~~Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.17(A)(1) for multiconductor cables and 392.17(A)(2) for single-conductor cables, provided that the following conditions apply:~~

~~(a) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(B), totals not more than 100 percent.~~

~~(b) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.10(M) and (N).~~

~~**(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.** The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.~~

~~(1) The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:~~

~~(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.~~

~~(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.~~

~~(2) The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:~~

~~(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.~~

~~(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.~~

Table 392.22(B)(1) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays					
Inside Width of Cable tray		Column 1 392.22(B)(1)(b) Only		Column 2[a] 392.22(B)(1)(c) Only	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
150	6	4,200	6.5	4,200 – (28 Sd)b	6.5 – (1.1 Sd)b
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

~~(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.67 and Table 310.68.~~

392.22 Number of Conductors or Cables

(A) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where the cable ampacity is determined according to 392.~~17~~80(A)(1)(c), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) Multiconductor Control and/or Signal Cables only. Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) Solid Bottom Cable Trays Containing Any Mixture. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power,
lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

See Table 392.22(A) on Page 239

(4) Solid Bottom Cable Tray - Multiconductor and/or Signal Cables Only. Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Ventilated Channel Cable Trays. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22(A)(5).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22(A)(5).

Table 392.22(A)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Multiconductor Cables					
Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) Solid Channel Cable Trays. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22(A)(6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22(A)(6).

Table 392.22(A)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

(B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single-conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the crosssectional
of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(B)(1) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(B)(1) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

(2) **Ventilated Channel Cable Trays.** Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

(C) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

392.30 Securing and Supporting of Cables

(A) Securely Fastened. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

Table 392.22(A)

Table 392.22(A) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

	Maximum Allowable Fill Area for Multiconductor Cables									
	Ladder or Ventilated Trough Cable Trays, 392.22(A)(1)						Solid Bottom Cable Trays, 392.22(A)(3)			
Inside Width of Cable tray	Column 1 Applicable for 392.22(A)(1)(b) Only		Column 2[a] Applicable for 392.22(A)(1)(c) Only		Column 3 Applicable for 392.22(A)(3)(b) Only		Column 4a Applicable for 392.22(A)(3) (c) Only			
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$	mm^2	$in.^2$	mm^2	$in.^2$	
150	6.0	4,500	7.0	4,500 – (30 Sd)b	7– (1.2 Sd)b	3,500	5.5	3,500–(25 Sdb)	5.5–Sdb	
225	9.0	6,800	10.5	6,800 – (30 Sd)	10.5– (1.2 Sd)	5,100	8.0	5,100–(25 Sd)	8.0–Sd	
300	12.0	9,000	14.0	9,000 – (30 Sd)	14– (1.2 Sd)	7,100	11.0	7,100–(25 Sd)	11.0–Sd	
450	18.0	13,500	21.0	13,500 – (30 Sd)	21– (1.2 Sd)	10,600	16.5	10,600–(25 Sd)	16.5–Sd	
600	24.0	18,000	28.0	18,000 – (30 Sd)	28– (1.2 Sd)	14,200	22.0	14,200–(25 Sd)	22.0–Sd	
750	30.0	22,500	35.0	22,500 – (30 Sd)	35– (1.2 Sd)	17,700	27.5	17,700–(25 Sd)	27.5–Sd	
900	36.0	27,000	42.0	27,000 – (30 Sd)	42– (1.2 Sd)	21,300	33.0	21,300–(25 Sd)	33.0–Sd	

[a]The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(B) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

~~Cable trays shall be supported at intervals in accordance with the installation instructions.~~

(C) At Transitions. At discontinuous cable tray segments or transitions to raceways or equipment, the conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

392.56 Cable Splices.

Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.

392.60 Grounding and Bonding.

(A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250.

(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided all the following requirements are met:

(1) The cable tray sections and fittings are identified as an equipment grounding conductor.

(2) The minimum cross-sectional area of cable trays conform to the requirements in Table 392.60(A).

(3) All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction and the total crosssectional area of both side rails for ladder or trough cable tray.

(4) Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using listed cable tray clamps or adapters, bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

392.80 Ampacity of Conductors

(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(1) **Multiconductor Cables.** The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(a) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

2) **Single-Conductor Cables.** The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (2)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a]			
	Steel Cable trays		Aluminum Cable Trays	
	mm^2	$in.^2$	mm^2	$in.^2$
60	129	0.20	129	0.20
100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50b	258	0.40
1000	---	---	387	0.60
1200	---	---	645	1.00
1600	---	---	967.5	1.50
2000	---	---	1290	2.00b

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

FPN: See Table 310.20.
(3) **Combinations of Multiconductor and Single-conductor Cables.** Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.80(A)(1) for multiconductor cables and 392.80(A)(2) for singleconductor cables, provided that the following conditions apply:
(a) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(B), totals not more than 100 percent.
(b) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.19(C) and (D).
(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.
The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.
(1) Multiconductor Cables. The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:
(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.
(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.
(2) **Single-Conductor Cables.** The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:
(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70.
Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.
(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.
(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.67 and Table 310.68.
III. Construction Specifications
392.100 Construction
(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.
(B) Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.
(C) Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.
(D) Side Rails. Cable trays shall have side rails or equivalent structural members.
(E) Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.
(F) Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.
Substantiation: The comments affirm the intent of CMP-8's CP804 action. These revisions further improve usability of the Article by providing needed additional subdivision, moving some text within the Article in order to correspond to the titles and editing a few sentences for improved clarity.
The outline of the Article was revised as follows:
I. General
II. Installation
392.10 Uses Permitted
392.12 Uses Not Permitted
392.18 Cable Tray Installation
392.19 Cable Installation
392.22 Number of Conductors or Cables
392.30 Securing and Supporting of Cables
392.46 Bushed Conduit and Tubing
392.56 Cable Splices
392.60 Grounding and Bonding
392.80 Ampacity of Conductors
III. Construction Specifications
392.100 Construction
The basis for the outline revisions are:
● Subdivisions 392.18 and 392.19 are changes to clarify for the reader the distinguishing requirements of cable tray installation vs. requirements for installing cables in the cable tray. In addition, the numbering of these subdivisions was selected to correspond to the numbering system in Article 300's sections 300.18 & 300.19.
● Ampacity of Conductors was renumbered to 392.80 so that the numbering would parallel the numbering system found in the Cable Articles 320, 328, 330, 332, 334, 336, and 340.
● The subdivision titles were reinstated. These title additions are consistent with the Style Manual and very helpful for readers to find desired information.
The sentence clarifications or relocations are as follows:
1. Modification to NEC 2008 392.6(A) sentence beginning "where cable trays support individual conductors and where conductors pass from one cable tray to another.....". The modified sentence is : "Where cables or conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft)."
The substantiation for this clarification is: If you take this existing language literally, you can have a single conductor tray cable extend up to 6 ft. from one tray to another (or to a piece of equipment) but you could not have a multi-conductor cable do so without a raceway or other supporting means. This is not likely to have been CMP-8's intent. In fact, if you look at the picture in the NEC 2008 Handbook, Exhibit 392.2, you'll see "examples of multi-conductor cables in cable trays....." not single conductors as mentioned in 392.6(A).
2. Relocated NEC 2008 392.6 Complete System subdivision (A) sentence beginning "A bonding jumper sized…" to 392.60 Grounding and Bonding. This relocation places the text with the corresponding subdivision title.
3. Relocated NEC 2008 392.6 Complete System subdivision (A) sentence beginning "The conductors shall be secured…" to 392.30(C), Securing and Supporting of Cables. This relocation places the text with the corresponding subdivision title. Additionally, clarifying text was provided to indicate that the requirement for securing cables applied to transitions.
4. Finally, the second sentence of NEC 2008 392.6 (J) which begins "For raceways terminating at the tray,…" is changed to "Raceways terminating at the tray shall be securely fastened to the cable tray system." This revised sentence appears in this comment's revised Article text as 392.18 (H). The phrase "a listed cable tray clamp or adapter" is removed. The listing requirement for conduit to cable tray clamps is relocated to 392.60 to recognize that the listing applies for grounding and bonding, not support.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel wants to take this opportunity to thank the submitter for her efforts to improve an outdated Article 392. The panel would like to direct the submitter to the Article 392 re-write included in comment 8-100a. Items mentioned in this comment that were already accepted during the ROP period will not be addressed in this panel statement.
1. Relative to the location of Tables, the printed format of the NEC sometimes makes it difficult to locate the Table where we feel it's best suited. NFPA will use their discretion as to where the NEC format will allow the Tables to appear.
2. The NEC Style Manual requires titles be assigned to Sections (e.g. 392.10 Uses Permitted) and the first level below the Section (e.g. 392.10(A) Wiring Methods). Titles at the next level are permitted but not mandatory, and titles beyond that level are not allowed. The panel retained titles at the third level to 392.22 and 392.80 only.
3. Requirements such as grounding or bonding have been located in Section 392.60 to be consistent with the Chapter 3 format.
4. Requirements relating to Securing and Supporting have been located in Section 392.30 to be consistent with the Chapter 3 format.
5. The panel wasn't able to follow your proposed change to the Section titled "Raceways, Boxes, and Conduit Bodies Supported from Cable Tray Systems". The wording you suggest is currently found in Section 392.18(G). Please refer to the Panel Comment 8-800.
6. The panel agrees with your suggestion to relocate Ampacity of Conductors from 392.17 to 392.80 which follows the format of other Chapter 3 Articles.
7. Proposed text for 392.19 is located to 392.20 as covered in 8-100a.
8. Changing the Section title of 392.30 Securing and Supporting by adding "of Cables" does not coincide with the Section title format adopted during the 1999 cycle.
9. The panel has separated Section 392.30 Securing and Supporting into to subsections (A) Cable Trays and (B) Cables and Conductors. Your suggestion relating to conductor securement during transitions has been located in 392.30(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-102 Log #1795 NEC-P08 **Final Action: Accept in Principle in Part (392)**

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 8-235a

Recommendation:

ARTICLE 392

Cable Trays

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, ***Metal Cable Tray System***s; NEMA–VE 2-1996, ***Metal Cable Tray Installation Guidelines***; and NEMA–FG-1998, ***Nonmetallic Cable Tray Systems.***

392.2 Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

II. Installation

392.10 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.

(A) Wiring Methods. The wiring methods in Table 392.10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.10(A) Wiring Methods

Wiring Method	Article
Armored cable	320
CATV cables	820
CATV raceways	820
Class 2 and Class 3 cables	725
Communications cables	800
Communications raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Network-powered broadband communications cables	830
Nonmetallic-sheathed cable	334
Non-power-limited fire alarm cable	760
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Polyvinyl chloride PVC conduit	352
Power and control tray cable	336
Power-limited fire alarm cable	760
Power-limited tray cable	725
Rigid metal conduit	344
Rigid nonmetallic conduit	352
RTRC	355
Signaling raceway	725

(B) In Industrial Establishments. The wiring methods in Table 392.10(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.10(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) **Single Conductors.** Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(2) **Medium Voltage.** Single and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(B)(1).

(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(D) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

(E) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

(F) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(G) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(H) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(I) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.10(H).

(J) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(K) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

(L)Cable Installation.

(1) **Multiconductor Cables Rated 600 Volts or Less.** Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(2) **Cables Rated Over 600 Volts.** Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(a) The cables rated over 600 volts are Type MC.

(b) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray

(M) Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(N) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.12 Uses Not Permitted.

Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

392.17 Ampacity of Conductors

(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(1) **Multiconductor Cables.**. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(a) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

(2)Single-Conductor Cables. The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (2)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

(3) **Combinations Of Multiconductor And Single-Conductor Cables**. Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.17(A)(1) for multiconductor cables and 392.17(A)(2) for single-conductor cables, provided that the following conditions apply:

(a) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(B), totals not more than 100 percent.

(b) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.10(M) and (N).

(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.

(1) **Multiconductor Cables (2001 Volts or Over).** The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.

(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(2) **Single-Conductor Cables (2001 Volts or Over).** The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.67 and Table 310.68.

392.22 Number of Conductors or Cables

(A) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(1) **Any Mixture of Cables.** Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where the cable ampacity is determined according to 392.17(A)(1)(c), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) **Multiconductor Control and/or Signal Cables Only.** Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) **Solid Bottom Cable Trays Containing Any Mixture.** Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

Table 392.22(A) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

Table 392.22(A) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

(25 Sd[b])	**5.5–Sd[b]**							
225	9.0	6,800	10.5	6,800 – (30 Sd)	10.5– (1.2 Sd)	5,100	8.0	5,100–
(25 Sd)	8.0–Sd							
300	12.0	9,000	14.0	9,000 – (30 Sd)	14– (1.2 Sd)	7,100	11.0	7,100–
(25 Sd)	11.0–Sd							
450	18.0	13,500	21.0	13,500 – (30 Sd)	21– (1.2 Sd)	10,600	16.5	10,600–
(25 Sd)	16.5–Sd							
600	24.0	18,000	28.0	18,000 – (30 Sd)	28– (1.2 Sd)	14,200	22.0	14,200–
(25 Sd)	22.0–Sd							
750	30.0	22,500	35.0	22,500 – (30 Sd)	35– (1.2 Sd)	17,700	27.5	17,700–
(25 Sd)	27.5–Sd							
900	36.0	27,000	42.0	27,000 – (30 Sd)	42– (1.2 Sd)	21,300	33.0	21,300–
(25 Sd)	33.0–Sd							

[a]The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm² for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(4) **Solid Bottom Cable Tray – Multiconducotr Control and/or Signal Cables Only.** Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) **Ventilated Channel Cable Trays**. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22(A)(5).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22(A)(5).

Table 392.22(A)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Multiconductor Cables					
Inside Width of Cable Tray	Column 2		Column 1	2 More Than One Cable	
				One Cable	
mm	in.	mm²	in.²	mm²	in.²
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) **Solid Channel Cable Trays.** Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22(A)(6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22(A)(6).

Table 392.22(A)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Column 2						
Inside Width of Cable Tray		Column 1 More than One Cable				One Cable
mm	in.	mm²	in.²		mm²	in.²
50	2	850	1.3	500	0.8	
75	3	1300	2.0	700	1.1	
100	4	2400	3.7	1400	2.1	
150	63600	5.5		2100	3.2	

(B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(1) **Ladder Or Ventilated Trough Cable Trays.** Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single-conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(B)(1) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(B)(1) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

Table 392.22(B)(1) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Single-Conductor Cables					
Inside Width of Cable Tray	Column 1		Column 2[a]		
	Applicable for 392.22(B)(1)(b) Only		Applicable for 392.22(B)(1)(c) Only		
mm	in.	mm²	in.²	mm²	in.²
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm², for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm² (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

(2) **Ventilated Channel Cable Trays.** Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

(C) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.
The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.
The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

1.30 Securing and Supporting

(A) Securely Fastened. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.
(B) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.
Cable trays shall be supported at intervals in accordance with the installation instructions.
392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.
392.56 Cable Splices.
Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.
392.60 Grounding and Bonding.

(A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250.
(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided all the following requirements are met:
(1) The cable tray sections and fittings are identified as an equipment grounding conductor.
(2) The minimum cross-sectional area of cable trays conform to the requirements in Table 392.60(A).
(3) All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction and the total cross-sectional area of both side rails for ladder or trough cable tray.
(4) Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.
Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a]			
	Steel		Aluminum	
	mm^2	$in.^2$	mm^2	$in.^2$
		60	129	0.20
100		258	0.40	129 0.20
200		451.5	0.70	129 0.20
400		645	1.00	258 0.40
600	967.5	1.50[b]		258 0.40
1000			---	--- 387 0.60
1200	---	--- 645	1.00	
1600	---		--- 967.5	1.50
2000		---		--- 1290 2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.
[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

III. Construction Specifications

(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.
(B) Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.
(C) Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.
(D) Side Rails. Cable trays shall have side rails or equivalent structural members.
(E) Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.
(F) Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material

Substantiation: The following proposal affirms the intent of CMP-8's CP804 action. This proposal adds usability and clarity for the reader by re-instating distinguishing subdivision titles. No new content is proposed. These title additions are consistent with the Style Manual and very helpful for readers to find desired information.

Specifically, this proposal includes the re-instatement of titles:
392.10(B)(1) Single Conductors.
392.10(B)(2) Medium Voltage.
392.10(L)(1) Multiconductor Cables Rated 600 Volts or Less.
392.10(L)(2) Cables Rated Over 600 Volts.
392.17(A)(1) Multiconductor Cables.
392.17(A)(2) Single-Conductor Cables.
392.17(A)(3) Combinations Of Multiconductor And Single-Conductor Cables.
392.17(B)(1) Multiconductor Cables (2001 Volts or Over).
392.17(B)(1) Single-Conductor Cables (2001 Volts or Over).
392.22(A)(1) Any Mixture of Cables.
392.22(A)(2) Multiconductor Control and/or Signal Cables Only. 392.22(A)(3) Solid Bottom Cable Trays Containing Any Mixture.
392.22(A)(4) Solid Bottom Cable Tray – Multiconducotr Control and/or Signal Cables Only.
392.22(A)(5) Ventilated Channel Cable Trays.
392.22(A)(6) Solid Channel Cable Trays.
392.22(B)(1) Ladder Or Ventilated Trough Cable Trays.
392.22(B)(2) Ventilated Channel Cable Trays.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: The panel wants to take this opportunity to thank the submitter for his efforts to improve an outdated Article 392. The panel directs the submitter to the Article 392 re-write included in Comment 8-100a.

The NEC Style Manual requires titles be assigned to Sections (e.g. 392.10 Uses Permitted) and the first level below the Section (e.g. 392.10(A) Wiring Methods). Titles at the next level are permitted but not mandatory, and titles beyond that level are not allowed. The panel retained titles at the third level to 392.22 and 392.80 only.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

8-103 Log #2591 NEC-P08 **Final Action: Accept in Principle in Part (392)**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 8-235a

Recommendation: Accept the proposal in principle.

Make the following additional editorial changes:

I. In 392.10, include only subsections (A), (B), (C), and (D). Move subsections (E) through (N) into new sections 392.18 and 392.20 as in items II and III below.

II. Create a new section 392.18 entitled "Cable Tray Installation. Relocate 392.10(E) through (K) as 392.18(A) through (G) respectively.

III. Create a new section 392.20 entitled "Cable and Conductor Installations." Relocate 392.10(L) through (N) as 392.20(A) through (C) respectively.

IV. In 392.10(E), which would become 392.18(A), relocate the last sentence of the first paragraph and the second paragraph on tray-to-tray or tray-to-equipment transitions to section 30, as covered in item VIII below. Relocate the final paragraph on bonding jumpers to section 60 as covered in item IX below

V. In 392.10(E), which would become 392.10(A), relocate the third paragraph to section 60, as covered in item IX below.

VI. In 392.17(A) and (B), which is the entirety of this section, relocate this material as 392.80 and 392.82, respectively.

VII. In 392.22, divide (A), (B), and (C) by voltage and configuration as follows:

392.22. Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

392.24. Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.

392.26. Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

VIII. Insert a new Section 392.28 at this location, as follows:

392.28. Marking. Cable trays containing conductors rated over 600 volts shall have a permanent, legible warning notice carrying the wording "DANGER—HIGH VOLTAGE—KEEP AWAY" placed in a readily visible position on all cable trays with ~~maximum~~ the spacing of warning notices not to exceed 3 m (10 ft).

IX. In 392.30, reorganize this section to read as follows:

392.30. Securing and Supporting.

(A) Cable Trays. Cable trays shall be supported at intervals in accordance with the installation instructions.

(B) Cables and Conductors. Cables and conductors shall be secured to and supported by the cable tray system in accordance with (1), (2) and (3) as applicable.

(1) ~~Securing and Supporting.~~ Runs Other Than Horizontal. In other than horizontal runs, the cables shall be fastened securely to transverse member of the cable trays.

(2) ~~Supports.~~ Raceway Transitions. ~~Supports.~~ Supports shall be provided to prevent stress on cables where they enter raceways ~~or other enclosures~~ from cable tray systems.

(3) Tray-to-Tray and Tray-to-Equipment Transitions. The system shall provide for the support of the cables and raceway wiring methods in accordance with their corresponding articles. Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

X. In 392.60, insert a new subsection as follows:

(C) Transitions. Where metallic cable tray systems are mechanically discontinuous as permitted in 392.18(A), a bonding jumper sized in accordance with 250.102 shall connect the two segments of the cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

XI. In the final sentences of the opening paragraphs of 392.22(A) and 392.22(B), which will become 392.22 and 392.24, respectively, delete the word "herein."

XII. Retain the 2008 NEC subdivision titles as they were in the current code it new locations, specifically, in 392.10(B)(1) and (2), and in 392.10(L)(1) and (2) [to become 392.20(A)(1) and (2)], 392.17(A)(1) through (3) [to become 392.80(A) through (C)], in 392.17(B)(1) and (2) [to become 392.82(A) and (B)], in 392.22(A)(1) through (6) [to become 392.22 (A) through (F)], and in 392.22(B)(1) and (2) [to become 392.24(A) and (B)]. Note that 392.22(C) will become 392.26 without titled subdivisions.

Substantiation: This comment is in general support of the CMP 8 effort to rearrange this article, as well as the extensive comment in the voting. Further modifications in the interest of readability are offered to improve the final result. Note that the parallel numbering rules in the NEC Style Manual cannot be applied literally and excessively rigidly to an article that covers a topic that is neither raceway not cable, but principally a support for either or both.

Specific substantiation follows:

I through III. Only the first four topics in 392.10 in the original proposal are permitted uses; the remainders are application rules that need separate sections, one for the tray itself and one for the supported conductors and cables. The suggested section numbers are nonconsecutive to allow for future insertions and don't generally conflict with the customary locations in other Chapter 3 wiring method articles.

IV. Writing as the originator of the language now in the NEC on this topic, the principal focus of these requirements is how conductors and cables will be supported at discontinuous points on a cable tray system, so it makes the most sense to include the coverage in the new Section 30. Cabled wiring methods have support limitations built into Sections 30 of the various cable articles, but there are no other NEC requirements for support of single conductors in these applications, necessitating this language. See also the substantiation for item VIII.

V. This topic is a grounding topic and, as pointed out in the comment on vote, belongs in the new section 60.

VI. Section 80 is, generally, the ampacity section in Chapter 3, hence the relocation, as also covered in the comment on vote. By using two sections (80 and 82) instead of one, the text is much more readable and all of the text has the same relative subdivision level as the 2008 and all prior editions of the NEC that covered this topic. This will greatly increase the comfort level for current users of the NEC, while still respecting the spirit of a common numbering scheme. No other Chapter 3 wiring method article approaches this amount of material on ampacity. If the organization in the proposal stands, using the 2008 NEC as a guide, there will be 23 column inches in 392.17, which would be over seven times the length of 334.80, the longest such section elsewhere in Chapter 3.

VII. Here again, an extremely long and complicated topic can be better addressed in terms of readability and continuity with past NEC editions by splitting the coverage into different sections that preserve the same subdivision formatting as in prior NEC editions. In this case almost 43 column inches are needed to address this topic in the current NEC; if this became a single section it would be one of the longest in the entire NEC. This should not be the goal of an article rewrite supposedly directed at usability.

VIII. This wording integrates the action on Proposal 8-260, as reflected in a companion comment. The warning sign must give a command in order to withstand legal challenges, which is why similar labels have been reworded throughout the NEC; see 110.34(C) for an example. The location has also been inserted into a field portion of the article because this is a field marking requirement, and located adjacent to another medium voltage provision. The panel action placed it in where it would become a manufacturing specification; tray manufacturers cannot be expected to have any idea where segments of their tray will end up and whether they will carry medium voltage conductors. The word "maximum" is deleted because it is redundant to the words "not to exceed."
IX. This section has been reorganized from that originally proposed in order to group related topics within the same subdivision. Specifically, (A) covers the support of the tray itself, and (B) covers the support of the contents of the tray. (B)(1) restates the existing NEC text on vertical (actually any non-horizontal) runs and (B)(2) covers tray-raceway transitions. The phrase "or other enclosures" is deleted because it is fully addressed in (B)(3). 392.30(B)(3) opens by picking up the cable support rule in 392.10(E) of the proposal [392.6(A) in the 2008 NEC]; all cable articles have support provisions relative to distances from terminations, and these will govern the required support from a tray to an enclosure. For consistency with raceway articles in Chapter 3, the rule does expand slightly by changing "the cables" to "cable and raceway wiring methods" because cable trays are permitted to support many raceway wiring methods and there is no reason to omit them from this rule.
The wording regarding this subject in the comment on vote (item 1) was not used in this comment because as drafted here it is very clear that multiconductor cables as well as raceways are allowed, and that the 6-foot limit only covers single conductors. This appears to meet the intent of the comment on vote and accords with the intent of this provision.
X. This is the relocation of the bonding jumper provision, as correctly covered in the comment on vote.
XI. The word "herein" is discouraged in the NEC Style Manual at 3.3.4 because "usually this word can be dropped without affecting clarity" and this seems to be the case in these two locations.
XII. The subdivision titles in the existing NEC absolutely should be retained, as mentioned in the comment on vote. If this organization is accepted, these titles will apply to second-level subdivisions in all but two of the cited cases, and thereby become mandatory as covered in 2.1.5.2 of the NEC Style Manual.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel wants to take this opportunity to thank the submitter for his efforts to improve an outdated Article 392. The panel would like to direct the submitter to the Article 392 re-write included in Comment 8-100a. Items mentioned in this comment that were already accepted during the ROP period will not be addressed in this panel statement.

1. The panel agrees that relocating items 392.10(E) through (K) to new Section 392.18(A) through (G) will add clarity to the Article.
2. The panel agrees with your recommendation to create a new Section 392.20 Cable and Conductor Installations for the purpose of relocating items 392.10(L) through (N). This new section will consist of four subsections (A) Multiconductor Cables Rated 600 Volts or Less, (B) Cables Rated Over 600 Volts, (C) Connected in Parallel, and (D) Single Conductors.
3. In Section 392.10(E), the panel agreed to relocate the last sentence of the first paragraph and the entire second paragraph on transitions from cable tray to cable tray or equipment to Section 392.30(B)(3) which incorporates all support requirements in one section. Also, to relocate the entire third paragraph of Section 392.10(E) to the Grounding Section 392.60(C) Transitions, which will locate all grounding and bonding requirements in one section.
4. The panel agreed that all ampacity requirements should be relocated from 392.17 to 392.80 which follows the format of other Chapter 3 Articles.
5. Rather than separate "Number of Conductors and Cables" into three sections, as requested, the panel feels that all related requirements should be located in one area Section 392.22. This section has been structured as (A) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays, (B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays, and (C) Number of Type MV and Type MC Cables (2001 Volts and Over) in Cable Trays. This format adds clarity to the requirement.
6. The panel agrees, instead of creating a new Section 392.28, the panel prefers to locate the WARNING NOTICE in Section 392.18(H).
7. The panel agrees with reorganizing 392.30 Securing and Supporting as suggested. This will make the section clear and easier to understand. However, the panel chooses not to use titles at this level to be consistent with other Articles.
8. The panel agrees that deleting the word "herein" in two places will add clarity to the article.
9. The NEC Style Manual requires titles be assigned to Sections (e.g. 392.10 Uses Permitted) and the first level below the Section (e.g. 392.10(A) Wiring Methods). Titles at the next level are permitted but not mandatory, and titles beyond that level are not allowed. The panel retained titles at the third level to 392.22 and 392.80 only.

Ballot Not Returned: 1 Griffith, M.

8-107 Log #1564 NEC-P08 **Final Action: Reject**
(392.5(G) (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-254
Recommendation: Accept the proposal.
Substantiation: Cable trays are a wiring method also, per Chapter 3, Wiring Methods and if provided with a cover, appear to meet the definition of raceway. Listing would relieve the Authority Having Jurisdiction from having to evaluate the suitability of cable trays such as grounding, spacing of supports, spacing of rungs, etc. One panel has stated they wish to have all wiring methods listed.
Panel Meeting Action: Reject
Panel Statement: Cables trays are support hardware systems for cables, raceways and conductors. This supporting system need only be approved per Section 110.2 which is consistent with other supporting materials referenced throughout the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-108 Log #1294 NEC-P08 **Final Action: Reject**
(392.6(l))

Submitter: Teri Dwyer, Wyoming, MN
Comment on Proposal No: 8-256
Recommendation: Revise text to read as follows:
(l) ~~Adequate~~ Minimum Access. Sufficient space, a minimum of 300 mm (12 in.) access headroom shall be provided and maintained about cable trays to permit ~~adequate~~ access for installing and maintaining the cables. ~~Care shall be taken to ensure that other building components (e.g., air conditioning ducts) do not restrict access to trays or wireways.~~
Substantiation: The panel should accept this as modified; "Adequate Access" is an ambiguous term without definition of space. The 300 mm (12 in.) was inserted to define the amount of space using the ANSI Standard for reference. (ANSI/TIA/EIA-569-A Section 4.5.6.2) In the panel statement, "The intent of the current text is clear and allows judgment by the designer/installer and AHJ", this is as clear as mud. When was the last time a judgment by and installer and an inspector were the same in the absence of definable code language? What is adequate to a 6 ft 180 lb installer may not be adequate to a 5 ft 10 in. 300 lb inspector. The NEC style manual is very clear that the NEC shall not contain references or requirements that are unenforceable or vague. There is a table in the NEC style manual that lists possibly unenforceable or vague terms and adequate is a word included in this table. The NEC style manual requires that the terms contained in this table be reviewed in context and if the resulting requirement is unenforceable or vague, the term shall not be used. To promote a uniform consistency, the NEC should contain defined and enforceable code language, not language that is subjective to individual opinion.
Panel Meeting Action: Reject
Panel Statement: Headroom is not defined. 110.26 reference to headroom has been deleted at the ROP. Requiring this 12 in. space along the entire cable tray would prevent electrical raceways and other building components from crossing the cable tray within 12 in. even though the raceway or component may not interfere with the required access to the contained conductors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-109 Log #1565 NEC-P08 **Final Action: Reject**
(392.6(E) and (F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-259
Recommendation: Accept the proposal with the following revisions:
(E) Multiconductor and single conductor cables operating at 600 volts, nominal, or less, shall be permitted to be installed in the same cable tray.
(F) Cables operating at over 600 volts, nominal and those operating at 600 volts, nominal or less installed in the same cable tray shall comply with either of the following:
(1) The cables operating at over 600 volts, nominal are Type MC.
(2) The cables operating at over 600 volts, nominal, are separated from the cables operating at 600 volts, nominal or less by an approved fixed barrier of a material compatible with the cable tray.
Substantiation: Single-conductor Type MC and MI cables should be included. The NEC doesn't prohibit cables rated over 600 volts from operating at 600 volts or less. At times, conductors rated over 600 volts are used for 600 volts or less applications, and the operating voltage should be the criterion.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

Comment on Proposal No: 8-260
Recommendation: Accept the panel action in principle.
Change the wording of the warning and, if Proposal 8-235a does not remain accepted, leave the location of the text as originally proposed; if Proposal 8-235a remains substantially accepted, retain the stand-alone section but relocate it into a field part of the article. See the companion comment submitted on Proposal 8-235a for a suggested location. The wording is to be as follows:
392.XX. Marking. Cable trays containing conductors rated over 600 volts shall have a permanent, legible warning notice carrying the wording "DANGER—HIGH VOLTAGE—KEEP AWAY" placed in a readily visible position on all cable trays with ~~maximum~~ the spacing of warning notices not to exceed 3.0 m (10 ft).
Substantiation: The warning sign must give a command in order to withstand legal challenges, which is why similar labels have been reworded throughout the NEC; see 110.34(C) for an example. The wording must clearly fall into a field portion of the article because this is a field marking requirement. The panel action placed it in where it would become a manufacturing specification; tray manufacturers cannot be expected to have any idea where segments of their tray will end up and whether they will carry medium voltage conductors. The word "maximum" is deleted because it is redundant to the words "not to exceed."
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 8-100a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-111 Log #506 NEC-P08 **Final Action: Reject**
(392.6(I))

Submitter: Patrick G. Heater, Netsian Technologies Group
Comment on Proposal No: 8-255
Recommendation: Revise text to read as follows:
(I) ~~Adequate~~ Minimum Access. Sufficient space, a minimum of 300mm (12 in.) access headroom shall be provided and maintained about cable trays to permit ~~adequate~~ access for installing and maintaining the cables. Care shall be taken to ensure that other building components (e.g., air conditioning ducts) do not restrict access to trays or wireways.
Substantiation: "Adequate Access" is an ambiguous term without definition of space. The 300mm (12in) was inserted to define the amount of space using the ANSI Standard for reference. (ANSI/TIA/EIA-569-A Section4.5.6.2) In the panel statement, "The intent of the current text is clear and allows judgment by the designer/installer and AHJ", this is as clear as mud. When was the last time a judgment by and installer and an inspector were the same in the absence of definable code language? What is adequate to a 6' 180lb installer may not be adequate to a 5'10" 300lb inspector. The NEC style manual is very clear that the NEC shall not contain references or requirements that are unenforceable or vague. There is a table in the NEC style manual that lists possibly unenforceable or vague terms and adequate is a word included in this table. The NEC style manual requires that the terms contained in this table be reviewed in context and if the resulting requirement is unenforceable or vague, the term shall not be used. To promote a uniform consistency, the NEC should contain defined and enforceable code language, not language that is subjective to individual opinion.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-108.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-112 Log #1423 NEC-P08 **Final Action: Reject**
(392.7(A))

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 8-263
Recommendation: Reject this proposal.
~~Metal cable tray containing non power conductors (communication, data, signal, etc.) shall be electrically continuous, through listed connections or the use of an insulated stranded bonding jumper not smaller than 10 AWG.~~
Substantiation: This proposal seems like a good idea. But, there are too many problems with it.
First of all, the majority of cable trays for Metallic data and communications conductors would fall under Article 800. Since Chapter 8 and Article 800 stand alone, they would not be affected by this requirement. Section 800.110 does require that raceways used for communication conductors to meet the requirements of Chapter 3; but, that does not include cable trays.
Second, there's the requirement for the trays to be electrically continuous or bonded with an insulated, stranded 10 AWG conductor. Bonding the cable trays internally, at first sounds like a good idea, but the actual reason is obscure. And if they are to be bonded to some other element of the electrical system (which the proposal does not require) what part of the system is that? To some equipment ground? To the grounding electrode system? Even 250.96, referenced in the present text in this Section, only requires 'internal' continuity.
Panel Meeting Action: Reject
Panel Statement: Cable tray, a support system, is covered by Article 392 not Article 800. 250.96 includes the statement "shall be bonded where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed on them." To conduct any fault current likely to energize the cable tray a bond based on 250.122 for load side, and a bond based on 250.66 for line side tied to the grounding system would be required.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-113 Log #1563 NEC-P08 **Final Action: Reject**
(392.7(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-262
Recommendation: Accept the proposal.
Substantiation: See the Substantiation for the Proposal. The panel should indicate which part is not accurate.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not add clarity to the section. Cable trays with covers are not an enclosure or raceway and are not exempt from 250.86 Exception 2.
Number Eligible to Vote: 12

Ballot Not Returned: 1 Griffith, M.

8-114 Log #1990 NEC-P08 **Final Action: Accept in Principle in Part**
(392.7(A))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 8-263
Recommendation: Revise the accepted text as shown below.
Metal cable tray containing non-power conductors (communication, data, signal, etc.) shall be electrically continuous, through listed connections or the use of a ~~an insulated~~ stranded bonding jumper not smaller than a 10 AWG.
Substantiation: There is no technical reason to require the bonding jumper to be an insulated conductor.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: See panel action on Comment 8-100a. The panel accepted the proposed revision to delete "an insulated". The text that was proposed will revise 392.60(A). "Stranded" was also removed to allow for solid conductors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-115 Log #1062 NEC-P08 **Final Action: Reject**
(392.7(A) [new 392.60(A)])

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 8-263
Recommendation: Reject Proposal 8-263.
Substantiation: The added text to require bonding of "Metal cable tray containing non-power conductors" is redundant and superfluous. The existing text of 392.7(A) [2008 NEC] presently requires: "Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250". If they are grounded, then they are effectively 'bonded' through the grounding conductor(s). Additionally, the NEC Style Manual states that the use of "etc." should be avoided.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-112.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-116 Log #364 NEC-P08 **Final Action: Accept**
(392.8(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-264
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-117 Log #1298 NEC-P08 **Final Action: Reject**
(392.8(D))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 8-264
Recommendation: The Proposal should be Accepted.
Substantiation: The proposed wording is more appropriate for a standard and is more explicit in describing the installation.
The Manual of Style for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).
Most of the Panels have accepted changes to replace "per" with more explicit language and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: The NEC style manual does not restrict the use of the word "per" in this code section. The proposed change does not add clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-118 Log #3 NEC-P08 **Final Action: Accept**
(392.9, 392.10, and Tables 392.9 and 392.10(A))

Submitter: Dallas Kellerman, Cablofil/Legrand
Comment on Proposal No: 8-267
Recommendation: The panel should accept the proposal with the 2 tables modified as shown below.

See Table 392.22(A) on Page 250

See Table 392.22(B)(1) on Page 250

Note that the tables use the reformatted Article 392 numbering in accordance with accepted Code-Making Panel 8 Proposal 8-235a (Log No. CP804).
Substantiation: The proposal should be accepted with the modifications presented in this comment as the fact exists that inquiries are often received by manufacturers regarding the allowable fill area for 2 in., 4 in., 8 in., 16 in., and 20 in. cable tray widths. These widths are standard widths for wire mesh cable tray (from NEMA VE 1). Since these widths are not listed in the table, and wire mesh cable tray is not mentioned, there is confusion in determining the allowable fill area.
The revised tables correct typographical and rounding errors presented in the original proposal. Table 392.22(B)(1) note b is revised to be consistent with a similar note in Table 392.22(A).
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 8-100a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-119 Log #2104 NEC-P08 **Final Action: Reject**
(Table 392.9 and Table 392.10(A))

Submitter: M. Shan Griffith, ELEKTEK, PLLC / Rep. Institute of Electrical and Electronic Engineers, Inc. (IEEE)
Comment on Proposal No: 8-267
Recommendation: Revise the coefficient ~~30~~ to 25 ahead of the term "Sd" in every row of the column with the heading "mm2" in Table 392.9 proposed by the submitter of Proposal 8-267 and accept the additional, smaller tray widths proposed.
Substantiation: The smaller widths of cable tray originally proposed to be included in these Tables by the submitter of Proposal 8-267 are recognized by NEMA and have been widely used throughout large industry for more than 5 years with proven success and no reported problems/failures. Additionally, these smaller width trays are available with a U/L listing as an equipment grounding conductor just like the larger width trays presently included in the Tables. Once the coefficient of "30" is corrected to "25" as proposed above for Table 392.9 the tray fill criteria will be correct.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with changing the coefficient from 30 to 25 in Column 2 of new Table 392.22(A) (old Table 392.9). The coefficients as they currently appear are correct because the coefficient for open bottom cable trays are not the same as for solid bottom cable tray. This is due to the additional air flow that open bottom cable trays provide. In addition, there was no technical substantiation provided to justify the change and the submitter of Proposal 8-267, who is the same submitter of Comment 8-118, did

Table 392.22(A) Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, Wire Mesh, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

ARTICLE 392
Cable Trays
I. General
392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.
FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.
392.2 Definition.
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.
II. Installation
392.10 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.
(A) Wiring Methods. The wiring methods in Table 392.10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.
Table 392.10(A) Wiring Methods

Wiring Method	Article
Armored cable	**320**
CATV cables	**820**
CATV raceways	**820**
Class 2 and Class 3 cables	**725**
Communications cables	**800**
Communications raceways	**800**
Electrical metallic tubing	**358**
Electrical nonmetallic tubing	**362**
Fire alarm cables	**760**

Rigid nonmetallic conduit	**352**
RTRC	**355**
Signaling raceway	**725**

(B) In Industrial Establishments. The wiring methods in Table 392.10(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.10(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(2) Single and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(B)(1).

(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.

(D) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

~~**(E) Complete System.** Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.~~

~~Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.~~

~~A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.~~

~~**(F) Completed Before Installation.** Each run of cable tray shall be completed before the installation of cables.~~

~~**(G) Covers.** In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.~~

~~**(H) Through Partitions and Walls.** Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.~~

~~**(I) Exposed and Accessible.** Cable trays shall be exposed and accessible except as permitted by 392.10(H).~~

~~**(J) Adequate Access.** Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.~~

~~**(K) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems**. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.~~
~~For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.~~
~~For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.~~

~~**(L)Cable Installation.**~~
~~(1) Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.~~
~~(2) Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:~~
~~(a) The cables rated over 600 volts are Type MC.~~
~~(b) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray~~

~~**(M) Connected in Parallel.** Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.~~

Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(N) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.12 Uses Not Permitted.

Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.

392.18 Cable Tray Installation

(A) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

(B) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(C) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(D) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(F) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.10(H).

(G) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(H) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

392.17 Ampacity of Conductors

(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(1) The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(a) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

(2) The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (2)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

(3) Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.17(A)(1) for multiconductor cables and 392.17(A)(2) for single-conductor cables, provided that the following conditions apply:

(a) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(B), totals not more than 100 percent.

(b) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.10(M) and (N).

(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.

(1) The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.

(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(2) The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.67 and Table 310.68.

392.19 Cable Installation.

(A) Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(B) Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(a) The cables rated over 600 volts are Type MC.

(b) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray

(C) Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

Single conductors shall be securely bound in circuit groups to prevent

excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(D) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.22 Number of Conductors or Cables

(A) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays.

The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where the cable ampacity is determined according to 392.17(A)(1)(c), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(4) Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22(A)(5).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22(A)(5).

Table 392.22(A)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated

Channel Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Multiconductor Cables

150	6	4500	7.0	2450	3.8

(6) Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22(A)(6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22(A)(6).

[a]The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm^2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

Table 392.22(A)(6) Allowable Cable Fill Area for Multiconductor

Cables in Solid Channel

Cable Trays for Cables Rated 2000 Volts or Less

50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

(B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays.
The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(1) Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single-conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(B)(1) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross-sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(B)(1) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

1.30 Securing and Supporting

(A) Securely Fastened. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

(B) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

Cable trays shall be supported at intervals in accordance with the installation instructions.

392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

392.56 Cable Splices.
Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.

392.60 Grounding and Bonding.

(A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250.

(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided all the following requirements are met:

(1) The cable tray sections and fittings are identified as an equipment grounding conductor.

(2) The minimum cross-sectional area of cable trays conform to the requirements in Table 392.60(A).

(3) All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction and the total cross-sectional area of both side rails for ladder or trough cable tray.

(4) Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

Table 392.22(B)(1) Allowable Cable Fill Area for Single-Conductor Cables in Ladder of Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Single-Conductor Cables Inside Width in Ladder or Ventilated Trough Cable Trays of Cable Tray Applicable for 392.22(B)(1)(b) Only		Column 1 Applicable for 392.22(B)(1)(c) Only		Column 2[a]	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
150	6	4,200	6.5	4,200 – (28 Sd)[b]	6.5 – (1.1 Sd)[b]
225	9	6,100	9.5	6,100 – (28 Sd)	9.5 – (1.1 Sd)
300	12	8,400	13.0	8,400 – (28 Sd)	13.0 – (1.1 Sd)
450	18	12,600	19.5	12,600 – (28 Sd)	19.5 – (1.1 Sd)
600	24	16,800	26.0	16,800 – (28 Sd)	26.0 – (1.1 Sd)
750	30	21,000	32.5	21,000 – (28 Sd)	32.5 – (1.1 Sd)
900	36	25,200	39.0	25,200 – (28 Sd)	39.0 – (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm^2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm^2 (in inches, of all 1000 kcmil) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

(2) Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

(C) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.
The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a] Steel Cable Trays		Aluminum Cable Trays	
	mm^2	$in.^2$	mm^2	$in.^2$
60			129	0.20
100			129	0.20
200	258	0.40	129	0.20
400	451.5	0.70	129	0.20
600	645	1.00	258	0.40
1000	967.5	1.50[b]	258	0.40
1200	---	---	387	0.60
1600	---	---	645	1.00
2000	---	---	967.5	1.50
	---	---	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.
[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

392.80 Ampacity of Conductors

(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(1) The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).

(a) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.

(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

FPN: See Table B.310.3.

(2) The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.

(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.

Exception to (2)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

FPN: See Table 310.20.

(3) Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.17(A)(1) for multiconductor cables and 392.17(A)(2) for single-conductor cables, provided that the following conditions apply:

(a) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated per 392.22(B), totals not more than 100 percent.

(b) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.10(M) and (N).

(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays.

The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.

(1) The allowable ampacity of multiconductor cables shall be as given in Table 310.75 and Table 310.76, subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.75 and Table 310.76 shall be permitted for multiconductor cables.

