for information on wires, cables and raceways in ceiling cavity, raised floor and air-handling unit room plenums. See section 3.3.22 for plenum definitions.
(D) Risers-Cables, Raceways and Cable Routing Assemblies in Vertical Runs. The following cables, raceways and cable routing assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types OFNP, OFCP, OFNR and OFCRPlenum and riser optical fiber raceways
(2) Riser cable routing assemblies
(3) Types OFNP, OFCP, OFNR and OFCR installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) riser cable routing assembly
Informational Note: See770.26 for firestop requirements for floor penetrations.
(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC

(2) Plenum, riser and general-purpose optical fiber raceways
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
Informational Note: See 770.26 for firestop requirements for floor penetrations.

(F) Risers-Cables, Raceways and Cable Routing Assemblies in Fireproof Shafts.. The following cables, raceways and cable routing assemblies shall be permitted to be installed in fireproof riser shafts having firestops at each floor:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly
Informational Note: See 770.26 for firestop requirements for floor penetrations.

(G) Risers-One- and Two-Family Dwellings. The following cables, raceways and cable routing assemblies shall be permitted in one- and two-family dwellings:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

(H) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following cables, raceways and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser or general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

(J) Other Building Locations. The following cables, raceways and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (I):
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

Substantiation: The panel action on the revision of 770.113 changed the title and included several applications of cable routing assemblies, but a few applications were missed. Also the current text of 770.154(B)(2) permits all optical fiber cable types in fireproof shafts and metal raceways in shafts but it does not explicitly permit optical fiber raceways. If bare cables are permitted, then cables in optical fiber raceways should be also be permitted. Cable routing assemblies should be permitted in fireproof shafts, but are clearly not suitable for installation inside metal raceway. In order to accommodate both optical fiber raceways and cable routing assemblies, the riser section on metal raceways or fireproof shafts was bifurcated. Repeated references to 770.110 can be replaced with a general requirement to install raceways in accordance with 770.110 and also 770.12. The title of the section was modified to clarify that it covers cable routing assemblies, not optical fiber cable routing assemblies.

Most of the text in this comment was submitted by Gerald Dorna as an affirmative ballot comment on this proposal. See the ROP.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-37.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-35 Log #489 NEC-P16 **Final Action: Reject**
(770.113)

Submitter: Code-Making Panel 3,
Comment on Proposal No: 16-48
Recommendation: The proposal should be Rejected.
Substantiation: At the direction of the Technical Correlating Committee, CMP- 3 formed a task group to provide a comment regarding this proposal. The CMP 3 members of the Task Group were Larry Ayer, Paul Casparro, David Mills, Mark Ode, Steve Owen, George Straniero, and Bob Walsh.
While the task group reviewed Proposal 16-48 it also reviewed the companion Proposal 16-56 that would adopt the use of an application table. Similar proposals were submitted to CMP-3 to apply parallel changes to Articles 725 and 760. These proposals were Rejected on the basis that the proposed table did not provide the same critical application information already located within the application section and that there was no technical substantiation provided in the proposal to justify the changes offered.

In addition, Proposal 16-48 requires taking section xxx.154 from articles 770, 800, 810, 820, and 830 and relocating them. CMP-16 stated that sections xxx.154 contain more than applications; they also contain installation rules and they are in the wrong place. As a result, the application requirements found within sections xxx.154 were moved to a new xxx.110 and similarly the installation requirements moved to a new xxx.113.

It would be difficult to do the same to Articles 725 and 760 during the ROC stage without the possibility of introducing new material which has not had public review. Article 725 deals with Class 1, Class 2, and Class 3 wiring methods and cables. The installation, application and separation requirements are spread throughout the Article and would affect the entire numbering structure. Similarly, Article 760 deals with both non-power-limited and power-limited cables with similar requirements spread throughout the Article.

This comment was developed by a CMP-3 Task Group and balloted through the entire panel with the following ballot results:
15 Eligible to vote
13 Affirmative (W.R. Whistler for T.F. Connaughton, S.D Burlison for J.C.

Menendez, and T.D. Mills for M.K. Sanders)

2 Ballots Not Returned (S.E. Egesdal and M.S. Sepulveda)

The following Affirmative Comment on Vote was received:

W.R. Whistler stated: "This issue needs to be addressed to ensure that consistent numbering throughout all of the affected articles is continued. If the proposed changes were to be implemented, it would make Articles 725 and 760 more usable as installation and application would be separated and not intertwined."

Panel Meeting Action: Reject

Panel Statement: The submitter noted that Proposal 16-48 had a companion Proposal 16-56 and that CMP 3 rejected companion proposals for Article 726 and 760. The submitter also noted that it would be difficult for CMP 3 to address the companion proposals for Articles 725 and 760 in the ROC stage without introducing new material that has not had public review.

In addition to the proposals for Article 770, CMP 16 processed companion proposals for Articles 800, 820 and 830. The submitter noted that CMP 3 had no technical substantiation. The CMP 16 proposals were developed by the CMP 16 Special Editorial Task Group. They had technical substantiation. In addition to the proposals for Article 770, CMP 16 processed companion proposals for Articles 800, 820 and 830.

In addition to the proposals submitted by the CMP 16 Special Editorial Task Group, actions on numerous other proposals were incorporated into the CMP 16 actions. There were so many interlocking actions that two members of the panel included a roadmap to the proposals in their affirmative ballot comments.

Proposal	Sections	Purpose	Action
16-48 & 56	770.154 & 770.113	Remove installation rules from the applications section 770.154 and relocate them in the installations section 770.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications, permitting communications raceways to substitute for optical fiber raceways, and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-59 which permits metallic cable trays in plenums, 4) proposal 16-62 which simplifies the installation rules for risers and, 5) proposals 16-51, 52 & 57 which provide for the applications of cable routing assemblies.
16-160 & 172	800.154 & 800.113	Remove installation rules from the applications section 800.154 and relocate them in the installations section 800.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-175 which permits metallic cable trays in plenums, 4) proposal 16-179 which simplifies the installation rules for risers and, 5) proposals 16-165, 166 & 173 which provide for the applications of cable routing assemblies.
16-267 & 278	820.154 & 820.113	Remove installation rules from the applications section 820.154 and relocate them in the installations section 820.113. Simplify cable applications by using a table.	AIP by clarifying the permitted wire and cable applications, permitting communications raceways to be used in place of CATV raceways, and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts and only provides for optical fiber raceways and communications raceways, 2) proposal 16-289a which deleted the listing section for CATV raceways, 3) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 4) proposal 16-280 which permits metallic cable trays in plenums, 5) proposal 16-282 which simplifies the installation rules for risers, and 6) proposals 16-272 & 273 which provide for the application of cable routing assemblies.
16-331, 339	830.151, 830.154 & 830.113	Remove installation rules from the applications sections 830.151 & 830.154 and relocate them in the installations section 830.113. Simplify cable applications by using a table.	AIP by clarifying the permitted cable applications and correlating with, 1) NFPA 90A-2009 which limits cabling in air ducts, 2) proposal 3-94 which changed the NEC nomenclature for air handling spaces, 3) proposal 16-340 which permits metallic cable trays in plenums and, 4) proposals 16-338 & 341 which simplify the installation rules for risers.

CMP 16 has reaffirmed its acceptance of the Special Editorial Task Group's proposals. See panel action on Comments 16-37, 16-44, 16-138, 16-148, 16-233, 16-239, 16-293 and 16-303 which were submitted by Craig Sato, Chairman of CMP 3 and 16 Reconciliation Task Group.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-36 Log #1620 NEC-P16 **Final Action: Hold**
(770.113)

TCC Action: The Technical Correlating Committee understands that only Comment 16-36 is being Held.

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-48
Recommendation: Revise proposed text t as follows:

770.113(B)(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in metal raceways ~~that are installed~~ in compliance with 300.22(B).

770.113(C)(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in metal raceways ~~that are installed~~ in compliance with 300.22(C).

770.113(D)(2) Delete this text.

770.113(D)(3) Renumber to (D)(2) and revise the text as follows:
Types OFNP, OFCP, OFNR, and OFCR installed in plenum optical fiber raceway, plenum communications raceway, riser optical fiber raceway, riser communications raceway or listed riser cable routing assemblies in accordance with 770.110.

770.113(E) Risers- Cables in Metal Raceways or ~~Fireproof~~ Fire-resistance-rated Shafts. Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted in metal raceway or in a ~~fireproof~~ fire-resistance-rated shaft with firestops at each floor.

770.113(F)(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC installed in plenum, riser, or general-purpose optical fiber raceway or plenum, riser or general-purpose communications raceway or in a raceway permitted in Chapter 3~~.~~

770.113(G) Cable Trays. The following cables and raceways shall be permitted to be ~~installed~~ supported in cable trays: Cable trays and cables in plenums shall be installed in accordance with 300.22 and 800.113(C)(4).

Substantiation: In (B)(2), the word "metal" should be added to make this requirement very simple and very clear without having to refer to the entire text of 300.22, just as the Panel clarified in (C)(4) that only *metallic* cable trays are allowed. The informational note in this section refers to NFPA 90A which requires the use of metal raceways in these spaces.

In (C)(5) "metal" was added to clarify that these cables must be installed in metal raceways in accordance with the requirements in 300.22(C) and NFPA 90A.

Text in 770.113(D)(2) was deleted and the requirement combined with the text in (3), now renumbered to (2). This eliminates redundant text.

In (E) "Fireproof" was changed to "fire-resistance-rated", which is the appropriate terminology.

In (F)(3) text was added to include Chapter 3 raceways which can also be used in one and two family dwellings

In (G) the word "installed" was changed to "supported" to properly reflect the use of cable tray as a support method. Text was added to clarify special requirements for plenum applications. Most of the other sections of 770.113 are *locations* (spaces uses for environmental air, risers, other building locations, etc.) not *products*. The use of cable tray and the type of cables allowed in cable trays are dependent upon where the tray is installed. This gets lost in the current (G), since it appears as if you could use all types of optical fiber cables in cable trays no matter where the cable tray is installed.

Panel Meeting Action: Hold

Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-37 Log #1627 NEC-P16 **Final Action: Accept in Principle (770.113)**

TCC Action: The Technical Correlating Committee directs that the phrase "and plenums" be removed from the title, the text, and the Informational Note in 770.113(B) as Accepted in the panel action text of Proposal 3-94.
Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-48
Recommendation: Revise text to read as follows:
770.113 Installation of Optical Fiber Cables and Raceways, and Cable Routing Assemblies. Installation of optical fiber cables and raceways, and cable routing assemblies shall comply with 770.113(A) through (J). Installation of raceways shall also comply with 770.12 and 770.110.
(A) Listing. Optical fiber cables and raceways, and cable routing assemblies installed in buildings shall be listed.
Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.
(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums, as described in 300.22(B) if they are directly associated with the air distribution system:
(1) Up to 1.22m (4 ft) of Types OFNP and OFCP
(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(B).
Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see Sections 4.3.4.1 (air ducts) and 4.3.11.3.3 (apparatus casings plenums) in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*
(C) Other Spaces Used For Environmental Air (Plenums). The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):
(1) Types OFNP and OFCP
(2) Plenum optical fiber raceway
(3) Types OFNP and OFCP installed in plenum optical fiber raceway or plenum communications raceway
(4) Types OFNP and OFCP supported by metallic cable trays or cable tray systems
(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in raceways that are installed in compliance with 300.22(C).
Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see Sections 4.3.11.2 (ceiling cavity plenum), 4.3.11.4 (air-handling unit room plenum) and 4.3.11.5 (raised floor plenum) of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*
(D) Risers-Cables, Raceways and Cable Routing Assemblies in Vertical Runs. The following cables, raceways and cable routing assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types OFNP, OFCP, OFNR and OFCR
(2) Plenum and riser optical fiber raceways
(3) Riser cable routing assemblies
(4) Types OFNP, OFCP, OFNR and OFCR installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) riser cable routing assembly
Informational Note: See770.26 for firestop requirements for floor penetrations.
(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
Informational Note: See 770.26 for firestop requirements for floor penetrations.
(F) Risers-Cables, Raceways and Cable Routing Assemblies in Fireproof Shafts. The following cables, raceways and cable routing assemblies shall be permitted to be installed in fireproof riser shafts having firestops at each floor:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly
Informational Note: See 770.26 for firestop requirements for floor penetrations.
(G) Risers-One- and Two-Family Dwellings. The following cables, raceways and cable routing assemblies shall be permitted in one- and two-family dwellings:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly
(H) Cable Trays. The following cables and raceways shall be permitted to be installed in cable trays:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
(I) Distributing Frames and Cross-Connect Arrays. The following cables, raceways and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays:
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser or general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly
(J) Other Building Locations. The following cables, raceways and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (I):
(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC
(2) Plenum, riser and general-purpose optical fiber raceways
(3) Riser and general-purpose cable routing assemblies
(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC installed in:
a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly
Substantiation: The panel action on the revision of 770.113 changed the title and included several applications of cable routing assemblies, but a few applications were missed. Also the current text of 770.154(B)(2) permits all optical fiber cable types in fireproof shafts and metal raceways in shafts but it does not explicitly permit optical fiber raceways. If bare cables are permitted, then cables in optical fiber raceways should be also be permitted.
Cable routing assemblies should be permitted in fireproof shafts, but are clearly not suitable for installation inside metal raceway. In order to accommodate both optical fiber raceways and cable routing assemblies, the riser section on metal raceways or fireproof shafts was bifurcated.
Repeated references to 770.110 can be replaced with a general requirement to install raceways in accordance with 770.110 and also 770.12. The title of the

section was modified to clarify that it covers cable routing assemblies, not optical fiber cable routing assemblies.

The recommended text for the informational notes dealing with installations in air handling spaces have been modified to better reflect the contents of the mandatory text.

Most of the text in this comment was submitted by Randy Ivans and Gerald Dorna as an affirmative ballot comment on this proposal. See the ROP.

Panel Meeting Action: Accept in Principle

Revise 770.113 to read as follows:

770.113 Installation of Optical Fiber Cables and Raceways, and Cable Routing Assemblies. Installation of optical fiber cables and raceways, and cable routing assemblies shall comply with 770.113 (A) through (J). Installation of raceways shall also comply with 770.12 and 770.110.

(A) Listing. Optical fiber cables and raceways, and cable routing assemblies installed in buildings shall be listed.

Exception: Optical fiber cables that comply with 770.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums, as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22m (4 ft) of Types OFNP and OFCP cables

(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in raceways that are installed in compliance with 300.22(B).

Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see sections 4.3.4.1 ~~(air ducts)~~ and 4.3.11.3.3 ~~(apparatus casings plenums)~~ in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(C) Other Spaces Used For Environmental Air (Plenums). The following cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Types OFNP and OFCP cables

(2) Plenum optical fiber raceway

(3) Types OFNP and OFCP cables installed in plenum optical fiber raceway or plenum communications raceway

(4) Types OFNP and OFCP cables and plenum optical fiber raceways supported by open metallic cable trays or cable tray systems

(5)Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in raceways that are installed in compliance with 300.22(C)

(6) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, OFC cables and plenum optical fiber raceways, riser optical fiber raceways and general-purpose optical fiber raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see sections 4.3.11.2 ~~(ceiling cavity plenum)~~, 4.3.11.4 ~~(air-handling unit room plenum)~~ and 4.3.11.5 ~~(raised floor plenum)~~ of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(D) Risers-Cables, Raceways and Cable Routing Assemblies in Vertical Runs. The following cables, raceways and cable routing assemblies shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types OFNP, OFCP, OFNR and OFCR cables

(2) Plenum and riser optical fiber raceways

(3) Riser cable routing assemblies

(4) Types OFNP, OFCP, OFNR and OFCR cables installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) riser cable routing assembly

Informational Note: See770.26 for firestop requirements for floor penetrations.

(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway

Informational Note: See 770.26 for firestop requirements for floor penetrations.

(F) Risers-Cables, Raceways and Cable Routing Assemblies in Fireproof Shafts. The following cables, raceways and cable routing assemblies shall be permitted to be installed in fireproof riser shafts having firestops at each floor:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Riser and general-purpose cable routing assemblies

(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

Informational Note: See 770.26 for firestop requirements for floor penetrations.

(G) Risers-One- and Two-Family Dwellings. The following cables, raceways and cable routing assemblies shall be permitted in one- and two-family dwellings:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Riser and general-purpose cable routing assemblies

(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

(H) Cable Trays. The following cables and raceways shall be permitted to be supported by ~~installed in~~ cable trays:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following cables, raceways and cable routing assemblies shall be permitted to be installed in distributing frames and cross-connect arrays:

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Riser or general-purpose cable routing assemblies

(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

(J) Other Building Locations. The following cables, raceways and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (I):

(1) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables

(2) Plenum, riser and general-purpose optical fiber raceways

(3) Riser and general-purpose cable routing assemblies

(4) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in:

a) plenum optical fiber raceway
b) plenum communications raceway
c) riser optical fiber raceway
d) riser communications raceway
e) general-purpose optical fiber raceway
f) general-purpose communications raceway
g) riser cable routing assembly
h) general-purpose cable routing assembly

(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OFC cables installed in a raceway of a type recognized in Chapter 3

Panel Statement: The panel added text to recognize solid bottom cable trays with a solid covers.

The panel added text to permit plenum raceways to be supported by open cable trays.

The panel restored cable in metal raceways for general building use which the submitter had inadvertently left out.

The panel added the word “cables” after each cable type. See panel action and statement on Comment 16-39.

The panel changed "included" to "recognized" in reference to Chapter 3.

The panel changed "installed in" cable trays to "supported by" cable trays.

The panel accepts in principle the recommendations to revise the informational notes. The panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text. The panel chooses not to include NFPA 90A "titles" in parenthesis following each section reference.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-38 Log #2420 NEC-P16 **Final Action: Accept in Principle in Part (770.113)**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-48
Recommendation: Add a (4) to read: Add a new (4) to read: Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG OFN, and OFC installed in a circular raceway complying with Chapter 3.. Cable tray and raceway installed in environmental air space and plenums shall comply with 300.22.
Substantiation: There is no reason to exclude metal raceways from using cable tray as a support system. The text clarifies that Chapter 3 must be consulted as 300.22 has special cable tray requirements and not all cable trays and/or all raceways are permitted in all locations. Also, circular raceways are best suited for cable tray support.
Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle the recommendation dealing with the installation of cables in raceways.

The panel does not accept the installation of cable trays and raceways in environmental air space, other than optical fiber raceways, is outside the scope of Article 770.

Panel Statement: See panel action and statement in Comment 16-37.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

BRUNSSEN, J.: The second sentence of the Panel Action should state: "The panel does not accept the installation of cable trays and raceways in environmental air space, other than optical fiber raceways, as they are outside the scope of Article 770." The sentence as presently stated is incomplete.

16-39 Log #1359 NEC-P16 **Final Action: Accept in Principle in Part (770.113(B), FPN and 770.113(C), FPN)**

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-48
Recommendation: (B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums, as described in 300.22(B), if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Types OFNP and OFCP cables

(2) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC cables installed in raceways that are installed in compliance with 300.22(B)

FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009, *Standard for the Installation of Air- Conditioning and Ventilation Systems*, for information on wires and cables installed in fabricated ducts and plenums used for environmental air ~~wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum~~.

(C) Other Spaces Used For Environmental Air (Plenums). The following wires, cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Types OFNP and OFCP cables

(2) Plenum optical fiber raceways installed in compliance with 770.110

(3) Types OFNP and OFCP cables installed in plenum optical fiber raceways or plenum communications raceways

(4) Types OFNP and OFCP cables supported by metallic cable trays or cable tray systems

(5) Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC cables and listed optical fiber wires and cables installed in raceways that are installed in compliance with 300.22(C).

FPN: See 4.3.11.2, 4.3.11.4, and 4.3.11.5 of NFPA 90A-2009, *Standard for the Installation of Air- Conditioning and Ventilation Systems*, for information on wires, cables and raceways installed in other spaces used for environmental air (plenums) ~~wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions~~ .
Substantiation: This comment is intended to bring consistency to this section. The FPN nomenclature or terminology needs to correspond to the terminology in the charging paragraph.

The term "air duct" is not used in this section or elsewhere in the article. The definitions from NFPA 90A are not necessary since this FPN sends the NEC user directly to the relevant sections for the requirements.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept in Principle in Part
The panel accepts in principle the recommendations to revise the informational notes. As recommended by the submitter, the panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text.
The panel does not accept the recommendations to include "wires" in the text because there are no wires in Article 770, only optical fiber cables.

The panel accepts in principle adding the word "cables" after each cable type.

Panel Statement: See panel action and statement on Comment 16-37.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-40 Log #2421 NEC-P16 **Final Action: Hold (770.113(D))**

TCC Action: The Technical Correlating Committee understands that the panel is holding only Comment 16-40.
Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-48
Recommendation: Revise the title of 770.113(D) to read: **Cable, Non-metallic Optical Fiber Raceways and Non-metallic Cable Routing Assemblies in Vertical Runs.**
Change the charging paragraph to read "...optical fiber cables...".

Also, change the charging paragraph to read: "...in vertical runs in a fire-resistive-rated shaft.
Substantiation: This correlates with 770.113(E) that stipulates metal and requires a "fireproof" shaft; this is also needed for non-metallic. ASTM and various codes now use the correct term "fire-resistance- rated" instead of "fireproof". We have submitted a comment to facilitate that term in 770.113(E). The term "optical fiber" is inserted for clarity and consistency.
Panel Meeting Action: Hold
Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-41 Log #1628 NEC-P16 **Final Action: Accept in Principle (770.133(B))**

TCC Action: In order to correlate with the action on Comment 3-96, the Technical Correlating Committee changes the action on Comment 16-41 from "Accept" to "Accept in Principle" and directs that the text of 770.133 be revised to read as follows:

"(B) With Communications Cables. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure, raceway or cable routing assembly with conductors of any of the following:

(1) Communications circuits in compliance with Parts I and IV of Article 800.

(2) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820.

(3) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 830.

(C) With Other Circuits. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure or raceway with conductors of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits
in compliance with Parts I and III of Article 725.

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760."

Revise existing (C) to (D).

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-51
Recommendation: Continue to accept Proposal 16-51 in principle in part.
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate cable routing assemblies into the section.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
DORNA, G.: The Panel 3 & 16 Reconciliation Task Group submitted Comments 3-96, 16-41, 16-143, 16-236 and 16-296, all dealing with the commingling of cables in raceways, cable trays, enclosures and cable routing assemblies. In the ROP, CMP 16 had had taken actions (accept, accept in principle, accept in principle in part) to treat cable routing assemblies in the same manner as raceways, cable trays, and enclosures, while CMP 3 had rejected the coordinating proposals. The Reconciliation Task Group's comments recommended that CMP 16 continue its direction, and that CMP 3 recognize cable routing assemblies and provide for their use. CMP 16 accepted the Reconciliation Task Group's comments and CMP 3 rejected them.
The CMP 3 rejection statement on Comment 3-96 included an alert to the TCC: "In addition it is brought to the attention of the technical correlating committee that CMP 16 has accepted changes that will allow the use of cable routing assemblies for the installation of Class 2 & 3 circuits and power-limited fire alarm circuits."
The text of 770.133(B) as modified by proposal 16-51 is shown below. (Comment 16-41 simply supported the panel action on Proposal 16-51.)The underlining was added for emphasis.
(B) With Other Conductors. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure, raceway, or cable routing assembly with conductors of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725
(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760
(3) Communications circuits in compliance with Parts I and IV of Article 800
(4) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820
(5) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 830
The text of 770.133(B) clearly shows that optical fiber cables are permitted to be installed in cable routing assemblies along with other cables that are installed in accordance with their own articles. Class 2 and Class 3 cables must be installed compliant with Article 725. Likewise, power-limited fire alarm cables must be installed compliant with Article 760.
The CMP 3 statement that "CMP 16 has accepted changes that will allow the use of cable routing assemblies for the installation of Class 2 & 3 circuits and power-limited fire alarm circuits" is not correct.
The Panel 16 actions on Proposal 16-51 and Comment 16-41 permit optical fiber cables to be installed in the same routing assembly with Class 2, Class 3 and power-limited fire alarm cables only if the Class 2, Class 3 and power-limited fire alarm cables are installed in compliance with Articles 725 and 760. Obviously, CMP 16 has taken no actions that change the cable installation requirements in Articles 725 and 760.
See also, my affirmative comments on Comments 16-143 and 16-236.

16-42 Log #793 NEC-P16 **Final Action: Reject**
(770.153(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-55
Recommendation: Accept the proposal intended for 770.133(A) as follows:
Second paragraph: Add "cabinet or other enclosure" after "raceway" in two places.
Substantiation: "Cabinet or other enclosure" is included in the third and fourth paragraphs and is appropriate for inclusion.
Panel Meeting Action: Reject
Panel Statement: Cabinets are already included in the third and fourth paragraphs. The submitter has not specified exactly where to include the recommended text.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-43 Log #327 NEC-P16 **Final Action: Accept in Principle**
(770.154)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-56
Recommendation: Revise text to read as follows:
770.154 Applications of Listed Optical Fiber Cables and Raceways, and Cable Routing Assemblies. Permitted and non-permitted applications of listed optical fiber cables and raceways, and cable routing assembly types shall be as indicated in Table 770.154(A). The permitted applications are subject to the installation rules of 770.110 and 770.113. The substitutions for optical fiber cables listed in Table 770.154(B) and illustrated in Figure 770.154 shall be permitted.

See Table 770.154(A) on Page 579

(Renumber Table 770.154(E) and Figure 770.154(E) to Table 770.154(B) and Figure 770.154 and insert them here.)
Substantiation: Multiple changes are recommended to improve the clarity of the new Table 770.154(A).
The applications are grouped in 1) in air-handling spaces, 2) in risers and 3) in all other spaces.
The column for hazardous locations was deleted to correlate with the panel action of proposal 16-16 which moved the hazardous locations requirements to 770.3. This move makes Article 770 parallel to articles 800 and 820.
NFPA 90A does not permit nonmetallic raceway in air ducts so the permitted use of plenum optical fiber raceway in 300.22(B) space was changed to a "N".
The column "In risers in metal raceways or fireproof shafts" was split into two columns because the permitted wiring methods in a raceway differ from the permitted wiring methods in a fireproof shaft. Obviously cable routing assemblies can be used in a fireproof shaft but not inside a raceway.
The titles of the table, the first column and the last two columns were modified to add cable routing assemblies to correlate with the panel actions on proposal 16-48.
The panel action permitted general-purpose cable in a riser in a vertical run. This was changed to an "N" to correlate with the panel action of proposals 16-48 & 16-62.
The column "In building locations other than fabricated ducts and plenums, other spaces used for environmental air (plenums), risers distributing frames and cross connect arrays" can simply be replaced with "General" to correlate with the titles of 800.154(C)(1) and, 820.154(C)(1).
The title of new Table 770.154 contains the word "listed" to correlate with the title of the section.
The two rows dealing with cable routing assemblies were moved above the raceways to bring the blank area of the table to the lower right-hand corner. This is an editorial change to improve the appearance of the table.
This comment is based on the affirmative ballot comment submitted by Gerald Dorna on this proposal. See the ROP.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and statement on Comment 16-44.
Number Eligible to Vote: 16

Table 770.154(A), Applications of Listed Optical Fiber Cables and Raceways, and Cable Routing Assemblies

Cable, Raceway and Cable Routing Assembly Types	Applications												
	In Air-Handling Spaces		In Risers				Within Buildings In Other Than Air-Handling Spaces and Risers						
	In fabricated ducts and plenums as described in 300.22(B)	In other spaces used for environmental air (plenums) as described in 300.22(C)	In vertical runs	In metal raceways	In fireproof shafts	In one- and two-family dwellings	General	In cable trays	In distributing frames and cross connect arrays	In any raceway in Chapter 3	In plenum optical fiber and communi-cations raceways	In riser optical fiber and communi-cations raceways and riser cable routing assemblies	In general-purpose optical fiber and communications raceways and general-purpose cable routing assemblies
OFNP, OFCP	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
OFNR, OFCR	N	N	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
OFNG, OFCG, OFN, OFC	N	N	N	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Riser Cable Routing Assemblies	N	N	Y	N	Y	Y	Y	N	Y	N	N	N	N
General-Purpose Cable Routing Assemblies	N	N	N	N	Y	Y	Y	N	Y	N	N	N	N

Riser Optical Fiber Raceways	N	N	Y	Y	Y	Y	Y	Y	Y	Y			
General-Purpose Optical Fiber Raceways	N	N	N	Y	Y	Y	Y	Y	Y	Y			

Note: An 'N' in the table indicates that the cable, raceway or cable routing assembly type shall not be permitted to be installed in the application. A 'Y' indicates that the cable, raceway or cable routing assembly type shall be permitted to be installed in the application, subject to the limitations described in 770.110 and 770.113.

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-44 Log #1622 NEC-P16 **Final Action: Accept in Principle**
(770.154)

TCC Action: The Technical Correlating Committee directs that the phrase "and plenums" be removed from the application columns in Table 770.154(A).

See the Technical Correlating Committee note on Comment 16-37.

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-56
Recommendation: Revise text to read as follows:

770.154 Applications of Listed Optical Fiber Cables and Raceways, and Cable Routing Assemblies. Permitted and non-permitted applications of listed optical fiber cables and raceways, and cable routing assembly types shall be as indicated in Table 770.154(A). The permitted applications are subject to the installation rules of 770.110 and 770.113. The substitutions for optical fiber cables listed in Table 770.154(B) and illustrated in Figure 770.154 shall be permitted.

See Table 770.154(A) on Page 581

Renumber Table 770.154(E) to become Table 770.154(B)) and Renumber Figure 770.154(E) to become Table Figure 770.154(B).
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

Multiple changes are recommended to improve the clarity of the new Table 770.154(A).

The Table has been reformatted in 'landscape' and is recommended by the Task Group to be presented this way in the Code to enhance readability and use.

The applications are grouped in 1) in air-handling spaces, 2) in risers and 3) in all other spaces.

The column for hazardous locations was deleted to correlate with the panel action of Proposal 16-16 which moved the hazardous locations requirements to 770.3. This move makes Article 770 parallel to Articles 800 and 820.

NFPA 90A does not permit nonmetallic raceway in air ducts so the permitted use of plenum optical fiber raceway in 300.22(B) space was changed to a "N".

The column "In risers in metal raceways or fireproof shafts" was split into two columns because the permitted wiring methods in a raceway differ from the permitted wiring methods in a fireproof shaft. Obviously cable routing assemblies can be used in a fireproof shaft but not inside a raceway.

The titles of the table, the first column and the last two columns were modified to add cable routing assemblies to correlate with the panel actions on Proposal 16-48.

The panel action permitted general-purpose cable in a riser in a vertical run. This was changed to an "N" to correlate with the panel action of Proposals 16-48 and 16-62.

The column "In building locations other than fabricated ducts and plenums, other spaces used for environmental air (plenums), risers distributing frames and cross connect arrays" can simply be replaced with "General" to correlate with the titles of 800.154(C)(1) and, 820.154(C)(1).

The title of new Table 770.154 contains the word "listed" to correlate with the title of the section.

The two rows dealing with cable routing assemblies were moved above the raceways to bring the blank area of the table to the lower right-hand corner. This is an editorial change to improve the appearance of the table.

This comment is based on the affirmative ballot comments submitted by Gerald Dorna and Randy Ivans on this proposal. See the ROP.
Panel Meeting Action: Accept in Principle

See TG revised Table 770.154(A) on Page 582

Panel Statement: "Y" was changed to "Y*" to emphasize to the user that installation rules apply.

Add "In..." to the second column in Table 770.154(A) as a prefix to each phrase.

"Chapter 3 raceway" was changed to "In any raceway recognized in Chapter 3 " for consistency with the installation rules.

See panel action on Comment 16-39.

The panel added eight rows to clarify the issues raised in Comment 16-36 including adding rows dealing with installations in raceways and cable trays. An editorial change was made to clarify that air handling spaces refers to 300.22(B) and (C) spaces.

The box "In Air-Handling Spaces" was divided into the component sections "In Fabricated Ducts and Plenums as Described in 300.22(B)" and "In Other Spaces Used for Environmental Air as Described in 300.22(C)" in order to reduce repetition in the next column.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-45 Log #2419 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-56
Recommendation: Revise the first sentence to read: Permitted and non-permitted applications of listed cables and raceways shall be ~~as indicated in Table 770.154(A)~~ in accordance with 770.110 and 770.113.
Substantiation: A comment has been submitted to delete Table 770.154(A). 770.154 will need to be revised for correlation if the Table is deleted.
The following is our reason for deleting the Table.
Table 770.154(A) is very confusing and will lead to misapplication. A number of notes are needed if this table moves forward. Many users will simply take the table as fact without reading limiting requirements applicable per 800.10 and 800.13 A simple "yes" or "no" does not always fit and will lead to misinterpretation.

Several cycles ago both CMP 8 and CMP 7 rewrote their articles. At that time both attempted to develop tables such as 770.154A. There was such a hue and cry against this and so many notes needed to explain what is actually permitted both Panels dropped the tables. Most tables in the NEC are there to clarify special conditions, not normal use. Text, as opposed to tables, is much easier to interpret and enforce correctly.

Just in case the Panel rejects this comment and continues with the Table, we have submitted a separate comment for 16-56 containing notes to the table. **However, REMOVING THE TABLE IS MUCH MORE USER FRIENDLY AS PAST CODE DEVELOPMENT HAS SHOWN.** Thorough reading of 770-110 and 770-113 by users will lead to easier and better enforcement and avoid installers having to remove and redo an installation due to noncompliance.
Panel Meeting Action: Reject
Panel Statement: The recommended action was intended to correlate with the acceptance of Comment 16-46. The panel rejected Comment 16-46.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-46 Log #2422 NEC-P16 **Final Action: Reject**

	In general-purpose optical fiber and communications raceway, and general-purpose cable routing assemblies	Y*	Y*	Y*	N	N			

Note: An ‘N’ in the table indicates that the cable type shall not be permitted to be installed in the application. A ‘Y*’ indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 770.110 and 770.113.

Informational Note 1: Part V of Article 770 covers installation methods within buildings. This table covers the applications of listed optical fiber cables and raceways, and cable routing assemblies in buildings. The definition of point of entrance is in 770.2. Optical fiber entrance cables that have not emerged from the rigid metal conduit or intermediate metal conduit are not considered to be in the building.

Informational Note No. 2: For information on the restrictions to the installation of optical fiber cables in fabricated ducts and plenums see 770.113(B).

a known fact that that "fireproof" is not a legally defensible term. A comment has been submitted to change the term in 770.113(E).
Panel Meeting Action: Hold
Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-48 Log #2424 NEC-P16 **Final Action: Accept in Principle in Part (Table 770.154(A))**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-56
Recommendation: If the Table is not deleted as proposed in a separate comment, revise Table 770.154(A) as follows:

Add Notes to clarify and change some Y(es) and N(o) permitted uses.

For reference purposes the columns of the draft Table have been numbered in numerical sequence from left to right. The cable and/or raceway types are for identification as shown in the far left product column. It is the intent that a parenthetical note number be placed with the identified product Y or N, with the corresponding note(s) at the bottom of the Table.

Column one –**OFNP and OFCP** – Indicate Note (1) Text: Note (1). OFNP and OFCP Cable in free air in a 300.22(B) location must be directly associated with the air distribution system and is limited to 1.22mm (4 ft); the length limitation does not apply where the cable is installed in a raceway complying with 300.22(B).

Columns one and two – **OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN and OPC** -- Indicate Note (2). Change N to Y for these cables and apply Note (2).

Text: Note 2. In 300.22(B) and (C) locations these cables are permitted in raceways that comply with 300.22(B) and C).

Column seven -- **OFNP, OFCP, OFNR and OFCR** -- Indicate Note (3). Text: Note 3. In 300.22 locations cable tray is required to be solid metal bottom with solid metal cover.

Column ten -- **OFNP, and OFCP, OFNR, OFCR, OFNG, OFCG, OFN, OPC, and Plenum, Riser, and General –Purpose Optical Fiber Raceways**-- Indicate Note (4) Text: Note 4. Where these cables and optical fiber raceways are installed in a Chapter 3 raceway located in 300.22 area the raceway must comply with 300.22 (A) and (B).

Column eleven– **OFNR, OFCR, OFNG, OFCG, OFN and OFC** -- Indicate Note (5) Text: Note 5. Although permitted in plenum communications raceways in locations other than plenums and environmental air spaces, this combination of raceway and cable is not permitted in 300.22 locations. Cables must be CMP.

Column twelve-- **OFNG, OFCG, CFN, OFC**-- Indicate Note (6). Text: Note 6. Although permitted in riser communications raceways in other locations, this combination of raceway and cable is not permitted in riser applications. The cable must be riser cable.

Column thirteen – **OFNP, OFCP, OFNR, OFCR** -- Indicate Note 7). Text: Note 7. These cables in General Purpose Communications Raceway do not constitute a plenum or riser complying installation.

Substantiation: Notes were developed from the following references:

Note (1). Per 77**0.113(B)**.

Note (2) Per 77**0.113(B)**(2) and 77**0.113(C)**(5).

Note (3) Per 770**.113 (B2), (C)(5) and (G)**

Note (4) This note is needed to assure that "any raceway in Chapter 3" is not misapplied.

Notes (5) and (6) are intended to clarify that when plenum or riser raceways are used that does not translate to a plenum or riser installation unless CMP or Riser cable (as applicable) are used.

Note (7) is intended to clarify that the use of plenum or riser cable in a General Purpose Communications Raceway still is suitable for only a general purpose application.

The Sections permitting the use of Plenum, Riser and General Purpose Raceway do not make it clear which cables have to be installed in which raceway to qualify for a specific application. These notes are also intended to clarify that when these raceways are used as liners in Chapter 3 raceways the location of the installation determines the appropriate Chapter 3 raceway.

Several comments have been submitted to770.113 that clarify metal and other Chapter 3 raceways are permitted. That fact is missing in some sections of 770.113. Developing these notes to the Table emphasized the misinterpretations and difficulty of applying the Table to the text. Column ten is a good example of crossover with Columns one and two and could easily be misinterpreted to use any Chapter 3 raceway anywhere with any cable. We urge the Panel to delete this Table, but offer these notes for consideration in the event you do not.

Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle recommendation 1. See Informational Note No 2 in Table 770.154(A).

The panel accepts in principle recommendation 2. See the row "In metal raceway that complies with 300.22(B)".

The panel accepts in principle recommendation 3. See the row "In metal raceway that complies with 300.22(B)" and the row "In metal raceway that complies with 300.22(C)".

The panel does not accept recommendation 4. Section 300.22(A) states "No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors."

The panel does not accept recommendation 5. The installation of Type CMP is covered in Article 800.

The panel accepts in principle recommendations 6 and 7. See the row "In plenum optical fiber and communications raceways" and the row "In riser optical fiber and communications raceways."

Panel Statement: See panel action on Comments 16-37 and 16-44.

16-49 Log #616 NEC-P16 **Final Action: Accept (770.154(A), 800.154(A), 820.154(A), and 830.154(B))**

TCC Action: The Technical Correlating Committee understands that the actions on Proposals 16-59, 16-175, and 16-280 were "Accepted in Principle".
Submitter: Jarrett Shinoski, CommScope, Inc. / Rep. Insulated Cable Engineers Association, Inc.
Comment on Proposal No: 16-59
Recommendation: Continue to accept Proposals 16-59, 16-175, 16-280, and to accept in principle Proposal 16-340.
Substantiation: The Insulated Cable Engineers Association supports the panel action clarify that metal cable trays and metal cable tray systems are permitted to be used in other space used for environmental air. These cable trays are commonly used in ceiling plenums and underfloor plenums.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-50 Log #636 NEC-P16 **Final Action: Accept (770.154(B)(1))**

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-62
Recommendation: Continue to accept this proposal in principle.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to accept this proposal in principle. We agree with Jerry Dorna's ballot comment:

The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".

Section 770.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.

The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-51 Log #639 NEC-P16 **Final Action: Accept (770.154(B)(1))**

(770.154(B)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-61
Recommendation: Accept the proposal with the following provisions:
Vertical runs of cables shall be supported if the vertical rise exceeds 30 m (100 ft). The support shall be provided at the tope of the run or as close to the top as practical. Intermediate supports shall be provided to limit supported length to no greater than 30 m (100 ft).
Substantiation: Provisions similar to Table 300.19(A) should be required to prevent strain and damage.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation has not addressed a safety issue.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-53 Log #475 NEC-P16 **Final Action: Accept in Principle**
(770.154(F))

Submitter: Code-Making Panel 14,
Comment on Proposal No: 16-63
Recommendation: This proposal should be rejected.
Substantiation: The suitability of equipment and wiring in Hazardous (Classified) Locations is covered in Articles 500-516 and is the responsibility of Panel 14.
This comment was developed by a CMP-14 Task Group and balloted through the entire panel with the following ballot results:
14 Eligible to vote
12 Affirmative
2 Ballots Not Returned (T. Beall and D.W. Zipse (Voting Alternate))
1 Comment on Affirmative Vote was received as follows:
D. Batta, Jr. stated: "I agree that the suitability of equipment and wiring in Hazardous (Classified) Locations is covered in Articles 500-516 and is the responsibility of Code-Making Panel 14.
770.154(F) approves several optical fiber cables for use in Hazardous (Classified) Locations that are not addressed in Articles 500-516. To avoid conflicts like this, the suitability of equipment and wiring for use in Hazardous (Classified) Locations should remain the responsibility of Panel 14."
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-15.
Number Eligible to Vote: 16

Ballot Not Returned: 1 Esemplare, R.

16-54 Log #1366 NEC-P16 **Final Action: Accept**
(770.154(H) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-64
Recommendation: Continue rejecting this proposal.
Substantiation: The proposal introduces terms that are associated with fire testing/fire performance and are not defined anywhere. Therefore, not only does no application exist (as CMP 16 correctly pointed out) but no organization has developed criteria for such fire performance.
Optical fiber cables in the NEC can be listed as complying with one of the following 4 categories: OFNP and OFCP (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), OFNR and OFCR (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), OFNG and OFCG (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of CSA FT4) and OFN and OFC (i.e. alternate cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581).
Nowhere does a definition exist for "very-low-smoke producing cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.
Nowhere does a definition exist for "fire hazard cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.
Note that there was not even a proposal addressing a recommended set of fire tests for optical fiber "fire hazard" cables.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation to continue to reject but does not necessarily agree with the submitter's substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-55 Log #2065 NEC-P16 **Final Action: Reject**
(770.154(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 16-64
Recommendation: Add new 770.154(H).
(H) Cables With Suffix Markings. Nonconductive and conductive optical fiber cables with single or multiple suffix markings shall be permitted where required to meet special applications.
(1) Cables for Wet Locations. Nonconductive and conductive optical fiber cables installed in wet locations shall be Types OFNP-WET, OFCP-WET, OFNPR-WET, OFCPR-WET, OFNG-WET, OFCG-WET, OFN-WET, OR OFC-WET.
(2) Cables Exposed to Direct Sunlight. Nonconductive and conductive optical fiber cables installed exposed to direct sunlight shall be Types OFNP-SR, OFCP-SR, OFNPR-SR, OFCPR-SR OFNG-SR, OFCG-SR OFN-SR OR OFC-SR.
(3) Cables in Corrosive Locations. Nonconductive and conductive optical fiber cables installed where exposed to oil shall be Types OFNP-PR, OFCP-PR,, OFNPR-PR, OFCPR-PR, OFNG-PR, OFCG-PR, OFN-PR, OR OFC-PR. Nonconductive and conductive optical fiber cables installed where exposed to oil and gas shall be Types OFNP-GR, OFCP-GR, OFNPR-GR, OFCPR-GR, OFNG-GR, OFCG-GR, OFN-GR, or OFC-GR.
(4) Very-Low-Smoke Producing Cables. Nonconductive and conductive optical fiber very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be Types OFNP-50, OFCP-50, OFNPR-50, OFCPR-50, OFNG-50, OFCG-50, OFN-50, OR OFC-50.
(5) Fire Hazard Cables. Nonconductive and conductive optical fiber fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be Types OFNP-FHC, OFCP-FHC, OFNPR-FHC, OFCPR-FHC, OFNG-FHC, OFCG-FHC, OFN-FHC, OR OFC-FHC.
Substantiation: This comment provides the application information missing from the proposal, as noted by Panel 16.
Panel Meeting Action: Reject
Panel Statement: Requiring that optical fiber installed in wet locations be listed for wet locations conflicts with 770.48 which permits 50 feet of unlisted cable to enter the building. Likewise, requiring that optical fiber cables that are exposed to direct sunlight be listed for exposure to sunlight also conflicts with 770.48. The requirements of 770.48 recognize that outside plant cables, which are designed for exposure to sunlight and water, need to be brought into buildings in order to connect with listing building cables. Indoor/outdoor listed cables are available that are designed to be used in wet locations and exposed to sunlight.

Ballot Not Returned: 1 Esemplare, R.

16-59 Log #992 NEC-P16 **Final Action: Reject**
(770.179(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-66
Recommendation: The Proposal should be Accepted in Principle, revised and the following words "and Annex A Explanatory Material" added after "NFPA 262-2007" so the revised text reads as follows:
~~FPN~~ Informational Note: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is ~~that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with~~ described in NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, and Annex A Explanatory Material.
Substantiation: The FPN refers to a single test method and defines the maximum values, which are not specified in the body of NFPA 262. Inclusion of the maximum values in the FPN are requirements and this violates 3.1.3 of the NEC Style Manual.

NFPA 262 defines the Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces but it does not specify any pass/fail criteria.

While the values specified for maximum peak optical density, maximum average optical density, and maximum allowable flame travel distance in the FPN are not included in the body of NFPA 262, they are contained in Annex A Explanatory Material. Addition of the words "and Annex A Explanatory Material" will reference the maximum values that are in the FPN and the proposed revised FPN will comply with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.
Panel Meeting Action: Reject
Panel Statement: The comment is on Proposal 16-66 but the recommended text does not address the subject of Proposal 16-66 which recommends moving the informational notes to an annex.

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-60 Log #1360 NEC-P16 **Final Action: Reject**
(770.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-66
Recommendation: 770.179 Optical Fiber Cables.

Optical fiber cables shall be listed in accordance with 770.179(A) through (D) and shall be marked in accordance with Table 770.179.

(A) Types OFNP and OFCP. Types OFNP and OFCP nonconductive and conductive optical fiber plenum cables shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire resistant and low smoke producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.*
Substantiation: Retain the FPN as in the current NEC, but only if the FPNs from CMP 3 are not changed to the same language. This comment is being written just in case CMP 3 is willing to change to existing NEC language.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position to not change the FPN.

The panel agrees with the submitter's statement that "the FPN is worded correctly".

See panel action and statement on Comment 16-61.
Number Eligible to Vote: 16

Ballot Not Returned: 1 Esemplare, R.

16-61 Log #1361 NEC-P16 **Final Action: Reject**
(770.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-66
Recommendation: 770.179 Optical Fiber Cables.

Optical fiber cables shall be listed in accordance with 770.179(A) through (D) and shall be marked in accordance with Table 770.179.

(A) Types OFNP and OFCP. Types OFNP and OFCP nonconductive and conductive optical fiber plenum cables shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire resistant and low smoke producing characteristics.

FPN: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.*

~~FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.*~~
Substantiation: This comment is intended to bring consistency to the NEC. In Articles 770, 800, 820 and 830, the FPN is worded correctly but different from what CMP 3 recommended. The original proposal I made to CMP 3 and CMP 16 was already made in the 2005 and 2008 NEC cycles, but was caught up in the "plenum cable moratorium" in the opinion of CMP 3 but not of CMP 16. The present wording also follows the requirements of the preceding section, which requires that the cable be listed as having both "adequate fire-resistant and low smoke-producing characteristics". The wording of CMP 3 (although adequate also) does not explain what is needed to define a cable that is a "low smoke-producing and fire-resistant cable" by omitting the words "a cable that is". However, if CMP 16 makes this change consistency is achieved in the NEC.

With regard to the comment by Mr. Ayers to the proposals in CMP 3, I agree with him, but the (incorrect) use of the term "fire-resistant cable" is consistent in not just the FPNs in all 6 relevant articles (725, 760, 770, 800, 820 and 830) but is also consistent with the use in the charging paragraph.

If CMP 3 and CMP 16 would both like to eliminate the term "fire-resistant cable", consistently in all locations, and replace it by a term such as "low flame spread cable", that would be an excellent idea, but it does require consistency (and probably a task group of both panels). In the meantime the use of the term "fire-resistant cable" is necessary to correlate with the charging paragraph.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position to not change the FPN.

16-62 Log #2839 NEC-P16 **Final Action: Reject**
(770.179(A), FPN)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 16-66
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that "the FPNs are more user-friendly in current locations" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by

multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: This FPN information is valuable for the user of the Code and the user should not have to go back to an annex to find it.

(770.179(E))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 16-76
Recommendation: Add new 770.179(E)

(E) Cables in Wet Locations. Nonconductive and conductive optical fiber cables specified in 770.154(A), (B), and (C) shall be listed for installation in wet locations, or shall have a moisture-impervious metal sheath, and shall be marked with a suffix as required in 770.179(E)(a) or (b).
(a) Cables installed in dry location shall not be required to have an additional suffix marking.
(b) Cables suitable for installation in wet locations shall be identified with the suffix "-WET". Conductors and cables listed for damp locations shall be suitable for installation in dry or damp locations. FPN: One method of defining suitability for installation in wet locations is by testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*

Substantiation: A companion comment provides application requirements.
Panel Meeting Action: Reject
Panel Statement: Section 770.179 contains listing requirements only. The recommended text is a mixture of listing requirements and installation requirements. The recommended text is inappropriate for a listing section.

Adding a metal sheath on a nonmetallic cable is inappropriate.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-70 Log #2144 NEC-P16 **Final Action: Accept in Principle**
(770.179(E) (New))

Submitter: Edward Walton, WC Services
Comment on Proposal No: 16-77
Recommendation: Add new text as follows:
770-179(E) Fiber Optic Circuit Integrity (CI) Cables. Cables suitable for use in systems to ensure survivability of critical circuits and pathways during a specified time under fire conditions shall be additionally listed as circuit integrity (CI) cable. Cables identified in 770.179(A) through (D) that meet the requirements for circuit integrity shall have the additional classification using the suffix "CI."

FPN: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-2001, Standard for Tests of Fire Resistive Cable.
Substantiation: In addressing the panel's statement, I believe the copy I have provided of Chapter 12 from NFPA 72 – 2010 makes it clear that there is a need for fiber optic cables that resist attack by fire. One of the best ways to provide this is to allow the designation of "CI" as proposed. This has worked well in Article 760 and would offer the user a better option than requiring an "electrical circuit protective system" or enclosure/protected area as the other options contained in Chapter 12 of NFPA 72 – 2010.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle

Add new text as follows:
770-179(E) Optical Fiber Circuit Integrity (CI) Cables. Cables suitable for use in systems to ensure survivability of critical circuits and pathways during a specified time under fire conditions shall be additionally listed as circuit integrity (CI) cable. Cables identified in 770.179(A) through (D) that meet the requirements for circuit integrity shall have the additional classification using the suffix "CI."

Informational note: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-2001, Standard for Tests of Fire Resistive Cable.
Panel Statement: The panel recognizes that the requirements of NFPA 72, National Fire Alarm and Signaling Code have broadened in new Chapter 12, Circuits and Pathways.

The 2008 NEC, Articles 725, 760 and 800 have provisions for circuit integrity (CI) cables. The user should also have the option of a circuit integrity optical fiber cable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-71 Log #2068 NEC-P16 **Final Action: Reject**
(770.179(F))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 16-78
Recommendation: Accept Proposal 16-78.
Substantiation: It is important for cable exposed to sunlight to be listed and marked for the purpose.
Panel Meeting Action: Reject
Panel Statement: Section 770.179 contains listing requirements only. The recommended text is a mixture of listing requirements and installation requirements. The recommended text is inappropriate for a listing section.

The submitter's substantiation that cables are not marked for exposure to direct sunlight is incorrect. There are cables marked as suitable for installation in direct sunlight.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-72 Log #2069 NEC-P16 **Final Action: Accept in Principle**
(770.179(G))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 16-79
Recommendation: Accept Proposal 16-79.
Substantiation: It is important for industries to have temperature rating information.
Panel Meeting Action: Accept in Principle

Revise 770.179 to read as follows:

770.179 Optical Fiber Cables. Optical fiber cables shall be listed in accordance with 770.179(A) through (D) and shall be marked in accordance with Table 770.179. Optical fiber cables shall have a temperature rating of not less than 60°C (140°F).
Panel Statement: Adding this last sentence will bring about parallelism with 800.179 which states "Communications wires and cables shall have a temperature rating of not less than 60°C."
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-73 Log #2070 NEC-P16 **Final Action: Reject**
(770.179(H) and FPN)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 16-80
Recommendation: Add new 770.179(H) and FPN as follows:
(H) Cables Installed Exposed to Oil or Gas. Nonconductive and conductive optical fiber cables installed where exposed to oil or gas and oil shall have the additional classification using the following suffixes: "-PR" for oil resistant, and "-GR" for gasoline and oil resistant.
FPN: One method of defining corrosion resistance is testing to the requirements of UL 1581, *Reference Standard for Electrical Wires, Cables, and Flexible Cords.*
Substantiation: Presently, there is no marking that identifies cables as being suitable for installation where exposed to oil or gas. It is important to have the correct cable for locations that have the potential to degrade cable and conductor insulation and cause system malfunction.
Panel Meeting Action: Reject
Panel Statement: Section 770.179 contains listing requirements only. The recommended text is a mixture of listing requirements and installation requirements. The recommended text is inappropriate for a listing section.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

Comment on Proposal No: 16-81
Recommendation: Accept Proposal 16-81.
Substantiation: There are cables available that would pass the UL 723 test, but it would be foolish for a manufacturer to submit a product for testing, as there is no marking available to differentiate a very low smoke cable from smoky cable.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient additional technical information for the panel to reverse its position.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-75 Log #1367 NEC-P16 **Final Action: Accept**
(770.179(L) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-81
Recommendation: Continue rejecting this proposal.
Substantiation: The proposal introduces a definition of a term that is associated with fire testing/fire performance and is not defined anywhere. Therefore, not only does no application exist (as CMP 16 correctly pointed out) but no organization has developed criteria for such fire performance.

Optical fiber cables in the NEC can be listed as complying with one of the following 4 categories: OFNP and OFCP (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), OFNR and OFCR (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), OFNG and OFCG (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of CSA FT4) and OFN and OFC (i.e. alternate cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581).

Nowhere does a definition exist for “very-low-smoke producing cables”; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable. The proposed fire properties recommended for such a listing do not correspond to any listing developed by a nationally recognized listing organization, even when optional listings are taken into account. UL has developed UL Subject 2424, “Outline of Investigation for Cable Marked “Limited Combustible”, which contains a set of listing criteria for which no application exists, but this document requires that cables also be tested in accordance with NFPA 259.

Cables listed to UL 2424 are already allowed by NFPA 90A to be used anywhere that plenum cables are required.

Both NFPA 90A and the mechanical codes (the IMC, International Mechanical Code, and the UMC, Uniform Mechanical Code) have requirements of 25/50 (flame spread index/smoke developed index, in accordance with ASTM E 84) for materials in plenums other than wires and cables (and some other materials). NFPA 13 (sprinkler standard) also made it clear that the use of plenum cables in plenums does not even introduce a fire hazard sufficient to require installation of sprinklers.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation to continue to reject but does not necessarily agree with the submitter’s substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

(770.182)

Submitter: Jarrett Shinoski, CommScope, Inc. / Rep. Insulated Cable Engineers Association, Inc.
Comment on Proposal No: 16-83
Recommendation: Continue to reject this proposal.
Substantiation: The Insulated Cable Engineers Association supports the panel action to reject this proposal. All listed optical fiber cables are suitable for use in cable trays. An additional listing category and marking is not needed.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-77 Log #1629 NEC-P16 **Final Action: Accept**
(770.182)

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-82
Recommendation: Continue to accept Proposal 16-82 in principle and revise the FPNs as follows:

(B) Riser Optical Fiber Raceways and Cable Routing Assemblies. ……

Informational Note: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways and cable routing assemblies pass the requirements of the test for flame propagation (riser) in UL 2024, *Standard for Optical Fiber Cable Raceway*, or UL2024A, *Outline of Investigation for ~~Optical Fiber~~ Cable Routing Assemblies, as applicable.*

(C) General-Purpose Optical Fiber Cable Raceways and Cable Routing Assemblies. ……

Informational Note: One method of defining resistance to the spread of fire is that the raceways and cable routing assemblies pass the requirements of the vertical-tray flame test (general use) in UL 2024, *Standard for Optical Fiber Cable Raceway*, or UL2024A, *Outline of Investigation for ~~Optical Fiber~~ Cable Routing Assemblies, as applicable.*
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

Cable routing assemblies were omitted from the FPNs. Acceptance of this comment will correct that oversight.

UL has changed the title and has expanded the scope of Outline of Investigation Subject 2024A and its associated Guide Information Page (White Book, QBAA). The title of the UL Outline has been changed from “Optical Cable Routing Assemblies” to “Cable Routing Assemblies” and the title of the QBAA Guide Information Page has been changed from “Optical Fiber/ Communications Cable Routing Assemblies for Use in Telecommunications Installations” to “Cable Routing Assemblies.” The scope has been broadened to include the application of cable routing assemblies with communications wires and Class 2, Class 3, power-limited fire alarm, and low-power network-powered broadband communications cables.

16-79 Log #996 NEC-P16 **Final Action: Reject**
(770.182(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-84
Recommendation: The Proposal should be Accepted in Principle and revised to read as shown:

~~FPN:~~ Informational Note: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is described in ~~that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with~~ the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.
Substantiation: UL 2024 defines the test method and the pass/fail criteria. The present FPN specifies the requirements when tested in accordance with UL 2024; that very clearly stipulates a requirement and a test method, which is not permitted in a FPN. Acceptance of the revised wording will provide the user with the reference to one method of determining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway and also comply with the NEC Style Manual.

Changing “FPN” to “Informational Note” provides correlation with the TCC Action on Proposal 1-37a.
Panel Meeting Action: Reject
Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on one method

of defining an optical fiber raceway that is low smoke producing and fire resistant.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-80 Log #2843 NEC-P16 **Final Action: Reject**
(770.182(A), FPN)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 16-85
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that "the FPNs are more user-friendly in current locations" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: This FPN information is valuable for the user of the Code and the user should not have to go back to an annex to find it.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

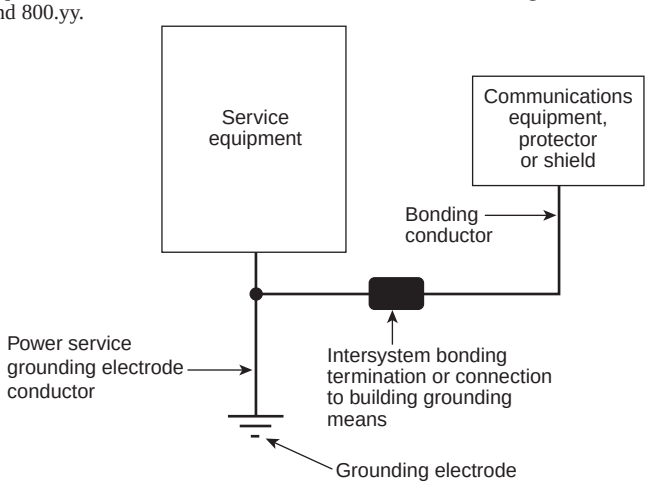
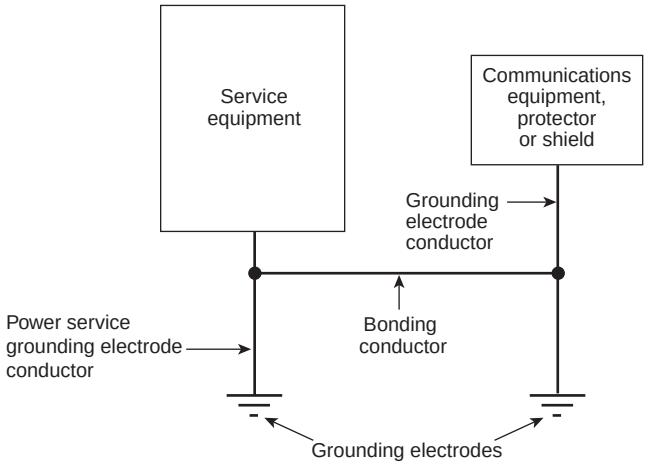
ARTICLE 800 — COMMUNICATIONS CIRCUITS

16-84a Log #CC1600 NEC-P16 **Final Action: Accept**
(800)

Submitter: Code-Making Panel 16,
Comment on Proposal No: 16-91
Recommendation: Insert the following informational note immediately following the number reference and title to Article 800 to read as follows:

Informational Note: The general term "Grounding Conductor" as previously used in this Article is replaced by either "Bonding Conductor" or "Grounding Electrode Conductor (GEC)" where applicable to more accurately reflect the application and function of the conductor. See Informational Figures 800.xx and 800.yy.





Insert the following informational note immediately following the number reference and title to Articles 770, 810, 820 and 830 to read as follows:

Informational Note: The general term "Grounding Conductor" as previously used in this Article is replaced by either "Bonding Conductor" or "Grounding Electrode Conductor (GEC)" where applicable to more accurately reflect the application and function of the conductor.

Substantiation: The panel adds an informational note to clarify the change relative to the use of the new terms "Bonding Conductor" or "Grounding Electrode Conductor (GEC)" which now replace the general term "Grounding Conductor". Two Figures are added to provide clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

BRUNSSEN, J.: It is imperative that the Informational Note (IN) contained in this comment become a part of the 2011 NEC. It provides a clear and concise explanation of the 'grounding conductor' revisions implemented by the Panel, as well as describing the application and functionality of the conductor. This is especially important as Panel 5 has acted to revert to the 2008 NEC definition of 'grounding electrode conductor' (GEC) (i.e., there will be no mention of communications in the definition of GEC in Article 100), while continuing to eliminate 'grounding conductor' from the Art. 100 definitions. Additionally, Panel 5 has substantiated their Panel Action on comments related to this issue based upon Panel 16 Panel Actions and the inclusion of the IN contained in this Panel Comment. Without the new IN and accompanying diagrams, and with no mention of communications in the Article 100 definition of GEC, I believe that total confusion in Article 770 and Chapter 8 will result.

IVANS, R.: While the general changes regarding the elimination of the term "Grounding Conductor" and replacing it with either "Grounding Electrode Conductor" or "Bonding Conductor" are intended to better align Chapter 8 and Article 770 with the rest of the Code, it represents a significant change to the communications industry and the terminology used in installation practices for many years. I fully support the inclusion of the informational figures into Article 800 with additional reference notes in the rest of the Chapter 8 Articles and Article 770. I will emphasize the importance of this by saying that without the inclusion of this explanatory material, I would likely not cast an affirmative vote for any of the proposals related to the elimination of the term "Grounding Conductor" on the basis that the change in terminology without clarifying explanations could lead to confusion and result in unsafe installations.

OHDE, H.: We support this CMP 16 comment and action regarding the addition of the informational note and the two informational figures to be located following the number reference and article title. This informational note and informational figures will provide the end user with language clarity relative to the use of the new terms "bonding conductor" or "grounding electrode conductor" where used appropriately throughout these articles.

16-85 Log #542 NEC-P16 **Final Action: Reject**
(800)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-91
Recommendation: Continue to reject the proposal.
Substantiation: The panel statement has correctly identified several criteria that make the "grounding electrode conductor" unique and different from a communications "grounding conductor". They include: connection of the grounded conductor (neutral) and the equipment grounding conductor from within the power service equipment to the grounding electrode/ grounding electrode system at the premises, specific requirements for material, installation, sizing and accessibility, and service as the interconnection point for other equipment/systems required to be grounded. Communications grounding conductors do not have the required attributes to serve these important functions. Identifying them as such will lead to confusion, misapplication of grounding rules and inadequate grounding. See my affirmative ballot comment on Proposal 16-91.

The Panel might consider, as a response to this comment, 'relocating' the existing definition of "Grounding Conductor" from Article 100 to Sections 770.2, 800.2, 820.2, 830.2 and 840.2 with no technical change, or revising the definition in Article 100 to suit communications applications as indicated in my affirmative ballot comment on Proposal 16-91.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter.

The panel has reviewed the proposed CMP 5 grounding terminology changes and has accepted the changes with editorial revisions in an effort to ensure consistent terminology throughout the Code.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

PIRKLE, W.: The terms "bonding conductor" and " grounding electrode conductor" provide clarity and consistency through out the code. The new terms better defines the function of the conductors.

16-86 Log #611 NEC-P16 **Final Action: Accept in Principle**
(800)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 16-91
Recommendation: Replace the term "~~grounding conductor~~", with the term "grounding electrode conductor", throughout this article.
Substantiation: The term "grounding electrode conductor", is a specific term and thus it is easier for most people in the industry to understand the purpose. The generic term "grounding conductor" is so general that most people can misunderstand the application. It cannot be held to be in the best interest of safety for a general misunderstanding of terms to be an allowable mode in the NEC process.
Panel Meeting Action: Accept in Principle

OHDE, H.: See our affirmative comment for Comment 16-22.

16-87 Log #1268 NEC-P16 **Final Action: Accept in Principle**
(800)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 16-91
Recommendation: I highly encourage CMP-16 to accept this proposal in principle and accept the coordinated set of comments that provide the completed revisions throughout Article 800.
Substantiation: This comment responds to action by CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 800. The coordinated comments actually even correct misuse of grounding terms in a few locations that existed for a few cycles.

CMP-5 has responsibilities for defined grounding and bonding terms (Code wide). This comment respects the independence of CMP-16 regarding Chapter 8 based on 90.3: this work is not an effort to remove that independence. These proposed revisions are technically correct and result in grounding and bonding terms being used consistently with how they are defined. The term "grounding conductor" is too broad and has been part of a planned migration for removal since the 2005 edition. This planned revision is part of a larger plan implemented by the NEC-2008 TCC assigned grounding and bonding task group work. The grounding and bonding concepts are simple. If grounding happens, a connection is made to an electrode by use of a grounding electrode conductor. Bonding connected conductive parts to establish continuity and conductivity between them. The proposed revisions do not change anything technically in the article: they only make the use of grounding terms consistent with how they are defined, improving the current text. The only change proposed is in use of terms. All other rules such as sizing, installation and so forth remain as specified in this article, as before.

Not accepting the proposed revisions shows a deliberate action to allow continued inconsistency and subjectivity to remain in the NEC. CMP-5 actions have deleted the term "grounding conductor" from Aarticle 100 and revised the term "grounding electrode conductor" to work consistently with the limited energy articles in Chapter 8. The term "grounding conductor" has been removed or replaced in Article 250 and other articles of the NEC. Not accepting the proposed revisions in the coordinated comments will result in the continued use of an orphaned term that is not specific and can lead to subjectivity. The proposed changes are technically correct and there have been no technical reasons brought forward to reject what is being proposed. I highly encourage CMP-16 to give strong consideration to the coordinated comments submitted that resolve these inconsistencies and improve clarity and usability within the limited energy articles with regards to grounding and bonding rules. The best approach in Code development work is to look at the long range objectives and what would be best for the NEC. It needs to be practicable, understandable, and enforceable. These proposed revisions are in the spirit of accomplishing all three of these objectives. It's not about who is right or wrong, it is about being successful and ending up with the best Code as a result.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel disagrees with the submitter. The panel has reviewed the proposed grounding terminology changes and has accepted the changes with editorial revisions in an effort to ensure consistent terminology throughout the Code.

16-88 Log #1996 NEC-P16 **Final Action: Accept in Principle**
(800)

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Comment on Proposal No: 16-91
Recommendation: Replace the term "grounding conductor" with "grounding electrode conductor" throughout this Article.
Substantiation: I agree with the submitter that the term "grounding conductor" and "grounding electrode conductor" are all but identical. The term "grounding electrode conductor" will not be mistaken in the field for the grounded conductor and refers to any point on the grounding electrode system.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-125.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22

16-89 Log #2095 NEC-P16 **Final Action: Accept in Principle**
(800)

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 16-91
Recommendation: Revise the proposal as follows: Replace the term "grounding conductor" with "bonding conductor" or "grounding electrode conductor" throughout the article as appropriate.
Substantiation: The present term "grounding conductor" is proposed to be deleted by CMP5. The present term is not correct in most applications. I was part of a CMP-5 and CMP-16 Task Group that could not come to a consensus. The members of CMP-5 went through all the sections in Articles 770, 800, 810, 830 and the proposed new Article 840. The proposed changes are being presented by Phil Simmons and I urge the code panel to either agree with the submitter or make additional changes as needed to remove the term "grounding conductor from these articles.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-125.
Number Eligible to Vote: 16

16-90 Log #2220 NEC-P16 **Final Action: Accept in Principle**
(800)

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-91
Recommendation: Accept Proposal 16-91 as intended to delete the term "grounding conductor" and replace it with the term "grounding electrode conductor" throughout Article 800.
Substantiation: Proposal 5-13 deleted the definition of "Grounding Conductor" in Article 100 during the 2011 ROP stage as well as the revision of the term "Grounding Electrode Conductor". The revision of the term "grounding electrode conductor" in Article 100 included wording necessary for the Chapter 8 Articles, therefore, the term "grounding conductor" is no longer needed or required. The term "grounding electrode conductor" is more correct than the term "grounding conductor". Proposal 5-18 which was accepted in principle and revised by CMP-1 reads as follows:

Grounding Electrode Conductor (GEC). A conductor used to connect the system grounded conductor, equipment, communications system protectors, antenna discharge units, communications system protectors, antenna discharge units, communications cables or network interface units to a grounding electrode or to a point on the grounding system.

Panel Meeting Action: Accept in Principle

16-92 Log #38 NEC-P16 **Final Action: Accept**
(800.1, FPN 6 (New))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-99
Recommendation: Accept proposal 16-99 in principle in part by taking the following action.

Renumber the new 800.3(F) Optical Fiber Cable established by panel action on proposal 16-133 to 800.3(G) Optical Fiber Cable.

Reject the proposed new FPN No. 6 and instead adopt a new 800.3(F) which reads as follows:

(F) Premises-Powered Broadband Communications Systems. Article 840 shall apply to premises-powered broadband communications systems.

Substantiation: Acceptance of this comment will provide parallel references to Articles 830 and 840. See panel action on proposals 16-93 and 16-97 which deleted the FPN referring to Article 830 because there already was a reference to Article 830 in 800.3. Moving the subsection on optical fiber cables down one letter with place the subsection on premises-powered broadband immediately after the subsection on network-powered broadband.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-93 Log #536 NEC-P16 **Final Action: Accept**
(800.1, FPN 6 (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-98
Recommendation: Continue to reject the proposal.
Substantiation: The panel has correctly observed that the submitter's proposed FPN directs the reader to a document that applies to facilities identified in 90.2(B)(4) as not covered by the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-94 Log #40 NEC-P16 **Final Action: Accept**
(800.2)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-105
Recommendation: Accept proposal 16-105 in principle by revising the definition of communications raceway to read as follows:
Communications Raceway. An enclosed channel of nonmetallic materials designed for holding communications wires and cables in plenum, riser and general-purpose applications.
Substantiation: The Technical Correlating Committee directed that the panel clarify the panel action on this proposal by complying with 2.2.2 of the NEC Style Manual to not contain mandatory text, such as "listed" and not contain the defined term. The recommended text complies with the Technical Correlating Committee directive.

The definition of raceway in Article 100 is:
"**Raceway.** An enclosed channel of metal or nonmetallic materials designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this *Code*. Raceways include, but are not limited to, rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible conduit, flexible metallic tubing, flexible metal conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceways, cellular concrete floor raceways, cellular metal floor raceways, surface raceways, wireways, and busways."

The beginning text recommended by this comment "An enclosed channel of nonmetallic materials designed for holding communications wires and cables..." is based on the definition of raceway in Article 100. The end of the definition which states that the raceways are designed for "plenum, riser and general-purpose applications" is intended to differentiate between plenum, riser and general-purpose communications raceways and a Chapter 3 raceway that is holding a communications cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-95 Log #463 NEC-P16 **Final Action: Reject**
(800.2)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 16-100
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:

Exposed (to Accidental Contact). A circuit that is in such a position that, in case of failure of supports or insulation, contact with another circuit ~~may~~ result<u>s</u>.

Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term may in this Section does not meet these criteria, it should be changed.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed text indicates that in the event of a failure of supports or insulation, contact with an electrical circuit **will** result. Such contact is a possibility but not a certainty.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-96 Log #537 NEC-P16 **Final Action: Accept in Principle**
(800.2)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-108
Recommendation: Revise the definition as follows: "**800.2. Cable Routing Assembly.** A structural system consisting of a single or multiple units and associated fittings used to support and protect optical fiber, communications and data cables."
Substantiation: As indicated in my affirmative ballot comment, the definition is incomplete. The Panel also needs to accommodate the TCC Action. The proposed revisions contained in this comment will complete the definition and satisfy the TCC's concerns. The 'requirement' that the assembly be listed can be included in the appropriate sections of the various Articles, e.g. 800.113(A).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-99.
The text meets the submitter's intent.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-97 Log #788 NEC-P16 **Final Action: Reject**
(800.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-101
Recommendation: Revise the definition of "premises" as follows:
The land and buildings or other structures located on the user side of the utility-user network point of demarcation.
Substantiation: Structures which are not "buildings" should be included.
Panel Meeting Action: Reject
Panel Statement: Adding "structures" would include telephone poles which support outside plant cables. Outdoor communications wiring, except drop wire, is outside the scope of this Article.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-98 Log #789 NEC-P16 **Final Action: Reject**
(800.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-100
Recommendation: Revise the definition of "Exposed" (to accidental contact) as follows:
A wire or cable, that in case of failure of supports or insulation, is likely to contact another conductor(s).
Substantiation: Failure can result in contact with other conductors which are not "circuits", such as a grounding conductor. "Likely" is a term used many times in the NEC. Per 3.1.2 of the NECStyle Manual, "may" shall only be used as a discretionary judgement by the Authority Having Jurisdiction.
Panel Meeting Action: Reject
Panel Statement: The term "may" as used in the present text connotes "a possibility"; the term "likely" connotes "is probable". The panel does not agree that these are probable events. Of concern is contact with other electric circuits that could energize the communications circuit resulting in an electrical safety hazard. Contact with "other conductors" such as "grounding conductors" would not result in an electrical safety hazard.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-99 Log #1630 NEC-P16 **Final Action: Accept**
(800.2)

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-108
Recommendation: Accept Proposal 16-108 in principle in part by taking the following actions:
Reject including the definition of cable routing assembly in Article 800.
Instead add a new 800.3(G) as follows:
(G) Cable Routing Assemblies. The definition in 770.2, the applications in 770.154 and installation rules in 770.113 shall apply to Article 800.
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.
Panel 16 accepted a definition of a cable routing assembly in multiple articles. It also established installation rules and listing requirements in multiple articles. The task group recommends that panel 16 simplify the multiple sections dealing with cable routing assemblies by placing the definition and installation rules in one article only. Since the primary application of cable routing assemblies is currently with optical fiber cables, the task group chose Article 770.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

16-102 Log #2425 NEC-P16 **Final Action: Accept in Principle**
(800.2.Point of Entrance)

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-91
Recommendation: Revise text to read as follows:
Point of Entrance. The point within a building at which the wire or cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected by a grounding electrode conductor to an electrode in accordance with 800.100(B).
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.
From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-103.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-103 Log #1892 NEC-P16 **Final Action: Accept in Principle**
(800.2 Point of Entrance)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-91
Recommendation: Revise text to read as follows:
Point of Entrance. The point within a building at which the wire or cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected by a grounding electrode conductor to an electrode in accordance with 800.100(B).
Substantiation: This comment responds to the action of CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 800.
Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Point of Entrance. The point within a building at which the wire or cable emerges from an external wall, from a
concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected
by a bonding conductor or grounding electrode conductor ~~to an electrode~~ in accordance with 800.100(B).
Panel Statement: The panel agrees with the submitter and edits the text as 800.100(B) includes both bonding conductors and grounding electrode conductors.

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-110
Recommendation: Revise the Panel Action to "Accept in Part". Accept the part as follows that states: "Re-letter the existing (A) to (B), (B) to (C), etc. and establish a new (A). **(A) Chapters 1 through 7.** The requirements of Chapters 1 through 7 shall not apply to Article 800 except where the requirements are specifically referenced in Article 800."
Delete the part that states: "See 90.3."
Substantiation: Removes the reference to 90.3 as flagged by the Technical Correlating Committee.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-107 Log #530 NEC-P16 **Final Action: Accept**
(800.3(D))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-112
Recommendation: Continue to reject this proposal.
Substantiation: The Panel Statement has correctly identified that Article 800 cables and wires contain very low power levels. They are essentially power-limited by the resistance of the battery-feed circuits and conductor lengths involved. If cut, it may be an inconvenience, but it does not constitute an electrical safety hazard. Where greater network power levels are used, such as in Article 830, *Network-Powered Broadband Communications Systems*, burial depths as specified in Table 830.47 apply.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation to continue to reject but does not necessarily agree with the submitter's substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-108 Log #433 NEC-P16 **Final Action: Reject**
(800.10(C))

Submitter: William Q. Cellini, Jr., Ardmore, PA
Comment on Proposal No: 16-114
Recommendation: New text to read as follows:
Service conductors & cables on exterior walls shall be installed in metallic conduit, for protection against burglars & arson; residential, etc., including telephone, security & fire alarm.
Substantiation: My original comment refers to the responsibility of the service provider & installer or owner/customer; whoever has jurisdiction.
Panel Meeting Action: Reject
Panel Statement: The submitter is referencing to a nonexistent section in the NEC. 800.10(C) is nonexistent.
The panel reiterates its position that a broad-based requirement, as proposed by the submitter, is inappropriate as only a small portion of communications installations are used for such purposes. Responsibility for physical protection to deter burglary/arson should accrue to the alarm service provider and/or customer, not the communications utility. The NEC cannot assign implementation responsibility.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-109 Log #1346 NEC-P16 **Final Action: Accept**

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-112 Log #1398 NEC-P16 **Final Action: Reject**
(800.26)

Submitter: Russell LeBlanc, The Peterson School
Comment on Proposal No: 16-123
Recommendation: The proposal should be accepted in principal but modified as follows:

If a conduit or raceway of metric designator 53 (trade size 2 inch) or larger, penetrates a fire-resistance-rated wall, partition, floor, or ceiling, and that same conduit or raceway also enters an enclosure of the ventilated type, that conduit or raceway shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway or conduit into other areas of the building or structure.
Substantiation: I have modified the wording for clarity and so the application is more focused, and less of a "sweeping" change.

In my original proposal I provided a first hand eyewitness account of what happened.

This was NOT a second hand or third hand story. I saw it happen with my own eyes! I am not a novice. I have been in the trade for over 25 years. I have also been teaching electrician classes for over 10 years. I am OSHA certified. I am an instructor approved by the Mass. Dept. of Education, and The Board of Examiners of Electricians. I have authored several other code changes. I am a member of NFPA. No, I am not a Fire chief or fire science engineer, or some other Fire Dept. Official. But I know what I saw, and it just did NOT seem right to me. I am very concerned. The smoke simply should NOT have been able to spread through the building via the raceways. What more technical substantiation is needed than that?

Lets break it down to simple science and logic.

If I build a fire in a fireplace, the smoke will go up the chimney flue, if the flue damper is OPEN.

If I build a fire in a fireplace, the smoke will NOT go up the chimney flue, if the flue damper is CLOSED!

Try it!

Apply logic here.

If I am wrong then maybe we don't need to seal the raceway ends. But this "chimney effect" of the unsealed pipes has already happened once. I have seen it. If it happens again, the occupants may not be as lucky as the first time I saw this phenomenon happen.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The recommended text is vague, unenforceable and lacks specificity. Insufficient data has been provided to justify such a change. Selection of conduit size requiring fire stopping is arbitrary. This may be more of a building Code issue rather than an electrical Code issue.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:

IVANS, R.: The submitter identifies a concern associated with conduit providing a bypass of firebreaks between floors that should not be ignored. Although there may be issues associated with the general nature of the original proposal or the seemingly arbitrary selection of 2" conduit, the solutions are not technically insurmountable. I am aware of installations where such sealing of conduit was required by local building codes and effectively implemented This item should have been put on hold for further study rather than rejected.

16-113 Log #618 NEC-P16 **Final Action: Accept**
(800.47)

Submitter: Jarrett Shinoski, CommScope, Inc. / Rep. Insulated Cable Engineers Association, Inc.
Comment on Proposal No: 16-129
Recommendation: Continue to accept Proposal 16-129 in principle.
Substantiation: The Insulated Cable Engineers Association supports the panel action to clarify that entrance cables do not need to be listed for wet applications.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-114 Log #2325 NEC-P16 **Final Action: Reject**
(800.47)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 16-129
Recommendation: Accept the proposal as originally submitted.
Substantiation: The panel did not substantiate the removal of 310.8(B) from the original proposal. The submitter is correct that 310.8(B) needs to be exempted from this rule, as it applies to damp locations. The same substantiation exempting 310.8(C) applies to damp locations.
Panel Meeting Action: Reject
Panel Statement: The panel action satisfied the submitter's intent concerning wet locations.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-116 Log #1893 NEC-P16 **Final Action: Accept in Principle (800.90(A) and (B))**

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-91
Recommendation: Revise text to read as follows:

The opening paragraph of 800.90(A) is unchanged by this Comment.

(A)(1) Fuseless Primary Protectors. Fuseless-type primary protectors shall be permitted under any of the conditions given in (A)(1)(a) through (A)(1)(e).

(a) Where conductors enter a building through a cable with grounded metallic sheath member(s) and where the conductors in the cable safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding electrode conductor

(b) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from a cable with an effectively grounded metallic sheath member(s) and where the conductors in the cable or cable stub, or the connections between the insulated conductors and the plant exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground, safely fuse on all currents greater than the current-carrying capacity of the primary protector, or the associated insulated conductors and of the primary protector grounding electrode conductor

(c) Where insulated conductors in accordance with 800.50(A) or (B) are used to extend circuits to a building from other than a cable with metallic sheath member(s), where (1) the primary protector is listed as being suitable for this purpose for application with circuits extending from other than a cable with metallic sheath members, and (2) the connections of the insulated conductors to the plant exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground or the conductors of the plant exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground safely fuse on all currents greater than the current-carrying capacity of the primary protector, or associated insulated conductors and of the primary protector grounding electrode conductor

800.90(A)(1)(d) is not changed by this Comment.

(e) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from cable with an effectively grounded metallic sheath member(s), and where (1) the combination of the primary protector and insulated conductors is listed as being suitable for this purpose for application with circuits extending from a cable with an effectively grounded metallic sheath member(s), and (2) the insulated conductors safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding electrode conductor

800.90(A)(2) is not changed by this Comment.

Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 800.

These comments address the changes suggested in proposal 16-91 in each section within Article 800 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

Panel Meeting Action: Accept in Principle
Revise text to read as follows:

The opening paragraph of 800.90(A) is unchanged by this Comment.

(A)(1) Fuseless Primary Protectors. Fuseless-type primary protectors shall be permitted under any of the conditions given in (A)(1)(a) through (A)(1)(e).

(a) Where conductors enter a building through a cable with grounded metallic sheath member(s) and where the conductors in the cable safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector bonding conductor or grounding electrode conductor

(b) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from a cable with an effectively grounded metallic sheath member(s) and where the conductors in the cable or cable stub, or the connections between the insulated conductors and the plant exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground, safely fuse on all currents greater than the current-carrying capacity of the primary protector, or the associated insulated conductors and of the primary protector bonding conductor or grounding electrode conductor

(c) Where insulated conductors in accordance with 800.50(A) or (B) are used to extend circuits to a building from other than a cable with metallic sheath member(s), where (1) the primary protector is listed as being suitable for this purpose for application with circuits extending from other than a cable with metallic sheath members, and (2) the connections of the insulated conductors to the plant exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground or the conductors of the plant exposed to accidental contact with electric light or power conductors operating at greater than 300 volts to ground safely fuse on all currents greater than the current-carrying capacity of the primary protector, or associated insulated conductors and of the primary protector bonding conductor or grounding electrode conductor

800.90(A)(1)(d) is not changed by this Comment.

(e) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from cable with an effectively grounded metallic sheath member(s), and where (1) the combination of the primary protector and insulated conductors is listed as being suitable for this purpose for application with circuits extending from a cable with an effectively grounded metallic sheath member(s), and (2) the insulated conductors safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector bonding conductor or grounding electrode conductor

800.90(A)(2) is not changed by this Comment.

Panel Statement: The panel accepts the submitter's text and adds "bonding conductor or" in four (4) locations. This ensures consistent terminology throughout the Code.

800.90(A)(2) is not changed by this Comment.

Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal

and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.

Panel Meeting Action: Accept in Principle

16-118 Log #405 NEC-P16 **Final Action: Accept**
(800.90(A), FPN No. 2(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 16-135
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

16-119 Log #302 NEC-P16 **Final Action: Accept**
(800.90(A)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 16-136
Recommendation: The Technical Correlating Committee directs the panel to reconsider the action on this proposal since the phrase "effectively grounded" is no longer defined in the NEC.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to review the panel action.

The panel has reconsidered the panel action on this proposal and determined that the use of the term "effectively grounded" is appropriate in this case. It is important in the use of fuseless protectors that service drops/wires extend from a cable with an effectively grounded metallic sheath to limit power fault and lightning currents. This is an essential requirement and is inherent in the listing and proper application of fuseless protectors. Use of the term "effectively grounded" provides correlation between the NEC and the NESC.

Ballot Not Returned: 1 Esemplare, R.

16-120 Log #540 NEC-P16 **Final Action: Accept**
(800.90(A)(1))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-136
Recommendation: Continue to reject the proposal.
Substantiation: It is an important safety consideration that cables from which circuits are extended to a building have a grounded metallic sheath. Section 800.90(A)(1) deals with the use of fuseless protectors and it is important, when using these protectors, that service drops/wires extend from a cable with a grounded metallic sheath to limit power fault and lightning currents. This is an essential requirement and is inherent in the listing and proper application of fuseless protectors. The cables addressed in this section are 'outside plant' cables that are covered by the NESC where the term "effectively grounded" is used. To delete "effectively" will reduce correlation between the NEC and the NESC. Note that this is an entirely different situation than that of Proposal 16-39 where the term "effectively" may be deleted (see my comment to Proposal 16-39).

Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Comment 16-119.

16-125 Log #1886 NEC-P16 **Final Action: Accept in Principle**
(800.100(A) and (B))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-91
Recommendation: Revise text to read as follows:
800.100 Cable and Primary Protector Bonding and Grounding. The primary protector and the metallic member(s) of the cable sheath shall be bonded or grounded as specified in 800.100(A) through (D).

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than the grounded metallic sheath member(s) and protected conductor(s) of the communications cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Length. The primary protector bonding conductor or grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector bonding conductor or grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 800.100(B)(2)(2) shall be driven, the primary protector shall be connected to the communications ground rod in accordance with 800.100(C), and the communications ground rod shall be connected to the power grounding electrode system in accordance with 800.100(D).

(5) Run in Straight Line. The bonding conductor or grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.

(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 800.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.
Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In Existing Buildings or Structures Without an Intersystem Bonding Termination ~~Grounding Means~~.
If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94 Exception

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure

(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 800.90(B), shall be considered accessible.

(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Electrode(s) ~~Means~~. If the existing building or structure served has no intersystem bonding termination or grounding electrode(s) ~~means, as described in 800.100(B)(2),~~ the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 800.100(B)(2) or (B)(3)(1), to any one of the individual grounding electrodes described in 250.52(A)(7) and (A)(8) or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors and grounded metallic members.

Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms

in Article 100 and not result in the use of an orphaned undefined term in Article 800.

These comments address the changes suggested in proposal 16-91 in each section within Article 800 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept. This includes adding "existing" to 800.100(B)(2) and (3). The provisions in these sections should properly apply to only existing installations to correlate with the rules in 250.94.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

800.100 Cable and Primary Protector Bonding and Grounding. The primary protector and the metallic member(s) of the cable sheath shall be bonded or grounded as specified in 800.100(A) through (D).

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than the grounded metallic sheath member(s) and protected conductor(s) of the communications cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Length. The primary protector bonding conductor or grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector bonding conductor or grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar bonding conductor or grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 800.100(B)(32)(2) shall be driven, the primary protector shall be connected to the communications ground rod in accordance with 800.100(C), and the communications ground rod shall be connected to the power grounding electrode system in accordance with 800.100(D).

(5) Run in Straight Line. The bonding conductor or grounding electrode conductor shall be run ~~to the grounding electrode~~ in as straight a line as practicable.

(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.

(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 800.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In ~~Existing~~ Buildings or Structures Wit~~hout an Intersystem Bonding Termination~~ Grounding Means.

If the ~~existing~~ building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94 Exception

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure of the power service, or

(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 800.90(B), shall be considered accessible.

(3) In ~~Existing~~ Buildings or Structures Without an Intersystem Bonding Termination or Grounding Means. If the ~~existing~~ building or structure served has no intersystem bonding termination or grounding means, as described in 800.100(B)(2), the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 800.100(B)(2) or (B)(3)(1), to any one of the individual grounding electrodes described in 250.52(A)(7) and (A)(8) or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors and grounded metallic members.

Panel Statement: The panel agrees with the submitter's intent and edits the text for editorial clarification.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

Comment on Affirmative:

BRUNSSEN, J.: 800.100(A)(6), first sentence, should state: "The bonding conductor or grounding electrode conductor shall be …", for consistency with 800.100(A) (1) though (5). 800.100(B)(3) should read as follows: "If the building or structure served has no intersystem bonding termination, or grounding means as described in 800.100(B)(2), …". The comma needs to be placed after "termination" and not after "means" to distinguish between buildings with an intersystem bonding termination as described in (B)(1) and buildings with grounding means as described in (B)(2).

OHDE, H.: See our affirmative comment for Comment 16-22.

16-126 Log #2428 NEC-P16 **Final Action: Accept in Principle (800.100(A) and (B))**

Submitter: Keith Lofland, IAEI

Comment on Proposal No: 16-91

Recommendation: Revise text to read as follows:

800.100 Cable and Primary Protector Bonding and Grounding. The primary protector and the metallic member(s) of the cable sheath shall be bonded or grounded as specified in 800.100(A) through (D).

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than the grounded metallic sheath member(s) and protected conductor(s) of the communications cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Length. The primary protector bonding conductor or grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector bonding conductor or grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 800.100(B)(2)(2) shall be driven, the primary protector shall be connected to the communications ground rod in accordance with 800.100(C), and the communications ground rod shall be connected to the power grounding electrode system in accordance with 800.100(D).

(5) Run in Straight Line. The bonding conductor or grounding electrode

conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.

(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 800.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In Existing Buildings or Structures Without an Intersystem Bonding Termination ~~Grounding Means~~.

If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94 Exception

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure

(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 800.90(B), shall be considered accessible.

(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Electrode(s) ~~Means~~. If the existing building or structure served has no intersystem bonding termination or grounding electrode(s) ~~means, as described in 800.100(B)(2),~~ the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 800.100(B)(2) or (B)(3)(1), to any one of the individual grounding electrodes described in 250.52(A)(7) and (A)(8) or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors and grounded metallic members.

Substantiation: Proposals have been submitted and at current, have been accepted to delete the term “grounding conductor” in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a “Ufer” ground or refer to nonmetallic-sheathed cable as “romex”. For the NEC to use incomplete or inadequate terms such as “grounding conductor” is equally if not more damaging to the learning environment.

(800.100(A)(4) Exception)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 16-143

Recommendation: Accept Proposal 16-143.

Substantiation: Whether or not 800.100(B)(1) through (3) presents a logical sequence for selecting the appropriate telecommunications grounding electrode, in order of preference, was not addressed by Proposal 16-143 and certainly not the purpose of the proposal.

The issue is in specifying a technically sound grounding electrode for electrical systems, such as telecommunications systems, that will assure such systems are connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. This is the purpose of a grounding electrode regardless of the system. The acceptance of both Proposal 16-143 and Proposal 16-151 would assure that appropriate electrodes would be utilized when the “primary protector” (grounding electrode

conductor as defined in Article 100) grounding length exceeds 20 feet and where the building or structure served has no natural grounding electrodes.