(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.71 and Table 310.72.

(2) The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.69 and Table 310.70. Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.69 and Table 310.70.

(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.69 and Table 310.70.

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.67 and Table 310.68.

Substantiation: The following proposal affirms the intent of CMP-8's CP804 action. This proposal adds usability and clarity for the reader by adding two distinguishing subdivisions and relocating one subdivision to create enhanced parallel structure to other NEC Code Articles. No new content is proposed other than the addition of the two subdivisions. Specifically, this proposal includes:

· Add subdivision 392.18 titled "Cable Tray Installation". Move paragraphs

392.10(E) – 392.10(K) to sub-paragraphs of 392.18. The numbering of this subdivision was selected to parallel Article 300's section 300.18 "Raceway Installation."

· Add subdivision 392.19 titled "Cable Installation". Move paragraphs 392.10(L)-392(N) to sub-paragraphs of 392.19. The numbering of this subdivision was selected to parallel Article 300's section 300.19 "Supporting Conductors in Vertical Raceways."

· Re-number subdivision 392.17 "Ampacity of Conductors" to 392.80. This change makes the numbering of this subdivision correspond to the numbering system in Cable Articles 320, 328, 330, 332, 334, 336, and 340.

Panel Meeting Action: Accept in Principle

Panel Statement: The submitter's intent is met with panel action on Comment 8-100a.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

8-121 Log #1796 NEC-P08 **Final Action: Accept in Part**
(392.10(K) and 392.60(B)(4))

Submitter: Michael P. Walls, American Chemistry Council

Comment on Proposal No: 8-235a

Recommendation: This comment involves editing of both 392.10(K) and 392.60(B)(4).

392.10(K) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray, the raceway ~~a listed cable tray clamp or adapter~~ shall be ~~used to~~ securely fastened ~~the raceway~~ to the cable tray system.

Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

392.60(B)(4) Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using listed cable tray clamps or adapters, bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

Substantiation: This comment affirms the intent of CMP-8's CP804 action. This comment adds usability and clarity for the reader by locating information under the relevant title or subtitle. No new content is proposed other than the relocation of the requirement for the listed cable tray clamp or adapter from 392.10(K) to 392.60(B)(4).

The primary intent of 392.10(K) is to prescribe supporting requirements of raceways, cables, boxes and conduit bodies from cables trays. Furthermore, the intent of 392.60(B) is to prescribe Grounding and bonding requirements of cable tray. Because listed cable tray clamps or adapters are listed by NRTLs based on their suitability for grounding and bonding, then the requirement for the use of listed cable tray clamps or adapters belongs in the section related to grounding and bonding rather than the section related to supporting from cable tray systems.

Panel Meeting Action: Accept in Part

Panel Statement: The panel accepts the proposed title to 392.10(K) per Proposal 8-235a, as indicated in new section 392.18(G) per panel action on Comment 8-8-100a. The rest of the comment was rejected because the proposed text is appropriate for 392.18(G). Listed clamps are available.

(392.60 [old 392.7])

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)

Comment on Proposal No: 8-235a

Recommendation: Restore title of 392.60 (old 392.7) to "**392.60 Grounding**" by deleting the text "and Bonding".

Substantiation: The Panel Action on this proposal should have been "Accept in Part". The revision to add "and Bonding" to the title of 392.60 (old 392.7) should not have been accepted. The section currently requires: "Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250". They are to be bonded only if being used as grounding conductors, per 250.96.

Further, if they are grounded (the text implies that all sections shall be grounded), then they are also 'bonded' via the grounding conductors; requiring additional 'bonding' is redundant.
Panel Meeting Action: Reject
Panel Statement: Grounding and bonding are requirements within 392.60.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-127 Log #684 NEC-P08 **Final Action: Reject**
(392.120)

Submitter: Paul E. Guidry, Fluor Enterprises, Inc. / Rep. Associated Builders and Contractors
Comment on Proposal No: 8-260
Recommendation: 392.120 Marking. Cable trays containing conductors rated over 600 volts shall have a permanent, legible warning notice carrying the wording "DANGER- HIGH VOLTAGE" placed in a readily visible position on all cable trays with maximum spacing of warning notices not to exceed ~~3m (10 ft)~~ 6 m (20 ft).
Substantiation: As a member of the task group that originated this proposal, I agree that marking high voltage cable trays adds a safety component; however, I feel like 3m (10) ft. is excessive. Most high voltage cables run several hundred or even several thousand feet through cable trays. Some runs are as long as a mile (5,280 ft) or more in refineries and petrochemical plants. On a mile long run, there would be 528 signs required. Pipe supports are typically spaced every 6m (20 ft). I believe one sign per bay is sufficient.
Panel Meeting Action: Reject
Panel Statement: The panel continues to support the Task Group's recommendation for spacing of 10 ft.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 394 — CONCEALED KNOB-AND-TUBE WIRING

7-60 Log #124 NEC-P07 **Final Action: Accept**
(394.12(4))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 7-152
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comment expressed in the voting.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel agrees that the original language in the NEC 2008 is appropriate and rejects the original proposal.
Panel Statement: The panel agrees with the negative comment that Knob and Tube wiring is an obsolete wiring method and is restricted in use. The 2008 language in Section 394.12 "uses not permitted" (4) restricting knob and tube from hazardous locations is appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 396 — MESSENGER SUPPORTED WIRING

7-61 Log #1562 NEC-P07 **Final Action: Reject**
(396.12)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-155
Recommendation: Accept the proposal.
Substantiation: See the Explanation of Negative Vote for Proposal 7-9, 320.12(1) in the 2010 ROP.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 7-2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-62 Log #2593 NEC-P07 **Final Action: Reject**
(396.30(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-158
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive. In Article 225, 225.4 Exception will only allow a bare messenger to be used as a grounded circuit conductor if another NEC location specifically recognizes this use. Article 250 does not meet this criterion because although 250.32(B) Exception allows a regrounded neutral in a limited circumstance, nothing in that wording permits the neutral to be uninsulated. That brings us to 396.30(B) which goes back to 225.4 Exception. If the messenger were insulated (obviously not practical) one could make the argument that 396.30(C) would allow the messenger for this purpose because 250.32(B) is mentioned, but for an uninsulated messenger we are left with no literal permission in the NEC. The proposal solves the problem once and for all with a simple declarative sentence.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the original proposal that the language in 225.4 allowing a bare neutral is actually contained within the exception. That exception does indicate that bare neutrals are only allowable if specifically mentioned in other parts of the Code. Article 250.32 (B) "Exception" allows such installations and is specific to existing premises wiring systems. The existing language in 396.30(B) is sufficient. If a reference to 250.32(B) Exception is necessary then such a reference should be located in the language of the exception to 225.4.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 399 — OUTDOOR, OVERHEAD CONDUCTORS, OVER 600 VOLTS

7-63 Log #125 NEC-P07 Final Action: Accept
(399)

TCC Action: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and agrees with the panel's suggested revision to the Article scope.

The Technical Correlating Committee revises the panel's action on new Article 399 to comply with 3.1.3, 3.2.1, and 3.3.5 of the NEC Style Manual with the text to read as follows:

"Article 399 Outdoor, Overhead Conductors, Over 600 Volts, Nominal

399.1 Scope. This article covers the use, and installation for outdoor, overhead conductors, over 600 volts, nominal.

399.2 Definition.

Outdoor Overhead Conductors. Single conductors, insulated, covered, or bare, installed outdoors on support structures.

399.10 Uses Permitted. Outdoor overhead conductors, over 600 volts, nominal, shall be permitted only for systems rated over 600 volts, nominal as follows:

(1) Outdoors
(2) For service conductors, feeders or branch circuits

Informational Note: For additional information on outdoor overhead conductors over 600 volts, see ANSI/IEEE C2-2007, National Electrical Safety Code.

399.12 Uses Not Permitted. Overhead conductors, over 600 volts, nominal shall not be permitted to be installed indoors.

399.30 Support.

(A) Conductors. Documentation of the engineered design by a licensed professional engineer engaged primarily in the design of such systems for the spacing between conductors shall be available upon request of the authority having jurisdiction and shall include the following:
(1) Applied voltage.
(2) Conductor size.
(3) Distance between support structures.
(4) Type of structure.
(5) Wind loading.
(6) Ice loading.
(7) Surge protection.

(B) Structures. Structures of wood, metal, concrete or combinations of those materials shall be provided for support of overhead conductors, over 600 volts, nominal. Documentation of the engineered design by a licensed professional engineer engaged primarily in the design of such systems and the installation of each support structure shall be available upon request of the authority having jurisdiction and shall include the following:
(1) Soil conditions.
(2) Foundations and structure settings.
(3) Weight of all supported conductors and equipment.
(4) Weather loading and other conditions such as ice, wind, temperature, and lightning.

(5) Angle where change of direction occurs.
(6) Spans between adjacent structures.
(7) Effect of dead end structures.
(8) Strength of guys and guy anchors.
(9) Structure size and material(s).
(10) Hardware.
(C) Insulators. Insulators used to support conductors shall be rated for all of the following:
(1) The applied phase to phase voltage.
(2) Mechanical strength required for each individual installation.
(3) Impulse Withstand BIL in accordance with Table 490.24.
Informational Note: 399.30 (A), (B), and (C) may not be all inclusive lists."
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 7-162
Recommendation: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.

In addition, the Technical Correlating Committee assigns this material as Article 399.

The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relative to the NEC Style Manual and statements expressed in the ballots.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel accepts the removal of the wording "Over 600 Volts" from the definition.

The panel revised 399.10 Uses Permitted (2) as follows: For service conductors, feeders or branch circuits
Panel Statement: The panel recommends that the TCC revise the scope as follows:
This article covers the use, and installation ~~and construction specifications~~ for outdoor, overhead conductors, over 600 volts.

The panel has reviewed the negative comments and provided changes in the panel action.
The panel does not agree with the negative comment No.4 with regard to 399.12. Conductors over 600 volts installed indoors are covered elsewhere in the NEC.

See panel action on Comment 7-67 for concerns on 399.30(A), (B), and (C).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

FAHRENTHOLD, C.: Article 90.1 (C) clearly states that the NEC is not intended as a design specification.

7-64 Log #1390 NEC-P07 **Final Action: Reject**
(399)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 7-162
Recommendation: Please reconsider and reject this proposal.
Substantiation: The proposal provides benefits for the inclusion of medium and high voltage substation and premises wiring installation requirements in the NEC. However, bringing NESC requirements into the NEC without the context of NESC basic provisions that are considered necessary for the safety of qualified personnel and the public under the specified conditions will result in an incomplete or unsafe installation.

We recommend and it may be more appropriate to create a task force to consider these items in a general area such as Article 110. For example, requirements for an electric substation apply to both outdoor and indoor applications and do not fall under the scope of Article 225. These requirements should be considered in a more general area.

We recommend a new article be written for Chapter 1 (possibly Article 120, entitled "Requirements for Electrical Installations over 600 Volts") that incorporates these concepts and integrates existing NEC text.
Panel Meeting Action: Reject
Panel Statement: The panel was assigned Article 399 by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

RAY, J.: EEI believes it is beneficial to provide medium and high voltage premises substation and wiring installation requirements in the NEC. Although the TCC has directed the work from the High Voltage Task Force be added as a new article, it would be appropriate to consider other options for including these recommendations in the NEC. Including these requirements in a general area such as Chapter 1 should be considered.

7-65 Log #1975 NEC-P07 **Final Action: Accept in Part**
(399)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Comment on Proposal No: 7-162
Recommendation: Delete 399.30 of the proposed article and add an informational note to 399.10 as follows.
Informational Note: For additional information on outdoor overhead conductors over 600 volts, see ANSI/IEEE C2-2007, *National Electrical Safety Code*.
Substantiation: Making National Electrical Safety Code (NESC) performance requirements into prescriptive requirements of the NEC is counterproductive. High voltage installations require engineering supervision. Informational note references to the NESC are suggested as a means to guide installers and inspectors upon plan review of engineered designs for high voltage installations. For further information regarding this comment, please refer to the article on "Connecting Premises Wiring to Supply Lines" published by the International Association of Electrical Inspectors in their September/October 2009 magazine (http://www.iaei.org/magazine/?p=4329#more-4329) on page 93.
Panel Meeting Action: Accept in Part

The panel accepts the informational note inserted after 399.10 as follows:
Informational Note: For additional information on outdoor overhead conductors over 600 volts, see ANSI/IEEE C2-2007, *National Electrical Safety Code*.
Panel Statement: The panel accepts the addition of the informational note and rejects the remainder of the comment. See the panel action and statement on comment 7-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

RAY, J.: See statement on comment 7-64.

7-66 Log #2594 NEC-P07 **Final Action: Accept in Principle**
(399 (New))

TCC Action: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.

See the Technical Correlating Committee action on Comment 7-63.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-162
Recommendation: Accept the proposal in principle.and make the following changes:

1. Combine the scope and the definition by deleting 399.2 and rewording the scope as follows:
399.1. Scope. This article covers the use, installation, and field construction specifications for ~~outdoor, overhead conductors,~~ systems operating over 600 volts using single conductors, whether insulated, covered, or bare, that are installed as open wiring overhead in outdoor locations on support structures.
II. Reword 399.10 to read as follows:
399.10. Uses Permitted. Outdoor, overhead conductors operating over 600 volts shall be permitted ~~only~~ for outdoor overhead service conductors, and for feeders and branch circuits, on systems operating over 600 volts.
III. Reword 399.12 to read as follows:
399.12. Uses Not Permitted. Outdoor, overhead conductors, over 600 volts shall not be extended inside a building unless converted to another wiring method in Chapter 3, or, where accessible only to qualified persons, continued as open wiring, all in accordance with 300.37.
IV. Insert parent language in 399.30 ahead of the three subsections reading as follows:
399.30. Support. Outdoor, overhead conductors operating over 600 volts shall meet any specified clearance requirements as applicable in 225.60 and 225.61. The engineering design for the system as covered in (A), (B), and (C) shall be documented and the documentation shall be made available to the authority having jurisdiction.
Then, change the lead-in wording for (A) to read "The spacing design shall demonstrate compliance with accepted national standards." Change the second sentence of the lead-in wording for (B) to read "The structure design and the clearances to be obtained by that design shall demonstrate compliance with accepted national standards."
Substantiation: I. There are numerous problems with the first two sections, especially the definition that defines the term using the term in direct violation of the NEC Style Manual at 2.2.2. The submitter understands that specific approval of the TCC will be required to make this change but it is far more readable and not at all circular. By inserting the word "field" we address the concern in the voting that this is some sort of construction specification for manufactured components, which it is not, but referencing field issues such as how high to build the support structures. The "open wiring" phrase was added to clarify that this article does not regulate single conductors operating outdoors over 600 volts and running overhead in a cable tray or something comparable.

II. The word "only" is problematic because it creates an implication that the use of this type of distribution cannot be used for 600-volt systems and lower. In fact, only the application of this article is limited to over 600-volt systems. The terminology on service work is rephrased to "overhead service conductors" to reflect changes in definitions now occurring under the supervision of CMP 4. The list format is not particularly helpful when it only contains two items and the concepts are easily presented in a simple sentence.
III. The ROP wording makes no sense because outdoor wiring that is not outdoors is not outdoor wiring. It is impossible to violate the section as written. In addition, as pointed out in the voting, forms of this wiring are used indoors. The rewritten text addresses these issues.
IV. The new parent language incorporates the specific clearances required in Part III of Article 225. In addition, it avoids the necessity for repeating the rule for making documentation available to the AHJ. The language suggested for (A) and (B) partially addresses the concern in the voting with respect to enforceability. The terminology "accepted national standards" is taken from the last sentence of 490.24, which involves similar concerns.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 7-67 and 7-63.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
RAY, J.: See statement on comment 7-64.

7-67 Log #1417 NEC-P07 **Final Action: Accept in Principle in Part (399.30)**

Submitter: Dennis A. Nielsen, Lawrence Berkeley National Laboratory / Rep. Institute of Electrical & Electronic Engineers, Inc.
Comment on Proposal No: 7-162
Recommendation: Continue to Accept the Panel Action except for the following indicated revisions.
399.30 Support.
(A) Conductors. Documentation of the ~~qualified~~ engineered design by a qualified engineer for the spacing ~~design~~ between conductors shall be available upon request of the authority having jurisdiction and shall include consideration of the following:
(1) Applied voltage.
(2) Conductor size.
(3) Distance between support structures.
(4) Type of structure.
(5) Wind/Ice loading.
(6) Surge protection
(B) Structures. Structures of wood, metal, concrete or combinations of those materials shall be provided for support of overhead conductors, over 600 volts. Documentation of the ~~qualified~~ engineered design by a qualified engineer and the installation of each support structure shall be available upon request of the authority having jurisdiction and shall include consideration of the following:
(1) Soil conditions.
(2) Foundations and structure settings.
(3) Weight of all supported conductors and equipment.
(4) Weather loading and other conditions (ice, wind, temperature, lightning. etc.),
(5) Angle where change of direction occurs.
(6) Spans between adjacent structures.
(7) Effect of dead end structures.
(8) Strength of guys and guy anchors.
(9) Structure size and material(s).
(10) Hardware.
(C) Insulators. Insulators used to support conductors shall be rated for all of the following:
(1) The applied phase to phase voltage.
(2) Mechanical strength required for each individual installation.
(3) Impulse Withstand BIL in accordance with Table 490.24.
Substantiation: 1. From the panel discussion it is understood that the term "qualified engineered design" is intended to mean designed by a qualified engineer.
2. It is also understood that other factors may need to be considered such as surge protection, lightning protection, etc.
Panel Meeting Action: Accept in Principle in Part
Continue to Accept the Panel Action except for the following indicated revisions.
399.30 Support.
(A) Conductors. Documentation of the ~~qualified~~ engineered design by a licensed professional engineer engaged primarily in the design of such systems for the spacing ~~design~~ between conductors shall be available upon request of the authority having jurisdiction and shall include consideration of the following:
(1) Applied voltage.
(2) Conductor size.
(3) Distance between support structures.
(4) Type of structure.
(5) Wind/Ice loading.
(6) Surge protection
(B) Structures. Structures of wood, metal, concrete or combinations of those materials shall be provided for support of overhead conductors, over 600 volts. Documentation of the ~~qualified~~ engineered design by a licensed professional engineer engaged primarily in the design of such systems and the installation of each support structure shall be available upon request of the authority having jurisdiction and shall include consideration of the following:
(1) Soil conditions.
(2) Foundations and structure settings.
(3) Weight of all supported conductors and equipment.
(4) Weather loading and other conditions such as but not limited to ice, wind, temperature, and lightning.
(5) Angle where change of direction occurs.
(6) Spans between adjacent structures.
(7) Effect of dead end structures.
(8) Strength of guys and guy anchors.
(9) Structure size and material(s).
(10) Hardware.
(C) Insulators. Insulators used to support conductors shall be rated for all of the following:
(1) The applied phase to phase voltage.
(2) Mechanical strength required for each individual installation.
(3) Impulse Withstand BIL in accordance with Table 490.24.
Informational Note: 399.30 (A), (B), and (C) are not all inclusive lists
Panel Statement: The panel agrees in part with the submitter's comment.
The panel accepts parts 399.30(A) (6) and (B) (4) (and other conditions), (lightning). The panel accepts the remainder of the comment in principle; refer to the panel action for revised text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
FAHRENTHOLD, C.: This proposal should have beeen rejected at the proposal stage. This work is covered by the National Electrical Safey Code which has been adopted by many states and municipalities. This article merely adds volume to the code without any substance and in ROC 7-65 that reference is added in an informational note.
NIELSEN, D.: The Panel should have accepted Comment 7-67 as submitted. The panel's change of the word "qualified" to "licensed professional" introduces a new requirement without public review. The term "licensed professional" is used by the state and or local jurisdiction for regulating the engineering practice. The intent of the original comment was to ensure that the engineer is qualified in providing an engineered design.
RAY, J.: See statement on comment 7-64.

ARTICLE 400 — FLEXIBLE CORDS AND CABLES

6-79a Log #CC602 NEC-P06 **Final Action: Accept (Table 400.4)**

Submitter: Code-Making Panel 6,
Comment on Proposal No: 6-140
Recommendation: Reject the portion of the panel action that removes 12 AWG and associated insulation thicknesses (2.41 mm and 95 mils) for Type HPN.
Substantiation: The panel failed to note that the insulation thickness for #12 AWG HPN is 95 mils (2.41mm) when they acted on Proposal 6-140. The recommendation corrects that oversight.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-80 Log #2180 NEC-P06 **Final Action: Reject (Table 400.4, 400.5(A), and 400.6)**

Submitter: Wayne E. Morris, Association of Home Appliance Manufacturers
Comment on Proposal No: 6-142
Recommendation: The Code-Making Panel should accept Proposal 6-142.
Substantiation: The original substantiation for this proposal provides evidence of the suitability of an SBST cord. Addition of this material to the NEC will allow manufacturers greater options in selecting materials while maintaining safety.
Panel Meeting Action: Reject
Panel Statement: The Submitter has not provided any additional substantiation that addresses the issues that were made in the Panel's Statement on the proposal.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-81 Log #126 NEC-P06 **Final Action: Accept**
(400.5)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 6-145
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal related to the action taken on Proposal 6-150.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel action on Proposal 6-145 modifies the panel action on Proposal 6-150. The ROP draft is correct.
Panel Statement: The panel accepts that the action taken on Proposal 6-150 should have been accept in principle. See action and statement on Proposal 6-145.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-82 Log #2414 NEC-P06 **Final Action: Reject**
(400.8(4))

Submitter: Michael Flegel, Reliance Controls Corporation
Comment on Proposal No: 6-156
Recommendation: Accept the proposal.
Substantiation: I can see where a power supply cord connected to a building is not safe because it always under power. A power cord from a portable generator to a building which is eventually connected to a transfer switch, is not live until the generator is connected. When the cord is not connected to the generator, it has no power. If the cord is damaged and people come into contact with it, they will not be injured.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that there is no technical substantiation to permit cords to be permanently installed as fixed wiring on a building surface.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 402 — FIXTURE WIRES

9-45 Log #1042 NEC-P09 **Final Action: Accept in Principle**
(404.2(C))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 9-95
Recommendation: Revise the accepted text from the panel action as shown below:

(C) Switches Controlling Lighting Loads. Where switches control lighting loads supplied by a grounded general purpose branch circuit, a grounded circuit conductor shall be provided at the switch location.

Exception: The grounded conductor shall be permitted to be omitted from the switch enclosure where either of the conditions in (1) or (2) apply.

(1) Conductors for switches controlling lighting loads enter the device box through a raceway having sufficient space for grounded conductor(s) for each branch circuit and using conductors with sufficient base ampacity to allow the additional grounded current carrying conductors to be installed in the future.
(2) Cable assemblies for switches controlling lighting loads enter the device box through a framing cavity that is open at the top or bottom on the same floor level, or through a wall, floor, or ceiling that is unfinished on one side.
Informational note: The provision for a (future) grounded conductor is to provide power to electronic lighting control devices.
Substantiation: Suggest the addition of an informational note to 404.2(C) to explain the reason for this requirement. If the 404.2(C) is read without the informational note, the rationale for the provision is truly obscure.

404.2(C) Exception (1) as written is incomplete in its requirements. The future installation of grounded conductor(s) also requires space in the raceway(s) for the added conductor(s) and sufficient ampacity in all conductors after derating for the added conductors.

404.2(C) Exception (2) as written is not parallel in its use of terms to (1). Suggest adding the words “loads” and “device” as shown above.
Panel Meeting Action: Accept in Principle

Revise text to read as follows:

In 404.2(C) in the ROP panel action, change “a grounded circuit conductor” to “the grounded circuit conductor for the controlled lighting circuit.”

In (1) of the Exception in the ROP panel action, add the following sentence: “The raceway shall have sufficient cross-sectional area to accommodate the extension of the grounded circuit conductor of the lighting circuit to the switch location whether or not the conductors in the raceway are required to be increased in size to comply with 310.15(B)(2)(a).”

In (2) of the Exception in the ROP panel action, insert the word “loads” as shown in this comment, but do not insert the word “device”. In addition, delete the word “device” from (1).

Revise the informational note by changing “provide power to” to “complete a circuit path for”.
Panel Statement: CMP 9 agrees that the raceway must accommodate the future conductor. This wording avoids the undefined terminology “base ampacity.” The panel wording also clarifies that not just any grounded circuit conductor will do, but only the one for the relevant lighting circuit. In (1) and (2) of the exception, the word “device” is not correct because not all such switch locations occur at device boxes. For example, a 4-in. sq. box with a plaster ring is not a device box. The panel has revised the recommended informational note to be technically correct.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 404 — SWITCHES

9-46 Log #1117 NEC-P09 **Final Action: Reject**
(404.8(A) Exception No. 4 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-102
Recommendation: Accept the proposal with the following revisions:

Exception No. 4: Switching devices identified for only automatic operation by temperature, pressure, flow, movement, proximity, magnetism, light, and the like, shall be accessible, but shall not be required to be readily accessible.
Substantiation: 404.1 states that the article applies to all switching devices. The devices covered in the proposal are switching devices as the panel stated, and are disconnecting means per the definition for “Switching Devices” in Article 100. Disconnecting means are generally required to be accessible. These switching devices can require adjustment and maintenance and should be noted to comply with 110.26.
Panel Meeting Action: Reject
Panel Statement: Although the article does cover such devices, it does not follow that this section covers these other switching devices. This section only covers switches as defined in Article 100, and therefore the exception is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-47 Log #1113 NEC-P09 **Final Action: Reject**
(404.8(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-103
Recommendation: Accept the proposal with the following revisions:

A snap switch, receptacle, dimmer, flanged surface device, pilot light, push button, or other devices shall not be grouped or ganged in enclosures with similar devices unless...(remainder unchanged).
Substantiation: The provision should include other devices where the hazard can be the same.
Panel Meeting Action: Reject
Panel Statement: The proposed language is phrased incorrectly for an article covering switches. The language in 404.8(B) is sufficiently inclusive.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-48 Log #1239 NEC-P09 **Final Action: Hold**
(404.8(C))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-106
Recommendation: Continue to accept the proposal but revise 404.8(C) as follows:

(C) Multipole Snap Switches. A multipole, general-use snap switch shall not be permitted to be fed from more than a single circuit unless it is listed and marked as a two-circuit or three-circuit switch. ~~, or unless its voltage rating is not less than the nominal line-to-line voltage of the system supplying the circuits.~~

Substantiation: The addition of the FPN provides important information for the safe use of 2 and 3 circuit switches. However, there is an additional safety concern that needs to be recognized. 404.8(C) as currently written allows for a potentially unsafe installation. If the deleted text shown above remains in the code, a general use multipole snap switch is permitted to be used for multicircuit applications. Listed two and three pole general use snap switches have not been evaluated for use in multicircuit applications. UL guide information, WJQR, states: "Multi-pole, general-use snap switches have not been investigated for more than single-circuit operation unless marked "2-circuit" or "3-circuit."

The reason that this statement appears in the guide information is that there are different test requirements for 2 and 3 pole snap switches and 2 and 3 circuit switches. It is true that some 2 and 3 pole switches on the market today can safely be used in 2 and 3 circuit applications. This is due to the robust design of many of these switches. However, there is no certainty that all 2 and 3 pole snap switches are suitable for use in 2 and 3 circuit applications, unless the switches have been specifically tested and marked in accordance with the ANSI/UL20, the Standard for General Use Snap Switches. The wiring device industry and UL are currently reviewing ANSI/UL20 to insure that the testing and marking of these switches clearly defines and differentiates the intended use of multipole and multi-circuit switches.
Panel Meeting Action: Hold
This action is on Comment 9-48 only.
Panel Statement: In accordance with 4.4.6.2.2(a) of the Regulations Governing Committee Projects, this comment must be held for action in the 2014 NEC cycle. The recommendation and substantiation provided in this comment should have been submitted during the comment period for the 2008 NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

HARTWELL, F.: This comment was submitted exactly three years too late. Note that even if it were submitted on a timely basis, or as a proposal, CMP 9 might well have taken some other action, such as including a requirement in the construction part of the article mandating that multipole snap switches be suitable for these applications. The original proposal (in the 2008 NEC cycle) specifically anticipated that the guide card requirements for snap switches would have to be changed if the proposal were accepted, as it was, and such changes generally take place in the context of adjustments being made to the governing product standard. Further, a representative of a major device manufacturer was consulted during the course of the CMP 9 meetings on the 2008 NEC, and he saw no problem with the anticipated wording. If indeed there are some multipole snap switches that do not comply with the applicable requirements for multi-circuit use, they should be upgraded because they are commonly applied in these cases with no one the wiser, as covered in the 2008 substantiation.

With that said, it is encouraging that the device industry is finally showing some signs of attentiveness to this issue. It is to be hoped that by the next gathering of CMP 9 in January of 2012, this question will be academic and no further activity will be necessary in the NEC.

9-49 Log #2307 NEC-P09 **Final Action: Accept**
(404.8(C))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 9-106
Recommendation: Revise the proposed text as follows:
FPN: See 210.7~~(B)~~ for disconnect requirements when more than one circuit supplies a switch.
Substantiation: 210.7 was changed by the accepted proposal 2-59. 210.7 no longer contains any subsections.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-50 Log #1568 NEC-P09 **Final Action: Accept**
(404.9(B) Exception No. 2 (New) and 404.12)

Submitter: Robert D. Osborne, Underwriters Laboratories Inc.
Comment on Proposal No: 9-110
Recommendation: The panel action should be changed to an "accept in principle". The proposed new exception should be written as follows:

"404.9(B) - Exception No. 2: Listed kits or listed assemblies shall not be required to be connected to an equipment grounding conductor if all of the following conditions are met:

(1) The device is provided with a nonmetallic faceplate that cannot be installed on any other type of device,

(2) The device does not have mounting means to accept other configurations of faceplates,

(3) The device is equipped with a nonmetallic yoke, and

(4) All parts of the device that are accessible after installation of the faceplate are manufactured of nonmetallic materials."

Additionally, Section 404.12 should be revised as follows:

404.12, last sentence, should read as follows: "Except as covered in 404.9(B), Exception No. 1, nonmetallic boxes for switches shall be installed with a wiring method that provides or includes an equipment grounding conductor."

Substantiation: While continuing to "accept in principle", the panel should consider modifications to the panel action to address the following concerns: (1) The proposal is specific to snap switches, consideration should be given to whether the exception should apply to all devices identified in the parent rule (including dimmers and similar control switches), (2) Require the device and cover plate to be listed as a kit or assembly - this mirrors the requirement in 406.4(D) for receptacle/faceplate combinations and is consistent with the panels intent that the yoke be designed to interface with a unique faceplate, (3) Include additional verbiage to ensure the yoke does not have mounting means to mount faceplates not provided as part of the listed assembly (i.e. the yoke should not be provided with threads to accept 6-32 screws for the mounting of traditional faceplates), (4) Limit the exception to those devices with all parts accessible after installation to be manufactured of nonmetallic materials (i.e., the switch operator should not be metallic), and (5) Revision to 404.12 to address the renumbering of the existing exception.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-51 Log #1112 NEC-P09 **Final Action: Reject**
(404.11)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-115
Recommendation: Accept the proposal with the following revisions:

A circuit breaker, including power-operated types, shall be permitted to serve as a switch, if it can be opened by an externally manually operable lever or handle.

Substantiation: Power failure should not be the only reason to require manual control of power operated circuit breakers. Control may be distant from the circuit breaker and there can be conditions other than power failure where personnel in the vicinity of the circuit breaker should have provisions for manual operation.
Panel Meeting Action: Reject
Panel Statement: The existing NEC text provides for hand operation in the event of unpowered conditions. It goes without saying that some sort of lever or handle will be required to accomplish this action, and it need not be restated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-52 Log #2595 NEC-P09 **Final Action: Accept**
(404.14(F) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-118
Recommendation: Accept the proposal in principle; change the end reference from "as provided in Article 210" to "as provided in 210.21(B)."
Substantiation: The panel overlooked a flagrant violation of the whole-article-cross-reference prohibition in the NEC Style Manual, at 4.1.1. This is the appropriate, and specific, reference.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-53 Log #1111 NEC-P09 **Final Action: Reject**
(404.15 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-120
Recommendation: Accept the proposal.
Substantiation: The same as the proposal. Whether or not current industry practices are causing problems is irrelevant; practices not governed can change. 404.14(D) and (E) require listing for specific switches, 430.109(A)(1), (2), (3), (4), and (5) require listing for switches, circuit breakers, and controllers (defined as making and breaking a circuit - "switching"). Circuit breakers are plainly not beyond the scope of Article 404, since circuit breakers used as switches (404.1) are still circuit breakers.
Panel Meeting Action: Reject
Panel Statement: This sort of marking requirement belongs in Article 240, if anywhere. It should only be considered in the context of other required markings that have to do with topics related to overcurrent protective functions, and therefore this subject should remain within the province of CMP 10. It should be noted that Section 110.21 already requires inclusion of manufacturers name or other identification, and 240.83 requires amperage and voltage ratings to be marked. Also, Section 240.83 already requires circuit breakers used in certain switching applications to be listed. Expansion of listing requirements for breakers should be addressed in Article 240, not Article 404.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-54 Log #1108 NEC-P09 **Final Action: Reject**
(404.19 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-124
Recommendation: Accept the proposal.
Substantiation: 404.1 includes switching devices, a unit that carries or controls (by switching) electric energy.
Panel Meeting Action: Reject
Panel Statement: Although these other devices are within the scope of Article 404, there are no limitations placed on them with respect to hand operation. Such limitations are imposed on "switches" and these are as defined in Article 100; other switching devices as covered in this comment are not covered by those limitations. The proposed text is unnecessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

14-2 Log #127 NEC-P14 **Final Action: Accept**
(404.80(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-130
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 14 for action in 504.80(A).
This action will be considered by Code-Making Panel 14 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-3 Log #1091 NEC-P14 **Final Action: Accept in Principle**
(404.80(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-130
Recommendation: Accept the proposal as intended for 504.80(A).
Substantiation: The proposal was mistakenly numbered.
Panel Meeting Action: Accept in Principle
Revise 504.80(A) to read: "Intrinsically safe circuits shall be identified at terminal and junction locations in a manner that is intended to ~~will~~ prevent unintentional interference with the circuits during testing and servicing."
Panel Statement: Panel 14 agrees with the submitter's intent and has revised the text to more clearly explain the requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 406 — RECEPTACLES, CORD CONNECTORS, AND ATTACHMENT PLUGS (CAPS)

18-5 Log #1110 NEC-P18 **Final Action: Reject**
(406.1)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-10
Recommendation: Accept the proposal.
Substantiation: Flanged surface devices are noted in various sections and serve the same purposes as plugs, receptacles, and cord connector bodies and should be included.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional information/substantiation for consideration. Flanged Surface devices are intended for installation in equipment (not the premises wiring system) as noted in the substantiation for Proposal 18-10. As such, they are covered by the appropriate product standards and by the product standard covering the flanged device. Placing additional installation requirements in the NEC is not necessary.
It is further noted that "flanged outlet" is by the definition in Article 100 a "receptacle" and already covered in 406.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-6 Log #2717 NEC-P18 **Final Action: Reject**
(406.1(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 18-11
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There are currently no product standard requirements for power safe protector (PSP) protection. The supporting documentation did not include investigation of the ability of this technology to mitigate the hazards associated with wiring device failure mechanisms. Installation of these devices is not currently prohibited by the NEC. There has yet to be an established correlation between over temperature and fire initiation beyond what is in the current receptacle standard.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-7 Log #1107 NEC-P18 **Final Action: Reject**
(406.2(A), (B), (C) and Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-8
Recommendation: Accept the proposal.
Substantiation: The proposal does contain proposed text. Flanged surface devices serve the same purpose as plugs, receptacles and cord connector bodies, and should be included. Flanged surface devices are noted in other NEC sections.
Panel Meeting Action: Reject
Panel Statement: See Panel action and statement on Comment 18-5.
Number Eligible to Vote: 11

(406.2(A), (B), and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-15
Recommendation: Accept the proposal with the following revisions:
Receptacles, Cord Connector Bodies, Attachment Plugs, and Flanged Surface Devices.
Ratings and Types.
(A) Listing devices covered by this article shall be listed and marked with the manufacturer's name or identification and voltage and ampere ratings.
(B) Ratings. Devices covered by this article shall be rated not less than 15 amperes, 125 volts, or 15 amperes, 250 volts and shall be a type that cannot be used as lampholders.
Exception: Where a lower rating is permitted by 410.62(C)(2).
(C) Aluminum Conductors. Devices covered by this article rated 20 amperes or less and directly connected to aluminum conductors shall be marked CO/ALR.
Substantiation: Flanged surface devices, which perform similar functions should be included in the provisions. 410.62(C)(2) should be noted to avoid conflict.
Panel Meeting Action: Reject
Panel Statement: See Panel action and statement on Comment 18-5. The submitter has provided no example of "conflict".

18-10 Log #488 NEC-P18 **Final Action: Accept in Principle**
(406.3(D))

Submitter: James T. Dollard, Jr., IBEW Local Union 98
Comment on Proposal No: 18-30
Recommendation: Continue to accept Proposal 18-30 in Principal, but make changes to address the comments in the voting.
Revise the existing 2008 NEC text in 406.3(D) as follows:
(D) Replacements. Replacements of receptacles shall comply with 406.3(D)(1) through (D)(6) as applicable.
(4) Arc-Fault Circuit Interrupter Protection. Where a receptacle outlet is supplied by a branch circuit that requires arc-fault circuit interrupter protection as specified elsewhere in this code, a replacement receptacle shall be:
(a) a listed outlet branch circuit type arc-fault circuit interrupter receptacle, or
(b) protected by a listed outlet branch circuit type arc-fault circuit interrupter receptacle, or
(c) protected by a listed combination type arc-fault circuit interrupter.
Substantiation: The panel's continued acceptance of this proposal will provide much needed arc fault protection in older homes. This comment is intended to address some of the concerns expressed by panel members. The proposed wording in this comment will allow AFCI protection to be provided by either a circuit breaker AFCI or by a receptacle AFCI when a receptacle is replaced. Both the receptacle and circuit breaker AFCI will provide protection for all receptacles and other outlets that are downstream on the branch circuit. The UL standard for AFCI's, UL1699, covers outlet branch circuit (OBC) type for receptacles. An OBC type AFCI receptacle provides series arcing protection upstream and downstream from its point of installation and parallel arc protection downstream of that point.
As noted in the proposal substantiation, AFCI protection in older homes is likely to be provided only when circuit breakers are replaced or when the service is upgraded. Continued acceptance of this proposal is necessary due to the fact that the replacement of circuit breakers individually or in a complete replacement as in a service upgrade does not require the use of AFCI type circuit breakers. The proposed text provides significant flexibility due to the fact that this addresses only receptacle replacements not the entire branch circuit. For example, receptacles installed on a multiwire branch circuit could easily be protected with a single outlet branch circuit (OBC) type at the first outlet.
Adopting the requirement to provide replacement receptacles with AFCI protection will greatly expand the use of AFCI's in older homes where there is a clear need for AFCI protection. As stated in the substantiation submitted with proposal 18-30 there is no practical reason to limit the level of safety provided by an AFCI to new homes only.
NFPA has published a report titled Home Electrical Fires, by John R. Hall Jr., dated March 2009. The report describes how the age of a dwelling is related to the increased risk of electrical fires. A table in the NFPA report states that the risk ratio for electrical fires is 0.5 for dwellings 11-20 years old, 1.0 for dwellings 21-40 years old and 1.6 for dwellings more than 40 years old. It is apparent that many older homes are at significantly greater risk and would benefit most from additional AFCI protection. There have been a number of reports submitted to CMP 2 in support of the requirement for AFCI protection. Many of these reports also identify a clear correlation between older homes and the increased occurrence of electrical fires. (The NFPA report is available at http://www.nfpa.org/itemDetail.asp?categoryID=423&itemID=18255&URL=Research/Fire%20reports/Major%20causes)
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(4) Arc-Fault Circuit Interrupter Protection. Where a receptacle outlet is supplied by a branch circuit that requires arc-fault circuit interrupter protection as specified elsewhere in this code, a replacement receptacle at this outlet shall be one of the following.
(1) a listed outlet branch circuit type arc-fault circuit interrupter receptacle.
(2) a receptacle protected by a listed outlet branch circuit type arc-fault circuit interrupter type receptacle.
(3) a receptacle protected by a listed combination type arc-fault circuit interrupter type circuit breaker.
This requirement becomes effective January 1, 2014.
Panel Statement: The panel editorially revised the recommendation to comply with the NEC Style Manual and added the effective date per their action on Comment 18-19. The panel added "type circuit breaker" to (3) to clarify the type of device that is permitted under this option.
Number Eligible to Vote: 11

18-11 Log #1860 NEC-P18 **Final Action: Reject**
(406.3(D)(2))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 18-25
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(2) Non–Grounding-Type Receptacles. If an equipment grounding conductor is present at the receptacle outlet, a non-grounding-type receptacle(s) shall be replaced with a grounding-type. An equipment grounding conductor shall be installed in compliance with 250.130(C) if an equipment grounding conductor does not exist at the receptacle outlet. ~~Where attachment to an equipment grounding conductor does not exist in the receptacle enclosure, the installation shall comply with (D)(3)(a), (D)(3)(b), or (D)(3)(c).~~
Exception: ~~(a)~~ *If installing an equipment grounding conductor is impracticable, a non–grounding-type receptacle(s) shall be permitted to be replaced with another non–grounding-type receptacle(s).*
~~(b) A non–grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles shall be marked "No Equipment Ground." An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.~~
~~(c) A non–grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked "GFCI Protected" and "No Equipment~~
Substantiation: The Panel failed to respond to the substantiation in the Proposal related to the violation of listing and labeling created by Section 406.3(D)(3) (Section 406.3(D)(2) in the 2011 NEC ROP Draft). This section creates a conflict with 110.3(B) and 250.114 in that the manufacturers of many small appliances require their equipment to be supplied by a branch circuit having an equipment grounding conductor and 250.114 requires many small appliances to be grounded.

Section 110.3(B) requires that equipment be installed and used in compliance with instructions included in the listing. Installing a grounding-type GFCI receptacle for these small appliances as presently permitted in 406.3(D)(3)(b) is a direct violation of 110.3(B) and cannot be a substitute for an equipment grounding conductor required in 250.114.

Manufacturers of listed equipment rely to a great extent on the installer and user complying with their installation and use instructions covered by 110.3(B). For example, manufacturers of GFCI receptacles require in their instructions that the receptacles be tested monthly. This is not a NEC rule but is covered by 110.3(B)(3). In fact, CMP-2 accepted Proposal 2-77 to require GFCIs to be installed in a readily accessible location to facilitate the testing required. Where is the testing required? In the manufacturer's instructions.

Please take a look at the UL Marking Guide for luminaires. This Guide includes 77 pages of installation and use markings that the installer and user must comply with if included by the manufacturer. Manufacturers of luminaires rely on installers and users complying with these markings for safety in accordance with 110.3(B).

In addition, the present language in 406.3(D)(3)(c) creates a possibly hazardous condition as the user of the grounding type receptacle has a reasonable expectation that an equipment grounding path is provided when a grounding type receptacle is installed. In essence, the practice of installing a grounding type GFCI without an equipment grounding conductor connected creates a "bear trap" of sorts. Since a ground-fault return path is not provided, a ground-fault in an appliance will simply energize the metal frame of the appliance. The unsuspecting user (often a homeowner) completes the fault return path by contacting the faulted appliance and a grounded appliance or ground-fault return path. The owner provides the test path for the GFCI device! This hardly seems appropriate and can be fatal in some instances!

These receptacles often supply electronic equipment through Surge Protection Devices (SPD) that rely on the connection to the equipment grounding conductor for function and safety. Plugging a plug strip (Relocatable Power Taps (XBYS) in the UL White Book) or other SPD device into a receptacle that does not have an equipment grounding conductor connection can be unsafe. The surge protection does not function. Equipment is left without an equipment grounding connection. These receptacles are often referred to as having a "phantom ground." Unfortunately, most people who plug the equipment into these receptacles do not realize their expensive equipment is unprotected, in spite of the little labels furnished by manufacturers of GFCI receptacles.

Replacing ungrounded receptacles with grounding-type through a GFCI without having an effective ground-fault return path defies logic, violates 110.3(B), 250.4(A) and 250.114. Doing so must then be considered unsafe. The NEC should not allow this practice to continue.