The electrodes identified in 250.52(A)(4) through (A)(8) are intended as minimum required electrodes that are capable of limiting the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. Note that the key word for electrodes specified by 250.52 is "minimum." The limited currents of telecommunications have little to do with the adequacy of a grounding electrode and especially one with high resistance tendencies such as a 5 ft long ground rod in dry earth. The claim by the committee that 5 ft long rods have "been used successfully and safely by the telecom industry for decades" is misrepresented as it is widely acknowledged that damage during thunderstorms often occurs to sensitive electronics that are connected to telecom wiring where grounding is often inadequate as lighting surges (direct or indirect) enter facilities on telecom lines. The National Electrical Code is not about telecom the utility but is rather about protecting users from the consequences of lightning, line surges, or unintentional contact with higher-voltage lines. There is no justification in specifying inadequate grounding electrodes that have no independent record of performance and that are obviously technically inferior to those require by 250-52(A)(4) through (A)(8).

Utilizing a 5 ft long ground rod by a particular segment of industry, where that industry may be responsible for that electrode, does not provide technical substantiation as to the worth of that electrode. The "statement "very little resistance change will result from using larger sizes of electrodes" is misapplied in this context. One authoritative reference, the *Soares Book on Grounding* states that the diameter of a ground rod does not materially reduce the resistance of a ground rod but that rather that a ground rod's resistance is substantially reduced by extending the length of a ground rod into earth. By actual calculation this could be as much as a 40%+ reduction in resistance by doubling a 5 ft long ground rod's length to 10 ft. It is assumed that the reference to 16-151 in the panel statement was to the tutorial, *The ABCs of Grounding and Bonding* that states, "Very little resistance change will result from using larger sizes of electrodes." This reference, when taken in context, agrees with Soares on the ineffectiveness of increasing the diameter of a ground rod, but the committee is negligent in not mentioning the effectiveness of increasing the length of a ground rod which is agreed upon in both *Soares Book on Grounding* and *The ABCs of Grounding and Bonding*. Power utilities also realize the advantage of deeper, thus longer, electrodes when grounding distribution systems such as substations where sectional ground rods are commonly installed from 20 to 60 ft deep. In addition, it is unfathomable that the committee would indicate that requiring a minimum standard electrode would be too expensive when compared to the damage and expense a lightning strike could cause to a structure where inadequate grounding is installed and especially where any additional cost is negligible. It is also interesting to note that 820.100(B)(3)(2), as well as the inference in 810.21(F)(3), requires that a rod or pipe electrode shall meet the requirements of 250.52(A)(5) while 800.100(B)(3)(2) allows a ½ inch by 5 ft rod or pipe electrode. This seems to be inconsistent concerning the various requirements between similar articles. Therefore, it is difficult to understand the resistance of the Panel 16 members in not accepting Proposals 16-143 and 16-151 that would provide an acceptable minimum standard for grounding telecommunications systems that would help limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation.

There is no argument that bonding together the communications grounding electrode and power grounding electrode system is an important safety aspect. However that also is not the issue addressed by Proposals 16-143 and 16-151. The issue remains to be that ½ in. diameter by 5 ft long ground rods are not an adequate electrode for grounding telecommunication systems and that the electrodes utilized for telecommunication systems installed as a part of the premise wiring system should meet the same minimum requirements as those in Article 250 as they serve the same purpose. The technical substantiation for this change was in Proposal 16-143 and 16-151 and is expanded in this Comment. Code-Making Panel 5 has the expertise on this subject and the users of the NEC as well as the public deserve a reliable minimum standard for grounding their telecommunications systems.

Panel Meeting Action: Reject

Panel Statement: The submitter has neither provided technical justification nor cited a safety issue to justify the elimination of the 5-foot communications ground rod.

See panel action and statement on Comment 16-28.

Number Eligible to Vote: 16

(800.100(B)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 16-151

Recommendation: Accept Proposal 16-151.

Substantiation: The issue addressed by this Proposal is in specifying a technically sound grounding electrode for electrical systems, such as telecommunications systems, that will assure such systems are connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. This is the purpose of a grounding electrode regardless of the system. The acceptance of both Proposal 16-151 and Proposal 16-143 would assure that appropriate electrodes would be utilized when the "primary protector" (grounding electrode conductor as defined in

Article 100) grounding length exceeds 20 feet and where the building or structure served has no natural grounding electrodes.

The electrodes identified in 250.52(A)(4) through (A)(8) are intended as minimum required electrodes that are capable of limiting the voltage imposed on electric and electronic equipment by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. The committee has seemingly sought to minimize the effects of such imposed faults by stating such faults or events such as lighting deal only in limited currents which is not necessarily true. In addition, limited currents have little to do with the adequacy of a grounding electrode and especially one with high resistance tendencies such as a 5 ft long ground rod. The claim by the committee that 5 ft long rods have "been used successfully and safely by the telecom industry for decades" is misrepresented as it is widely acknowledged that damage during thunderstorms often occurs to sensitive electronics that are connected to telecom wiring where grounding is often inadequate as lighting surges (direct or indirect) enter facilities on telecom lines. The National Electrical Code is not about telecom the utility but is rather about protecting users from the consequences of lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. There is no justification in specifying inadequate grounding electrodes that have no independent record of performance and that are obviously technically inferior to those required by 250-52(A)(4) through (A)(8).

Utilizing a 5 ft long ground rod by a particular segment of industry, where that industry may be responsible for that electrode, does not provide technical substantiation as to the worth of that electrode. The "statement "very little resistance change will result from using larger sizes of electrodes" from *The ABCs of Grounding and Bonding* is misapplied in this context. One authoritative reference, the *Soares Book on Grounding* states that the diameter of a ground rod does not materially reduce the resistance of a ground rod but rather that a ground rod's resistance is substantially reduced by extending the length of a ground rod into earth. By actual calculation this could be as much as a 40%+ reduction in resistance by doubling a 5 ft long ground rod's length to 10 ft. Therefore, the reference from *The ABCs of Grounding and Bonding*, when taken in context, agrees with Soares on the ineffectiveness of increasing the diameter of a ground rod, but the panel is negligent in not mentioning the effectiveness of increasing the length of a ground rod in the panel statement. Power utilities also realize the advantage of deeper, thus longer, electrodes when grounding distribution systems such as substations where sectional ground rods are commonly installed from 20 to 60 ft deep. In addition, it is unfathomable that the committee would indicate that requiring a minimum standard electrode would be too expensive when compared to the damage and expense a lightning strike could cause to a structure where inadequate grounding is installed and especially where any additional installation cost is negligible. It is also interesting to note that 820.100(B)(3)(2), as well as the inference in 810.21(F)(3), specifies that a rod or pipe electrode shall meet the requirements of 250.52(A)(5) while other NEC Chapter 8 Articles as well as 800.100(B)(3)(2) allows the inadequate ½ inch by 5 ft long rod or pipe while all other grounding parameters remain essentially the same. This seems to be inconsistent concerning the various requirements between similar articles. Therefore, it is difficult to understand the resistance of the Panel 16 members in not accepting Proposal 16-151 that would provide an acceptable minimum standard for grounding telecommunications systems that would help limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation..

There is no argument that bonding together the communications grounding electrode and power grounding electrode system is an important safety aspect. However that also is not the issue addressed by Proposal 16-151. The issue remains to be that ½ in. diameter by 5 ft long ground rods are not an adequate electrode for grounding telecommunication systems and that the electrodes utilized for systems installed as a part of the premise wiring system should meet the same minimum requirements as those in Article 250 as they serve the same purpose. The technical substantiation for this change was in Proposal 16-151 and is expanded in this Comment. Code-Making Panel 5 has the expertise on this subject and the users of the NEC as well as the public deserve a reliable minimum standard for grounding any and all telecommunications systems.

In addressing the last part of the panel statement, section 800.100(B)(3) addresses "In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means", and 800.100(B)(2) addresses "In Buildings or Structures with Grounding Means." What possibly could the panel mean when it states "must be taken in context?" 800.100(B)(3) addresses buildings and structures without electrodes, thus there are no grounding electrode means at the building or structure to be identified. Paragraph 800.100(B)(3)(1) states "To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)", but these are not in existence according to the title of 800.100(B)(3). Therefore, the only choice left is 800.100(B)(3)(2) and that states the electrode shall be a plate electrode (A)(7), a local metal underground system or structure (A)(8), or "a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter, driven, where practicable, into permanently damp earth." Not allowed is a ground ring (A)(4) and a listed electrode which is an excellent grounding electrode. A 12.7 mm pipe is approximately a 3/8-inch trade size which is half the required diameter of a pipe electrode of 3/4-inch required by 250.52(A)(5) for a pipe electrode which is considered to be the minimum size for durability that goes back to the 1925 NEC edition. As to a 5 ft rod or pipe being driven into permanently damp earth – where in the US could this be consistently accomplished? The problems in this section alone justify the acceptance of Proposal 16-151.

Panel Meeting Action: Reject

Panel Statement: The panel reiterates its position as stated in the panel statement of the submitter's original proposal. The submitter has neither provided technical justification nor cited a safety issue to justify the elimination of the 5-foot communications ground rod that has been used successfully and safely by the communications industry for decades. It is unreasonable and unnecessary to require installation of such power-oriented grounding means as proposed by the submitter solely for communications applications where power fault and lightning currents are limited by the relatively fine gauge of communications conductors and cable shields.

Ballot Results: Affirmative: 14 Negative: 1

Ballot Not Returned: 1 Esemplare, R.

Explanation of Negative:

BOYER, J.: Proposal 16-151 should be reconsidered and accepted as proposed. It is technically sound, reasonable and will aid in reducing losses from lightning, line surges and unintentional contact with higher-voltage lines. Furthermore, it would help stabilize the voltage to earth during normal operation.

16-135 Log #1895 NEC-P16 **Final Action: Accept in Principle**
(800.106(A) and (B))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 16-91

Recommendation: Revise text to read as follows:

800.106 Primary Protector Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with 800.106(A)(1) and (A)(2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector ~~ground~~ shall be connected to a grounding electrode ~~conductor~~ in accordance with 800.100(B)(3).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector ~~ground~~ shall be connected to a grounding electrode ~~conductor~~ in accordance with 800.100(B)(3).

(B) Bonding. The primary protector grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper ~~grounding~~ conductor not smaller than 12 AWG under either of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 800.106(A)

(2) Where the mobile home is supplied by cord and plug

Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 800.

These comments address the changes suggested in Proposal 16-91 in each section within Article 800 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

800.106 Primary Protector Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with 800.106(A)(1) and (A)(2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector ~~ground~~ shall be connected to a grounding electrode conductor or grounding electrode in accordance with 800.100(B)(3).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector ~~ground~~ shall be connected to a

grounding electrode ~~conductor~~ in accordance with 800.100(B)(3).
(B) Bonding. The primary protector grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper ~~grounding~~ conductor not smaller than 12 AWG under either of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 800.106(A)
(2) Where the mobile home is supplied by cord and plug.
Panel Statement: The panel accepts the submitter's text and adds "electrode conductor or" to allow the option to connect to the grounding electrode or grounding electrode conductor. This retains the original intent of 800.106(A)(1).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
BRUNSSEN, J.: Revise 800.106(A)(1) to read as follows: "(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector shall be connected to a grounding electrode in accordance with 800.100(B)(3)." It is unlikely that a grounding electrode conductor will be available if there is no mobile home service equipment, a grounding electrode conductor is not mentioned in any of the sections referenced in 800.100(B)(3), and the revision is consistent with the proposed text of 800.106(A)(2).
OHDE, H.: See our affirmative comment for Comment 16-22.

16-136 Log #2429 NEC-P16 **Final Action: Accept in Principle**
(800.106(A) and (B))

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-91
Recommendation: Revise text to read as follows:
800.106 Primary Protector Grounding and Bonding at Mobile Homes.
(A) Grounding. Grounding shall comply with 800.106(A)(1) and (A)(2).
(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector ~~ground~~ shall be connected to a grounding electrode ~~conductor~~ in accordance with 800.100(B)(3).
(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector ~~ground~~ shall be connected to a grounding electrode ~~conductor~~ in accordance with 800.100(B)(3).
(B) Bonding. The primary protector grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper ~~grounding~~ conductor not smaller than 12 AWG under either of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 800.106(A)
(2) Where the mobile home is supplied by cord and plug
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.
From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-135.

Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-137 Log #30 NEC-P16 **Final Action: Accept**
(800.110(A)(2))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-159
Recommendation: Replace "optical fiber raceway" with "communications raceway" three times.
Substantiation: Jerry Dona's ballot statement was:
This proposal contains a cut-and-paste error. It is a companion proposal to 16-47. "Optical fiber raceway" should have been replaced with "communications raceway".
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-138 Log #1631 NEC-P16 **Final Action: Accept in Principle**
(800.113)

TCC Action: The Technical Correlating Committee directs the phrase "and plenums" be removed from the title, text and informational note in 800.113(B) because the accepted text in the title, text, and the Informational Note in 300.22(B), as accepted in Proposal 3-94 does not include the term "fabricated plenums."
Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-160
Recommendation: Revise text to read as follows:
800.113 Installation of Communications Wires, Cables and Raceways. Installation of communications wires, cables and raceways shall comply with 800.113 (A) through (L). Installation of raceways shall also comply with 800.110.
(A) Listing. Communications wires, cables and raceways installed in buildings shall be listed.
Exception: Communications cables that comply with 800.48 shall not be required to be listed.
(B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums used for environmental air as described in 300.22(B) if they are directly associated with the air distribution system.
(1) Up to 1.22 m (4 ft) of Type CMP
(2) Types CMP, CMR, CMG, CM, CMX and communications wires installed in raceways that are installed in compliance with 300.22(B)
Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see Sections 4.3.4.1 (air ducts) and 4.3.11.3.3 (apparatus casings plenums) in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*
(C) Other Spaces Used For Environmental Air (Plenums). The following wires, cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C).
(1) Type CMP
(2) Plenum communications raceway
(3) Type CMP installed in plenum communications raceway
(4) Type CMP supported by metallic cable trays or cable tray systems
(5) Types CMP, CMR, CMG, CM, CMX and communications wires installed in raceways that are installed in compliance with 300.22(C)
Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see Sections 4.3.11.2 (ceiling cavity plenum), 4.3.11.4 (air-handling unit room plenum) and 4.3.11.5 (raised floor plenum) of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*
(D) Risers- Cables and Raceways in Vertical Runs. The following cables and raceways shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types CMP and CMR
(2) Plenum and riser communications raceways
(3) Types CMP and CMR installed in:
a) plenum communications raceway
b) riser communications raceway
c) riser cable routing assembly
Informational Note: See 800.26 for firestop requirements for floor penetrations.
(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor.
(1) Types CMP, CMR, CMG, CM and CMX
(2) Plenum, riser and general-purpose communications raceways
(3) Types CMP, CMR, CMG, CM and CMX installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
Informational Note: See 800.26 for firestop requirements for floor penetrations.
(F) Risers-Cables and Raceways in Fireproof Shafts. The following cables and raceways shall be permitted to be installed in fireproof riser shafts having firestops at each floor.
(1) Types CMP, CMR, CMG, CM and CMX
(2) Plenum, riser and general-purpose communications raceways
(3) Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Informational Note: See 800.26 for firestop requirements for floor penetrations.
(G) Risers- One- and Two-Family Dwellings. The following cables and raceways shall be permitted in one- and two-family dwellings:
(1) Types CMP, CMR, CMG and CM

(2) Type CMX less than 6 mm (0.25 in.) in diameter,
(3) Plenum, riser and general-purpose communications raceways
(4) Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(H) Cable Trays. The following wires, cables and raceways shall be permitted to be installed in cable trays.
(1) Types CMP, CMR, CMG and CM
(2) Plenum, riser and general-purpose communications raceways
(3) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following wires, cables and raceways shall be permitted to be installed in distributing frames and cross-connect arrays.
(1) Types CMP, CMR, CMG, CM and communications wires
(2) Plenum, riser and general-purpose communications raceways
(3) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(J) Other Building Locations. The following wires, cables and raceways shall be permitted to be installed in building locations other than the locations covered in 800.113(B) through (I).
(1) Types CMP, CMR, CMG and CM
(2) A maximum of 3 m (10 ft) of exposed Type CMX in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(5) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(6) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(7) Type CMUC undercarpet communications wires and cables installed under carpet

(K) Multifamily Dwellings. The following cables, raceways and wring assemblies shall be permitted to be installed in multifamily dwellings in locations other than the locations covered in 800.113(B) through (G).
(1) Types CMP, CMR, CMG, CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Communications wires and Types CMP, CMR, CMG and CM installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(5) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(6) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(7) Type CMUC undercarpet communications wires and cables installed under carpet

(L) One- and Two-Family Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 800.113(B) through (F).
(1) Types CMP, CMR, CMG, CM
(2) Type CMX less than 6 mm (0.25 in.) in diameter
(3) Plenum, riser and general-purpose communications raceways
(4) Communications wires and Types CMP, CMR, CMG and CM installed in;
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(5) Types CMP, CMR, CMG and CM installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(6) Communication wires and Types CMP, CMR, CMG, CM and CMX and installed in a raceway of a type included in Chapter 3
(7) Type CMUC undercarpet communications wires and cables installed under carpet
(8) Hybrid power and communications cable listed in accordance with 800.179(I)

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate installation of cables in cable routing assemblies into the section. However the task group recommends that the listing, applications and installation of the cable routing assemblies be consolidated into Article 770 and not be duplicated in each of panel sixteen's articles. Accordingly, the recommended text for this section includes installation of wires and cables in cable routing assemblies and omits the installation of the cable routing assemblies which belong in 770.113.

Section 800.110 permits communications wires to be installed in communications raceways but 800.154 has no specific application for communications wires in communications raceways. Communications wires are used primarily in cross-connect arrays. They should be permitted to be installed in communications raceways and routing assemblies that are part of a cross-connect array.

The panel action on the revision of 800.113 included several applications of cable routing assemblies, but a few applications were missed.

The recommended text for the informational notes dealing with installations in air handling spaces have been modified to better reflect the contents of the mandatory text.

Most of the text in this comment was submitted by Randy Ivans and Gerald Dorna as an affirmative ballot comments on this proposal. See the ROP.

Panel Meeting Action: Accept in Principle

Revise 800.113 to read as follows:

800.113 Installation of Communications Wires, Cables and Raceways. Installation of communications wires, cables and raceways shall comply with 800.113 (A) through (L). Installation of raceways shall also comply with 800.110.

(A) Listing. Communications wires, cables and raceways installed in buildings shall be listed.

Exception: Communications cables that comply with 800.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums used for environmental air as described in 300.22(B) if they are directly associated with the air distribution system.
(1) Up to 1.22 m (4 ft) of Type CMP cable
(2) Types CMP, CMR, CMG, CM, CMX cables and communications wires installed in raceways that are installed in compliance with 300.22(B)

Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see sections 4.3.4.1 ~~(air ducts)~~ and 4.3.11.3.3 ~~(apparatus casings plenums)~~ in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(C) Other Spaces Used For Environmental Air (Plenums). The following wires, cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C).
(1) Type CMP cable
(2) Plenum communications raceway
(3) Type CMP cable installed in plenum communications raceway
(4) Type CMP cables and plenum communications raceways supported by open metallic cable trays or cable tray systems
(5) Types CMP, CMR, CMG, CM, CMX cables and communications wires installed in raceways that are installed in compliance with 300.22(C)
(6) Types CMP, CMR, CMG, CM, CMX cables and plenum communications raceways, riser communications raceways and general-purpose communications raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)
Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see sections 4.3.11.2 ~~(ceiling cavity plenum)~~, 4.3.11.4 ~~(air-handling unit room plenum)~~ and 4.3.11.5 ~~(raised floor plenum)~~ of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(D) Risers- Cables and Raceways in Vertical Runs. The following cables and raceways shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types CMP and CMR cables
(2) Plenum and riser communications raceways
(3) Types CMP and CMR cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) riser cable routing assembly

Informational Note: See 800.26 for firestop requirements for floor penetrations.

(E) Risers-Cables and Raceways in Metal Raceways. The following cables and raceways shall be permitted in metal raceways in a riser having firestops at each floor.
(1) Types CMP, CMR, CMG, CM and CMX cables
(2) Plenum, riser and general-purpose communications raceways
(3) Types CMP, CMR, CMG, CM and CMX cables installed in:

a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

Informational Note: See 800.26 for firestop requirements for floor penetrations.

(F) Risers-Cables and Raceways in Fireproof Shafts.. The following cables and raceways shall be permitted to be installed in fireproof riser shafts having firestops at each floor.

(1) Types CMP, CMR, CMG, CM and CMX cables
(2) Plenum, riser and general-purpose communications raceways
(3) Types CMP, CMR, CMG and CM cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

Informational Note: See 800.26 for firestop requirements for floor penetrations.

(G) Risers- One- and Two-Family Dwellings. The following cables and raceways shall be permitted in one- and two-family dwellings:

(1) Types CMP, CMR, CMG and CM cables
(2) Type CMX cable less than 6 mm (0.25 in.) in diameter
(3) Plenum, riser and general-purpose communications raceways
(4) Types CMP, CMR, CMG and CM cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(H) Cable Trays. The following wires, cables and raceways shall be permitted to be supported by ~~installed in~~ cable trays.

(1) Types CMP, CMR, CMG and CM cables
(2) Plenum, riser and general-purpose communications raceways
(3) Communications wires and Types CMP, CMR, CMG and CM cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following wires, cables and raceways shall be permitted to be installed in distributing frames and cross-connect arrays.

(1) Types CMP, CMR, CMG, CM cables and communications wires
(2) Plenum, riser and general-purpose communications raceways
(3) Communications wires and Types CMP, CMR, CMG and CM cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(J) Other Building Locations. The following wires, cables and raceways shall be permitted to be installed in building locations other than the locations covered in 800.113(B) through (I).

(1) Types CMP, CMR, CMG and CM cables
(2) A maximum of 3 m (10 ft) of exposed Type CMX in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Communications wires and Types CMP, CMR, CMG and CM cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(5) Types CMP, CMR, CMG and CM cables installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(6) Communication wires and Types CMP, CMR, CMG, CM and CMX cables ~~and~~ installed in a raceway of a type recognized ~~included~~ in Chapter 3
(7) Type CMUC undercarpet communications wires and cables installed under carpet

(K) Multifamily Dwellings. The following cables, raceways and wring assemblies shall be permitted to be installed in multifamily dwellings in locations other than the locations covered in 800.113(B) through (G).

(1) Types CMP, CMR, CMG, CM cables
(2) Type CMX cable less than 6 mm (0.25 in.) in diameter in nonconcealed spaces
(3) Plenum, riser and general-purpose communications raceways
(4) Communications wires and Types CMP, CMR, CMG and CM cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(5) Types CMP, CMR, CMG and CM cables installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(6) Communication wires and Types CMP, CMR, CMG, CM and CMX cables ~~and~~ installed in a raceway of a type recognized ~~included~~ in Chapter 3
(7) Type CMUC undercarpet communications wires and cables installed under carpet

(L) One- and Two-Family Dwellings. The following cables and raceways shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 800.113(B) through (F).

(1) Types CMP, CMR, CMG, CM cables
(2) Type CMX cable less than 6 mm (0.25 in.) in diameter
(3) Plenum, riser and general-purpose communications raceways
(4) Communications wires and Types CMP, CMR, CMG and CM cables installed in;
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(5) Types CMP, CMR, CMG and CM cables installed in:
a) riser cable routing assembly
b) general-purpose cable routing assembly
(6) Communication wires and Types CMP, CMR, CMG, CM and CMX cables ~~and~~ installed in a raceway of a type recognized ~~included~~ in Chapter 3
(7) Type CMUC undercarpet communications wires and cables installed under carpet
(8) Hybrid power and communications cable listed in accordance with 800.179(I)

Panel Statement: The panel added text to recognize solid bottom cable trays with a solid covers.

The panel added text to permit plenum raceways to be supported by open cable trays.

The panel added the word "cables" after each cable type. See panel action on Comment 16-140.

The panel changed "included" to "recognized" in reference to Chapter 3.

The panel changed "installed in" cable trays to "supported by" cable trays.

The panel accepts in principle the recommendations to revise the informational notes. The panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text. The panel chooses not to include NFPA 90A "titles" in parenthesis following each section reference.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-139 Log #1925 NEC-P16 **Final Action: Hold**
(800.113)

TCC Action: The Technical Correlating Committee understands that only Comment 16-139 is being held.
Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-160
Recommendation: Revise the text as follows:

800.113(B)(2) Types CMP, CMR, CMG, CM, CMX and listed communications wires installed in metal raceways ~~that are installed~~ in compliance with 300.22(B).

800.113(C)(5) Types CMP, CMR, CMG, CM, CMX, and listed communications wires installed in metal raceways ~~that are installed~~ in compliance with 300.22(C).

800.113(E) Risers- Cables in Metal Raceways or ~~Fireproof~~ Fire-Resistance-Rated Shafts. Types CMP, CMR, CMG, CM and CMX shall be permitted in metal raceway or in a ~~fireproof~~ fire-resistance-rated shaft with firestops at each floor.

800.113(F)(4) Types CMP, CMR, CMG and CM installed in plenum, riser or general-purpose communications raceway or in a raceway permitted in Chapter 3.

800.113(G) Cable Trays. The following cables and raceways shall be permitted to be ~~installed~~ supported in cable trays~~:~~ and shall comply with 300.22 when installed in ducts, plenums, and other environmental air spaces.

Substantiation: In (B)(2), the word "metal" should be added to make this requirement very simple and very clear without having to refer to the entire text of 300.22, just as the Panel clarified in (C)(4) that only *metallic* cable trays are allowed. The informational note in this section refers to NFPA 90A which requires the use of metal raceways in these spaces.

In (C)(5) "metal" was added to clarify that these cables must be installed in metal raceways in accordance with the requirements in 300.22(C) and NFPA 90A. 800.113(C)(2) and (3) list plenum communications raceways which are the nonmetallic type of raceways that are allowed for use with CMP cables only.

In (E) "Fireproof" was changed to "fire-resistance-rated", which is the appropriate terminology.

In (F)(4) text was added to include Chapter 3 raceways which can also be used in one and two family dwellings.

In (G) the word "installed" was changed to "supported" to properly reflect the use of cable tray as a support method. Text was added to clarify special requirements for plenum applications. Most of the other sections of 800.113 are *locations* (spaces uses for environmental air, risers, other building locations, etc.) not *products*. The use of cable tray and the type of cables allowed in cable trays are dependent upon where the tray is installed. This gets lost in the current (G), since it appears as if you could use Types CMP, CMR, CMG and CM cable in cable trays wherever the cable tray is installed. 300.22 requires

solid bottom metal cable tray and solid metal covers.
Panel Meeting Action: Hold
Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-140 Log #1347 NEC-P16 **Final Action: Accept in Principle (800.113(B), FPN and 800.113(C), FPN)**

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-160
Recommendation: (B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums, as described in 300.22(B), if they are directly associated with the air distribution system:
(1) Up to 1.22 m (4 ft) of Type CMP cables
(2) Types CMP, CMR, CMG, CM, and CMX cables and listed communications wires and cables installed in raceways that are installed in compliance with 300.22(B)
FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009, *Standard for the Installation of Air- Conditioning and Ventilation Systems*, for information on wires and cables installed in fabricated ducts and plenums used for environmental air ~~wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum~~.
(C) Other Spaces Used For Environmental Air (Plenums). The following wires, cables and raceways shall be permitted in other spaces used for environmental air as described in 300.22(C):
(1) Type CMP cables
(2) Plenum communications raceways installed in compliance with 800.110
(3) Type CMP cables installed in plenum communications raceways
(4) Type CMP cables supported by metallic cable trays or cable tray systems
(5) Types CMP, CMR, CMG, CM, and CMX cables and listed communications wires and cables installed in raceways that are installed in compliance with 300.22(C).
FPN: See 4.3.11.2, 4.3.11.4, and 4.3.11.5 of NFPA 90A-2009, *Standard for the Installation of Air- Conditioning and Ventilation Systems*, for information on wires, cables and raceways installed in other spaces used for environmental air (plenums) ~~wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions~~ .
Substantiation: This comment is intended to bring consistency to this section. The FPN nomenclature or terminology needs to correspond to the terminology in the charging paragraph.
The term "air duct" is not used in this section or elsewhere in the article. The definitions from NFPA 90A are not necessary since this FPN sends the NEC user directly to the relevant sections for the requirements.
It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts in principle the recommendations to revise the informational notes. As recommended by the submitter, the panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text.
The panel accepts in principle the recommendations to revise the informational notes. See panel action and statement on Comment 16-138.
The panel accepts in principle adding the word "cables" after each cable type. See panel action and statement on Comment 16-138.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-141 Log #797 NEC-P16 **Final Action: Reject (800.133)**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-164
Recommendation: Accept the proposal.
Substantiation: Communications circuits may consist of wires, not cables, which are defined as an assembly of two or more conductors. 800.133(A)(1) refers to cables of any of the following, whereas the "following" may not be composed of "cables". Single conductors of Class 2 and 3 circuits should be classified, but not required to be listed as a communication cable. The first sentence of (h) only requires classification as communication circuits, not listing.
Panel Meeting Action: Reject
Panel Statement: The provision for the reclassification of Class 2 and Class 3 circuits as communications circuits is in Article 800 and Article 725. Both articles are correlated. If CMP-16 accepted a change without a corresponding change in Article 725, correlation would be lost. The submitter has not mentioned any correlating proposal for Article 725.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-142 Log #307 NEC-P16 **Final Action: Accept in Principle in Part (800.133(A)(1)(a))**

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 16-166
Recommendation: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with the NEC Style Manual with respect to the use of mandatory language.
The Technical Correlating Committee directs that the Chairs of Code-Making Panels 3 and 16 form a Task Group to correlate the actions taken on this proposal and Proposal 3-196.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle in Part
The panel agrees that the Chairs of Code-Making Panels 3 and 16 formed a Task Group to correlate the actions taken on this proposal and Proposal 3-196.
Panel Statement: The task group does not see any issue with mandatory language in this proposal and guesses that the TCC directive was simply a "cut and paste" error from its directive on a related proposal. The panel refers the TCC to the statement on Comment 16-143.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-143 Log #1632 NEC-P16 **Final Action: Accept in Principle (800.133(A)(1)(a))**

TCC Action: In order to correlate with the action taken on Comment 3-96, the Technical Correlating Committee changes the action on Comment 16-143 from "Accept" to "Accept in Principle" and revises 800.133(A)(1) to read as follows:
"(a) Optical Fiber and Communications Cables. Communications cables shall be permitted in the same raceway, cable tray, enclosure or cable routing assembly with cables of any of the following:
(1) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770
(2) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820
(3) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 830.
(b) Other Circuits. Communications cables shall be permitted in the same raceway, cable tray, or enclosure with cables of any of the following:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725
(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760."
Existing (b) will become (c).
Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-166
Recommendation: Continue to accept Proposal 16-166 in principle in part and make the following editorial revisions:
Delete "or" between "cable tray" and "enclosure".
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.
The TCC also directed that the proposal be rewritten to remove mandatory language. The task group does not see any issue with mandatory language in this proposal and guesses that the TCC directive was simply a "cut and paste" error from its directive on a related proposal.
The task group supports the panel action on the proposal to incorporate cable routing assemblies into the section. However in its review of this and related proposals, the task group found a minor error. This comment is editorial.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the text in the draft is correct.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
DORNA, G.: The Panel 3 & 16 Reconciliation Task Group submitted Comments 3-96, 16-41, 16-143, 16-236 and 16-296, all dealing with the commingling of cables in raceways, cable trays, enclosures and cable routing assemblies. In the ROP, CMP 16 had taken actions (accept, accept in principle, accept in principle in part) to treat cable routing assemblies in the same manner as raceways, cable trays, and enclosures, while CMP 3 had rejected the coordinating proposals. The Reconciliation Task Group's comments recommended that CMP 16 continue its direction and that CMP 3 recognize cable routing assemblies and provide for their use. CMP 16 accepted the

Reconciliation Task Group's comments and CMP 3 rejected them.

The CMP 3 rejection statement on Comment 3-96 included an alert to the TCC:

"In addition it is brought to the attention of the technical correlating committee that CMP 16 has accepted changes that will allow the use of cable routing assemblies for the installation of Class 2 & 3 circuits and power-limited fire alarm circuits."

The text of 800.133(A)(1)(a) as modified by Proposal 16-166 and Comment 16-143 is shown below. The underlining was added for emphasis.

(a) *Other Circuits.* Communications cables shall be permitted in the same raceway, cable tray, enclosure, or cable routing assembly with cables of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760

(3) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770

(4) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820

(5) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 83

The text of 800.133(A)(1)(a) clearly shows that communications cables are permitted to be installed in cable routing assemblies along with other cables that are installed in accordance with their own articles. Class 2 and Class 3 cables must be installed compliant with Article 725. Likewise power-limited fire alarm cables must be installed compliant with Article 760.

The CMP 3 statement that "CMP 16 has accepted changes that will allow the use of cable routing assemblies for the installation of Class 2 & 3 circuits and power-limited fire alarm circuits" is not correct.

The Panel 16 actions on Proposal 16-166 and Comment 16-143 permits communications cables to be installed in the same routing assembly with Class 2, Class 3 and power-limited fire alarm cables only if the Class 2, Class 3 and power-limited fire alarm cables are installed in compliance with Articles 725 and 760. Obviously, CMP 16 has taken no actions that change the cable installation requirements in Articles 725 and 760.

See also, my affirmative comments on Comments 16-41 and 16-236.

16-144 Log #2682 NEC-P16 **Final Action: Reject**
(800.133(A)(2) Exception No. 3 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 16-167
Recommendation: Accept the proposal.
Substantiation: The first portion of the panel statement regarding the absence of a specific application cited is difficult to understand. The substantiation cited an actual NEC section [334.116(C)] that recognizes such a construction. However, Chapter 8 will trump that allowance unless correlating language is in place. This needs correlation, the wording of Exception No. 2 does not require listing and seems to describe something CMP 3 described in its statement on a companion proposal for 725.136(I)(3) (Proposal 3-195).

Because of the Chapter 8 location, this issue still needs attention, only partially due to formal recognition of this construction in some form in 334.116(C). In addition, CMP 16 (and 3) will have on its ROC agenda, courtesy of CMP 9 and the TCC sending it there, Proposal 9-8 which covers a form of tray cable with this type of separation. This submitter has rigorously defended the system separation rules in print for decades, but the issues don't go away, and technology may have advanced to the point where some form of these cable constructions can be recognized.
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position on Proposal 16-167.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-145 Log #796 NEC-P16 **Final Action: Reject**
(800.133(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-168
Recommendation: Accept the proposal with the following revisions:

Communications wires and cables shall not be attached to the exterior of any raceway, cable, or conductor as a means of support.

Exception No. 1: Overhead aerial conductors shall be permitted to be attached to an approved raceway mast.

Exception No. 2: Conductors shall be permitted to be supported by a messenger wire.
Substantiation: The purpose of raceways is covered in the definition of "raceway" in Article 100. Provisions should allow support by raceway masts and messenger wires.
Panel Meeting Action: Reject
Panel Statement: The proposed editorial changes provide no additional clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-146 Log #1215 NEC-P16 **Final Action: Reject**
(800.135 (New))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 16-171
Recommendation: This proposal should have been Accepted.
Substantiation: Panel Member Mr. Ivans is correct in his Negative statement. Communication cable and connectors carry an electrical current and should not become easily accessible. Outlet Boxes and brackets have been listed by NRTL's, such as UL, to insure that incidental contact with other electrical light and power conductors does not occur.
Panel Meeting Action: Reject
Panel Statement: The text, as suggested in Proposal 16-171, is too broad. Not all communications devices or equipment need to be mounted in boxes, on a bracket or in assemblies designed for the purpose (e.g., telephone set, FAX machine).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:

IVANS, R.: Loose and exposed cable or connectors can pose a risk of electric shock. Ringing voltages can exceed 100V and should not become easily accessible due to weak mounting or terminating methods. Loose cabling and connectors can come into contact with electric light and power conductors.

There are boxes and brackets listed for this purpose using the requirements in UL Subject 2269, "Outline of Investigation for Optical Fiber/ Communications/ Signaling/Coaxial Cable Outlet Boxes." Companies have certifications with UL under the category "Optical Fiber/Communications/Signaling/Coaxial Cable Outlet Boxes", QAZR.

Note: An 'N' in the table indicates that the wire, cable, raceway or cable routing assembly type shall not be permitted to be installed in the application. A 'Y' indicates that the wire, cable, raceway or cable routing assembly type shall be permitted to be installed in the application, subject to the limitations described in 800.110 and 800.113.

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-148 Log #1623 NEC-P16 **Final Action: Accept in Principle (800.154)**

TCC Action: The Technical Correlating Committee directs that the phrase "and plenums" be removed from the application columns in Table 800.154(A) and Informational Note No. 2.

See the Technical Correlating Committee Note on Comment 16-37.

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-172
Recommendation: Revise text to read as follows:

800.154 Applications of Listed Communications Wires, Cables and Raceways. Permitted and non-permitted applications of listed communications wires, cables and raceways shall be as indicated in Table 800.154(A). The permitted applications are subject to the installation rules of 800.110 and 800.113. The substitutions for communications cables listed in Table 800.154(B) and illustrated in Figure 800.154 shall be permitted.

See Table 800.154(A) on Page 610

Renumber Figure 800.154(E) to become Figure 800.154
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate installation of cables in cable routing assemblies into the section. However the task group recommends that the listing, applications and installation of the cable routing assemblies be consolidated into Article 770 and not be duplicated in each of panel sixteen's articles. Accordingly, the recommended text for this section includes applications of wires and cables in cable routing assemblies and omits the installation of the cable routing assemblies which belong in 770.154.

Table 800.154(A) has been reformatted in 'landscape' and is recommended by the Task Group to be presented this way in the Code to enhance readability and use.

Section 800.110 permits communications wires to be installed in communications raceway.

Most of the text in this comment was submitted by Randy Ivans and Gerald Dorna as an affirmative ballot comments on this proposal. See the ROP.
Panel Meeting Action: Accept in Principle

See TG revised Table 800.154(A) on Page 611

Panel Statement: "Y" was changed to "Y*" to emphasize to the user that installation rules apply.

Add "In..." to the second column in Table 800.154(A) as a prefix to each phrase.

"Chapter 3 raceway" was changed to "In any raceway recognized in Chapter 3 " for consistency with the installation rules.

See panel action on Comment 16-140.

The panel added eight rows to clarify the issues raised in Comment 16-139 including adding rows dealing with installations in raceways and cable trays. An editorial change was made to clarify that air handling spaces refers to 300.22(B) & (C) spaces.

The box "In Air-Handling Spaces" was divided into the component sections "In Fabricated Ducts and Plenums as Described in 300.22(B)" and "In Other Spaces Used for Environmental Air as Described in 300.22(C)" in order to reduce repetition in the next column.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-149 Log #2168 NEC-P16 **Final Action: Reject (800.154)**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-172
Recommendation: It is understood Proposal 16-172 is a companion proposal to 16-160.

Revise the first sentence to read: Permitted and non-permitted applications of listed communications wires, cables and raceways shall be as ~~indicated in Table 800.154(A)~~ in accordance with 800.110 and 800.113.
Substantiation: A comment has been submitted to delete Table 800.154(A). 800.154 will need to be revised for correlation if the Table is deleted.

The following is our reason for deleting the Table.

Table 800.154(A) is very confusing and will lead to misapplication. A number of notes are needed if this table moves forward. Many users will simply take the table as fact without reading limiting requirements applicable per 800.10 and 800.113 A simple "yes" or "no" does not always fit and will lead to misinterpretation.

Several cycles ago both CMP 8 and CMP 7 rewrote their articles. At that time both attempted to develop tables such as 800.154A. There was such a hue and cry against this and so many notes needed to explain what is actually permitted both Panels dropped the tables. Most tables in the NEC are there to clarify special conditions, not normal use. Text, as opposed to tables, is much easier to interpret and enforce correctly.

Just in case the Panel rejects this comment and continues with the Table, we have submitted a separate comment for 16-172/16-160 containing notes to the table. However, REMOVING THE TABLE IS MUCH MORE USER FRIENDLY AS PAST CODE DEVELOPMENT HAS SHOWN. Thorough reading of 800-110 and 800-113 by users will lead to easier and better enforcement and avoid installers having to remove and redo an installation due to noncompliance.
Panel Meeting Action: Reject
Panel Statement: The recommended action was intended to correlate with the acceptance of Comment 16-151. The panel rejected Comment 16-151.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-150 Log #2169 NEC-P16 **Final Action: Accept in Principle in Part (Table 800.154(A))**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-172
Recommendation: If the Table is not deleted as proposed in a separate comment, revise Table 800.154(A) as follows:

Add Notes to clarify and change some Y(es) and N(o) permitted uses.

For reference purposes the columns of the draft Table have been numbered in numerical sequence from left to right. The cable and/or raceway types are for identification as shown in the far left product column. It is the intent that a parenthetical note number be placed with the identified product Y or N, with the corresponding note(s) at the bottom of the Table.

Column one – **CMP Cable** – Indicate Note (1) Text: Note (1). CMP Cable in free air in a 300.22(B) location must be associated with the air distribution system and is limited to 1.22mm (4 ft); the length limitation does not apply where the cable is installed in a raceway complying with 300.22(B).

Columns one and two two – **CMP,CMR, CMG, CM and CMX** -- Indicate Note (2). Change N to Y for CMR, CMG, CM and CMX and apply Note (2).

Text: Note 2. In 300.22(B) and (C) locations these cables are permitted in raceways that comply with 300.22(B) and (C).

Column 6 – **CMX** – Indicate Note (3). Text: Note 3. Limited to 3 m (10 ft) exposed in non-concealed spaces.

Column 6 - **CMUC** – Indicate Note (4). Text: Note 4. Under carpet only.

Also change N to Y to agree with 800.113 (I)(6).

Column seven, eight, and 9 – **CMUC** -- Indicate Note (4), Text: Note 4. Under carpet only.

Column seven, eight and 9 – **CMX** – Indicate Note (5). Text: Note 5. Limited to less than 6mm (0.25 in) in diameter unless installed in a raceway of a type included in Chapter 3.

Column ten -- **CMR, CMG, CM, and Hybrid power and communications cables** -- Indicate Note (6) Text: Note 6. Where these cables are supported by cable tray in 300.22(C) locations, cable trays are required to be solid metal bottom with solid metal covers.

Column ten – **Riser and general purpose cable routing assemblies** --indicate Note (7). Text: Note 7. Riser and general purpose cable routing assemblies are not permitted to be supported by cable trays,

Column thirteen – **CMUC** – Change Y to N because only use permitted is under carpet.

Column thirteen – **CMR, CMG, CM, CMX** –Indicate Note (8). Text: Note 8. Subject to requirements of 300.22.

	Plenum communications raceways	Y	Y	Y	N	N	N	Y			
	Riser communications raceways and riser cable routing assemblies	Y	Y	Y	N	N	N	Y			
	General-purpose communications raceways and general-purpose cable routing assemblies	Y	Y	Y	N	N	N	Y			

Note: An ‘N’ in the table indicates that the cable type shall not be permitted to be installed in the application. A ‘Y’ indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 800.110 and 800.113.

Table 800.154(A

Applications of Listed Communications Wires, Cables and Raceways in Buildings

Applications		Wire, Cable and Raceway Type									
		CMP	CMR	CMG CM	CMX	CMUC	Hybrid power and communications cables	Communications wires	Plenum communi-cations raceways	Riser communica-tions raceways	General-purpose communications raceways
In Fabricated Ducts and Plenums as Described in 300.22(B)	In fabricated ducts and plenums	Y*	N	N	N	N	N	N	N	N	N
	In metal raceway that complies with 300.22(B)	Y*	Y*	Y*	Y*	N	N	Y*	Y*	Y*	Y*
In Other Spaces Used for Environmental Air as Described in 300.22(C)	In other spaces used for environmental air	Y*	N	N	N	N	N	N	Y*	N	N
	In metal raceway that complies with 300.22(C)	Y*	Y*	Y*	Y*	N	N	Y*	Y*	Y*	Y*
	In plenum communica-tions raceways	Y*	N	N	N	N	N	N	N	N	N
	Supported by open metal cable trays	Y*	N	N	N	N	N	N	N	N	N
	Supported by solid bot-tom metal cable trays with solid metal covers	Y*	Y*	Y*	Y*	N	N	N	Y*	Y*	Y*
In Risers	In vertical runs	Y*	Y*	N	N	N	N	N	Y*	Y*	N
	In metal raceways	Y*	Y*	Y*	Y*	N	N	N	Y*	Y*	Y*
	In fireproof shafts	Y*	Y*	Y*	Y*	N	N	N	Y*	Y*	Y*
	In plenum communica-tions raceways	Y*	Y*	N	N	N	N	N			N
	In riser communications raceways	Y*	Y*	N	N	N	N	N			N
	In riser cable routing assemblies	Y*	Y*	N	N	N	N	N	N	N	N
	In one- and two-family dwellings	Y*	Y*	Y*	Y*	N	Y*	N	Y*	Y*	Y*
Within Buildings in Other Than Air-Handling Spaces and Risers	General	Y*	Y*	Y*	Y*	N	N	N	Y*	Y*	Y*
	In one- and two-family dwellings	Y*	Y*	Y*	Y*	Y*	Y*	N	Y*	Y*	Y*
	In multifamily dwellings	Y*	Y*	Y*	Y*	Y*	N	N	Y*	Y*	Y*
	In nonconcealed spaces	Y*	Y*	Y*	Y*	Y*	N	N	Y*	Y*	Y*
	Supported by cable trays	Y*	Y*	Y*	N	N	N	N	Y*	Y*	Y*
	Under carpet	N	N	N	N	Y*	N	N	N	N	N
	In distributing frames and cross-connect arrays	Y*	Y*	Y*	N	N	N	Y*	Y*	Y*	Y*
	In any raceway recog-nized in Chapter 3	Y*	Y*	Y*	Y*	N	N	Y*	Y*	Y*	Y*
	In plenum communica-tions raceways	Y*	Y*	Y*	N	N	N	Y*			
	In riser communications raceways and riser cable routing assemblies	Y*	Y*	Y*	N	N	N	Y*			
	In general-purpose com-munications raceways and general-purpose cable routing assemblies	Y*	Y*	Y*	N	N	N	Y*			

Note: An 'N' in the table indicates that the cable type shall not be permitted to be installed in the application. A 'Y*' indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 800.110 and 800.113.

Informational Note 1: Part V of Article 800 covers installation methods within buildings. This table covers the applications of listed communications wires, cables and raceways in buildings. The definition of point of entrance is in 800.2. Communications entrance cables that have not emerged from the rigid metal conduit or intermediate metal conduit are not considered to be in the building.

Informational Note No. 2: For information on the restrictions to the installation of communications cables in fabricated ducts and plenums see 800.113(B).

Column fourteen – **CMR, CMG and CM.** Indicate Note (9) Text: Note 9. Although permitted in plenum communications raceways in locations other than plenums and environmental air spaces, this combination of raceway and cable is not permitted in 30.22 locations. Cables must be CMP.

Column Fifteen -- **CMG AND CM**.-- Indicate Note (10). Text: Note 10. Although permitted in riser communications raceways in other locations, this combination of raceway and cable is not permitted in riser applications. The cable must be riser cable.

Column Sixteen – **CMP and CMR –** Indicate Note (11). Text: Note 11. CMP and CMR in General Purpose Communications Raceway does not constitute a plenum or riser complying installation.

Substantiation: Notes were developed from the following references:

Note (1). Per **800.113(B)**.

Note (2) Per **800.113(B)**(2) and **800.113(C)**(5).

Note (3) Per **800.113(I)**(2)

Note (4) Per **800.113(I)**(6), **800.113(J)**(6), and **800.113(K)**(6)

Note (5) Per **800.113**(F)(2), (J)(2) and (5), AND (K)(2) and (5)

Note (6) Per **800.113(B) and (C) that refer to 300.22(B) and (C) where cable tray is not noted in (B), and solid metal bottom tray with metal cover is required in (C).**

Note (7) **Cable Routing Assemblies are a support system as are cable trays, which is the title of this column. One support system should not support another.**

The Panel may prefer to separate the plenum, riser and general purpose raceways from cable routing assemblies for easier interpretation as they are not used exactly the same.

In Column 13 the requested change for CMUC from Y to N is appropriate because the title of this column is "In any raceway in Chapter 3" and the use of CMUC is limited to under carpet only.

Notes 9 and 10 are intended to clarify that when plenum or riser raceways are used that does not translate to a plenum or riser installation unless CMP or Riser cable (as applicable) are used.

Note 11 is intended to clarify that the use of plenum or riser cable in a General Purpose Communications Raceway still is suitable for only a general purpose application.

Several comments have been submitted to 800.113 that clarify metal and other Chapter 3 raceways are permitted. That fact is missing in some sections of 800.113 although the Table shows Yes. Developing these notes to the Table emphasized the misinterpretations and difficulty of applying the Table to the text. Note 8 is a good example of crossover with Columns one and two and could easily be misinterpreted to use any Chapter 3 raceway anywhere with any cable. We urge the Panel to delete this Table, but offer these notes for consideration in the event you do not.

Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle recommendation 1. See Informational Note No 2 in Table 800.154(A).

The panel accepts in principle recommendation 2. See The row "In metal raceway that complies with 300.22(B)".

The panel accepts in principle recommendation 3. The information in recommended Note (3) is in 800.113(J).

The panel accepts in principle recommendation 4. The information in recommended Note (4) is in 800.113(J).

The panel accepts in principle recommendation 5. The information in the second recommended Note (4) is in 800.113(L).

The panel accepts in principle recommendation 6. The information in recommended Note (5) is in 800.113(J).

The panel does not accept recommendation 7. See panel action on proposal 16-175 which permits plenum cable to be installed in metallic cable trays in plenums.

The panel does not accept recommendation 8. The installation of cable routing assemblies is in 770.113.

The panel accepts in principle recommendation 9. The information on the use of CMUC is in 800.113(L).

The panel does not accept recommendation 9. See 800.113(C) which only permits Type CMP.

The panel accepts in principle recommendation 10. See The row "In metal raceway that complies with 300.22(B)" and the row "In metal raceway that complies with 300.22(C)".

The panel accepts in principle recommendation 11. See the row "In plenum optical fiber and communications raceways" and the row "In riser optical fiber and communications raceways."

Panel Statement: See panel action on Comments 16-138 and 16-148.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-151 Log #2170 NEC-P16 **Final Action: Reject**
(Table 800.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America

Comment on Proposal No: 16-172

Recommendation: Delete Table 800.154(A)

Substantiation: This is a companion comment for revision of 800.154.

See also comment to add notes to Table 800.154(A) if this comment is not accepted.

Panel Meeting Action: Reject

Panel Statement: The submitter has provided no substantiation for the recommended action.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-152 Log #2171 NEC-P16 **Final Action: Hold**
(800.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America

Comment on Proposal No: 16-172

Recommendation: It is understood 16-172 is a companion proposal to 16-160.

For the purpose of this comment the columns are referenced numerically from left to right and as shown in the draft.

Revise column headings as follows:

1. Add "Specifically" before "Fabricated"; delete "and plenums"

4. Change "fireproof" to "fire-resistance- rated."

Substantiation: 1. To correlate with the title of 300.22(B) and avoid confusion.

4. The term "fireproof " is being replaced with the correct description "fire-resistance-rated" throughout ASTM fire related standards and other codes. It is a known fact that that "fireproof" is not a legally defensible term. A comment has been submitted to change the term in 800.113(E).

Panel Meeting Action: Hold

Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-153 Log #1362 NEC-P16 **Final Action: Accept**
(800.154(H) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Comment on Proposal No: 16-183

Recommendation: Continue rejecting this proposal.

Substantiation: The proposal introduces terms that are associated with fire testing/fire performance and are not defined anywhere. Therefore, not only does no application exist (as CMP 16 correctly pointed out) but no organization has developed criteria for such fire performance.

Communications cables in the NEC can be listed as complying with one of the following 6 categories: CMP (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), CMR (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), CMG (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of CSA FT4), CM (i.e. alternate cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581), CMX (i.e. limited use cables listed as suitable for use in dwellings or in raceways and resistant to flame spread and that comply with the requirements of the vertical wire test VW-1 in UL 1581) and CMUC (i.e. cables listed as suitable for use under carpets and resistant to flame spread and that comply with the requirements of the vertical wire test VW-1 in UL 1581).

Nowhere does a definition exist for "very-low-smoke producing cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.

Nowhere does a definition exist for "fire hazard cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the recommendation to continue to reject but does not necessarily agree with the submitter's substantiation.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-154 Log #2073 NEC-P16 **Final Action: Reject**
(800.154(H) (New))

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 16-183
Recommendation: Add new 800.154(H).

(H) Communications Cables With Suffix Markings. Communications cables with single or multiple suffix markings shall be permitted where required to meet special applications.

(1) Communications Circuit Integrity (CI) Cables or Electrical Circuit Protective System. Circuit integrity (CI) cables or a listed electrical circuit protective system shall be permitted for use in communications systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.

(2) Communications Cables for Wet Locations. Communications cables installed in wet locations shall be Types CMP-WET, CMR-WET, CMG-WET, OR CM-WET.

(3) Communications Cables Exposed to Direct Sunlight. Communications cables installed exposed to direct sunlight shall be Types CMP-SR, CMR-SR, CMG-SR, or CM-SR.

(4) Communications Cables in Corrosive Locations. Communications cables installed in where exposed to oil shall be Types CMP-PR, CMR-PR, CMG-PR, or CM-PR. Communications cables installed in where exposed to oil and gas shall be Types CMP-GR, CMR-GR, CMG-GR, or CM-GR

(5) Communications Very-Low-Smoke Producing Cables. Communications very-low-smoke producing cables installed to provide low flame spread and very-low-smoke emissions shall be Types CMP-50, CMR-50, CMG-50, or CM-50.

(6) Communications Fire Hazard Cables. Communications fire hazard cables installed to provide low flame spread, very-low-smoke, and known potential heat release shall be Types CMP-FHC, CMR-FHC, CMG-FHC, or CM-FHC.

Substantiation: The comment provides the application information missing from the proposal, as noted by Panel 16.
Panel Meeting Action: Reject
Panel Statement: Requiring that communications cables installed in wet locations be listed for wet locations conflicts with 800.48 which permits 50 feet of unlisted cable to enter the building. It also conflicts with the panel action on Proposal 16-129 which clarified that the requirements of 310.8(C) (which requires cables in wet locations to be listed for wet locations), does not apply to communications cables. Likewise, requiring that communications cables that are exposed to direct sunlight be listed for exposure to sunlight also conflicts with 800.48. The requirements of 800.48 recognize that outside plant cables, which are designed for exposure to sunlight and water, need to be brought into buildings in order to connect with listing building cables.

16-155 Log #2846 NEC-P16 **Final Action: Reject**
(800.170, FPN)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 16-186
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that "the FPNs are more user-friendly in current locations" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: This FPN information is valuable for the user of the Code and the user should not have to go back to an annex to find it.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

(Table 800.179)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-172
Recommendation: Delete the "Reference" column in Table 800.179.
Substantiation: The panel action on proposal 16-172 changed the references to 800.154. Rather than correcting the references, simply delete the "Reference" column because it is not needed. See Tables 725.179 and 760.179(I) which have no "Reference" column.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-157 Log #2074 NEC-P16 **Final Action: Reject**
(800.179)

Submitter: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.
Comment on Proposal No: 16-187
Recommendation: Accept Proposal 16-187.
Substantiation: It is important to have requirements for cable temperature rating.
Panel Meeting Action: Reject
Panel Statement: The panel has not accepted any of the proposals or comments for new cable types, therefore, markings are not required.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-158 Log #640 NEC-P16 **Final Action: Accept**
(800.179(A), FPN)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-188
Recommendation: Continue to reject this proposal.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to reject this proposal and recommends that the panel continue to reject it.

A fine print note giving information on fire testing of plenum cable has been in the NEC since the 1984 edition. It has undergone only minor editorial changes since 1984. It provides extremely useful to cable manufacturers. The proposed change would remove essential information.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-159 Log #999 NEC-P16 **Final Action: Reject**
(800.179(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-188
Recommendation: The Proposal should be Accepted in Principle, revised and the following words "and Annex A Explanatory Material" added after "NFPA 262-2007" so the revised text reads as follows:
~~FPN~~ Informational Note: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is ~~that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with~~ described in NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, and Annex A Explanatory Material.
Substantiation: The FPN refers to a test method and defines the maximum values, which are not specified in the body of NFPA 262. Inclusion of the maximum values in the FPN are requirements and this violates 3.1.3 of the NEC Style Manual.

NFPA 262 defines the Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces but it does not specify any pass/fail criteria.

While the values specified for maximum peak optical density, maximum average optical density, and maximum allowable flame travel distance in the FPN are not included in the body of NFPA 262, they are contained in Annex A Explanatory Material. Addition of the words "and Annex A Explanatory Material" will reference the maximum values that are in the FPN and the proposed revised FPN will comply with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.
Panel Meeting Action: Reject
Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on one method of determining what a low-smoke producing and fire-resistant cable is.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

(800.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-188
Recommendation: 800.179 Communications Wires and Cables.

Communications wires and cables shall be listed in accordance with 800.179(A) through (I) and marked in accordance with Table 800.179. Conductors in communications cables, other than in a coaxial cable, shall be copper.

Communications wires and cables shall have a voltage rating of not less than 300 volts. The insulation for the individual conductors, other than the outer conductor of a coaxial cable, shall be rated for 300 volts minimum. The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire. Communications wires and cables shall have a temperature rating of not less than 60°C.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

FPN No. 1: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

FPN No. 2: See 800.170 for listing requirement for equipment. (A) Types OFNP and OFCP.

(A) Type CMP. Type CMP communications plenum cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.

Substantiation: Retain the FPN as in the current NEC, but only if the FPNs from CMP 3 are not changed to the same language. This comment is being written just in case CMP 3 is willing to change to existing NEC language.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Reject
Panel Statement: The panel upholds its position to not change the FPN.

The panel agrees with the submitter's statement that "the FPN is worded correctly".

See panel action and statement on Comment 16-61.

16-161 Log #1349 NEC-P16 **Final Action: Reject**
(800.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-188
Recommendation: 800.179 Communications Wires and Cables.

Communications wires and cables shall be listed in accordance with 800.179(A) through (I) and marked in accordance with Table 800.179. Conductors in communications cables, other than in a coaxial cable, shall be copper.

Communications wires and cables shall have a voltage rating of not less than 300 volts. The insulation for the individual conductors, other than the outer conductor of a coaxial cable, shall be rated for 300 volts minimum. The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire. Communications wires and cables shall have a temperature rating of not less than 60°C.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

FPN No. 1: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

FPN No. 2: See 800.170 for listing requirement for equipment. (A) Types OFNP and OFCP.

(A) Type CMP. Type CMP communications plenum cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.

~~FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.~~

Substantiation: This comment is intended to bring consistency to the NEC. In Articles 770, 800, 820 and 830, the FPN is worded correctly but different from what CMP 3 recommended. The original proposal I made to CMP 3 and CMP 16 was already made in the 2005 and 2008 NEC cycles, but was caught up in the "plenum cable moratorium" in the opinion of CMP 3 but not of CMP 16. The present wording also follows the requirements of the preceding section, which requires that the cable be listed as having both "adequate fire-resistant and low smoke-producing characteristics". The wording of CMP 3 (although adequate also) does not explain what is needed to define a cable that is a "low smoke-producing and fire-resistant cable" by omitting the words "a cable that is". However, if CMP 16 makes this change consistency is achieved in the NEC.

With regard to the comment by Mr. Ayers to the proposals in CMP 3, I agree with him, but the (incorrect) use of the term "fire-resistant cable" is consistent in not just the FPNs in all 6 relevant articles (725, 760, 770, 800, 820 and 830) but is also consistent with the use in the charging paragraph.

If CMP 3 and CMP 16 would both like to eliminate the term "fire-resistant cable", consistently in all locations, and replace it by a term such as "low flame spread cable", that would be an excellent idea, but it does require consistency (and probably a task group of both panels). In the meantime the use of the term "fire-resistant cable" is necessary to correlate with the charging paragraph.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Reject
Panel Statement: The panel upholds its position to not change the FPN.

The panel agrees with the submitter's statement that "the FPN is worded correctly".

Comment on Proposal No: 16-191
Recommendation: The Proposal should be Accepted in Principle and 800.179(B), FPN revised as follows:

~~FPN~~ Informational Note: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is described in ~~that the cables pass the requirements of~~ ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.*

Substantiation: The original proposal incorrectly identified 820.179(B), FPN in the Recommendation.

The existing phrase "…is that the cables pass the requirements…" specifies a requirement which violates 3.1.3 of the NEC Style Manual. The revised text will still provide the user with a reference that directs them to the appropriate

standard that contains the test requirements and the pass/fail criteria and the revised FPN complies with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on one method of defining the fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

(800.179(C), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-193

Recommendation: The Proposal should be Accepted in Principle and the text revised as shown:

~~FPN~~ Informational Note: One method of defining resistant to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing~~ described in the CSA "Vertical Flame Test — Cables in Cable Trays," ~~as described~~ in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

Substantiation: Acceptance of the revised wording shown above will still provide the user with a reference to a "method of defining resistant to the spread of fire" and also comply with the NEC Style Manual that FPNs not contain requirements. The pass/fail criteria is already defined in the standard.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on one method of defining resistant to the spread of fire.

16-165 Log #1002 NEC-P16 **Final Action: Reject**
(800.179(D), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-197

Recommendation: The Proposal should be Accepted in Principle in Part and the text revised as follows:

~~FPN~~ Informational Note: One method of defining resistant to the spread of fire is ~~that the cables do not spread fire to the top of the tray~~ described in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing~~ described in the CSA "Vertical Flame Test — Cables in Cable Trays," ~~as described~~ in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

Substantiation: The existing FPN specifically defines "that the cables not spread fire to the top of the tray in UL 1685" and "for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the Vertical Flame Test – Cables in Cable Trays in CSA C22.2…", those are very specific requirements.

Acceptance of the revised wording will still provide the user with the references to two methods of defining "resistant to the spread of fire" and also comply with the NEC Style Manual that FPNs not contain requirements. The pass/fail criteria are already defined in those two standards.

The text in the second paragraph correctly uses the term "described" and the proposed revision simply relocates the term and uses it in the first paragraph as well.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on two methods of defining resistant to the spread of fire.

(800.179(G), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-200

Recommendation: The Proposal should be Accepted in Principle and reworded as follows:

~~FPN~~ Informational Note: One method of defining circuit integrity is ~~by establishing a minimum 2-hour fire resistance rating for the cable when tested~~ described in ~~accordance with~~ UL 2196-2002, Standard for Tests of Fire Resistive Cables.

Substantiation: Acceptance of the revised wording will still provide the user with a reference to a method of defining "circuit integrity" and also comply with the NEC Style Manual that FPN's not contain requirements. The pass/fail criteria is already defined in the standard. The deleted text specifically defines the one method of defining circuit integrity and includes the minimum rating for the cable and the specific test; that could very easily be interpreted as a requirement in the FPN.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on one method of defining circuit integrity.

16-169 Log #1363 NEC-P16 **Final Action: Accept**
(800.179(J) (New))

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-204
Recommendation: Continue rejecting this proposal.
Substantiation: The proposal introduces a definition of a term that is associated with fire testing/fire performance and is not defined anywhere. Therefore, not only does no application exist (as CMP 16 correctly pointed out) but no organization has developed criteria for such fire performance.

Communications cables in the NEC can be listed as complying with one of the following 6 categories: CMP (i.e. cables listed as plenum cables and that comply with the requirements of NFPA 262), CMR (i.e. cables listed as riser cables and that comply with the requirements of UL 1666), CMG (i.e. cables listed as general purpose, or tray, cables and that comply with the requirements of CSA FT4), CM (i.e. alternate cables listed as general purpose, or tray, cables and that comply with the requirements of UL 1685 or of CSA FT4 or of the vertical cable tray test in UL 1581), CMX (i.e. limited use cables listed as suitable for use in dwellings or in raceways and resistant to flame spread and that comply with the requirements of the vertical wire test VW-1 in UL 1581) and CMUC (i.e. cables listed as suitable for use under carpets and resistant to flame spread and that comply with the requirements of the vertical wire test VW-1 in UL 1581).

Nowhere does a definition exist for "fire hazard cables"; no test exists for that type of cables and no listing category exists for that type of cable. Requiring a marking (even if it is optional) for such a type of cable makes no sense because it would be a marking in advance of any such category of cable. The proposed fire properties recommended for such a listing do not correspond to any listing developed by a nationally recognized listing organization, even when optional listings are taken into account. UL has developed UL Subject 2424, "Outline of Investigation for Cable Marked "Limited Combustible", which contains a set of listing criteria for which no application exists, but this document requires that cables also be tested in accordance with UL 723 after oven aging.

Cables listed to UL 2424 are already allowed by NFPA 90A to be used anywhere that plenum cables are required.

Both NFPA 90A and the mechanical codes (the IMC, International Mechanical Code, and the UMC, Uniform Mechanical Code) have requirements of 25/50 (flame spread index/smoke developed index, in accordance with ASTM E 84) for materials in plenums other than wires and cables (and some other materials). NFPA 13 (sprinkler standard) also made it clear that the use of plenum cables in plenums does not even introduce a fire hazard sufficient to require installation of sprinklers.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation to continue to reject but does not necessarily agree with the submitter's substantiation.

16-179 Log #1006 NEC-P16 **Final Action: Reject**
(800.182)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-211
Recommendation: The Proposal was correctly Accepted in Principle, however, the following revisions should be made to the Section:

Revise 800.182(A) FPN as follows:

~~FPN~~ Informational Note: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is ~~that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with~~ described in the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.

Revise 800.182(B) FPN as follows:

~~FPN~~ Informational Note: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is described in ~~that the raceways pass the requirements of~~ the Test for Flame Propagation (Riser) in UL 2024, Standard for Optical Fiber Cable Raceway.

Revise 800.182(C) FPN as follows:

~~FPN~~ Informational Note: One method of defining resistance to the spread of fire is ~~that the raceways pass the requirements of~~ described in the "Vertical-Tray Flame Test (General Use) in UL 2024, Standard for Optical Fiber Cable Raceway.

Substantiation: The existing phrases in 800.182(A) FPN that specify the maximum values when tested in accordance with UL 2024 specifies a requirement which violates 3.1.3 of the NEC Style Manual.

The existing phrase in both 800.182(B) FPN and 800.182(C) FPN "…that the raceways pass the requirements of…" specifies a requirement which violates 3.1.3 of the NEC Style Manual.

The revised text will still provide the user with references that directs them to the appropriate standard that contains the test requirements and the pass/fail criteria and the revised FPN complies with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject
Panel Statement: The informational note in 800.182(A) does not contain requirements and is not written in mandatory language; it provides information on one method of defining an optical fiber raceway that is low smoke producing and fire resistant.

The informational note in 800.182(B) does not contain requirements and is not written in mandatory language; it provides information on one method of defining the fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

The informational note in 800.182(C)does not contain requirements and is not written in mandatory language; it provides information on defining resistance to the spread of fire.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-180 Log #1633 NEC-P16 **Final Action: Accept in Principle**
(800.182)

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-211
Recommendation: Accept Proposal 16-211 in principle in part by rejecting the recommended text in Proposal 16-211 and instead accepting the task group's comment on Proposal 16-108 which refers to Article 770 for applications of cable routing assemblies.
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

Panel 16 accepted listing requirements for cable routing assemblies in multiple articles. The task group recommends that panel 16 simplify the multiple sections dealing with cable routing assemblies by placing the listing requirements in one article only. Since the primary application of cable routing assemblies is currently with optical fiber cables, the task group chose Article 770. This proposal is not needed if the panel accepts the task group comment on Proposal 16-108.

Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts the principle of placing the listing requirements of cable routing assemblies in 770.182, and not repeating them in Chapter 8. See panel action on Comment 16-99. The panel accepts the recommendation to reject the recommended text of Proposal 16-211.

16-181 Log #543 NEC-P16 **Final Action: Reject**
(810)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-212
Recommendation: Continue to reject the proposal.
Substantiation: The panel statement has correctly identified several criteria that make the "grounding electrode conductor" unique and different from a communications "grounding conductor". They include: connection of the grounded conductor (neutral) and the equipment grounding conductor from within the power service equipment to the grounding electrode/ grounding electrode system at the premises, specific requirements for material, installation, sizing and accessibility, and service as the interconnection point for other equipment/systems required to be grounded. Communications grounding conductors do not have the required attributes to serve these important functions. Identifying them as such will lead to confusion, misapplication of grounding rules and inadequate grounding.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter.

The panel has reviewed the proposed CMP 5 grounding terminology changes and has accepted the changes with editorial revisions in an effort to ensure consistent terminology throughout the Code.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
PIRKLE, W.: See comment on 16-85.

16-182 Log #612 NEC-P16 **Final Action: Accept in Principle**
(810)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 16-212
Recommendation: Replace the term "~~grounding conductor~~", with the term "grounding electrode conductor", throughout this article.
Substantiation: The term "grounding electrode conductor", is a specific term and thus it is easier for most people in the industry to understand the purpose. The generic term "grounding conductor" is so general that most people can misunderstand the application. It cannot be held to be in the best interest of safety for a general misunderstanding of terms to be an allowable mode in the NEC process.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-190.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-183 Log #1269 NEC-P16 **Final Action: Accept in Principle**
(810)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 16-212
Recommendation: I highly encourage CMP-16 to accept this proposal in principle and accept the coordinated set of comments that provide the completed revisions throughout Article 810.
Substantiation: This comment responds to action by CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 810. The coordinated comments actually even correct misuse of grounding terms in a few locations that existed for a few cycles.

CMP-5 has responsibilities for defined grounding and bonding terms (Code wide). This comment respects the independence of CMP-16 regarding Chapter 8 based on 90.3: this work is not an effort to remove that independence. These proposed revisions are technically correct and result in grounding and bonding terms being used consistently with how they are defined. The term "grounding conductor" is too broad and has been part of a planned migration for removal since the 2005 edition. This planned revision is part of a larger plan implemented by the NEC-2008 TCC assigned grounding and bonding task group work. The grounding and bonding concepts are simple. If grounding happens, a connection is made to an electrode by use of a grounding electrode conductor. Bonding connected conductive parts to establish continuity and

conductivity between them. The proposed revisions do not change anything technically in the article: they only make the use of grounding terms consistent with how they are defined, improving the current text. The only change proposed is in use of terms. All other rules such as sizing, installation and so forth remain as specified in this article, as before.

Not accepting the proposed revisions shows a deliberate action to allow continued inconsistency and subjectivity to remain in the NEC. CMP-5 actions have deleted the term "grounding conductor" from Article 100 and revised the term "grounding electrode conductor" to work consistently with the limited energy articles in Chapter 8. The term "grounding conductor" has been removed or replaced in Article 250 and other articles of the NEC. Not accepting the proposed revisions in the coordinated comments will result in the continued use of an orphaned term that is not specific and can lead to subjectivity. The proposed changes are technically correct and there have been no technical reasons brought forward to reject what is being proposed. I highly encourage CMP-16 to give strong consideration to the coordinated comments submitted that resolve these inconsistencies and improve clarity and usability within the limited energy articles with regards to grounding and bonding rules. The best approach in Code development work is to look at the long range objectives and what would be best for the NEC. It needs to be practical, understandable, and enforceable. These proposed revisions are in the spirit of accomplishing all three of these objectives. It's not about who is right or wrong, it is about being successful and ending up with the best Code as a result.

Panel Meeting Action: Accept in Principle
Panel Statement: The panel disagrees with the submitter. The panel has reviewed the proposed grounding terminology changes and has accepted the changes with editorial revisions in an effort to ensure consistent terminology throughout the Code.

16-185 Log #2096 NEC-P16 **Final Action: Accept in Principle (810)**

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 16-212
Recommendation: Revise the proposal as follows: Replace the term "grounding conductor" with "bonding conductor" or "grounding electrode conductor" throughout the article as appropriate.
Substantiation: The present term "grounding conductor" is proposed to be deleted by CMP5. The present term is not correct in most applications. I was part of a CMP-5 and CMP-16 Task Group that could not come to a consensus. The members of CMP-5 went through all the sections in Articles 770, 800, 810, 830 and the proposed new Article 840. The proposed changes are being presented by Phil Simmons and I urge the code panel to either agree with the submitter or make additional changes as needed to remove the term "grounding conductor from these articles.
Panel Meeting Action: Accept in Principle

16-186 Log #2221 NEC-P16 **Final Action: Accept in Principle (810)**

Submitter: Harold C. Ohde, IBEW #134
Comment on Proposal No: 16-212
Recommendation: Accept Proposal 16-212 as intended to delete the term "grounding conductor" and replace it with the term "grounding electrode conductor" throughout Article 810.
Substantiation: Proposal 5-13 deleted the definition of "Grounding Conductor" in Article 100 during the 2011 ROP stage as well as the revision of the term "Grounding Electrode Conductor". The revision of the term "grounding electrode conductor" in Article 100 included wording necessary for the Chapter 8 Articles, therefore, the term "grounding conductor" is no longer needed or required. The term "grounding electrode conductor" is more correct than the term "grounding conductor". Proposal 5-18 which was accepted in principle and revised by CMP-1 reads as follows:
Grounding Electrode Conductor (GEC). A conductor used to connect the system grounded conductor, equipment, communications system protectors, antenna discharge units, communications cables or network interface units to a grounding electrode or to a point on the grounding system.
Panel Meeting Action: Accept in Principle

16-188 Log #308 NEC-P16 **Final Action: Accept (810.13)**

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 16-214
Recommendation: The Technical Correlating Committee directs that the panel clarify that the panel action intends to delete "of less than 250 volts between conductors".

In addition, the Technical Correlating Committee directs the Chair of Code-Making Panel 4 to establish a Task Group to correlate the action on this proposal with the actions taken by Code-Making Panel 4.

This shall be considered as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action on Proposal 16-214.

The panel did not intend to delete "of less than 250 volts between conductors". Note that the text is correct in the draft.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-189 Log #2780 NEC-P16 **Final Action: Accept**
(810.13)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Accept"
to correlate with similar accepted comments acted on by other panels.
Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 16-214
Recommendation: Proposal should be rejected.
Substantiation: CMP 4 rewrote the definitions and subsequent requirements for the installation of the service conductors that the submitter is referencing in his proposal. The submitter presented rationale in his substantiation based on the presumption that CMP 4 would accept his proposals to CMP 4, we did not. The submitter is incorrect that under existing NEC requirements all "service drop" and "service entrance" conductors are utility owned, they are not. Utilizing the word "service" in 408.3 will be sufficient whether the recommended changes in Article 430 pass or not.
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position on Proposal 16-214.

Section 810.13 applies regardless of ownership of the electric light or service entrance conductors.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-190 Log #1897 NEC-P16 **Final Action: Accept in Principle**
(810.21)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-212
Recommendation: Revise text to read as follows:
810.21 Bonding Conductors and Grounding Electrode Conductors — Receiving Stations.
Bonding conductors and grounding electrode conductors shall comply with 810.21(A) through (K).
(A) Material. The bonding conductor and grounding electrode conductor shall be of copper, aluminum, copper-clad steel, bronze, or similar corrosion-resistant material. Aluminum or copper-clad aluminum bonding conductors and grounding electrode conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum conductors shall not be installed within 450 mm (18 in.) of the earth.
(B) Insulation. Insulation on bonding conductors and grounding electrode conductors shall not be required.
(C) Supports. The bonding conductors and grounding electrode conductors shall be securely fastened in place and shall be permitted to be directly attached to the surface wired over without the use of insulating supports.
Exception: Where proper support cannot be provided, the size of the bonding conductors and grounding electrode conductors shall be increased proportionately.
(D) Mechanical Protection. The bonding conductors and grounding electrode conductor shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is run in a metal raceway, both ends of the raceway shall be bonded to the contained ~~grounding~~ conductor or to the same terminal or electrode to which the ~~grounding~~ conductor is connected.
(E) Run in Straight Line. The grounding electrode conductor for an antenna mast or antenna discharge unit shall be run in as straight a line as practicable from the mast or discharge unit to the grounding electrode.
(F) Electrode. The grounding electrode conductor shall be connected as required in (F)(1) through (F)(3).
(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.
Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.
(2) In Existing Buildings or Structures Without an Intersystem Bonding Termination ~~Grounding Means~~.
If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on the following:
(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping systems, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to the building, as covered in 250.94
(4) The nonflexible metallic power service raceway
(5) The service equipment enclosure, or
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosures

A bonding device intended to provide a termination point for the bonding ~~grounding~~ conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.
(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Means. If the existing building or structure served has no intersystem bonding termination or grounding means as described in 810.21(F)(2).
(1) To any one of the individual electrodes described in 250.52; or
(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 810.21(F)(2) or (F)(3)(1), to an effectively grounded metal structure. **[ROP 16-221]**

(G) Inside or Outside Building. The bonding conductor or grounding electrode conductor shall be permitted to be run either inside or outside the building.
(H) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 10 AWG copper, 8 AWG aluminum, or 17 AWG copper-clad steel or bronze.
(I) Common Ground. A single bonding conductor or grounding electrode conductor shall be permitted for both protective and operating purposes.
(J) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the radio and television equipment grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.
(K) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 810.

These comments address the changes suggested in Proposal 16-212 in each section within Article 810 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept. This includes adding "existing" to 800.100(B)(2) and (3). The provisions in these sections should properly apply to only existing installations to correlate with the rules in 250.94.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
810.21 Bonding Conductors and Grounding Electrode Conductors — Receiving Stations.
Bonding conductors or ~~and~~ grounding electrode conductors shall comply with 810.21(A) through (K).
(A) Material. The bonding conductor or ~~and~~ grounding electrode conductor shall be of copper, aluminum, copper-clad steel, bronze, or similar corrosion-resistant material. Aluminum or copper-clad aluminum bonding conductors or ~~and~~ grounding electrode conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum conductors shall not be installed within 450 mm (18 in.) of the earth.
(B) Insulation. Insulation on bonding conductors or ~~and~~ grounding electrode conductors shall not be required.
(C) Supports. The bonding conductors and grounding electrode conductors shall be securely fastened in place and shall be permitted to be directly attached to the surface wired over without the use of insulating supports.
Exception: Where proper support cannot be provided, the size of the bonding conductors and grounding electrode conductors shall be increased proportionately.
(D) Mechanical Protection. The bonding conductors and grounding electrode

conductor shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is run in a metal raceway, both ends of the raceway shall be bonded to the contained ~~grounding~~ conductor or to the same terminal or electrode to which the ~~grounding~~ conductor is connected.

(E) Run in Straight Line. The bonding conductor or grounding electrode conductor for an antenna mast or antenna discharge unit shall be run in as straight a line as practicable ~~from the mast or discharge unit to the grounding electrode~~.

(F) Electrode. The bonding conductor or grounding electrode conductor shall be connected as required in (F)(1) through (F)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In ~~Existing~~ Buildings or Structures Wit~~hout an Intersystem Bonding Termination~~ Grounding Means.

If the ~~existing~~ building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping systems, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to the building, as covered in 250.94

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure, or

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosures of the power service

A bonding device intended to provide a termination point for the bonding ~~grounding~~ conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

(3) In ~~Existing~~ Buildings or Structures Without an Intersystem Bonding Termination or Grounding Means. If the ~~existing~~ building or structure served has no intersystem bonding termination or grounding means as described in 810.21(F)(2).

(1) To any one of the individual electrodes described in 250.52; or

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 810.21(F)(2) or (F)(3)(1), to an effectively grounded metal structure. **~~[ROP 16-221]~~**

(G) Inside or Outside Building. The bonding conductor or grounding electrode conductor shall be permitted to be run either inside or outside the building.

(H) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 10 AWG copper, 8 AWG aluminum, or 17 AWG copper-clad steel or bronze.

(I) Common Ground. A single bonding conductor or grounding electrode conductor shall be permitted for both protective and operating purposes.

(J) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the radio and television equipment grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.

(K) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.

Panel Statement: The panel agrees with the submitter's intent and edits the text for editorial clarification.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

Comment on Affirmative:

BRUNSSEN, J.: Revise the first sentence of 810.21 as follows: "Bonding conductors and grounding electrode conductors shall comply with 810.21(A) through (K)." Both bonding and grounding electrode conductors need to comply with (A) through (K); revised text correlates with similar text of 810.58. There is inconsistent use of the plural 'conductors' as well as the conjunctions 'and' and 'or' throughout 810.21(A) through (K). Revise 810.21(B) as follows: "Insulation on the bonding conductor or grounding electrode conductor shall not be required." Revise 810.21(C) as follows: "The bonding conductor or grounding electrode conductor shall be …". Revise the exception following 810.21(C) as follows: "…The size of the bonding conductor or grounding electrode conductor shall be …". Revise 810.21(D) as follows: "The bonding conductor or grounding electrode conductor shall be …". Revise 810.21(F)(3) by adding commas to delineate between buildings having an intersystem bonding termination and those having the grounding means of 810.21(F)(2). Final text is contained in the Panel Action for Comment 16-193.

OHDE, H.: See our affirmative comment for Comment 16-22.

16-191 Log #2430 NEC-P16 **Final Action: Accept in Principle (810.21)**

Submitter: Keith Lofland, IAEI

Comment on Proposal No: 16-212

Recommendation: Revise text to read as follows:

810.21 Bonding Conductors and Grounding Electrode Conductors — Receiving Stations.

Bonding conductors and grounding electrode conductors shall comply with 810.21(A) through (K).

(A) Material. The bonding conductor and grounding electrode conductor shall be of copper, aluminum, copper-clad steel, bronze, or similar corrosion-resistant material. Aluminum or copper-clad aluminum bonding conductors and grounding electrode conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum conductors shall not be installed within 450 mm (18 in.) of the earth.

(B) Insulation. Insulation on bonding conductors and grounding electrode conductors shall not be required.

(C) Supports. The bonding conductors and grounding electrode conductors shall be securely fastened in place and shall be permitted to be directly attached to the surface wired over without the use of insulating supports.

Exception: Where proper support cannot be provided, the size of the bonding conductors and grounding electrode conductors shall be increased proportionately.

(D) Mechanical Protection. The bonding conductors and grounding electrode conductor shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is run in a metal raceway, both ends of the raceway shall be bonded to the contained ~~grounding~~ conductor or to the same terminal or electrode to which the ~~grounding~~ conductor is connected.

(E) Run in Straight Line. The grounding electrode conductor for an antenna mast or antenna discharge unit shall be run in as straight a line as practicable from the mast or discharge unit to the grounding electrode.

(F) Electrode. The grounding electrode conductor shall be connected as required in (F)(1) through (F)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In Existing Buildings or Structures Without an Intersystem Bonding Termination ~~Grounding Means~~.

If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping systems, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to the building, as covered in 250.94

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure, or

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosures

A bonding device intended to provide a termination point for the bonding ~~grounding~~ conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Means. If the existing building or structure served has no intersystem bonding termination or grounding means as described in 810.21(F)(2).

(1) To any one of the individual electrodes described in 250.52; or

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 810.21(F)(2) or (F)(3)(1), to an effectively grounded metal structure. **[ROP 16-221]**

(G) Inside or Outside Building. The bonding conductor or grounding electrode conductor shall be permitted to be run either inside or outside the building.

(H) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 10 AWG copper, 8 AWG aluminum, or 17 AWG copper-clad steel or bronze.

(I) Common Ground. A single bonding conductor or grounding electrode conductor shall be permitted for both protective and operating purposes.

(J) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the radio and television equipment grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.

(K) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.
Panel Meeting Action: Accept in Principle

OHDE, H.: See our affirmative comment for Comment 16-22.

16-192 Log #1253 NEC-P16 **Final Action: Accept in Principle (810.21(F)(3))**

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 16-220
Recommendation: Accept Proposal 16-220.
Substantiation: In addressing the panel statement, section 810.21(F)(3) addresses "In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means", and 810.21(B)(2) addresses "In Buildings or Structures with Grounding Means." What possibly could the panel mean when it states "must be taken in context?" 810.21(B)(3) addresses buildings and structures without electrodes, thus there are no grounding electrode means at the building or structure to be utilized and grounding electrode(s) have to be installed. Paragraph 810.21(B)(3)(1) states "To any one of the individual electrodes described in 250.52, but these are not in existence according to the title of 810.21(B)(3). Therefore, the only choice left is 810.21(B)(3)(2) and that states the electrode shall be an effectively grounded metal structure, which again, is not in existence as again, the title of 810.21(B)(3) states "…Without …Grounding Means." Also, the word "effectively" was dropped by Code-Making Panel 5 as being subjective and inadequate in determining if a metal structure is grounded. So, why does it remain in 810.21(B)(3)(2)? The grounding electrodes that could feasibly be installed are those in 250.52(A)(4) through (A)(8), those suggested in Proposal 16-220. The issues pointed out in this comment justify the acceptance of Proposal 16-36.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-193.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-193 Log #2327 NEC-P16 **Final Action: Accept in Principle (810.21(F)(3))**

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 16-219
Recommendation: This proposal should have been accepted as submitted.
Substantiation: The term "effectively grounded" is no longer used in the NEC. The reason it is no longer used is that it is too vague and subjective—what is the difference between "grounded" and "effectively grounded"? CMP-16 should follow the lead of CMP-5 in this endeavor.

Item (2) Can be removed due to the fact that it is already covered in (existing) item 1.

By removing (2), the Code can also eliminate the list format by including the text of (1) in the main text of the rule.
Panel Meeting Action: Accept in Principle

Revise 810.21(F)(3) as follows: If the building or structure served has no intersystem bonding termination, or grounding means as described in 810.21(F)(2), the grounding electrode conductor shall be connected to an electrode as described in 250.52.

Delete (1) and (2) as the submitter suggests.
Panel Statement: The panel agrees that "effectively" does not contribute clarity in this case. Addition of 810.21(F)(2) references the previous paragraph that identifies grounding means at the building or structure. Addition of the submitter's proposed text clarifies that if a grounding means does not exist, one should be installed in accordance with 250.52.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-194 Log #1898 NEC-P16 **Final Action: Accept (810.58)**

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-212
Recommendation: Revise text to read as follows:
810.58 Bonding Conductors and Grounding Electrode Conductors — Amateur and Citizen Band Transmitting and Receiving Stations. Bonding conductors and grounding electrode conductors shall comply with 810.58(A) through (C).
(A) Other Sections. All bonding conductors and grounding electrode conductors for amateur and citizen band transmitting and receiving stations shall comply with 810.21(A) through (K). **[ROP 16-222]**

(B) Size of Protective Bonding Conductor or Grounding Electrode Conductor. The protective bonding conductor or grounding electrode conductor for transmitting stations shall be as large as the lead-in but not smaller than 10 AWG copper, bronze, or copper-clad steel.
(C) Size of Operating Bonding Conductor or Grounding Electrode Conductor. The operating bonding conductor or grounding electrode conductor for transmitting stations shall not be less than 14 AWG copper or its equivalent.
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 810.

These comments address the changes suggested in Proposal 16-212 in each section within Article 810 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

(810.71)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-212
Recommendation: Revise text to read as follows:
810.71 General. Transmitters shall comply with 810.71(A) through (C).
(A) Enclosing. The transmitter shall be enclosed in a metal frame or grille or separated from the operating space by a barrier or other equivalent means.~~,~~ All metallic parts of the equipment shall be ~~which are effectively~~ connected to a bonding ~~grounding~~ conductor.
(B) Grounding of Controls. All external metal handles and controls accessible to the operating personnel shall be effectively connected to an equipment grounding conductor if the transmitter is powered by the premises wiring system or grounded with a conductor in accordance with 810.21.
(C) Interlocks on Doors. All access doors shall be provided with interlocks that disconnect all voltages of over 350 volts between conductors when any access door is opened.
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 810.
These comments address the changes suggested in proposal 16-212 in each section within Article 810 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.
Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept in Principle in Part
Revise 810.71 to read as follows:
810.71 General. Transmitters shall comply with 810.71(A) through (C).
(A) Enclosing. The transmitter shall be enclosed in a metal frame or grille or separated from the operating space by a barrier or other equivalent means, all metallic parts of which are effectively connected to a bonding or grounding electrode conductor.
Panel Statement: The panel accepts parts (B) and (C).
The panel does not accept "equipment shall be" in Part (A) as provided by the submitter as this is unrelated to the original proposal and unsubstantiated. "Bonding or grounding electrode conductor" was changed for consistency with other Comments.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
BRUNSSEN, J.: For consistency with similar revisions throughout 770, 800, 810, 820, 830 and 840, revise the latter portion of 810.71(A) as follows: "…are effectively connected to a bonding conductor or grounding electrode conductor." The word 'conductor' is added after 'bonding' for consistency.
OHDE, H.: See our affirmative comment for Comment 16-22.

16-200 Log #613 NEC-P16 **Final Action: Accept in Principle**
(820)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 16-225
Recommendation: Replace the term "~~grounding conductor~~", with the term "grounding electrode conductor", throughout this article.
Substantiation: The term "grounding electrode conductor", is a specific term and thus it is easier for most people in the industry to understand the purpose. The generic term "grounding conductor" is so general that most people can misunderstand the application. It cannot be held to be in the best interest of safety for a general misunderstanding of terms to be an allowable mode in the NEC process.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-224.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-201 Log #1270 NEC-P16 **Final Action: Accept in Principle (820)**

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 16-225
Recommendation: I highly encourage CMP-16 to accept this proposal in principle and accept the coordinated set of comments that provide the completed revisions throughout Article 820.
Substantiation: This comment responds to action by CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 820. The coordinated comments actually even correct misuse of grounding terms in a few locations that existed for a few cycles.

CMP-5 has responsibilities for defined grounding and bonding terms (Code wide). This comment respects the independence of CMP-16 regarding Chapter 8 based on 90.3: this work is not an effort to remove that independence. These proposed revisions are technically correct and result in grounding and bonding terms being used consistently with how they are defined. The term "grounding conductor" is too broad and has been part of a planned migration for removal since the 2005 edition. This planned revision is part of a larger plan implemented by the NEC-2008 TCC assigned grounding and bonding task group work. The grounding and bonding concepts are simple. If grounding happens, a connection is made to an electrode by use of a grounding electrode conductor. Bonding connected conductive parts to establish continuity and conductivity between them. The proposed revisions do not change anything technically in the article: they only make the use of grounding terms consistent with how they are defined, improving the current text. The only change proposed is in use of terms. All other rules such as sizing, installation and so forth remain as specified in this article, as before.

Not accepting the proposed revisions shows a deliberate action to allow continued inconsistency and subjectivity to remain in the NEC. CMP-5 actions have deleted the term "grounding conductor" from Article 100 and revised the term "grounding electrode conductor" to work consistently with the limited energy articles in Chapter 8. The term "grounding conductor" has been removed or replaced in Article 250 and other articles of the NEC. Not accepting the proposed revisions in the coordinated comments will result in the continued use of an orphaned term that is not specific and can lead to subjectivity. The proposed changes are technically correct and there have been no technical reasons brought forward to reject what is being proposed. I highly encourage CMP-16 to give strong consideration to the coordinated comments submitted that resolve these inconsistencies and improve clarity and usability within the limited energy articles with regards to grounding and bonding rules. The best approach in Code development work is to look at the long range objectives and what would be best for the NEC. It needs to be practical, understandable, and enforceable. These proposed revisions are in the spirit of accomplishing all three of these objectives. It's not about who is right or wrong, it is about being successful and ending up with the best Code as a result.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel disagrees with the submitter. The panel has reviewed the proposed grounding terminology changes and has accepted the changes with editorial revisions in an effort to ensure consistent terminology throughout the Code.