Section 250.114 includes a requirement that many cord-and-plug connected appliances are required to be grounded. Supplying these appliances through a GFCI receptacle without an equipment grounding conductor has to be considered unsafe as doing so violates 110.3(B) and 250.114. The NEC should not allow this unsafe practice and CMP-18 should remove the conflict 406.3(D)(3)(c) creates with other sections.

Present Section 250.130(C) provides a practical means of installing an equipment grounding conductor if one does not exist at the receptacle outlet. Granted, this may not be as convenient as installing a GFCI device but should provide a safe installation and allow compliance with 110.3(B) and 250.114. The provision is added to the Comment that adding an equipment grounding conductor at the receptacle outlet is not required if it is impracticable to do so. This allows for hardship cases and allows the electrical inspector to make a judgment in these situations.

Electrical inspectors commonly cite violations of 110.3(B). Manufacturers want them to do so. Inspectors should not have to choose whether to enforce the safety grounding rules in Article 250 and those of appliance manufacturers or permit the relaxed replacement rules in 406.3(D)(3). I am willing to bet that manufacturers do not want to delete 110.3(B)!

Panel Meeting Action: Reject

Panel Statement: The Panel disagrees with the submitter's contention that the present requirement creates a conflict with 110.3(B). The GFCI is required to be marked "No Equipment Ground". If a piece of utilization equipment is required to be connected to a circuit with an equipment grounding conductor and it is not, this is a violation of 110.3(B), not a conflict.

The only alternative provided by the submitter is to install a grounding conductor and a grounding type receptacle and properly ground it or install a non-grounding receptacle. In many older installations an equipment grounding conductor is not present and properly installing a new one is far more difficult than simply installing a non-grounding type receptacle. Requiring that an equipment grounding conductor be installed where a grounding type receptacle is used will result in defaulting to the use of a non-grounding type receptacle and this results in using an adapter or removing the ground prong from the appliance.

The net result is that 110.3(B) is again violated. Worse, there will be no ground fault protection at all. The Panel disagrees with the submitter's statement that the unsuspecting user could be electrocuted. While the user may receive a shock, the very purpose of a GFCI is to protect against such a shock being of a magnitude or duration sufficient to cause electrocution. Further, the submitter seems to suggest that some equipment such as Surge Protective Devices (SPD) might not operate properly. This may be correct. However, the Panel believes providing shock protection to the user outweighs the submitter's concern for the equipment to function properly.

(406.3(D)(3))

Submitter: James M. Daly, Upper Saddle River, NJ

Comment on Proposal No: 18-20

Recommendation: The Proposal should be Accepted in Principle in Part.

The proposed changes to 406.3(D)(3)(b) should be Accepted in Principle by adding in the first sentence a hyphen between "circuit" and "interrupter" and deleting "-type of", and in the third sentence, deleting "-type". The revised text would then read:

First sentence: "…with a ground-fault circuit-interrupter receptacle(s)."

Third sentence: "…from the ground-fault circuit-interrupter receptacle to any outlet…".

The proposed changes to 406.3(D)(3)(c) should be Rejected.

Substantiation: The reference to 406.3(D)(3) in the Proposal was correct since both 406.3(D)(3)(b) and (c) were addressed in the Proposal.

The addition of the hyphen between "circuit" and "interrupter" in the first sentence is correct since "circuit interrupter" is an adjective and also correlates with the existing punctuation in the third sentence. Deletion of "-type" in both sentences is appropriate since the receptacle is either a GFCI receptacle or it is not. I do not believe that UL has multiple types of GFCIs.

Panel Meeting Action: Reject

Panel Statement: The panel recognizes that the proper application of the term will be addressed by NFPA editorial staff based on the panel's use of the term in their action on Proposal 18-20.

18-16 Log #1089 NEC-P18 **Final Action: Reject**
(406.3(D)(4))

Submitter: Greg Taylor, City of Knoxville
Comment on Proposal No: 18-30
Recommendation: Delete the following text:
~~**(4) Arc-Fault Circuit-Interrupters.** Listed combination arc-fault circuit interrupter receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this code. Exception: Unless the receptacle is protected by an upstream AFCI.~~
Substantiation: There are currently no listed combination type AFCI receptacles available as of this comment. There are some in development that are being tested under the UL Standard 1699 which uses only modern NM-B cable with a ground. However there is no data available to know whether this new technology will be compatible with all previous wiring methods. Although it is true that GFCI protection is currently required for replacement receptacles, Code Panel 2 did not mandate the use of GFCI receptacles before they were even available. There needs to be more testing performed before requiring an unavailable, untested device to be installed in every home in the country. Also, as written, the new code requirement will be in direct conflict with 406.(D)(3) that allows 2-wire receptacles to be used for replacement purposes. I hope that Code Panel 18 will take another look at this new requirement and allow testing of older wiring methods to be completed before requiring this.
Panel Meeting Action: Reject
Panel Statement: CPSC data indicates that over 90 percent of fires of electrical origin are in homes over 10 years of age. This proposal applies AFCI protection where the majority of fires occur. See the panel action and submitter's substantiation on Comment on 18-10. The panel action on Comment 18-19 has added an effective date of January 1, 2014 for implementation of this requirement.

Ballot Results: Affirmative: 11

18-18 Log #1577 NEC-P18 **Final Action: Reject**
(406.3(D)(4))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 18-30
Recommendation: The panel should reconsider and reject the proposal.
Substantiation: The proposal is misplaced and results in a retrofit approach that imposes a requirement that is not even required in new construction. Retrofit requirements have to be approached with great caution in the NEC. The most prominent place where retrofit has been required is in 406.4(D)(2). This provision requires that GFCI protection be provided where receptacles are replaced in areas where GFCI protection is required.

This proposal attempts to equate the GFCI retrofit provision with some type of AFCI retrofit provision.

Here is the problem. The NEC does require GFCI protection of receptacles; the NEC does NOT require AFCI protection of receptacles. AFCI protection is required in 210.12(B) for branch circuits – not receptacles. In essence, CMP 18 has implemented a retrofit requirement that doesn't exist in new construction.

Take the following example:

(1) A receptacle becomes damaged in a bedroom and it is the last receptacle on the circuit.

(2) The new provision from the ROP would require that when that receptacle is changed, AFCI protection must be provided for the receptacle.

(3) So the contractor replaces the receptacle with an AFCI receptacle (assuming one would exist). This gives you AFCI protection for that single receptacle, no protection for the branch circuit. Since 210.12 requires protection for the branch circuit, you have retrofitted a level of protection not even recognized by the current NEC.

CMP 18 has responsibility for receptacles. They do not have responsibility for branch circuits or for the cords that are plugged into receptacles. Given that AFCI is a branch circuit protection issue, how can it be in the purview of CMP 18?

The NEC Technical Correlating Committee also has a significant part of their scope and responsibility at stake in this proposal. CMP 2 has been discussing the possible ways to require retrofitting of AFCIs in the NEC for 5 code cycles and has had more discussions, presentations, technical reports and other data presented on the topic of AFCIs. Each discussion results in further considerations and concerns that must be addressed to make the retrofit viable. As Mr. Wells points out in his affirmative comment on the vote, the trigger for retrofitting AFCIs needs to be looked at more broadly. The appropriate place for this to occur is in CMP 2.

CMP 18 has slid through the back door with a requirement to retrofit a protection they do not have within their scope and have done so in a manner that results in potentially none of the protection that is expected by the basic NEC rules for AFCI.

Ballot Results: Affirmative: 11

18-19 Log #2311 NEC-P18 **Final Action: Accept**
(406.3(D)(4) (New))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 18-30
Recommendation: Insert an effective date of January 1, 2014 for this requirement.
Substantiation: AFCI receptacles do not have any track record, and (to the best of *my* knowledge) are not available currently. If this proposal passes, and AFCI receptacles are not available in 2011, there could be some major problems. If this occurs, the only solution is to use AFCI breakers. The problems with this are several. For example, there are currently no 2-pole combination AFCI breakers. If an existing dwelling utilizes multiwire branch circuits, there is no easy way to comply with this new requirement. Also, many older homes have panelboards that will not accept an AFCI breaker. In these cases, changing a receptacle would result in having to perform a complete electrical service change!

By accepting this comment, we can give the manufacturer's the time that they need for research and development, and for mass production, knowing that in 2014 their product will have a market.

Listed. Devices covered by this article shall be listed and marked with the manufacturers name or identification and voltage and ampere ratings.
(A) Construction. Devices covered by this article shall be of dead-front construction so that no parts intended to carry current are exposed when energized.
(B) Connection. Devices covered by this article shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle, cord connector body, or flanged surface outlet. Delete (D).
Substantiation: (A) should apply to all devices covered by this article. (D) and flanged surface outlets, which are similar in construction and use to receptacles and cord connector bodies. I could not find 18-3 in the proposals for Article 406. The safety requirements of (A), and (B) do not cover flanged surface devices noted in the first paragraph.
Panel Meeting Action: Reject
Panel Statement: See Panel action and statement on Comment 18-5.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-27 Log #1093 NEC-P18 **Final Action: Reject**
(406.7)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-43
Recommendation: Accept the proposal.
Substantiation: See the proposal substantiation. A 20-ampere T-slot receptacle, cord connector body, or flanged surface outlet will accept an attachment plug with a different rating (15-ampere parallel blades). The last sentence is superfluous as non-grounding type receptacles, cord connector bodies, and flanged surface outlets will not accept attachment plugs with a fixed grounding member. A plug with a movable grounding member for use with a non-grounding type can be deemed to be a grounding type when so used.
Panel Meeting Action: Reject
Panel Statement: See Panel action and statement on Comment 18-5.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
WELLS, J.: The last sentence of 406.7 is not superfluous and is the reason for the product standards now requiring a rejection feature.

18-28 Log #1566 NEC-P18 **Final Action: Reject**
(406.8)

Submitter: Robert D. Osborne, Underwriters Laboratories Inc.
Comment on Proposal No: 18-45
Recommendation: The proposal should be accepted in principal, with the text modified to read as follows:
406.8 Receptacles in Damp or Wet Locations.
(A) Damp Locations. A receptacle installed outdoors in a location protected from the weather or in other damp locations shall have an enclosure for the receptacle that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed).
An installation suitable for wet locations shall also be considered suitable for damp locations.

A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff. All 15- and 20-ampere, 125- and 250-volt nonlocking receptacles shall be a listed weather-resistant type unless they are an integral part of a listed assembly, where the overall assembly has an environmental rating suitable for outdoor applications.

FPN: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20 in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles.

(B) Wet Locations.

(1) 15- and 20-Ampere Receptacles in a Wet Location. 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted. All 15- and 20-ampere, 125- and 250-volt nonlocking receptacles shall be listed weather-resistant type unless they are an integral part of a listed assembly, where the overall assembly has an environmental rating suitable for outdoor applications.

FPN: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15, and 6-20 in ANSI/NEMA WD 6-2002, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles.

Exception: 15- and 20-ampere, 125- through 250-volt receptacles installed in a wet location and subject to routine high-pressure spray washing shall be permitted to have an enclosure that is weatherproof when the attachment plug is removed.

Substantiation: The original proposal to require "weather resistant" receptacles cited misapplications, poor installation and assembly (of the receptacle and cover plate), intentional or unintentional breaking off the protective covers, and improper installation and reinstallation of outdoor outlets (A2007 ROP: 18-28 and 18-33). The original panel action to require all receptacles to be weather resistant was modified (in response to comment 18-16) to apply only to 15- and 20-ampere, 125- and 250-volt nonlocking receptacles. This comment noted that the substantiation for the original proposal concluded that it is predominately 15- and 20-ampere nonlocking receptacles that are affected by the use and installation practices identified. Similarly, receptacles that are part of a listed device, such as a power outlet, are not subject to the same installation practices, as they are installed at the factory, and are subject the Standards requirements that ensure proper protection of all electrical components (including receptacles).

The problem with the present Code requirements is that it requires all 15- and 20-ampere, 125- and 250-volt nonlocking receptacles to be listed as "weather resistant", but equipment such as a power outlet are likely to include many other receptacle configurations, and circuit breakers. No substantiation was provided, and no requirement was proposed to require protection for other receptacle configurations or other electrical components (which may be immediately adjacent to the 15- and 20-ampere receptacles).

Panel Meeting Action: Reject

Panel Statement: The certification process does not ensure that when installed the listed equipment will continue to provide equivalent protection to that afforded by the receptacle being listed as weather- resistant in accordance with UL 498. For example, the covers of power outlets can be damaged or left open thus exposing the receptacle to the elements.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

18-29 Log #2597 NEC-P18 **Final Action: Accept**
(406.8(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-54
Recommendation: Accept the panel action in principle and revise the new sentence as follows:
For other than one- or two-family dwellings, an outlet box hood ~~when~~ installed for this purpose shall be listed and where installed on an enclosure supported from grade as described in 314.23(B) or as described in 314.23(F) shall be identified as "extra-duty."
Substantiation: The word "when" addresses a condition of time, and this is a condition of place. Normally the word "where" is used, but in this case the sentence reads better without either word. The simple declarative sentence construction "… an outlet box hood installed for this purpose …" is very clear and readable.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-30 Log #1514 NEC-P18 **Final Action: Reject**
(406.8(B)(3) (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-52
Recommendation: Accept the proposal with the following revision:
Other Type Devices. A flanged surface outlet shall comply with 406.8(B)(1) and (B)(2). A cord connector body in wet locations shall be constructed or protected so as to be weatherproof.
Substantiation: These devices are similar in construction and use to receptacles and should be covered and comply with 110.11 and 110.3(A)(1)(8).
Panel Meeting Action: Reject
Panel Statement: See Panel action and statement on Comment 18-5.

18-33 Log #2598 NEC-P18 **Final Action: Accept**
(406.11)

TCC Action: The Technical Correlating Committee directs the panel action to be revised to read as follows:
"Exception: Receptacles in the following locations shall not be required to be tamper-resistant."
The remainder of the panel action is unchanged.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-71
Recommendation: Convert the exceptions into a single exception using a list format, as follows:
Exception: Receptacles in the following three locations are not required to be tamper-resistant.
(1) [As in Exception No. 1.]
(2) [As in Exception No. 2.]
(3) [As in Exception No. 3.]
(4) [As in Exception No. 4 from Proposal 18-82].
Substantiation: CMP 18 did an excellent job in framing the scope of these exceptions. This was the entire point of this submitters Proposal 18-76. This comment is editorial, and intended to address a violation of the NEC Style Manual at 3.1.4.1 in that none of the exceptions are written in the form of a

complete sentence. Rather than repeating language about not being required to be tamper resistant three times, this format uses a list that is more economical in terms of wording. The way the panel worded the exceptions makes them qualify perfectly for a list format, as covered in the NEC Style Manual, at 3.3.5. The exception added under Proposal 18-82 is also correctly worded for this list format, and can be added in the same way.
Panel Meeting Action: Accept

ARTICLE 408 — SWITCHBOARDS AND PANELBOARDS

9-55 Log #1992 NEC-P09 **Final Action: Reject**
(408.3(A)(2))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 9-136
Recommendation: This proposal should be accepted.
Substantiation: Working on energized is a serious safety hazard. It is not possible, in many cases, to have the utility disconnect the service so that an electrician can install a new breaker or do other work in the service equipment. There are no provisions in NFPA 70E or the OSHA rules that will permit the electrician to do this work with the exposed line side service connections energized. If protection for the line side terminations is provided by the manufacturer of the service equipment this work can be done safely and incompliance with the OSHA rules. Without the line side barrier it is not possible to do work in a service panel and be in compliance with the OSHA rules. The safety of the worker should be a primary concern of the NEC.
Panel Meeting Action: Reject
Panel Statement: The equipment cited (panelboards and switchboards) would still require appropriate personnel protective equipment regardless of the inclusion of the barriers as noted, as these barriers do not provide “arc protection”. Equipment should not be worked on while energized unless appropriate precautions are taken.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-56 Log #2774 NEC-P09 **Final Action: Accept**
(408.3(C))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 9-137
Recommendation: Proposal should be rejected.
Substantiation: CMP 4 rewrote the definitions and subsequent requirements for the installation of the service conductors that the submitter is referencing in his proposal. The submitter presented rationale in his substantiation based on the presumption that CMP 4 would accept his proposals to CMP 4, we did not. The submitter is incorrect that under existing NEC requirements all “service drop” and “service entrance” conductors are utility owned, they are not. Utilizing the word “service” in 408.3 will be sufficient whether the recommended changes in Article 430 pass or not.
Panel Meeting Action: Accept
Panel Statement: CMP 9 assumes the article reference in the substantiation is to Article 230.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-57 Log #1511 NEC-P09 **Final Action: Reject**
(408.4)

TCC Action: The Technical Correlating Committee clarifies that the panel action is to “Reject” this comment and continue to Accept the proposal in Part, as noted in the proposal panel action.
Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-143
Recommendation: Accept the proposal.
Substantiation: Motor control centers may not be within the scope of Article 408, but 408.2 specifies circuit breakers shall comply with certain articles that apply; Article 100 does apply. 110.22 requires identification of disconnecting means and a circuit breaker is a disconnecting means.
Panel Meeting Action: Reject
Panel Statement: As previously stated, motor control centers are not within the scope of Article 408, and they are not installed within panelboards or switchboards (as is the case with circuit breakers). The submitter may wish to submit a proposal to Part VIII of Article 430 in the 2014 NEC cycle.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-57a Log #CC900 NEC-P09 **Final Action: Accept**
(408.4)

Submitter: Code-Making Panel 9,
Comment on Proposal No: 9-142
Recommendation: Revise 408.4(B) in the panel action on Proposal 9-142 to read:
(B) Source of Supply. All switchboards and panelboards supplied by a feeder in other than one- or two-family dwellings shall be marked as to the device or equipment where the power supply originates.
Substantiation: This wording will correlate with the final wording of the panel action on Proposal 9-34. That wording requires the identification to show a specific device; a general reference to a location such as “Electrical Room #3” is not sufficient. As indicated in the panel statement on Comment 9-11, CMP 9 concludes that the hazards addressed in Proposals 9-33 and 9-34 are comparable to those addressed in Proposal 9-142 and the final language here should require notation of specific devices. Additionally, in these cases the appropriate notation may be a specific generator or transformer, and the language has been broadened accordingly (“or equipment”) to allow for such references.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-58 Log #1218 NEC-P09 **Final Action: Reject**
(408.4(B) Exception No. 1)

Submitter: David E. Shapiro, Safety First Electric
Comment on Proposal No: 9-142
Recommendation: Revise as follows:
...buildings where served by a single source of power.
Substantiation: I have worked on residences served by multiple sources of power. With these, it would have enhanced safety to have the locations of the sources identified.

Panel Meeting Action: Reject
Panel Statement: The comment recommends additional text to the text that was not accepted by CMP 9. In addition, CMP 9 does not agree that power distribution in one- and two-family dwellings is so complex as to require posting of this information even if multiple sources of supply exist. The identification rules in 230.2(E) and 702.8(A) are sufficient in such cases.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(408.8)

_TCC Action: The Technical Correlating Committee notes that no changes were made by Code-Making Panel 1 relating to work space warning signs as addressed in this comment, therefore, correlation is unnecessary.
Submitter: Russell LeBlanc, The Peterson School
Comment on Proposal No: 9-144
Recommendation: Accept this proposal, but modify the section from 408.8 to 110.17 as follows.

110.17 Work Space Warning Signs

Switchboards and panelboards shall be field marked with a sign or plaque to warn qualified and unqualified persons of the work spaces required to be kept clear by 110.26A(1), (2), (3) or 110.32 as applicable. The sign or plaque shall be located so as to be clearly visible to persons in the workspace and shall be permitted to be on or adjacent to the equipment. The marking shall include the words:
WARNING!
AREA IN FRONT OF ELECTRICAL PANEL MUST BE KEPT CLEAR FOR _____.
The marking shall also include the dimensions of the depth, width, and height required to be kept clear for the workspace.

Substantiation: This requirement may be more appropriate for Article 110 than 408.

This proposal NEEDS to be accepted. Every electrician I know has been put in this dangerous situation where the workspace has been “stolen”. I realize that if the AHJ “enforces” the current language in the NEC then workspaces might be kept clear. The problem with that is the AHJ already DOES “enforce” it... but only at the time of installation unless someone discovers it and reports it after the initial installation. It may be too late by then. Disconnects may be unreachable. Circuit breakers get hidden. Panel doors become impossible to open. All this can add up to a disaster in an emergency. I hope that we don’t wait for a tragedy to finally accept this proposal. Please be “PRO-ACTIVE” on this. You can see the problem in the photos I have provided. This is a real and dangerous situation right now! I also realize that a warning sign is not a guarantee that the workspace will be kept clear. But it may prevent that first tragedy from ever happening. Per section 110.16, we are required to “remind” qualified electricians of the dangers of an arc-flash with a warning sign. My proposal parallels that requirement. The dangers of that arc-flash will be greatly magnified without the proper working space available. Let’s “remind” other people of the need to keep the workspaces clear.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: CMP 9 understands that this Comment has been considered by CMP 1. The action on this comment is not based on technical merit. CMP 9 requests that the Technical Correlating Committee correlate the Final Action on this comment to agree with the action taken by CMP 1.

9-61 Log #467 NEC-P09 **Final Action: Accept**
(408.36 Exception No. 1)

Submitter: Code-Making Panel 4,
Comment on Proposal No: 9-153
Recommendation: This proposal should be rejected.
Substantiation: The submitter is incorrect in his statement that the maximum number of disconnects referred to in 230.71 are feeding loads. The disconnects are to disconnect the source of supply which is the service. 230.71 is stating how many devices may be used as the service disconnecting means, which may be six multipole circuit breakers, or six sets of switches and fuses. 230.71(B) clarifies that the multipole switches or circuit breakers do not have to be factory made assemblies with only one operating handle, such as a two pole or three pole circuit breaker. They may be single pole breakers with identified handle ties or a master handle to make them operate as if they were a factory assembled unit operating all the ungrounded conductors. 408.36 correctly uses the wording from 230.71 in stating that a panelboard may have up to six disconnects which function as the service disconnecting means. The statement that 18 single pole breakers could not act as a the service disconnect is incorrect, in that if they have a master handle or identified handle tie and are the disconnects for a three phase panel, then 18 single pole breakers arranged as six disconnects would meet the requirements of this section. The submitter states that the language in Art. 230.72(B) is vague. He is citing the incorrect code section. Art. 230.71(B) is clear in stating that when "properly equipped with identified handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand." then multiple single-pole breakers can be utilized to meet the requirements of Art. 230.71(A).

9-62 Log #43 NEC-P09 **Final Action: Accept**
(408.51)

Submitter: Code-Making Panel 5,
Comment on Proposal No: 9-157
Recommendation: CMP-5 recommends this proposal be rejected.
Substantiation: CMP-5 concurs with the negative ballots, and the substantiation provided in those ballots, submitted by Mr. Osborne and Mr. Rupp. The product standard applicable to switchboards is UL 891. Tables 14 and 15 of that standard identifies the size of the equipment-grounding conductor (bus) based on the overcurrent protection device rating for switchboards with a main breaker and of the main bus rating where the switchboard has more than one main overcurrent device. The sizing of the equipment-grounding conductor (bus) is based on NEC Table 250.122 as a connection point of the equipment grounding paths from the feeders and branch circuits to then complete the ground fault current path to the system grounded conductor, via the main or system bonding jumper. This bus is not related to bonding conductors for connecting supply side equipment.

The proposal as submitted is problematic for AHJ enforcement since the product is controlled by the product standard and the sizing of the service conductors and therefore the equipment bonding conductors is an engineering design or field installer decision. Nowhere in National Electrical Code are there equivalent busbar sizes for the various cable sizes used in table 250.66, where 250.102(C) derives minimum conductor sizes. Any change in service entrance conductor sizes in the field due to various reasons could potentially require changing of the equipment grounding busbar to ensure equivalency thereby affecting the listing of the switchboard. Authorities Having Jurisdiction depend on listing of the equipment for conformance to product safety standards and being able to be installed in accordance with the National Electrical Code. It is also noted that equipment grounding busbars are also used in equipment rated as Service Entrance Equipment other than Switchboards, as the proposal would cover, (panelboards, motor control centers, industrial control panels, etc). No substantiation was provided of any problems in the field, and this issue appears to be more a product standard issue properly addressed through that process and not a code issue.

This Comment was developed by a CMP-5 Task Group and balloted through the entire panel with the following ballot results:

16 Eligible to Vote
14 Affirmative (Alternate P.J. LeVasseur for Principal D. Hammel and Alternate P.R. Picard for Principal R. Temblador)
2 Ballots Not Returned (D. Brender and G.S. Harding)
No Comments on Affirmative Vote were received.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-63 Log #129 NEC-P09 **Final Action: Accept**
(408.51)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-157
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the negative comments expressed in the voting and that this proposal be referred to Code-Making Panel 5 for comment.

This action will be considered by Code-Making Panel 9 as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the direction of the Technical Correlating Committee to reconsider its action based on the voting comments and has acted to reject Proposal 9-157 via its action on Comment 9-62.
Panel Statement: Refer to the panel action on Comment 9-62.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-64 Log #1567 NEC-P09 **Final Action: Accept**
(408.51)

Submitter: Robert D. Osborne, Underwriters Laboratories Inc.
Comment on Proposal No: 9-157
Recommendation: The Panel should reject this proposal.
Substantiation: The example used in the substantiation is a Code violation, as 250.80 requires service raceways and enclosures to be bonded to the grounded system conductor, with the method of bonding detailed in 250.92(B). Identifying Section 250-102(C) as the source of requirements for the equipment grounding conductor is incorrect, as this applies to the sizing of supply side enclosure bonding jumpers.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-65 Log #1771 NEC-P09 **Final Action: Accept**
(408.51)

Submitter: Chad Kennedy, Schneider Electric/Square D
Comment on Proposal No: 9-157
Recommendation: This proposal should be rejected.
Substantiation: I agree with the ROP comments by panel members Osborne and Rupp. The NEC requirements should not be revised solely based on the misunderstanding of some users whose current practice for bonding service raceway is not code compliant. The requirements in 250.80 and 250.92 provide very clear requirements on how service raceway is to be bonded.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-66 Log #1861 NEC-P09 **Final Action: Reject**
(408.51)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 9-157
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
408.51 Busbars. Insulated or bare busbars shall be rigidly mounted. Busbars for the supply-side bonding jumper(s) ~~equipment grounding conductor~~ in switchboards listed for use as service equipment shall be sized in compliance with 250.102(C), or the busbar location shall be labeled to prohibit bonding connections associated with service-entrance conductors.
Substantiation: Continue to support including rules in this section to ensure the proper sizing of busbars in switchboards that are identified as suitable for use as service equipment.

The present UL Standard on construction of switchboards (UL 891) allows the busbars installed in these switchboards to be sized based upon Table 250.122 rather than according to 250.102(C). Note that CMP-5 created a new definition of "Supply-Side Bonding Jumper in 250.2 and has used this term for sizing and installing bonding jumpers on the supply side of services and separately derived systems. The sizing rules continue to be located in 250.122(C). The sizing rules did not change though the previous term "Equipment Bonding Jumper" has been changed.

The attached "Analysis of Table 14 of UL 891 for Sizing Supply-Side Bonding Jumper" shows that the equipment grounding conductor or bonding conductor required in UL 891 is deficient for 21 out of the 23 ampere-ratings shown in the Table.

Even though separately derived systems are not mentioned in the rule, the UL White Book in (WEVZ) for deadfront switchboards indicates they are also suitable for separately derived systems. Here's another important reason to include this vital sizing rule in 408.51 – the system bonding jumper is required by 250.30(A)(1) to be sized identically to that shown in the accompanying "Analysis of Table 14 of UL 891 for Sizing Supply-Side Bonding Jumper".

Some are saying these construction requirements do not belong in the NEC but should be in UL 891. CMP-9 has a long history of including construction requirements in the NEC Articles under its jurisdiction. It is fairly safe to say if the construction requirements are included in the NEC, the UL Safety Standards will follow. Many, many, perhaps hundreds of construction requirements are found in the NEC. This one brings a significant safety issue to light and deserves being located in Article 408.

Here are the locations of construction requirements in Article 408 alone: 408.3(A)(1), 408.3(A)(2), 408.3(B) (well about half of the rule!), 408.3(C) (most of this rule deals with the construction of panelboards and switchboards), 408.3(D) (sure looks like construction rules), 408.3(G) (I guess this can be both a construction and installation rule!), and, of course Part IV.

The revised rule will ensure that the equipment grounding busbar in service equipment is sized properly for termination of bonding jumpers and main bonding jumpers. It is very common to terminate bonding jumpers for raceways containing service-entrance conductors on the equipment grounding or bonding busbar. The bonding jumpers are required to be sized in accordance with 250.102(C). The bonding jumpers for main and system bonding jumpers are required to be sized according to 250.28(D) which is identical to the requirement in 250.102(C). If connected to the equipment grounding or bonding busbar, in 21 out of 23 constructions that just meet the UL Standard, it will be too small.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: CMP 9 does not want to second guess CMP 5 regarding a rule that almost exclusively involves sizing requirements for grounding components governed by provisions in Article 250. CMP 5, (see Comment 9-62) unanimously voted to advise that this proposal should be rejected and CMP 9 accepted CMP 5's recommendation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

9-67 Log #2599 NEC-P09 **Final Action: Reject**
(408.51)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 9-157

Recommendation: Continue to accept the panel action on this proposal.

Substantiation: Although the explanations of negative votes are correct relative to the practice cited in the proposal substantiation as being a code violation for the reasons given, it is also correct that the installation practice of landing these bonding jumpers on the equipment grounding bus is very commonly observed in the field. The new labeling will raise field awareness regarding this potential violation. Remember that busbar sizing compliance with 250.102(C) is not readily apparent to an installer because busbars do not have ampacity labeling. Only the manufacturer and the testing laboratory will be in a position to know how this component is sized and for what current capacity. The change will not require the redesign of grounding components in switchboards unless the manufacturer chooses to avoid the label.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 9-66.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HARTWELL, F.: The panel statement regarding jurisdiction is correct, but the assertion in this comment about field issues is as well. CMP 5 should review this issue in the 2014 cycle.

ARTICLE 409 — INDUSTRIAL CONTROL PANELS

11-1 Log #1067 NEC-P11 **Final Action: Accept**
(409.5)

Submitter: Noel Williams, Herriman, UT

Comment on Proposal No: 11-5

Recommendation: Continue to reject this proposal along with the identical or similar proposals such as 11-4, 11-6, 11-7, 11-8 - all of which are referred by panel statements to this proposal ROP 11-5.

Substantiation: Adding a requirement for approval is entirely redundant as noted in the panel statement. If listing is required of all industrial control panels, then Article 409 becomes essentially worthless and all the rest of Article 409 (all of Part II) should be deleted. Some parts of the UL standards must still be used (such as for determining the short-circuit current rating) even when using Article 409. But if all such panels are required to be listed, the provisions of Part II will not be used as the product safety standard will the the document used for evaluation. A requirement for listing of all control panels would also interfere with the application of NFPA 79 in some respects.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-2 Log #1241 NEC-P11 **Final Action: Accept**
(409.22)

TCC Action: The Technical Correlating Committee directs the proposed text be revised to read as follows since the original text in the comment would have required an industrial control panel at all locations where short-circuit current was not exceeded:

"409.22 Short-Circuit Current Rating. An industrial control panel shall not be installed where the available fault current exceeds its short-circuit current rating as marked in accordance with 409.110(3)."

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 11-9

Recommendation: Revise original proposal text and add new section 409.22 as follows:

409.22 Short-Circuit Current Rating. An industrial control panel shall ~~not~~ be installed ~~at a point on the electrical system~~ where the available fault current does not exceed ~~is in excess of~~ its ~~marked~~ short-circuit current rating as marked in accordance with 409.110(3).

Substantiation: The original proposal should have been accepted in principle, but with revision to place in positive text as was done with proposal 12-177 Log #4406 NEC-P12. This will ensure consistency and avoid ambiguities between application of control panels under Article 409 and those in Article 670.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-3 Log #130 NEC-P11 **Final Action: Accept**
(409.110(3))

Submitter: Technical Correlating Committee on National Electrical Code®,

Comment on Proposal No: 11-23

Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal concerning the use of the word "when" since the NEC Style Manual considers "when" as a condition of time.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel has clarified the NEC Technical Correlating Committee concerns by the action on Comment 11-4.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-4 Log #580 NEC-P11 **Final Action: Accept in Principle**
(409.110(3))

Submitter: Bob Fahey, City of Jamesville

Comment on Proposal No: 11-23

Recommendation: Revise text to read as follows:

(3) ~~When an~~ Industrial control panel~~s~~ ~~is~~ supplied by more than one power source such that more than one disconnecting means is required to disconnect all power within the control panel, it shall be marked to indicate that more than one disconnecting means is required to de-energize the equipment.

Substantiation: The Technical Correlating Committee indicated the word "when" should not be used in this context, therefore I am suggesting removing "when an" from the proposed text, the new revised text does not change the intent of the original proposal as approved by the code panel.

Panel Meeting Action: Accept in Principle

Revise existing text to read as follows:

(3) Industrial control panels supplied by more than one power source such that more than one disconnecting means is required to disconnect all power within the control panel shall be marked to indicate that more than one disconnecting means is required to de-energize the equipment.

Panel Statement: The panel accepts the submitter's recommendation and editorially deleted "it" before "shall" for readability.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

ARTICLE 410 — LUMINAIRES (LIGHTING FIXTURES), LAMPHOLDERS, AND LAMPS

18-37 Log #2600 NEC-P18 **Final Action: Reject**
(410.10(C)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-98
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive. The submitter knows quite well what "identified" means, which is why the proposal substantiation quoted it. All listed luminaires are, necessarily, identified for a specific purpose. The purpose of this rule, however, is to assure that it will not be necessary to refer to a cut sheet or listing report to determine suitability. These luminaires are marked for this purpose so the suitability is evident in the field during installation and at the time of inspection. The continued retention of the term "identified" is incorrect and meaningless in the context of 410.6.
Panel Meeting Action: Reject
Panel Statement: The product standard that applies to commercial cooking hood luminaires is UL1598, 3rd Edition, Section 12.3. This product standard requires a marking "Suitable for use within commercial cooking hoods" on products that have been evaluated and found suitable for this application. This satisfies the code requirement that the product be identified for the purpose. It is typical for product standards to require markings when the Code specifies that a product be identified for a purpose; the standards development organizations prepare product standards with the intent that product meeting the standards will also satisfy the applicable code requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-38 Log #1520 NEC-P18 **Final Action: Reject**
(410.11)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-101
Recommendation: Revise the panel action as follows:
Combustible material. Luminaires and lampholders that operate with a surface temperature higher than 90° C (194° F) shall be constructed, installed or equipped with approved means to minimize the likelihood of igniting combustible material, or clearly and durable marked to indicate a minimum separation distance from combustible material.
Substantiation: "Installed" so that combustible material is not subject to temperatures in excess of 90° C does not provide specifics and is a judgment, where no means such as shades or guards are provided. Protocols for listed equipment would provide minimum clearance dimensions.
Panel Meeting Action: Reject
Panel Statement: The original proposal did not present data to substantiate that lampholders are creating heating issues. The code already restricts bare lamps in areas that could present heating hazards such as in clothes closets. The issues raised by the submitter regarding the enforcement of the panel action illustrates the complications that the proposed code change would present. Since no problem has been demonstrated, the panel concludes that a code change is not warranted. The suggested rewording places the responsibility for determining whether the means to minimize the likelihood of igniting combustible material on the AHJ. That is what use of the term "approved" accomplishes. The Panel does not agree with this approach.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-39 Log #1519 NEC-P18 **Final Action: Accept in Part**
(410.16(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-106
Recommendation: Accept the proposal with the following revisions:
(A) Only luminaires of the following types shall be permitted in a closet: (remainder unchanged)
Delete (B).
Substantiation: Luminaires are already required to be listed per 410.6. "Permitted to be" is not a requirement per 90.5(B), and therefore not enforceable. Some sections use the word "only" or "limited" where something is restricted.
(B) is superfluuous if "only" is accepted in (A).
Panel Meeting Action: Accept in Part
Accept the recommendation for 410.16 (A) and reject the recommendation for 410.16 (B).
Panel Statement: The panel agrees with the comment that will simplify (A) but concludes that (B) should remain to reinforce the restriction it is intended to convey.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
WELLS, J.: While the submitter may consider (B) superfluous, I consider it essential. It is precisely the type of equipment prohibited that has historically been installed and resulted in fires.

18-40 Log #1518 NEC-P18 **Final Action: Reject**
(410.18)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-107
Recommendation: Accept the proposal with the following revisions:
Space in accordance with 110.26 shall be provided for lamps and equipment installed in covers.
Substantiation: The present wording applies the requirement to all covers, whether or not lighting is installed. "Adequately" and "properly" are terms to be avoided per the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: No data demonstrating a problem with the current code language was provided in the submitter's proposal or comment. The panel has concluded that expanding this requirement to lampholders or other equipment is not necessary.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12 \

18-41 Log #2313 NEC-P18 **Final Action: Accept in Principle**
(410.20)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 18-109
Recommendation: Please revise the text to better clarify the requirement.
Substantiation: As currently written, the text does not function as a sentence. I am not quite certain what the panel intended in its text, so I apologize for not being able to offer a real solution to the problem. Perhaps the second occurrence of the word "shall" should be changed to "can" or "may"?
Panel Meeting Action: Accept in Principle
Revise Section 410.20 to read:
Canopies and outlet boxes taken together shall provide sufficient space so that luminaire conductors and their connecting devices are capable of being installed in accordance with 314.16.
Panel Statement: The submitter raises a valid point. It should be noted that the Standard for Safety for Luminaires, UL1598, allows junction boxes and splice compartments that are integral to luminaires to have reduced free volume in respect to the requirements of 314.16. The reason being is that 314.16 applies to general purpose boxes and conduit bodies where installed conductors and devices are variable, whereas the conductors and devices that will be contained within a luminaire junction box are known.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-42 Log #131 NEC-P18 **Final Action: Accept**
(410.24)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 18-112
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with respect to subdivision titles.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise headings to read as follows:
(A) Independent of the Outlet Box.
(B) Access to Boxes.
Panel Statement: The panel accepts the direction of the Technical Correlating Committee and revises the titles as shown in the 2011 NEC ROP Draft.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-43 Log #1517 NEC-P18 **Final Action: Reject**
(410.24(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-115
Recommendation: Accept the proposal with the following revisions:
Surface mounted luminairs using straight or U-shape fluorescent lamps and mounted over a box shall be provided with approved openings to provide access to wiring in the box.
Substantiation: Some electric-discharge luminaries, such as mercury vapor and sodium vapor, are not supported by an outlet box (chain support) and don't require openings in the back to an outlet box. Outlet boxes are not permitted to be concealed (rendered inaccessible) by 314.29 and 314.72(D).
Panel Meeting Action: Reject
Panel Statement: Chain suspended luminaires are not mounted over concealed outlet boxes. Chain suspended luminaires are provided with a canopy that, as required by the nationally recognized product safety standards, must provide access to the outlet box. The recommendation inappropriately limits this requirement to two specific types of luminaires. Further it ignores a key element in the present requirement related to the fact that these luminaires are not solely supported by the outlet box. The fact that this section requires access to the box is for the very purpose of being correlated with 314.29.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-44 Log #1516 NEC-P18 **Final Action: Reject**
(410.31)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-120
Recommendation: Accept the proposal as intended for 410.64 and referencing 410.65 as follows:
"Except as permitted in 410.65, luminaires shall not be used as a raceway unless listed and marked for such use."
Substantiation: Correlation with 410.65. Conductors such as grounding electrode conductors and cables such as coaxial and optical fiber should be included.
Panel Meeting Action: Reject
Panel Statement: Section 410.65 does not apply to luminaires used as raceways, rather it applies to luminaires connected together. Raceways, as referred to in 410.64, contain conductors that are not associated with the lighting circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-45 Log #2516 NEC-P18 **Final Action: Reject**
(410.36(A))

Submitter: Patricia Barron, Safety Quick Light
Comment on Proposal No: 18-130
Recommendation: Revise text to read as follows:
410.36 (A) Outlet Boxes. Outlet boxes or fittings installed as required by 314.23 and complying with the provisions of 314.27(A) and 314.27(B) shall be permitted to support luminaries. A Luminaire supported by the outlet box shall be supplied with a power plug designed for mating with receptacle in accordance with 314.27(A).
Substantiation: Statement of Problem - There are a significant number of electrocutions and accidents occurring during luminaire installations, which result in substantial numbers of **injuries and cases of death.**
Substantiation for Comment: The proposed Power Plug for luminaires is based on the same concept of a standard wall receptacle and plug. Replacing the existing mounting method for luminaires, with the power plug and the pre-installation of the receptacle method **will eliminates 100% of all shock hazard risks**, while installing Luminaires. Luminaires will be safely plugged in or out, to the ceiling or wall. (The power plug UL and CSA Certified, has passed a 200 pound load test and can be used for all luminaries up to 50 pounds).The plug **makes luminaire installations as safe as plugging in a table lamp to the wall**. Luminaries can be plugged or unplugged for bulb replacement, painting, or other, free of risk and **without touching any energized circuits**. An outlet box, without a fixture, but with the receptacle is completely enclosed and safe - exactly like a standard wall receptacle. **When using the proposed power plug and receptacle, all luminaire associated wiring risks are completely eliminated.**
For a video demonstration go to: www.safetypowerplug.com
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The code does not prohibit this product, with the understanding that it is listed.
As indicated in the ROP panel statement "Installation of this device has the same level of risk as installing a luminaire". The comment does not include any data or statement that disproves this fact. Incorrect wiring connections to this device will create the same hazards associated with incorrect wiring connections to a luminaire. Reversed polarity connections are not precluded by this product. There is no indication that the product has been evaluated for inductive loads, voltages greater than 120V, current in excess of 5A. Accordingly, the device is not suitable for use with all luminaires. Additionally, physical size of the unit will not fit all outlet box mounted luminaire designs. The panel reiterates concern that this product has the potential to expose conductors and splices in the outlet box to untrained individuals. There is a single configuration of the mating components that does not preclude connecting luminaires with a voltage rating that is incompatible with the voltage available at the outlet. If this product is intended for use at all boxes intended for connection of luminaires it is necessary to have configurations that are similar to the requirements of 406.3(F).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-46 Log #1862 NEC-P18 **Final Action: Accept**
(410.42, 410.44, and 410.46)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 18-122
Recommendation: Revise the existing text of the 2008 NEC as follows:
410.42 ~~Exposed~~ Luminaire(s) ~~(A)~~ With Exposed Conductive Parts.
Exposed metal parts shall be connected to an equipment grounding conductor or insulated from the equipment grounding conductor and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 38 mm (11/2 in.) from lamp terminals shall not be required to be grounded.
410.44 Methods of Grounding. Luminaires and equipment shall be mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.
Exception No. 1: ~~(B) Made of Insulating Material.~~ Luminaires made of insulating material that are directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding attachment to an equipment grounding conductor shall be made of insulating material and shall have no exposed conductive parts.
Exception No. 2 ~~1~~: Replacement luminaires shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250.130(C). The luminaire shall then comply with 410.42(A).
Exception No. 3 2: If ~~Where~~ no equipment grounding conductor exists at the outlet, replacement luminaires that are GFCI protected shall not be required to be connected to an equipment grounding conductor.
410.46 ~~410.44~~ Equipment Grounding Conductor Attachment. Luminaires with exposed metal parts shall be provided with a means for connecting an equipment grounding conductor for such luminaires.
~~**410.46 Methods of Grounding.** Luminaires and equipment shall be mechanically connected to an equipment grounding conductor as specified in 250.118 and sized in accordance with 250.122.~~
Substantiation: The rules on grounding of luminaires need to be re-organized into a proper sequence. The present requirement in 410.46 is a primary rule and should be located before 410.42(B). Then the present 410.42(B) must be located after the primary rule that requires grounding of luminaires and become an exception as, in reality, the existing (B) provides an exception to 410.46.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Comment intends to use the word "if" where appropriate.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the submitter's recommendation does not include any proposed text based on Proposal 18-126.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-47 Log #1515 NEC-P18 **Final Action: Reject**
(410.62(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-132
Recommendation: Accept the proposal with the following revisions:
Cord-connected adjustable luminaries and lampholders that are secured in place, shall not be required to be equipped with an attachment plug, if the cord is an extra-hard or hard usage type that complies with 400.3, contains an equipment grounding conductor, and is not longer than necessary for maximum adjustment of the lluminaire or lampholder.
Substantiation: Cords should be identified for the use, e.g., wet locations, sunlight resistance, and specified to contain an EGC.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any data to support that a problem or safety hazard exists with cords not being identified. The current requirement addresses cord-connected adjustable luminaires. Equipment grounding conductors and environmental considerations are addressed by the applicable product safety standards.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-48 Log #2601 NEC-P18 **Final Action: Reject**
(410.62(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-134
Recommendation: Accept the proposal in principle and reword as follows:
(C) Electric-Discharge Luminaires. Electric discharge luminaires shall comply with (1), and also with (2) or (3) or both as specifically apply to the application.
(1) Cord-Connected Installations. Luminaires in compliance with any of the conditions in (a) through (c) shall be permitted to be cord connected provided the luminaire is located directly below the outlet or busway and the cord is visible over its entire length and not be subject to strain or physical damage.
(a) Plug-Connected. A luminaire shall be permitted to be connected with a cord terminating in a grounding-type attachment plug or busway plug.
(b) Strain Relief and Canopy Provided. A luminaire assembly equipped with a strain relief and canopy shall be permitted to use a cord connection between the luminaire assembly and the canopy. The canopy shall be permitted to include a section of raceway not over 150 mm (6 in.) in length and intended to facilitate the connection to an outlet box mounted above a suspended ceiling.
(c) Manufactured Wiring Systems. Listed assemblies incorporating manufactured wiring system connectors in accordance with 604.6(C), shall be permitted to be cord connected.
[No changes to (2) or (3).]
Substantiation: The submitter appreciates the clarifications of intent as expressed in the panel statement, and has adjusted the wording accordingly. The parent text now specifically requires compliance with (1) in all cases, with (2) and/or (3) as apply to the application at hand. The submitter disputes the statement that the location material was omitted. The location requirement was and is in the parent text of (1). The visibility rule was omitted, and is now included in the parent text of (1) because it applies in all cases. The submitter apologizes for this oversight.
Panel Meeting Action: Reject
Panel Statement: The proposal and comment reflects an opinion that the current language is not user friendly but the panel has not received any additional comments from users supporting the submitter's original recommendation. The panel has received no substantiation identifying how the current requirement is misunderstood and the resultant problems or hazards. Additionally, the submitter has not substantiated the removal of "for listed assembly" in 410.62(C)(1).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-49 Log #1523 NEC-P18 **Final Action: Reject**
(410.64)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-136a
Recommendation: Accept the proposal with the following revisions:
Luminaires as Raceways. Luminaires shall not be used as junction points for through wiring except as permitted in 410.64(B), or as raceways unless they comply with 410.64(A), (B), or (C).
Substantiation: Junction points should be covered, also where used as raceways for other than circuit conductors such as grounding electrode conductors, coaxial and fiber optic cables.
Panel Meeting Action: Reject
Panel Statement: The term "junction point" is not defined in the NEC. While the term is used in other parts of the Code (i.e., 230.6, 300.15 & 517.19(D)), the submitter has not presented a compelling reason to include it in this article. Grounding electrode conductors, coaxial & fiber optic cables are already addressed by the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-50 Log #1522 NEC-P18 **Final Action: Reject**
(410.68)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-142
Recommendation: Accept the proposal with the following revisions:
Feeder and a branch circuit conductors within 75 mm (3 in) of a ballast shall have an insulation temperature rating not lower than 90° C (194° F) unless the ballast or luminaire containing the ballast is marked for use with conductors with a higher insulation temperature rating.
Substantiation: The basic rule is for 90 degree insulation rating, which should be a minimum since ballasts or luminaries with a lower temperature designation may be replaced and not suitable for lower than 90° C.
Panel Meeting Action: Reject
Panel Statement: The temperature marking referenced by the current code is based on product listing criteria. Ballast replacement should be accomplished with a direct replacement ballast or a ballast provided as part of a listed or classified retrofit kit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-51 Log #1521 NEC-P18 **Final Action: Reject**
(410.82(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-155
Recommendation: Accept the proposal with the following revisions:
Where used with Edison-base lampholders the grounded circuit conductor shall be connected to the screw shell and the terminal of the attachment plug identified in accordance with 200.10(B).
Substantiation: "Identified" for the grounded conductor is superfluous; 200.6 and 200.7 already apply. "identified blade" can apply to the blades that are identified for use with the ungrounded conductor(s) (shorter or different configuration). Some plugs have prongs, not blades. The grounded conductor should clearly be the circuit conductor; an equipment grounding conductor is also a grounded conductor. Where molded plugs are involved the grounded circuit conductor will be connected to the proper blade or prong.
Panel Meeting Action: Reject
Panel Statement: Neither the proposal nor the comment have identified a problem with the current code language nor a compelling reason to revise the language. This requirement is addressed by the appropriate product safety standard, UL153. The Panel carefully read the substantiation and fails to understand what the problem is. How is the present wording being misunderstood? What hazard results from such misunderstanding? How does the proposed rewording correct the situation?
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-52 Log #1531 NEC-P18 **Final Action: Accept in Principle**
(410.96)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-161
Recommendation: Accept the proposal.
Substantiation: The panel statement regarding 334.12(B)(4) did not consider the definition in Article 100 of Location, Dry, which states a temporary damp location can still be considered as a dry location.
Panel Meeting Action: Accept in Principle
Revise 410.96 to read as follows:
Lampholders in Wet or Damp Locations. Lampholders installed in wet locations shall be listed for use in wet locations. Lampholders installed in damp locations shall be listed for damp locations or shall be listed for wet locations.
Panel Statement: The panel action clarifies the use of lampholders based on where they are installed. The panel did consider all of the definitions associated with "location" in Article 100. UL496 required environmental markings are "wet' or "damp" location for lampholders. While "weatherproof" is addressed by this standard, the required identification would be "wet" or "damp".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-53 Log #2312 NEC-P18 **Final Action: Reject**
(410.116(A)(1))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 18-167
Recommendation: Please revise the text to by changing the word "off" to "of", as follows:
The points of support and the trim finishing off the openings in the ceiling, wall, or other finished surface shall be permitted to be in contact with combustible materials.
Substantiation: There seems to be a typo in the panel's revised text.
Panel Meeting Action: Reject
Panel Statement: The panel intended to use "finishing off". This term is used in the current code and no problem with the term has been identified in the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-54 Log #1530 NEC-P18 **Final Action: Reject**
(410.117(A), (B), and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-169
Recommendation: Accept the proposal with the following revisions:
Delete (B)
(C) Where the branch circuit conductors are not rated for the temperature encountered, tap conductors rated for the temperatures encountered shall be run from the luminaire or lampholder connections to a box or conduit body located at least 300 mm (1 ft) from the luminaire or lampholder terminal connections. Such tap conductors shall be at least 450 mm (18 in.) in length.
Substantiation: (B) is covered by (A) which covers all conductors including insulated equipment grounding conductors. The provision should also apply to lampholders. "Permitted" is not a requirement and cannot be enforced. Any suitable wiring method should be permitted for the tap conductors. If fixture wires are used for the tap, they should be permitted in lengths as specified in 240.5(B)(2). Taps should be permitted from a conduit body.
Panel Meeting Action: Reject
Panel Statement: Section 410.117(B) is fundamental and ensures that supply conductors have temperature rating sufficient for the application. Section 410.117(A) is provided as direction to the product safety standard to ensure that manufacturer installed wiring is suitable for the application temperatures the submitter has provided no compelling argument, nor statement of problem, to delete 410.117(B). This requirement is specific to luminaires and the submitter has not provided a compelling argument nor statement of problem with the current code to justify the proposed text revision. "Shall be permitted" has a clear meaning as a permissive rule in 90.5(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-55 Log #2408 NEC-P18 **Final Action: Accept**
(410.130(G)(1))

Submitter: Brian E. Rock, Hubbell Inc.
Comment on Proposal No: 18-180
Recommendation: If the Panel revises its previous Panel Action to Reject for any reason, revise any proposed text in proposed Exception No 2 to replace "twist-lock type photocell or shorting cap" with "locking-type photocell or shorting cap".
Substantiation: "Twist-Lock", as proposed by the Submitter of P18-180, is a registered trademark (U.S. Patent & Trademark Office Nos. 565,872, 1,800,509, and 1,845,454) of Hubbell Incorporated for receptacles, attachment plug caps, cable connectors, and inlets (motor attachment plug caps) of the locking-blade construction, and for enclosures employing similar. If the Panel revises its Panel Action for any reason and decides to include the P2-87 Submitter's new text, change to generic "locking-type photocell or shorting cap".
Panel Meeting Action: Accept
Panel Statement: The panel notes that the original action on Proposal 18-180 will remain unchanged because the panel has received no other comments on this action. The panel understands the concern expressed in the submitter's recommendation and substantiation and will be cognizant about not using the cited term in future panel actions or statements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-56 Log #1050 NEC-P18 **Final Action: Reject**
(410.130(H))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 18-182
Recommendation: Accept this proposal to add text as follows:
The ballasts of fluorescent luminaries and high intensity discharge luminaries shall be protected against fault current in accordance with their limited short-circuit withstand rating.
Substantiation: These ballasts have a limited short-circuit withstand rating (normally, 200 amperes) and unless a circuit's design takes this into consideration, a serious hazard may exist. Section 110.1 is quite vague in this regard and cannot be relied upon to prompt the installer to provide supplementary protection where necessary.
Panel Meeting Action: Reject
Panel Statement: Section 110.10 does cover the submitter's concern. The submitter has not provided technical substantiation or data indicating that 110.10 does not adequately address the issue cited in the original recommendation and substantiation for Proposal 18-182.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-57 Log #2602 NEC-P18 **Final Action: Reject**
(410.135)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-183
Recommendation: Accept the proposal.
Substantiation: The panel statement objects to the uncertainty relative to whether equipment may still be listed in this category. This seems very unlikely. If such luminaires were being listed, surely the UL guide card information would reflect this, as well as the UL Luminaire Marking Guide. The rule requires that luminaires with open circuit voltages above 300 not be used in dwelling units unless certain construction features are present. Those features, as described in the NEC, would normally be the subject of provisions in a product standard and then result in a marking. If a member of the public walks into a building supply store frequented by both commercial patrons and homeowners, how else would they know what luminaire was unsuitable for residential use? It is simple common sense that if this were a relevant limitation, there would be some evidence of it having been applied in the existing product mix.
This rule has been in the NEC for about 65 years without modification. The submitter archives UL guide card information over the last 25 years, and to the best of his knowledge no indication of a marking has appeared in any of those publications. It is generally correct to be suspicious of any attempt to change the NEC if there is no record of loss experience. However, if this provision has been without observable force and effect for decades, it is time to seriously review its technical relevance. The body best equipped to do that is CMP 18, and that review should now occur.
The proposal substantiation made the argument that the requirement was obsolete. The panel statement refers to 4.3.3.d of the Regulations, requiring a statement of a problem. Therefore it can be logically established that according to CMP 18, an obsolete requirement is not a problem. This submitter is the senior member of CMP 9 and in his entire time of service he cannot recall a single instance when CMP 9 failed to act on the merits of a proposal of this nature. If any member of the public submitted a proposal suggesting that a provision within CMP 9's purview was obsolete, one of two things would happen, and by the end of the code cycle. Either the provision would be modernized, or a very compelling argument would be made in a panel statement, during the ROP period so there would be opportunity for rebuttal, explaining exactly why the requirement needed to stay in place.
Panel Meeting Action: Reject
Panel Statement: This section should be retained because 410.135 is still used as a basis for product safety requirements applicable to cold cathode electric discharge lighting systems that are listed for installation in dwelling units. The submitter has not provided any data demonstrating that products with open-circuit voltage exceeding 300 volts are obsolete. This provision also provides direction for new lighting technologies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-58 Log #1529 NEC-P18 **Final Action: Reject**
(410.140(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-188
Recommendation: Delete.
Substantiation: This provision doesn't correlate with Article 100 definition of live parts, i.e., energized. Literal wording requires terminals of an electric-discharge lamp in a shipping carton to be considered live.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided a statement of problem with the current requirement. It is obvious that a lampholder in a shipping carton is not energized.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-59 Log #2603 NEC-P18 **Final Action: Reject**
(410.140(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-189
Recommendation: Accept the proposal.
Substantiation: Statement of problem: The existing NEC text uses the term "live part" in a manner inconsistent with the definition of the term in Article 100. An energized lamp terminal is obviously live and unworthy of a code requirement to state the obvious. Consideration of an energized lamp terminal for enforcement purposes as an uninsulated live part is not obvious and certainly worthy of a specific rule.
When the live part definition first entered Article 100 (1996 NEC) it applied to uninsulated or exposed parts that presented a shock hazard, and this rule fully comported with that definition. When the definition changed to its present form in the 2002 NEC, this section failed to correlate with that change. This proposal provides that correlation, and certainly does comply with the Regulations Governing Committee Projects.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that changing "live part" to "uninsulated live part" is not necessary based on the current product listing requirements that address the accessibility to live parts concern. The panel refers the submitter to the requirements of 410.142.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-60 Log #132 NEC-P18 **Final Action: Accept**
(410.141(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 18-190
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered by Code-Making Panel 18 based upon the action of Code-Making Panel 1 taken on Proposal 1-63.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the direction of the Technical Correlating Committee to review it's action on Proposal 18-190 and rejects the proposal.
Panel Statement: Since Proposal 1-63 was rejected, the term "lockable disconnecting means" is not an appropriate substitute for the text of 410.141(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-61 Log #1528 NEC-P18 **Final Action: Reject**
(410.141(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-191
Recommendation: Accept the proposal with the following revisions:
The switch or circuit breaker shall be readily accessible, and within sight from the luminaire(s) or lamp(s) or provided with an approved permanent integral means for locking in the open (off) position.
Substantiation: Locking means should be permanent and integral to the disconnecting means. It is not reasonable to assume makeshift methods (defined as crude and temporary) to be as effective, as the panel stated. Open position should be designated "off" to differ from an open door or cover.
Panel Meeting Action: Reject
Panel Statement: The panel does not find any substantiation for the inclusion of "integral". Several manufacturers make add-on means that are just as effective and permanent as those integral with the disconnect.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-62 Log #2604 NEC-P18 **Final Action: Reject**
(410.141(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-190
Recommendation: Continue to accept the panel action, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110: "**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement to Comment 18-60 which was submitted by the Technical Correlating Committee. CMP 1 has not included a definition for "lockable disconnecting means" in their comment actions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 422 — APPLIANCES

17-4 Log #1525 NEC-P17 **Final Action: Reject**
(422.13)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-9
Recommendation: Accept the proposal.
Substantiation: Continuous load contributes to perhaps excessive heating of terminals of feeder and service conductor overcurrent devices also. Continuous load is applied to feeder and service conductors in Examples (D)(3) and (D)(3)(a) in Annex D. If they are not to be included, the examples should be changed to avoid confusion.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided additional documentation to justify this change in the code. The examples of Annex D, examples (D)(3) and (D)(4) do not specifically address water heaters. CMP 17 has determined that the heating elements of a storage type water heater are not typically continuously energized for more than 3 hours as defined for continuous loads per Article 100.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-5 Log #1952 NEC-P17 **Final Action: Accept in Principle**
(422.15(C) (New))

Submitter: Thomas V. Blewitt, Underwriters Laboratories Inc.
Comment on Proposal No: 17-11
Recommendation: Revise text to read as follows:
(C) An equipment grounding conductor shall be used where the central vacuum outlet assembly has accessible noncurrent-carrying metal parts, likely to be energized. Parts that are not considered likely to be energized are metal screws or rivets in polymeric enclosures or faceplates, external metal springs used on a self-closing polymeric cover, and the like.
Substantiation: As noted in my negative ballot, the Panel Action did not provide inspectors with clarity on whether the small parts of the vacuum outlet assemblies required grounding. The proposed additional text provides that

guidance to inspectors and is consistent with text in the soon to be published 8th edition of product safety Standard UL1017 (Vacuum Cleaners, Blower Cleaners and Household Floor Finishing Machines). See text from standard that has achieved consensus.

8.2.6 All accessible noncurrent-carrying metal parts of a central vacuum cleaner's electrified wall valve assembly (outlet assembly) that are likely to be energized shall be connected to the equipment grounding conductor or equipment grounding terminal of the valve assembly. Parts that are not considered likely to be energized are metal screws or rivets in polymeric enclosures or faceplates, external metal springs used on a self-closing polymeric cover, and the like. Electrified wall valves connected to an extra-low voltage circuit are excluded from this requirement.

Panel Meeting Action: Accept in Principle

Revise 422.15(C) to read as follows:

(C) Accessible non-current-carrying metal parts of the central vacuum outlet assembly likely to become energized shall be connected to an equipment grounding conductor in accordance with 250.110. Incidental metal parts such as screws or rivets installed into or on insulating material shall not be considered likely to become energized.

Panel Statement: The panel agrees with the recommendation in principle but has revised the language for clarification and to comply with the manual of style. Also metal parts "likely to BE energized" are not non-current-carrying. "Likely to BECOME energized" is the appropriate wording for non-current-carrying conductive parts, as used in 250.110.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

17-6 Log #2182 NEC-P17 **Final Action: Accept in Principle**
(422.15(C) (New))

Submitter: Wayne E. Morris, Association of Home Appliance Manufacturers
Comment on Proposal No: 17-11
Recommendation: The change CMP-17 made to the text of proposal 17-11 is not acceptable. Instead, AHAM suggests "C. Grounding, if needed, shall be in compliance with 250.110".
Substantiation: The change CMP-17 made to the text will not correct the issue. Some local inspectors have interpreted the requirements of section 422.15 (C) of NEC 2008 as requiring the all metal parts, such as screws or springs, be grounded. Grounding should not be required for such parts that are not likely to be energized. There was debate at the CMP 17 meetings about using the term "likely to be energized," but Section 250.110 includes the phrase "Likely to be energized".

The Association of Home Appliance Manufacturers represents manufacturers of central vacuum cleaners. We believe confusion is created by the current verbiage in the 2008 NEC:

"(C) Accessible non-current carrying metal parts of the central vacuum outlet assembly shall be connected to an equipment grounding conductor."

Mr. Ralph Guinn suggested alternate wording in a 2011 NEC Proposal:

"(C) An equipment grounding conductor shall be used where the central vacuum outlet assembly has accessible noncurrent-carrying metal parts, likely to be energized."

It is my understanding that the CMP 17 did not agree with the use of "likely to be energized" and found it difficult to work with this proposal as it did not start from the wording in the 2008 NEC.

CMP 17 proposed alternate wording in the ROP meeting January 20-24, 2009: "Accessible non-current carrying metal parts of the central vacuum outlet assembly shall be grounded in accordance with 250.110."

[Note that if you go to 250.110, it uses "likely to be energized..."].

We believe that this proposed change language to 422.15 (C) still has some problems.

Final home inspectors are unfamiliar with CVS inlets.

The central vacuum outlet assembly is composed of a backing plate that is screwed to a wall stud (plastic body with metal flange for support) and the actual wall valve plate that has a spring-loaded door cover. The visible wall valve plate has two metal screws to affix this part to the backing plate.

Some wall valves have low voltage supplied from the vacuum cleaner power unit in the basement/garage. This low voltage is isolated and approved by UL as class 2 power. The low voltage is actuated from a switch on the power head unit (connector, hose, wand, and floor nozzle). Some of these low-voltage assemblies also make available a 120V separate cord that is connected to a nearby standard 120V wall receptacle to power the motor in the power head.

Some wall valves have a 120V connection in the visible wall valve plate. This connection consists of a UL recognized connector permanently molded to a 2-wire "Romex"™ wire that is connected in the wall to a standard receptacle. The screws that affix the visible wall valve plate and cover to the backing plate appear to be the issue with inspectors.

Many inspectors see the assemblies for the first time already fully installed in a home. Upon reading the code, they assume the mounting screws should be grounded. A quick continuity check obviously shows that they are not. The inspector will then hold final clearance of the house. This causes much undo stress and cost to the builder, home owner, sub-contractor and manufacture. A quick removal and deeper inspection of the product would reveal there is no need to ground anything contained in a CVS electrified inlet assembly.

The valves in question are indeed safe and do not require grounding of the mounting screws. The screws are either more than 2 inches from the incoming electrical power or protected by 2 or more layers of insulation including over one half inch of air space. Underwriters Laboratories has created a section covering valves for this use within their standard UL1017. As they will now list or recognize products to this standard, evaluation to the separation of circuits and grounding has been completed. We believe that UL does not require the screws to be grounded.

Manufacturers of Central Vacuum Systems that include listed electrical vacuum inlet assemblies need clarification for the final inspectors that the accessible metal screws on the currently available 2 styles of valves, do not need be grounded. The current and proposed text does not fulfill this need.

A recommendation might be to omit the grounding statement for this section. This may not be feasible, and therefore we suggest that it be changed to the following:

"C. Grounding, if needed, shall be in compliance with 250.110."

This text provides for an easier to maintain code as there will not be redundant messages that would require future changes to take place in multiple locations. This will also push the true intent of the statement to the article within the code that is intended to cover the need.

The above statement also helps to highlight that the valves may not need to have the screws grounded and direct the inspector to the correct place to make that determination.

For the above reasons, we are asking members of the CMP 17 to consider voting "No" on Proposal 17-11, Log #1559 and allow the CMP to work on this language in December 2009 at the ROC stage.

Note: Supporting material is available for review at NFPA Headquarters.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP 17 accepts the direction of the TCC to act on Proposal 17-17, and the panel continues to reject the proposal.
Cord and plug connected microwave ovens are being installed and plugged into existing receptacles that have been previously installed under previous permits. When installing a hardwired microwave oven, a permit would be required, which will allow the inspector to verify the loading on the branch circuit. Subsection 90.1(B) is a warning to installers to let them know that meeting the minimum requirements of the NEC may not allow for future expansion of the installation; it is not a limitation on the Code for establishing minimum requirements for installations.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-12 Log #1524 NEC-P17 **Final Action: Reject**
(422.21 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-19
Recommendation: Accept the proposal.
Substantiation: 550.15(E) has a similar provision. If not necessary for other type occupancies, it should not be necessary for mobile homes.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any additional documentation that would justify accepting this comment. See original panel statement to Proposal 17-19.
The submitters suggestion for 550.15(E) is not under the purview of CMP 17.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-13 Log #1534 NEC-P17 **Final Action: Accept in Principle in Part**
(422.30)

TCC Action: The Technical Correlating Committee revises the panel's action in 680.23(F)(2) to comply with 2.6 and 3.1.4 of the NEC Style Manual regarding exceptions and directs that the text will read as follows: "Other than listed low-voltage luminaires not requiring grounding, all...".
Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-20
Recommendation: Revise the panel statement as follows:
An approved means shall be provided to simultaneously disconnect all ungrounded conductors of each branch circuit supplying an appliance in accordance with the following sections of Part III. If an appliance is supplied by more than one circuit the disconnecting means shall be grouped and durably marked to identify the appliance controlled.
Substantiation: Appliances may be supplied by more than one circuit from the same source, such as a panelboard, transformer, or service.
Panel Meeting Action: Accept in Principle in Part
Revise 422.30 to read as follows:
422.30 General.
A means shall be provided to disconnect simultaneously each appliance from all ungrounded conductors in accordance with the following sections of Part III. If an appliance is supplied by more than one branch circuit or feeder, these disconnecting means shall be grouped and identified as the appliance disconnect.
Panel Statement: CMP 17 accepts the submitters substantiation but rejects the proposed revised text. Adding the word "approved" to the first sentence of this section does not add any substantial improvement to this section. The process of approving something is already covered in Section 110.2 And the term "Approved" is defined in Article 100. The panel modified the text to more clearly state the "source" as "branch circuit or feeder." The panel also added text to clarify the identification of the disconnecting means. The panel chose not to use the term "durably" because the AHJ determines the suitability of marking means, dependent on the location.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-14 Log #2606 NEC-P17 **Final Action: Accept**
(422.31 and 422.32)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-21
Recommendation: Accept the proposal in principle.
Change the beginning of the new (C) to read as follows: "(C). Motor-operated Appliances Rated Over 1/8 Horsepower. For permanently-connected motor-operated appliances with motors rated over 1/8 horsepower, the branch-circuit switch … [as in the proposal].
Substantiation: The relevant criterion that should govern wither a remote lock-out is acceptable should be whether the equipment is capable of sudden movement. By placing the "motor-operated" criterion into this section the correct application is clarified. With respect to the comments in the voting, a 1/8 horsepower motor will run in the vicinity of or somewhat above 300 VA, so the confluence of the two criteria is correct.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
MORRIS, W.: AHAM has continued to remind the CMP 17 that motors are not rated and marked in HP and as long as the code will require this, inspectors will be looking for these markings. This causes confusion. Industrial motors may be marked in HP but not usually household appliances.
PANNOCK, J.: Appliance motors are not typically rated and marked in HP. The code should not refer to HP as it creates confusion for the inspectors who will be looking for these markings.

17-15 Log #1533 NEC-P17 **Final Action: Reject**
(422.31(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-23
Recommendation: Accept the proposal.
Substantiation: If locking means are permanent, integral and part of listed equipment have been evaluated by the listing agency. It is not reasonable to assume makeshift methods are as suitable or effective.
Panel Meeting Action: Reject
Panel Statement: There is no substantiation provided to show the current section is inadequate or being misinterpreted. The section already requires that the provision for locking remain in place with or without the lock installed. Where the disconnecting means is a switch or circuit breaker, the provision for locking is permanently affixed to the enclosure (switch's faceplate or circuit breaker's panelboard) rather than directly to either the switch or circuit breaker itself. The provision for locking, although permanent, is not necessarily integral

to the disconnecting means itself.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-16 Log #2607 NEC-P17 **Final Action: Reject**
(422.31(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-22
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110: "**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
Panel Meeting Action: Reject
Panel Statement: CMP 1 has not accepted this definition.
Should CMP 1's action be reversed, it is recommended that the TCC consider "holding" this proposal and comment for the next cycle.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-17 Log #1532 NEC-P17 **Final Action: Reject**
(422.33(A) and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-27
Recommendation: Accept the proposal with the following revisions:
(A) Where the separable cord connector body, plug, receptacle or flanged surface outlet are not readily accessible, cord and plug connected appliances shall be provided with disconnecting means in accordance with 422.31(C). The rating of an attachment plug, receptacle, cord connector body, and flanged surface device shall not be less than the rating of any appliance connected thereto.
Substantiation: Cord and plug connections are not permitted to be not accessible (permanently closed in by the structure). Flanged surface devices with construction and uses similar to receptacles and attachment plugs should be included.
Panel Meeting Action: Reject
Panel Statement: CMP 17 does not accept the submitter's substantiation. The definition the submitter refers to is for "Accessible (as applied to wiring methods)". The definition for this disconnecting means for an appliance should refer to the definition of "Accessible (as applied to equipment)". The definition of "equipment" includes appliances.
A flanged surface outlet is already addressed either as a separable connector or a receptacle.

17-19 Log #2711 NEC-P17 **Final Action: Reject**
(422.49)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 17-30
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional documentation to show that this product has been listed. The companion proposals for neither 422.49 [Proposal 17-30] nor the associated Article 100 Power Safe Protector definition [Proposal 2-27] do not establish limiting safe values for any protection parameters. Any device with a current-interrupting feature and red and green indicator lights could purport to provide power safe protector protection. As such, the proposed requirement is unenforceable.
The additional documentation does not provide sufficient data to show the PSP device will add any greater level of safety in regards to mitigating electrocution hazards than the currently required GFCI devices provide. The UL Research Report clearly states that its scope was to "assess the ability of the Energy Safe Technologies Power Safe Protector (PSP) receptacle design to prevent overheating and thereby mitigate the likelihood of ignition of the electrical wiring system." The requirement for using GFCI protection in this code section is to prevent electrocution where electricity is being used in wet locations. The report clearly states that "An evaluation of this "Power Off" paradigm was not included in this research investigation".
The submitter has not addressed prohibited use of a proprietary trademarked name in mandatory Code requirements (Annex A.14, Guide for Officers of Technical Committees and Technical Correlating Committees of the NFPA). U.S. Patent & Trademark Office shows a live application [USPTO Serial Number 77633351] for registration of "POWERSAFE" by the submitter's corporation Energy Safe Technologies Inc.

Comment on Proposal No: 17-40
Recommendation: Accept the proposal.
Substantiation: See Explanation of Negative Vote on Proposal 7-9, 320.12(1) of the 2010 ROP. If "likely" is not acceptable, it should be removed in over 80 places in the NEC.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided justification acceptable to the panel to justify this change. The submitter referred to the explanation of negative vote on Proposal 7-9 of the 2010 ROP, of which the panel would refer the submitter to the action of that proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-23 Log #1541 NEC-P17 **Final Action: Reject**
(424.19)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-43
Recommendation: Accept the proposal with the following revisions:
Disconnecting Means. An approved disconnecting means that simultaneously disconnects all ungrounded conductors shall be provided for each branch circuit supplying fixed electric space heating equipment. The disconnecting means shall be provided with an approved integral means for locking in the open (off) position. Where the equipment is supplied by more than one circuit, the disconnecting means shall be grouped and durably marked to indicate the equipment controlled. Where a switch is used as the disconnecting means for combination loads, it shall comply with 430.110(C).
Substantiation: "Approved" will cover switch ratings and other requirements. Simultaneous disconnection of ALL conductors is not practical where there is more than one supply circuit. Disconnecting means should be durably marked to specifically indicate the equipment controlled. Switches should comply with 430.110(C). All disconnecting means such as circuit breakers and molded case switches are not limited to 80 percent of the load. The 125 percent factor for disconnecting means is somewhat unusual and generally relates to conductors to minimize heating at overcurrent device terminals; not disconnecting devices which are rated to carry and interrupt their rated current. 430.110 indicates 115 percent for motor circuit switches and 100 percent for molded case switches. "Off" should be noted after "open" since open can apply to a door or a cover.
Panel Meeting Action: Reject
Panel Statement: The editorial changes have not added further substance or clarity. The panel reaffirms its reason for rejection of Proposal 17-43. The panel also rejects the proposal to eliminate the 125 percent increase in total rating of the disconnect since a major concern is that the heater continue to work during freezing weather. The panel also rejects the proposal to add the requirements locking disconnects in the open (off) positions in this section since they are already individually addressed in sections 424.19(A)(1)(2), 424.19(A)(2)(2) and 424.19(B)(1).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-24 Log #2608 NEC-P17 **Final Action: Reject**
(424.19)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-42
Recommendation: Accept the proposal in part, contingent on the companion comment to this being accepted by CMP 1. Reject the modifications to 424.19(A)(2), but accept the remainder of the proposal.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:
"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
The wording proposed for 424.19(A)(2) should be rejected because the wording accepted under Proposal 17-44 does not specifically contain a lockable disconnect requirement, and therefore that portion of the proposal is now moot. Note that as stated the proposal omits the "1/8" size that should appear ahead of "Horsepower" in the titles of 424.19(A)(1) and 424.19(A)(2). This should be corrected by staff.
Panel Meeting Action: Reject
Panel Statement: CMP 1 has not accepted this definition.
Should CMP 1's action be reversed, it is recommended that the TCC consider "holding" this proposal and comment for the next cycle.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-25 Log #1542 NEC-P17 **Final Action: Accept in Principle in Part**
(424.19(B)(1))

TCC Action: The Technical Correlating Committee notes that the panel's action on this comment to revise 424.19(A)(2)(2) is in conflict with the panel action on Proposal 17-44.
The Technical Correlating Committee directs that 424.19(A)(2) be revised in accordance with the action taken on Proposal 17-44.
Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-45
Recommendation: Accept the proposal with the following revisions:
...or has approved integral provisions for locking in the open (off) position.
Substantiation: Locking provisions should be part of the disconnecting means evaluated by listing protocols; and clearly specify the off position, not an open door or panel of the device.
Panel Meeting Action: Accept in Principle in Part
In 424.19(A)(1)(2), 424.19(A)(2)(2) and 424.19(B)(1) add "(off)" after the word "open."
Panel Statement: CMP 17 accepts the proposal to clarify use of the word "open" by adding "(off)" after it, but also proposes to add it to 424.19(A)(1)(2) and 424.19(A)(2)(2). The panel continues to reject the rest of the proposed changes as originally rejected in the ROP.
Where the disconnecting means is a switch or circuit breaker, the provision for locking is permanently affixed to the enclosure (switch's faceplate or circuit breaker's panelboard) rather than directly to either the switch or circuit breaker itself. The provision for locking, although permanent, is not necessarily integral to the disconnecting means itself.
It is recommended that the TCC consider making similar clarifications throughout the Code for correlation and consistency.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-26 Log #366 NEC-P17 **Final Action: Accept**
(424.44(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-57
Recommendation: The proposal should be accepted in principle and in part. Accept the principle that the text should agree with the title in format. Reject the use of slash marks in this wording as currently used in the text, and revise the text to agree with the title, as follows: "Constant wattage heating cables shall not exceed 54 watts per linear meter (16½ watts per linear foot) of cable."
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.
The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 426 — FIXED OUTDOOR ELECTRIC DEICING AND SNOW-MELTING EQUIPMENT

17-27 Log #1647 NEC-P17 **Final Action: Accept**
(426.20(C)(3))

Submitter: Paul Crivell, CDM Inc.
Comment on Proposal No: 17-71
Recommendation: Revise 426.20(C)(3) follows:
Equipment that has been ~~specially investigated~~ listed for other forms of installation shall be installed only in the manner for which it has been identified ~~investigated.~~

Substantiation: The proposal 17-71 should be accepted in part and principle for the following reasons:

The word "investigated" is not defined and is therefore subjective and not enforceable. The purpose of 426.20(C)(3) is to allow embedded deicing and snow-melting resistance heating elements to be installed with different cover than prescribed in 426.20 (C)(1) and 426.20(C)(2). It is not too restrictive to require that the heating elements be listed and for listing to "*identify*" alternate installation requirements which do not comply with those prescribed in 426.20(C)(1) or 426.20(C)(2).

The heating elements are not necessarily "listed" for a manner of installation, but more accurately its listing could "identify" a manner of installation other than that prescribed in 426.20(C)(1) or 426.20(C)(2).

The following panel statement could be used to Accept in Part and Principle:

The heating elements are not necessarily "listed" for a manner of installation, but more accurately its listing could "identify" a manner of installation other than that prescribed in 426.20(C)(1) or 426.20(C)(2).

426.20(C)(3) and the wording proposed in 17-71 should be revised as follows:

Equipment that has been ~~specially investigated~~ listed for other forms of installation shall be installed only in the manner for which it has been identified ~~investigated~~.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-28 Log #136 NEC-P17 **Final Action: Accept**
(426.22(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 17-72
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action and statement of this proposal to identify what was not accepted and the reason it was not accepted.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise 426.22(B) to read as follows:

(B) Raceways. All but 25 mm to 150 mm (1 in. to 6 in.) of nonheating leads not having a grounding sheath shall be enclosed in a rigid metal conduit, electrical metallic tubing, intermediate metal conduit, or other raceways within asphalt or masonry. The distance from the factory splice to raceway shall not be less than 25 mm (1 in.) or more than 150 mm (6 in.).

Panel Statement: The panel accepts the direction of the TCC.

CMP 17 accepts the addition of the term "metal" and the deletion of "Type TW and other approved types" as proposed, but does not accept the proposed change of adding the words "of conductors" because it would be redundant. The panel also does not accept the need to add the word "identified." Note that the submitter shows the word "approved" as being deleted and replaced with "identified," but the term "approved" is not in the current code section and no substantiation was provided for the change. The panel also made an editorial change to make the last phrase a separate sentence.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-29 Log #1369 NEC-P17 **Final Action: Reject**
(426.32)

Submitter: Neal Fenster, Thermo Systems Technology, Inc.
Comment on Proposal No: 17-78
Recommendation: Revise text to read as follows:

Unless protected by ~~a ground-fault circuit-interrupter protection for personnel~~ ground fault protection the secondary winding of the isolation transformer connected to the impedance heating elements shall not have an output voltage greater than 30 volts ac.

Where ~~ground-fault circuit-interrupter protection for personnel~~ ground fault protection is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.

Substantiation: The higher operating current levels of electrical impedance heating systems are not compatible with a Class A type protection system.

An impedance system "looks" like a pair of insulated conductors running parallel to ground. Normally when you have a pair of conductors running parallel to ground, the electrical fields cancel and there is very little, to no inductive and capacitive coupling to ground. Due to the geometry of even a very well designed impedance system (one of the insulated conductors is a large insulated pipe) the electrical fields do not cancel locally. The result is a small percentage of the current "leaks" to ground due to inductive and capacitive coupling.

While it is a small percentage, impedance systems run "high" currents (100-1000 amps), and a small percentage of leakage is still significant. The leakage current is distributed along the pipe, and as it is capacitive and inductive coupled, it does not present a danger to personnel; however, a ground fault device "sees" the summation of the leakage currents. This summation will almost always exceed the 5 ma trip setting of a personnel level ground fault. This will result in "false" trips.

Unfortunately, in my experience, field personnel will disable a device that is causing false trips. This will result in an unsafe operating condition, as no ground fault protection will be functional.

For this reason, equipment level ground fault should be specified.

Panel Meeting Action: Reject
Panel Statement: The requirement for GFCI protection is only for those systems that have greater than 30 volts AC on the secondary side of the isolation transformer. If the voltage exceeds 30 volts AC at 100 – 1000 amperes, GFCI protection should certainly be provided for the protection of personnel at these voltages. The submitter is seeking to protect personnel with a device that is not meant for personnel protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 427 — FIXED ELECTRIC HEATING EQUIPMENT

17-30 Log #1370 NEC-P17 **Final Action: Reject**
(427.27)

Submitter: Neal Fenster, Thermo Systems Technology, Inc.
Comment on Proposal No: 17-86
Recommendation: Revise text to read as follows:

Unless protected by ~~a ground-fault circuit-interrupter protection for personnel~~ ground fault protection the secondary winding of the isolation transformer connected to the impedance heating elements shall not have an output voltage greater than 30 volts ac.

Where ~~ground-fault circuit-interrupter protection for personnel~~ ground fault protection is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.

Substantiation: The higher operating current levels of electrical impedance heating systems are not compatible with a Class A type protection system.

An impedance system "looks" like a pair of insulated conductors running parallel to ground. Normally when you have a pair of conductors running parallel to ground, the electrical fields cancel and there is very little, to no inductive and capacitive coupling to ground. Due to the geometry of even a very well designed impedance system (one of the insulated conductors is a large insulated pipe) the electrical fields do not cancel locally. The result is a small percentage of the current "leaks" to ground due to inductive and capacitive coupling.

While it is a small percentage, impedance systems run "high" currents (100-1000 amps), and a small percentage of leakage is still significant. The leakage current is distributed along the pipe, and as it is capacitive and inductive coupled, it does not present a danger to personnel; however, a ground fault device "sees" the summation of the leakage currents. (427.56(C)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-88
Recommendation: Accept the proposal with revised (D)(3) as follows:
Be provided with approved permanent integral means for locking the open (off) position.
Substantiation: Temperature actuated devices are controlled by temperature, not smoke. Locking means should be approved permanent and integral with the device.
Panel Meeting Action: Reject
Panel Statement: The proposal would establish conflicting requirements for combined switching devices (427.56(D)) and for temperature control with the "off" position (427.56(A)). The panel understands that comment reference is to 427.56(D)(3) not 427.56(C)(1).
The submitter has not provided substantiation for requiring an integral means for locking either in the proposal or comment. Adding the word "approved" does not add clarity.
The panel also reaffirms its reason for rejection of Proposal 17-88.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 430 — MOTORS, MOTOR CIRCUITS, AND CONTROLLERS

11-5 Log #2852 NEC-P11 **Final Action: Hold**
(430.2)

TCC Action: The Technical Correlating Committee directs that the Chair of Code-Making Panel 11 appoint a Task Group including members from Code-Making Panels 3 and 11 to address the issues raised in Proposal 11-25 and Comments 11-5 and 11-35 for correlation of applications of Class I, 2, and 3 power limited circuits supplying small motors.
Submitter: Paul Guidry, Fluor Enterprises Inc
Comment on Proposal No: 11-25
Recommendation: Add FPN No. 2 to existing definition of Valve Actuator Motor (VAM) Assemblies in 430.2 to read:
Valve Actuator Motor (VAM) Assemblies. A manufactured assembly, used to operate a valve, consisting of an actuator motor and other components such as controllers, torque switches, limit switches, and overload protection.
FPN No. 1: VAMs typically have short-time duty and high-torque characteristics.
FPN No. 2: Small motors associated with electrically operated valves used as control circuit devices are not included in this definition. The motors may or may not be an integral part of the valve. For more information see UL 429, Electrically Operated Valves.
Substantiation: The definition of VAMs as defined in Art. 430 applies to valve actuator motors used on pipelines and process piping.
Small Electrically Operated Valves used for water, wastewater, and HVAC applications (for example) can contain motors, but could also be operated in some other fashion. These small valves are not intended to be in the scope of Art. 430 and are not considered to be VAMs as defined in Art. 430.
Panel Meeting Action: Hold
Panel Statement: The panel "holds" the proposal and comment in accordance with NFPA Regulation Governing Committee Projects Section 4.4.6.2.2(c) because the proposed changes could not be handled within the timeframe for processing the report. The panel understands that the application of some small motors may fall under the requirements of Article 725 if they are supplied by Class 1, 2 or 3 circuits. However, more information is needed to allow full consideration of this issue before making changes to clarify which applications clearly fall in this category. The panel suggests that the NEC Technical Correlating Committee appoint a joint task group with CMP 3, as correlation may be needed with the requirements of Article 725.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
TODD, L.: I believe that this could have been handled as follows:
Accept in Principal
Revise the text to add Information Note No 2: Motors integral to listed electrically operated valves are not included in this definition.
Panel Statement: UL 424 covers Electrically Operated Valves. These can contain motors, but could also be operated in some other mode. They would be considered listed products and are not obvious that they even have motors in them other than the ratings in the technical data, which is not required to be marked on the unit. In the NEC, 430.2 Definition for Valve Actuator Motor, it indicated that this is an assembly, used to operate a valve.... So there is a valve and then a motor used to actuate it. It is these motors used to actuate a valve that are intended to be covered by this definition. In the case of a product listed to UL 424, you do not have a motor actuating a valve, but a valve that might have a motor in it as part of it.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 11-31
Recommendation: The proposal should be rejected.
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. As the TCC noted, in this case it potentially inverts the meaning of the phrase. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.
The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

(430.11)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 11-36
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:
Suitable guards or enclosures shall be provided to protect exposed current-carrying parts of motors and the insulation of motor leads installed directly under equipment or in other locations where dripping or spraying oil, water, or other liquid ~~may~~ is capable of occurring, unless the motor is designed for the existing conditions.
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term may in this Section does not meet these either of these criteria, it should be changed.

(430.22(G))

Submitter: Code-Making Panel 11,
Comment on Proposal No: 11-50
Recommendation: Revise 430.22(G) to read as follows:
(G) Conductors for small motors. Conductors for small motors shall not be smaller than 14 AWG unless otherwise permitted in 430.22(G)(1) or 430.22(G)(2).
(1) 18AWG copper. Where installed in a cabinet or enclosure, 18 AWG individual copper conductors, copper conductors that are part of a jacketed multiconductor cable assembly, or copper conductors in a flexible cord shall be permitted, under either of the following sets of conditions:
(1) Motor circuits with a full-load ampacity greater than 3.5 amperes or less than or equal to 5 amperes provided all the following conditions are met:
a. Circuit is protected in accordance with 430.52
b. Circuit is provided with maximum Class 10 overload protection in accordance with 430.32
c. Overcurrent protection is provided in accordance with 240.4(D)(1)(2).
(2) Motor circuits with a full-load ampacity of 3.5 amperes or less provided all the following are met:
a. Circuit is protected in accordance with 430.52
b. Circuit is provided with maximum Class 20 overload protection in accordance with 430.32
c. Overcurrent protection is provided in accordance with 240.4(D)(1)(2).
(2) 16 AWG Copper. Where installed in a cabinet or enclosure, 16 AWG individual copper conductors, copper conductors that are part of a jacketed multiconductor cable assembly, or copper conductors in a flexible cord shall be permitted under either of the following sets of conditions:
(1) Motor circuits with a full-load ampacity greater than 5.5 amperes and less than or equal to 8 amperes provided all the following conditions are met:
a. Circuit is protected in accordance with 430.52
b. Circuit is provided with maximum Class 10 overload protection in accordance with 430.32
c. Overcurrent protection is provided in accordance with 240.4(D)(2)(2).
(2) Motor circuits with a full-load ampacity of 5.5 amperes or less provided all the following are met:
a. Circuit is protected in accordance with 430.52
b. Circuit is provided with maximum Class 20 overload protection in accordance with 430.32
c. Overcurrent protection is provided in accordance with 240.4(D)(2)(2).
Substantiation: The panel has modified the language accepted by Proposal 11-50 to incorporate the changes accepted in the actions on Comments 11-18, 19 and 20. The panel has included additional revisions for clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DESJARLAIS, J.: The revisions made by the panel change the intent of the original proposal. The original proposal provided a means by which 18AWG and 16 AWG cable assemblies and cord could be used outside of enclosures. The verbiage in its present form restricts the use of cable assemblies and cords to the interior of enclosures only. The use of cord and cable assemblies is already adequately addressed in Clauses 400.7 and 400.8. In addition, no exception was made for listed equipment that may employ internal motor conductors smaller than 18 AWG.