~~*FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 90A–2002, Standard for the Installation of Air-Conditioning and Ventilating Systems. Only editorial changes were made to the extracted text to make it consistent with this Code.*~~
Substantiation: This text needs to be deleted as the extract text (definition of air duct) has been deleted by the proposal.
It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-208 Log #1634 NEC-P16 **Final Action: Accept**
(820.2)

Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-232
Recommendation: Accept Proposal 16-232 in principle in part by taking the following actions:
Reject including the definition of cable routing assembly in Article 820. Instead add a new 820.3(I) as follows:
(I) Cable Routing Assemblies. The definition in 770.2, the applications in 770.154 and installation rules in 770.113 shall apply to Article 820.
Add a new 830.3(G) as follows:
(G) Cable Routing Assemblies. The definition in 770.2, the applications in 770.154 and installation rules in 770.113 shall apply to Article 830.
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.
Panel 16 accepted a definition of a cable routing assembly in multiple articles. It also established installation rules and listing requirements in multiple articles. The task group recommends that panel 16 simplify the multiple sections dealing with cable routing assemblies by placing the definition and installation rules in one article only with appropriate references to that article from the other articles. Since the primary application of cable routing assemblies is currently with optical fiber cables, the task group chose Article 770 to contain the primary requirements dealing with cable routing assemblies.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-209 Log #310 NEC-P16 **Final Action: Accept**
(820.2.Optical Fiber/Communications Cable Routing Assembly)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 16-232
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 2.2.2 of the NEC Style Manual to not contain mandatory text, such as "listed."
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to review the panel action on Proposal 16-232.

OHDE, H.: See our affirmative comment for Comment 16-22.

16-211 Log #1900 NEC-P16 **Final Action: Accept in Principle**
(820.2 Point of Entrance)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-225
Recommendation: Revise text to read as follows:
Point of Entrance. The point within a building at which the wire or cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected by a grounding <u>electrode</u> conductor to an electrode in accordance with 820.100(B).
Substantiation: This comment responds to the action of CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 800.
Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Point of Entrance. The point within a building at which the coaxial cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC)

connected by a bonding conductor or grounding electrode conductor ~~to an electrode~~ in accordance with 820.100(B).
Panel Statement: The panel agrees with the submitter and edits the text as 820.100(B) includes both bonding conductors and grounding electrode conductors.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-212 Log #311 NEC-P16 **Final Action: Accept in Principle**
(820.3(A) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 16-236
Recommendation: The Technical Correlating Committee directs that the panel delete the subsection since 90.3 already provides the information and compliance with 4.1 of the NEC Style Manual is necessary.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts the direction of the TCC to take action on Proposal 16-236.
The panel meets the intent of the TCC to delete the reference to 90.3.
See panel action and statement on Comment 16-213.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-213 Log #545 NEC-P16 **Final Action: Reject**
(820.3(A) (New))

TCC Action: In accordance with 4.1 of the NEC Style Manual, the Technical Correlating Committee directs that this comment and Proposal 16-236 be reported as "Reject" since there is no need to duplicate part of 90.3.
Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-236
Recommendation: Revise the panel action to 'Accept in Part'. Accept the part as follows that states: "Re-letter the existing (A) to (B), (B) to (C), etc. and establish a new (A). **(A) Chapters 1 through 7.** The requirements of Chapters 1 through 7 shall not apply to Article ~~800~~ 820 except where the requirements are specifically referenced in Article ~~800~~ 820."
Delete the part that states: "See 90.3."
Substantiation: Removes the reference to 90.3 as flagged by the Technical Correlating Committee. Corrects a typographical error by changing "800" to "820". Note that the preprint is correct with respect to the typographical error.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-214 Log #1352 NEC-P16 **Final Action: Accept**
(820.24, FPN 2)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-240
Recommendation: FPN # 2; See NFPA 90A-2009, *Standard for Installation of Air-Conditioning and Ventilation Systems*, for discrete combustible components installed in accordance with 300.22(B) and (C).
Note to staff and TCC: See also FPNs to the following sections, which have no associated proposals: 424.66 and 640.3(B).
Substantiation: Please reference the updated edition of NFPA 90A: 2009.
It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-215 Log #546 NEC-P16 **Final Action: Accept**
(820.25)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-241
Recommendation: Continue to reject this proposal.
Substantiation: The submitter has provided no substantiation for the new requirement that is essentially unenforceable.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-216 Log #641 NEC-P16 **Final Action: Accept**
(820.25)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-241
Recommendation: Continue to reject this proposal.
Substantiation: Panel 1 rejected similar Proposals 1-139 and 1-146 with the statement "The submitter has not substantiated that a problem exists, or that the problem would be alleviated by removing abandoned cables and equipment neatly. Rather, the panel concludes, that in some cases, abandoned cables and equipment are best left abandoned. The proposed text is unnecessary as the section more appropriately applies to "Requirements for Electrical Installations" and "Mechanical Execution of Work.""
Panel 3 rejected similar Proposals 3-173 and 3-253 with the statement. "The submitter has not provided technical substantiation for the proposed change, and compliance with this requirement would be unenforceable. This is already covered under 90.4 and 110.2.
Panel 12 rejected similar Proposals 12-114, 12-146 with the statement. "The requirement is unenforceable. Disposition of removed materials is not a code responsibility. The remaining installation is required to be in accordance with 110.3, which is enforceable."
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-217 Log #1399 NEC-P16 **Final Action: Reject**
(820.26)

Submitter: Russell LeBlanc, The Peterson School
Comment on Proposal No: 16-242
Recommendation: The proposal should be accepted in principal but modified as follows:
If a conduit or raceway of metric designator 53 (trade size 2 inch) or larger, penetrates a fire-resistance-rated wall, partition, floor, or ceiling, and that same conduit or raceway also enters an enclosure of the ventilated type, that conduit or raceway shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway or conduit into other areas of the building or structure.
Substantiation: I have modified the wording for clarity and so the application is more focused, and less of a "sweeping" change.
In my original proposal I provided a first hand eyewitness account of what happened.
This was NOT a second hand or third hand story. I saw it happen with my own eyes! I am not a novice. I have been in the trade for over 25 years. I have also been teaching electrician classes for over 10 years. I am OSHA certified. I am an instructor approved by the Mass. Dept. of Education, and The Board of Examiners of Electricians. I have authored several other code changes. I am a member of NFPA. No, I am not a Fire chief or fire science engineer, or some other Fire Dept. Official. But I know what I saw, and it just did NOT seem right to me. I am very concerned. The smoke simply should NOT have been able to spread through the building via the raceways. What more technical substantiation is needed than that?
Lets break it down to simple science and logic.
If I build a fire in a fireplace, the smoke will go up the chimney flue, if the flue damper is OPEN.
If I build a fire in a fireplace, the smoke will NOT go up the chimney flue, if the flue damper is CLOSED!
Try it!
Apply logic here.
If I am wrong then maybe we don't need to seal the raceway ends. But this "chimney effect" of the unsealed pipes has already happened once. I have seen it. If it happens again, the occupants may not be as lucky as the first time I saw this phenomenon happen.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The recommended text is vague, unenforceable and lacks specificity. Insufficient data has been provided to justify such a change. Selection of conduit size requiring fire stopping is arbitrary. This may be more of a building Code issue rather than an electrical Code issue.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:
IVANS, R.: The submitter identifies a concern associated with conduit providing a bypass of firebreaks between floors that should not be ignored.

Although there may be issues associated with the general nature of the original proposal or the seemingly arbitrary selection of 2" conduit, the solutions are not technically insurmountable. I am aware of installations where such sealing of conduit was required by local building codes and effectively implemented This item should have been put on hold for further study rather than rejected.

16-218 Log #2781 NEC-P16 **Final Action: Accept**
(820.44(B) Exception)

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 16-243
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-219 Log #2782 NEC-P16 **Final Action: Accept**
(820.47(B) Exception No. 1)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Accept" to correlate with similar accepted comments acted on by other panels.
Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 16-247
Recommendation: Proposal should be rejected.
Substantiation: CMP 4 rewrote the definitions and subsequent requirements for the installation of the service conductors that the submitter is referencing in his proposal. The submitter presented rationale in his substantiation based on the presumption that CMP 4 would accept his proposals to CMP 4, we did not. The submitter is incorrect that under existing NEC requirements all "service drop" and "service entrance" conductors are utility owned, they are not. Utilizing the word "service" in 408.3 will be sufficient whether the recommended changes in Article 430 pass or not.
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position on Proposal 16-247.
The addition of the word "entrance" adds clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-220 Log #1901 NEC-P16 **Final Action: Accept**
(820.93)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-225
Recommendation: Revise text to read as follows:
820.93 Grounding of the Outer Conductive Shield of Coaxial Cables. Coaxial cables entering buildings or attached to buildings shall comply with 820.93(A) or (B). Where the outer conductive shield of a coaxial cable is grounded, no other protective devices shall be required. For purposes of this section, grounding located at mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

Informational Note: Selecting a grounding location to achieve the shortest practicable bonding conductor or grounding electrode conductor helps limit potential differences between CATV and other metallic systems.

Sections 820.93(A), (B), (C), and (D) are not affected by this Comment.
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 820.

These comments address the changes suggested in proposal 16-225 in each section within Article 820 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-221 Log #2434 NEC-P16 **Final Action: Accept**
(820.93)

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-225
Recommendation: Revise text to read as follows:
820.93 Grounding of the Outer Conductive Shield of Coaxial Cables. Coaxial cables entering buildings or attached to buildings shall comply with 820.93(A) or (B). Where the outer conductive shield of a coaxial cable is grounded, no other protective devices shall be required. For purposes of this section, grounding located at mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

Informational Note: Selecting a grounding location to achieve the shortest practicable bonding conductor or grounding electrode conductor helps limit potential differences between CATV and other metallic systems.

Sections 820.93(A), (B), (C), and (D) are not affected by this Comment.
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-222 Log #547 NEC-P16 **Final Action: Accept**
(820.100 (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-250
Recommendation: Continue to reject this proposal.
Substantiation: The proposed revision is unnecessary. The Panel Statement has correctly indicated that all Article 250 grounding requirements that are applicable to CATV are presently fully covered in Article 820, IV, *Grounding Methods*, with reference to specific sections of Article 250 as appropriate. Further, the NEC Style Manual prohibits reference to complete articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-223 Log #468 NEC-P16 **Final Action: Hold**
(820.100(A) and (B))

TCC Action: The Technical Correlating Committee directs that Comment 16-223 be reported as "Hold" as it introduces new material that has not received public review.
Submitter: Steven C. Johnson, Johnson Telecom, LLC / Rep. National Cable & Telecommunications Assn.
Comment on Proposal No: 16-261
Recommendation: Change Panel action from Reject to Accept in Principle with the wording changes below:
820.100(A)(4)
Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding conductor length of 6.0 m (20 ft), a separate ~~grounding electrode~~ communications ground rod meeting the minimum dimensional criteria of 820.100(B)(3)(2) shall be driven, and the grounding conductor shall be connected to the communications ground rod

in accordance with 820.100(C). The communications ground rod shall be connected~~. as specified in 250.52(A)(5); (A)(6), or (A)(7) shall be used, the grounding conductor shall be connected to the separate grounding electrode in accordance with 250.70, and the separate grounding electrode shall be connected~~ to the power grounding electrode system in accordance with 820.100(D).

820.100(B)(3)(2) If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52~~(A)(5)~~, (A)(7), and (A)(8)~~.~~ , or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 820.44(F)(3) and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for grounding.

Substantiation: Panel 16 concluded in the ROP that a 5 ft ground rod was sufficient for Article 800 applications. Articles 770, 800, and 830 all specify a 5 ft ground rod while Article 820 specifies an 8 ft ground rod (by reference to 250.52). From the Panel Statement on Proposal 16-151: "The tutorial, The ABCs of Grounding and Bonding, states: "Very little resistance change will result from using larger sizes of electrodes." The most important safety aspect is the bonding together of the power and telecom systems." Added text (above) is taken from Article 800 and 830 with minor changes. Changing 820 to allow 5 ft ground rods will create more consistent requirements and parallelism among Articles 770, 800, 820, and 830.

Panel Meeting Action: Reject

Panel Statement: The panel does not accept the text provided by the submitter. The submitter's recommendation is beyond the scope of Proposal 16-261. The submitter is introducing new material.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 14 Negative: 1

Ballot Not Returned: 1 Esemplare, R.

Explanation of Negative:

JOHNSON, S.: Acceptance of this comment would bring Article 820 ground rod requirements consistent with Articles 770, 800, and 830.

16-224 Log #1902 NEC-P16 **Final Action: Accept in Principle**
(820.100(A) and (B))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 16-225

Recommendation: Revise text to read as follows:

820.100 Cable Bonding or Grounding. The shield of the coaxial cable shall be grounded or bonded as specified in 820.100(A) through (D).

Exception: For communication systems using coaxial cable confined within the premises and isolated from outside cable plant, the shield shall be permitted to be grounded by a connection to an equipment grounding conductor as described in 250.118. Connecting to an equipment grounding conductor through a grounded receptacle using a dedicated grounding conductor and permanently connected listed device shall be permitted. Use of a cord and plug for the connection to an equipment grounding conductor shall not be permitted.

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than the outer sheath of the coaxial cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Length. The primary protector grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector bonding conductor or grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate grounding electrode as specified in 250.52(A)(5), (A)(6), or (A)(7) shall be used, the grounding electrode conductor shall be connected to the separate grounding electrode in accordance with 250.70, and the separate grounding electrode shall be connected to the power grounding electrode system in accordance with 820.100(D).

(5) Run in Straight Line. The bonding conductor and grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.

(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 820.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In Existing Buildings or Structures without an Intersystem Bonding Termination ~~Grounding Means~~.

If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94 Exception

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure

(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is connected to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 820.93, shall be considered accessible.

(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Electrode(s) ~~Means~~. If the existing building or structure served has no intersystem bonding termination or grounding electrode(s) ~~means, as described in 820.100(B)(2),~~ the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2) or (B)(3)(1), to any one of the individual grounding electrodes described in 250.52(A)(5), (A)(7) and (A)(8).

Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 820.

These comments address the changes suggested in Proposal 16-225 in each section within Article 820 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept. This includes adding "existing" to 820.100(B)(2) and (3). The provisions in these sections should properly apply to only existing installations to correlate with the rules in 250.94.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

820.100 Cable Bonding and ~~or~~ Grounding. The shield of the coaxial cable shall be bonded or grounded ~~or bonded~~ as specified in 820.100(A) through (D).

Exception: For communication systems using coaxial cable confined within the premises and isolated from outside cable plant, the shield shall be permitted to be grounded by a connection to an equipment grounding conductor as described in 250.118. Connecting to an equipment grounding

conductor through a grounded receptacle using a dedicated grounding conductor and permanently connected listed device shall be permitted. Use of a cord and plug for the connection to an equipment grounding conductor shall not be permitted.

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than the outer sheath of the coaxial cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Length. The ~~primary protector~~ grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the ~~primary protector~~ bonding conductor or grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar bonding conductor or grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate grounding electrode as specified in 250.52(A)(5), (A)(6), or (A)(7) shall be used, the grounding electrode conductor shall be connected to the separate grounding electrode in accordance with 250.70, and the separate grounding electrode shall be connected to the power grounding electrode system in accordance with 820.100(D).

(5) Run in Straight Line. The bonding conductor or and grounding electrode conductor shall be run ~~to the grounding electrode~~ in as straight a line as practicable.

(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.

(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 820.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In ~~Existing~~ Buildings or Structures with~~out an Intersystem Bonding Termination~~ Grounding Means.

If the ~~existing~~ building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94 Exception

(4) The nonflexible metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure of the power service, or

(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is connected to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 820.93, shall be considered accessible.

(3) In ~~Existing~~ Buildings or Structures Without an Intersystem Bonding Termination or Grounding Means. If the ~~existing~~ building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2), the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2) or (B)(3)(1), to any one of the individual grounding electrodes described in 250.52(A)(5), (A)(7) and (A)(8).

Panel Statement: The panel agrees with the submitter's intent and edits the text for editorial clarification.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

BRUNSSEN, J.: 820.100(A)(6), first sentence, should state: "The bonding conductor or grounding electrode conductor shall be …", for consistency with 820.100(A) (1) though (5). 820.100(B)(3) should read as follows: "If the building or structure served has no intersystem bonding termination, or grounding means as described in 820.100(B)(2), …". The comma needs to be placed after "termination" and not after "means" to distinguish between buildings with an intersystem bonding termination as described in (B)(1) and buildings with grounding means as described in (B)(2).

OHDE, H.: See our affirmative comment for Comment 16-22.

16-225 Log #2435 NEC-P16 **Final Action: Accept in Principle**
(820.100(A) and (B))

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-225
Recommendation: Revise text to read as follows:

820.100 Cable Bonding or Grounding. The shield of the coaxial cable shall be grounded or bonded as specified in 820.100(A) through (D).

Exception: For communication systems using coaxial cable confined within the premises and isolated from outside cable plant, the shield shall be permitted to be grounded by a connection to an equipment grounding conductor as described in 250.118. Connecting to an equipment grounding conductor through a grounded receptacle using a dedicated grounding conductor and permanently connected listed device shall be permitted. Use of a cord and plug for the connection to an equipment grounding conductor shall not be permitted.

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity not less than the outer sheath of the coaxial cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Length. The primary protector grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector bonding conductor or grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate grounding electrode as specified in 250.52(A)(5), (A)(6), or (A)(7) shall be used, the grounding electrode conductor shall be connected to the separate grounding electrode in accordance with 250.70, and the separate grounding electrode shall be connected to the power grounding electrode system in accordance with 820.100(D).

(5) Run in Straight Line. The bonding conductor and grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.

(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 820.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In Existing Buildings or Structures without an Intersystem Bonding Termination ~~Grounding Means~~.

If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94 Exception

(4) The nonflexible metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure
(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is connected to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is nonremovable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 820.93, shall be considered accessible.

(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Electrode(s) ~~Means~~. If the existing building or structure served has no intersystem bonding termination or grounding electrode(s) ~~means, as described in 820.100(B)(2),~~ the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)
(2) If the building or structure served has no intersystem bonding termination or grounding means, as described in 820.100(B)(2) or (B)(3)(1), to any one of the individual grounding electrodes described in 250.52(A)(5), (A)(7) and (A)(8).

Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.

Panel Meeting Action: Accept in Principle

16-229 Log #1254 NEC-P16 **Final Action: Reject**
(820.100(B)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 16-261
Recommendation: Accept Proposal 16-261.
Substantiation: In addressing the panel statement, section 820.100(B)(3) addresses "In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means", and 820.100(B)(2) addresses "In Buildings or Structures with Grounding Means." What possibly could the panel mean when it states "must be taken in context?" 820.100(B)(3) addresses buildings and structures without electrodes, thus there are no grounding electrode means at the building or structure to be identified. Paragraph 820.100(B)(3)(1) states "To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)", but these are not in existence according to the title of 820.100(B)(3). Therefore, the only choices left according to 820.100(B)(3)(2) are a pipe or rod electrode per, 250.52((A)(5); a plate electrode, 250.52(A)(7); or a local metal underground system or structure, 250.52((A)(8). This requirement prohibits the use of a ground ring, (A)(4), and a listed grounding electrode, (A)(6), an excellent electrode. It is also interesting to note that 820.100(B)(3)(2), as well as the inference in 810.21(F)(3), specifies that a rod or pipe electrode shall meet the requirements of 250.52(A)(5) while other NEC Chapter 8 Articles as well as 770.100(B)(3)(2) allows the inadequate ½ inch by 5 ft long rod or pipe while all other grounding parameters remain essentially the same. This seems to be inconsistent, while being the proper reference, concerning the various requirements between similar articles and especially the panel statements issued by Panel 16 for 2010 ROP proposals 16-36, 16-143, 16-151, 16-323, and 16-327.

The issues pointed out here justify the acceptance of Proposal 16-261.

Panel Meeting Action: Reject
Panel Statement: The panel reiterates its position as stated in the panel statement for the submitter's original proposal. Grounding electrode choices currently are provided in 820.100(B)(3)(1) and (2). If there's nothing available, the installer has the option of selecting and installing one from 820.100(B)(3)(1) and (2).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:
BOYER, J.: Proposal 16-261 should be reconsidered and accepted as proposed. It is technically sound, reasonable and will aid in reducing losses from lightning, line surges and unintentional contact with higher-voltage lines. Furthermore, they it would help stabilize the voltage to earth during normal operation.

16-230 Log #1903 NEC-P16 **Final Action: Accept in Principle**
(820.106(A) and (B))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-225
Recommendation: Revise text to read as follows:
820.106 Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with 820.106(A)(1) and (A)(2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground or surge arrestor ground, shall be connected to a grounding electrode ~~conductor~~ in accordance with 820.100(B)(3).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground or surge arrestor

ground, shall be connected to a grounding electrode ~~conductor~~ in accordance with 820.100(B)(3).
(B) Bonding. The coaxial cable shield grounding terminal, surge arrestor grounding terminal, or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper bonding ~~grounding~~ conductor not smaller than 12 AWG under any of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 820.106(A)
(2) Where the mobile home is supplied by cord and plug
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 820.
These comments address the changes suggested in Proposal 16-225 in each section within Article 820 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.
Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept.
Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
820.106 Grounding and Bonding at Mobile Homes.
(A) Grounding. Grounding shall comply with 820.106(A)(1) and (A)(2).
(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground or surge arrestor ground, shall be connected to a grounding electrode conductor or grounding electrode ~~conductor~~ in accordance with 820.100(B)(3).
(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground or surge arrestor ground, shall be connected to a grounding electrode ~~conductor~~ in accordance with 820.100(B)(3).
(B) Bonding. The coaxial cable shield grounding terminal, surge arrestor grounding terminal, or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper ~~bonding grounding~~ conductor not smaller than 12 AWG under any of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 820.106(A)
(2) Where the mobile home is supplied by cord and plug.
Panel Statement: The panel accepts the submitter's text and adds "electrode conductor or" to allow the option to connect to the grounding electrode or grounding electrode conductor. This retains the original intent of 820.106(A)(1).
The panel accepts the submitter's text and deletes "bonding" in (B) as it is clearly implied by the title of the subsection.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
BRUNSSEN, J.: Revise 820.106(A)(1) to read as follows: "(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the coaxial cable shield ground or surge arrestor ground shall be connected to a grounding electrode in accordance with 820.100(B)(3)." It is unlikely that a grounding electrode conductor will be available if there is no mobile home service equipment, a grounding electrode conductor is not mentioned in any of the sections referenced in 820.100(B)(3), and the revision is consistent with the proposed text of 820.106(A)(2). The second comma is unnecessary.
OHDE, H.: See our affirmative comment for Comment 16-22.

(820.113)

TCC Action: The Technical Correlating Committee directs the phrase "and plenums" be removed from the title, text and informational note in 820.113(B) because the accepted text in the title, text, and the Informational Note in 300.22(B), as accepted in Proposal 3-94, does not include the term "fabricated plenums."
Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-267
Recommendation: Revise 820.113 to read as follows:
820.113 Installation of Coaxial Cables. Installation of coaxial cables shall comply with 820.113(A) through (K). Installation of raceways shall comply with 820.110.
(A) Listing. Coaxial cables installed in buildings shall be listed.
Exception: Coaxial cables that comply with 820.48 shall not be required to be listed.
(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system:
(1) Up to 1.22 m (4 ft) of Type CATVP

(2) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(B)

Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see Sections 4.3.4.1 (air ducts) and 4.3.11.3.3 (apparatus casings plenums) in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C).

(1) Type CATVP

(2) Type CATVP installed in plenum communications raceway

(3) Type CATVP supported by metallic cable trays or cable tray systems

(4) Types CATVP, CATVR, CATV and CATVX installed in raceways that are installed in compliance with 300.22(C)

Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see Sections 4.3.11.2 (ceiling cavity plenum), 4.3.11.4 (air-handling unit room plenum) and 4.3.11.5 (raised floor plenum) of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(D) Risers- Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types CATVP and CATVR

(2) Types CATVP and CATVR installed in

(a) plenum communications raceway

(b) riser communications raceway

(c) riser cable routing assembly

Informational Note: See 820.26 for firestop requirements for floor penetrations.

(E) Risers-Cables in Metal Raceways. The following cables shall be permitted in metal raceways in a riser having firestops at each floor:

(1) Types CATVP, CATVR, CATV and CATVX

(2) Types CATVP, CATVR, CATV and CATVX installed in:

a) plenum communications raceway

b) riser communications raceway

c) general-purpose communications raceway

Informational Note: See 820.26 for firestop requirements for floor penetrations.

(F) Risers-Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts with firestops at each floor:

(1) Types CATVP, CATVR, CATV and CATVX

(2) Types CATVP, CATVR and CATV installed in:

a) plenum communications raceway

b) riser communications raceway

c) general-purpose communications raceway

d) riser cable routing assembly

e) general-purpose cable routing assembly

Informational Note: See 820.26 for firestop requirements for floor penetrations

(G) Risers- One- and Two-Family Dwellings. The following cables shall be permitted one- and two-family dwellings:

(1) Types CATVP, CATVR and CATV

(2) Type CATVX less than 10 mm (0.375 in.) in diameter

(3) Types CATVP, CATVR and CATV installed in:

a) plenum communications raceway

b) riser communications raceway

c) general-purpose communications raceway

d) riser cable routing assembly

e) general-purpose cable routing assembly

Informational Note: See 820.26 for firestop requirements for floor penetrations

(H) Cable Trays. The following cables shall be permitted to be installed in cable trays.

(1) Types CATVP, CATVR, and CATV

(2) Types CATVP, CATVR and CATV installed in:

a) plenum communications raceway

b) riser communications raceway

c) general-purpose communications raceway

(I) Distributing Frames and Cross-Connect Arrays. The following cables shall be permitted to be installed in distributing frames and cross-connect arrays.

(1) Types CATVP, CATVR and CATV

(2) Types CATVP, CATVR and CATV installed in:

a) plenum communications raceway

b) riser communications raceway

c) general-purpose communications raceway

d) riser cable routing assembly

e) general-purpose cable routing assembly

(J) Other Building Locations. The following cables and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 820.113(B) through (I).

1) Types CATVP, CATVR and CATV

2) A maximum of 3m (10 ft) of exposed Type CATVX in nonconcealed spaces

3) Types CATVP, CATVR and CATV installed in:

a) plenum communications raceway

b) riser communications raceway

c) general-purpose communications raceway

_d) riser cable routing assembly

_e) general-purpose cable routing assembly

4) Types CATVP, CATVR, CATV and Type CATVX installed in a raceway of a type included in Chapter 3

(J) One- and Two-Family and Multifamily Dwellings. The following cables and cable routing assemblies shall be permitted to be installed in one- and two-family and multifamily dwellings in locations other than the locations covered in 820.113(B) through (I).

(1) Types CATVP, CATVR and CATV

(2) Type CATVX less than 10 mm (0.375 in.) in diameter

(3) Types CATVP, CATVR and CATV installed in:

a) plenum communications raceway

b) riser communications raceway

c) general-purpose communications raceway

d) riser cable routing assembly

e) general-purpose cable routing assembly

(4) Types CATVP, CATVR, CATV and Type CATVX installed in a raceway of a type included in Chapter 3

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate installation of cables in cable routing assemblies into the section. However the task group recommends that the listing, applications and installation of the cable routing assemblies be consolidated into Article 770 and not be duplicated in each of panel sixteen's articles. Accordingly the recommended text for this section includes installation of wires and cables in cable routing assemblies and omits the installation of the cable routing assemblies which belong in 770.113.

The recommended text for the informational notes dealing with installations in air handling spaces have been modified to better reflect the contents of the mandatory text.

The panel action on the revision of 820.113 didn't add any specific applications of coaxial cable in cable routing assemblies. The recommended text corrects this oversight.

Most of the text in this comment was submitted by Randy Ivans and Gerald Dorna as an affirmative ballot comments on this proposal. See the ROP.

Panel Meeting Action: Accept in Principle

Revise 820.113 to read as follows:

820.113 Installation of Coaxial Cables. Installation of coaxial cables shall comply with 820.113 (A) through (K). Installation of raceways shall comply with 820.110.

(A) Listing. Coaxial cables installed in buildings shall be listed.

Exception: Coaxial cables that comply with 820.48 shall not be required to be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted in ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type CATVP cable

(2) Types CATVP, CATVR, CATV and CATVX cables installed in raceways that are installed in compliance with 300.22(B)

Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see sections 4.3.4.1 ~~(air ducts)~~ and 4.3.11.3.3 ~~(apparatus casings plenums)~~ in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C).

(1) Type CATVP cable

(2) Type CATVP cable installed in plenum communications raceway

(3) Type CATVP cable supported by open metallic cable trays or cable tray systems

(4) Types CATVP, CATVR, CATV and CATVX cables installed in raceways that are installed in compliance with 300.22(C)

(5)Types CATVP, CATVR, CATV and CATVX cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see sections 4.3.11.2 ~~(ceiling cavity plenum)~~, 4.3.11.4 ~~(air-handling unit room plenum)~~ and 4.3.11.5 ~~(raised floor plenum)~~ of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(D) Risers- Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types CATVP and CATVR cables

(2) Types CATVP and CATVR cables installed in

(a) plenum communications raceway

(b) riser communications raceway

(c) riser cable routing assembly

Informational Note: See 820.26 for firestop requirements for floor penetrations.

(E) Risers-Cables in Metal Raceways. The following cables shall be

permitted in metal raceways in a riser having firestops at each floor:
(1) Types CATVP, CATVR, CATV and CATVX cables
(2) Types CATVP, CATVR, CATV and CATVX cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
Informational Note: See 820.26 for firestop requirements for floor penetrations.
(F) Risers-Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts with firestops at each floor:
(1) Types CATVP, CATVR, CATV and CATVX cables
(2) Types CATVP, CATVR and CATV cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Informational Note: See 820.26 for firestop requirements for floor penetrations
(G) Risers- One- and Two-Family Dwellings. The following cables shall be permitted one- and two-family dwellings:
(1) Types CATVP, CATVR and CATV cables
(2) Type CATVX cable less than 10 mm (0.375 in.) in diameter
(3) Types CATVP, CATVR and CATV cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Informational Note: See 820.26 for firestop requirements for floor penetrations
(H) Cable Trays. The following cables shall be permitted to be supported by ~~installed in~~ cable trays.
(1) Types CATVP, CATVR, and CATV cables
(2) Types CATVP, CATVR and CATV cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
(I) Distributing Frames and Cross-Connect Arrays. The following cables shall be permitted to be installed in distributing frames and cross-connect arrays.
(1) Types CATVP, CATVR and CATV cables
(2) Types CATVP, CATVR and CATV cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
(J) Other Building Locations. The following cables and cable routing assemblies shall be permitted to be installed in building locations other than the locations covered in 820.113(B) through (I).
1) Types CATVP, CATVR and CATV cables
2) A maximum of 3m (10 ft) of exposed Type CATVX cable in nonconcealed spaces
3) Types CATVP, CATVR and CATV cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
4) Types CATVP, CATVR, CATV and Type CATVX cables installed in a raceway of a type recognized ~~included~~ in Chapter 3
(K~~J~~) One- and Two-Family and Multifamily Dwellings. The following cables and cable routing assemblies shall be permitted to be installed in one- and two-family and multifamily dwellings in locations other than the locations covered in 820.113(B) through (I).
(1) Types CATVP, CATVR and CATV cables
(2) Type CATVX cable less than 10 mm (0.375 in.) in diameter
(3) Types CATVP, CATVR and CATV cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Types CATVP, CATVR, CATV and Type CATVX cables installed in a raceway of a type recognized ~~included~~ in Chapter 3
Panel Statement: The panel added text to recognize solid bottom cable trays with a solid covers.
The panel added text to permit plenum raceways to be supported by open cable trays.
The panel added the word "cables" after each cable type. See panel action on comment 16-235.
The panel changed "included" to "recognized" in reference to Chapter 3.
The panel changed "installed in" cable trays to "supported by" cable trays.
The panel accepts in principle the recommendations to revise the informational notes. The panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text. The panel chooses not to include NFPA 90A "titles" in parenthesis following each section reference.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-234 Log #1924 NEC-P16 **Final Action: Hold**
(820.113)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-267
Recommendation: Revise the text as follows:
820.113(B)(2) Types CATVP, CATVR, CATV, and CATVX installed in metal raceways ~~that are installed~~ in compliance with 300.22(B).
820.113(C)(4) Types CATVP, CATVR, CATV, and CATVX installed in metal raceways ~~that are installed~~ in compliance with 300.22(C).
820.113(E) Risers- Cables in Metal Raceways or ~~Fireproof~~ Fire-Resistance-Rated Shafts. The following cables shall be permitted in metal raceway or in a ~~fireproof~~ fire-resistance-rated shaft with firestops at each floor.
Delete 820.113(E)(2).
820.113(F)(2) Types CATVP, CATAVR, and CATV installed in plenum, riser or general-purpose communications raceway or in a raceway permitted in Chapter 3~~.~~
820.113(G) Cable Trays. The following cables and raceways shall be permitted to be ~~installed~~ supported in cable trays ~~:~~ and shall comply with 300.22 when installed in ducts, plenums, and other environmental air spaces.
(1) Types CATVP and CATVR~~, and CATV~~ in accordance with 820.113(C) and 820.113(D).
Substantiation: In (B)(2), the word "metal" should be added to make this requirement very simple and very clear without having to refer to the entire text of 300.22, just as the Panel clarified in (C)(3) that only *metallic* cable trays are allowed. The informational note in this section refers to NFPA 90A which requires the use of metal raceways in these spaces.
In (C)(4) "metal" was added to clarify that the cables listed must be installed in metal raceways in accordance with the requirements in 300.22(C) and NFPA 90A.
In (E) "Fireproof" was changed to "fire-resistance-rated", which is the appropriate terminology.
Text in 800.113(E)(2) was deleted. This text incorrectly allows the use of CATVP, CATVR, and CATV cables "installed in plenum, riser, or general-purpose communications raceway" in a section that deals with cables in metal raceways or fireproof shafts. The current text in 2008 NEC only allows CATV and CATVX cables to be installed in metal raceway or fireproof shafts in riser applications.
In (F)(2) text was added to include Chapter 3 raceways which can also be used in one and two family risers.
In (G) the word "installed" was changed to "supported" to properly reflect the use of cable tray as a support method. Text was changed in (1) to clarify special requirements for plenum applications. Most of the other sections of 820.113 are *locations* (spaces uses for environmental air, risers, other building locations, etc.) not *products*. The use of cable tray and the type of cables allowed in cable trays are dependent upon where the tray is installed. This gets lost in the current (G), since it appears as if you could use Types CATVP, CATVR, and CATV cables in cable trays wherever the cable tray is installed. 300.22 requires solid bottom metal cable tray and solid metal covers.
Panel Meeting Action: Hold
Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-235 Log #1353 NEC-P16 **Final Action: Accept in Principle in Part**
(820.113(B), FPN and 820.113(C), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-267
Recommendation: (B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ducts and plenums, as described in 300.22(B), if they are directly associated with the air distribution system:
(1) Up to 1.22 m (4 ft) of Type CATVP cables
(2) Types CATVP, CATVR, CATV, and CATVX cables and listed wires and cables installed in raceways that are installed in compliance with 300.22(B)
FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009, *Standard for the Installation of Air- Conditioning and Ventilation Systems*, for information on wires and cables installed in fabricated ducts and plenums used for environmental air ~~wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum~~.
(C) Other Spaces Used For Environmental Air (Plenums). The following wires and cables shall be permitted in other spaces used for environmental air as described in 300.22(C):
(1) Type CATVP cables
(2) Type CATVP cables installed in plenum communications raceways

(3) Type CATVP cables supported by metallic cable trays or cable tray systems

(4) Types CATVP, CATVR, CATV and CATVX cables and listed wires and cables installed in raceways that are installed in compliance with 300.22(C).

FPN: See 4.3.11.2, 4.3.11.4, and 4.3.11.5 of NFPA 90A-2009, *Standard for the Installation of Air- Conditioning and Ventilation Systems*, for information on wires and cables installed in other spaces used for environmental air (plenums) ~~wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions~~ .

Substantiation: This comment is intended to bring consistency to this section. The FPN nomenclature or terminology needs to correspond to the terminology in the charging paragraph.

The term "air duct" is not used in this section or elsewhere in the article. The definitions from NFPA 90A are not necessary since this FPN sends the NEC user directly to the relevant sections for the requirements.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Accept in Principle in Part

Panel Statement: The panel accepts in principle the recommendations to revise the informational notes. As recommended by the submitter, the panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text. See panel action on Comment 16-233.

The panel does not accept the recommendations to include "wires" in the text because there are no wires in Article 820, only coaxial cables.

The panel accepts in principle adding the word "cables" after each cable type. See panel action on Comment 16-233.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-236 Log #1636 NEC-P16 **Final Action: Accept in Principle**
(820.133(A)(1)(a))

TCC Action: In order to correlate with the action on Comment 3-96, the Technical Correlating Committee changes the action on Comment 16-236 from "Accept" to "Accept in Principle" and revises 820.133(A)(1) to read as follows:

"(a) Optical Fiber and Communications Cables. Coaxial cables shall be permitted in the same raceway, cable tray, or enclosure, or cable routing assembly with jacketed cables of any of the following:

(1) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770

(2) Communications circuits in compliance with Parts I and IV of Article 800

(3) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 830.

(b) Other Circuits. Coaxial cables shall be permitted in the same raceway, cable tray, or enclosure with jacketed cables of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760."

Change existing (b) to (c).

Submitter: Craig Sato, Underwriters Laboratories Inc.

Comment on Proposal No: 16-273

Recommendation: Continue to accept Proposal 16-273 in part in principle and make the following editorial revisions:

Delete "or" between "cable tray" and "enclosure".

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate cable routing assemblies into the section. However in its review of this and related proposals, the task group found a minor error. This comment is editorial.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the text in the draft is correct.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

Comment on Affirmative:

DORNA, G.: The Panel 3 & 16 Reconciliation Task Group submitted Comments 3-96, 16-41, 16-143, 16-236 and 16-296, all dealing with the commingling of cables in raceways, cable trays, enclosures and cable routing assemblies. In the ROP, CMP 16 had had taken actions (accept, accept in principle, accept in principle in part) to treat cable routing assemblies in the same manner as raceways, cable trays, and enclosures, while CMP 3 had rejected the coordinating proposals. The Reconciliation Task Group's comments recommended that CMP 16 continue its direction and that CMP 3 recognize cable routing assemblies and provide for their use. CMP 16 accepted the Reconciliation Task Group's comments and CMP 3 rejected them.

The CMP 3 rejection statement on Comment 3-96 included an alert to the TCC:

"In addition it is brought to the attention of the technical correlating committee that CMP 16 has accepted changes that will allow the use of cable routing assemblies for the installation of Class 2 & 3 circuits and power-limited fire alarm circuits."

The text of 820.133(A)(1)(a) as modified by Proposal 16-273 and Comment 16-236 is shown below. The underlining was added for emphasis.

(a) *Other Circuits.* Coaxial cables shall be permitted in the same raceway, cable tray, enclosure, or cable routing assembly with jacketed cables of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760

(3) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770

(4) Communications circuits in compliance with Parts I and IV of Article 800

(5) Low-power network-powered broadband communications circuits in compliance with Parts I and IV of Article 830

The text of 820.133(A)(1)(a) clearly shows that coaxial cables are permitted to be installed in cable routing assemblies along with other cables that are installed in accordance with their own articles. Class 2 and Class 3 cables must be installed compliant with Article 725. Likewise power-limited fire alarm cables must be installed compliant with Article 760.

The CMP 3 statement that "CMP 16 has accepted changes that will allow the use of cable routing assemblies for the installation of Class 2 & 3 circuits and power-limited fire alarm circuits" is not correct.

The Panel 16 actions on Proposal 16-273 and Comment 16-236 permit coaxial cables to be installed in the same routing assembly with Class 2, Class 3 and power-limited fire alarm cables only if the Class 2, Class 3 and power-limited fire alarm cables are installed in compliance with Articles 725 and 760. Obviously, CMP 16 has taken no actions that change the cable installation requirements in Articles 725 and 760.

See also, my affirmative comments on Comments 16-41 and 16-143.

16-237 Log #2683 NEC-P16 **Final Action: Reject**
(820.133(A)(2) Exception No. 3 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 16-274

Recommendation: Accept the proposal.

Substantiation: The first portion of the panel statement regarding the absence of a specific application cited is difficult to understand. The substantiation cited an actual NEC section [334.116(C)] that recognizes such a construction. However, Chapter 8 will trump that allowance unless correlating language is in place. This needs correlation, the wording of Exception No. 2 does not require listing and seems to describe something CMP 3 described in its statement on a companion proposal for 725.136(I)(3) (Proposal 3-195).

Because of the Chapter 8 location, this issue still needs attention, only partially due to formal recognition of this construction in some form in 334.116(C). In addition, CMP 16 (and 3) will have on its ROC agenda, courtesy of CMP 9 and the TCC sending it there, Proposal 9-8 which covers a form of tray cable with this type of separation. This submitter has rigorously defended the system separation rules in print for decades, but the issues don't go away, and technology may have advanced to the point where some form of these cable constructions can be recognized.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide any listing requirements. See 800.179(I) for an example of a listing requirement for a hybrid power and communications cable.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-238 Log #880 NEC-P16 **Final Action: Reject**
(820.133(B))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 16-275

Recommendation: Accept the proposal with the following revisions:

Coaxial cables shall not be attached to the exterior of any raceway, cable, or conductor as a means of support.

Exception No. 1: Overhead aerial spans shall be permitted to be attached to an approved raceway mast. Cables shall be permitted to be supported by a messenger wire that is not a circuit conductor.

Substantiation: The purpose of raceways is already covered in the definition of raceway in Article 100. Raceway masts and messenger wires should be specified as acceptable means of support.

Panel Meeting Action: Reject

Panel Statement: The proposed editorial changes provide no additional clarity.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-239 Log #1640 NEC-P16 **Final Action: Accept in Principle (820.154)**

TCC Action: The Technical Correlating Committee directs the phrase "and plenums" be removed from the application columns in Table 820.154 and the Informational Note that follows Table 820.154.
Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-278
Recommendation: Revise 820.154 to read as follows:
820.154 Applications of Listed CATV Cables. Permitted and non-permitted applications of listed coaxial cables shall be as indicated in Table 820.154(A). The permitted applications are subject to the installation rules of 820.113. The substitutions for coaxial cables listed in Table 820.154(B) and illustrated in Figure 820.154 shall be permitted.

See Table 820.154(A) on Page 636

(E) Cable Substitutions. The uses and substitutions for CATV coaxial cables listed in Table 820.154(B) and illustrated in Figure 820.154 shall be permitted.

FPN: The substitute cables in Table 820.154(B) and Figure 820.154 are only coaxial-type cables.

Renumber Table 820.154(E) to become Table 820.154(B).
Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate installation of cables in cable routing assemblies into the section. However the task group recommends that the listing, applications and installation of the cable routing assemblies be consolidated into Article 770 and not be duplicated in each of panel sixteen's articles. Accordingly the recommended text for this section includes applications of wires and cables in cable routing assemblies and omits the installation of the cable routing assemblies which belong in 770.154.

Table 820.154(A) has been reformatted in 'landscape' and is recommended by the Task Group to be presented this way in the Code to enhance readability and use.

Most of the text in this comment was submitted by Gerald Dorna as an affirmative ballot comments on this proposal. See the ROP.
Panel Meeting Action: Accept in Principle

See TG revised Table 820.154(A) rev 5 on page 636

Panel Statement: "Y" was changed to "Y*" to emphasize to the user that installation rules apply.

Add "In..." to the second column in Table 820.154(A) as a prefix to each phrase.

"Chapter 3 raceway" was changed to "In any raceway recognized in Chapter 3 " for consistency with the installation rules.

See panel action on Comment 16-235.

The panel added eight rows to clarify the issues raised in Comment 16-241 including adding rows dealing with installations in raceways and cable trays. An editorial change was made to clarify that air handling spaces refers to 300.22(B) & (C) spaces.

The box "In Air-Handling Spaces" was divided into the component sections "In Fabricated Ducts and Plenums as Described in 300.22(B)" and "In Other Spaces Used for Environmental Air as Described in 300.22(C)" in order to reduce repetition in the next column.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-240 Log #2128 NEC-P16 **Final Action: Reject (820.154)**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-278
Recommendation: It is understood 16-278 is a companion proposal to 16-267.

Revise the first sentence of 820.154 to read: Permitted and non-permitted applications of listed coaxial cables shall be as indicated in ~~Table 820.154(A)~~ 820.110 and 820.113.
Substantiation: A comment has been submitted to delete Table 820.154(A). 820.154 will need to be revised for correlation if the Table is deleted.
The following is our reason for deleting the Table.

Table 820.154(A) is very confusing and will lead to misapplication. A number of notes are needed if this table moves forward. Many users will simply take the table as fact without reading limiting requirements applicable per 820.10 and 800.13 A simple "yes" or "no" does not always fit and will lead to misinterpretation.

Several cycles ago both CMP 8 and CMP 7 rewrote their articles. At that time both attempted to develop tables such as 820.154A. There was such a hue and cry against this and so many notes needed to explain what is actually permitted both Panels dropped the tables. Most tables in the NEC are there to clarify special conditions, not normal use. Text, as opposed to tables, is much easier to interpret and enforce correctly.

Just in case the Panel rejects this comment and continues with the Table, we have submitted a separate comment for 16-278 containing notes to the table. However, REMOVING THE TABLE IS MUCH MORE USER FRIENDLY AS PAST CODE DEVELOPMENT HAS SHOWN. Thorough reading of 820-110 and 820-113 by users will lead to easier and better enforcement and avoid installers having to remove and redo an installation due to noncompliance.
Panel Meeting Action: Reject
Panel Statement: The recommended action was intended to correlate with the acceptance of Comment 16-242. The panel rejected Comment 16-242.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

16-241 Log #2129 NEC-P16 **Final Action: Accept in Principle in Part (Table 820.154(A))**

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-278
Recommendation: If the Table is not deleted as proposed in a separate comment, revise Table 820.154(A) as follows:

Add Notes to clarify and change some Y(es) and N(o) permitted uses.

For reference purposes the columns of the draft Table have been numbered in numerical sequence from left to right. The cable and/or raceway types are for identification as shown in the far left product column. It is the intent that a parenthetical note number be placed with the identified product Y or N, with the corresponding note(s) at the bottom of the Table.

Column one – **CATVP Cable** – Indicate Note (1) Text: Note (1). CATVP Cable in free air in a 300.22(B) location must be associated with the air distribution system and is limited to 1.22mm (4 ft); the length limitation does not apply where the cable is installed in a raceway complying with 300.22(B).

Columns one and two – **CATVP, CATVR, CATV, and CATVX** -- Indicate Note (2). Change N to Y for CATVR, CATV, CATVX and apply Note (2).

Text: Note 2. In 300.22(B) and (C) locations these cables are permitted in raceways that comply with 300.22(B) and (C).

Column 6 – **CATVX –** Indicate Note (3). Text: Note 3. Limited to 3 m (10 ft) exposed in non-concealed spaces.

Column 6 – **CATVP, CATVR, CATV, and CATVX** -- Indicate Note (4). Text: Note 4. Permitted in. any raceway in Chapter 3, subject to 300.22.

Also change N to Y to agree with 820.113 (I)(4).

Column seven and eight – **CATVX** – Indicate Note (5). Text: Note 5. Limited to less than 10mm (0.375 in) in diameter.

Column Eleven – **CATVP, CATVR, CATV, and CATVX** – Indicate Note (6). Text: Note 6. Subject to requirements of 300.22.

Column Twelve – **CATVR, CATV and CATVX.** Indicate Note (7) Text: Note 7. Although permitted in plenum communications raceways in locations other than plenums and environmental air spaces, this combination of raceway and cable is not permitted in 300.22 locations. Cables must be CMP.

Column Thirteen – **CATV and CATVX** -- Indicate Note (8). Text: Note 8. Although permitted in riser communications raceways in other locations, this combination of raceway and cable is not permitted in riser applications. The cable must be riser cable.

Column Fourteen – **CATVP and CATVR --** Indicate Note (9). Text: Note 9. CATVP or CATVR in General Purpose Communications Raceway does not constitute a plenum or riser complying installation.
Substantiation: The following are the reasons for suggesting these notes:

Note (1) Per **820.113(B)**.

Note (2) Per **820.113(B)**(2) and **820.113(C)**(2).

Note (3) Per **820.113(I)**(2)

Note (4) Per **820.113(I)**(4),

Note (5) Per **820.113**(J)(2)

Note (6) To clarify that although all the cables are permitted in any Chapter 3 raceway 300.22 has specific limits on which raceways can be used in those locations. The uses permitted in 820.113 (A) and (B) are crossover requirements. Unfortunately, there are some who will wonder if column 11 doesn't supersede those sections

Notes (7) and (8) are intended to clarify that when plenum or riser raceways are used that does not translate to a plenum or riser installation unless CMP or Riser cable (as applicable) are used.

Note (9) is intended to clarify that the use of plenum or riser cable in a general purpose communications raceway still is suitable for only a general purpose application.
Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle recommendation 1. See Informational Note No 2 in Table 820.154(A).

The panel accepts in principle recommendation 2. See The row "In metal raceway that complies with 300.22(B)".

Table 820.154(A), Applications of Listed Coaxial Cables

Applications		Cable Type			
		CATVP	CATVR	CATV	CATVX
In Air-Handling Spaces	Fabricated Ducts and plenums as described in 300.22(B)	Y	N	N	N
	Other spaces used for environmental air (plenums) as described in 300.22(C)	Y	N	N	N
In Risers	Vertical runs	Y	Y	N	N
	Metal raceways	Y	Y	Y	Y
	Fireproof shafts	Y	Y	Y	Y
	One-and two- family dwellings	Y	Y	Y	Y
Within Buildings in Other Than Air-Handling Spaces and Risers	General	Y	Y	Y	Y
	One- and two-family dwellings	Y	Y	Y	Y
	Multifamily dwellings	Y	Y	Y	Y
	Nonconcealed spaces	Y	Y	Y	Y
	Cable trays	Y	Y	Y	N
	Distributing frames and cross-connect arrays	Y	Y	Y	N
	Chapter 3 raceway	Y	Y	Y	Y
	Plenum communications raceways	Y	Y	Y	N
	Riser communications raceways	Y	Y	Y	N
	General-purpose communications raceways	Y	Y	Y	N
	Riser cable routing assemblies	Y	Y	Y	N
	General-purpose cable routing assemblies	Y	Y	Y	N

Note: An 'N' in the table indicates that the cable type shall not be permitted to be installed in the application. A 'Y' indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 820.113.

Table 820.154(A)
Applications of Listed Coaxial Cables in Buildings

Applications		**Cable Type**			
		CATVP	CATVR	CATV	CATVX
In Fabricated Ducts and Plenums as Described in 300.22(B)	In fabricated ducts and plenums as described in 300.22(B)	Y*	N	N	N
	In metal raceway that complies with 300.22(B)	Y*	Y*	Y*	Y*

	In any raceway recognized in Chapter 3	Y*	Y*	Y*	Y*
	In plenum communications raceways	Y*	Y*	Y*	N
	In riser communications raceways	Y*	Y*	Y*	N
	In general-purpose communications raceways	Y*	Y*	Y*	N
	In riser cable routing assemblies	Y*	Y*	Y*	N
	In general-purpose cable routing assemblies	Y*	Y*	Y*	N

Note: An 'N' in the table indicates that the cable type shall not be permitted to be installed in the application. A 'Y*' indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 820.113.

Informational Note 1: Part V of Article 820 covers installation methods within buildings. This table covers the applications of listed coaxial cables in buildings. The definition of point of entrance is in 820.2. Coaxial entrance cables that have not emerged from the rigid metal conduit or intermediate metal conduit are not considered to be in the building.

Informational Note No. 2: For information on the restrictions to the installation of communications cables in fabricated ducts and plenums see 820.113(B).

The panel accepts in principle recommendation 3. The information in recommended Note (3) is in 820.113(J).

The panel accepts in principle recommendation 4. See The row "In metal raceway that complies with 300.22(B)" and the row "In metal raceway that complies with 300.22(C)".

The panel accepts in principle recommendation 5. The information in recommended Note (5) is in 820.113(G).

The panel accepts in principle recommendation 6. See The row "In metal raceway that complies with 300.22(B)" and the row "In metal raceway that complies with 300.22(C)".

The panel does not accept recommendation 7. See 820.113(C) which only permits Type CATVP.

The panel accepts in principle recommendation 8. See the rows "In plenum communications raceways" and "In riser communications raceways."

The panel does not accept recommendation 9. See 820.113(C) which only permits Type CATVP.

Panel Statement: See panel action on Comments 16-233 and 16-239.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-242 Log #2130 NEC-P16 **Final Action: Reject**
(Table 820.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-278
Recommendation: Delete Table 820.154(A).
Substantiation: This is a companion comment for revision of 820.154.

See also comment to add notes to Table 820.154(A) if this comment is not accepted.

Panel Meeting Action: Reject
Panel Statement: The submitter has provided no substantiation for the recommended action.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-243 Log #2131 NEC-P16 **Final Action: Hold**
(Table 820.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-278
Recommendation: For the purpose of this comment the columns are referenced numerically from left to right and as shown in the draft.

Revise column headings as follows:

1. Add "Specifically" before "Fabricated"; delete "and plenums"
4. Change "fireproof" to "fire-resistance- rated."

Substantiation: 1. To correlate with the title of 300.22(B) and avoid confusion.

4. The term "fireproof " is being replaced with the correct description "fire-resistance-rated" throughout ASTM fire related standards and other codes. It is a known fact that that "fireproof" is not a legally defensible term. A comment has been submitted to change the term in 820.113(E).

Panel Meeting Action: Hold
Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-244 Log #642 NEC-P16 **Final Action: Accept**
(820.154(B)(1))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-282
Recommendation: Continue to accept this proposal in principle.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to accept this proposal in principle. We agree with Jerry Dorna's ballot comment:

The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".

Section 820.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.

The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.

Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-245 Log #19 NEC-P16 **Final Action: Accept**
(Table 820.179)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-278
Recommendation: Delete the "Reference" column in Table 820.179.
Substantiation: The panel action on proposal 16-278 changed the references to 820.154. Rather than correcting the references, simply delete the "Reference" column because it is not needed. See Tables 725.179 and 760.179(I) which have no "Reference" column.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-246 Log #643 NEC-P16 **Final Action: Accept**
(820.179(A), FPN)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-283
Recommendation: Continue to reject this proposal.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to reject this proposal and recommends that the panel continue to reject it.

A fine print note giving information on fire testing of plenum cable has been in the NEC since the 1984 edition. It has undergone only minor editorial changes since 1984. It provides extremely useful to cable manufacturers. The proposed change would remove essential information.

Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-247 Log #1007 NEC-P16 **Final Action: Reject**
(820.179(A), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 16-283
Recommendation: The Proposal should be Accepted in Principle, revised and the following words "and Annex A Explanatory Material" added after "NFPA 262-2007" so the revised text reads as follows:

~~FPN~~ Informational Note: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is ~~that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with~~ described in NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, and Annex A Explanatory Material.

Substantiation: The FPN refers to a test method and defines the maximum values, which are not specified in the body of NFPA 262. Inclusion of the maximum values in the FPN are requirements and this violates 3.1.3 of the NEC Style Manual.

NFPA 262 defines the Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces but it does not specify any pass/fail criteria.

While the values specified for maximum peak optical density, maximum average optical density, and maximum allowable flame travel distance in the FPN are not included in the body of NFPA 262, they are contained in Annex A Explanatory Material. Addition of the words "and Annex A Explanatory Material" will reference the maximum values that are in the FPN and the proposed revised FPN will comply with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject
Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on one method of defining a low-smoke producing and fire-resistant cable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-248 Log #1354 NEC-P16 **Final Action: Reject**
(820.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-283
Recommendation: 820.179 Coaxial Cables.

Cables shall be listed in accordance with 820.179(A) through (D) and marked

in accordance with Table 820.179. The cable voltage rating shall not be marked on the cable.

FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

(A) Type CATVP. Type CATVP community antenna television plenum coaxial cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.

Substantiation: Retain the FPN as in the current NEC, but only if the FPNs from CMP 3 are not changed to the same language. This comment is being written just in case CMP 3 is willing to change to existing NEC language.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Reject

Panel Statement: The panel upholds its position to not change the FPN.

The panel agrees with the submitter's statement that "the FPN is worded correctly".

See panel action and statement on Comment 16-61.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-249 Log #1355 NEC-P16 **Final Action: Reject**
(820.179(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Comment on Proposal No: 16-283

Recommendation: 820.179 Coaxial Cables.

Cables shall be listed in accordance with 820.179(A) through (D) and marked in accordance with Table 820.179. The cable voltage rating shall not be marked on the cable.

FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

(A) Type CATVP. Type CATVP community antenna television plenum coaxial cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.

~~FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.~~

Substantiation: This comment is intended to bring consistency to the NEC. In Articles 770, 800, 820 and 830, the FPN is worded correctly but different from what CMP 3 recommended. The original proposal I made to CMP 3 and CMP 16 was already made in the 2005 and 2008 NEC cycles, but was caught up in the "plenum cable moratorium" in the opinion of CMP 3 but not of CMP 16. The present wording also follows the requirements of the preceding section, which requires that the cable be listed as having both "adequate fire-resistant and low smoke-producing characteristics". The wording of CMP 3 (although adequate also) does not explain what is needed to define a cable that is a "low smoke-producing and fire-resistant cable" by omitting the words "a cable that is". However, if CMP 16 makes this change consistency is achieved in the NEC.

With regard to the comment by Mr. Ayers to the proposals in CMP 3, I agree with him, but the (incorrect) use of the term "fire-resistant cable" is consistent in not just the FPNs in all 6 relevant articles (725, 760, 770, 800, 820 and 830) but is also consistent with the use in the charging paragraph.

If CMP 3 and CMP 16 would both like to eliminate the term "fire-resistant cable", consistently in all locations, and replace it by a term such as "low flame spread cable", that would be an excellent idea, but it does require consistency (and probably a task group of both panels). In the meantime the use of the term "fire-resistant cable" is necessary to correlate with the charging paragraph.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Reject

Panel Statement: The panel upholds its position to not change the FPN.

The panel agrees with the submitter's statement that "the FPN is worded correctly".

See panel action and statement on Comment 16-61.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-250 Log #1008 NEC-P16 **Final Action: Reject**
(820.179(B), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-285

Recommendation: The Proposal should be Accepted in Principle and revised as follows:

~~FPN~~ Informational Note: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is described in ~~that the cables pass the requirements of~~ ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.*

Substantiation: The existing phrase "…that the cables pass the requirements…" specifies a requirement which violates 3.1.3 of the NEC Style Manual. The revised text will still provide the user with a reference that directs them to the appropriate standard that contains the test requirements and the pass/fail criteria and the revised FPN complies with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on one method of defining fire-resistant characteristics capable of carrying fire floor to floor.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-251 Log #1009 NEC-P16 **Final Action: Reject**
(820.179(C), FPN)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-288

Recommendation: The Proposal should be Accepted in Principle in Part and the text revised as follows:

~~FPN~~ Informational Note: One method of defining resistant to the spread of fire is ~~that the cables do not spread fire to the top of the tray~~ described in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing~~ described in the CSA "Vertical Flame Test — Cables in Cable Trays," ~~as described~~ in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

Substantiation: Acceptance of the revised wording shown above will still provide the user with the references to two methods of defining "resistant to the spread of fire" and also comply with the NEC Style Manual that FPN's not contain requirements. The pass/fail criteria are already defined in those two standards.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on two methods of defining resistant to the spread of fire.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

16-257 Log #614 NEC-P16 **Final Action: Accept in Principle**
(830)

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 16-293
Recommendation: Replace the term "~~grounding conductor~~", with the term "grounding electrode conductor", throughout this article.
Substantiation: The term "grounding electrode conductor", is a specific term and thus it is easier for most people in the industry to understand the purpose. The generic term "grounding conductor" is so general that most people can misunderstand the application. It cannot be held to be in the best interest of safety for a general misunderstanding of terms to be an allowable mode in the NEC process.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-282.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-258 Log #1271 NEC-P16 **Final Action: Accept in Principle (830)**

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 16-293
Recommendation: I highly encourage CMP-16 to accept this proposal in principle and accept the coordinated set of comments that provide the completed revisions throughout Article 830.
Substantiation: This comment responds to action by CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 830. The coordinated comments actually even correct misuse of grounding terms in a few locations that existed for a few cycles.

CMP-5 has responsibilities for defined grounding and bonding terms (Code wide). This comment respects the independence of CMP-16 regarding Chapter 8 based on 90.3: this work is not an effort to remove that independence. These proposed revisions are technically correct and result in grounding and bonding terms being used consistently with how they are defined. The term "grounding conductor" is too broad and has been part of a planned migration for removal since the 2005 edition. This planned revision is part of a larger plan implemented by the NEC-2008 TCC assigned grounding and bonding task group work. The grounding and bonding concepts are simple. If grounding happens, a connection is made to an electrode by use of a grounding electrode conductor. Bonding connected conductive parts to establish continuity and conductivity between them. The proposed revisions do not change anything technically in the article: they only make the use of grounding terms consistent with how they are defined, improving the current text. The only change proposed is in use of terms. All other rules such as sizing, installation and so forth remain as specified in this article, as before.

Not accepting the proposed revisions shows a deliberate action to allow continued inconsistency and subjectivity to remain in the NEC. CMP-5 actions have deleted the term "grounding conductor" from Article 100 and revised the term "grounding electrode conductor" to work consistently with the limited energy articles in Chapter 8. The term "grounding conductor" has been removed or replaced in Article 250 and other articles of the NEC. Not accepting the proposed revisions in the coordinated comments will result in the continued use of an orphaned term that is not specific and can lead to subjectivity. The proposed changes are technically correct and there have been no technical reasons brought forward to reject what is being proposed. I highly encourage CMP-16 to give strong consideration to the coordinated comments submitted that resolve these inconsistencies and improve clarity and usability within the limited energy articles with regards to grounding and bonding rules. The best approach in Code development work is to look at the long range objectives and what would be best for the NEC. It needs to be practical, understandable, and enforceable. These proposed revisions are in the spirit of accomplishing all three of these objectives. It's not about who is right or wrong, it is about being successful and ending up with the best Code as a result.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel disagrees with the submitter. The panel has reviewed the proposed grounding terminology changes and has accepted the changes with editorial revisions in an effort to ensure consistent terminology throughout the Code.

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 16-293
Recommendation: Revise the proposal as follows: Replace the term "grounding conductor" with "bonding conductor" or "grounding electrode conductor" throughout the article as appropriate.
Substantiation: The present term "grounding conductor" is proposed to be deleted by CMP5. The present term is not correct in most applications. I was part of a CMP-5 and CMP-16 Task Group that could not come to a consensus. The members of CMP-5 went through all the sections in Articles 770, 800, 810, 830 and the proposed new Article 840. The proposed changes are being presented by Phil Simmons and I urge the code panel to either agree with the submitter or make additional changes as needed to remove the term "grounding conductor from these articles.
Panel Meeting Action: Accept in Principle

16-263 Log #464 NEC-P16 **Final Action: Reject**
(830.2)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 16-294
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:

Exposed (to Accidental Contact). A circuit that is in such a position that, in case of failure of supports or insulation, contact with another circuit ~~may~~ results.

Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term may in this Section does not meet these criteria, it should be changed.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed text indicates that in the event of a failure of supports or insulation, contact with an electrical circuit **will** result. Such contact is a possibility but not a certainty.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-264 Log #785 NEC-P16 **Final Action: Reject**
(830.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 16-294
Recommendation: Revise text to read as follows:

Exposed (to accidental contact). A conductor in such a position that in case of failure of supports or insulation, is likely to contact another conductor.

Substantiation: Failure can cause contact or with other conductors which are not a "circuit" such as a grounding conductor. "Likely" is a term used 80+ times in the NEC. Per 3.1.2 of the NEC Style Manual, "may" shall only be used as a discretionary judgement by the Authority Having Jurisdiction.
Panel Meeting Action: Reject
Panel Statement: The term "may" as used in the present text connotes "a possibility"; the term "likely" connotes "is probable". The panel does not agree that these are probable events. Of concern is contact with other electric circuits that could energize the communications circuit resulting in an electrical safety hazard. Contact with "other conductors" such as "grounding conductors" would not result in an electrical safety hazard.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-265 Log #2437 NEC-P16 **Final Action: Accept in Principle**
(830.2.Point of Entrance)

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) connected by a grounding electrode conductor to an electrode in accordance with 830.100(B).
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.
Panel Meeting Action: Accept in Principle

Ballot Not Returned: 1 Esemplare, R.

16-271 Log #1400 NEC-P16 **Final Action: Reject**
(830.26)

Submitter: Russell LeBlanc, The Peterson School
Comment on Proposal No: 16-306
Recommendation: The proposal should be accepted in principal but modified as follows:

If a conduit or raceway of metric designator 53 (trade size 2 inch) or larger, penetrates a fire-resistance-rated wall, partition, floor, or ceiling, and that same conduit or raceway also enters an enclosure of the ventilated type, that conduit or raceway shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway or conduit into other areas of the building or structure.

Substantiation: I have modified the wording for clarity and so the application is more focused, and less of a "sweeping" change.

In my original proposal I provided a first hand eyewitness account of what happened.

This was NOT a second hand or third hand story. I saw it happen with my own eyes! I am not a novice. I have been in the trade for over 25 years. I have also been teaching electrician classes for over 10 years. I am OSHA certified. I am an instructor approved by the Mass. Dept. of Education, and The Board of Examiners of Electricians. I have authored several other code changes. I am a member of NFPA. No, I am not a Fire chief or fire science engineer, or some other Fire Dept. Official. But I know what I saw, and it just did NOT seem right to me. I am very concerned. The smoke simply should NOT have been able to spread through the building via the raceways. What more technical substantiation is needed than that?

Lets break it down to simple science and logic.

If I build a fire in a fireplace, the smoke will go up the chimney flue, if the flue damper is OPEN.

If I build a fire in a fireplace, the smoke will NOT go up the chimney flue, if the flue damper is CLOSED!

Try it!

Apply logic here.

If I am wrong then maybe we don't need to seal the raceway ends. But this "chimney effect" of the unsealed pipes has already happened once. I have seen it. If it happens again, the occupants may not be as lucky as the first time I saw this phenomenon happen.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The recommended text is vague, unenforceable and lacks specificity. Insufficient data has been provided to justify such a change. Selection of conduit size requiring fire stopping is arbitrary. This may be more of a building Code issue rather than an electrical Code issue.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:
IVANS, R.: The submitter identifies a concern associated with conduit providing a bypass of firebreaks between floors that should not be ignored. Although there may be issues associated with the general nature of the original proposal or the seemingly arbitrary selection of 2" conduit, the solutions are not technically insurmountable. I am aware of installations where such sealing of conduit was required by local building codes and effectively implemented This item should have been put on hold for further study rather than rejected.

16-272 Log #2783 NEC-P16 **Final Action: Accept**
(830.44(C) Exception)

Ballot Not Returned: 1 Esemplare, R.

16-276 Log #406 NEC-P16 **Final Action: Reject**
(830.90(A), FPN No. 2(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 16-317
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position on Proposal 16-317.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 13 Negative: 2
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:
BRUNSSEN, J.: The Panel acted to accept similar comment 16-118. The Panel Meeting Action should have been consistent to accept this comment as well.
GUBISCH, R.: I am voting negative so that this action will be consistent with the panel action taken on Comment 16-118.

16-277 Log #1896 NEC-P16 **Final Action: Accept**
(830.90(B)(3), FPN)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
Informational Note: Selecting a network interface unit and primary protector location to achieve the shortest practicable primary protector bonding conductor or grounding electrode conductor helps limit potential differences between communications circuits and other metallic systems.
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 830.
These comments address the changes suggested in Proposal 16-293 in each section within Article 830 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.
Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

16-278 Log #1905 NEC-P16 **Final Action: Accept**
(830.93)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-293
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
Informational Note: Selecting a network interface unit and primary protector location to achieve the shortest practicable primary protector bonding conductor or grounding electrode conductor helps limit potential differences between communications circuits and other metallic systems.
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 830.
These comments address the changes suggested in Proposal 16-293 in each section within Article 830 where the term "grounding conductor" is used. 16-279 Log #2439 NEC-P16 **Final Action: Accept**
(830.93)

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
830.93 Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables. Network-powered communications cables entering buildings or attaching to buildings shall comply with 830.93(A) or (B). For purposes of this section, grounding located at mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.
Informational Note: Selecting a grounding location to achieve the shortest practicable bonding conductor or grounding electrode conductor helps limit

potential differences between the network-powered broadband communications circuits and other metallic systems.

Sections 830.93(A) and (B) are not affected by this Comment.

Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.

Ballot Not Returned: 1 Esemplare, R.

16-282 Log #1907 NEC-P16 **Final Action: Accept in Principle**
(830.100(A) and (B))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:

830.100 Cable, Network Interface Unit, and Primary Protector Grounding. Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 830.100(A) through (D).

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.

(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG and shall have a current-carrying capacity not less than that of the grounded metallic member(s) and protected conductor(s) of the

network-powered broadband communications cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.
(4) Length. The bonding conductor and grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the bonding conductor and grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar grounding bonding conductor and electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.
Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 830.100(B)(3)(2) shall be driven, and the grounding electrode conductor shall be connected to the communications ground rod in accordance with 830.100(C). The communications ground rod shall be bonded to the power grounding electrode system in accordance with 830.100(D).
(5) Run in Straight Line. The bonding conductor and grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.
(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.
(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 830.100(B)(1), (B)(2), or (B)(3).
(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.
Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.
(2) In Existing Buildings or Structures without an Intersystem Bonding Termination ~~Grounding Means~~.
If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:
(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94 Exception
(4) The nonflexible metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure, or
(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is connected to an electrode as covered in 250.32
A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.
For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 830.93, shall be considered accessible.
(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Electrode(s) ~~Means~~. If the existing building or structure served has no intersystem bonding termination or grounding electrode(s) ~~means, as described in 830.100(B)(2),~~ the grounding electrode conductor shall be connected to either of the following:
(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)
(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 830.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7) and (A)(8), or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as grounding electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 830.

These comments address the changes suggested in Proposal 16-293 in each section within Article 830 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept. This includes adding "existing" to 830.100(B)(2) and (3). The provisions in these sections should properly apply to only existing installations to correlate with the rules in 250.94.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
830.100 Cable, Network Interface Unit, and Primary Protector Bonding and Grounding. Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be bonded or grounded shall be connected ~~grounded~~ as specified in 830.100(A) through (D).
(A) Bonding Conductor or Grounding Electrode Conductor.
(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.
(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.
(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG and shall have a current-carrying capacity not less than that of the grounded metallic member(s) and protected conductor(s) of the network-powered broadband communications cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.
(4) Length. The bonding conductor and grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the bonding conductor and grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar ~~grounding~~ bonding conductor or ~~and~~ grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.
Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 830.100(B)(3)(2) shall be driven, and the grounding electrode conductor shall be connected to the communications ground rod in accordance with 830.100(C). The communications ground rod shall be bonded to the power grounding electrode system in accordance with 830.100(D).
(5) Run in Straight Line. The bonding conductor or ~~and~~ grounding electrode conductor shall be run ~~to the grounding electrode~~ in as straight a line as practicable.
(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.
(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 830.100(B)(1), (B)(2), or (B)(3).
(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.
(2) In ~~Existing~~ Buildings or Structures ~~without an Intersystem Bonding Termination~~ Grounding Means.
If the ~~existing~~ building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:
(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from

its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94 Exception
(4) The nonflexible metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure of the power service, or
(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is connected to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 830.93, shall be considered accessible.

(3) In ~~Existing~~ Buildings or Structures Without an Intersystem Bonding Termination or Grounding ~~Electrode(s)~~ Means. If the ~~existing~~ building or structure served has no intersystem bonding termination or grounding electrode(s) means, as described in 830.100(B)(2), the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 830.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7) and (A)(8), or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as grounding electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.

Panel Statement: The panel agrees with the submitter's intent and edits the text for editorial clarification.

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

BRUNSSEN, J.: Revise 830.100(A)(4) to read as follows: "(4) Length. The bonding conductor or grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the bonding conductor or grounding electrode conductor …". Replace "and" with "or" for consistency with other items in this section and similar sections in Chapter 8. Revise 830.100(A)(6) as follows: "The Bonding conductor or grounding electrode conductor shall be …". Replace "and" with "or" for consistency; "conductors" should be singular. 830.100(B)(3) should read as follows: "If the building or structure served has no intersystem bonding termination, or grounding means as described in 830.100(B)(2), …". The word "electrode(s)" is a typo; the comma needs to be placed after "termination" and not after "means" to distinguish between buildings with an intersystem bonding termination as described in (B)(1) and buildings with grounding means as described in (B)(2). These changes will provide consistency throughout Article 770 and Chapter 8.

OHDE, H.: See our affirmative comment for Comment 16-22.

16-283 Log #2440 NEC-P16 **Final Action: Accept in Principle**
(830.100(A) and (B))

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:

830.100 Cable, Network Interface Unit, and Primary Protector Grounding. Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 830.100(A) through (D).

(A) Bonding Conductor or Grounding Electrode Conductor.

(1) Insulation. The bonding conductor or grounding electrode conductor shall be listed and shall be permitted to be insulated, covered, or bare.
(2) Material. The bonding conductor or grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.
(3) Size. The bonding conductor or grounding electrode conductor shall not be smaller than 14 AWG and shall have a current-carrying capacity not less than that of the grounded metallic member(s) and protected conductor(s) of the network-powered broadband communications cable. The bonding conductor or grounding electrode conductor shall not be required to exceed 6 AWG.
(4) Length. The bonding conductor and grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the bonding conductor and grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

Informational Note: Similar grounding bonding conductor and electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum bonding conductor or grounding electrode conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 830.100(B)(3)(2) shall be driven, and the grounding electrode conductor shall be connected to the communications ground rod in accordance with 830.100(C). The communications ground rod shall be bonded to the power grounding electrode system in accordance with 830.100(D).

(5) Run in Straight Line. The bonding conductor and grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.
(6) Physical Protection. ~~The~~ Bonding conductors and grounding electrode conductors shall be protected where exposed to physical damage. Where the bonding conductor or grounding electrode conductor is installed ~~run~~ in a metal raceway, both ends of the raceway shall be bonded to the ~~grounding~~ contained conductor or to the same terminal or electrode to which the bonding conductor or grounding electrode conductor is connected.

(B) Electrode. The bonding conductor or grounding electrode conductor shall be connected in accordance with 830.100(B)(1), (B)(2), or (B)(3).

(1) In Buildings or Structures with an Intersystem Bonding Termination. If the building or structure served has an intersystem bonding termination as required by 250.94, the bonding ~~grounding~~ conductor shall be connected to the intersystem bonding termination.

Informational Note: See Article 100 for the definition of *Intersystem Bonding Termination*.

(2) In Existing Buildings or Structures without an Intersystem Bonding Termination ~~Grounding Means~~.
If the existing building or structure served has no intersystem bonding termination, the bonding conductor or grounding electrode conductor shall be connected to the nearest accessible location on one of the following:

(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94 Exception
(4) The nonflexible metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure, or
(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is connected to an electrode as covered in 250.32

A bonding device intended to provide a termination point for the grounding electrode conductor (intersystem bonding) shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 830.93, shall be considered accessible.

(3) In Existing Buildings or Structures Without an Intersystem Bonding Termination or Grounding Electrode(s) ~~Means~~. If the existing building or structure served has no intersystem bonding termination or grounding electrode(s) ~~means, as described in 830.100(B)(2),~~ the grounding electrode conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 830.100(B)(2) or (B)(3)(1), to any one of the individual electrodes described in 250.52(A)(7) and (A)(8), or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as grounding electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.

Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.

Comment on Proposal No: 16-323
Recommendation: Accept Proposal 16-323.
Substantiation: Whether or not 830.100(B)(1) through (3) presents a logical sequence for selecting the appropriate telecommunications grounding electrode, in order of preference, was not addressed by Proposal 16-323 and certainly not the purpose of the proposal.

The issue is in specifying a technically sound grounding electrode for electrical systems, such as network-powered broadband communications systems, that will assure such systems are connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. This is the purpose of a grounding electrode regardless of the system. The acceptance of both Proposal 16-323 and Proposal 16-327 would assure that appropriate electrodes would be utilized when the "primary protector" (grounding electrode conductor as defined in Article 100) grounding length exceeds 20 feet and where the building or structure served has no natural grounding electrodes.

The electrodes identified in 250.52(A)(4) through (A)(8) are intended as minimum required electrodes that are capable of limiting the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. Note that the key word for electrodes specified by 250.52 is "minimum." Any current limitations concerning network-powered broadband communications systems have little to do with the adequacy of a grounding electrode and especially one with high resistance tendencies such as a 5 ft long ground rod. The claim by the committee that 5 ft long rods have "been used successfully and safely by the telecom industry for decades" is misrepresented as it is widely acknowledged that damage during thunderstorms often occurs to sensitive electronics that are connected to telecom wiring where grounding is often inadequate as lighting surges (direct or indirect) enter facilities on telecom lines. The National Electrical Code is not about telecom the utility but is rather about protecting users from the consequences of lightning, line surges, or unintentional contact with higher-voltage lines. There is no justification in specifying inadequate grounding electrodes that have no independent record of performance and that are obviously technically inferior to those require by 250-52(A)(4) through (A)(8).

Utilizing a 5 ft long ground rod by a particular segment of industry, where that industry may be responsible for that electrode, does not provide technical substantiation as to the worth of that electrode. The "statement "very little resistance change will result from using larger sizes of electrodes" is misapplied in this context. One authoritative reference, the *Soares Book on Grounding* states that the diameter of a ground rod does not materially reduce the resistance of a ground rod but that rather that a ground rod's resistance is substantially reduced by extending the length of a ground rod into earth. By actual calculation this could be as much as a 40%+ reduction in resistance by doubling a 5 ft long ground rod's length to 10 ft. It is assumed that the reference to 16-151 in the panel statement was to the tutorial, *The ABCs of Grounding and Bonding* that states, "Very little resistance change will result from using larger sizes of electrodes." This reference, when taken in context, agrees with Soares on the ineffectiveness of increasing the diameter of a ground rod, but the committee is negligent in not mentioning the effectiveness of increasing the length of a ground rod which is agreed upon in both *Soares Book on Grounding* and *The ABCs of Grounding and Bonding*. Power utilities also realize the advantage of deeper, thus longer, electrodes when grounding distribution systems such as substations where sectional ground rods are commonly installed from 20 to 60 ft deep. In addition, it is unfathomable that the committee would indicate that requiring a minimum standard electrode would be too expensive when compared to the damage and expense a lightning strike could cause to a structure where inadequate grounding is installed and especially where any additional cost is negligible. It is also interesting to note that 820.100(B)(3)(2), as well as the inference in 810.21(F)(3), requires that a rod or pipe electrode shall meet the requirements of 250.52(A)(5) while 830.100(B)(3)(2) allows a ½ inch by 5 ft rod or pipe electrode. This seems to be inconsistent concerning the various requirements between similar articles. Therefore, it is difficult to understand the resistance of the Panel 16 members in not accepting Proposals 16-323 and 16-327 that would provide an acceptable minimum standard for grounding telecommunications systems that would help limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation.

There is no argument that bonding together the communications grounding electrode and power grounding electrode system is an important safety aspect. However that also is not the issue addressed by Proposals 16-323 and 16-327. The issue remains to be that ½ in. diameter by 5 ft long ground rods are not an adequate electrode for grounding telecommunication systems and that the electrodes utilized for telecommunication systems installed as a part of the premise wiring system should meet the same minimum requirements as those in Article 250 as they serve the same purpose. The technical substantiation for this change was in Proposal 16-323 and 16-327 and is expanded in this Comment. Code-Making Panel 5 has the expertise on this subject and the users of the NEC as well as the public deserve a reliable minimum standard for grounding their telecommunications systems.
Panel Meeting Action: Reject
Panel Statement: The submitter has neither provided technical justification nor cited a safety issue to justify the elimination of the 5-foot communications ground rod. See panel action and statement on Comment 16-28.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:
BOYER, J.: Proposal 16-323 should be reconsidered and accepted as proposed. It is technically sound, reasonable and will aid in reducing losses from lightning, line surges and unintentional contact with higher-voltage lines. Furthermore, it would help stabilize the voltage to earth during normal operation.

16-288 Log #319 NEC-P16 **Final Action: Accept**
(830.100(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 16-324
Recommendation: The Technical Correlating Committee directs the panel to reconsider the action on this proposal as the existing numbering complies with the NEC Style Manual and is consistent with other lists in the code.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to to review the proposal to comply with the NEC Style Manual.
See action on Comment 16-26.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-289 Log #1256 NEC-P16 **Final Action: Reject**
(830.100(B)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 16-327
Recommendation: Accept Proposal 16-327.
Substantiation: The issue addressed by this Proposal is in specifying a technically sound grounding electrode for electrical systems, such as telecommunications systems, that will assure such systems are connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. This is the purpose of a grounding electrode regardless of the system. The acceptance of both Proposal 16-327 and Proposal 16-323 would assure that appropriate electrodes would be utilized when the "primary protector" (grounding electrode conductor as defined in Article 100) grounding length exceeds 20 feet and where the building or structure served has no natural grounding electrodes.

The electrodes identified in 250.52(A)(4) through (A)(8) are intended as minimum required electrodes that are capable of limiting the voltage imposed on electric and electronic equipment by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. The committee has seemingly sought to minimize the effects of such imposed faults by stating such faults or events such as lighting deal only in limited currents which is not necessarily true. In addition, limited currents have little to do with the adequacy of a grounding electrode and especially one with high resistance tendencies such as a 5 ft long ground rod. The claim by the committee that 5 ft long rods have "been used successfully and safely by the telecom industry for decades" is misrepresented as it is widely acknowledged that damage during thunderstorms often occurs to sensitive electronics that are connected to telecom wiring where grounding is often inadequate as lighting surges (direct or indirect) enter facilities on telecom lines. The National Electrical Code is not about telecom the utility but is rather about protecting users from the consequences of lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. There is no justification in specifying inadequate grounding electrodes that have no independent record of performance and that are obviously technically inferior to those required by 250-52(A)(4) through (A)(8).

Utilizing a 5 ft long ground rod by a particular segment of industry, where that industry may be responsible for that electrode, does not provide technical substantiation as to the worth of that electrode. The "statement "very little resistance change will result from using larger sizes of electrodes" from *The ABCs of Grounding and Bonding* is misapplied in this context. One authoritative reference, the *Soares Book on Grounding* states that the diameter of a ground rod does not materially reduce the resistance of a ground rod but rather that a ground rod's resistance is substantially reduced by extending the length of a ground rod into earth. By actual calculation this could be as much as a 40%+ reduction in resistance by doubling a 5 ft long ground rod's length to 10 ft. Therefore, the reference from *The ABCs of Grounding and Bonding*, when taken in context, agrees with Soares on the ineffectiveness of increasing the diameter of a ground rod, but the panel is negligent in not mentioning the effectiveness of increasing the length of a ground rod in the panel statement. Power utilities also realize the advantage of deeper, thus longer, electrodes when grounding distribution systems such as substations where sectional ground rods are commonly installed from 20 to 60 ft deep. In addition, it is unfathomable that the committee would indicate that requiring a minimum standard electrode would be too expensive when compared to the damage and expense a lightning strike could cause to a structure where inadequate grounding is installed and especially where any additional installation cost is negligible. It is also interesting to note that 820.100(B)(3)(2), as well as the inference in 810.21(F)(3), specifies that a rod or pipe electrode shall meet the requirements of 250.52(A)(5) while other NEC Chapter 8 Articles as well as 830.100(B)(3)(2) allows the inadequate ½ inch by 5 ft long rod or pipe while all other grounding parameters remain essentially the same. This seems to be inconsistent concerning the various requirements between similar articles. Therefore, it is difficult to understand the resistance of the Panel 16 members in not accepting Proposal 16-327 that would provide an acceptable minimum standard for grounding telecommunications systems that would help limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation..

There is no argument that bonding together the communications grounding electrode and power grounding electrode system is an important safety aspect. However that also is not the issue addressed by Proposal 16-327. The issue remains to be that ½ in. diameter by 5 ft long ground rods are not an adequate electrode for grounding network-powered broadband communication systems and that the electrodes utilized for systems installed as a part of the premise wiring system should meet the same minimum requirements as those in Article 250 as they serve the same purpose. The technical substantiation for this change was in Proposal 16-327 and is expanded in this Comment. Code-Making Panel 5 has the expertise on this subject and the users of the NEC as well as the public deserve a reliable minimum standard for grounding any and all telecommunications systems.

In addressing the last part of the panel statement, section 830.100(B)(3) addresses "In Buildings or Structures Without Intersystem Bonding Termination or Grounding Means", and 830.100(B)(2) addresses "In Buildings or Structures with Grounding Means." What possibly could the panel mean when it states "must be taken in context?" 830.100(B)(3) addresses buildings and structures without electrodes, thus there are no grounding electrode means at the building or structure to be identified. Paragraph 830.100(B)(3)(1) states "To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)", but these are not in existence according to the title of 830.100(B)(3). Therefore, the only choice left is 830.100(B)(3)(2) and that states the electrode shall be a plate electrode (A)(7), a local metal underground system or structure (A)(8), or "a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter, driven, where practicable, into permanently damp earth." Not allowed is a ground ring (A)(4) and a listed electrode which is an excellent grounding electrode. A 12.7 mm pipe is approximately a 3/8-inch trade size which is half the required diameter of a pipe electrode of 3/4-inch required by 250.52(A)(5) for a pipe electrode which is considered to be the minimum size for durability that goes back to the 1925 NEC edition. As to a 5 ft rod or pipe being driven into permanently damp earth – where in the US could this be consistently accomplished? The problems in this section alone justify the acceptance of Proposal 16-327.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its position as stated in the panel statement for the submitter's original proposal. The submitter has neither provided technical justification nor cited a safety issue to justify the elimination of the 5-foot communications ground rod that has been used successfully and safely by the communications industry for decades. It is unreasonable and unnecessary to require installation of such power-oriented grounding means as proposed by the submitter solely for communications applications where power fault and lightning currents are limited by the relatively fine gauge of communications conductors and cable shields.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:
BOYER, J.: Proposal 327 should be reconsidered and accepted as proposed. It is technically sound, reasonable and will aid in reducing losses from lightning, line surges and unintentional contact with higher-voltage lines. Furthermore, it would help stabilize the voltage to earth during normal operation.

16-290 Log #1908 NEC-P16 **Final Action: Accept in Principle**
(830.106(A))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
830.106 Grounding and Bonding at Mobile Homes.
(A) Grounding. Grounding shall comply with 830.106(A)(1) or (A)(2).
(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector

ground shall be installed connected to a grounding electrode ~~conductor~~ in accordance with 830.100(B)(3).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9.0 m (30 ft) of, the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed connected to a grounding electrode ~~conductor~~ in accordance with 830.100(B)(3).

Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 830.

These comments address the changes suggested in Proposal 16-293 in each section within Article 830 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

830.106 Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with 830.106(A)(1) or (A)(2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed connected to a grounding electrode conductor or grounding electrode ~~conductor~~ in accordance with 830.100(B)(3).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9.0 m (30 ft) of, the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed connected to a grounding electrode ~~conductor~~ in accordance with 830.100(B)(3).

Panel Statement: The panel accepts the submitter's text and adds "grounding electrode conductor or" to allow the option to connect to the grounding electrode or grounding electrode conductor. This retains the original intent of 830.106(A)(1).

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

Comment on Affirmative:

BRUNSSEN, J.: Revise 830.106(A)(1) to read as follows: "(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be connected to a grounding electrode in accordance with 820.100(B)(3)." It is unlikely that a grounding electrode conductor will be available if there is no mobile home service equipment, a grounding electrode conductor is not mentioned in any of the sections referenced in 830.100(B)(3), and the revision is consistent with the proposed text of 830.106(A)(2).

OHDE, H.: See our affirmative comment for Comment 16-22.

16-291 Log #2441 NEC-P16 **Final Action: Accept in Principle**
(830.106(A))

Submitter: Keith Lofland, IAEI

Comment on Proposal No: 16-293

Recommendation: Revise text to read as follows:

830.106 Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with 830.106(A)(1) or (A)(2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed connected to a grounding electrode ~~conductor~~ in accordance with 830.100(B)(3).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9.0 m (30 ft) of, the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed connected to a grounding electrode ~~conductor~~ in accordance with 830.100(B)(3).

Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.

Panel Meeting Action: Accept in Principle

TCC Action: The Technical Correlating Committee directs the phrase "and plenums" be removed from the title, text, and Informational Note in 830.113(B).

Submitter: Craig Sato, Underwriters Laboratories Inc.

Comment on Proposal No: 16-331

Recommendation: Accept Proposal 16-331 in principle by revising 830.113 as follows:

830.113 Installation of Network-Powered Broadband Communications Cables. Installation of network-powered broadband communications cables shall comply with 830.113(A) through (H).

(A) Listing. Network-powered broadband communications cables installed in buildings shall be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted to be installed in air ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system.

(1) Up to 1.22 m (4 ft) of Type BLP

(2) Types BLP, BMR, BLR, BM, BL and BLX installed in raceways that are installed in compliance with 300.22(B)

Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see Sections 4.3.4.1 (air ducts) and 4.3.11.3.3 (apparatus casings plenums) in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C).

(1) Type BLP

(2) Type BLP installed in plenum communications raceway

(3) Type BLP supported by metallic cable trays or cable tray systems

(4) Types BLP, BMR, BLR, BM, BL and BLX installed in raceways that are installed in compliance with 300.22(C)

Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see Sections 4.3.11.2 (ceiling cavity plenum), 4.3.11.4 (air-handling unit room plenum) and 4.3.11.5 (raised floor plenum) of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(D) Risers-Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types BLP, BMR and BLR
(2) Types BLP and BLR installed in
(a) plenum communications raceway
(b) riser communications raceway
(c) riser cable routing assembly
Informational Note: See 830.26 for firestop requirements for floor penetrations.
(E) Risers-Cables in Metal Raceways. The following cables shall be permitted in metal raceway or in a riser having with firestops at each floor:
(1) Types BLP, BMR, BLR, BM, BL and BLX
(2) Types BLP, BLR and BL installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
Informational Note: See 830.26 for firestop requirements for floor penetrations.
(F) Risers-Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts with firestops at each floor:
(1) Types BLP, BMR, BLR, BM, BL and BLX
(2) Types BLP, BLR and BL installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Informational Note: See 830.26 for firestop requirements for floor penetrations.
(G) Risers- One- and Two-Family Dwellings. The following cables shall be permitted one- and two-family dwellings:
(1) Types BLP, BMR, BLR, BM, BL
(2) Types BL and BLX less than 10 mm (0.375 in.) in diameter
(3) Types BLP, BLR, and BL installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Informational Note: See 830.26 for firestop requirements for floor penetrations.
(H) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than the locations covered in 830.113(B) through (G).
(1) Types BLP, BMR, BLR, BM and BL
(2) Type BLP, BMR, BLR, BM, BL and BLX installed in a raceway
(3) Types BLP, BLR, and BL
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
(4) Types BLX and BL less than 10 mm (0.375 in.) in diameter in one- and two-family dwellings
(5) Types BMU and BLU cables entering the building from outside and run in rigid metal conduit or intermediate metal conduit where the conduits is connected by a grounding conductor to an electrode in accordance with 830.100(B).
Informational Note: This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.
(6) A maximum length of 15 m (50 ft) within the building of Type BLX cable entering the building from outside and terminated at a NIU or a primary protection location

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate cable routing assemblies into the sections 770.133(B) (Proposals 16-51 and 52), 800.133(A)(1)(a) (Proposals 16-165 and 166), 820.133(A)(1)(a) (Proposals 16-272 and 273). Cable routing assemblies need to be included in Article 830 also to correlate with the panel actions on these other proposals. This comment includes provisions for the installation of network-powered broadband cables in cable routing assemblies and in communications raceways in order to correlate with the requirements of 770.133(B), 800.133(A)(1)(a) and 820.133(A)(1)(a).

The recommended text for the informational notes dealing with installations in air handling spaces have been modified to better reflect the contents of the mandatory text.

Panel Meeting Action: Accept in Principle

Revise 830.113 as follows:

830.113 Installation of Network-Powered Broadband Communications Cables. Installation of network-powered broadband communications cables shall comply with 830.113 (A) through (H).

(A) Listing. Network-powered broadband communications cables installed in buildings shall be listed.