Comment on Affirmative:
DESJARLAIS, J.: I agree with the panel's action regarding this specific proposal however I disagree with the panel's overall revisions regarding the use of cable assemblies and cord. See substantiation in 11-17a.

11-19 Log #2814 NEC-P11 **Final Action: Accept in Principle in Part (430.22(G))**

Submitter: Jay Tamblingson, Rockwell Automation
Comment on Proposal No: 11-50
Recommendation: Revise accepted new text as follows:
(G) Conductors for Small Motors. Conductors for small motors shall not be smaller than 14 AWG unless otherwise permitted in 430.22(G)(1) or 430.22(G)(2).
(1) 18AWG Copper. 18 AWG Copper shall be permitted if part of a jacketed multiconductor cable assembly or
flexible cord, or individual conductors used in a cabinet or enclosure, under either of the following sets of conditions:
(1) Motor circuits with a full-load ampacity of 5 amperes or less provided all the following conditions are met:
(a) Circuit is protected in accordance with ~~430.52~~Article 430 Part IV
(b) Circuit is provided with Class 10 overload protection in accordance with 430.32
(c) Overcurrent protection is provided in accordance with 240.4(D)(1)(2).
(2) Motor circuits with a full-load ampacity of 3.5 amperes or less provided all the following are met:
(a) Circuit is protected in accordance with ~~430.52~~Article 430 Part IV
(b) Circuit is provided with Class 20 overload protection in accordance with 430.32
(c) Overcurrent protection is provided in accordance with 240.4(D)(1)(2).
(2) 16AWG Copper. 16 AWG copper shall be permitted if part of a jacketed multiconductor cable assembly or flexible
cord, or individual conductors used in a cabinet or enclosure, under either of the following sets of conditions:
(1) Motor circuits with a full-load ampacity of 8 amperes or less provided all the following conditions are met:
(a) Circuit is protected in accordance with ~~430.52~~Article 430 Part IV
(b) Circuit is provided with Class 10 overload protection in accordance with 430.32
(c) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).
(2) Motor circuits with a full-load ampacity of 5.5 amperes or less provided all the following are met:
(a) Circuit is protected in accordance with ~~430.52~~Article 430 Part IV
(b) Circuit is provided with Class 20 overload protection in accordance with 430.32
(c) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).
Substantiation: The proposed changes add clarity as follows:

1. Add missing comma after "flexible cord," in 430.22(G)(1)as it in 430.22(G)(2)to clarify that the requirement for use in a cabinet or enclosure only applies to individual conductors. It appears this was inadvertently deleted when accepted text was written
2. Change "under the following conditions" to "under either of the following sets of conditions" in 430.22(G)(1)and (2) to clarify that both sets are not required for smaller ampacity (3.5A or less) circuits.
3. Change reference from "430.52" to "Article 430 Part IV" to ensure that compliance to all pertinent provisions for branch circuit protection under Part IV are required.

Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel rejects "Article 430 Part IV" in four places. The panel does not agree with the substantiation that the requirement for use in a cabinet or enclosure only applies to individual conductors and hence the addition of the comma in the main paragraph of (1) is rejected. The panel accepts in principle the remainder and has revised it for clarity. See the recommendation of Comment 11-17a.
The panel intends that these small conductors comply with the specific Code requirements of Section 430.52 and not necessarily other Sections in Part IV. Referral to "Part IV" would not conform to the style manual as it does not refer to a specific section.
The panel maintains that the requirements in 430.22(G)(1) and (G)(2) apply to all conductors, not just individual conductors. It is intended that the requirements being addressed apply to conductors used within a cabinet or enclosure. Wiring methods for application outside the enclosure are covered by other parts of the Code, for example Article 400.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
DESJARLAIS, J.: See my Explanation on Negative on 11-17a.

11-20 Log #1424 NEC-P11 **Final Action: Accept in Principle (430.22(G)(1)(2))**

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 11-50
Recommendation: Revise 430.22(G)(1)(2)b, within the proposal to read as follows:
b. Circuit is provided with Class 10 or Class 20 overload protection in accordance with 430.32.
Substantiation: As worded, only Class 20 overloads are permitted. Faster acting Class 10 overloads, common with IEC-type equipment, will provide the same or better protection.
An alternate wording could be: "maximum Class 20 overload protection". But the problem with that is that it could be misinterpreted to mean the maximum level of protection is Class 20 – thus allowing Class 30 overloads because they offer less protection.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 11-17a.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
DESJARLAIS, J.: I agree with the panel's action regarding this specific proposal however I disagree with the panel's overall revisions regarding the use of cable assemblies and cord. See substantiation in 11-17a.

11-21 Log #1543 NEC-P11 **Final Action: Accept in Principle in Part (430.24 Exception No. 3)**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-51
Recommendation: Accept the proposal with the following revisions:
Where the circuitry is interlocked to prevent simultaneous operation of the motors or other load, the conductor ampacity shall be permitted to be based on the summation of 125 percent of the largest motor or continuous load, whichever is larger, and the current of all other loads to be operated simultaneously.
Substantiation: "Simultaneously" is the term usually used in the NEC. "At the same time, can literally be 1:00 PM on Monday and 1:00 PM on Tuesday. Proposal clarifies that the 125 percent applies only to the largest of the motor or continuous load. Applying the factor to both results in a 250 percent factor which is excessive and not needed to reduce the heating effects at termination of overcurrent devices.
Panel Meeting Action: Accept in Principle in Part
The panel agrees to add the terms "simultaneous" and "simultaneously" as suggested by the submitter. The panel rejects the remainder of the suggested changes.
Revise Exception No. 3 to read as follows:
Exception No. 3: Where the circuitry is interlocked so as to prevent simultaneous operation of selected motors or other loads, the conductor ampacity shall be permitted to be based on the summation of the currents of the motors and other loads to be operated simultaneously that results in the highest total current.
Panel Statement: It is the panel's intent to require 125 percent of the largest motor, plus 125 percent of the continuous load for those loads operating simultaneously. No technical substantiation has been provided to the panel for only requiring 125 percent for the largest of the motor or the continuous load.
The panel disagrees with the submitter's substantiation that the total factor applied would be 250 percent and directs the submitter to see Proposal 11-50a which was accepted.
The panel has made revisions for clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-22 Log #1243 NEC-P11 **Final Action: Reject**
(430.28)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 11-55
Recommendation: Accept the proposal, revised as follows:
430.28
Exception: Feeder tap conductors applied in accordance with 430.28(1) shall be permitted to terminate in more than one branch-circuit protective device, connected in a parallel arrangement, either by:
a) Use of a bus-bar wiring accessory listed for such use, with a single set of line-side terminals for connection to the feeder tap conductors and more than one set of load-side bus connections for attachment to branch-circuit protective devices intended to be mounted directly to the bus-bar wiring accessory or
b) Use of conductors connected between line-side terminals of branch-circuit protective devices where the total length of the initial tap conductor and all interconnecting conductors to the additional branch-circuit protective devices does not exceed 3m (10 ft).
Substantiation: As noted in the NEMA negative comment to the Panel statements, the reasoning for the statements is not supported by the Code wording. The proposed additions to the Code cannot result in overloading of the tap conductors; Section 430.24 addresses the ampacity of the tap conductors for these applications. The revised wording provides an exception permitting the use of bus-bar wiring accessories and connections between line-side terminals. The use of the bus-bar accessories results in fewer connections, and a reduction of the possibility of arc-flash hazards.
For clarification of the intentions of the proposal, a drawing illustrating the existing permissions of 430.28(1) and the proposed permissions is provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 11-23.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DESJARLAIS, J.: I support 11-23 in lieu of this proposal. See substantiation for 11-23.
WRIGHT, J.: The Panel should have accepted the Comment, which would have accepted Proposal 11-55, as modified by the Comment. The proposed wording does not advocate tapping a tap, other than as permitted by 240.21, which states: "*Conductors supplied under the provisions of 240.21(A) through (H) shall not supply another conductor except through an overcurrent protective device meeting the requirements of 240.4.* Taps CAN be tapped under these conditions.
The concept of the bus-bar wiring accessory proposed in part (a) of the exception to 430.28 meets the requirements of 240.21, in that the conductor from the feeder ends in multiple branch-circuit protective devices; any conductors from that point on are supplied through an overcurrent protective device meeting the requirements of 240. The busbars within the listed busbar wiring accessory have been evaluated for current-carrying capacity and short-circuit withstandability as part of the listing.
The concept of the "daisy-chaining" proposed under part (b) of the exception to 430.28 was not intended to advocate tapping a tap. The entire length of the tap, which lands on multiple branch-circuit protective devices within the tap, is restricted to a maximum of 10 feet, and was intended to represent one tap from the feeder. All wiring leaving the load side of each branch circuit protective device attached to the tap meets the requirements of 240.21.

11-23 Log #1285 NEC-P11 **Final Action: Reject**
(430.28)

Submitter: James R. Wright, Siemens Industry, Inc.
Comment on Proposal No: 11-55
Recommendation: Accept the proposal, revised as follows:
430.28
Exception: Feeder tap conductors applied in accordance with 430.28(1) shall be permitted to terminate in more than one branch-circuit protective device, connected in a parallel arrangement, either by:
a) Use of a bus-bar wiring accessory listed for such use, with a single set of line-side terminals for connection to the feeder tap conductors and more than one set of load-side bus connections for attachment to branch-circuit protective devices intended to be mounted directly to the bus-bar wiring accessory or
b) Use of conductors connected between line-side terminals of branch-circuit protective devices where the total length of the initial tap conductor and all interconnecting conductors to the additional branch-circuit protective devices does not exceed 3m (10 ft). All conductors, from the tap to the final connection to the last branch-circuit protective device, shall have the same ampacity.
Substantiation: As noted in the NEMA negative comment to the Panel statements, the reasoning for the statements is not supported by the Code wording. The proposed additions to the Code cannot result in overloading of the tap conductors; Section 430.24 addresses the ampacity of the tap conductors for these applications. The revised wording provides an exception permitting the use of bus-bar wiring accessories and connections between line-side terminals. The use of the bus-bar accessories results in fewer connections, and a reduction of the possibility of arc-flash hazards.
For clarification of the intentions of the proposal, a drawing illustrating the existing permissions of 430.28(1) and the proposed permissions is provided.
Note: This comment contains the same material as the NEMA comment on the proposal, with the addition of the last sentence under (b).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Acceptance of the comment would allow a tap to be made to a tap which is specifically prohibited by 240.21. CMP 10 actions on proposal ROP 10-56 of the 1999 edition of the NEC specifically prohibited tapping a tap. The panel intends that tap conductors be terminated into a single overcurrent device.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DESJARLAIS, J.: The proposed verbiage cannot result in overloading of the tap conductors. Section 430.24 addresses the ampacity of the tap conductors for these applications. The revised wording provides an exception permitting the use of bus-bar wiring accessories and connections between line-side terminals. The use of the bus-bar accessories results in fewer connections and a reduction in the possibility of arc-flash hazards.
WRIGHT, J.: See NEMA Negative vote on Comment 11-22.

11-24 Log #1553 NEC-P11 **Final Action: Accept**
(430.31)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-56
Recommendation: Accept the proposal with the following revisions:
These provisions shall not require overload protection where a power loss would cause a hazard such as in the case of fire pumps.
Substantiation: Proposal is similar to 240.4(A) and does not use the term "might" which is to be avoided per the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-25 Log #371 NEC-P11 **Final Action: Reject**
(Table 430.37)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 11-60
Recommendation: The proposal should be accepted in part. Accept only the removal of the hyphen from the word "conductors". Reject the remainder of the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Reject
Panel Statement: The panel action taken on the original proposal provides more precise language and clarity to the Table.
Note that the hyphen was only added due to the change in line for text processing and would not occur if the word appeared on a single line.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-26 Log #2315 NEC-P11 **Final Action: Accept**
(430.42(C))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 11-63
Recommendation: Delete the new informational note.
Substantiation: The added informational note is not necessary; due to the fact the rule now specifically addresses the issue. Even if 210.50(A) did not exist, this rule would still be the same. Needlessly referring the Code user to other sections of the Code does not really accomplish anything, other than making the Code book a little longer.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-27 Log #2610 NEC-P11 **Final Action: Accept**
(430.42(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 11-63
Recommendation: Accept the proposal in principle; change the end reference from "as provided in Article 210" to "as provided in 210.21(B)."
Substantiation: The panel overlooked a flagrant violation of the whole-article-cross-reference prohibition in the NEC Style Manual, at 4.1.1. This is the appropriate, and specific, reference.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-28 Log #1244 NEC-P11 **Final Action: Accept**
(430.53(D)(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 11-70
Recommendation: Revise accepted text as follows:
No conductor to the motor shall have an ampacity less than one-third that of the branch-circuit conductors, with a minimum in accordance with 430.22, the conductors to the motor overload device being not more than 7.5 m (25 ft) long and being protected from physical damage by being enclosed in an approved raceway or by use of other approved means.
Substantiation: Revise accepted text to clarify that "other approved means" is meant to correspond to "being protected from physical damage" rather than "being enclosed". This clarifies that, for example, approved means such as using TC-ER cable protected by struts and angles as permitted under 336.10(7) for industrial establishments meets the requirements for physical protection of the conductors.
In addition, the panel commented that the accepted text was consistent with similar requirements in 240.21, 430.28, and 430.53(D). The proposed revised language improves consistency with 240.21(B)(2)(3) and 430.28(2) 25ft tap rules. Although 430.43(D) requires the taps to be enclosed, this requirement is expected to be more onerous as the taps are 10ft or less and can be 1/10 of the branch circuit conductor (rather than 1/3).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-29 Log #1245 NEC-P11 **Final Action: Accept in Part**
(430.63)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 11-75
Recommendation: Modify proposed new text to say "not less than that required for the sum of the other load(s)"
Keep the FPN in the original proposal.
Substantiation: The proposed wording change would permit the feeder overcurrent device to be rated for any single other load and the motor load(s). The requirement should be for the feeder overcurrent device to be rated for the sum of the other loads plus the motor load(s).
Continuous loads can be a factor in feeder short circuit and ground fault selection. Hence the inclusion of the FPN.
Panel Meeting Action: Accept in Part
The panel accepts the additional language "sum of". The panel rejects the addition of the fine print note. Revised text to read:
430.63 Rating or Setting – Motor and Other Loads.
Where a feeder supplies a motor load and other load(s), the feeder protective device shall have a rating not less than that required for the sum of the other load(s), plus the following:
(Retain the listed items from the committee action on the original proposal. The exception is unchanged.)
Panel Statement: NEC style manual section 4.1 prohibits the use of fine print notes where the information is redundant, the fine print note adds redundancy and does not add clarity to this Code section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-30 Log #750 NEC-P11 **Final Action: Accept**
(Table 430.72(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 11-76
Recommendation: The Proposal should be Accepted in Principle with the following revisions:
In Note 2, change "Table 310.17" to "Table 310.15(B)(17)".
In Note 3, change "Table 310.16" to "Table 310.15(B)(16)".
Substantiation: This will correlate with the Panel Action on Proposal 6-52.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the comment contingent upon Panel 6's action on Comment 6-21. This action is to be referred to the Technical Correlating Committee for review.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-31 Log #2214 NEC-P11 **Final Action: Accept**
(430.72(C))

Submitter: Vincent J. Saporita, Cooper Bussmann
Comment on Proposal No: 11-78
Recommendation: Reject the proposal.
Substantiation: The text of 430.72(A) General specifically states that the motor control circuit shall be permitted to be protected by either a supplementary or branch-circuit overcurrent protective device(s). Part (C) provides protection requirements for the control circuit transformer. Note well that the text of 430.72(C)(1),(2),(3),(4), and (5) is application specific referring to other NEC sections or to performance requirements. 430.73(C)(1), (2),(3), (4) and (5) are not product specific. If a manual motor protector is suitable for control circuit transformer protection then its use is already covered in 430.7(C)(5). Other Means, then use of a manual motor protector for control circuit transformer protection is, in fact, a product standard issue and would be part of the product safety standard UL508 and verified by product listing after appropriate testing. Inclusion of product specific requirements in 430.72(C) will lead to field misapplication.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DESJARLAIS, J.: Rather than leading to possible field misapplication, the verbiage in the original proposal in ROP 11-78 would prevent possible field rejection of equipment listed for this specific application.
WRIGHT, J.: The Panel should have Rejected this comment. The Commenter's substantiation is incorrect, as follows:
1. The statement that "all other permitted protective means presently in the Code are not product-specific is wrong; the permitted protective means in the Code are product-specific, in that Fuses, Circuit Breakers, and Supplementary Protectors are permitted. The Proposal would add another Product, Manual Motor Controllers Suitable for Tap Conductor Protection.
2. While the concept may be covered under the existing 430.72(c)(5) Other Means, what may or may not be acceptable under "Other Means" is vague. The purpose of the Proposal was to clarify that the additional product, when used as specified, is permitted.
3. The statement that this becomes a Product standards issue and would only be acceptable after proper testing and listing is in itself valid. The Proposal includes the requirement that the product be listed for this application. However, listing alone does not guarantee that the Product will be accepted. While many AHJs will accept the product because it is listed, there are some AHJs who may not accept it. The product may be rejected because the AHJ does not understand that the listing also extends to the use as protection for a control transformer. The product may also be rejected simply because the Code does not specifically permit its use in this application.
4. The statement that the inclusion of product-specific requirements will lead to misapplication is incorrect, in that the purpose of the proposal was to do just the opposite. The Code contains many product-specific requirements for a multitude of products in order to prevent misapplication of the products.

11-32 Log #1246 NEC-P11 **Final Action: Accept**
(430.74)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 11-86
Recommendation: Change from "so that an ground-fault" to "so that a ground-fault".
Substantiation: Editorial.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-33 Log #452 NEC-P11 **Final Action: Accept**
(430.75 Exception No. 2)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 11-87
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:
Exception No. 2: The motor control circuit disconnecting means shall be permitted to be remote from the motor controller power supply disconnecting means where the opening of one or more motor control circuit disconnecting means ~~may~~ is capable of resulting in potentially unsafe disconnecting conditions for personnel or property and the conditions of items (a) and (b) of Exception No. 1 are complied with.
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.
However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Since the use of the term may in this Section does not meet either of these criteria, it should be changed.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-34 Log #1551 NEC-P11 **Final Action: Accept in Principle**
(430.75 Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-87
Recommendation: Change the word "may" to "would".
Substantiation: Correlation with 240.4(A). Per the NEC Style Manual, "may" is a term relating to discretion of the Authority Having Jurisdiction.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel has used different terminology that resolves the manual of style concern in the action on Comment 11-33.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-35 Log #2173 NEC-P11 **Final Action: Hold**
(430.81(C) and FPN (NEW))

TCC Action: See the Technical Correlating Committee Note on Comment 11-5.
Submitter: Jeff M. Goldsmith, General Electric Company
Comment on Proposal No: 11-25
Recommendation: Change the proposed modification of a definition in 430.2 to the addition of a new subsection (C) in 430.81, to read:
(C) Small Valve Actuator Motor (VAM) Assembly. A listed VAM controlled by an industrial control panel shall be permitted to be classified as a control circuit load, wired as an Article 725 remote-control circuit.
FPN: Listed valve actuators comply with the UL 429 Standard for Electrically Operated Valves.
Substantiation: ln response to the panel statement on my proposal:
UL 429 section 25.3 includes "The temperature rise attained by the motor of a motor-operated valve. lf stalling the motor is not part of the normal operation,... the motor, when stalled or otherwise operated with a blocked valve system, shall not show any manifestation of a risk of fire," UL 429 does apply to motor-operated valves, and to motor-operated valve actuators that are one of the two principal components.
UL 50BA section 46.1.1 says: "A control circuit load shall comply with... b) An electrically-operated valve shall comply with... UL 429". The opposite of a UL 508A control circuit is a power circuit, which UL 508A defines as "Conductors and components of branch and feeder circuits." Therefore, UL 508A says that a motor-operated valve control circuit is not necessarily a branch circuit or a motor branch circuit.
The Control Circuit definition in Article 409 includes "carries the electric signals directing the performance of the controller". A motor-operated valve actuator directs the fluid switching performance of a valve. Adding a word to the Remote-Control Circuit definition "Any electrical circuit that controls any other [fluid] circuit through a relay or an equivalent device" shows that valve actuator circuits are essentially 725.41(B) Class 1 Remote-Control and Signaling Circuits.
UL 508A defines limits for control circuit loads, and section 51 requires load rating markings on a listed panel. So "controlled by an industrial control panel" works in 430.81 that "is intended to require suitable controllers for all motors".
Panel Meeting Action: Hold
Panel Statement: See panel action and statement on Comment 11-5.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
TODD, L.: See comment on Comment 11-5. The change in definition is the better place to put this change in my opinion.

11-36 Log #1550 NEC-P11 **Final Action: Reject**
(430.82(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-89
Recommendation: Accept the proposal.
Substantiation: The panel statement is partially correct; the definition of "identified" may relate to listing, but the definition is "recognized" as suitable for the specific purpose, function, use, etc.
Panel Meeting Action: Reject
Panel Statement: The term "capable" is defined in Webster's 11th Collegiate Dictionary, the official NFPA dictionary as, "having traits conducting to or admitting of". The present code text contains clear language and is more specific than the proposed language. Furthermore no technical substantiation has been submitted to indicate problems exist with the existing language.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-37 Log #2778 NEC-P11 **Final Action: Accept**
(430.95)

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 11-93
Recommendation: Proposal should be rejected.
Substantiation: CMP 4 rewrote the definitions and subsequent requirements for the installation of the service conductors that the submitter is referencing in his proposal. The submitter presented rationale in his substantiation based on the presumption that CMP 4 would accept his proposals to CMP 4, we did not. The submitter is incorrect that under existing NEC requirements all "service drop" and "service entrance" conductors are utility owned, they are not. Utilizing the word "service" in 408.3 will be sufficient whether the recommended changes in Article 430 pass or not.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-38 Log #140 NEC-P11 **Final Action: Accept**
(430.102)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 11-95
Recommendation: The Technical Correlating Committee directs the panel to reconsider the proposal and correlate with the action taken on Proposal 1-63.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the technical correlating committee direction. See panel action and statement on Comment 11-39.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-39 Log #2611 NEC-P11 **Final Action: Reject**
(430.102)

Based on the Code-Making Panel's action on Comment 1-46, the Technical Correlating Committee directs that Comment 11-39 be reported as "Reject".
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 11-95
Recommendation: Continue to accept the proposal in the form the panel accepted it, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:
"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
Note that the provisions in this language for local modifications of the rule protect the minor changes CMP 11 included in their action.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation contingent upon CMP 1's acceptance of the proposed definition of "Disconnecting Means, (Lockable)" (Comment 1-46). This action is to be referred to the technical correlating committee for review. In addition, the panel continues to accept the panel action taken on the original proposal 11-95.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-40 Log #1549 NEC-P11 **Final Action: Reject**
(430.103)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-99
Recommendation: Accept the proposal and revise the first sentence as follows:
The disconnecting means shall simultaneously open all ungrounded branch circuit conductors.
Substantiation: Presumably, the provision is for branch circuit conductors. "Supply" conductors includes feeders and service conductors.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no documentation that existing language is misleading or causing problems in the field. The use of the word "supply" is not ambiguous in the context of this section.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-41 Log #1555 NEC-P11 **Final Action: Reject**
(430.110(A) Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-103
Recommendation: Revise as follows:
The disconnecting means for motors rated 600 volts, nominal, or less, supplying a single motor shall have an ampere rating not less than 115 percent of the nameplate full-load current rating of the motor of the full-load current rating specified in Tables 430.247 through 430.250, whichever is greater, and for motors with overload protection, not less than the applicable trip values specified in 430.32(1), (2), and (4).
Substantiation: Full-load nameplate current ratings may be different from Table values which specify speed, normal torque, typical, usual, belted, conditions. The 125 percent, 170 percent of 430.32(A) and 430.32 (A)(4) temperature rise slightly less than that marked on the nameplate, can permit a current greater than 115 percent for a duration that can overhear heat terminals and exceed an ampere rating of 115 percent. This provision should apply to a single motor since (C)(1) generally requires higher ratings.
Panel Meeting Action: Reject
Panel Statement: The present language requires the values in the tables be used to size the disconnecting means. This requirement and value consistently guarantees the disconnect is properly and safely sized for the present motor and future replacement motors. The existing language in this section applies to a single motor, as the last word "motor" is singular and not plural.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-42 Log #1554 NEC-P11 **Final Action: Reject**
(430.110(C)(2) Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-105
Recommendation: Accept the proposal with the following revisions:
A motor circuit switch without fuseholders having a horsepower rating not less than the equivalent horsepower of the combined loads determined in accordance with 430.110(C)(1) shall be permitted to have an ampere rating less than 115 percent, but not less than 100 percent of all full-load currents.
Substantiation: Less than 115 percent does not establish a lower limit; 50 percent is less than 115 percent. Nonfused does not prohibit fuseholders with jumpers or copper tubes which one manufacturer states current capabilities of their switches can be attained in switches where fuses are replaced with copper bars.
Panel Meeting Action: Reject
Panel Statement: Listed motor circuit switches are rated in horsepower, therefore the switch would be sized properly due to the horsepower rating and calculation as required in 430.110(C)(1). The less than 115 percent of the full load ampere rating is permitted due to the horsepower rating of the switch. Listed nonfused motor circuit switches are manufactured without fuseholders, therefore copper tubes or jumpers are unable to be installed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-43 Log #1540 NEC-P11 **Final Action: Reject**
(430.113 and Exception No. 1 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-106
Recommendation: Accept the proposal with the following revisions:
More Than One Supply Circuit. Motors and motor-operated equipment supplied by more than one branch circuit shall be provided with a disconnecting means for the supply circuit(s) on or immediately adjacent to the equipment served. Where more than one disconnecting means is provided, a durable sign shall be provided on or immediately adjacent to each disconnecting means indicating the equipment controlled.
Exception: The disconnecting means shall not be required to be on or immediately adjacent to the motor(s), if a disconnecting means is provided to disconnect the controller(s) and is provided with an approved permanent means for locking in the open(off) position.
Substantiation: "Source" may be construed as (and in many times) as a panelboard. Transformer, service, or separately derived system. The provision should clearly indicate "circuit". The present second sentence is covered by the first sentence. Present warning sign requirement doesn't indicate what is to be warned.
Panel Meeting Action: Reject
Panel Statement: Substantiation has not been provided that the present requirements are unclear or are presenting a hazard. The use of "source" is clear in this context.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-43a Log #CC1100 NEC-P11 **Final Action: Accept**
(430-123)

TCC Action: The Technical Correlating Committee directs that in Exception No. 1, the words "as permitted in" be inserted preceding "430.52(C)(5)", and the brackets be removed, from the section reference to comply with the NEC Style Manual.

The Technical Correlating Committee further directs that in (B) the word "if" be replaced with the word "where" in 2 places to comply with the NEC Style Manual.

Submitter: Code-Making Panel 11,
Comment on Proposal No: 11-107a
Recommendation: Revise 430.123 to read as follows:

430.123 Branch Circuit Short-Circuit and Ground Fault Protection.

(A) Drive Protection and Markings. The branch circuit short-circuit and ground-fault protection for a circuit supplying an adjustable-speed drive system shall be of a type and ampere rating or setting not exceeding that specified by the manufacturer's instructions provided with the adjustable-speed drive system. If the instructions do not specify a type and ampere rating or setting, a branch-circuit fuse or inverse-time circuit breaker shall be used and shall be sized in accordance with 430.52 based upon the input current rating of the adjustable-speed drive system. The rating or setting of the overcurrent protective device shall not exceed that allowed by 430.52.

Exception No. 1: Additional branch circuit short-circuit and ground-fault protection for an adjustable-speed drive system is not required if the adjustable-speed drive system is provided with integral branch circuit rated protection such as an inverse-time circuit breaker, branch-circuit fuses, or semiconductor fuses [430.52(C)(5)].

Exception No. 2: Unless specified in the manufacturer's instructions supplied with the adjustable-speed drive system, "common dc bus" adjustable-speed drive system designed as part of a single integrated drive system shall not be required to have individual branch circuit protective devices installed in the dc input conductors.

(B) Drive and Bypass Protection. If a branch circuit short-circuit and ground-fault protective device provides protection for both the adjustable-speed drive system and a bypass circuit, the specific branch circuit protective device and its ratings or settings shall not exceed those specified by the manufacturer's instructions provided with the adjustable-speed drive system. If the bypass circuit requires different branch circuit short-circuit and ground-fault protection, separate branch circuit short-circuit and ground-fault protection shall be provided for both the adjustable-speed drive system and the bypass circuit.

Substantiation: The panel has modified the language accepted by Proposal 11-107a to incorporate the changes accepted in the actions on Comments 11-44, 45, 46 and 47. The panel has included additional revisions for clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-44 Log #1240 NEC-P11 **Final Action: Accept in Principle in Part**
(430.123)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 11-107a
Recommendation: The following statement should be added as the last sentence for the paragraph under (A):

"In no event shall the rating or setting of the overcurrent protective device exceed that allowed by 430.52."

Exception 2 should be deleted.

Substantiation: This will prevent manufacturers from specifying oversized overcurrent devices that will not provide the protection for the conductors required by 430.52. It reinstates the proposed sentence from proposal 11-110 for the end of article 430.130 (A).

Exception 2 should be deleted on the basis that a single large power supply could supply a "common dc bus" that supplies an unspecified number of drives controllers that have no individual protection on the dc bus. This exception is essentially creating a group motor installation without any of the protection requirements for a group motor installation. It is also a concern that the inclusion of Exception 2 would permit an installer, or others, to build an assembly without being required to undergo the appropriate testing for protection coordination.

Panel Meeting Action: Accept in Principle in Part - The panel accepts in principle the addition of the sentence "In no event shall the rating or setting of the overcurrent protective device exceed that allowed by 430.52." The panel has rejected the recommendation to delete Exception No. 2.
Panel Statement: See recommendation on Comment 11-43a.

Relative to rejection to delete Exception no. 2, common adjustable-speed drive system topography utilizes multiple "cell" technology which converts drive input AC to DC which is isolated in each individual cell and protected by cell DC bus protection that trips the short circuit protective device feeding the drive in the event of a short circuit or other DC "out of limit" value such as overvoltage or undervoltage. This technology feeds a single motor and not multiple motors.

Panel Statement: See recommendation on Comment 11-43a.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-47 Log #2813 NEC-P11 **Final Action: Accept in Principle in Part**
(430.123)

Submitter: Jay Tamblingson, Rockwell Automation
Comment on Proposal No: 11-107a
Recommendation: Revise accepted new text as follows:

430.123 Branch Circuit Short-Circuit and Ground Fault Protection.

(A) Drive Protection and Markings. The branch circuit short-circuit and ground-fault protection for a circuit supplying power conversion equipment shall be of ~~the~~a type and maximum size specified by the manufacturer's instructions provided with the power conversion equipment, with the size not to exceed that permitted under Article 430 Part IV for the type of device selected. When the instructions do not specify ~~the~~a type and size, a branch-circuit fuse or inverse-time circuit breaker shall be used and shall be sized in accordance with Article 430 Part IV based upon the input current rating of the power conversion equipment ~~multiplied by the percentage from Table 430.52~~.

Exception No. 1: Additional branch circuit short-circuit and ground-fault protection is not required for power conversion equipment where provided with integral branch circuit rated protection such as: an inverse-time circuit breaker, branch-circuit fuses or semiconductor fuses, as provided in section 430.52(C)(5), in all ungrounded input conductors.

Exception No. 2: ~~Unless specified in the manufacturer's instructions supplied with the power conversion equipment,~~ Listed "common dc bus" power conversion equipment ~~is not~~ shall not be required to have individual branch circuit protective devices installed in the dc input conductors where not required by product listing and installed as specified in the manufacturer's instructions supplied with the power conversion equipment.

(B) Drive and Bypass Protection. For an adjustable speed drive system that includes a bypass device, ~~Where~~ a common branch circuit short-circuit and ground-fault protective device shall be permitted to provide~~s~~ protection for both the ~~adjustable speed drive system~~ power conversion equipment and a~~t~~he bypass circuit~~,~~ where the specific branch circuit protective device and its ratings or setting~~s~~ is selected ~~must~~ not to exceed ~~those marked on the adjustable speed drive controller~~that permitted under 430.123(A) for the power conversion equipment and that permitted under Article 430 Part IV for the bypass circuit. ~~Where the bypass circuit requires a different branch circuit short-circuit and ground-fault protective device, ratings or settings other than those marked on the adjustable speed drive controller, then separate branch circuit short-circuit and ground-fault protection shall be provided for both the adjustable speed drive controller and bypass circuit.~~

Substantiation: The proposed changes clarifies the following issues:

1. The type and size of protection specified by the manufacturer shall not exceed that permitted under Part IV to ensure branch circuit conductors are adequately protected. In addition, editorial comments to improve readability and indicate that more that one type of protection and maximum size is specified.

2. When the type and size is not specified, sizing of the fuse or circuit breaker is done in accordance with Part IV. The modification permits use of text which is not present in Table 430.52 as is currently written.

3. Exception 2 was rewritten to default to protection being required unless specified by product listing. This addresses concerns that listed products that utilize a common dc bus (e.g. multi-motor drives)often incorporate protection of individual amplifier modules as part of the product listing and do not require additional protection.

4. Protection for drive bypass was rewritten to provide reference to 430.153(A) and Article 430 Part IV to ensure consistency of application between drives with and without bypass. In addition, the text was rewritten to address only the use of a common protective device for both circuits, as separate protection is by default required under 430.123(A) and Part IV.

Panel Meeting Action: Accept in Principle in Part - The panel rejects the proposed references to Part IV in 430.123(A) and (B), and the language associated with "Listed common dc bus" in Exception No. 2. The panel accepts in principle the remainder of the recommendation with revisions for clarity.

Panel Statement: See recommendation on Comment 11-43a.

The panel rejected the reference to "430 Part IV" as the sizing of the short circuit and ground fault protection is specifically given in 430.52, the remainder of Part IV is not pertinent to the sizing requirements required by this Code section.

The panel rejected the language associated with "Listed common dc bus" in Exception No. 2 because those products are not always listed and drive topography does not always require additional dc bus overcurrent protection.

Ballot Results: Affirmative: 15

11-49 Log #2613 NEC-P11 **Final Action: Reject**
(430.227)

TCC Action: Based on the Code-Making Panel's action on Comment 1-46, the Technical Correlating Committee directs that Comment 11-49 be reported as "Reject".

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 11-114
Recommendation: Continue to accept the proposal, contingent on the companion comment to this being accepted by CMP 1.

Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:

"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."

Panel Meeting Action: Accept

Panel Statement: The panel accepts the recommendation contingent upon CMP 1's acceptance of the proposed definition of "Disconnecting Means, (Lockable)" (Comment 1-46). This action is to be referred to the Technical Correlating Committee for review.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

COLE, T.: The current language is clear and is consistent with other sections of the code. The proposed language is a step backwards for safety in that a disconnect could be lockable, the locking device could be rendered unusable if a cover is taken off. The original code made it very clear the intent of the locking device.

11-50 Log #2614 NEC-P11 **Final Action: Accept in Principle**
(430.245)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 11-117
Recommendation: Accept the panel action in principle.

Change the end phrasing "shall be connected to them in the manner specified in Article 250" to "shall be bonded to them in accordance with 250.96(A)."

Substantiation: This language uses the more precise term "bonded" and avoids the whole-article reference prohibition in the NEC Style Manual at 4.1.1.

Panel Meeting Action: Accept in Principle

Accept the comment in principle to read:

250.245(A) Grounding Through Terminal Housings.

Where the wiring to motors is metal-enclosed cable or in metal raceways, junction boxes to house motor terminals shall be provided, and the armor of the cable or the metal raceways shall be connected to them in the manner specified in 250.96(A) and 250.97.

Panel Statement: The panel agrees the submitters substantiation and made revisions to include circuits of 250 volts or less and over 250 volts to ground.

Number Eligible to Vote: 15

Comment on Proposal No: 11-120
Recommendation: The Proposal should be Accepted in Principle and revised as follows:

Change "Table 310.16 through Table 310.19" to "Table 310.15(B)(16) through Table 310.15(B)(19)".

Substantiation: This will correlate with the Panel Action on Proposal 6-52.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the comment contingent upon Panel 6's action on Comment 6-21. This action is to be referred to the Technical Correlating Committee for review.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-52 Log #1425 NEC-P11 **Final Action: Reject**
(440.9)

The Technical Correlating Committee directs that Proposal 11-129 and Comment 11-52 both be reported as "Reject" since the Code-Making panel with jurisdiction over the individual wiring method is the panel that decides the necessity of an equipment grounding conductor.

The Technical Correlating Committee directs that the Chairs of Code-Making Panels 7, 8 and 11 form a Task Group to develop proposals for the 2014 edition of the NEC to correlate this issue.

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 11-129
Recommendation: Revise proposed new 440.9 as follows:
~~Any wiring method employed shall contain~~ All branch circuits shall be supplemented by an equipment grounding conductor in accordance with 250.118(1).

Substantiation: This comment addresses two issues.

First, the proposed wording does not indicate that the requirement applies only to branch circuits and not to feeders or services. It takes a bit more scholarship that that used by most code users to notice that Section 440.1 does limit the scope of the article to air conditioning and refrigeration branch circuits. Making it explicit here, will simply make the code clearer.

Second, calling the equipment ground a "supplemental equipment grounding conductor" should help avoid issues of creating conflicts with issues that are under the prevue of CMP's 5 or 7. Other articles of the code, such as Articles 517, 547,555, and 680 have requirements for a wire-type equipment grounding conductor to be included with circuits.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel agrees in principle with the concept of "supplemental" and "branch circuit".

The panel has not added "supplemental" specifically to the requirement because it would suggest that two internal equipment grounding conductors be installed in some wiring methods per the requirements of 250.118. Only a single internal equipment grounding conductor is intended. The concept of branch circuit is already addressed in the scope of 440. See the panel action on Comment 11-60.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

DESJARLAIS, J.: See my explanation of negative on 11-60.

WRIGHT, J.: See NEMA Negative vote on Comment 11-59.

11-53 Log #142 NEC-P11 **Final Action: Accept**
(440.14, FPN (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 11-126
Recommendation: The Technical Correlating Committee directs that the panel reconsider its action on this proposal since there is no need to duplicate 110.26 in accordance with 4.1 of the NEC Style Manual.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel has reconsidered the panel action on proposal 11-126 as directed by the Technical Correlating Committee. The panel concurs that 110.26 applies in accordance with 90.3. The panel also realizes conflicting interpretations do occur with respect to nonfused disconnects. The panel intends that 110.26 apply regardless of the type of disconnect installed.
Number Eligible to Vote: 15

11-55 Log #1536 NEC-P11 **Final Action: Reject**
(440.14 Exception No. 1)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-128
Recommendation: Accept the proposal with the following revisions:

Where the disconnecting means provided in accordance with 430.102(A) has approved permanent means for locking in the open (off), and the refrigeration or air conditioning equipment is essential to a process in a facility with written safety procedures, and where only qualified persons install and service the disconnecting means shall not be required to be within sight of the equipment. The exception should also apply to nonindustrial processes such as commercial, institutional, governmental, military, where the NEC is enforced. 508.20 does not specify occupancy type.

Substantiation: The exception should also apply to nonindustrial processes such as may be located in commercial, institutional, government and military premises where the NEC is enforced. Safety procedures and qualified persons should be the criteria, not occupancy. 408.20 does not specify occupancy.
Panel Meeting Action: Reject
Panel Statement: The present code text contains clear language and is more specific than the proposed language. It is not the intent of Panel 11 to reduce the level of safety by expanding the exception for other than industrial installations. There is no correlation between section 408.20 and the exception to 440.14. Section 408.20 are the requirements for the location of switchboards with exposed live parts and 440.14 are rules for the location of required air-conditioning and refrigerating equipment disconnects.

Ballot Results: Affirmative: 15

11-58 Log #500 NEC-P11 **Final Action: Reject**
(440.15 (New))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 11-129
Recommendation: Reject this proposal.
Substantiation: I agree with the negative vote by the committee. The substantiation does not verify that an enclosed EGC would have prevented the accident. When an electrical installation is damaged, and not repaired, shock hazards can and do occur. The single report of metal raceway in the Chicago incident cited was related to poor maintenance or improper supporting and securing. Requiring an additional green wire would likely not solve this safety issue. The broken down conduit would likely cause the enclosed EGC to be broken as well or circuit conductors insulation to be cut and continuity of one or both ground return paths may be interrupted which would prevent the overcurrent device from operating or a separated raceway to becoming energized and presenting the shock hazard.

The National Electrical Code (NEC) can never consider all of the issues that may come up in an installation during its lifetime. Good code rules must only consider compliant installations at the time of the new installation. All scientific studies including the Soares' Tables and the Georgia Tech studies (GEMI) of equipment grounding conductor performance has shown the steel circular raceway to be the superior low impedance return path. Please reject this proposal.
Panel Meeting Action: Reject
Panel Statement: The panel recognizes wiring methods installed outdoors are more susceptible to being damaged and/or compromised. History has proven the integrity of the wiring method to provide an effective ground-fault return path is sometimes jeopardized. The panel does not agree with the substantiation that the broken down conduit would likely cause the enclosed equipment grounding conductor to be broken as well. See panel action and statement on Comment 11-60.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
DESJARLAIS, J.: See my explanation of negative on 11-60.
TODD, L.: As identified by the submitter of this comment, the substantiation in the original proposal showed that maintenance was not performed on this specific installation. If outdoor locations, other than the specific circumstances noted in the proposal submitters substantiation, are not protected by current requirements in Article 250, then that article should be revised for all outdoor equipment and not limited to equipment covered by Article 440.
WRIGHT, J.: See NEMA Negative vote on Comment 11-59.

11-59 Log #578 NEC-P11 **Final Action: Reject**
(440.15 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 11-129
Recommendation: Oppose the Panel Action and delete the proposed new section.
~~Add new section 440.9 to read as follows: Any wiring method employed shall contain an equipment grounding conductor in accordance with 250.118(1).~~
Substantiation: The substantiation provided does not indicate whether or not an equipment grounding conductor in accordance with 250.118(1).was used in these installations. There is also no substantiation provided that the equipment grounding conductor types permitted by 250.118 do not provide safe grounding required by the NEC.
Since the submitter has not provided details of the accidents he cites in his substantiation, there is no evidence that an insulated EGC would have prevented any of these accidents. There are many reasons for accidents to occur. The overcurrent device may have been selected incorrectly, the installations may not have been code compliant or branch circuit wiring may have been damaged. Without the specific details it is impossible to assess the benefit that this change would make.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 11-58.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DESJARLAIS, J.: See my explanation of negative on 11-60.
WRIGHT, J.: The substantiation submitted with proposal 11-129 was insufficient to justify this requirement for a supplementary grounding conductor in all outdoor wiring methods. The CPSC data only reflects the number of incidences, not the cause. There were just 2 photos submitted reflecting what could be installation or maintenance issues.
The Panel Statement in Comment 11-60 that "wiring methods installed outdoors are more susceptible to being damaged" is very general and insufficient substantiation for adding this requirement to all types of wiring methods in all types of units in all types of outdoor applications. This should be a design decision based on the type of wiring method used and the unique installation environment in which the equipment is installed.
The Technical Correlating Committee has assigned responsibility for the suitability of a wiring method as an equipment grounding conductor to CMP 7 and 8 and grounding is the responsibility of CMP 5. This comment should be rejected as being outside the scope of Panel 11.

11-60 Log #2535 NEC-P11 **Final Action: Accept in Principle**
(440.15 (New))

TCC Action: See the the Technical Correlating Committee Note on Comment 11-52.

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 11-129
Recommendation: Add new text to read as follows:
440.9 Equipment Grounding. Any wiring method employed shall contain an equipment grounding conductor in accordance with 250.118(1).
Substantiation: I would appeal to the technical committee to put a "hold" on this proposal so additional comments can be reviewed and language clarified for the application. There are concerns for what type of AC unit (commercial or residential) and facility locations that could be hard wired or cord and plug connected. There are still many locations where cord and plug connected AC units are not installed at a structure with a grounding electrode system. An additional issue is this appears to be a maintenance issue that is not uncommon, it may not be safe but it works, the building owner or tenant has a responsibility for equipment. There is also the issue for the installation of an equipment grounding conductor does not guarantee a good fault current path but it is the best first line of defense. No matter what wiring method is installed, many wiring systems cannot take the abuse of standing, stepping, or damaging of a cable or raceway system that an ground path will be assured to be effective and maintained even with a separate equipment grounding conductor. There is concern for the type of equipment this article represents and the added statement under this article "General Scope" would apply to all air conditioning and refrigerating equipment that is installed is that really the intent? Additional substantiation and clarification needs to be addressed and not a across the board one requirement will work in all instances for article 440 installations. This may require a task group from code making panels from 5, 7, 8, and 11 and the affect on those articles to require an equipment grounding conductor.
Panel Meeting Action: Accept in Principle
Revise 440.9 to read as follows:
440.9 Equipment Grounding. Any wiring method installed outdoors shall contain an equipment grounding conductor in accordance with 250.118(1).
Panel Statement: The panel agrees in principle with the recommendation but has added the words "installed outdoors" to limit the requirement to situations where physical damage occurs. Wiring methods installed outdoors are more susceptible to being damaged and/or compromised.
The panel notes that the submitter's substantiation does not support his recommendation. The panel does not agree with the submitter's suggestion that the committee "hold" the proposal (and comment). A need for this change has been demonstrated as noted in Proposal 11-129.
The modification clarifies the requirement as to the intended applications.
The panel clarifies that this requirement is intended to supplement other recognized types of equipment grounding conductors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 4
Explanation of Negative:
DESJARLAIS, J.: The danger from a potential shock hazard is of major concern and must be rigorously addressed in all installations. With that in mind however it should be noted that EMT is permitted as a suitable grounding means in clause 250-118 (4). The substantiation and cited case histories in the original proposal, ROP 11-129, for accepting the revised verbiage proposed by the panel can most likely be traced to abuses to the overall equipment occurring either after installation or possibly due to incorrect initial installation. If a particular installation has the potential for the EMT to be subjected to heavy abuse clause 358.12 (1) is already in place to address such concerns. Whether or not clause 358.12 (1) is applicable for a given installation should be determined at the time of installation by the AHJ. The proposal in its current form removes the ability of the AHJ to make this decision for AC and Refrigeration type equipment. In addition this proposal removes the ability to use Rigid Metal Conduit as an alternate grounding means if a given situation substantiates 358.12 (1). Furthermore, if it is the panel's opinion that EMT, Rigid Metal Conduit and other means currently permitted by clause 250.118 are inadequate as grounding means for outdoor installations then it would be more appropriate if this restriction were implemented on a wider scale and proposed to be adopted by CMP 5 in article 250.118.
MISSILDINE, JR., J.: Requiring a conductor for equipment ground rather than use of conduit or other means described in 250.118 is not a substitute for proper conduit application, installation or maintenance. Also, this change would only correct the stated problem for air conditioning and refrigeration equipment, not all rooftop units such as air handling units which would be covered by Article 430. This does not preclude the voluntary use of a conductor for the equipment ground.
TODD, L.: This is the comment used by the panel to revise Article 440 to contain an equipment grounding conductor in the wiring method employed outdoors. As I noted in my negative vote on comment 11-58, grounding means are covered in Article 250 and directions should be made generally to the code and not call out one special type of equipment for this additional requirement. If the situations identified by the panel are true (and they probably are) then they apply to all equipment installed outdoors and not just equipment covered by Article 440. The proper panel covering grounding should consider this issue and determine if current grounding means are adequate considering the poor maintenance records noted that could lead to situations increasing the risk to those coming in contact with the equipment.
WRIGHT, J.: Although the submitter of this comment included the text from Proposal 11-129, it is obvious by his comments that he did not think the Panel should accept this Proposal because there was insufficient substantiation to apply this rule "across-the-board". The submitter asked for the proposal to be held so that additional substantiation could be provided and different types of installations could be considered.
The Technical Correlating Committee has assigned responsibility for the suitability of a wiring method as an equipment grounding conductor to CMP 7 and 8 and grounding is the responsibility of CMP 5. This comment should be rejected as being outside the scope of Panel 11.

11-61 Log #2616 NEC-P11 **Final Action: Reject**
(440.15 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 11-129
Recommendation: Reject the proposal.
Substantiation: There was zero technical substantiation offered to unwind generations of experience with the entirety of 250.118 and its predecessors. There was zero technical substantiation that provided a basis to treat Article 440 loads different than other comparable loads elsewhere in the NEC. Where will this end? Will we now kill off raceway and cable armor grounding qualification a load at a time throughout the NEC every time there is some random loss experience that might have to do with equipment grounding continuity. CMP 5, in this cycle, just rejected another proposal to disqualify EMT as an equipment grounding conductor. The panel action was extremely irresponsible.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comments 11-58 and 11-60. Adding an equipment grounding conductor in accordance with 250.118(1) will increase the safety of installations under the scope of Article 440 by providing an additional effective ground fault return path.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DESJARLAIS, J.: See my explanation of negative on 11-60.
WRIGHT, J.: See NEMA Negative vote on Comment 11-59.

11-62 Log #1799 NEC-P11 **Final Action: Reject**
(440.15 Exception (New))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 11-129
Recommendation: Add new Exception as follows:
Exception: In industrial installations with written safety procedures and where the conditions of maintenance and supervision ensure that only qualified persons service the equipment, provisions of 250.118 shall apply for equipment grounding.
Substantiation: The panel action was an appropriate remedy for an equipment grounding problem that exists with residential and commercial air conditioning installations. The supporting documentation identified a problem that exists with these residential and commercial installations but there was no evidence presented that the existing practices in industrial installations should be modified by this new code section. Typical industrial refrigeration units involve large motors whose installation does not require a local disconnect switch (440.14 Exception No. 1) and, therefore, the cited equipment grounding problem does not exist and the substantiation does not apply. The equipment grounding requirements of 250.118 should continue to apply to industrial installations and the recommended exception should be included.
Panel Meeting Action: Reject
Panel Statement: The panel is concerned that safety practices in all installations (including industrial installations) may not adequately address the concerns being addressed by the new requirement, particularly in outdoor applications.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
DESJARLAIS, J.: See my explanation of negative on 11-60.
GLOVER, W.: The panel action was an appropriate remedy for an equipment grounding problem that exists with residential outdoor air conditioning installations. The supporting documentation in proposal 11-129 identified a problem that exists with these residential installations but there was no evidence presented that the existing practices in industrial installations should be modified by this new code section. The equipment grounding requirements of 250.118 should continue to apply to industrial installations and the recommended exception should be included.
Comment on Affirmative:
COLE, T.: The exception requested is consistent with other parts of the code that allow for oversight by qualified professionals in industrial applications. The substantiation for the code change did not deal with industrial accidents per se in regards to air conditioning and refrigeration units.

ARTICLE 445 — GENERATORS

13-2 Log #497 NEC-P13 **Final Action: Reject**
(445.1)

Submitter: David Flegel, Reliance Controls Corp.
Comment on Proposal No: 13-3
Recommendation: This proposal should be rejected.
Substantiation: This proposed change to 445.1 should be rejected. Acceptance of this proposal would place Article 445 in direct conflict with the scope of the National Electrical Code, and possibly subvert the intended and stated purpose of the Code. 90.2 of the NEC specifically states that the NEC covers the installation of electrical equipment. The article makes no reference to the Code covering the design and construction of equipment. 90.1(C) further states that the Code "is not intended as a design specification." Such parameters as internal overcurrent protection, internal bushing requirements, terminal housings, and so on are obviously design specifications and are not allowed in the Code.
Panel Meeting Action: Reject
Panel Statement: The requirements in Article 445 concerning portable and permanently installed generators do not deal with product design or product specification, any more than similar requirements in Article 430 apply to internal wiring of motors. Marking of a motor nameplate is required in 430.7 and marking for generators is required in 445.11. Overcurrent protection for various types of motors is found in 430.52 and Table 430.52 and 445.12 provides overcurrent protection requirements for various types of generators. Motor terminal housings are covered in 430.12 and for generators in 445.17. The same text for bushing requirements is found in 430.13 for motors as is found in 445.16. The required ampacity for conductors for motors is located in 430.6, 430.22, 430.24, and numerous other locations within Article 430, as similarly covered in 445.13 for generators. Disconnecting means requirements for motors are covered in Part IX in Article 430 and in 445.18 for generators. Proposal 13-3 was intended to detail the various requirements noted within Article 445. Maybe a much simpler way to provide this coverage would be to state as follows: "This article covers generators." Similar to the scope of Article 430 stating that it covers motors.
Many articles in the NEC provide requirements for the design of equipment and construction of equipment, such as the requirements in Part VI covering wiring of luminaires, Part VII covering construction of luminaires, Part IX covering construction of lampholders, and the construction requirements in Articles 312 for cabinets, and Article 314 for boxes and similar enclosures, as well as the Parts dealing with construction requirements for almost all wiring methods in Chapter 3. None of these subvert the intended and stated purpose of the Code or makes the scope of Article 445 too broad as alluded in the substantiation of the Comment.

Ballot Results: Affirmative: 18

13-3 Log #1201 NEC-P13 **Final Action: Reject**
(445.1)

Submitter: Michael Flegel, Reliance Controls Corporation
Comment on Proposal No: 13-3
Recommendation: Reject the proposal.
Substantiation: This section originally covered large permanently installed generators many of which are assembled on site. This requires details on how to properly install them including such things as wire size. With the addition of Proposal 13-19, this Article moves into portable generators. While it is important to ensure portable generators are installed properly, the NEC should not develop a product standard for portable generators. Changing the scope could open up the article to this kind of activity such as determining the size of the wiring internal to a portable generator. The proposed scope seems to be too broad.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 13-2.

13-5 Log #2136 NEC-P13 **Final Action: Reject**
(445.1)

Submitter: Gary L. Olson, Cummins Power Generation
Comment on Proposal No: 13-3
Recommendation: None given.
Substantiation: We are in agreement with the panel recommendation and that the current text is insufficient. Article 445 has not kept up with the many changes in the code that are driven by the fact that many generator installations are much more complex than when the original requirements were written. In particular, it is important that in many installations (such as when parallel generators are used or when a generator serves multiple distribution points) considering the generator as a source leads to inappropriate requirements for protection, wiring provisions, etc.

We suggest to the TCC that the scope of Article 445 should extend to the source distribution point as described and defined for separation purposes in 700.9 (8)(5) and the new rules in article 695. Thus, the alternate power source includes the necessary equipment, conductors, and overcurrent protection to the point where the feeders receive their supply. This will clarify and rationalize the interface of the alternate power system to many other articles, such as those describing service entrance requirements, protection, conductor sizing, and other requirements. For example, in a parallel generator application where the generators are larger than 1000A, ground fault protection is required. However, due to the location of the bonding point in the system it is possible that the ground fault protection will only function when the fault is between the paralleling breaker and the generator set, thus protecting the generator set, and not the downstream devices as is the result when a single source serves a load. 8y considering the generator bus as the source of power for the downstream feeders, the ground fault protection would be started at the feeder(s) rather than the generator paralleling breaker, thus protecting the distribution system and load as is intended, and potentially preventing the total shutdown of the power system due to tripping of the ground fault protection on the generator breakers. In paralleling applications the generator paralleling breakers are often smaller than other downstream devices, which definitely complicates the design process, and may result in unnecessary over-sizing of the paralleling breakers in order to meet requirements that are not necessarily applicable in this situation.
Panel Meeting Action: Reject

13-6 Log #372 NEC-P13 **Final Action: Accept**
(445.11)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 13-9
Recommendation: Continue to reject the proposal.
Substantiation: The preposition “per” in the English language carries the precise meaning of “for each” in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in “Table 3.2.1, Possibly Unenforceable and Vague Terms.” Section 3.3.4 of the same document requires that “NEC language shall be brief, clear, and emphatic.” Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: “Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel.”

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning “in accordance with” and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

13-7 Log #2875 NEC-P13 **Final Action: Reject**
(445.11)

Submitter: Shawn Booth, Newfields, NH
Comment on Proposal No: 13-10
Recommendation: Revise text as follows:

The Manufacturer’s nameplate shall also include the minimum distance from combustible materials ~~and the minimum distance from doors and window openings.~~
Substantiation: The information of the combustible materials will let the installer and the authority having jurisdiction, which not every generator is the same and some of them can be installed closer than five feet to combustible materials. This will ensure that the generator is listed and has been properly tested to be installed at the distance that is on the manufacturer’s nameplate.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any technical substantiation to answer the issues raised in the proposal Panel Statement. Generators are built for various types of fuel and various exhaust system configurations. Each different fuel and exhaust configuration may require a different distance from combustible materials so providing manufacturers’ data for all the possible distances would be almost impossible. In addition, the various types of construction may combine noncombustible materials, such as block or brick, with combustible frames for doors and windows. The location of the generator should remain with the installer and the authority having jurisdiction as a field decision based on the construction of any structures as well as the type and amount of fuel stored in or with the generator. NFPA 37,*Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines* contains minimum clearance requirements.
Number Eligible to Vote: 18

13-9 Log #569 NEC-P13 **Final Action: Reject**
(445.12(A) and 445.13 Exception)

Submitter: Rick Lorenz, Cummins Power Generation
Comment on Proposal No: 13-11
Recommendation: 445.13 Exception: Where <u>the design and</u> operation of the generator prevents an overcurrent condition. the ampacity of the conductors shall not be less than 100 percent of the nameplate current rating of the generator.
Substantiation: In the past, inherent design generator overload protection was achieved by the use of limited horsepower engines and/or shunt excited generators. Within the power generation industry today these engine and generator factors are no longer common. NEC mandated generator overcurrent protection should be only provided by a listed device so an Authority Having Jurisdiction can positively verify the acceptability of the equipment In addition. no code or technical definition exists for the term “inherent design”. The definition of Overcurrent, per Article 100 of the NEC can result from overload, short circuit or ground fault therefore overcurrent protection is more comprehensive than just overload protection.

445.13 Exception should now reflect overcurrent protection not overload protection.

240.21 (G) Should correlate to 445.12 & 445.13 and reference overcurrent protection.
Panel Meeting Action: Reject
Panel Statement: Inherent protection is still a valid means of protecting some generators. See the panel action and statement on Comment 13-10 which reverts back to the term “overload”.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-10 Log #1597 NEC-P13 **Final Action: Accept in Part (445.12(A) and 445.13 Exception)**

Submitter: Lawrence W. Forshner, Cummins Northeast, Inc.
Comment on Proposal No: 13-11
Recommendation: 445.12(A) Maintain the acceptance of protective relays, and revert overcurrent back to overload.

(A) Constant Voltage Generators. Constant-voltage generators, except ac generator exciters, shall be protected from overload ~~overcurrent~~ by inherent design, circuit breakers, fuses, protective relays, or other acceptable overcurrent protective means suitable for the conditions of use.

445.13 Exception: Change the Exception as follows:

Where the design and operation of the generator ~~prevent overloading~~, incorporates listed overcurrent protection, the ampacity of the conductors shall not be less than 100 percent of the nameplate current rating of the generator.
Substantiation: The partial acceptance of this proposal has created confusion and conflicting text.
Substantiation 445.12(A)
We agree with the panel that "inherent design" is still a valid means of protecting some generators. However, there is significant confusion as to the meaning of "inherent design". We believe that the term relates to a machine that will be protected from overload by the nature of the inherent characteristics of the machine. In other words, "inherent" should not be applied to actions of a control circuit on a generator set, but rather reflective of the response of the machine regardless of how it is controlled. In practice, this would not be appropriate protection for most generators, but would be applicable in some limited cases, such as single phase shunt-excited generators with active voltage regulators. In those cases, a short circuit will cause the voltage and current output of the machine to collapse, since the power supply for the voltage regulator will be eliminated. Because the term "inherent" is not defined, it is subject to interpretation and misuse.

In order to protect a generator from overcurrent, the sensing for excess current could not be made at the output of the generator, but would have to be at the source of the current (for example, on the "star" side of the wye connected stator windings). This is often not possible due to the physical design of the generator, particularly in smaller machines. Therefore "overload" should remain. Also, 240.21(G) will still correlate with the acceptance of this comment, in that it references overload protection located at the load end of the feeder.
Substantiation 445.13 exception:

"445.13 Ampacity of conductors" is a rule for sizing conductors connected to a generator. Present code would allow generator overload protection to be at the load end of the feeder, when terminated in an overcurrent device(s), if the conductors were rated at 115% of the nameplate current rating of the generator. Reducing the conductor ampacity, per the exception, should not be allowed, unless overcurrent protection, recognized in article 240 is provided with the generator.

Depending on the manufacturer, overcurrent protection is provided by protective relays, circuit breakers, and with some fuse applications. Relay schemes, or circuit breakers with electronic trip modules are set to insure generator protection, and aid the designer in their coordination challenges. There is no technical substantiation to allow "inherent design" to justify reducing the ampacity for conductors directly connected to a generator.
Panel Meeting Action: Accept in Part

The panel accepts the recommendation to revert to "overload" and notes that "protective relays" was added by Proposal 13-11. The panel rejects the recommendation for 445.13.
Panel Statement: Relay protection can only provide generator overcurrent protection if the sensing current transformers are located on the supply side of the generator winding, (such as the star side of a wye connected three phase generator.) This may not be physically possible on smaller machines. Therefore overload protection should remain in 445.12(A). Protective relays can provide protection for external faults with steady state and network short circuit current protection, protection against unbalanced loads, protection against internal phase faults. Protective relays are listed under UL category NRGU on page 234 of the 2009 UL White Book and the UL basic standards are UL 508 for Industrial Control Equipment and UL 1053 for Ground-Fault Sensing and Relaying Equipment. The changes to the exception in 445.13 were not accepted because CMP-13 has reversed their action on Proposal 13-11 by replacing "overcurrent" with "overload".
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-11 Log #621 NEC-P13 **Final Action: Accept in Principle (445.13)**

Submitter: Lawrence W. Forshner, Cummins Northeast, Inc.
Comment on Proposal No: 13-14
Recommendation: This proposal should have been accepted in principal. See comment to Proposal 10-57. Taps should be allowed with proper design and protection. To say they should be the same as transformers, however, would not allow a single feeder to be tapped as described in 445.19 and 700.9(B)(5), per 240.21(C).
Substantiation: Conductors from generators prior to 1984, were considered to be, and were installed similar to service conductors. Although not specifically classified and listed in 230.201, they are the only conductors that can be connected to a voltage source with only overload protection at the load end, as is the case with service entrance conductors. They are allowed in 240.21(D) and (G) using similar language. Feeder taps, transformer secondary connections, motor branch circuits, all have some type of upstream ground fault and short circuit protection. Even part VIII of Article 240 with engineering supervision: "Conductors are considered to be protected under short circuit conditions if sized per Table 240.92(B)". When the "Classification of Service Conductors" was removed from the 1984 code, by default, conductors directly connected to generators became feeders. The panel statement supports the argument that when the stator windings of an AC alternator directly supply feeders sized at 115% of the name plate current rating of the generator, the conductors are considered to be protected under short-circuit conditions, in that the alternator thermal damage curve is to the left of the conductor thermal damage curve, causing the alternator to fail before the conductors are damaged. The design described above is very unusual. Generators are not specified void of some type of alternator protection. When a standard inverse/time circuit breaker is selected in the field, it will often not protect the alternator from damage under overload conditions. The level of electrical and electronic sophistication incorporated in a generator control is very advanced. It may have a relay protection that monitors frequency, voltage, and current under all load conditions, or will be specified with a breaker usually with an electronic trip module configured to ensure alternator protection and facilitate coordination. If it is listed and recognized in Article 240 for providing overcurrent protection for the ungrounded conductors, than feeder tap rules should apply. The idea that some designers are creating an installation that intends a generator to go to failure is not practicable. In reality, small events such as a motor single phasing, or a bolted fault occurring after a renovation, seriously shortens the life of the unprotected generator. Then, when it is needed to start a fire pump, smoke evacuation fans, stair pressurization fans, egress lighting, and smoke proof enclosure fans, it may fail because of the damage that occurred collectively by the smaller overcurrent events. I would argue, when considering the available fault currents on some of the larger gen-sets, direct connections, with only overload protection on the load end of the feeder, should only be done with engineering supervision. 240.21(G) is always the topic of debate as to how far conductors from a generator can be run inside a building. My answer would be when engine driven generators are installed within a building; they are required by NFPA 37 to be in a one hour room. Therefore, when the feeders leave the room, they are entering the building, similar to when a transformer secondary leaves a vault, and 225.31 and 225.32 would apply.

I am in agreement with the panel statement. It supports my comment to Proposal 10-57, in that smaller conductors tapped from a feeder or the generator bus could never be considered as being protected from short circuits, without an overcurrent protective devise at the generator.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Comment 13-13 addresses the recommendation of this comment.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-12 Log #1537 NEC-P13 **Final Action: Reject (445.13)**

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 13-15
Recommendation: Accept the proposal with the following revisions:

Neutral conductors of dc generators that must carry ground-fault currents shall have an ampacity not less than the largest conductor.
Substantiation: This provision appears intended to require at least equal ampacity to the negative and positive conductors. If the - and + conductors are 6 AWG copper with an ampacity of 65 and the neutral is a 6 AWG aluminum conductor, the ampacity is 50. Is this the intent?
Panel Meeting Action: Reject
Panel Statement: The size of the conductor is based on the ampacity of the conductor, therefore a 6 AWG aluminum conductor does not correspond to a 6 AWG copper conductor.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-13 Log #470 NEC-P13 **Final Action: Accept in Principle**
(445.19)

Submitter: Lawrence W. Forshner, Cummins Northeast, Inc.
Comment on Proposal No: 13-18
Recommendation: 445.19 Generators Supplying Multiple Loads.

Add the following to the beginning of the sentence:

When the design of a listed generator is provided with overcurrent protection meeting the requirements of 240.15(A), a single generator supplying more than one load, or multiple generators operating in parallel, shall be permitted to supply either of the following:

(1) A vertical switchboard with separate enclosures.

Add second sentence to 445.19(2):

(2) Individual enclosures with overcurrent protection tapped from a single feeder for load separation and distribution. The installation of the tap conductors shall meet the requirements of 240.21(B)(1) through (5).

Add new subsection "a", "b", and "c" after (2):

a. Direct taps from a generator terminal housing that meets the requirements of 445.17, shall be permitted when generators are located outdoors of a building or structure if installed per the requirements of 240.21(B)(5).

b. Direct taps from a generator terminal housing that meets the requirements of 445.17 shall be permitted when generators are located inside a building or structure if installed per the requirements of 240.21(B)(1), (2), (3), and (4).

c. Direct taps from a generator terminal housing, when housed generators are located outdoors of a building or structure, shall comply with 445.19(2)(a) or 445.19(2)(b).

Add new subsection (7) text to 240.4(E)(7) 445.19(2), Generator taps.

Substantiation: This comment is per panel statement to proposal (10-57 2011 ROP). It provides for a generator tap consistent with present wording in 445.19, and references the appropriate sections of Article 240. It is also consistent with new 2008 NEC text in 700.9(B)(5)(b) and 695.4(A), and supported by the substantiation in Proposal 13-8 in the 2008 NEC ROP that created 445.19. It is suggested that this comment be submitted to CMP 10 for information and consideration.

Substantiation: 1st sentence

The Task group that was formed for the 2008 NEC revision cycle with representatives from NFPA 70; NFPA 99; and NFPA 110, should be recognized for eliminating many of the conflicts designers had in trying to design a reliable code compliant feeder arrangement to supply loads from an on-site generator. However they did not fully address generator, feeder, and feeder tap protection. Inherent protection as allowed per 445.12(A) refers to a design in which a short term overcurrent condition causes a collapse of the voltage on the output of the alternator. A single phase fault may not cause the field to collapse until it develops into a line to line failure, causing alternator damage. Other drawbacks to this "shunt-type" design are poor motor starting, and poor (generator) coordination, therefore, they are usually not specified on emergency systems or paralleled systems, but have been historically accepted as providing overload protection. The panel statement in the 2008 ROP (13-118) does recognize that "the exception to 700.9(B)(5)(b) will permit the use of an overcurrent protective device at the source or for the equipment." I would argue, however, that it has to be required at the source, to allow down stream taps. Listed overcurrent protection described in 240.15(A) will provide overcurrent protection for the ungrounded feeder conductors, allow the tap conductors to meet the definition given in 240.2, and because it is provided by the manufacturer with the gen-set, ensures alternator protection. The instantaneous time/current settings whether integral or adjustable, give consideration to the thermal damage curve of the alternator windings, a fully rated feeder, and facilitate reliability by providing optimum coordination. Field installed overcurrent protective devices will not necessarily protect the alternator, and will not facilitate optimum coordinate.

When the generator overload protection required by 445.12(A) is accomplished by a field installed breaker or set of fuses and the generator is cables directly as allowed per 240.21(G), and sized per 445.13, the breaker or fuses could be on the load end of the feeder. The breaker, in this situation, is providing overload protection for the generator, and the feeder. Allowing multiple overcurrent protective devices in separate vertical sections of a switchboard as described in 445.19(1) or taps as described in 445.19(2) without overcurrent protection at the generator would not necessarily protect the generator, excessive current beyond the thermal damage curve of the alternator windings will significantly reduce the life of the generator, or cause complete failure. The common line side bus of a switchboard supplying individual sections, or taps that are described in 445.19(2) and 700.9(B)(5) would conflict with the requirements of 445.12, 445.13, and 240.21(G), if alternator protection is not considered. It also would make it very difficult for the AHJ to enforce 445.12(A). Feeder taps without overcurrent protection upstream as described in 240.15(A), would conflict with the requirements described in 240.21, in that, a direct generator tap with additional down stream taps is a violation of the second sentence in 240.21. Also, the definition for tap conductors in 240.2 recognizes that overcurrent protection is "ahead of its point of supply" but "exceeds the value permitted". To summarize, modern generators employ a listed overcurrent protective device integral with their control, by means of fuses, breakers or protective relays. This design ensures protection of the alternator windings, a fully rated feeder, is designed to facilitate coordination, and makes down stream, or direct tap designs consistent with the definition for tap conductors given in Article 240.

Substantiation for (2) a, b, and c:

To allow for taps and not list conditions and rules for the installation of the taps such as: length, wiring methods, ratings exceeding calculated loads, rules for sizing grounding conductors etc., creates confusion. Referencing the "feeder tap rules" as described in 240.21(B), will eliminate confusion as to how to install the tap conductors. I am in agreement with the first sentence in the "Substantiation" given by the task group (2008 NEC ROP 13-8) that generators are not designed for multiple devices to be located on the generator. However, the generator terminal housing could accept multiple smaller feeders (taps), such as three sets of 3/0's compared to two sets of 400KCM conductors, for example. There is no compromise of electrical safety if the taps described in 445.19(2) were directly tapped from the generator bus or a feeder with an equivalent ampacity, if all the present rules of 240.21(B) were adhered to. It's simply a design choice. Having the ability to use a 25 ft tap rule within a building or in an outdoor walk-in housing is long overdue, and will alleviate the physical constraints of trying to mount multiple breaker enclosures on the side of an alternator.

Panel Meeting Action: Accept in Principle

Revise 445.19 to read as follows:

445.19 Generators Supplying Multiple Loads. A single generator supplying more than one load, or multiple generators operating in parallel, shall be permitted to supply either of the following:

(1) A vertical switchboard with separate sections.

(2) Individual enclosures with overcurrent protection tapped from a single feeder for load separation and distribution if a generator(s) is provided with overcurrent protection meeting the requirements of 240.15(A).

Panel Statement: The panel action clarifies the application of tap conductors where multiple enclosures are supplied from a generator.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:

ODE, M.: While I am voting affirmative to the accept in principle, I recommend the following correction to the suggested text by inserting "the" rather than "a" before "generator" in (2) since the "a" could imply that overcurrent protection is acceptable for conductors from only one generator and not for other multiple generators with conductors supplying individual enclosures. The intent is to require compliance with 240.15 for each generator where tap conductors are then supplying individual enclosures, not just a single generator. The final text would read as follows:

"445.19 Generators Supplying Multiple Loads. A single generator supplying more than one load, or multiple generators operating in parallel, shall be permitted to supply either of the following: (1) A vertical switchboard with separate sections (2) Individual enclosures with overcurrent protection tapped from a single feeder for load separation and distribution, if the generator(s) is provided with overcurrent protection meeting the requirements of 240.15(A)."

13-14 Log #571 NEC-P13 **Final Action: Reject**
(445.20)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Jeff Heggen, Perhats Wenstrom Associates, Inc.
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: GFCI protection integral to a generator may not necessarily ensure adequate personnel protection. In particular, a poorly grounded bonded-neutral generator may not provide a ground path adequate to allow the GFCI to trip. In such cases, a user would mistakenly be led to believe that he or she was adequately protected when, in fact, they were not. GFCI protection, when required by Code, is best provided independently of the generator.
Panel Meeting Action: Accept
Panel Statement: See the panel statement on Comment 13-27.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 9 Negative: 9

Explanation of Negative:

ADAMS, M.: See my Explanation of Negative Vote on Comment 13-27.

BOREK, S.: See my Explanation of Negative Vote on Comment 13-27.

CONRAD, J.: See my Explanation of Negative Vote on Comment 13-27.

CURRIN, JR., R.: See my negative statement on comment 13-27.

LITTLE, L.: See our negative statement on comment 13-27.

MOUTON, C.: See explanation for negative vote on Comment 13-27.

ODE, M.: A GFCI receptacle monitors the amount of current that goes out on the ungrounded conductor and then comes back on the neutral conductor and if there is leakage of 6 milliamps or greater that does not come back through the GFCI comparison device, then the GFCI device will trip. GFCIs will trip without the benefit of an equipment grounding conductor path back to the source but obviously having a lower impedance path back to the source is much more desirable since the equipment grounding conductor path back to the frame of the generator and then back to the source on the system bonding jumper to the neutral provides a much lower impedance path.

Section 250.20(B)(1) requires any AC system of 50 volts to 1000 volts to be grounded where the system can be grounded so that the maximum voltage to ground on the ungrounded conductor does not exceed 150 volts. Section 250.20(D) requires any separately derived system, as covered by 250.20(B) to be grounded in accordance with 250.30(A) of which a portable generator would be covered under this section.

"250.20 Alternating-Current Systems to Be Grounded. Alternating-current systems shall be grounded as provided for in 250.20(A), (B), (C), (D), or (E). Other systems shall be permitted to be grounded. If such systems are grounded, they shall comply with the applicable provisions of this article.

(B) Alternating-Current Systems of 50 Volts to 1000 Volts. Alternating-current systems of 50 volts to 1000 volts that supply premises wiring and premises wiring systems shall be grounded under any of the following conditions:

(1) Where the system can be grounded so that the maximum voltage to ground on the ungrounded conductors does not exceed 150 volts"

In addition, 250.34 does not require the frame of a portable generator to be connected to a grounding electrode if the portable generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both.

"250.34 Portable and Vehicle-Mounted Generators.

(A) Portable Generators. The frame of a portable generator shall not be required to be connected to a grounding electrode as defined in 250.52 for a system supplied by the generator under the following conditions:

(1) The generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both, and

(2) The normally non–current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are connected to the generator frame."

In addition, the normally non-current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are required to be connected to the generator frame. This section does not state that floating the neutral in the generator is acceptable since the generator is a separately derived system and must have a system bonding jumper installed from the equipment grounding system in the generator to the grounded or neutral conductor within the generator.

A portable generator, supplying power to any premises, where there is no direct electrical connection to conductors of another power system, is a separately derived system. Section 250.34(C) requires the grounded conductor from the generator to be connected to the generator frame where 250.26 requires the conductor to be grounded.

"250.34 Portable and Vehicle-Mounted Generators.

(C) Grounded Conductor Bonding. A system conductor that is required to be grounded by 250.26 shall be connected to the generator frame where the generator is a component of a separately derived system.

250.26 Conductor to Be Grounded — Alternating-Current Systems.

For ac premises wiring systems, the conductor to be grounded shall be as specified in the following:

(1) Single-phase, 2-wire — one conductor

(2) Single-phase, 3-wire — the neutral conductor"

The equipment grounding conductor must also be connected to the generator frame. Premises wiring would apply to both fixed loads and portable loads, such as drills and other portable electrical equipment and the danger of electrocution applies anywhere electricity is used. Over the many years these issues have been dealt with in the NEC and with OSHA, there has only been one exception to this rule and that exception applied to 5 kW and smaller 2-wire single-phase generators. This exception was removed from the NEC in the 2002 cycle with the intent that all portable generators be required to have GFCI protection, however, OSHA 29 CFR 1926.404(b)(1)(ii) still has the exception. In OSHA, the exception only applies to 5 kW and smaller 2-wire single phase generators. Any 120/240 volt 3-wire generators must have the neutral connected to the frame and must have GFCI protection, based n the NEC and the OSHA requirements. The 5 kW and smaller 2-wire generators were excluded from GFCI protection since 2-wire generators larger than 5 kW could have capacitive coupling or capacitive reactance effects where ac current at 60 hertz could pass between the winding and the case of the generator

Comment on Proposal No: 13-19
Recommendation: ~~445.20. All 125 volt, single phase, 15- 20-, and 30-ampere receptacle outlets, that are a part of a 15kW or smaller, portable generator, shall have ground fault circuit interrupter protection for personnel integral to the generator or receptacle.~~

Substantiation: A large percentage of portable generators are used for household backup power. Household circuits that are required to have GFCI protection already have it. If there is also a GFCI on the generator and the neutral is floating, it will be non-functional. If the generator neutral is bonded and a GFCI is present, it will make the generator incompatible with most transfer switch systems. The NEC requires transfer switches for this application. It doesn't make sense to make them incompatible with the available generators.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 13-19
Recommendation: NEMA opposes the Panel Action and recommends that the proposed new section be deleted.
~~**445.20. Ground-Fault Circuit Interrupter Protection for Receptacles on 15-kW or Smaller, Portable Generators.**~~
~~All 125-volt, single-phase, 15- 20-, and 30-ampere receptacle outlets, that are a part of a 15 kW or smaller,~~
~~portable generator, shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle.~~
Substantiation: This proposal seeks to add GFCI protection to all 125V generator outlets. In order to establish a functional GFCI configuration on the generator, the generator must be of the bonded neutral variety.
GFCI's are intended to be used only in grounded neutral systems per UL 943. A portable generator by itself does not provide an assured grounding of one of the power conductors. This could result in fault situations in which the GFCI will not provide protection, yet users would assume that they are protected. The portable generators usage in a popular stand alone (125V) application – recreational vehicles - is a good example on how assumed personal protection could lead to accidents in case the grounding is not reliably implemented, a likely occurrence when non-qualified users install the equipment.

Submitter: Andrew S. McConnell, Boyle Fredrickson SC
Comment on Proposal No: 13-19
Recommendation: Proposal 13-19 should be rejected.
Substantiation: 90.2 specifically defines the National Electrical Code as an installation code, and Article 90.1(c) specifically indicates the National Electrical Code is <u>not</u> intended as a design specification. However, the proposed change to 590.6 concerns the <u>design</u> of portable generators, not their installation. This is a substantial departure from the historical intent and purpose of the National Electrical Code.
Under conventional and accepted use of the Code for safe installation practices, the NFPA would not have product liability exposures in the event a manufacturer produce a <u>product</u> that possesses some hidden safety flaw,. However, under the proposed <u>product design specification</u> of 590.6, it is possible that the NFPA could be subjected to exposure in product liability litigation. For example, a manufacturer may comply with Code requirements and produce a generator with an on-board GFCI. In the event the configuration has a safety flaw and does not prevent <u>all possible</u> ground faults, resulting in injury or death, the NFPA could be named as a defendant in a product liability lawsuit because the generator was designed to the required <u>design specifications</u> of 590.6.
The NFPA should give careful thought to the significant departure in the intent and purpose of the National Electrical Code reflected by the proposed change to 590.6, and should avoid acting in a manner that could expose it to potential liability resulting from the specification of product design features.

Comment on Proposal No: 13-19
Recommendation: Delete 445.20 as follows:

~~445.20. All 125-volt, single phase, 15 20, and 30 ampere receptacle outlets, that are a part of a 15 kW or smaller, portable generator, shall have ground fault circuit interrupter protection for personnel integral to the generator or receptacle.~~

Substantiation: Most of the commercially available small generators like the Honda EU2000 (Honeywell, ETQ, and Onan are just a few of the others) feature a floating neutral. Adding a GFCI to the receptacle will serve no purpose, as it will be completely ineffective on a floating neutral generator because the ground and neutral are not tied together. How can the NEC mandate a "safety" measure that won't work?

Submitter: Kurt von Eckroth, Eckroth Engineering, LLC
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: Please see below for substantiation to reject Proposal 13-19.

· This proposal is clearly outside of the scope of the National Electrical Code. The submitter addresses applications of small portable generators such as lighting on camp sites, powering table saws and hand-held tools, and so on. However, 90.2 of the NEC clearly states that the NEC covers the installation of electrical equipment only in premises, yards and lots, parking lots, carnivals, industrial substations, conductors and equipment that connect to the supply of electricity, and installations **used by the electric utility**. Therefore, the NEC has no authority over generators used in stand-alone applications. No any need to.

· According to 90.2 of the NEC, the NEC is an installation code, not a construction code. As an installation code, the NEC can mandate that a particular feature exists (a disconnect at a certain location, for example), **but not how** it is to be achieved (circuit breaker, switch, properly rated plug-and connector, etc.). Therefore, while the NEC can mandate ground fault protection for particular circuits, **it is not within its authority to mandate that said ground fault protection must be provided by a GFCI outlet integral to the generator**.

· If ground fault protection is necessary in a particular application, the Code can require it. However, since there are many different ways to achieve ground fault protection (GFCI outlet, GFCI circuit breaker, GFCI cord set, portable personal GFCI protection device, etc.) the only way that the Code can mandate integral GFCI outlets in generators is if it becomes a product design and performance code, and 90.2 clearly states it is not.

· The proposal would create a Code conflict. **525.23 (C) clearly states that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. The purpose of this is to assure that egress lighting is always available. Since egress lighting is often powered by portable generators at these sorts of events, the proposed 445.20 cannot mandate GFCI outlets on portable generators.** If the NEC Code Making Panel 13 approves this proposal, the NEC Technical Correlating Committee to whom CMP13 reports will have no choice but to reject the proposal.

· In order for GFCI protection to function, there must be a path for the ground fault current to return back to the power source. In utility systems, this path through the ground is created through a process called bonding and grounding. The reasons for grounding electrical systems are spelled out in 250.4 (A) (1), and are unique to utility power systems. In such a case, the GFCI is necessary to protect the user from being killed by the utility power since exposed metal parts are intentionally electrified through the bonding and grounding process. **However, with stand-alone portable generators, the reasons for bonding and grounding are mitigated and electrification of the ground through bonding and grounding is not required by the NEC**.

Public safety for portable generators is best served by protecting the user through the use of basic insulation and isolation. **This proposal DELIBERATLY (1) creates a ground path, (2) allows the electrocution to begin and then (3) attempts to stop it before lethality using a complicated and electronic sensing and interrupting device.** Quite simply, if there is no ground fault path, then there can be no electrocution as a result of a ground fault.

· The NEC allows both floating neutral and bonded neutral generators. For stand-alone use, it makes no sense to require GFCI protection on a floating neutral generator because of the way it is constructed. In order for a ground fault to occur, a path back to the generator head through the ground must exist. **Since a floating neutral generator has no internal connection between its neutral and its frame, such a path, even if its frame is grounded to earth, does not exist. As a result, the GFCI protection on the generator will never detect a ground fault because it is physically impossible for one to exist.** This change also creates a number of consequences:

· It would mandate the use of a product that currently does not exist—a high vibration/high temperature hardened GFCI.

· It would effectively eliminate all floating neutral generators (the most common kind), as the generator-mounted GFCI will not function unless the neutral and the ground are bonded together at the generator.

· It would force all generators to be tied to their own 6-foot ground rod. Without it, the GFCI will not function.

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Richard Fenner, Webster, MA
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: 590.6 requires ground fault protection for personnel for all temporary wiring installations. 590.6 also permits the GFCI protection to be provided in the electrical outlet, cord set, or device incorporating listed GFCI protection for personnel identified for portable use. If approved, the proposed 445.20 would be in obvious conflict with 590.6, since 445.20 would restrict ground fault protection to the use of GFCI outlets in generators but 590.6 would permit other forms of ground fault protection.
Panel Meeting Action: Accept
Panel Statement: See the panel statement on Comment 13-27.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 9 Negative: 9
Explanation of Negative:
ADAMS, M.: See my Explanation of Negative Vote on Comment 13-27.

Submitter: Robert Bartley, Waterford, MI
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: This proposal is not covered by the National Electrical Code. The submitter addresses uses of small portable generators for such things as lighting on camp sites, powering table saws and hand-held tools, and so on. However,90.2 of the NEC states that the NEC covers the installation of electrical equipment only in premises, yards and lots, parking lots, carnivals, industrial substations, conductors and equipment that connect to the supply of electricity, and installations used by the electric utility. The NEC obviously has no jurisdiction over generators used in standalone applications.

Submitter: Patricia Lemmon, Waterford, MI
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected
Substantiation: The NEC is an installation code and, according to 90.2, not a construction code. As an installation code, the NEC can mandate that a particular feature exists (a "disconnect" at a certain location, for example), but not how it is to be achieved (circuit breaker, switch, properly rated plug-and-connector, etc.). Therefore, while the NEC can mandate ground fault protection in some instances, it is not within its authority to require that ground fault protection be provided by a GFCI outlet on the generator.
Panel Meeting Action: Accept

(445.20)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: David J. Fransen, Robert Bohm Electric Co., Inc.
Comment on Proposal No: 13-19
Recommendation: ~~445.20. All 125-volt, single-phase, 15- 20-, and 30-ampere receptacle outlets, that are a part of a 15 kW or smaller, portable generator, shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle.~~ Please eliminate this proposal.
Substantiation: Many generators have a floating neutral. Under article 702, they are installed as a non-separately derived system. A GFCI installed on these generators will not function properly because there is no connection between the ground and the neutral. In the case of a bonded neutral generator there will also be reliability problems because the generator must be solidly grounded for the GFCI to function properly. This is not required and is rarely done.

Submitter: Michael Flegel, Reliance Controls Corporation
Comment on Proposal No: 13-19
Recommendation: Reject the proposal.
Substantiation: Statement of Problems Proposal 13-19
Substantiation for Problems 1, 2 and 6 is listed below.

1. It is impossible to have a ground fault back to the generator if it is not bonded and grounded, so GFCI protection on the generator doesn't make sense since no requirement exists for bonding and grounding. In complex systems and in harsh environments, neutrals can be pulled to ground beyond the generator. GFCI protection on generators that are not bonded and grounded does not protect people against these ground faults but they may believe it does. This may encourage bad safety practices and/or discourage people from taking further steps to protect themselves against ground faults.

2. The bonding and grounding needed in Problem 1 will create ground fault hazards. Why intentionally create a hazard and then have to add a device to protect against it, especially when the added device is an electronic device on a piece of hot, vibrating equipment which adds to the likelihood of its failure? It makes more sense to float the system. A floating neutral portable generator without GFCI protection is safer than a bonded neutral portable generator with GFCI protection in stand alone applications even if the latter if properly grounded. There is no need to have GFCI protection in stand alone applications even if the latter is properly grounded. There is no need to have GFCI protection built into a floating neutral generator.

3. This Proposal conflicts with the Exception in 590(A) of Proposal 3-140. If the Temporary Installation is powered by a 125 volt portable generator 15 kW or less, people cannot substitute an assured equipment grounding program in lieu of GFCI protection because no non-GFCI outlet is available on the generator.

4. 90.2 of the National Electrical Code states that the Code only covers the installation of electrical conductors, equipment, and raceways, etc. It does not cover the design of equipment such as having GFCI protection built into a portable generator. The Code can and does address the following installation aspects of a portable generator:

a. Adding downstream GFCI protection—Article 590 (2008)

b. Bonded or not bonded—There are several sections addressing Separately and Non-separately derived systems

c. Receptacles connected to the frame—250.34

In each case, the Code does not dictate that the generator has these design features but rather it instructs on how to install it when a generator has these features. The NEC does not develop product standards for the equipment that is installed. The NEC can specify how to install a bonded neutral generator with GFCI protection, or a floating neutral generator without GFCI protection but it shouldn't require that the generator have the protection built in.