(B) Fabricated Ducts and Plenums Used for Environmental Air. The following cables shall be permitted ~~to be installed~~ in ~~air~~ ducts and plenums as described in 300.22(B) if they are directly associated with the air distribution system.
(1) Up to 1.22 m (4 ft) of Type BLP cable
(2) Types BLP, BMR, BLR, BM, BL and BLX cables installed in raceways that are installed in compliance with 300.22(B)
Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see sections 4.3.4.1 ~~(air ducts)~~ and 4.3.11.3.3 ~~(apparatus casings plenums)~~ in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted ~~to be installed~~ in other spaces used for environmental air as described in 300.22(C).
(1) Type BLP cable
(2) Type BLP cable installed in plenum communications raceway
(3) Type BLP cable supported by open metallic cable trays or cable tray systems
(4) Types BLP, BMR, BLR, BM, BL and BLX cables installed in raceways that are installed in compliance with 300.22(C)
(5)Types BLP, BMR, BLR, BM, BL and BLX cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)
Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see sections 4.3.11.2 ~~(ceiling cavity plenum)~~, 4.3.11.4 ~~(air-handling unit room plenum)~~ and 4.3.11.5 ~~(raised floor plenum)~~ of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

(D) Risers-Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:
(1) Types BLP, BMR and BLR cables
(2) Types BLP and BLR cables installed in
(a) plenum communications raceway
(b) riser communications raceway
(c) riser cable routing assembly
Informational Note: See 830.26 for firestop requirements for floor penetrations.

(E) Risers-Cables in Metal Raceways. The following cables shall be permitted in metal raceway ~~or~~ in a riser having with firestops at each floor:
(1) Types BLP, BMR, BLR, BM, BL and BLX cables
(2) Types BLP, BLR and BL cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
Informational Note: See 830.26 for firestop requirements for floor penetrations.

(F) Risers-Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts with firestops at each floor:
(1) Types BLP, BMR, BLR, BM, BL and BLX cables
(2) Types BLP, BLR and BL cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Informational Note: See 830.26 for firestop requirements for floor penetrations.

(G) Risers- One- and Two-Family Dwellings. The following cables shall be permitted one- and two-family dwellings:
(1) Types BLP, BMR, BLR, BM, BL cables and Types BL and BLX cables less than 10 mm (0.375 in.) in diameter
(3) Types BLP, BLR, and BL cables installed in:
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly
Informational Note: See 830.26 for firestop requirements for floor penetrations.

(H) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than the locations covered in 830.113(B) through (G).
(1) Types BLP, BMR, BLR, BM and BL cables
(2) Types BLP, BMR, BLR, BM, BL and BLX cables installed in a raceway
(3) Types BLP, BLR, and BL
a) plenum communications raceway
b) riser communications raceway
c) general-purpose communications raceway
d) riser cable routing assembly
e) general-purpose cable routing assembly

(4) Types BLX and BL cables less than 10 mm (0.375 in.) in diameter in one- and two-family dwellings

(5) Types BMU and BLU cables entering the building from outside and run in rigid metal conduit or intermediate metal conduit where the conduits is connected by a bonding conductor or grounding electrode conductor ~~to an electrode~~ in accordance with 830.100(B).

Informational Note: This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

(6) A maximum length of 15 m (50 ft) within the building of Type BLX cable entering the building from outside and terminated at a NIU or a primary protection location.

Panel Statement: The panel deleted the definition of "air duct" in its action on Proposal 16-104.

The panel added text to recognize solid bottom cable trays with a solid covers.

The panel added text to permit plenum raceways to be supported by open cable trays.

The panel added the word "cables" after each cable type. See panel action on Comment 16-295.

The panel made changes relative to deleting "grounding conductor" and replacing with "bonding conductor" or "grounding electrode conductor".

The panel accepts in principle the recommendations to revise the informational notes. The panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text. The panel chooses not to include NFPA 90A "titles" in parenthesis following each section reference.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-294 Log #1926 NEC-P16 **Final Action: Hold**
(830.113 (New))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-331
Recommendation: Revise the text as follows:

830.113(B)(2) Types BLP, BMR, BLR, BM, BL and BLX installed in metal raceways ~~that are installed~~ in compliance with 300.22(B).

830.113(C)(3) Types BLP, BMR, BLR, BM, BL, and BLX installed in metal raceways ~~that are installed~~ in compliance with 300.22(C).

830.113(E) Risers- Cables in Metal Raceways or ~~Fireproof~~ Fire-Resistance-Rated Shafts. Types BLP, BMR, BLR, BM, BL, and BLX cables shall be permitted in metal raceway or in a ~~fireproof~~ fire-resistance-rated shaft with firestops at each floor.

Substantiation: In (B)(2), the word "metal" should be added to make this requirement very simple and very clear without having to refer to the entire text of 300.22, just as the Panel clarified in (C)(2) that only *metallic* cable trays are allowed. The informational note in this section refers to NFPA 90A which requires the use of metal raceways in these spaces.

In (C)(3) "metal" was added to clarify that the cables listed must be installed in metal raceways in accordance with the requirements in 300.22(C) and NFPA 90A.

In (E) "Fireproof" was changed to "fire-resistance-rated", which is the appropriate terminology.

Panel Meeting Action: Hold
Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-295 Log #1356 NEC-P16 **Final Action: Accept in Principle in Part**
(830.113(B), FPN and 830.113(C) FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-160
Recommendation: (B) Fabricated Ducts and Plenums Used for Environmental Air. The following wires and cables shall be permitted in ~~air~~ ducts and plenums, as described in 300.22(B), if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type BLP cables

(2) Types BLP, BMR, BLR, BM, BL and BLX cables installed in raceways that are installed in compliance with 300.22(B)

FPN: See 4.3.4 and 4.3.11.3.3 of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems*, for information on wires and cables installed in fabricated ducts and plenums used for environmental air ~~wire and cables in air ducts and apparatus casings plenums. See 3.3.22 for the definition of an apparatus casing plenum~~.

(C) Other Spaces Used For Environmental Air (Plenums). The following wires and cables shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Type BLP cables

(2) Type BLP cables supported by metallic cable trays or cable tray systems

(3) Types BLP, BMR, BLR, BM, BL and BLX cables and listed wires and cables installed in raceways that are installed in compliance with 300.22(C).

FPN: See 4.3.11.2, 4.3.11.4, and 4.3.11.5 of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems*, for information on wires, cables and raceways installed in other spaces used for environmental air (plenums) ~~wire, cables, and raceways in ceiling cavity, raised floor, and air-handling unit room plenums. See 3.3.22 for plenum definitions~~ .

Substantiation: This comment is intended to bring consistency to this section. The FPN nomenclature or terminology needs to correspond to the terminology in the charging paragraph.

The term "air duct" is not used in this section or elsewhere in the article. The definitions from NFPA 90A are not necessary since this FPN sends the NEC user directly to the relevant sections for the requirements.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel accepts in principle the recommendations to revise the informational notes. As recommended by the submitter, the panel text provides information on air handling spaces using NEC terminology in lieu of NFPA 90A terminology as was used in the ROP text.

The comment is on Proposal 16-160 which addresses Article 800. The recommended text is for Article 830. The panel understands that this comment is on Proposal 16-331.

The panel accepts in principle the recommendation to delete the word "air". See panel action on Comment 16-293.

The panel accepts in principle the recommendations to revise the informational notes. See panel action on Comment 16-293.

The panel does not accept the recommendations to include "wires" in the text because there are no wires in Article 830, only cables.

The panel accepts in principle adding the word "cables" after each cable type. See panel action on Comment 16-293.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-296 Log #1638 NEC-P16 **Final Action: Accept in Principle**
(830.133(A)(1)(b) and (c))

TCC Action: In order to correlate with the action on Comment 3-96, the Technical Correlating Committee changes the action on Comment 16-296 from "Accept" to "Accept in Principle" and revises 830.133(A)(1) to read as follows:

"(b) Low-Power Network-Powered Broadband Communications Circuit Cables with Optical Fiber Cables and Other Communications Cables. Low-power network-powered broadband communications cables shall be permitted in the same raceway, cable tray, enclosure or cable routing assembly with jacketed cables of any of the following circuits:

(1) Communications circuits in compliance with Parts I and IV of Article 800

(2) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770

(3) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820

(c) Low-Power Network-Powered Broadband Communications Circuit Cables With Other Circuits. Low-power network-powered broadband communications cables shall be permitted in the same raceway, cable tray or, enclosure with jacketed cables of any of the following circuits:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760

(d) Medium-Power Network-Powered Broadband Communications Circuit Cables With Optical Fiber Cables and Other Communications Cables. Medium-power network-powered broadband communications cables shall not be permitted in the same raceway, cable tray, enclosure or cable routing assembly with conductors of any of the following circuits:

(1) Communications circuits in compliance with Parts I and IV of Article 800

(2) Conductive optical fiber cables in compliance with Parts I and IV of Article 770

(3) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820

(e) Medium-Power Network-Powered Broadband Communications Circuit Cables With Other Circuits. Medium-power network-powered broadband communications cables shall not be permitted in the same raceway, cable tray, or enclosure with conductors of any of the following circuits:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725
(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760."
Change existing (d) to (f).
Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-333
Recommendation: Accept Proposal 16-333 in principle by making the following revisions:

(b) *Low-Power Network-Powered Broadband Communications Circuit Cables.* Low-power network-powered broadband communications cables shall be permitted in the same raceway, cable tray, ~~or~~ enclosure or cable routing assembly with jacketed cables of any of the following circuits:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760

(3) Communications circuits in compliance with Parts I and IV of Article 800

(4) Nonconductive and conductive optical fiber cables in compliance with Parts I and IV of Article 770

(5) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820

(c) *Medium-Power Network-Powered Broadband Communications Circuit Cables.* Medium-power network-powered broadband communications cables shall not be permitted in the same raceway, cable tray, ~~or~~ enclosure or cable routing assembly with conductors of any of the following circuits:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725

(2) Power-limited fire alarm systems in compliance with Parts I and III of Article 760

(3) Communications circuits in compliance with Parts I and IV of Article 800

(4) Conductive optical fiber cables in compliance with Parts I and IV of Article 770

(5) Community antenna television and radio distribution systems in compliance with Parts I and IV of Article 820

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate cable routing assemblies into the sections 770.133(B) (Proposals 16-51 and 52), 800.133(A)(1)(a) (Proposals 16-165 and 166), 820.133 (Proposals 16-272 and 273). Cable routing assemblies need to be included in Article 830 also to correlate with the panel actions on these other proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:

DORNA, G.: See my Explanation of Affirmative Vote on Comments 16-41, 16-143 and 16-236.

16-297 Log #2684 NEC-P16 **Final Action: Reject**
(830.133(A)(2) Exception No. 3 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 16-334
Recommendation: Accept the proposal.
Substantiation: The first portion of the panel statement regarding the absence of a specific application cited is difficult to understand. The substantiation cited an actual NEC section [334.116(C)] that recognizes such a construction. However, Chapter 8 will trump that allowance unless correlating language is in place. This needs correlation, the wording of Exception No. 2 does not require listing and seems to describe something CMP 3 described in its statement on a companion proposal for 725.136(I)(3) (Proposal 3-195).

Because of the Chapter 8 location, this issue still needs attention, only partially due to formal recognition of this construction in some form in 334.116(C). In addition, CMP 16 (and 3) will have on its ROC agenda, courtesy of CMP 9 and the TCC sending it there, Proposal 9-8 which covers a form of tray cable with this type of separation. This submitter has rigorously defended the system separation rules in print for decades, but the issues don't go away, and technology may have advanced to the point where some form of these cable constructions can be recognized.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any listing requirements. See 800.179(I) for an example of a listing requirement for a hybrid power and communications cable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-298 Log #1202 NEC-P16 **Final Action: Reject**
(830.135)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 16-337
Recommendation: This proposal should be Accepted.
Substantiation: Panel member Mr. Ivans is correct in his Negative statement. Network Powered Broadband Circuit cable and connectors carry an electrical current and should not become easily accessible. Outlet Boxes and brackets have been listed by NRT's, such as UL, to insure that incidental contact with other electrical light and power conductors does not occur.
Panel Meeting Action: Reject
Panel Statement: The text, as suggested in Proposal 16-337, is too broad. Not all communications devices or equipment need to be mounted in boxes, on a bracket or in assemblies designed for the purpose (e.g., telephone set, FAX machine).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:

IVANS, R.: Loose and exposed cable or connectors can pose a risk of electric shock. Ringing voltages can exceed 100V and should not become easily accessible due to weak mounting or terminating methods. Loose cabling and connectors can come into contact with electric light and power conductors.

There are boxes and brackets listed for this purpose using the requirements in UL Subject 2269, "Outline of Investigation for Optical Fiber/ Communications/ Signaling/Coaxial Cable Outlet Boxes." Companies have certifications with UL under the category "Optical Fiber/Communications/Signaling/Coaxial Cable Outlet Boxes", QAZR.

16-299 Log #44 NEC-P16 **Final Action: Accept**
(830.151)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-331
Recommendation: Delete Section 830.151.
Substantiation: "Delete Section 830.151" was the first line of the recommendation in Proposal 16-331. It was overlooked in the panel action. See the ballot comments by Jerry Dorna and Randy Ivan.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-300 Log #645 NEC-P16 **Final Action: Reject**
(830.151(B))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" to correlate with the action taken on Comment 16-299.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-338
Recommendation: Continue to accept this proposal in principle.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to accept this proposal in principle. We agree with Jerry Dorna's ballot comment:

The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".

Section 830.151(B) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BMR. Floor penetrations requiring Type BMR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.

The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.
Panel Meeting Action: Accept
Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-301 Log #1909 NEC-P16 **Final Action: Reject**
(830.151(C) Exception)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" to correlate with the action taken on Comment 16-299.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
(C) Other Wiring. Cables installed in locations other than the locations covered in 830.151(A) and (B) shall be Type BM.
Exception: Type BMU cable shall be permitted where the cable enters the building from the outside and is run in rigid metal conduit or intermediate metal conduit, and such conduits are connected by a grounding electrode conductor to a grounding ~~an~~ electrode in accordance with 830.100(B).
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 830.

These comments address the changes suggested in proposal 16-293 in each section within Article 830 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(C) Other Wiring. Cables installed in locations other than the locations covered in 830.151(A) and (B) shall be Type BM.
Exception: Type BMU cable shall be permitted where the cable enters the building from the outside and is run in rigid metal conduit or intermediate metal conduit, and such conduits are connected ~~by a grounding electrode conductor~~ to a grounding an electrode in accordance with 830.100(B).
Panel Statement: The panel accepts the submitter's text and edits for clarity.

16-302 Log #2442 NEC-P16 **Final Action: Reject**
(830.151(C) Exception)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" to correlate with the action taken on Comment 16-299.
Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
(C) Other Wiring. Cables installed in locations other than the locations covered in 830.151(A) and (B) shall be Type BM.
Exception: Type BMU cable shall be permitted where the cable enters the building from the outside and is run in rigid metal conduit or intermediate metal conduit, and such conduits are connected by a grounding electrode conductor to a grounding ~~an~~ electrode in accordance with 830.100(B).
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 16-301.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-303 Log #1639 NEC-P16 **Final Action: Accept in Principle**
(830.154)

TCC Action: The Technical Correlating Committee directs that the phrase "and plenums" be removed from the title, text, and informational note in Table 830.154 because the accepted text in the title, text, and the Informational Note in 300.22(B), as accepted in Proposal 3-94, does not include the term "fabricated plenums."
Submitter: Craig Sato, Underwriters Laboratories Inc.
Comment on Proposal No: 16-339
Recommendation: Revise text to read as follows:
830.154 Applications of Network-Powered Broadband Communications System Cables. Permitted and non-permitted applications of listed network-powered broadband communications system cables shall be as indicated in Table 830.154(A). The permitted applications are subject to the installation rules of 830.40, 830.110 and 830.113. The substitutions for network-powered broadband system cables listed in Table 830.154(B) shall be permitted.

See Table 830.154(A) on Page 654

Renumber Table 830.154 to become Table 830.154(B).

Substantiation: At the direction of the TCC, the chairmen of panels 3 and 16 formed a task group to correlate the actions of panels 3 and 16 on the proposals dealing with cable routing assemblies. The panel 3 members of the task group are Larry Ayers and Sandy Egesdal. The panel 16 members are Stan Kaufman and Craig Sato (chairman). This comment is being submitted by the task group chairman on behalf of the task group.

The task group supports the panel action on the proposal to incorporate installation of cables in cable routing assemblies into the section. However the task group recommends that the listing, applications and installation of the cable routing assemblies be consolidated into Article 770 and not be duplicated in each of panel sixteen's articles. Accordingly the recommended text for this section includes applications of wires and cables in cable routing assemblies and omits the installation of the cable routing assemblies which belong in 770.154.

Table 830.154(A) has been reformatted in 'landscape' and is recommended by the Task Group to be presented this way in the Code to enhance readability and use.

Most of the text in this comment was submitted by Gerald Dorna and Randy Ivans as an affirmative ballot comments on this proposal. See the ROP.
Panel Meeting Action: Accept in Principle

See TG revised Table 830.154(B) on page 654

Panel Statement: "Y" was changed to "Y*" to emphasize to the user that installation rules apply.

Add "In..." to the second column in Table 830.154(A) as a prefix to each phrase.

"Chapter 3 raceway" was changed to "In any raceway recognized in Chapter 3 " for consistency with the installation rules.

See panel action on Comment 16-292.

The panel added eight rows to clarify the issues raised in Comment 16-295 including adding rows dealing with installations in raceways and cable trays. An editorial change was made to clarify that air handling spaces refers to 300.22(B) & (C) spaces.

The box "In Air-Handling Spaces" was divided into the component sections "In Fabricated Ducts and Plenums as Described in 300.22(B)" and "In Other Spaces Used for Environmental Air as Described in 300.22(C)" in order to reduce repetition in the next column.
Number Eligible to Vote: 16

	In general purpose communications raceways	Y*	Y*	Y*	N	N	N	N
	In riser cable routing assemblies	Y*	Y*	Y*	N	N	N	N
	In general-purpose cable routing assemblies	Y*	Y*	Y*	N	N	N	N

Note: An ‘N’ in the table indicates that the cable type shall not be permitted to be installed in the application. A ‘Y*’ indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 830.113.

Informational Note 1: Part V of Article 830 covers installation methods within buildings. This table covers the applications of listed network-powered broadband communications cables in buildings. The definition of point of entrance is in 830.2. Network-powered broadband communications cables entrance cables that have not emerged from the rigid metal conduit or intermediate metal conduit are not considered to be in the building.

Informational Note No. 2: For information on the restrictions to the installation of network-powered broadband communications cables in fabricated ducts and plenums see 830.113(B).

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-304 Log #2415 NEC-P16 **Final Action: Reject**
(830.154)

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-339
Recommendation: Revise the first sentence of 830.154 to read:
Permitted and non-permitted applications of listed network-powered broadband communications system cables shall be ~~as indicated in Table 830.154(A)~~ in accordance with 830.110 and 830.113.
Substantiation: A comment has been submitted to delete Table 830.154(A). 830.154 will need to be revised for correlation if the Table is deleted.
The following is our reason for deleting the Table.
Proposals to delete all of the Tales in the 800 series. Some are more confusing than others but consistency is needed. A number of notes are needed if this table moves forward. Many users will simply take the table as fact without reading limiting requirements applicable per 830.10 and 830.13 A simple "yes" or "no" does not always fit and will lead to misinterpretation.
Several cycles ago both CMP 8 and CMP 7 rewrote their articles. At that time both attempted to develop tables such as 820.154A. There was such a hue and cry against this and so many notes needed to explain what is actually permitted both Panels dropped the tables. Most tables in the NEC are there to clarify special conditions, not normal use. Text, as opposed to tables, is much easier to interpret and enforce correctly.
Just in case the Panel rejects this comment and continues with the Table, we have submitted a separate comment for 16-278 containing notes to the table.
However, REMOVING THE TABLE IS MUCH MORE USER FRIENDLY AS PAST CODE DEVELOPMENT HAS SHOWN. Thorough reading of 820-110 and 820-113 by users will lead to easier and better enforcement and avoid installers having to remove and redo an installation due to noncompliance.
Panel Meeting Action: Reject
Panel Statement: The recommended action was intended to correlate with the acceptance of Comment 16-306. The panel rejected Comment 16-306.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-305 Log #2416 NEC-P16 **Final Action: Accept in Principle in Part**
(Table 830.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-339
Recommendation: If the Table is not deleted as proposed in a separate comment, revise Table 830.154(A) as follows:
Add Notes to clarify and change some Y(es) and N(o) permitted uses.
For reference purposes the columns of the draft Table have been numbered in numerical sequence from left to right. The cable and/or raceway types are for identification as shown in the far left product column. It is the intent that a parenthetical note number be placed with the identified product Y or N, with the corresponding note(s) at the bottom of the Table.
Column one –**BLP** – Indicate Note (1) Text: Note (1). in free air in a 300.22(B) location must be directly associated with the air distribution system and is limited to 1.2 2mm (4 ft); the length limitation does not apply where the cable is installed in a raceway complying with 300.22(B).
Columns one and two – **BMR, BLR, BM, BL and BLK** - Indicate Note (2). Change N to Y for CATVR, CATV, CATVX and apply Note (2).
Text: Note 2. In 300.22(B) and (C) locations these cables are permitted in raceways that comply with 300.22(B) and (C).
Column eight - **BMR, BLR, BM, BL, and BLX** --Indicate Note (3). Text: Note 3. In 300.22 locations cable tray is required to be solid metal bottom with solid metal cover.
Column Ten – **BLP, BMR, BLR,BM, BL and BLX --** Indicate Note (4). Text: Note 4. Where these cables are installed in a Chapter 3 raceway located in a 300.22 area the raceway must comply with 300.22 (A) and (B).
Substantiation: Note (1). Per **830.113(B)**.
Note (2) Per **830.113(B)**(2) and **820.113(C)(3**).
Note (3) Per **830.113(B)**(2) and **(C)(3)**
Note (4) Per **This text is needed to assure that "any raceway in Chapter 3" is not misapplied.**
Panel Meeting Action: Accept in Principle in Part
The panel accepts in principle recommendation 1. See Informational Note No 2 in Table 830.154.
The panel does not accept recommendation 2. CATV cables are not included in Table 830.154(A).
The panel does not accept recommendation 3. See panel action on proposal 16-340 which permits plenum cable to be installed metallic cable trays in plenums.
The panel does not accept recommendation 4. Section 300.22(A) states "No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors."
Panel Statement: See panel action on Comments 16-293 and 16-303.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-306 Log #2417 NEC-P16 **Final Action: Reject**
(Table 830.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-339
Recommendation: Delete Table 830.154(A).
Substantiation: This is a companion comment for revision of 830.154.
See also comment to add notes to Table 830.154(A) if this comment is not accepted.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no substantiation for the recommended action.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

16-307 Log #2418 NEC-P16 **Final Action: Hold**
(Table 830.154(A))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 16-339
Recommendation: For the purpose of this comment the columns are referenced numerically from left to right and as shown in the draft.
Revise column headings as follows:
1. Add "Specifically" before "Fabricated"; delete "and plenums"
4. Change "fireproof" to "fire-resistance- rated."
Substantiation: 1. To correlate with the title of 300.22(B) and avoid confusion.
4. The term "fireproof " is being replaced with the correct description "fire-resistance-rated" throughout ASTM fire related standards and other codes. It is a known fact that that "fireproof" is not a legally defensible term. A comment has been submitted to change the term in 830.113.
Panel Meeting Action: Hold
Panel Statement: Changing "fireproof" to "fire-resistance rated" is a concept that has not had public review by being published in the ROP.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-308 Log #623 NEC-P16 **Final Action: Accept**
(830.154(B)(1))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-341
Recommendation: Continue to accept this proposal in principle.
Substantiation: The Communications Cable & Connectivity Association agrees with the panel action to accept this proposal in principle. We agree with Jerry Dorna's ballot comment:
The current riser requirements are so complicated that they could be considered to be a "vague and unenforceable".
Section 830.154(B)(1) requires that "Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BLP, BLR, or BMR. Floor penetrations requiring Type BMR or BLR shall contain only cables suitable for riser or plenum use". Consequently at least two floor penetrations are required, one for plenum and riser cables and another for general-purpose cables.
The panel action on this proposal greatly simplifies the installation rules for cables in risers in other than one and two-family dwellings. The installation rules for one and two-family dwellings are already simplified since any listed cable is permitted.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-309 Log #1910 NEC-P16 **Final Action: Accept in Principle**
(830.154(C)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
(3) Type BLU Cable. Type BLU cable entering the building from outside shall be permitted to be run in rigid metal conduit or intermediate metal conduit. Such conduits shall be connected by a grounding electrode conductor to a ~~an~~ grounding electrode in accordance with 830.100(B).
Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to

provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 830.

These comments address the changes suggested in Proposal 16-293 in each section within Article 830 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

(830.154(C)(3))

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-293
Recommendation: Revise text to read as follows:
(3) Type BLU Cable. Type BLU cable entering the building from outside shall be permitted to be run in rigid metal conduit or intermediate metal conduit. Such conduits shall be connected by a grounding electrode conductor to a ~~an~~ grounding electrode in accordance with 830.100(B).
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.

From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.

16-311 Log #1357 NEC-P16 **Final Action: Reject**
(830.179(2), FPN 4)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 16-343
Recommendation: 830.179 Network-Powered Broadband Communications Equipment and Cables.

Network-powered broadband communications equipment and cables shall be listed as suitable for the purpose.

Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance with Article 820 and are used for low-power network-powered broadband communications circuits.

Exception No. 2: Substitute cables for network-powered broadband communications cables shall be permitted as shown in Table 830.154.

(2) Types BLU, BLX, BL, BLR, and BLP Cables. Network-powered broadband communications low-power underground cable, Type BLU; limited-use network-powered broadband communications low-power cable, Type BLX; network-powered broadband communications low-power cable, Type BL; network-powered broadband communications low-power riser cable, Type BLR; and network-powered broadband communications low-power plenum cable, Type BLP, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11. Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.

Substantiation: Retain the FPN as in the current NEC, but only if the FPNs from CMP 3 are not changed to the same language. This comment is being written just in case CMP 3 is willing to change to existing NEC language.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Reject
Panel Statement: The panel upholds its position to not change the FPN.

The panel agrees with the submitter's statement that "the FPN is worded correctly".

Comment on Proposal No: 16-343
Recommendation: 830.179 Network-Powered Broadband Communications Equipment and Cables.

Network-powered broadband communications equipment and cables shall be listed as suitable for the purpose.

Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance with Article 820 and are used for low-power network-powered broadband communications circuits.

Exception No. 2: Substitute cables for network-powered broadband communications cables shall be permitted as shown in Table 830.154.

(2) Types BLU, BLX, BL, BLR, and BLP Cables. Network-powered broadband communications low-power underground cable, Type BLU; limited-use network-powered broadband communications low-power cable, Type BLX; network-powered broadband communications low-power cable, Type BL; network-powered broadband communications low-power riser cable, Type BLR; and network-powered broadband communications low-power plenum cable, Type BLP, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11. Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN No. 4: One method of defining low smoke producing and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.

~~FPN No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2007, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*.~~

Substantiation: This comment is intended to bring consistency to the NEC. In Articles 770, 800, 820 and 830, the FPN is worded correctly but different from what CMP 3 recommended. The original proposal I made to CMP 3 and CMP 16 was already made in the 2005 and 2008 NEC cycles, but was caught up in the "plenum cable moratorium" in the opinion of CMP 3 but not of CMP 16. The present wording also follows the requirements of the preceding section, which requires that the cable be listed as having both "adequate fire-resistant and low smoke-producing characteristics". The wording of CMP 3 (although adequate also) does not explain what is needed to define a cable that is a "low smoke-producing and fire-resistant cable" by omitting the words "a cable that is". However, if CMP 16 makes this change consistency is achieved in the NEC.

With regard to the comment by Mr. Ayers to the proposals in CMP 3, I agree with him, but the (incorrect) use of the term "fire-resistant cable" is consistent in not just the FPNs in all 6 relevant articles (725, 760, 770, 800, 820 and 830) but is also consistent with the use in the charging paragraph.

If CMP 3 and CMP 16 would both like to eliminate the term "fire-resistant cable", consistently in all locations, and replace it by a term such as "low flame spread cable", that would be an excellent idea, but it does require consistency (and probably a task group of both panels). In the meantime the use of the term "fire-resistant cable" is necessary to correlate with the charging paragraph.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Reject

Panel Statement: The panel upholds its position to not change the FPN.

The panel agrees with the submitter's statement that "the FPN is worded correctly".

See panel action and statement on Comment 16-61.

16-313 Log #1014 NEC-P16 **Final Action: Reject**

(830.179(A)(1), FPN No. 1 and No. 2)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-346

Recommendation: The Proposal should be Accepted in Principle in Part and the text revised as follows:

~~FPN No. 1~~ Informational Note No. 1: One method of defining resistant to the spread of fire is ~~that the cables do not spread fire to the top of the tray~~ described in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing~~ described in the CSA "Vertical Flame Test — Cables in Cable Trays," ~~as described~~ in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

~~FPN No. 2~~ Informational Note No. 2: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is described in ~~that the cables pass the requirements of~~ ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.*

Substantiation: Acceptance of the revised wording in FPN No. 1 will still provide the user with the references to two methods of defining "resistant to the spread of fire" and also comply with the NEC Style Manual that FPNs not contain requirements. The pass/fail criteria are already defined in those two standards.

The existing phrase in FPN No. 2 "…that the cables pass the requirements…" specifies a requirement which violates 3.1.3 of the NEC Style Manual. The revised text will still provide the user with a reference that directs them to the appropriate standard that contains the test requirements and the pass/fail criteria and the revised FPN complies with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: The informational note does not contain requirements and is not written in mandatory language; it provides information on two methods of defining resistant to the spread of fire.

Number Eligible to Vote: 16

16-314 Log #1015 NEC-P16 **Final Action: Reject**

(830.179(A)(1), FPN No. 1 through No. 4)

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 16-348

Recommendation: The Proposal should be Accepted in Principle in Part, revised and the following words "and Annex A Explanatory Material" added after "NFPA 262-2007" in FPN No.4 so the revised FPNs read as follows:

~~FPN No. 2~~ Informational Note No. 2: One method of defining resistant to the spread of fire is ~~that the cables do not spread fire to the top of the tray~~ described in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining resistant to the spread of fire is ~~for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing~~ described in the CSA "Vertical Flame Test — Cables in Cable Trays," ~~as described~~ in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

~~FPN No. 3~~ Informational Note No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is described in ~~that the cables pass the requirements of~~ ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.*

~~FPN No. 4~~ Informational Note No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is ~~that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with~~ described in NFPA 262-2007, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, and Annex A Explanatory Material.

Substantiation: Acceptance of the revised wording in FPN No. 2 will still provide the user with the references to two methods of defining "resistant to the spread of fire" and also comply with the NEC Style Manual that FPNs not contain requirements. The pass/fail criteria are already defined in those two standards.

The existing phrase in FPN No. 3 "…that the cables pass the requirements…" specifies a requirement which violates 3.1.3 of the NEC Style Manual. The revised text will still provide the user with a reference that directs them to the appropriate standard that contains the test requirements and the pass/fail criteria and the revised FPN complies with the NEC Style Manual.

The current text in FPN No. 4 specifies a single test method and defines the maximum values, which are not specified in the body of NFPA 262. Inclusion of the maximum values in the FPN are requirements and this violates 3.1.3 of the NEC Style Manual.

NFPA 262 defines the Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces but it does not specify any pass/fail criteria.

While the values specified for maximum peak optical density, maximum average optical density, and maximum allowable flame travel distance in the FPN are not included in the body of NFPA 262, they are contained in Annex A Explanatory Material. Addition of the words "and Annex A Explanatory Material" will reference the maximum values that are in the FPN and the proposed revised FPN will comply with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Panel Meeting Action: Reject

Panel Statement: Informational Note No. 2 does not contain requirements and is not written in mandatory language; it provides information on two methods of defining resistant to the spread of fire.

Informational Note No. 3 note does not contain requirements and is not written in mandatory language; it provides information on one method of defining fire-resistant characteristics capable of carrying fire floor to floor.

Informational Note No. 4 does not contain requirements and is not written in mandatory language; it provides information on one method of defining a low-smoke producing and fire-resistant cable.

ARTICLE 840 —PREMISES-POWERED BROADBAND COMMUNICATIONS SYSTEMS

16-315 Log #321 NEC-P16 **Final Action: Accept**

(840 (New))

Submitter: Technical Correlating Committee on National Electrical Code®,

Comment on Proposal No: 16-349

Recommendation: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.

The Technical Correlating Committee further directs that the panel review the proposed changes for compliance with the NEC Style Manual with respect to titles for first level subsections.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the direction of the TCC to review the proposed first level subsections.

See panel action and statement on Comments 16-330, 16-331 and 16-332.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-316 Log #615 NEC-P16 **Final Action: Accept in Principle (840)**

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 16-212
Recommendation: Replace the term "~~grounding conductor~~", with the term "grounding electrode conductor", throughout this article.
Substantiation: The term "grounding electrode conductor", is a specific term and thus it is easier for most people in the industry to understand the purpose. The generic term "grounding conductor" is so general that most people can misunderstand the application. It cannot be held to be in the best interest of safety for a general misunderstanding of terms to be an allowable mode in the NEC process.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel understands that the submitter's reference to Proposal 16-212 is incorrect and should be to Proposal 16-349.

The panel refers the submitter to the action and statement on Comment 16-334.

Submitter: Vijay Ghelani, Alcatel-Lucent
Comment on Proposal No: 16-349
Recommendation: We support and agree with the clarification submitted by Randy Ivans of UL Inc. indicating that Section 840.101 should be reworded as follows:
"840.101 Premises Circuits Not Leaving the Building.
Where the ONT is served by a nonconductive optical fiber cable, or where any non-current-carrying metallic member is interrupted by an insulating joint or equivalent device, and circuits that terminate at the ONT and are completely contained within the building (i.e., do not exit the building), 840.101 (A) or and (B) or and (C) shall apply as applicable.
(A) The shield of coaxial cable shall be grounded by one of the following:
(1) Any of the methods described in 820.100 or 820.106.
(2) A fixed connection when using to an equipment grounding conductor as described in 250.118. Use of the equipment grounding conductor to ground the ONT shall not require additional grounding of the coaxial cable shield.
(3) Connection to the ONT grounding terminal provided that the terminal is connected to an equipment grounding conductor through a listed grounding device that will retain the ground connection if the ONT is unplugged.
(B) Communications circuits shall not be required to be grounded.
(C) The ONT shall not be required to be grounded unless required by its listing. Where grounding is required, connecting to an equipment grounding conductor through a listed grounding device that will retain the ground connection if the ONT is unplugged shall be permitted. If the coaxial cable shield is separately grounded as permitted required in 840.101 (A)(1) or 840.101(A)(2), the use of a cord and plug for the connection to the ONT grounding connection shall be permitted.
FPN No. 1. Where required to be grounded, a listed device that extends the equipment grounding conductor from the receptacle to the ONT equipment grounding terminal is permitted. Sizing of the extended equipment grounding conductor is covered in Table 250.122."
Substantiation: None given.

Ballot Not Returned: 1 Esemplare, R.

16-318 Log #1272 NEC-P16 **Final Action: Accept in Principle (840 (New))**

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 16-349
Recommendation: I highly encourage CMP-16 to accept this proposal in principle and accept the coordinated set of comments that provide the completed revisions throughout Article 840.
Substantiation: This comment responds to action by CMP-5 to delete the term "grounding conductor" and revise the term "grounding electrode conductor." Two definitions that apply to a conductive path in the grounding scheme that functions as a grounding electrode conductor are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 840. The coordinated comments actually even correct misuse of grounding terms in a few locations that existed for a few cycles.

CMP-5 has responsibilities for defined grounding and bonding terms (Code wide). This comment respects the independence of CMP-16 regarding Chapter 8 based on 90.3: this work is not an effort to remove that independence. These proposed revisions are technically correct and result in grounding and bonding terms being used consistently with how they are defined. The term "grounding conductor" is too broad and has been part of a planned migration for removal since the 2005 edition. This planned revision is part of a larger plan implemented by the NEC-2008 TCC assigned grounding and bonding task group work. The grounding and bonding concepts are simple. If grounding happens, a connection is made to an electrode by use of a grounding electrode conductor. Bonding connected conductive parts to establish continuity and conductivity between them. The proposed revisions do not change anything technically in the article: they only make the use of grounding terms consistent with how they are defined, improving the current text. The only change proposed is in use of terms. All other rules such as sizing, installation and so forth remain as specified in this article, as before.

Not accepting the proposed revisions shows a deliberate action to allow continued inconsistency and subjectivity to remain in the NEC. CMP-5 actions have deleted the term "grounding conductor" from Article 100 and revised the term "grounding electrode conductor" to work consistently with the limited energy articles in Chapter 8. The term "grounding conductor" has been removed or replaced in Article 250 and other articles of the NEC. Not accepting the proposed revisions in the coordinated comments will result in the continued use of an orphaned term that is not specific and can lead to subjectivity. The proposed changes are technically correct and there have been no technical reasons brought forward to reject what is being proposed. I highly encourage CMP-16 to give strong consideration to the coordinated comments submitted that resolve these inconsistencies and improve clarity and usability within the limited energy articles with regards to grounding and bonding rules. The best approach in Code development work is to look at the long range objectives and what would be best for the NEC. It needs to be practical, understandable, and enforceable. These proposed revisions are in the spirit of accomplishing all three of these objectives. It's not about who is right or wrong, it is about being successful and ending up with the best Code as a result.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel addressed the submitter's concerns. See action and statement on Comment 16-334.
Number Eligible to Vote: 16

OHDE, H.: See our affirmative comment for Comment 16-22.

16-319 Log #2099 NEC-P16 **Final Action: Accept in Principle (840 (New))**

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 16-349
Recommendation: Revise the proposal as follows: Replace the term "grounding conductor" with "bonding conductor" or "grounding electrode conductor" throughout the article as appropriate.
Substantiation: The present term "grounding conductor" is proposed to be deleted by CMP5. The present term is not correct in most applications. I was part of a CMP-5 and CMP-16 Task Group that could not come to a consensus. The members of CMP-5 went through all the sections in Articles 770, 800, 810, 830 and the proposed new Article 840. The proposed changes are being presented by Phil Simmons and I urge the code panel to either agree with the submitter or make additional changes as needed to remove the term "grounding conductor from these articles.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel addressed the submitter's concerns. See action and statement on Comment 16-334.

16-320 Log #2272 NEC-P16 **Final Action: Accept in Principle (840 (New))**

Submitter: Terry C. Coleman, National Joint Apprentice & Training Committee / Rep. IBEW
Comment on Proposal No: 16-349
Recommendation: Accept Proposal 16-349 as intended to delete the term "grounding conductor" and replace it with the term "grounding electrode conductor" throughout this Article 840.
Substantiation: Proposal 5-13 deleted the definition of "Grounding Conductor" in Article 100 during the 2011 ROP stage as well as the revision of the term" Grounding Electrode Conductor. The revision of the term "grounding

electrode conductor" in Article 100 included wording necessary for the Chapter 8 Articles, therefore, the term "grounding conductor" is no longer needed or required. The term "grounding electrode conductor" is more correct than the term "grounding conductor". Proposal 5-18 which was accepted in principle and revised by CMP-1 reads as follows:

Grounding Electrode Condcutor (GEC). A conductor used to connect the system grounded conductor, equipment, communications system protectors, antenna discharge units, communications cables or network interface units to a grounding electrode or to a point on the grounding system.

Panel Meeting Action: Accept in Principle
Panel Statement: The panel addressed the submitter's concerns. See action and statement on Comment 16-334.

16-321 Log #2685 NEC-P16 **Final Action: Accept in Principle in Part (840)**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 16-349
Recommendation: Accept the proposal as in the panel action in the ROP, but make the following additional changes:

I. In 840.2, Optical Network Terminal (ONT), change "component voice, audio, video, data, and/or interactive electrical service signals" to "component signals, including voice, audio, video, data, and interactive electrical service."

II. Delete 840.3(A), reletterering the remaining subsections.

III. In 840.101(A), insert a first level subdivision title as follows: "Shield Grounding."

IV. In 840.101(B), insert a first level subdivision title as follows: "Communications Circuit Grounding."

V. In 840.101(C), insert a first level subdivision title as follows: "Optical Network Terminal Grounding." Begin the third sentence "Where ~~If~~ the coaxial cable …"

VI. Retitle 840.101(C) FPN No. 1 as "Informational Note" (no number)

VII. In 840.106(A), apply second level subdivision titles to (1) and (2), as follows: "(1) Service Equipment Remote" and "(2) Main Disconnect Remote".

Substantiation: These are editorial changes to reflect requirements in the NEC Style Manual (NECSM) as follows:

I. Removes the prohibited wording "and/or".

II through V. Requirement of the NECSM at 2.1.5.2.

V.I Requirement of the NECSM at 2.4.3.

VII. Requirement of the NECSM at 2.1.5.2.

Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:

840.2 **Optical Network Terminal (ONT).** as follows: **"**A device that converts an optical signal into component signals including voice, audio, video, data, wireless ~~signals~~, and~~/or~~ interactive service electrical ~~signals~~ and is considered…".

Panel Statement: The panel does not accept the submitter's revision of 840.2. The panel has revised the submitter's text of 840.2 to include missing text.

The panel wishes to retain 840.3(A) but has eliminated the reference to 90.3.

See panel action for Comments 16-330, 16-331 and 16-332 for titles to subsections 840.101(A), (B) and(C). See panel action for Comment 16-333 on 840.101(C) FPN.

The panel does not accept the submitter's recommendation VII.

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-328 Log #604 NEC-P16 **Final Action: Reject**
(840.48)

TCC Action: The Technical Correlating Committee directs this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee notes that the wording accepted in Proposal 16-349 remains because deletion of the reference to 770.48 would create a correlation issue resulting in unlisted cables entering a building without an installation application.

Submitter: William J. McCoy, Telco Sales, Inc.
Comment on Proposal No: 16-349
Recommendation: Revise text as follows:

~~Section 770.48 shall apply.~~

Conductive and Nonconductive Cables. Unlisted conductive and nonconductive outside plant optical fiber cables shall be installed up to 15 m (50 ft) from the point of entrance to its termination in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Polyvinyl Chloride Conduit: Type PVC; and Article 358, Electrical Metallic Tubing: Type EMT.

Section 770.48(B) shall apply.

FPN No. 1: Splice cases or terminal boxes both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.

FPN No. 2: See 770.2 for the definition of Point of Entrance.

Substantiation: The 50 feet exemption to install unlisted optical fiber cable past the point of entrance outlined in 770.48 has proved not to be a liability as a source of fire in communications installation when installed in vaults or rooms containing communications type equipment that meet NEBS requirements and/or has a fire suppression system. However, a number of installations for premises-powered equipment involve unlisted conductive and/or non-conductive optical fiber cable being run from the outside and installed up to 50 feet in environments, such as garages, where flammable items are stored and in some cases come in contact with the unlisted cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 7 Negative: 8
Ballot Not Returned: 1 Esemplare, R.
Explanation of Negative:

BRUNSSEN, J.: Acceptance of the comment would require all unlisted conductive and non-conductive optical fiber cables to be installed in conduit, thus conflicting with the '50-foot rule' contained in Articles 770, 800, 820 and 830. Non-conductive optical fiber cable is not susceptible to lightning and power influences and hence, is not likely to pose an electrical safety hazard or initiate a fire. The submitter has not adequately substantiated such a change to a rule that has been applied safely and effectively to communications entrance cables for many decades. Further, the comment would permit the use of rigid PVC conduit and electrical metallic tubing (EMT) not currently permitted in Article 770 and the other articles of Chapter 8. This is a significant technical revision that has not been adequately substantiated.

DORNA, G.: The definition of point of entrance in 770.2, 800.2, 820.2 and 830.2 treats outside plant cables run in grounded rigid metal conduit (Type RMC) or intermediate metal conduit (Type IMC) as outside the building. Comment 16-328 effectively extends the point of entrance by permitting the outside plant cables to be run in rigid polyvinyl chloride conduit and electrical metallic tubing.

Section 770.48 permits unlisted nonconductive, but not conductive, optical fiber cables to be run in rigid polyvinyl chloride conduit and electrical metallic tubing. The reason for the different treatment of conductive and nonconductive outside plant entrance cables is that a conductive cable may become accidentally energized and rigid metal conduit and intermediate metal conduit were considered to be adequate to carry a fault current to ground.

If comment 16-328 is accepted, unlisted conductive optical fiber cables will be permitted to be run in rigid polyvinyl chloride conduit and electrical metallic tubing, a significant change that has not been substantiated.

FUNKE, D.: Data provided was insufficient to substantiate a significant safety issue that would require this additional installation restriction.

GUBISCH, R.: There is insufficient substantiation for the need for the changes.

IVANS, R.: Although there might be some merit in revisiting the "50 foot exemption rule" with respect to how installation practices might have changed over the years, more study is required to make sure onerous requirements are not imposed that do not contribute to the level of safety of these installations. This proposal should be rejected based on the following points:

-This is completely new technical material. Although the new Article 840 was widely discussed, this topic, which substantially changes the requirement, was not part of the original proposal or in the report on proposals for the new article.

-No technical substantiation has been provided.

-There have been no reports of problems identified even though permitting outside plant cable to run 50 feet inside of a building has been permitted in Chapter 8 Articles and Article 770 for many years.

-The substantiation refers to potential issues with cables installed in garages, etc. but the proposal does not limit the new requirements to these installations. The other articles that permit outside plant cable to run up to 50 feet inside premises do not restrict the location of the installed cable.

-Adding this requirement to the new article would cause it not to be aligned with other articles where similar cable installation practices are permitted.

-The proposal is incomplete as it does not reference 770.154(C) which limits these installation methods only to locations other than plenums, risers, etc.

JANIKOWSKI, R.: No substantiation was provided to require non-conductive fiber optic cables be installed in a raceway in garages.

JOHNSON, S.: This comment presents new material and would impose additional requirements that have not had public review during the proposal period. Accepting this comment would adopt inconsistent requirements in Article 840 compared to Articles 770, 800, 820, and 830. Further, the text is in conflict with the definition of "point of entrance". The comment talks about allowing unlisted optical fiber cables to be installed beyond the "point of entrance" if said cables are within conduit. One definition of point of entrance is the point where the cable exits the conduit. This comment adds confusion to the requirement.

PIRKLE, W.: Commercial installations normally have a protective raceway to protect this cable. Residential installations in Article 300 list several installation methods to protect this cable from damage.