5. 525.23 (C) clearly states that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. The purpose of this is to assure that egress lighting is always available. Since egress lighting can be powered by 125 volt portable generators at these sorts of events, the proposal will not allow compliance to this Article.

6. The proposal has not substantiated a safety problem; it just incorrectly states there is one. GFCI protection on the generator would ensure that people would use it, but is only effective if people properly bond and ground the generator and is not as effective as other alternatives as stated above in Problems 1 and 2. If you don't electrify the ground by tying the neutral of the generator to it, you have no ground path for a ground fault to occur. People are safer in all the conditions stated in the substantiation of the Proposal with a floating neutral generator without GFCI protection.

Do you know for a fact that the current safety record isn't due to the fact that very few portable generators are grounded and many of them 5kW and less are floating neutral generators? Are you sure adding GFCI protection will make things better and not worse? Isolation is a powerful safety device and should not be ignored. Has somebody provided data to show that what is being done now is not safe?

Bonding and Grounding—Utility vs. Portable Generators

OSHA requires bonded neutral generators in their regulations for construction sites. In reading these regulations, they appear to be identical to the NEC requirements except for this bonding requirement. The interpretation in Appendix A explains their position. To completely understand OSHA's response, please read the request letter by Mr. Iwasa. It appears OSHA incorrectly interprets the NEC. It says a generator in stand alone use is a separately derived system (see Article 100) and as such needs to be bonded. Please note the interpretation does not have any safety arguments other than misinterpreting the NEC which leaves it with no technical merit. As such, it has no relevance in this discussion.

Generators used in simple stand alone applications, operate in a much different environment than a premises wiring system being fed from the utility. There is no huge generator capable of outputting high fault current, no transformers and switchgear, and no large, elevated distribution system subject to lightning strikes all of which can create surges in the system. Such surges must be addressed through bonding and grounding rather than having them go through appliances and endanger safety. The reason for bonding and grounding is substantially reduced when utility power is removed. As a matter of fact, Article 250 agrees and does not require the grounding of a generator in stand-alone applications. This allows a floating system using either floating neutral generators or bonded-neutral generators that are not grounded.

Bonding and grounding have some pitfalls that are tolerated in order to get the desired protection described above from utility systems. A bonded and grounded system creates numerous pathways for current to flow back to the power source. These include the ground, and any metal object connected to the ground such as plumbing fixtures and popes and heating ducts. If someone comes in contact with a hot wire from the power source and one of these objects, the circuit is completed with disastrous results to the individual. In fact, people did realize that these pitfalls created very dangerous situations for premises wiring systems. Products and systems were developed to mitigate the safety risks. Grounding wires were added to appliance plugs and grounding terminals were added to receptacles so that a hot wire faulting to the case of an appliance would cause a short, tripping the circuit breaker. This protected the user in case he touched the case and one of the extensive return paths to the power source created by bonding and grounding the system. The GFCI was invented to interrupt the current flow when the current out of a receptacle isn't the same amount as the returning current. If it isn't returning through the receptacle, then it probably is returning through a person that is touching one of those many objects that have a path back to the power source, again, as a result of bonding and grounding the system.

Why create a more dangerous situation by connecting multiple objects to a return path back to the source if there are no advantages in doing so like in stand alone portable generator applications? Some people would argue that the devices used to protect people in bonded and grounded systems no longer would work in a floating situation. **This is true but they fail to understand they are not necessary.** The circuit breaker tripping in the fault-to-case example above and the GFCI protection are two of the safety devices in bonded and grounded systems mentioned earlier. In the first case, the fault to the case represents only a connection of the person to one wire from the source in a floating system. Because there is no path back to the source, the individual holding the tool is not injured. Similarly, a GFCI would never trip because there is never a ground path available back to the generator i.e. a ground fault can never occur back to the source. **This truly is a paradigm shift in the way we think about electrical systems and it is important for people to understand they have to look at portable generator applications differently.**

Stand Alone Installations

For the casual user such as a camper of home owner working in the back yard, the floating neutral generator is the safest and most cost effective application that does not require additional ground fault protection using GFCIs. Multipoint failures are extremely unlikely to occur but what if they do? **The floating system without GFCI protection still seems to be the safer of the two alternatives as shown in Appendix B (substantiation for Problems 1, 2, and 6).** GFCI protection is needed on a bonded neutral generator that is properly grounded but grounding the generator is unlikely since the NEC does not require it. If not grounded, the protection is unnecessary on the generator because you have a system that does not intentionally create any paths back to the source. However, it is more likely that the neutral in a bonded neutral generator is pulled to ground at the source since the frame is already bonded to the neutral. The solution to that is not to do it which results in the floating neutral generator.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: It is clear that there is not an industry consensus on an approach that provides the safest use of portable generators in all applications. Acceptance of this comment does not indicate that the panel agrees with all of the substantiation in this comment and the other comments related to this issue.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 9 Negative: 9
Explanation of Negative:

ADAMS, M.: I agree with the negative comments on vote submitted by Ms. Little, Mr. Olson, and Mr. Mouton.

BOREK, S.: I agree with the negative comments submitted by Ms. L. Little.

CONRAD, J.: I am voting against the panel action to accept comment 13-27. After further review and investigation, I found that the majority of the portable generator available today that are sold through many retailers already have GFCI receptacles on them.

I think it would be very confusing for the public when some gen-set have it and other don't. I also don't agree with the submitters comment that "we are creating a safety issue by adding the GFCI receptacles".

CURRIN, JR., R.: This comment should have been rejected. Where a floating neutral generator is connected to premises wiring through a transfer switch the system is grounded and GFCI protection is necessary to protect persons from shock as required in 210.8. Safety is the primary concern. Several statements were submitted indicating potential problems with requiring GFCI protection.

I feel that the problems can be solved at either the manufacturing level (transfer switches) or during the installation. They do not justify reducing the safety of the consumer who most likely would utilize generators during adverse weather conditions when GFCI protection would be critical. In the event a single pole 120 volt transfer switch is used, the consumer would in all likelihood use any remaining 120 volt receptacles to supply other needs.

LITTLE, L.: We are voting against the panel action to accept comment 13-27. Our comments are as follows:

There are 50 comments addressing proposal 13-19. Two comments were submitted to revise the accepted proposal and 48 were submitted to reject the proposal. At first glance there seems to be a broad based objection to the proposal. Upon further review it appears clear that this is simply a letter writing campaign from a limited base within the manufacturing community. The comments are submitted primarily from manufacturers and vendors of single pole, 120-volt, 15 and 20-ampere transfer switches. The belief that this is a letter writing campaign is supported by the facts that 31 of the comments share consecutive log numbers, indicating that they were submitted in bulk, and much of the substantiation used is repetitive, a result of "cutting and pasting" from a just a few comments.

This issue at hand is simple. This is about safety.

The submitters of these comments seek to protect commercial interests and choose to ignore serious safety concerns where a floating neutral generator is connected to premises wiring through a transfer switch. The recurring theme in the comments written to reject proposal 13-19, focuses on potential and perceived problems of incompatibility. This safety issue is created by design and it is only through design, through the use of GFCI protection, that we can achieve an acceptable level of protection.

The action to accept this comment by CMP-13 ignores the following safety and correlation concerns:

(1) The transformation of a system intended to be ungrounded to a grounded system. This situation occurs when a homeowner supplies a single pole 120-volt, 15 or 20-ampere, transfer switch from an unbonded generator equipped with 15/20-amp receptacles. In this case, the non-GFCI protected receptacles provided on the generator are no longer isolated and have neither GFCI protection nor the protection offered by an isolated (ungrounded) system.

(2) Allowing a "floating neutral" generator is a violation of 250.20(B), and if allowed, results in a situation where the voltage on a 120 volt system can be as high as 240 volts between the line conductor and the frame of the generator. In reality, accepting the comment accepts the premise that not only should "floating neutral" systems be allowed, but they should be required.

(3) Conflict with 210.8(A)(3) & 210.8(B)(4), which require GFCI protection of all 125-volt, single phase, 15- and 20-ampere receptacles.

(4) Conflict with requirements adopted by CMP-3 that accepted the companion proposal and rejected comments similar to the ones accepted here.

(5) Lack of true isolation of system, which becomes a problem for generators over 5 kW (capacitive coupling of generator windings prevent true isolation of system – the reason for the 5 kW limitation that was in place for "Temporary Installations" prior to the 2002 Code), and becomes less reliable as generators age and conductive paths develop between the windings and the metal housing around the windings.

The committee was addressed by the submitter of this comment during the ROC meeting. The submitter clearly stated that in a "stand alone" situation, the isolated/floating neutral design was safe and GFCI's were not necessary. The ungrounded conductor would have no reference to ground. However, the submitter readily admitted that when a single pole 120-volt, 15/20-ampere or a two pole 240-volt transfer switch is used with such a generator, the system becomes "grounded" and is no longer a "stand alone" system. This means that we now have all of the 120-volt, 15 and 20-ampere receptacles on the generator with potential to ground and NO GFCI protection.

The reader of the ROC need not do any more than simply read the substantiation submitted by those wishing to reject proposal 13-19 to find absolutely essential reasons to require GFCI protection of all 120-volt, 15/20/30-ampere receptacles on portable generators. A few examples are provided below:

• The submitter of comment 13-38 states that with a floating neutral type generator there is no need for GFCI protection because the neutral and ground conductors are not connected to a grounding system. However, the same submitter fully acknowledges that where the system is grounded (as would be the case when a transfer switch is employed) GFCI protection is necessary to protect persons from being electrocuted.

• The submitter of comment 13-18 representing a law firm suggests that NFPA could be the subject of legal action should proposal 13-19 be successful. It is interesting that the desire of this submitter to reject proposal 13-19 in itself suggests legal action. In reality, the submitters of other comments to reject proposal 13-19 including manufacturers and vendors of transfer switches have populated the ROC with compelling data for legal action against themselves where the use of a floating neutral generator, together with a transfer switch, contributes to injury or death. It is evident in the substantiation provided that the submitters of these comments understand completely that where a floating neutral generator is connected to a transfer switch with a solid neutral connection to premises wiring serious shock hazards are created. The "stand alone" system of the floating neutral generator becomes a grounded system and all of the receptacles on the generator have potential to ground and no GFCI protection. This is in direct conflict with sections 210.8 and 590.6 of the NEC. The compatibility arguments provided in these comments ignore these hazards.

• The submitter of comment 13-40 (representing a major generator manufacturing company) not only recognizes the need for GFCI protection, but seeks to expand it to all generators and not just those 15 kW or smaller. Requiring portable generators to be equipped with GFCI protection of all 120-volt, 15/20/30-ampere receptacles is within the scope of the NEC. See 90.1(A).

• 90.1 Purpose.

(A) Practical Safeguarding. The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity.

Where a portable generator is used as a source for temporary power Article 590 applies. See 590.1.

• 590.1 Scope. The provisions of this article apply to temporary electric power and lighting installations.

Where a portable generator is used as a power source it becomes part of the "premises wiring" and the entire NEC applies. See the Article 100 definition of "premises wiring."

• Premises Wiring (System). Interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed. This includes (a) wiring from the service point or power source to the outlets or (b) wiring from and including the power source to the outlets where there is no service point.

Such wiring does not include wiring internal to appliances, luminaires, motors, controllers, motor control centers, and similar equipment.

Other arguments to reject proposal 13-19 are also without merit. Egress lighting in a carnival type installation can be service supplied, supplied by a large trailer mounted generator or of the battery backup type. It could be argued that the use of the relatively small generators that are the focus of this proposal in themselves present a dilemma with reliability when used for such important issues as egress lighting. Namely, it is problematic that such generators must be shutdown to fill their relatively small fuel tanks, and egress lighting would rely on standard cord and plug configurations as a means of connection. Traffic signal systems and wiring are not within the purview of the NEC.

Summary

This comment must be rejected in the name of safety.

Where is the largest market for portable generators 15 kW and smaller? The vast majority are sold to homeowners.

Why does the typical homeowner buy a generator? The typical homeowner purchases a portable generator for use when the local power grid fails due to ice storms, hurricanes or other weather related events.

When will the homeowner use the generator? The homeowner will use the generator during these weather related events.

When the homeowner connects the generator to the home though a transfer switch that creates a solid connection to the grounded conductor of premises wiring, the system is grounded. A serious safety issue is now created with all of the remaining receptacles on the generator as they are no longer supplied from a "standalone" system. All of the remaining receptacles on the generator now have potential to ground without GFCI protection.

Anyone who thinks that the homeowner will simply connect a single extension cord to a 120-volt, 15/20-ampere transfer switch and not utilize the other receptacles and circuits on the generator has likely never used a portable generator when power is lost in a weather related event. The single circuit fed through the transfer switch will most likely supply a heater and possibly some lighting. The homeowner will run more extension cords to sump pumps, refrigerators, portable lighting, portable shop vacuums and much more. The homeowner will go outdoors in a storm environment, with everything wet, without GFCI protection.

The majority of transfer switches used by home owners are rated at 240-volts and the GFCI requirement implemented by proposal 13-19 for 120-volt 15/20/30-ampere receptacles has no impact as there would not be an issue with the operation of the GFCI. The problem noted by many of the comment submitters occurs only where a single pole, 120-volt, 15/20-ampere transfer switch is employed. In this situation, when a homeowner has an existing single pole 120-volt, 15/20-ampere transfer switch and purchases a new generator with GFCI protection, the home owner will be required to replace the transfer switch or the manufacturer will design a device for compatibility.

The scope of the NEC includes the homeowner who will connect a portable generator to premises wiring and then utilize other receptacles on the portable generator. It is practical to safeguard the homeowner from the hazards that arise from the use of a portable generator that is grounded through a transfer switch connection to premises wiring.

MOUTON, C.: The panel action should have been to reject the comment. Having a GFCI mounted on the portable generator is the safest configuration to protect personnel from electric shock hazards.

ODE, M.: See my explanation for negative vote in Comment 13-14.

OLSON, G.: The committee should have at least dealt with the issue associated with the bonding of portable generators that are interconnected with a premises distribution system. A simple requirement that a label be added to the generator indicating whether or not the neutral is bonded in the machine would be useful in properly applying the machine regardless of the application.

TOBIAS, JR., D.: I agree with the negative comments on vote as submitted by Mr. Ode, Ms. Little, Mr. Conrad, Mr. Currin, Mr. Olson and Mr. Mouton.

13-28 Log #1656 NEC-P13 **Final Action: Reject**
(445.20)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Gary Rauch, Sussex, WI
Comment on Proposal No: 13-19
Recommendation: Delete the following text: ~~445.20. Ground Fault Circuit Interrupter Protection for Receptacles on 15 kW or Smaller Portable Generators. All 125-volt, single-phase, 15- 20-, and 30-ampere receptacle outlets, that are part of a 15 kW or smaller, portable generator, shall have ground fault circuit interrupter protection for personnel integral to the generator or receptacle.~~
Substantiation: Article 525.23(C) states that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. This is to assure that egress lighting is always available. Since egress lighting is often powered by portable generators at these sorts of events, the proposed article incorrectly mandates GFCI outlets on all portable generators. Supplemental GFCI protection can easily be added if necessary.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Dave Parker, Milwaukee, WI
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: Integral GFCI-protected outlets will not necessarily trip as intended. For instance, in a floating neutral generator where there is no connection between the neutral and ground, the GFCI will not trip. In a bonded neutral generator, the GFCI may not trip unless the generator is connected to a ground rod, which is not required by the Code [250.34(A)]. The appearance of GFCI's on portable generators will mistakenly lead the user to believe that he/she is adequately protected by a GFCI.

Comment on Proposal No: 13-19
Recommendation: Delete the following text: ~~445.20. Ground Fault Circuit Interrupter Protection for Receptacles on 15 kW or Smaller Portable Generators. All 125-volt, single-phase, 15- 20-, and 30-ampere receptacle outlets, that are part of a 15 kW or smaller, portable generator, shall have ground fault circuit interrupter protection for personnel integral to the generator or receptacle.~~
Substantiation: There is a large installed base of transfer switches for switching the hot leg of a 120 volt utility and portable generator. these are in multiple municipal and state traffic signal installations that have been designed for portable generator backup during a power outage. GFCI receptacles on bonded neutral generators will trip if used on these systems, thereby creating the possibility of a safety threat far more serious than that which the GFCI is intended to prevent. GFCI protection, when required by the Code, is more reliable if located independently from the generator.
Panel Meeting Action: Accept

Submitter: Bill Wade, Charlotte, NC
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: The proposal would create an obvious Code conflict. 525.23(C) states that egress lighting circuits for carnivals, circuses, fairs, and simmilar events cannot be GFCI protected. The purpose of this is to assure that egress lighting is unencumbered. Since egress lighting is often powered by portable generators at outdoor events, the proposed 445.20 cannot mandate GFCI outlets on portable generators. If CMP 13 approves this proposal, the TCC will have to reject it.

Submitter: Chad Kennedy, Schneider Electric/Square D
Comment on Proposal No: 13-19
Recommendation: The proposal should be rejected.
Substantiation: The industry has not agreed on how to best protect the public for the range of portable generator applications. This resulted in the product standard being published without qualifying as an ANSI consensus standard. There are public safety concerns when portable generators are used as optional standby sources which have not been resolved. For example, consider the large number of installations which intend for the generator to be connected as a non-separately derived source. Failure of the generator to supply needed power will result in users taking safety risks such as removing equipment grounding connections in order to operate the system. Experience in extended weather related power outages provides numerous examples of how misuse can lead to tragedy. The panel should reject this proposal based on the lack of industry consensus for the requirements and the failure to safely address the intended use for an application with a large installed base.

Submitter: James Pond, Webster, MA
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: If ground fault protection is necessary in a particular application, the Code can require it. However, since there are many different ways to achieve ground fault protection (GFCI outlet, GFCI circuit breaker, GFCI cord set, portable personal GFCI protection device, etc.) the only way that the NEC can mandate integral GFCI outlets in generators is if it is a product design and performance requirement as in an ANSI standard. This is clearly contrary to 90.2.

Submitter: Howard Butcher, Dallas, TX
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: A majority of the portable generators sold these days are for home standby use. In such applications, premises wiring systems, which already have GFCI protection built in per the NEC, don't need them on the generator. In addition, most of these generators have or should have floating neutrals. Not only do floating neutral generators not need GFCI protection for stand alone use because they are isolated from the ground, but they are also easier and less expensive to connect to a premises wiring system. The best solution already exists without the need for GFCI protection.

Comment on Proposal No: 13-19
Recommendation: Delete text.
~~**445.20 Ground-Fault Circuit-Interrupter Protection for Receptacles on 15 kW or Smaller Portable Generators.** All 125-volt, single phase, 15-, 20-, and 30-ampere receptacle outlets, that are part of a 15 kW or smaller portable generator, shall have ground-fault circuit-interrupter protection for personnel integral to the generator or receptacle.~~
Substantiation: This proposal should be rejected. Here in Florida, there are many single pole transfer switches installed by municipalities and the state for backup 120-volt generator control of traffic signals. The GFCIs on bonded-neutral generators will trip if used under these circumstances, thereby, causing a loss of generator power and resulting in consequences that could be far more serious than those which the GFCI was intended to prevent, especially during an emergency evacuation.
Panel Meeting Action: Accept

Comment on Proposal No: 13-19
Recommendation: Delete text.
~~**445.20 Ground-Fault Circuit-Interrupter Protection for Receptacles on 15 kW or Smaller Portable Generators.** All 125-volt, single phase, 15-, 20-, and 30-ampere receptacle outlets, that are part of a 15 kW or smaller portable generator, shall have ground-fault circuit-interrupter protection for personnel integral to the generator or receptacle.~~
Substantiation: This proposal should be rejected for the following reasons:
1) This proposal conflicts with 525.23(C) which requires that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. A number of widely-used small portable generators are manufactured with 125-volt outlets only, and do not include 125/250-volt twist-lock outlets. Allowing 125/250-volt outlets to be non-GFCI protected would still not enable such a generator to be used. Supplemental GFCI protection, where otherwise required, can be easily added under existing Code provisions.
2) There is a very large installed base of municipal traffic signal transfer switches that are single-pole 120-volt. A bonded neutral generator with GFCls integral to the generator will not work in these applications. This is because generator bonding will cause a small amount of current to return to the generator through the grounding conductor, creating an imbalance that will always trip the GFCI. Thus, GFCIs under power will not be able to establish a non-tripped condition. Failure to establish temporary backup power for traffic signals (particularly on emergency evacuation routes) would disrupt "public health and safety", a condition that is not permitted under the scope of 708.1.
3) Current GFCI devices are intended for mounting in stationary applications, and not to be added to portable generators. The combination of exposure to excessive vibration and heat plus typically inadequate grounding could easily mislead a user into thinking adequate protection has been provided.
4) The Code recognizes both floating and bonded neutral generators. Floating neutral generators offer an exceptional degree of electrical safety specifically because there is not a bond between the neutral and generator frame. Connecting the neutral to the frame, creates new problems which GFCIs are intended to prevent, but GFCls will not reliably trip because generators are not typically used (nor required to be used) with a ground rod [250.34(A)].
5) This proposal should be rejected in light of the unintended consequences of GFCIs on both bonded-neutral and floating-neutral generators. GFCIs will not trip on a bonded-neutral generator without a connection to earth (ground rod, water pipe, etc.), which is not required according to 250.34(A). GFCs will never trip on a floating-neutral generator, and should not be required at all.
6) 90.1(C) clearly states that the Code is not intended as a design specification. Accordingly, the Code is clearly not intended to direct a manufacturer to design his product in a particular manner, including making GFCI outlets integral to a generator. The panel should proceed with extreme caution. This proposal should be rejected at least until all the negative consequences of undertaking the responsibilities of product design are thoroughly evaluated.

Comment on Proposal No: 13-19
Recommendation: Proposal 13-19 should be rejected entirely.
We have been made aware that this pending code proposal will require GFCI protection to be integral to all portable generators smaller than 15 kW, regardless of whether or not GFCI protection will perform as intended.
Proposal 13-19 will add this Article to the NEC:
445.20 Ground-Fault Circuit Interrupter Protection for Receptacles, on 15 kW or Smaller, Portable Generators. All 125-volt single-phase, 15-, 20-, and 30-ampere receptacle outlets.
Proposal 13-19 should be rejected entirely.
We have been made aware that this pending code proposal will require GFCI protection to be integral to all portable generators small than 15 kW, regardless of whether or not GFCI protection will perform as intended.
Proposal 13-19 will the following to the NEC:
445.20 Ground-Fault Circuit Interrupter Protection for Receptacles, on 15 kW or Smaller, Portable Generators. All 125-volt single phase, 15-, 20-, 30-ampere receptacle outlets.
Substantiation: Proposal 13-19 should be rejected entirely for the following reasons, including but not limited to:
1. GFCIs on generators will not function reliably unless the neutral and ground conductors are connected to a functional grounding system, which they generally are not.

The NEC does not require the grounding of portable generators when used in stand-alone applications. This becomes extremely important for workers at temporary installations, where GFCI protection is required by the NEC. In such cases, ineffective protection given by the GFCI protection on the portable generator can mistakenly lead personnel to believe that they are protected by the generator GFCI, and discontinue the use of personal or other supplemental GFCI protection that has kept them safe for years. This could be a serious mistake.
2. This Proposal would create at least two Code conflicts.
525.23(C) clearly states that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. The purpose of this is to assure that egress lighting is always available. Since egress lighting is often powered by portable generators at these sorts of events, the proposed additional Articles cannot mandate GFCI outlets on portable generators.
In addition, proposed 590.6(A)(3) and the Exception under 590.6(A) are mutually exclusive. The Exception allows 590.6(B)(2) under circumstances that are "not compatible with GFCI protection" but the proposal does not provide for a portable generator where non-GFCI protection is allowed.
3. If floating neutral generators are used, there is no need for the GFCI.
In a system as complex as premises wiring, full isolation is not possible, and the reasons for grounding such unique electrical systems are spelled out in 250.4(A)(1). In such a case, the GFCI is necessary to protect the user from being injured or killed by the utility power since exposed metal parts are intentionally electrified through the bonding and grounding process. However, with a stand-alone portable generator, bonding and grounding is not required by the NEC, and full isolation is easily achievable. Therefore, public safety for portable generators is best served by protecting the user through the use of simple, dependable basic insulation and isolation, instead of through a process that deliberately:
(a) creates a ground path,
(b) allows the electrocution to begin and then,
(c) attempts to stop it before lethality is complete using a complicated and fragile electronic sensing and interrupting device.
Quite simply, if there is no ground fault path, then there can be no ground fault.
4. This proposal is clearly outside of the scope of the National Electrical Code.
UL addresses applications of small portable generators such as lighting on camp sites, powering table saws and hand-held tools, and so on. However, 90.2 of the National Electrical Code states that the Code only covers the installation of electrical conductors, equipment, and raceways, etc. It does not cover electrical equipment that is not installed. Neither the portable generator used in a stand-alone application nor the appliances it powers are installed. As a result, the NEC clearly has no jurisdiction over portable generators used in stand-

alone applications.

5. The NEC cannot mandate design or construction requirements for equipment.

As an installation code, the NEC can mandate that a particfular feature exists (disconnect at a certain location, for example), but not how it is to be achieved (circuit breaker, switch, properly rated plug-and-connector, etc.). Therefore, while the NEC can mandate ground fault protection for particular circuits, it is not within its authority to mandate that said ground fault protection must be provided by a GFCI outlet integral to the generator.

UL was the submitter of this proposal. This was a provision that was lobbied heavily by UL during the STP 2201 group's attempt to develop a standard for small portable generators. The group repeatedly voted against this provision, and UL is now trying to force it into the NEC instead.

NEMA Codes and Standards are also opposed, and have voted against it. Unfortunately, NEMA is only one voice (albeit a loud one).

We believe that this proposal is ill-conceived (even though well-intended) and will lead to confusion at the user level, will not improve portable generator safety as intended, or are better addressed by existing code requirements.

Panel Meeting Action: Accept

Panel Statement: See the panel statement on Comment 13-27.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 9 Negative: 9

Explanation of Negative:

ADAMS, M.: See my Explanation of Negative Vote on Comment 13-27.

BOREK, S.: See my Explanation of Negative Vote on Comment 13-27.

CONRAD, J.: See my Explanation of Negative Vote on Comment 13-27.

CURRIN, JR., R.: See my negative statement on comment 13-27.

LITTLE, L.: See our negative statement on comment 13-27.

MOUTON, C.: See explanation for negative vote on Comment 13-27.

ODE, M.: The proposed change only applies to 125-volt, 15-, 20-, and 30-ampere receptacles on a 15 kW or smaller portable generator. Existing installations using a single conductor transfer switch could certainly use 20- or 30-ampere 120/240-volt receptacles that are not required by 445.20 to be GFCI protected. New installations can certainly use either two pole or three pole transfer switches. See my explanation for negative vote in Comments 13-14 and 13-15.

OLSON, G.: See my Explanation of Negative Vote on Comment 13-27.

TOBIAS, JR., D.: See my Explanation of Negative Vote on Comment 13-27.

13-39 Log #2127 NEC-P13 **Final Action: Reject**
(445.20)

Submitter: Lora Christensen, Reliance Controls Corp.

Comment on Proposal No: 13-19

Recommendation: Revise text to read as follows:

445.20. Ground-Fault Circuit Interrupter Protection for Receptacles on 15 kW or Smaller, Portable Generators. All 125-volt, single-phase, 15- 20-, and 30-ampere receptacle outlets, that are a part of a 15 kW or smaller, bonded-neutral portable generator, shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle.

Substantiation: If there is no neutral connection to the ground, ground faults back to the source are impossible so no need to have GFCI protection on the source. Bonded-neutral generators have the frame of the generator tied to the neutral of the generator. This increases the possibility of the neutral being connected to the ground. Floating-neutral generators only have the grounding conductors tied to the frame isolating the neutral from the frame thereby preventing the neutral from being connected to the ground. No need to have GFCI protection on a floating neutral generator.

Panel Meeting Action: Reject

Panel Statement: The panel action on Comment 13-27 has overturned the panel action on Proposal 13-19. See the panel statement on Comment 13-27.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 17 Negative: 1

Explanation of Negative:

ODE, M.: This should have been an accept in part with not accepting the suggested text of "bonded-neutral" since capacitive coupling of an ungrounded 2-wire system can be a shock and electrocution hazard.

A GFCI receptacle monitors the amount of current that goes out on the ungrounded conductor and then comes back on the neutral conductor and if there is leakage of 6 milliamps or greater that does not come back through the GFCI comparison device, then the GFCI device will trip. GFCIs will trip without the benefit of an equipment grounding conductor path back to the source but obviously having a lower impedance path back to the source is much more desirable since the equipment grounding conductor path back to the frame of the generator and then back to the source on the system bonding jumper to the neutral provides a much lower impedance path.

Section 250.20(B)(1) requires any AC system of 50 volts to 1000 volts to be grounded where the system can be grounded so that the maximum voltage to ground on the ungrounded conductor does not exceed 150 volts. Section 250.20(D) requires any separately derived system, as covered by 250.20(B) to be grounded in accordance with 250.30(A) of which a portable generator would be covered under this section.

"250.20 Alternating-Current Systems to Be Grounded.

Alternating-current systems shall be grounded as provided for in 250.20(A), (B), (C), (D), or (E). Other systems shall be permitted to be grounded. If such systems are grounded, they shall comply with the applicable provisions of this article.

(B) Alternating-Current Systems of 50 Volts to 1000 Volts. Alternating-current systems of 50 volts to 1000 volts that supply premises wiring and premises wiring systems shall be grounded under any of the following conditions:

(1) Where the system can be grounded so that the maximum voltage to ground on the ungrounded conductors does not exceed 150 volts"

In addition, 250.34 does not require the frame of a portable generator to be connected to a grounding electrode if the portable generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both.

"250.34 Portable and Vehicle-Mounted Generators.

(A) Portable Generators. The frame of a portable generator shall not be required to be connected to a grounding electrode as defined in 250.52 for a system supplied by the generator under the following conditions:

(1) The generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both, and

(2) The normally non–current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are connected to the generator frame."

In addition, the normally non-current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are required to be connected to the generator frame. This section does not state that floating the neutral in the generator is acceptable since the generator is a separately derived system and must have a system bonding jumper installed from the equipment grounding system in the generator to the grounded or neutral conductor within the generator.

A portable generator, supplying power to any premises, where there is no direct electrical connection to conductors of another power system, is a separately derived system. Section 250.34(C) requires the grounded conductor from the generator to be connected to the generator frame where 250.26 requires the conductor to be grounded.

"250.34 Portable and Vehicle-Mounted Generators.

(C) Grounded Conductor Bonding. A system conductor that is required to be grounded by 250.26 shall be connected to the generator frame where the generator is a component of a separately derived system.

250.26 Conductor to Be Grounded — Alternating-Current Systems.

For ac premises wiring systems, the conductor to be grounded shall be as specified in the following:

(1) Single-phase, 2-wire — one conductor

(2) Single-phase, 3-wire — the neutral conductor"

The equipment grounding conductor must also be connected to the generator frame. Premises wiring would apply to both fixed loads and portable loads, such as drills and other portable electrical equipment and the danger of electrocution applies anywhere electricity is used. Over the many years these issues have been dealt with in the NEC and with OSHA, there has only been one exception to this rule and that exception applied to 5 kW and smaller 2-wire single-phase generators. This exception was removed from the NEC in the 2002 cycle with the intent that all portable generators be required to have GFCI protection, however, OSHA 29 CFR 1926.404(b)(1)(ii) still has the exception. In OSHA, the exception only applies to 5 kW and smaller 2-wire single phase generators. Any 120/240 volt 3-wire generators must have the neutral connected to the frame and must have GFCI protection, based n the NEC and the OSHA requirements. The 5 kW and smaller 2-wire generators were excluded from GFCI protection since 2-wire generators larger than 5 kW could have capacitive coupling or capacitive reactance effects where ac current at 60 hertz could pass between the winding and the case of the generator.

13-40 Log #2135 NEC-P13 **Final Action: Reject**
(445.20)

Submitter: Gary L. Olson, Cummins Power Generation

Comment on Proposal No: 13-19

Recommendation: Delete text as indicated. Add new sentence.

445.20. Ground-Fault Circuit Interrupter Protection for Receptacles on ~~15 kW or Smaller,~~ Portable Generators. All 125-volt, single-phase, 15-, 20-, and 30- ampere receptacle outlets that are a part of a ~~15 kW or smaller,~~ portable generator, shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle. Receptacles that do not incorporate GFCI shall be labeled to indicate this.

Substantiation: There is no technical justification for the "15kW or smaller" on the proposed new text. The problem described could occur on nearly any portable generator installation because generator installations tend to be exposed to dirt and moisture while they are operating. Consequently, GFCI should be applied on circuits where a tool or other temporary device is connected and used in locations as specified in 210.6. Some receptacles, such as 120/240V twist lock devices are most often used to connect a generator to premises wiring systems, and these should not require GFCI because protection should be with in the premises or respective load. When a receptacle on a portable generator is not protected by GFCI it should be labeled as such. A portable generator should have a label on the genset that indicates whether or not the neutral is bonded to frame, because these machines are often connected

to premises wiring systems, and this system must incorporate proper neutral bonding and switching provisions (i.e., a switched neutral in the ATS) in order to result in a safe installation. Finally, some thought perhaps should be given to the term "portable generator", as it could be mean different things to different users.
Panel Meeting Action: Reject
Panel Statement: The panel action on Comment 13-27 has overturned the panel action on Proposal 13-19. See the panel statement on Comment 13-27.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 14 Negative: 4
Explanation of Negative:
CURRIN, JR., R.: CMP-13 should have accepted this comment. See my negative statement on comment 13-27.
LITTLE, L.: This comment should have been accepted. See our negative statement on comment 13-27.
ODE, M.: See my explanation for negative vote in Comment 13-14.
OLSON, G.: I think the committee should have accepted this in principal. Whether a generator is provided with a bonded neutral or floating neutral, depending on how the equipment is used, a hazardous condition could develop. At a minimum the committee should have addressed this issue by requiring at least a label indicating how it should be connected based on the design of the equipment as it ships.

Submitter: Jeffrey Flegel, Reliance Controls Corp.
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: This proposal will cause mass confusion in the marketplace. The installed base of single-pole, 120V manual transfer switches will not operate with generators with GFCI outlet protection and with the neutral bonded to the generator frame. Tens of thousands of single-pole manual transfer switches would be rendered inoperable and require replacement with more expensive two-pole transfer switches. These applications go far beyond home standby use and agricultural applications. For example, from New York to Florida, traffic signals along storm and flood evacuation routes are equipped with single-pole manual transfer switches that will not work with 120V, GFCI protected portable generators. Many of these routes are critical for Homeland Security and may be subject to the requirements of Article 708. Therefore, the NEC should consider the severe economic and safety impact on the public sector and reject this proposal.

Comment on Proposal No: 13-19
Recommendation: The proposal should be rejected.
Substantiation: Most portable generators sold these days are for home standby use. In this application, premises wiring systems, which already have GFCI protection built in per the NEC don't need them on the generator. In addition, most of these generators have floating neutrals. Not only do floating neutral generators not need GFCI protection for stand alone use, because they are isolated from the ground, but they are also easier and less expensive to connect to a premises wiring system. A superior solution already exists without the need for GFCI protection.

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Michael Ferranti, Edison, NJ
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: This proposal will cause problems in the existing manual transfer switch market. Existing single-pole, double-throw, 125V manual transfer switches won't work with generators with GFCI outlet protection. Thousands of transfer switches would be rendered useless and need replacement. Or, worse yet, they might not be replaced at all. This would be dangerous. For example, in the state of New York, traffic signals along storm and flood evacuation routes are equipped with single-pole manual transfer switches that will not work with GFCI protected portable generators. Therefore, the NEC should consider the severe problems this decision will cause and reject this proposal.
Panel Meeting Action: Accept

Number Eligible to Vote: 18
Ballot Results: Affirmative: 9 Negative: 9
Explanation of Negative:
ADAMS, M.: See my Explanation of Negative Vote on Comment 13-27.
BOREK, S.: See my Explanation of Negative Vote on Comment 13-27.
CONRAD, J.: See my Explanation of Negative Vote on Comment 13-27.
CURRIN, JR., R.: See my negative statement on comment 13-27.
LITTLE, L.: See our negative statement on comment 13-27.
MOUTON, C.: See explanation for negative vote on Comment 13-27.
ODE, M.: The proposed change only applies to 125-volt, 15-, 20-, and 30-ampere receptacles on a 15 kW or smaller portable generator. Existing installations using a single conductor transfer switch could certainly use 20- or 30-ampere 120/240-volt receptacles that are not required by 445.20 to be GFCI protected. New installations can certainly use either two pole or three pole transfer switches. See my explanation for negative vote in Comment 13-14.
OLSON, G.: See my Explanation of Negative Vote on Comment 13-27.
TOBIAS, JR., D.: See my Explanation of Negative Vote on Comment 13-27.

13-49 Log #2203 NEC-P13 **Final Action: Reject**

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Tony Ferranti, Edison, NJ
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: The bonded neutral and ground conductors on a portable generator must be solidly connected to a functional grounding system in order for GFCIs to reliably interrupt a fault to ground before lethality is complete in the event of an electrocution. The NEC does not require the grounding of portable generators when used in stand-alone applications. This becomes extremely important for those working under temporary installations (Article 590), where conditions require GFCI protection, and where unintentional grounding and bonding are more likely to occur away from the generator. In such cases, the ineffective protection given by the GFCI protection on the portable generator in these instances may give the false impression that personnel are protected from ground faults when, in fact, they are not. This may cause them to discontinue use of other types of protection they have been using in the past. This would be dangerous and life-threatening.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Christopher Glianna, Edison, NJ
Comment on Proposal No: 13-19
Recommendation: The proposal should be rejected.
Substantiation: The proposal would create a Code conflict. 525.23(C) states that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. The purpose of this is to assure that egress lighting is unencumbered. Since egress lighting is sometimes powered by portable generators at outdoor events, the proposed 445.20 cannot mandate GFCI outlets on portable generators. If this proposal is accepted, the TCC will have to reject it.
Panel Meeting Action: Accept

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Joseph Fani, Edison, NJ
Comment on Proposal No: 13-19
Recommendation: The Proposal should be rejected.
Substantiation: If ground fault protection is necessary in a particular application, the Code can require it. However, since there are many different ways to achieve ground fault protection (GFCI outlet, GFCI circuit breaker, GFCI cord set, portable personal GFCI protection device, etc.) the only way that the NEC can mandate integral GFCI outlets in generators is if it is a product design and performance requirement as in an ANSI standard. This is clearly contrary to NEC 90.2.

Submitter: Michael Wade, Charlotte, NC
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: In order for GFCI protection to function, there needs to be a path for the ground fault current to return back to the power source. In utility systems, this path through the ground is created through a process called bonding and grounding. The reasons for grounding electrical systems are spelled out in 250.4(A)(1), and are unique to utility power systems. In such a case, the GFCI is necessary to protect the user from being killed by the utility power since the ground and the exposed metal parts touching the ground are intentionally electrified through the bonding and grounding process. However, with a stand-alone portable generator, the reasons for bonding and grounding are mitigated and electrification of the ground through bonding and grounding is not required by the NEC. Public safety for portable generators is best served by protecting the user through the use of basic insulation and isolation, instead of through a process that deliberately (1) creates a ground path, (2) allows the electrocution to begin and then (3) attempts to stop it before lethality is complete using a complicated and fragile electronic sensing and interrupting device. Quite simply, if there is no ground fault path, then there can be no ground fault.

Submitter: Pam Dwertman, Cincinnati, OH
Comment on Proposal No: 13-19
Recommendation: The proposal should be rejected.
Substantiation: The exception in 590.6(A) allows for the use of an assured equipment grounding conductor program instead of GFCI protection for those receptacle outlets used to supply equipment that would create a greater hazard if power were interrupted or having a design that is not compatible with GFCI protection. The proposal would not allow a portable generator to be used in these applications. Since GFCI protection can be added to any portable generator application, the code should not restrict the use of portable generators in these instances which is exactly what the proposed change would be. People may be tempted, or even encouraged, to use a portable generator in an application in which they should not.

Submitter: James Goldschmidt, Cincinnati, OH
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected.
Substantiation: This proposal is not covered by the National Electrical Code. The submitter addresses uses of small portable generators for such things as lighting on camp sites, powering table saws and hand-held tools, and so on. However, 90.2 of the NEC states that the NEC covers the installation of electrical equipment only in premises, yards and lots, parking lots, carnivals, industrial substations, conductors and equipment that connect to the supply of electricity, and installations used by the electric utility. The NEC obviously has no jurisdiction over generators used in stand-alone applications.

Submitter: Ted Lecher, Sourcing Synergies, LLC
Comment on Proposal No: 13-19
Recommendation: This proposal should be rejected completely.
Substantiation: CMP 13 has overstepped its authority in this matter. According to 90.2 of the NEC, the NEC is an installation code, not a construction code. As an installation code, the NEC can mandate that a particular feature exists (a disconnect at a certain location, for example), but not how it is to be achieved (circuit breaker, switch, properly rated plug-and-connector, etc.). Therefore, while the NEC can mandate ground fault protection for particular circuits, it is not within its authority to mandate that said ground fault protection must be provided by a GFCI outlet integral to the generator.

Comment on Proposal No: 13-19
Recommendation: Delete entire proposal.
Substantiation: 1. Portable generators 15 kW or smaller with GFCI protection will not operate with the installed base of non-automatic transfer switches used for standby power applications. Over 3/4 of portable generators sold are used at one time or another for standby power applications, connected to a manual transfer switch, to provide standby power to buildings. Adopting the proposal will create field user issues not solvable without modification to existing, installed equipment.

2. GFCIs on portable generators will not operate properly unless the generator ground and neutral are connected to grounding system, which is not required by the NEC in temporary applications, leading to false sense of security and defeating the possible GFCI protection benefits.

3. This proposal is not within the scope of the NEC. The NEC covers the installation, not the design of equipment. This proposal attempts to mandate certain designs for portable generators, the NEC does not apply.

Panel Meeting Action: Accept
Panel Statement: See the panel statement on Comment 13-27.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 9 Negative: 9
Explanation of Negative:

13-62 Log #2518 NEC-P13 **Final Action: Reject**
(445.20)

The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: Bill Johnson, Champion Power Equipment
Comment on Proposal No: 13-19
Recommendation: Reject Proposal 13-19.
Substantiation: Requiring the addition of GFCI receptacles on all 125 volt portable generator panels may introduce safety hazards. GFCI receptacles are not reliable when exposed to the vibration and environment of portable generators powered by single cylinder reciprocating engines. The operational environment of portable generators is much more severe than the environment in which household GFCI receptacles operate and household mounted GFCI receptacles are les reliable than non-GFCI receptacles. For this reason, GFCI receptacles in homes do not generally control lighting so that safe egress in a power outage is possible. Loss of electrical power to lighting (visibility) or power to tools caused by false tripping of generator mounted GFCI receptacles can create safety hazards. Also, panel mounted GFCI receptacles require bonding one hot leg of a 2-wire single phase 120 volt generator output to the generator frame in order to sense a ground fault. The use of floating neutrals in many applications is common in order to eliminate a short circuit return path, preventing an otherwise lethal condition. Installation of GFCI receptacles combined with a floating neutral may result in a false sense of security and a safety hazard.

There is no evidence that mandating GFCI receptacles on all 125 volt portable generator receptacles is safer than the non-GFCI receptacles used in houses. In fact, it is very possible that the proposed mandate will increase safety hazards.

(445.20)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

The Technical Correlating Committee directs that Proposal 13-19 be reported as "Reject" because Comments 13-14 through 13-33, 13-35, 13-36, 13-37, 13-38, and 13-41 through 13-63 failed ballot.

These comments received less than two-thirds affirmative vote. Therefore, consensus no longer exists.

Submitter: James Jongkind, American Honda Motor Co., Inc.
Comment on Proposal No: 13-19
Recommendation: Please do not accept the proposal as it could have serious unintended consequences.
Substantiation: Based on Honda's long history of producing floating neutral generators without occurrence of electric shock, we strongly urge you to carefully consider that mandating GFCIs would likely increase the frequency of electric shock via the neutral bonding and frame grounding required for the device to function properly.

While recent revisions to UL943 improve their function and durability, these GFCIs are primarily intended for use on premises and NOT on portable generators which are subject to a host of operational conditions which contribute to their malfunction. Until such time it can be shown that the widespread application of GFCIs on portable generators will reduce the already low number of electric shock cases that occur using the proven floating neutral design, the NEC should not adopt a mandatory requirement.