16-329 Log #2150 NEC-P16 **Final Action: Accept in Principle**
(840.101)

Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-349
Recommendation: Agree with the panel decision to accept in principle.

Revise text to read as follows:

840.101 Premises Circuits Not Leaving the Building. Where the ONT is served by a nonconductive optical fiber cable, or where any non-current carrying metallic member is interrupted by an insulating joint or equivalent device, and circuits that terminate at the ONT and are completely contained within the building (i.e., do not exit the building), 840.101 (A) ~~or~~ and (B) ~~or~~ and (C) shall apply as applicable.

(A) The shield of coaxial cable shall be grounded by one of the following:

(1) Any of the methods described in 820.100 or 820.106.

(2) A fixed connection ~~when using~~ to an equipment grounding conductor as described in 250.118. ~~Use of the equipment grounding conductor to ground the ONT shall not require additional grounding of the coaxial cable shield.~~

(3) Connection to the ONT grounding terminal provided that the terminal is connected to ground by one of the methods described in 800.100 or 800.106, or to an equipment grounding conductor through a listed grounding device that will retain the ground connection if the ONT is unplugged.

(B) Communications circuits shall not be required to be grounded.

(C) The ONT shall not be required to be grounded unless required by its listing. ~~Where grounding is required, connecting to an equipment grounding conductor through a listed grounding device that will retain the ground connection if the ONT is unplugged shall be permitted.~~ If the coaxial cable shield is separately grounded as ~~permitted~~ described in 840.101(A)(1) or 840.101(A)(2), the use of a cord and plug for the connection to the ONT grounding connection shall be permitted.

FPN No. 1. Where required to be grounded, a listed device that extends the equipment grounding conductor from the receptacle to the ONT equipment grounding terminal is permitted. Sizing of the extended equipment grounding conductor is covered in Table 250.122.

Substantiation: 1. Opening Paragraph - The paragraph covers the grounding of the shield, communications circuits and the ONT separately. It is therefore necessary to say A and B and C, as applicable. You need to consider grounding (or not) of each of the three items. For example, it would not be appropriate to just not ground a communications circuit, as just applying (B) would permit.

2. In (A)(2), since it is an option, "when using" is not needed. I also struck out "Use of the equipment grounding conductor to ground the ONT shall not require additional grounding of the coaxial cable shield." since this can be

misinterpreted to mean that if I ground the ONT per (C) then I don't need to do anything else. This isn't quite true, especially if the ONT is only grounded via a plug. (C) currently states that permanent grounding is permitted but not required for the ONT.

3. I added (A)(3) which permits the coax shield to be grounded through the ONT ground as long as the ONT ground is permanent. I should point out that a "listed grounding device" can be a specialty device that provides a permanent ground connection to an outlet but can also be a listed grounding clamp, terminal, etc. depending on the installation. "Permitted" is appropriate here since it is one of several alternatives required by "shall be grounded by one of the following" in (A).

4. (C) has been rewritten to only cover the ONT. Since permanent grounding of the coax shield is covered in the proposal by (A), I struck out the wording on the permanent ground connection here. I changed "permitted" to "required" since the permanent grounding of the shield is required by (A) and clarified that this only applies when the shield is grounded separately from the ONT. The last "permitted" is OK since you can ground the shield separately and also permanently ground the ONT if you want to (but don't have to!).

Panel Meeting Action: Accept in Principle

Revise submitter's text for (A)(3) as follows:

"…by one of the methods described in ~~800.100~~ 820.100 or ~~800.106,~~ 820.106 or to an equipment…".

Panel Statement: Article 820 is the appropriate reference for coaxial cable.

Comment on Proposal No: 16-349
Recommendation: Revise 840.101(A) as follows: "**(A) Grounding of the Coaxial Cable Shield.** The shield of coaxial cable shall be grounded by one of the following:" [Note: Staff has already incorporated similar text in the draft.]
Substantiation: A title is required per the NEC Style Manual.
Panel Meeting Action: Accept in Principle

Revise Title to read as follows:

(A) Coaxial Cable Shield Grounding.

Panel Statement: The revision eliminates an unnecessary preposition. This comment changes the title.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-331 Log #560 NEC-P16 **Final Action: Accept in Principle (840.101(B))**

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-349
Recommendation: Revise 840.101(B) as follows: "**(B) Grounding of Communications Circuits.** Communications circuits shall not be required to be grounded." [Note: Staff has already incorporated similar text in the draft.]
Substantiation: A title is required per the NEC Style Manual.
Panel Meeting Action: Accept in Principle

Revise Title to read as follows:

(B) Communications Circuit Grounding.

Panel Statement: The revision eliminates an unnecessary preposition. This comment changes the title.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-332 Log #561 NEC-P16 **Final Action: Accept in Principle (840.101(C))**

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-349
Recommendation: Revise 840.101(C) as follows: "**(C) Grounding of The ONT.** The ONT shall not be required to be grounded unless required by its listing." The remaining text is unchanged. [Note: Staff has already incorporated similar text in the draft.]
Substantiation: A title is required per the NEC Style Manual.
Panel Meeting Action: Accept in Principle

Revise Title to read as follows:

"(C) ONT Grounding."

Panel Statement: The revision eliminates an unnecessary preposition. This comment changes the title.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-333 Log #562 NEC-P16 **Final Action: Accept (840.101(C), FPN)**

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-349
Recommendation: Revise 840.101(C) FPN as follows: "~~FPN No. 1.~~ Informational Note: Where required to be grounded, a listed device …". The remaining text is unchanged. [Note: Staff has already incorporated the revision in the draft.]
Substantiation: "FPN" has been replaced by "Informational Note". There is only one note, hence no need to number.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-334 Log #1906 NEC-P16 **Final Action: Accept in Principle in Part (840.106(A) and (B))**

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 16-349
Recommendation: Revise text to read as follows:

840.106 Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with (1) and (2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ONT, if required to be grounded, shall be connected to a grounding electrode ~~conductor~~ in accordance with 840.100. Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93.

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, ONT, if required to be grounded, shall be connected to a grounding electrode ~~conductor~~ in accordance with 840.100. Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93.

(B) Bonding. The ONT grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper grounding electrode conductor not smaller than 12 AWG under any of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 840.106(A).

(2) Where the mobile home is supplied by cord and plug.

Substantiation: This comment responds to the action of CMP-5 to delete the definition of the term "grounding conductor" in Article 100 and revise the definition of the term "grounding electrode conductor" to include functions necessary in the Chapter 8 articles. As contained in the 2008 edition of the NEC, two different definitions that apply to the same component in the grounding scheme are unnecessary and can lead to confusion. Conductors that connect equipment to the earth through a grounding electrode should be identified as "grounding electrode conductors." This revision is made to provide consistency and correlation with defined grounding and bonding terms in Article 100 and not result in the use of an orphaned undefined term in Article 840.

These comments address the changes suggested in other proposals for Chapter 8 articles for each section within Article 840 where the term "grounding conductor" is used. These comments are developed using the 2011 ROP draft text so the initial work of CMP-16 remains undisturbed. As suggested in the proposal, this comment replaces the term "grounding conductor" with "grounding electrode conductor", or, if more appropriate, with the term "bonding jumper" or "bonding conductor" in each specific section where the term "grounding conductor" is used. The revisions to each section improve clarity, maintain their meaning, and are consistent with the definitions in Article 100 as revised.

Other editorial changes are included to improve the syntax but intend to maintain the existing meaning without introducing a new concept.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

840.106 Grounding and Bonding at Mobile Homes.

(A) Grounding. Grounding shall comply with (1) and (2).

(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ONT, if required to be grounded, shall be connected to a grounding electrode ~~conductor~~ in accordance with 840.100. Premises communications circuits and premises community

antenna television (CATV) circuits shall be grounded in accordance with 840.93.
(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, ONT, if required to be grounded, shall be connected to a grounding electrode ~~conductor~~ in accordance with 840.100. Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93.
(B) Bonding. The ONT grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper ~~grounding electrode~~ conductor not smaller than 12 AWG under any of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 840.106(A).
(2) Where the mobile home is supplied by cord and plug.
Panel Statement: The panel accepts the submitter's text for 840.106(A).
The suggested change to 840.106(B) is inappropriate as it is not a connection to a grounding electrode that is being discussed, but a bond to the metal frame of the mobile home.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
BRUNSSEN, J.: Editorially insert "the" before "ONT" in 840.106(A)(2).
OHDE, H.: See our affirmative comment for Comment 16-22.

16-335 Log #2444 NEC-P16 **Final Action: Accept in Principle**
(840.106(A) and (B))

Submitter: Keith Lofland, IAEI
Comment on Proposal No: 16-349
Recommendation: Revise text to read as follows:
820.106 Grounding and Bonding at Mobile Homes.
(A) Grounding. Grounding shall comply with (1) and (2).
(1) Where there is no mobile home service equipment located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ONT, if required to be grounded, shall be connected to a grounding electrode ~~conductor~~ in accordance with 840.100. Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93.
(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, ONT, if required to be grounded, shall be connected to a grounding electrode ~~conductor~~ in accordance with 840.100. Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93.
(B) Bonding. The ONT grounding terminal or grounding electrode shall be connected to the metal frame or available grounding terminal of the mobile home with a copper grounding electrode conductor not smaller than 12 AWG under any of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 840.106(A).
(2) Where the mobile home is supplied by cord and plug.
Substantiation: Proposals have been submitted and at current, have been accepted to delete the term "grounding conductor" in Article 100. This proposal and comment for revision should be accepted by CMP-16 to complete the work of the Tack Group from CMP-5 and CMP-16.
From a teaching or instruction standpoint, it is critical to get students of the NEC to use proper terminology. For the sake of the entire student body, the instructor cannot allow a student to call a concrete-encased electrode a "Ufer" ground or refer to nonmetallic-sheathed cable as "romex". For the NEC to use incomplete or inadequate terms such as "grounding conductor" is equally if not more damaging to the learning environment.
Panel Meeting Action: Accept in Principle
Panel Statement: See action and statement on Comment 16-334.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.
Comment on Affirmative:
OHDE, H.: See our affirmative comment for Comment 16-22.

16-336 Log #563 NEC-P16 **Final Action: Reject**
(840.106(A)(1))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-349
Recommendation: Revise the last sentence of 840.106(A)(1) as follows:
"Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded or interrupted in accordance with 840.93."
Substantiation: Revise to include interruption. 840.93 permits grounding or interruption.
Panel Meeting Action: Reject
Panel Statement: The panel does not accept the submitter's text. Grounding is required; interruption is not an option.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-337 Log #564 NEC-P16 **Final Action: Accept**
(840.106(A)(2))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-349
Recommendation: Revise as follows: "(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the ONT, if required to be grounded, shall be connected to a grounding conductor in accordance with ~~840.100(B)(3)~~800.100(B)(3). Premises communications circuits and premises community antenna television (CATV) circuits shall be grounded in accordance with 840.93."
Substantiation: This section refers to 840.100(B)(3) that was deleted by the Panel and is an invalid reference. Under the conditions of 840.106(A)(2), grounding according to 800.100 (B)(3) is appropriate. Grammatically add the article "the" before "ONT".
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-338 Log #565 NEC-P16 **Final Action: Accept**
(840.133)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 16-349
Recommendation: Revise as follows: "**840.133 Installation of Optical Fibers and Electrical Conductors Associated with Premises-Powered Broadband Communications Systems.**
Substantiation: Revise editorially for correlation with 770.133 and the title of Article 840.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

16-339 Log #2146 NEC-P16 **Final Action: Accept**
(840.170(D))

Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-349
Recommendation: Agree with the panel decision to accept in principle.
Revise text to read as follows:
(D) Premises Community Antenna Television (CATV) Circuits. Premises community antenna television (CATV) coaxial cables connecting to the ONT shall be listed in accordance with 820.179. Applicable grounding means shall be listed for application with premises-powered broadband communications systems.
Substantiation: Paragraph 840.101(A) requires grounding of the coaxial shield. Grounding methods described in 840.101(A)(1) and 840.101(A)(2) do not require the grounding connection to be made via the ONT. Currently paragraph 840.170(A) requires the ONT grounding means to be listed but this does not necessarily automatically extend to grounding means not associated directly with the ONT. This proposal clarifies the requirement for listing.
Listed devices are readily available and certified under categories such as "Communication Grounding and Bonding Equipment" and "Grounding and Bonding Equipment". The basic standard used to investigate products in these categories is ANSI/UL 467, "Grounding and Bonding Equipment."
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Esemplare, R.

ARTICLE 862

16-340 Log #1213 NEC-P16 **Final Action: Reject**
(862 (New))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 16-350
Recommendation: This proposal should been Accepted.
Substantiation: This proposal and the associated proposals for the new raceway article should have been accepted or accepted in principle. A Panel action to correct the acronym "OFCR" and to revise the definition to remove the reference to a "corrugated raceway of circular cross section" could have been easily completed by Panel 16.

I recommend that the Panel Action for this comment be "Hold for Further Study". I also recommend that a NFPA Task Group consisting of Panel Members from Panels 3, 8 and 16 be assembled to address the new raceway article for the 2014 NEC.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided text to address the issues in the panel reject statement in the ROP. The panel has taken steps to reduce the proliferation of raceway types by eliminating CATV raceways to correlate with NFPA 90A, which only recognizes optical fiber and communications raceways.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

CHAPTER 9 TABLES

6-83 Log #566 NEC-P06 **Final Action: Accept**
(Chapter 9, Table Notes)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 6-177
Recommendation: Accept the proposal in principle in part. Accept the part that adds optical fiber cables to Note 5. Revise Note 5 as follows: "(5) For conductors not included in Chapter 9 such as multi-conductor cables and optical fiber cables, the actual dimensions shall be used.
Substantiation: Presently Chapter 9 Table Note (5) only addresses conductors. Optical fiber cables are not considered conductors. Acceptance in Principal in Part of Proposal 6-177 would include optical fiber cables. Inclusion of optical fiber cables in note 5 will bring about correlation with section 770.110 of the current edition of the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-84 Log #576 NEC-P06 **Final Action: Accept**
(Chapter 9, Tables)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 6-181
Recommendation: Accept new text as originally submitted.
Substantiation: Dimensions for Types RHH, RHW, or USE were obtained from industry sources. Bare conductor dimensions are from UL 1581 standard. UL does not specify insulated conductor dimensions, only wall thicknesses.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

8-128 Log #567 NEC-P08 **Final Action: Accept**
(Chapter 9, Table Notes)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 8-278
Recommendation: Accept the proposal in principle in part. Accept the part that adds optical fiber cables to Note 5. Revise Note 5 as follows:
"(5) For conductors not included in Chapter 9 such as multiconductor cables and optical fiber cables, the actual dimensions shall be used."
Substantiation: Presently, Chapter 9 Table Note (5) only addresses conductors. Optical fiber cables are not considered conductors. Acceptance in Principal in Part of Proposal 8-278 would include optical fiber cables. Inclusion of optical fiber cables in note 5 will bring about correlation with section 770.110 of the current edition of the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

6-85 Log #23 NEC-P06 **Final Action: Accept in Part**
(Chapter 9, Table Notes)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 6-177
Recommendation: Accept the proposed changes in Note 5.
Substantiation: Acceptance of the inclusion of optical fiber cables in note 5 will bring about correlation with section 770.110 of the current edition of the NEC. The last sentence of 770.110 states "Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply."

See also proposal 16-47 which reorganizes section 770.110. Panel 16 action on proposal 16-47 retains the reference to Chapter 9 in 770.110(B)(1) and 770.110(B)(2).
Panel Meeting Action: Accept in Part

See panel action on Comment 6-83.
Panel Statement: The Panel agrees with the inclusion of optical fiber cables in note 5 as recommended in the proposal see panel action on Comment 6-83.

The panel rejects adding the language "flexible cords and cable".

No technical substantiation was provided for the rejected change. There is no evidence that there is a problem or confusion with the current code text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

8-129 Log #24 NEC-P08 **Final Action: Accept in Part**
(Chapter 9, Table Notes)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 8-278
Recommendation: Accept the proposed changes in Note 5.
Substantiation: Acceptance of the inclusion of optical fiber cables in note 5 will bring about correlation with section 770.110 of the current edition of the NEC. The last sentence of 770.110 states "Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply."

See also proposal 16-47 which reorganizes section 770.110. Panel 16 action on proposal 16-47 retains the reference to Chapter 9 in 770.110(B)(1) and 770.110(B)(2).
Panel Meeting Action: Accept in Part
Panel Statement: See panel action on Comment 8-128. CMP 8 accepts the addition of "and optical fiber cables," and continues to reject the rest of Proposal 8-278.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

1-151 Log #2386 NEC-P01 **Final Action: Accept in Principle**
(Chapter 9, Tables 13(A) and 13(B))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 1-274
Recommendation: Accept in Principle. Place this material in a new informational Annex X. A correlating change to Section 110.5 ought to be considered also::

110.5 Conductors. Conductors normally used to carry current shall be of copper unless otherwise provided in this Code. Where the conductor material is not specified, the material and the sizes given in this Code shall apply to copper **or aluminum** conductors. Where other materials are used, the size shall be changed accordingly.
Substantiation: Assuming that the submitter will return in the ROC with UL and CEC with data that lines up accurately and can be formatted according to the NEC Style Manual, let us consider the committee's basis for rejection:.

The panel claims, "The addition of these tightening torque values to the NEC has not been technically substantiated." It is noteworthy that "technical substantiation" is, itself, unsubstantiated, as shown in Section 4.4.3 of the NFPA Regulations Governing Committee Projects.

4.3.3 Content of Proposals. Each Proposal shall be submitted to the Council Secretary and shall include the following:

(a) Identification of the submitter and his or her affiliation (i.e., TC, organization, company), where appropriate

(b) Identification of the Document, edition of the Document, and paragraph of the Document to which the Proposal is directed

(c) Proposed text of the Proposal, including the wording to be added, revised (and how revised), or deleted

(d) Statement of the problem and substantiation for Proposal

(e) The signature of the submitter or other means of authentication approved by the Council Secretary

(f) Two copies of any document(s) (other than an NFPA document) being proposed as a reference standard or publication (see 3.3.7)

The significance of torque-tightening ought to be intuitively obvious. The

Fine Print Note at the end of 110.14 reflects this; reproduced below for the convenience of the Panel.

FPN: Many terminations and equipment are marked with a tightening torque.

Elsewhere, the word torque shows up in NFPA 70B twelve times. To its credit, the Committee gave the submitter a prescription for how this proposal might be rehabilitated and re-submitted in the ROC to increase its chances of eventual integration into the 2011 NEC. There is a strong tailwind in the electrical construction market that needs this change in the NEC now.

Panel Meeting Action: Accept in Principle

See the panel action on Comment 1-152.

Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

6-86 Log #2460 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 5)

Submitter: Edward Walton, WC Services

Comment on Proposal No: 6-179

Recommendation: In response to the panel statement:

1. Revise Table 5 Note to read *Types RHH, RHW and RHW-2 with composite insulation.

2, Insert in the appropriate location of Chapter 9, Table 5 the corrected dimensions for Types RHH*, RHW* and RHW-2* as shown in the table I have provided.

See Chapter 9, Table 5 on Page 665

Substantiation: 1. Conforms with the UL 44 description consisting of an inner and outer layer as shown in UL 44 Table 15 that I have provided.

2. I have also provided a UL Table which contains the corrected diameters and areas for Types RHH, RHW and RHW-2 with composite insulation.

It should be noted that these conductor types require an insulation per Table 15 plus an outer jacket per Table 21 or a composite insulation, but are not approved as an insulation without an outer jacket.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided a specific instruction or complete tables including the retention of the existing conductors without outer jacket. Furthermore, the panel disagrees with the submitters substantiation "It should be noted that these conductor types require an insulation per Table 15 plus an outer jacket per Table 21 or a composite insulation, but are not approved as an insulation without an outer jacket." RHH, RHW, and RHW-2 conductors can be approved as an insulation without an outer jacket.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-87 Log #1019 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 5)

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481

Comment on Proposal No: 6-178

Recommendation: To the members of Code-Making Panels 6 and 8 concerning: Proposal 6-178, Log 2554, NEC-P-06 and Proposal 8-282, Log 2554a, NEC-P-08.

Substantiation: There is an error in Annex C for #10 THW conductors. This error has been in the NEC since the 2002 edition when Chapter, 9 Table 5 was condensed. The approximate area of fill for one #10 THW conductor was changed from.0333 in.^{2} to its current 0.0243 in.^{2} (Chapter 9, Table 5 of the 2008 NEC) without making a change to Annex C. (See the paperwork I have provided).

For example: If I needed to find out how many #10 THW conductors will be allowed at 40% fill in a 1 1/4 in. EMT conduit, I would go to Chapter 9, Table 4 and find the area is 0.598 in.^{2}. Dividing 0.598 in.^{2} (40% fill) by 0.0243 in.^{2} (area of a single #10 THW) equals 24 conductors in a 1 1/4 EMT conduit. The Annex C, Table C.1 answer is 18.

Another example: If I needed to find out how many #10 THW conductors will be allowed at 40% fill in a 2 in. Schedule 40 PVC conduit, I would go to Chapter 9, Table 4 and find the area is 1.316 in.^{2}. Dividing 1.316 in.^{2} (40% fill) by 0.0243 in.^{2} (area of a single #10 THW) equals 54 conductors in a 2 in. PVC conduit. The Annex C, Table C.10 answer is 39.

A final example: If I needed to find out how many #10 THW conductors will be allowed at 40% fill in a 3 1/2 in. rigid metal conduit, I would go to Chapter 9, Table 4 and find the area is 1.316 in.^{2}. Dividing 4.004 in.^{2} (40% fill) by 0.243 in.^{2} (area of a single #10 THW) equals 164 conductors in a 3 1/2 in. rigid metal conduit. The Annex C, Table C.8 answer is 120.

All of these examples were calculated and checked using a current 2008 NEC code book.

There are two possible solutions to this problem, either modify Annex C (I have provided examples with corrected numbers), or change the Chapter 9, Table 5 value of #10 THW back to its 1999 NEC value of 0.0333 in.^{2}. I have provided copies of the 1999, 2002 (with 10 THW double listed), 2005, and 2008 Chapter 9, Table 5 areas highlighted. Cod- Making Panel 6 has stated that the Chapter 9, Table 5 values for #10 THW are correct. I was unaware of any change to area of 10 THW between the years 1999 and 2002, but if there was, then the second solution may not be valid.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel has confirmed that the values in Table 5 of Chapter 9 are correct. The panel has confirmed that a comment has been submitted to Panel 8 to review Annex C.

6-90 Log #407 NEC-P06 **Final Action: Accept**
(Chapter 9, Table 8, FPN)

TCC Action: The Technical Correlating Committee notes that Proposal 8-281 was "Accepted" by Code-Making Panel 8, however, it was inadvertently marked as "Reject" as the final action in the Report on Proposals.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 8-281

Recommendation: Continue to accept the proposal.

Substantiation: This proposal removes the slang construction that substitutes "per" for "in accordance with" and is correct and enhances clarity. It is therefore to be distinguished from those proposals that would remove a perfectly concise and correct use of the word as a proposition meaning "for each". Comments have been submitted on all such proposals accordingly.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

1-152 Log #2733 NEC-P01 **Final Action: Accept**
(Chapter 9, Tables 13(A) and 13(B))

Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 1-274
Recommendation: Add language and three Recommended Tightening Torque Tables from UL 486 Standard to a new informational Annex as suggested by the Panel in their ROP Comment to read as follows:

Annex I: Recommended Tightening Torque Tables from UL Standard 486A-B

See Tables 21, 22 and 23 on Page 667

In the absence of connector or equipment manufacturer's recommended torque values, the following tables may be used to correctly tighten screw-type connections for power and lighting circuits*. Control and signal circuits may require different torque values and the manufacturer should be contacted for guidance.
Substantiation: Improper electrical connections are a problem for the entire electrical industry. They are the biggest cause of electrical failures. No less than the Super Haldron particle accelerator in Switzerland, costing billions of dollars, has been shut down because of an electrical connection failure.

The addition of Recommended Torque Tightening Tables would help the electrical industry to reduce connection problems, because their inclusion would make proper tightening torque values readily available where not marked on the connector, or equipment, or where the installation instructions no longer accompany the connector. Furthermore, the explicit inclusion in the Code would also make it very clear that torque wrenches are needed to comply with manufacturers' installation instructions for mechanical set screw connectors.

When independent testing laboratories, such as ETL and UL, do load cycling tests on set-screw mechanical connectors, they are installed on test racks with torque wrenches. If electricians without torque wrenches installed the connectors on test racks, the variations in their performance would be unacceptable, which is why installation to very specific tightening torque is mandated.

Theoretically, 110.3(B) already requires that set-screw mechanical connectors be installed to manufacturers recommended torque values, or in their absence default values from UL Standards. However, the reality in the field is that very few electricians have torque wrenches.

Regarding the concern about control circuit conductor terminals of industrial control equipment, they can easily be excluded with the addition of specific language.

Alcan Cable sponsored torque-tightening demonstrations at the recent NJATC National Training Exposition and the NECA Show And even when given the manufacturers' recommended installation torque values. Fifty-seven percent under-tightened by more than 20 percent, and 19 percent over-tightened by more than 20 percent.

This weak link connecting the NEC, UL performance testing and field installation will be improved by the proposed inclusion of Recommended Torque Tightening Tables in the NEC's new informational annex.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the three tables are the copyrighted property of UL, and permission for their usage has been requested and received by NFPA.

The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX A – PRODUCT SAFETY STANDARDS

1-153 Log #323 NEC-P01 **Final Action: Accept**
(Annex A)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-301
Recommendation: The Technical Correlating Committee directs that this proposal be forwarded to Code-Making Panel 1 for action

This action will be considered by Code-Making panel 1 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel "Accepts in Part" the action taken by Code-Making Panel 14 on Proposal 14-301, with the exception of the following:

Delete the following reference as the second reference in the proposal to this document is the correct reference.
"ISA 12.13.01, Combustible Gas Detectors, Performance Requirements for ANSI/ISA-60079-29-1."
Panel Statement: The panel accepts the directive of the Technical Correlating Committee to review Proposal 14-301.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX B – APPLICATION INFORMATION FOR AMPACITY CALCULATION

6-91 Log #408 NEC-P06 **Final Action: Accept**
(Figure B310.3, FPN)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-187
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept

800 – 1000	(405 – 508)	–		–		4.5	(40)	5.6	(50)	111.7	(900)	124.3	(1100)	45.2	(400)	56.5	(500)
1250 – 2000	(635 –1010)	–		–		–		–		111.7	(900)	124.3	(1100)	56.5	(500)	67.8	(600)

[a] For values of slot width or length not corresponding to those specified select the largest torque value associated with the conductor size. Slot width is the nominal design value. Slot length shall be measured at the bottom of the slot.

Table 22 – Tightening torque for slotted head screws smaller than No. 10 intended for use with 8 AWG (8.4 mm²) or smaller conductors (Clauses 9.1.9.4 and 9.1.9.6)

Slot length of screw[a]		Tightening torque, N-m (lbf-in)			
		Slot width of screw smaller than 1.2 mm (0.047 in)[b]		Slot width of screw 1.2 mm (0.047 in) and larger[b]	
mm	(in)	A	B	A	B
Less than 4	(Less than 5/32)	0.68 (6)	0.79 (7)	0.79 (7)	1.0 (9)
4	(5/32)	0.68 (6)	0.79 (7)	1.1 (10)	1.4 (12)
4.8	(3/16)	0.68 (6)	0.79 (7)	1.1 (10)	1.4 (12)
5.5	(7/32)	0.68 (6)	0.79 (7)	1.1 (10)	1.4 (12)
6.4	(1/4)	0.79 (7)	1.0 (9)	1.1 (10)	1.4 (12)
7.1	(9/32)			1.4 (12)	1.7 (15)
Above 7.1	(Above 9/32)			1.8 (15)	2.3 (20)

[a] For slot lengths of intermediate values, select torques pertaining to next shorter slot lengths. Also, see 9.1.9.6 for screws with multiple tightening means. Slot length shall be measured at the bottom of the slot.

[b] Slot width is the nominal design value.

Table 23 – Tightening torque for screws with recessed alien or square drives (Clauses 9.1.9.4 and 9.1.9.6)

Socket width across flats[a]		Tightening torque, N-m (lbf-in)			
mm	(in)	A		B	
3.2	(1/8)	4.0	(35)	5.1	(45)
4.0	(5/32)	9.0	(80)	11.3	(100)
4.8	(3/16)	11.3	(100)	13.5	(120)
5.5	(7/32)	13.5	(120)	16.9	(150)
6.4	(1/4)	16.9	(150)	22.5	(200)
7.9	(5/16)	25.4	(225)	31.1	(275)
9.5	(3/8)	33.9	(300)	42.4	(375)
12.7	(1/2)	45.2	(400)	56.5	(500)
14.3	(9/16)	56.5	(500)	67.8	(600)

[a] See 9.1.9.6 for screws with multiple tightening means.

*For proper termination of conductors, it is very important that field connections be properly tightened. In the absence of manufacturer's instructions on the equipment, the torque values given in these tables are recommended. Because it is normal for some relaxation to occur in service, checking torque values sometime after installation is not a reliable means of determining the values of torque applied at installation.

6-93 Log #410 NEC-P06 **Final Action: Accept**
(Table B310.5)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-191
Recommendation: The proposal should be accepted in part. Accept the second change from "per" to "in Accordance with" but reject the first change from "per" to "in Each".
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the portion of this proposal that corrects such an instance is to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of the first change in this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

Ballot Results: Affirmative: 11

6-98 Log #415 NEC-P06 **Final Action: Accept**
(Table B310.9)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-196
Recommendation: Continue to accept the proposal.
Substantiation: This proposal removes the slang construction that substitutes "per" for "in accordance with" and is correct and enhances clarity. It is therefore to be distinguished from those proposals that would remove a perfectly concise and correct use of the word as a proposition meaning "for each". Comments have been submitted on all such proposals accordingly.
Panel Meeting Action: Accept
Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-99 Log #416 NEC-P06 **Final Action: Accept**
(Table B310.10)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-197
Recommendation: Continue to accept the proposal.
Substantiation: This proposal removes the slang construction that substitutes "per" for "in accordance with" and is correct and enhances clarity. It is therefore to be distinguished from those proposals that would remove a perfectly concise and correct use of the word as a proposition meaning "for each". Comments have been submitted on all such proposals accordingly.

Ballot Results: Affirmative: 11

6-100 Log #472 NEC-P06 **Final Action: Accept in Part**
(Table B310.11)

Submitter: Steven R. Terry, Electronic Theatre Controls Inc.
Comment on Proposal No: 6-199
Recommendation: 1. Revise Table Heading Column 1 of the proposal to: Number of Current-Carrying Conductors (See Note 1).
2. Continue to add Note below the table as per the proposal.
Substantiation: Whether or not the change of the table headings for Tables B.310.11 and 310.15(B)(2)(a) in 1993 from "Number of Conductors" to "Number of Current-Carrying Conductors" were accompanied by an associated Proposal or Panel Action does not alter the fact that the change made the table clearer! CMP 6 did us a favor in 1993 with this editorial change! Previous to this change, there was always confusion between the number of physical conductors, and those conductors that are to be used in this Ampacity Adjustment Factor calculation. This proposal actually improves the situation by the addition of Note 1 to remind the reader how to arrive at the number of current carrying conductors. However, the revision of the table heading is obfuscating and confusing, because it conflicts with the section title and requires the reader to follow Note 1 to determine that this particular "Number of Conductors" is not simply that, but rather a "special definition" arrived at by applying the recommendation of Note 1, not what the heading actually says.
This is very confusing, and the Code would be much better with the original column heading, but with the parenthetical reference to the new Note.
Note: I have made an accompanying comment to Proposal 6-57 for Table B.310.15(B)(2)(a).
Panel Meeting Action: Accept in Part
The panel rejects part 1. With the mandatory note below the table, it is clear that all conductors, except in accordance with 310.15(B)(4) and (5), are to be included. The panel accepts Part 2 of the submitters comment.
Panel Statement: The panel continues to accept Part 2 of the comment while rejecting Part 1 of the comment. See panel action and statement on Comment 6-24.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-101 Log #2686 NEC-P06 **Final Action: Accept**
(Table B.310.11)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-199
Recommendation: Accept the panel action in part.
Reject the deletion of the word "total" from the description of the term "N".
Substantiation: The word "total" is a significant help with assisting with general understanding of the point that all potentially current-carrying conductors are counted. It is quite true that upon reflection the "number of conductors that may be current-carrying" does involve the total, but the word should be left to make the point immediately intuitively obvious.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ANNEX C – CONDUIT AND TUBING FILL FOR CONDUCTORS AND FIXTURE WIRES OF THE SAME SIZE

8-130 Log #1019a NEC-P08 **Final Action: Reject**
(Annex C)

TCC Action: The Technical Correlating Committee directs the chair of Code-Making Panel 6 to appoint a Task Group comprised of members from Code-Making Panels 6 and 8 to review Annex C for correlation to evaluate and provide any necessary corrections to tables that pertain to raceway fill for the 2014 edition of the NEC.

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481
Comment on Proposal No: 8-282
Recommendation: To the members of Code-Making Panels 6 and 8 concerning: Proposal 6-178, Log 2554, NEC-P-06 and Proposal 8-282, Log 2554a, NEC-P-08.
Substantiation: There is an error in Annex C for #10 THW conductors. This error has been in the NEC since the 2002 edition when Chapter, 9 Table 5 was condensed. The approximate area of fill for one #10 THW conductor was changed from.0333 in.^{2} to its current 0.0243 in.^{2} (Chapter 9, Table 5 of the 2008 NEC) without making a change to Annex C. (See the paperwork I have provided).
For example: If I needed to find out how many #10 THW conductors will be allowed at 40% fill in a 1 1/4 in. EMT conduit, I would go to Chapter 9, Table 4 and find the area is 0.598 in.^{2}. Dividing 0.598 in.^{2} (40% fill) by 0.0243 in.^{2} (area of a single #10 THW) equals 24 conductors in a 1 1/4 EMT conduit. The Annex C, Table C.1 answer is 18.
Another example: If I needed to find out how many #10 THW conductors will be allowed at 40% fill in a 2 in. Schedule 40 PVC conduit, I would go to Chapter 9, Table 4 and find the area is 1.316 in.^{2}. Dividing 1.316 in.^{2} (40% fill) by 0.0243 in.^{2} (area of a single #10 THW) equals 54 conductors in a 2 in. PVC conduit. The Annex C, Table C.10 answer is 39.
A final example: If I needed to find out how many #10 THW conductors will be allowed at 40% fill in a 3 1/2 in. rigid metal conduit, I would go to Chapter 9, Table 4 and find the area is 1.316 in.^{2}. Dividing 4.004 in.^{2} (40% fill) by 0.243 in.^{2} (area of a single #10 THW) equals 164 conductors in a 3 1/2 in. rigid metal conduit. The Annex C, Table C.8 answer is 120.
All of these examples were calculated and checked using a current 2008 NEC code book.
There are two possible solutions to this problem, either modify Annex C (I have provided examples with corrected numbers), or change the Chapter 9, Table 5 value of #10 THW back to its 1999 NEC value of 0.0333 in.^{2}. I have provided copies of the 1999, 2002 (with 10 THW double listed), 2005, and 2008 Chapter 9, Table 5 areas highlighted. Cod- Making Panel 6 has stated that the Chapter 9, Table 5 values for #10 THW are correct. I was unaware of any change to area of 10 THW between the years 1999 and 2002, but if there was, then the second solution may not be valid.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This comment does not comply with Section 4.4.5 of the NFPA Regulations Governing Committee Projects in that it does not provide text of the comment, including the wording to be added, revised (and how revised), or deleted.
Per the panel action and statement on Proposal 6-178, CMP 6 states that the dimension for 10 AWG THW in Chapter 9, Table 5 is correct. The new numbers of conductors for Annex C seem correct however, the new values require public review before publication. Informational Annexes are not mandatory.
CMP 8 recommends a task group be formed comprised of CMP 6 and CMP 8 members to review for accuracy the tables in Informational Annex C.
CMP 8 understands that a change in conductor type THW insulation thickness occurred in the 2002 code cycle, and CMP 8 at that time rejected a proposal to revise annex C for this conductor type based on products manufactured prior to the effective date were still being installed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

2-189 Log #2687 NEC-P02 **Final Action: Accept in Principle**
(Annex A through H)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-372
Recommendation: Correct the title of Annex C in the proposal wording to say "…Conductors and Fixtures Wires…".
Substantiation: This Annex was not retitled. A proposal to substitute luminaire wires for fixture wires in Article 402 (Proposal 6-172) failed, as it should have failed, and this annex title should not be changed.

Panel Meeting Action: Accept in Principle
Panel Statement: The panel agrees with the submitter; however, this is a staff responsibility.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX D − EXAMPLES

2-190 Log #417 NEC-P02 **Final Action: Accept**
(Example D.1(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-374
Recommendation: The Proposal should continue to be accepted.
Substantiation: Although the use of the word "per" in this context does not violate the NEC Style Manual, its use in this context where the other units are abbreviated is appropriate. The context is a formula, and the multiplication of terms (ft^2 by VA/ft^2) is more easily understood by a reader as leading to the correct unit (VA). This comment is offered in distinction to others by this submitter opposing the withdrawal of the term "per" so as to help clarify when this change would be editorially correct. It may be well advised, however, to await any advice from the Glossary of Terms Committee before making any such changes.
Panel Meeting Action: Accept

Comment on Proposal No: 2-373
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-192 Log #418 NEC-P02 **Final Action: Accept**
(Example D.1(b))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-376
Recommendation: The proposal should be accepted in principle and in part. Do not remove the word "per". Accept in principle correcting the reference to a "line", but do so by replacing "line" with "conductor."
Substantiation: All three columns have load totals that reflect some definite current loading on a set of service (or feeder) conductors, and this comment makes the required correction. Of course, the principal focus of the original proposal is to remove "per" from the NEC on the grounds that it does not belong in a standard. That premise is frequently correct, such as when it is used as a slang term for "in accordance with", and in some other cases where a slash mark (meaning division) can be used in a formulaic presentation. However, it is not correct when it is used in the sense of "for each".

The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel." A majority of the code-making panels have made a similar assessment.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-202 Log #424 NEC-P02 **Final Action: Accept**
(Example D.5(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-388
Recommendation: The proposal should be accepted in part. Accept the first change that changes "per" to "in accordance with" Reject the reminder of the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the first part of this proposal to correct such an instance is to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the second and third recommendations of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept

2-203 Log #425 NEC-P02 **Final Action: Accept**
(Example D.5(b))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-389
Recommendation: The proposal should be accepted in part. Accept the first change that replaces "per" with "in accordance with". Reject the second change that results in "120V/leg".
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the first part of this proposal to correct such an instance is to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in this case it would be confusing and less clear because the remainder of the line uses division symbols that create a flow of text. The slash mark is confusing in this case because it would is a second and differing mathematical symbol also intended to convey the sense of division, but in this case with "leg" in the denominator. This is more confusing to the reader than the simple (and proper) use of the word "per" as in "for each".

(Example D.11)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-310
Recommendation: Accept the proposal in part. Accept the first change that converts "VA per ft2" to "VA/ft2" and the part of the last change that replaces "50A" with "50-ampere"; continue to reject the other proposed changes.
Substantiation: Although the use of the word "per" in the first instance does not violate the NEC Style Manual, its use here where the other units are abbreviated is appropriate. The context is a formula, and the multiplication of terms (ft by ft by VA/ft2) is more easily understood by a reader as leading to the correct unit (VA). The second change should continue to be rejected for a closely related reason; the ampere value obtained will immediately become the subject of further mathematical calculations, and here again, anything that enhances a reader's understanding of how the cancellation (or non-cancellation) of units can be used to judge the correctness of a final result is to be encouraged. The term "leg is indeed used in other residential examples, including Example D5(a) and D5(b). The conclusion should read "… a 50-ampere supply cord" because the general rules in the Style Manual should be applied here, the point where there are no further calculations to be made.
Panel Meeting Action: Reject
Panel Statement: The panel has rejected this comment to maintain consistency throughout the Code.
The Technical Correlating Committee may want to consider addressing this issue in the next revision of the NEC Style Manual.

The Technical Correlating Committee may want to consider addressing this issue in the next revision of the NEC Style Manual.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-222 Log #1032 NEC-P19 **Final Action: Reject**
(Example D.12)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-311
Recommendation: The Proposal should be Accepted in Part and revise under Lighting and Small-Appliance Load: "Lighting (70 ft × 10 ft × 3 VA/ft^2 ~~VA per ft2~~)"
The remainder of the Proposal should continue to be Rejected.
Substantiation: While the NEC Style Manual does not specifically show VA/ft^2, it does show that cubic feet per minute should be styled as "ft^3/min" and this would be analogous to the proposed "VA/ft^2".
Panel Meeting Action: Reject
Panel Statement: The panel has rejected this comment to maintain consistency throughout the Code.
The Technical Correlating Committee may want to consider addressing this issue in the next revision of the NEC Style Manual.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

ANNEX I

3-249 Log #2851 NEC-P03 **Final Action: Reject**
(Annex I (New))

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 3-340
Recommendation: The panel should accept the proposal and develop the new Annex I.
Substantiation: The panel statement that this "information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 3-161.
Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

16-341 Log #2850 NEC-P16 **Final Action: Reject**
(Annex I (New))

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 16-351
Recommendation: The Panel should accept this proposal and develop the new Annex I.
Substantiation: The panel statement that "the FPNs are more user-friendly in current locations" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: The panel sees the addition of an Annex as unnecessary.
FPN information is valuable for the user of the Code and the user should not have to go back to an annex to find it.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

NFPA 70®

National Electrical Code® (Report on Proposals)

Proposed 2011 Edition

Reference: **4-263 (Log #4499) Panel Statement**

The National Electrical Code Technical Correlating Committee notes the following error in the ROP on NFPA 70®, *National Electrical Code*®.

1. Proposal 4-263 on page 889 of the ROP has an incorrect panel statement. This proposal recommends a new Article 694. The published panel statement repeated the panel action. Shown below is the panel statement as it should have been published.

Panel Statement:

1. In the definitions, the term "battery" was replaced by "battery or other energy storage device" to allow new devices such as UltraCapacitors to be included.
2. The "Rated Power" definition was revised to recognize that maximum turbine power output can occur at wind speeds of less than 11 m/s.
3. The "Maximum Power" definition was revised – "peak instantaneous" was changed to "instantaneous", "peak" being redundant.
4. The reference to "motor generators" was removed from 694.4(B) to eliminate ambiguity and because motor generators are not used in Small Wind Electric Systems.
5. 694.4(A) was changed to be the same as the language in 690 (indicating that one or more systems are permissible).
6. 694.4(B) was reworded to improve clarity.
7. The location requirement in 694.14(C)(5) (grouping) was moved to 694.14(C)(1) (location) and reworded to improve clarity.
8. The exception to 694.9 was changed to recognize that, unlike PV systems, wind turbine inverters may be designed to backfeed alternators for starting or speed control
9. 694.9(B) was changed to be the same as the new language being proposed for Article 690.
10. The allowance for the use of shorting plugs was moved from 694.16 to 694.15. Shorting switches were also included.
11. 694.31(B) was modified to permit use of flexible cables to allow "ready removal for maintenance and repair", and 694.31(C) was added to mirror dc cable requirements for PV systems.
12. 694.63 was revised to improve clarity. Some of the justification text, including the definition of normal voltage ranges, was moved to an FPN.
13. 694.64 Section changed to refer to Article 705.
14. 694.71(G)(1) was removed as there is no corresponding section 694.41. This was residual text from 690.71.
15. 694.72(B)(2)(1) was changed from turbine to small wind electric system output to cover the more general case.

The panel revised the proposed language to comply with the NEC Style Manual:

16. Definitions were sorted in alphabetical order
17. Optional plurals "(s)" were replaced with normal plurals.
18. The where was changed to when in all cases not referring to location.
19. References to other standards were moved into FPNs.
20. References to entire articles were changed to refer to parts.

21. Small typographical errors were also corrected, and the part numbering was changed from 69x to 694 to reflect the proposed new article number.

NFPA 70®

National Electrical Code® (Report on Proposals)

Proposed 2011 Edition

Reference: **16-212 (Log #4186) Committee Action**

The National Electrical Code Technical Correlating Committee notes the following error in the ROP on NFPA 70®, *National Electrical Code*®.

1. Proposal 16-212 on page 1114 of the ROP has an incorrect committee action. The published committee action should be Reject. Shown below is the proposal with the committee action as it should have been published.

Report on Proposals – June 2010 **NFPA 70**

16-212 Log #4186 NEC-P16 **Final Action: Reject**
(810)

TCC Action: It was the action of the Technical Correlating Committee that a Task Group be formed including members from Code-Making Panels 5 and 16 to review and make recommendations on revising the use of the phrase "grounding conductor" and revising it to "grounding electrode conductor."
Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Replace the term "grounding conductor" with "grounding electrode conductor" throughout this Article.
Substantiation: The term "Grounding Conductor" is being proposed to be deleted because it is almost identical to the term "grounding electrode conductor". The defined term "grounding electrode conductor" includes the ability of connecting to a point on the grounding electrode system. This has been submitted as a single proposal to the Article instead of numerous proposals to allow the panel to ensure the resulting language still meets their intent in each specific section.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 16-91.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
JANIKOWSKI, R.: I agree with the submitter that the term "grounding conductor" and "grounding electrode conductor" are all but identical. The term "grounding electrode conductor" will not be mistaken in the field for the grounded conductor and refers to any point on the grounding electrode system.
Comment on Affirmative:
BRUNSSEN, J.: This is a correlation issue with Panel 5. Although the deletion of the term "grounding conductor" is appropriate for articles covered by Panel 5, the term is used over 120 times in Chapter 8 articles covering low power communications circuits and elsewhere in the code. The term "Grounding Conductor" has proven a useful and well understood term within the communications articles and a definition should be retained in Article 100. Substitution of "Grounding Conductor" with "Grounding Electrode Conductor" is not appropriate for all uses in Chapter 8 articles. The definition of "Grounding Conductor" could be modified to make it more specific to communications circuits as follows: "**Grounding Conductor**. A conductor used to connect communications equipment and cable shield, as required, to a grounding electrode system or grounding electrode(s)." This definition would meet the needs of Chapter 8.