9-68 Log #373 NEC-P09 **Final Action: Accept**
(450.5)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-166
Recommendation: Continue to reject the proposal.
Substantiation: The CMP 9 actions on this topic are correct for all such proposals within its scope. It is interesting to note that there are some applications of the word "per" that are not really correct, or at least capable of improvement. One good example where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

9-80 Log #685 NEC-P09 **Final Action: Reject**
(450.23)

Submitter: Paul Mrozinsky, Montgomery, AL
Comment on Proposal No: N/A
Recommendation: NFPA 70 descriptions define substations that are installed on the floor with walls or chain link fences with lockable doors. The 12470/480 volt substations I have to deal with are on platforms twelve feet in the air with one ladder access with no lockable access doors. One of these substations straddles a production line. Several of these substations have liquid filled transformers that were installed as replacements for failed dry type transformers with no confinement reservoirs. NFPA 70, 450-23 defines the requirement for the confinement reservoirs; but does not address the fact that if the transformer itself develops a leak the hot fluid could splash out of the containment and off the platform splattering all over the floor underneath including equipment and scalding people in the vicinity. Where is the missing link defining what must be concerning this type of installation elevated twelve feet above the floor? Are these types of installations permitted with production operations underneath or in close proximity?
Substantiation: It will define the acceptable installation of elevated platform substations with liquid filled and dry transformers. Where may these substations be installed with regards to manufacturing, including welding, and flame or laser cutting, operations below them or in near proximity to them. Welding and cutting operations exceed the 300 degree centigrade temperature of acceptable fluid in fluid filled transformers. This issue has open questions with OSHA and insurance companies that I have been in contact with.
Panel Meeting Action: Reject
Panel Statement: This comment does not comply with the Regulations Governing Committee Projects [at 4.4.5(b) and (c)] in that no proposal was identified and no suggested text was provided. The submitter is encouraged to resubmit in a timely way for the 2014 NEC cycle.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 460 — CAPACITORS

11-63 Log #1558 NEC-P11 **Final Action: Reject**
(460.8(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-144
Recommendation: Accept the word "identified" changed to "approved" in two places.
Substantiation: The panel response regarding "identified" is partially correct; it may relate to testing agencies per the FPN, but the definition states: "Recognizables" as suitable for the specific purpose, function, use, environment, application and so forth.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the revisions as proposed as no technical substantiation has been provided in regards to the disconnecting means. The submitters concerns are presently covered in 110.3.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-64 Log #1557 NEC-P11 **Final Action: Reject**
(460.10 Exception No. 2 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 11-145
Recommendation: Accept the proposal with the following revisions:
Exception No. 2: Capacitor cases installed on nonmetallic poles supplying open overhead conductors as covered in Article 225 which do not provide an equipment grounding conductor, shall not be required to be grounded.
Substantiation: Premises with large areas and numbers of separate buildings or other structures supplied by 600 volt or less systems where an equipment grounding conductor is not required to be run with the conductors such as those supplying transformers, as covered in 250.110, Exception No. 2 should be excluded.
Panel Meeting Action: Reject
Panel Statement: Section 250.32 requires an equipment grounding conductor to be installed when installing circuits between buildings and other structures, therefore an equipment grounding conductor will be present. The panel recognizes the exception to 250.110 for capacitors located 8 feet or more above grade mounted on wooden poles and intends to require all other capacitors to be properly grounded to an equipment grounding conductor.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 480 — STORAGE BATTERIES

13-64 Log #585 NEC-P13 **Final Action: Accept in Principle in Part**
(480.2)

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-30
Recommendation: Modify the panel's proposed language as follows:
Nominal ~~Battery~~ dc Voltage. The voltage ~~calculated~~ assigned to a cell appropriate to its chemistry, or to a battery based on the number and type of cells in the battery ~~on the basis of 2 volts for each cell for the lead-acid type. 1.2 volts for each cell for the alkali type, and 4 volts for each cell of the lithium-ion type.~~
Move deleted text to a Fine Print Note (FPN) as follows:
FPN: The most common nominal cell voltages are; 2 volts per cell for the lead-acid systems, 1.2 volts per cell for alkali systems, and 4 volts per cell for Li-ion systems, although nominal voltages might vary with different chemistries.
Substantiation: The definition should be "generic" enough to apply to any battery, not just to specific chemistries. When necessary, specific chemistries can be addressed in the body of the Article.
(1) Change the term "battery" to "dc" in order to distinguish it from nominal ac voltage. The term "nominal dc voltage" can then apply either to a "cell" (which is what the NEC 2008 definition describes), or to a "battery" (which can consist of hundreds of "cells").
(2) Add the words "assigned to a cell appropriate to its chemistry, or to a battery based on the number and type of cells in the battery." This wording accomplishes three goals:
[a] it allows the term to apply both to cells and to batteries;
[b] it allows for variations in chemistries; and
[c] it allows the term to be consistently used from one cycle to the next without having to redefine it every time a new chemistry is introduced.
(3) Move the cell-specific information, which is tutorial in nature, into a FPN. The wording of the FPN points out that nominal cell voltage can vary from one chemistry to another within a battery type. For example, there are many differnet chemistries all lumped together under the term "lithium-ion". Not all lithium cells are 4 volts.
- Lithium-ion phosphate is about 3.5 volts (nominal); see http://www.batteryuniversity.com/partone-5Ahtm
-Lithium-metal-polymer (presently discontinued for stationary use, but still used in motive) is about 3 volts; see http://www.itpower.co.uk/investire/pdfs/lithium.pdf
-LIthium-iln titanate is 2.3 volts (nominal).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
Nominal Battery Voltage. The voltage of a battery based on the number and type of cells in the battery.
FPN: The most common nominal cell voltages are; 2 volts per cell for the lead-acid systems, 1.2 volts per cell for alkali systems, and 4 volts per cell for Li-ion systems. Nominal voltages might vary with different chemistries.
Panel Statement: The panel has simplified the recommended definition and is not aware of any confusion that exists in discerning the type of voltage derived from a battery.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-65 Log #588 NEC-P13 **Final Action: Accept in Part**
(480.2)

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-31
Recommendation: Modify the panel's proposed definition as follows:
Sealed Cell ~~or Sealed Battery~~. A cell ~~or battery~~ that has no provision for the routine addition of water or electrolyte or for external measurement of electrolyte specific gravity and may contain pressure relief venting.
Substantiation: Delete references to "battery." "Cells" are sealed. "Batteries" are not and cannot be sealed. [A battery - which is multiple cells in series - might be put into a so-called "sealed enclosure", but that has nothing to do with this definition as intended by this Code.] Add the word "routine" because people have found ways to re-hydrate a dehydrated VRLA battery (for example), but that was never the intent of the design.
Cells can be "sealed" to prevent the release of gas, and they can be sealed to prevent the addition or the release of liquid (electrolyte)...or sometimes both. This definition specifically addresses the electrolyte and allows for valve regulated cells to be included under the definition of "sealed." Academically speaking, that would be incorrect; but for the practical application of this code it is acceptable.
Panel Meeting Action: Accept in Part
The panel accepts the addition of the word "routine" and rejects the remainder of the comment.
Panel Statement: The use of the phrase "sealed batteries" is a very common method of describing a multiple cell lead acid battery or a sealed gel cell battery that has a permanent cap and does not usually allow fluid to be added to the battery or release of gases out of the cells. There was no technical substantiation provided that the term sealed battery is not being used. Routine was accepted since extreme measures obviously could be used to permit fluid to be added to the battery. The panel notes that the title should be "Sealed Cell or Sealed Battery" and is incorrect in the ROP Draft.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-66 Log #589 NEC-P13 **Final Action: Accept**
(480.2)

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-28
Recommendation: Modify the panel's recommended definition:
Battery System. Interconnected battery subsystems consisting of one or more storage batteries and battery chargers, and can include inverters, converters and associated electrical equipment.
Substantiation: Clarify that a battery system can actually consist of multiple "batteries." Clarify that a battery system will always contain, as a minimum, one or more batteries and one or more battery chargers. Clarify that other features, such as inverters, converters, and electrical equipment may or may not always be present. For example, a fully integrated UPS system containing charger(s), inverter(s) battery(ies) and controls could be considered a "battery back-up system". In some applications, such as a dc power system for telecommunications, there probably would not be any inverters.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-67 Log #380 NEC-P13 **Final Action: Accept**
(480.2.Nominal Battery Voltage)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 13-29
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-68 Log #532 NEC-P13 **Final Action: Hold**
(480.5)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 13-34
Recommendation: The Panel Action should have been Accept in Part. Per Mr. Degnan's affirmative comment, add an exception as follows: "*Exception: Where stationary batteries are used for standby generator startup, communications or other applications requiring high reliability.*" Further, the Panel should consider assigning an energy level at which 840.5 applies. As written the requirement applies equally to a string of 20 "D" cells or three 12-volt automobile batteries in series. The ampere-hour rating, and hence the capacity for injury and property damage is orders of magnitude greater for the auto batteries; it is almost non-existent for the "D" cells.
Substantiation: The current requirement is too broad and considers neither applications requiring higher reliability nor energy level (i.e., ampere-hour rating of the battery).
Panel Meeting Action: Hold
The action holds only Comment 13-68.
Panel Statement: The comment introduces new material regarding communications or other applications that require high degree of reliability.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-69 Log #584 NEC-P13 **Final Action: Accept in Part**
(480.5)

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-34
Recommendation: Modify the original proposal:
480.5 Disconnecting Means. A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system over ~~30~~ 50 volts. A disconnecting means shall be readily accessible. ~~and located within sight of the battery system.~~
Substantiation: The proposal should have been Accepted in Part.
1) The 30 volt requirement was added in the last code cycle without any technical substantiation for why that level was chosen. The industry standard has always been 50 volts nominal. We note that NFPA 70E, which had permitted an even higher voltage, was revised in the upcoming release to 50 volts nominal. The use of 30 volts in the NEC creates a correlation conflict.
2) The last half of the final sentence should be deleted due to the FPN that was added in Proposal 13-33.
Panel Meeting Action: Accept in Part
Accept the recommendation to change the voltage level to "over 50 volts" and reject the remainder of the comment.
Panel Statement: Looking back at the 2008 NEC comments, Comment 13-21 to Proposal 13-16 did seem to assign the voltage of 30 volts arbitrarily without any substantiation in the Panel Statement for the action. Section 480.4 does not require overcurrent protection for conductors from a battery rated less than 50 volts and 690.71(E) and (F) require disconnection of batteries for more than twenty-four 2 volt cells (in excess of 48 volts).
The remainder of the comment was rejected because "located within sight" provides a defined distance of 50 feet or less for the location of the disconnecting means for the batteries. The FPN added in Proposal 13-33 references a permissive requirement whereas "located within sight of the battery system" as used in this section is mandatory.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18
Comment on Affirmative:
SPINA, M.: 50VDC should be considered as the nominal DC voltage of the battery.

13-70 Log #2514 NEC-P13 **Final Action: Reject**
(480.7)

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-36
Recommendation: Delete the existing text:
~~480.7 Insulation of Batteries of over 250 volts. The provisions of 480.6 shall apply to storage batteries having the cells connected so as to operate at a nominal voltage exceeding 250 volts, and, in addition, the provisions of this section shall also apply to such batteries. Cells shall be installed in groups having a total nominal voltage of not over 250 volts. Insulation, which can be air, shall be provided between groups and shall have a minimum separation between live battery parts of opposite polarity of 50 mm (2 in.) for battery voltages not exceeding 600 volts."~~
Substantiation: 480.7 provides no benefit. It requires separating cells of battery system into groups of 250 Volts. The actual voltage of the battery will depend upon the application, which may be much higher than 250 volts. When connected in series, separating into groups will only create a high voltage group and a low voltage group, but they are all part of the same battery. The requirement for inserting either a physical insulator or an air gap at the 250 volt level (which is roughly at the mid-point of most battery systems):
- increases the cost and complexity,
- introduces failure points,
- reduces reliability of the system,
- increases the possibility of human error, and
- provides absolutely no safety benefit.

See the material that I have provided for additional technical data.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided to indicate that the current requirement has caused reduced reliability, increased failure points, increased incidents of human error or reduced safety. The substantiation does not adequately support a reduction in the level of safety provided by the current separation requirement. There are currently task groups working on coordination of battery requirements in NFPA 70, NFPA 70E, and other industry standards.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-71 Log #587 NEC-P13 **Final Action: Accept**
(480.9, FPN)

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-37
Recommendation: Affirm the panel action to delete the proposed FPN.
~~FPN: For large installations requiring ventilation see Article 500.5 Classification of Locations (B) Class I Locations (2) Class I, Division 2 (2) in which ignitable concentrations of gases or vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or~~
Substantiation: The IEEE Stationary Battery Committee supports the panel's rejection of Proposal 13-37. A new FPN is not necessary. The presence of batteries in a space does not create a hazardous location when the batteries are installed, maintained and operated in accordance with best practices and codes.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-72 Log #586 NEC-P13 **Final Action: Accept**
(480.9(A))

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-39
Recommendation: Affirm the panel action to Reject the proposed new FPN.
~~FPN: For large installations requiring ventilation see 500.5 Classification of Locations (8) Class I Class I, Division 2 (2) in which ignitable concentrations of gases or vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment.~~
Substantiation: The IEEE Stationary Battery Committee supports the panel's rejection of the proposal. The presence of batteries does not create a hazardous location when installed, maintained and operated in compliance with best practices and codes.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

13-73 Log #583 NEC-P13 **Final Action: Hold**
(480.9(A), FPN (New))

Submitter: Stephen McCluer, APC by Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-38
Recommendation: Revise text to read as follows:
FPN: See ~~IEEE/ASHRAE Std. 1635, Guide for the Ventilation and Thermal Management of Stationary Battery Installations.~~ NFPA 1 Chapter 52 for ventilation considerations for specific battery chemistries.
Substantiation: Some battery technologies do not require ventilation greater than that required for human habitation. The standard included in the original proposal will include design guidelines for various battery types, but the standard has not been released by IEEE and ASHRAE at the time of this comment. The Uniform Fire Code (NFPA 1) identifies ventilation requirements for several types of batteries.
Panel Meeting Action: Hold
The panel action holds only Comment 13-73.
Panel Statement: This comment is held for the 2014 NEC revision cycle. The comment introduces a new standard (NFPA 1) that the public has not had an opportunity to review and comment.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

ARTICLE 490 — EQUIPMENT, OVER 600 VOLTS, NOMINAL

9-83 Log #2617 NEC-P09 **Final Action: Accept**
(490.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-186
Recommendation: Accept the panel action on the proposal in principle.
In the panel action in 490.33, change the title to read "Guarding of Energized Parts Operating at 600 Volts, Nominal, or Less Within Compartments." In the panel action on 490.35(B), change the wording to read "Where operating at 600 volts nominal, or less, control equipment, relays …".
Substantiation: This comment incorporates the preferred wording provided by the TCC, to which there is no objection.
Panel Meeting Action: Accept

9-86 Log #1311 NEC-P09 **Final Action: Reject**
(490.3)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 9-187
Recommendation: The Proposal should be Accepted.
Substantiation: The proposed wording provides clarity, is more appropriate for a standard, and complies with the NEC Style Manual.
The Manual of Style for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).
Most of the Panels have accepted changes to replace "per" with more explicit language and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 9-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-87 Log #1134 NEC-P09 **Final Action: Reject**
(490.21(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-195
Recommendation: Accept the proposal with the following revisions:
Circuit Interrupting Devices. Where more than one switch, circuit breaker, contactor, or other switching device, or combination of such devices is supplied by different circuits and the load side terminals are interconnected to provide for connection to different circuit conductors, each switching device shall be provided with approved means to prevent closing of more than one such device. Each such device shall be provided with a conspicuous durable sign warning of the presence of more than one supply circuit.
Substantiation: Switching devices other than load interrupter switches can be used for this application. Such arrangements are generally supplied by different circuits, but not necessarily different sources (of supply). The justification to close multiple switching devices connected in this matter should be explained in the panel statement.
Panel Meeting Action: Reject

Panel Statement: Switchgear arrangements to enhance reliability such as "main-tie-main" configurations require the ability to close all three devices at the same time. Additionally, generator testing to ensure proper synchronization requires closing multiple switching devices at the same time.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-88 Log #1556 NEC-P09 **Final Action: Reject**
(490.21(E))

(490.22)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-196
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing specific text on "designed for the purpose" in the last sentence of this section.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Hold
This action is on Comment 9-89 only.
Panel Statement: The TCC recommendation is on text that was not subject to the panel action on Proposal 9-196 and action on this recommendation is not appropriate at this point in the process. Action on this recommendation at this time precludes public review and comment. This action holds any potential revision to the last sentence regarding fuseholders and does not obstruct implementing CMP 9's action on Proposal 9-196.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-90 Log #146 NEC-P09 **Final Action: Accept**
(490.44(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-201
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered by Code-Making Panel 9 based upon the action of Code-Making Panel 1 taken on Proposal 1-63.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the direction of the Technical Correlating Committee to reconsider its action on Proposal 9-201 and has taken action in Comment 9-91 to hold Proposal 9-201 and Comment 9-91.
Panel Statement: See the panel action and statement on Comment 9-91.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-91 Log #2618 NEC-P09 **Final Action: Hold**
(490.44(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-201
Recommendation: Continue to accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110: "**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
Panel Meeting Action: Hold
This action holds Comment 9-91 and Proposal 9-201 for the 2014 NEC revision cycle.
Panel Statement: Because CMP 1 has held comments related to this topic, this action correlates with CMP 1's actions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-92 Log #2775 NEC-P09 **Final Action: Accept**
(490.47)

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 9-202
Recommendation: Proposal should be rejected.
Substantiation: CMP 4 rewrote the definitions and subsequent requirements for the installation of the service conductors that the submitter is referencing in his proposal. The submitter presented rationale in his substantiation based on the presumption that CMP 4 would accept his proposals to CMP 4, we did not. The submitter is incorrect that under existing NEC requirements all "service drop" and "service entrance" conductors are utility owned, they are not. Utilizing the word "service" in 408.3 will be sufficient whether the recommended changes in Article 430 pass or not.
Panel Meeting Action: Accept
Panel Statement: CMP 9 assumes the article reference in the substantiation is to Article 230.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 500 — HAZARDOUS (CLASSIFIED) LOCATIONS, CLASSES I, II, AND III, DIVISIONS 1 AND 2

14-4 Log #682 NEC-P14 **Final Action: Reject**
(500 through 516)

Submitter: Evans Massey, Baldor Electric Company
Comment on Proposal No: 14-6a
Recommendation: In the Fine Print Notes (FPNs) appearing in Articles 500 through 506, 510, 511, 514, 515 and 516, delete all publication and revision dates for standards that are not extracted as text.
Substantiation: The Technical Correlating Committee action on1Proposal 14-6a (Log#CP1400) refers to *Manual of Style for NFPA Technical Committee Documents* section 2.3.1.2.4 in the request to maintain dated references to external standards. Panel 14 is bound instead by the National Electric Code (*NEC*®) Style Manual, which in Section 4.2 states that reference to other standards shall not be in mandatory Code text. There is no requirement to have dated references to these external standards. Identification of dated reference is only mandated for extracts, as discussed in Section 4.3.2.3.
Undated references are appropriate for the hazardous location series of external IEC based standards, for instance the ANSI/ISA 60079, and ANSI/ISA 61241 series. Where certification is sought for product in the US, typically the most recent version of the standards are used. With dated references for this standards series the following problems can occur- In the US, we could be using one version for NEC, another version for USCG and MMS Certification, and yet a third by our third party certifiers. This is further complicated by the adoption cycle of the Code. If a manufacturer held certification to the most recent version of the standard, and due to delays in adoption, certain states were using earlier versions of the code, it would be impossible to demonstrate compliance to the previous version of the standard that would be requested from earlier versions of the Code. Further, in Chapter 4 – Essentially what this means is that third party certified product will be unable to meet the Code if the dated references are included.

Panel Meeting Action: Reject
Panel Statement: The NEC Technical Correlating Committee has directed that dates are to be included.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-5 Log #2303 NEC-P14 **Final Action: Accept in Part**
(500 through 516)

TCC Action: Based on the panel statement on Comment 14-5 and the Technical Correlating Committee's Comment 14-6, which was Accepted, the Technical Correlating Committee directs that the panel action on this comment be reported as "Accept in Part", and accepts the restoration of the publication dates in Articles 500-506, 510, 511, 513, 514, 515 and 516, but not the additional Annex since the panel does not have jurisdiction over it.
Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 14-6a
Recommendation: Restore the publication and revision dates for referenced documents mentioned in the Fine Print Notes (FPNs) as they appeared in the 2008 NEC in Articles 500 through 506, 510, 511, 513, 514, 515 and 516. Provide these same publication and revision dates for those same documents appearing in Annex A.
Substantiation: While fine print notes are intended to provide reference information only, document publication and revision dates are important. Just like the date of the NEC revision needs to be retained for general information affecting designs and installations made at a point in time, these dated references also serve an important task. Deleting the publication and revision information would be disservice for uses and practitioners of this Code.
Panel Meeting Action: Reject
Panel Statement: The NEC Technical Correlating Committee has directed that the correct dates are to be included. Annex A is under the jurisdiction of Panel 1.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
WECHSLER, D.: The requested action was to restore the publication and revision dates for referenced documents mentioned in the Fine Print Notes (FPNs) as they appeared in the 2008 NEC in Articles 500 through 506, 510, 511, 513, 514, 515 and 516, and not eliminate some of the dates as the proposal action reflected.

However the NEC Technical Correlating Committee directed that the correct dates were to be included and this action was accepted in part, but since Annex A was under the jurisdiction of Panel 1 no action was taken on the Annex material. Therefore the action on this comment really was to accept in Principle.

A real mess may however result from the resultant actions taken as the specific detailed documentation perhaps may not have addressed for example, action taken to comply with the direction by the TCC, the facts that some fpn documents had dates which were not designated for change during the 2011 document cycle nor where considered as part of any proposed action, and action which should now result in some documents such as the ISA 60079-0 being dated 2005 and not 2009. For this reason it is strongly recommended that the Standards Council eliminate all the product standard fine print notes from Articles under the purview of CMP-14, as it was determined in the meeting that there was actually little value in retaining this product standard fine print notes at all.

14-6 Log #147 NEC-P14 **Final Action: Accept**
(500.2)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-8
Recommendation: The Technical Correlating Committee directs that the number, title and edition of the document from which this extract is taken be listed at the end of the extract in accordance with NEC Style Manual 4.3.2.3.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the panel action on Proposal 14-9, in accordance with the *Manual of Style for NFPA Technical Committee Documents* .

Ballot Results: Affirmative: 14

14-7 Log #1292 NEC-P14 **Final Action: Reject**
(500.2 Combustible Dust)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 14-9
Recommendation: We request CMP-14 reconsider the action on Proposal 14-9 and reject the proposal.
Substantiation: The definition of combustible dust is covered in NFPA 499, which is referenced in 500.4(B). The classification of the area should be determined by professionals using NFPA 499. That complete process is required to be documented in accordance with 500.4(A). The area classification process and documentation is supposed to occur as part of the design process and prior to the installation. NEC 90.1(C) indicates this "Code" is not intended as a design manual. NEC 90.2(A) indicates the "Code" covers installation requirements for electrical systems. The proper place for the definition of "Combustible Dust" is NFPA 499. In an effort to minimize the chance of owner/operators assuming area classification is an installation responsibility, enforcement recommends this information be excluded from the NEC and remain in NFPA 499. Including the definition in multiple locations, including the NEC, increases the number of correlation responsibilities required as documents are revised without increasing safety.
Panel Meeting Action: Reject
Panel Statement: Panel 14 agrees that the definition of combustible dust, as extracted from NFPA 499, should be included because this information is important in hazardous area classification.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
JONES, R.: I agree with the substantiation submitted with Comment 14-7. The NEC is an installation standard and is not intended as a design manual.

OFFERDAHL, D.: To date there has been no documentation presented to indicate that the existing definition for "Combustible Dust" in NFPA 499, is not or has not been sufficient. The inclusion of a definition for "Combustible Dust in Section 500.2 and 506.2 will increase the probability that facility management staff will assume that the installers can complete such a task and that ultimately because there are now definitions for combustible dust. Therefore AHJ's could now also be assumed to be responsible for classification of the area or location." The existing reference to NFPA 499 for the definition of combustible dust located in Section 500.4(B) has been adequate for many years and a change has not been supported by current documentation.
Comment on Affirmative:
SIMMONS, J.: James Carpenter is correct in his assessment of the negative effects of adding this definition to the NEC. Section 90.1 tells us, in subsection (A) that "the purpose of this Code is the practical safeguarding of persons and property from the hazards arising from the use of electricity." The addition of the definition does not increase the safety of Class II installations. Subsection (C) (Intention) of Section 90.1 goes on to indicate that "this Code is not intended as a design specification or an instruction manual for untrained persons."

The addition of a definition that states a combustible dust is "any finely divided solid material that is 420 microns or smaller in diameter and presents a fire or explosion hazard" does nothing to help an inspection agency insure the safety of a Class II installation. It also does not help the installer have a better understanding of what is required to safely install Class II wiring.

Area classification is a design function which requires the use of many standards in addition to the NEC. Typically the design professional determines the area classification and provides that information to the inspection agency and installer in the form of plans and specifications. The design professional may need to refer to more than one standard to determine the appropriate area classification.

The inclusion of selected references from other standards in the NEC could, in some cases, lead to unsafe installations where uninformed designers rely strictly on the NEC to design projects for hazardous locations believing that the important parts of the other standards have been referenced in the NEC.

There has been a tendency in the past few code cycles to add more and more "design" references, particularly in the form of FPNs, to the NEC. As the number of design references increase, the NEC becomes more difficult for inspectors and installers to use. As 90.1 indicates, the NEC is not intended to be used as a design manual.

14-8 Log #490 NEC-P14 **Final Action: Reject**
(500.5(C)(1)(3), FPN)

Submitter: Mindy Wang, Ampco Safety Tools
Comment on Proposal No: 14-14
Recommendation: Revise text to read as follows:

500.5 Classification of Locations.

(C) Class II Locations.

(1) Class II, Division 1.

(3) In which Group E combustible dusts may be present in quantities sufficient to be hazardous.

FPN: Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution is necessary to avoid ignition and explosion. For further information on classification and safeguards against fire and explosion for combustible metal dusts, see NFPA 484 – 2009, Standard for Combustible Metals.

Substantiation: NFPA 484 addresses area classification by identifying the following locations to be classified per Article 500 of NFPA 70:

- Chapter 6 Aluminum, Section **6.1.6 Electrical Power and Control, paragraph 6.1.6.2, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 6 Aluminum, Section **6.2.4.2 Electrical Equipment, paragraph 6.2.4.2.4, "**Wet solvent milling areas or other areas where combustible or flammable liquids are present shall be classified where applicable, in accordance with Article 500 of *NFPA 70, National Electrical Code"*
- Chapter 6 Aluminum, Section **6.2.4.3 Plasma Spray Operations, paragraph 6.2.4.4, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 7 Magnesium, Section **7.1.6 Electrical Power, paragraph 7.1.6.2, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 7 Magnesium, Section **7.3.4 Electrical Equipment, paragraph 7.3.4.1, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 7 Magnesium, Section **7.7.6 Storage of Magnesium Powder, paragraph 7.7.6.6, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 8 Niobium, Section **8.1.4 Electrical Power, paragraph 8.1.4.3, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 9 Tantalum, Section **9.1.3 Electrical Power, paragraph 9.1.3.1, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 10 Titanium, Section **10.6.2 Titanium Powder Handling, paragraph 10.6.2.4* *Electrical Installations.***, "In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 11 Zirconium, Section **11.6.2.4 Electrical Installations, paragraph 11.6.2.4.2, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 12, Requirements Combustible Metals Covered Chapter 5 Chapter 11, Section **12.3.2 Storage of Combustible Metal Powder, paragraph 12.3.2.6, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code*."
- Chapter 12, Requirements Combustible Metals Covered Chapter 5 Chapter 11, Section 12.5 Electrical Equipment, paragraph **12.5.2, "**In local areas of a plant where a hazardous quantity of dust accumulates or is present in suspension in the air, the area shall be classified, and all electrical equipment and installations in those local areas shall comply with Article 500 of *NFPA 70, National Electrical Code.*"

Proposed text provides cross reference to an existing standard on dust hazard and is consistant with other informative FPN found in Article 500.

Panel Meeting Action: Reject
Panel Statement: The submitter has provided no additional information to substantiate the comment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-9 Log #454 NEC-P14 **Final Action: Reject**
(500.5(C)(2)(1))

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 14-15
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:

"(1) In which combustible dust due to abnormal operations may be are present in the air in quantities sufficient to produce explosive or ignitable mixtures; or...".

Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms *may* or *can* shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term *may* shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term *may* in this Section does not meet these either of these criteria, it should be changed.

The change wording proposed here does not change the meaning of this Section since the requirement relates to the abnormal operations as opposed to normal operations in Section 500.5(C)(1) which has similar wording.

Panel Meeting Action: Reject
Panel Statement: The recommendation does not comply with Section 4.4.5 of the NFPA Regulations Governing Committee Projects, as it is not clear what text changes are being proposed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-10 Log #1132 NEC-P14 **Final Action: Reject**
(500.5(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-16
Recommendation: Accept the proposal.
Substantiation: The word "flyings" should be inserted after the first use of "fibers" as it is in the last half of the sentence. "Or where materials producing combustible fibers/flyings" is superfluous; if they are producing fibers/flyings they are present and included in "because of the presence of..."
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-11 Log #2155 NEC-P14 **Final Action: Accept**
(500.5(D))

Submitter: Jeremy Neagle, Intertek Testing Services
Comment on Proposal No: 14-16
Recommendation: Revise 500.5(D) as follows:

"(D) Class III Locations. Class III locations are those that are hazardous because of the presence of easily ignitible fibers or where materials producing combustible flyings are handled, manufactured, or used, but in which such fibers/flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in 500.5(D)(1) and (D)(2)."

Substantiation: I agree with the panel action and statement. However, the submitter introduces text (although shown incorrectly with struck-through formatting) which would clarify the current text of the code. Adding the word 'where' before 'materials' corrects the grammar of the sentence and clarifies the requirements of the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-12 Log #1131 NEC-P14 **Final Action: Reject**
(500.7(K)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-22
Recommendation: Accept the proposal with the following revisions:
In a building or other structure located in or with an opening into a Class 1, Division 2 location where the interior of the building or other structure does not contain a source of flammable gas or vapor, electrical equipment in that building or other structure shall not be required to comply with requirements for Class 1, Division 2 locations.
Substantiation: Structures other than "buildings" should be included. All electrical equipment for unclassified locations may not be suitable for the conditions. "General" equipment for unclassified locations is broad and may be deemed to modify "uses permitted" and "uses not permitted" provisions.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-13 Log #1287 NEC-P14 **Final Action: Reject**
(500.8, FPN 1)

Submitter: Mindy Wang, Ampco Safety Tools
Comment on Proposal No: 14-23
Recommendation: Revise original proposal to read as follows:
500.8 Equipment.
FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance. Spark resistant tools may be needed to control ignition sources in classified locations.
Substantiation: The scope of Article 500 covers the requirements for electrical and electronic equipment and wiring in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases, flammable liquid–produced vapors, combustible liquid–produced vapors, combustible dusts, or ignitable fibers/flyings.
Section 500.8 states that "Articles 500 through 504 require equipment construction and installation that ensure safe performance under conditions of proper use and maintenance." Hand tools are often used in installation or maintenance.
FM Approvals LLC, formerly Factory Mutual Research Corporation, (FM) is an international organization recognized by the U.S. government as a Nationally Recognized Testing Laboratory (NRTL) for scientific research and product certification. Product approval from a NRTL assures that products meet consensus-based standards of safety to provide the assurance, required by OSHA, that these products are safe for use in the United States workplace. FM Approval Standard 7910, Spark Resistant Tools is used as guidance to evaluate tools intended for use in environments where there is a risk of ignition of flammable materials, dusts or vapors resulting from sparks created by iron and steel hand tools. These tools prevent the ignition of flammable materials, dusts or vapors by mechanical sparks created by the use of iron and steel hand tools slipping or striking a surface. These tools provide a solution in place of ferrous tools in flammable environments.
As stated in FPN No 1 of section 500.8, "It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance." Flammable atmospheres require a variety of safety measures including control of ignition sources. Hand tools should not be overlooked as a potential ignition source in flammable atmospheres.
Proposed text provides additional information on more than ordinary care that is available and can be taken with regard to installation and maintenance in classified (hazardous) locations; therefore, we believe proposed text is within the scope of Article 500. We respectfully request the Committee to reconsider our proposal.
Panel Meeting Action: Reject
Panel Statement: The use of spark resistant tools is not within the scope of the *National Electrical Code*.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-14 Log #1288 NEC-P14 **Final Action: Reject**
(500.8, FPN 1)

Submitter: Mindy Wang, Ampco Safety Tools
Comment on Proposal No: 14-23
Recommendation: Revise original proposal to read as follows:
500.8 Equipment.
FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance. For further information on ignition sources control pertaining to flammable and combustible liquids see NFPA 30-2008, Flammable and Combustible Liquids Code. For further information on ignition sources control pertaining to combustible dusts see NFPA 654-2006, Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids.
Substantiation: Article 500 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases, flammable liquid–produced vapors, combustible liquid–produced vapors, combustible dusts, or ignitable fibers/flyings.
Proposed text provides cross reference to existing standards on control of ignition sources in flammable atmospheres and is consistant with other informative FPN found in Article 500.
Panel Meeting Action: Reject
Panel Statement: It is not the intent of nor is it within the scope of the Code to provide cross references to other standards that deal with sources of ignition beyond those presented by the electrical system, nor does the proposed text contribute to the utility of the Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-15 Log #382 NEC-P14 **Final Action: Accept**
(500.8(B)(2)(b))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-24
Recommendation: Continue to accept the proposal.
Substantiation: This proposal removes the slang construction that substitutes "per" for "in accordance with" and is correct and enhances clarity. It is therefore to be distinguished from those proposals that would remove a perfectly concise and correct use of the word as a proposition meaning "for each". Comments have been submitted on all such proposals accordingly.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-16 Log #1684 NEC-P14 **Final Action: Reject**
(500.8(B)(3)(6))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-25
Recommendation: Delete and substitute text as follows:
(3) Where specfically permitted in Articles 501 through 503, electrical equipment not specifically identified for use in hazardous (classified) locations shall be permitted to be installed or used in Division 2 locations if the equipment does not constitute a source of ignition under normal conditions of use.
(C) Where flammable gases, flammable liquid produced vapors, combustible liquid produced vapors, combustible dusts, ignitable fibers/flyings are or likely to be present, their simultaneous presence shall be considered when determining the safe operation of the electrical equipment.
Substantiation: "General Purpose" is not Code defined; "equipment" includes enclosures part of or in connection with, an electrical system per the Article 100 definition.
In (6), fibers/flyings should be included as they can affect safe operating temperatures. "Likely" is a term used over 80 times in the NEC
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-17 Log #1683 NEC-P14 **Final Action: Reject**
(500.8(C)(6))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-30
Recommendation: Accept the proposal revised as follows:
Fixed equipment in Class 1 locations that is approved for use in Class 1 Division 2 locations shall not be required to be marked with the class, division, group, temperature class, or ambient temperature range.
Substantiation: Although "general purpose" may be it may be deemed not to include weatherproof, dusttight, etc., which even if not required may be installed. Who is to determine "acceptable"? "Approved" is defined as acceptable to the AHJ.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. 14-18 Log #2317 NEC-P14 **Final Action: Reject**
(500.8(E))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 14-33
Recommendation: Revise the text to mirror the requirements of 110.12(A), as follows:
(3) Unused Openings. All unused openings, other than those intended for the operation of equipment, those intended formounting purposes, or those permitted as part of the design for listed equipment, shall be closed with listed metal close-up plugs. The plug engagement shall comply with 500.8(E)(1) or 500.8(E)(2).
Substantiation: This comment is mainly for consistency with other Code requirements. Although openings in hazardous locations equipment are often only for raceway and cable entries, there may be other openings that must remain open as well.
Panel Meeting Action: Reject
Panel Statement: The text as proposed in this comment would allow the possibility of an unsafe condition. All unused threaded openings must be plugged so that the integrity of the enclosure is maintained. Panel 14 notes that 500.8(E) applies to a special application and it is not the Panel's intent to mirror the requirement of 110.12(A).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-19 Log #2539 NEC-P14 **Final Action: Hold**
(500.8(E)(1))

Submitter: Richard A. Janoski, Finleyville, PA
Comment on Proposal No: 14-33
Recommendation: Revise text to read as follows:
(1) **Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings.** For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, listed conduit fittings, or listed cable fittings shall be used.
Substantiation: As 500.8(E)(1) is presented in the 2008 NEC, a grammatical error leaves the conduit fittings and the cable fittings without a rule that requires them to be listed. The word "listed" is only preceding the word "conduit", therefore it only applies to the conduit. The addition of the word "listed" preceding the conduit fittings, and the cable fittings will add the necessary listing requirement. This will also provide continuity between the proposed text for 500.8(E)(1) and 500.8(E)(2).
Panel Meeting Action: Hold
Panel Statement: While the panel supports the comment, the suggested wording addresses text that was not altered at the Report on Proposals (ROP) stage and, therefore, constitutes new material. This comment will automatically be logged as a proposal for the next revision cycle of the Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-20 Log #2619 NEC-P14 **Final Action: Accept in Principle**
(500.8(E)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-33
Recommendation: Accept the proposal in principle.
In 500.8(E)(1) change "referred to herein" to "described in this section."
Substantiation: The NEC Style Manual (at 3.3.4) does not permit the word "herein" because the "here" in the "herein" is indistinct, and requires that if the pointer is necessary (frequently it is not but it is appropriate in this case) an alternate, and specific pointer such as the one suggested in this comment must be used.
Panel Meeting Action: Accept in Principle
Delete the phrase "referred to herein" from the second sentence of 500.8(E)(1).
Panel Statement: The panel agrees with the submitter and has deleted the ambiguous phrase.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-21 Log #2157 NEC-P14 **Final Action: Accept**
(500.8(E)(2))

Submitter: Jeremy Neagle, Intertek Testing Services
Comment on Proposal No: 14-33
Recommendation: The third sentence of 500.8(E)(2) should be revised to read as follows:
'…Metric threaded entries into explosionproof equipment shall have a class of fit of at least 6g/6H and shall be made up with at least five threads fully engaged for Group C and Group D, and at least ~~not less than~~ eight ~~full~~ threads fully engaged for Group A and Group B…'
Substantiation: The proposed changes clarify the text of the code and are consistent with the wording used throughout this section of the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-22 Log #2620 NEC-P14 **Final Action: Reject**
(500.8(E)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-34
Recommendation: Accept the proposal in principle.
Change "identified as being metric" to "identified and marked as being metric."
Substantiation: The panel statement is not responsive. The sentence applies to "equipment with metric threaded entries …" and then "such entries" as the subject of the next clause. How can this rule be covering anything but equipment? It then asks that this equipment either be identified as metric, or shipped with NPT adapters. All of this makes perfect sense, as long as "identified" really means "marked." This comment suggests using both terms to avoid losing the original concept, but the word "marked" is essential to assure correct application in the field.
Panel Meeting Action: Reject
Panel Statement: Marking is only one method of identification. Other equally acceptable methods can be used.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-23 Log #10 NEC-P14 **Final Action: Reject**
(500.8(F))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 14-35
Recommendation: Accept this proposal in part by accepting the recommended text for 500.8(F) and continuing to reject the recommendation for a fine print note.
Substantiation: The panel statement about adding conductive optical fiber cables assumes that conductive optical fiber cables are not already covered. The current text covers optical fiber cables that have "conductors that are capable of carrying current". See the definition of conductive optical fiber cable in 770.2; a cable that has "conductors that are capable of carrying current" is a conductive optical fiber cable. A typical conductive optical fiber cable has a metallic strength member.
Composite optical fiber cables have electrical conductors that are intentionally current-carrying. Section 770.3(A) states that conductive optical fiber cables are classified as electrical cables in accordance with the type of electrical conductors.
Panel Meeting Action: Reject
Panel Statement: No additional substantiation has been provided for the addition of "conductive optical fiber cable".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 501 — CLASS I LOCATIONS

14-24 Log #1545 NEC-P14 **Final Action: Reject**
(501.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-36
Recommendation: Accept the proposal with the following revisions:
Wiring Methods. Wiring methods shall comply with 501.10(A) or (B).
(A) Class 1, Division 1.
In Class 1, Division 1 locations, only the wiring methods in (a) through (d) shall be employed.
(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit with threaded fittings and thread to thread connections.
Exception: Type PVC conduit and Type RTRC conduit containing an equipment grounding conductor shall be permitted underground where encased in a cement concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover from the top of the conduit to finished grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit with threaded fittings and connections shall be used for not less than the last 600 mm (24 in.) of the underground run to emergence and the point of connection to the above ground wiring method or enclosure.
(b) Type MI cable with approved termination fittings.
(c) On premises with restricted public access where the conditions of supervision and maintenance ensure that only qualified persons install and service the installation,
Type MC-HL and Type ITC-HL cable listed for Class 1, Zone 1, or Division locations, with a gas/vaportight continuous corregated sheath and overall jacket of polymeric material, with fittings listed for the application, and containing an equipment grounding conductor.
FPN: See 330.12, 727.4, and 727.5 for restrictions on the use of Type MC and Type ITC cables.
(2) Flexible Connections. Where necessary to employ flexible connections. flexible fittings listed for Class 1 locations and containing an equipment grounding conductor, or flexible cords or cables in accordance with 400.3 and 501.140 shall be permitted in lengths not longer than necessary.
(3) Boxes and Fittings. All boxes, other enclosures, and fittings shall be approved for Class 1 locations.
Substantiation: "Shall be permitted" does not impose a requirement per 90.5 and thus, is not enforceable. 250.122 already applies. Threaded fittings and connections should be specified for RMC and IMC. (See 342.42 and 344.42). Type MI cable and fittings are not required to be listed in Article 332; installation and support are covered in that Article.
(c) should be predicated on supervision and maintenance, not type of occupancy; "industrial" rules out commercial and governmental occupancies and is not specified in 408.20 for a similar provision.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-25 Log #1552 NEC-P14 **Final Action: Reject**
(501.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-36
Recommendation: Accept the proposal with the following revisions:
Wiring Methods. Wiring methods shall comply 501.10(A) and (B).
(A) Class 1, Division 1.
(1) General. In Class 1, Division 1 locations, only the wiring methods in (a) through (d) shall be utilized unless otherwise permitted in 501.10(B)(3).
(a) Threaded rigid metal conduit, threaded steel intermediate metal conduit, with threaded fittings and connections.
Exception: Type PVC conduit and Type TRTRC conduit containing an equipment grounding conductor shall be permitted underground where encased in a cement concrete envelope a minimum of 500 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover, measured from the top of the conduit to finished grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit, with threaded fittings and connections shall be used for not less than the last 600 mm (24 in.) of the underground run to the above wiring method or enclosure.
(b) Type MI cable with termination fittings approved for the location.
(c) On premises with restricted public access where the conditions of supervision and maintenance ensure that only qualified persons install and service the installation. Type MC-HL cable containing an equipment grounding conductor and listed for use in in Class 1, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metal sheath, an overall jacket of polymetric material.
FPN: See 300.12 for restrictions on use of Type MC cable.
Substantiation: In (A)(1), "shall be permitted" is not mandatory per 90.5.
(B) (Not Enforceable) and doesn't correlate with 501.10, Wiring methods, which uses the word "shall". Threaded fittings and connections should be required in addition to threaded RMC and IMC since 342.42 and 344.42 do not prohibit threadless couplings and connectors. The first sentence of the Exception should specify "underground" since the first sentence specifies underground. In the Exception, the dimensions should be a minimum since "shall" requires 2 ft, no more. The concrete envelope should specify "cement" since there is also asphalt concrete. In the Exception, "point of emergence" is superfluous and permits RMC and IMC to terminate at ground level. The above ground wiring may not be a raceway, such as an enclosure or Type MI cable. Article 330 in my 2008 NEC does not reference MC-HL. Article 332 does not require listing for Type MI cable or fittings. Proposal 3-38, 332.4 (new) in the 2010 ROP to require listing, was rejected.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-26 Log #148 NEC-P14 **Final Action: Accept**
(501.10(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-37
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text to read as follows:
501.10 Wiring Methods. Wiring methods shall comply with 501.10(A) or (B).
(A) Class I, Division 1.
(1) General. In Class I, Division 1 locations, the wiring methods in (a) through (d) shall be permitted.
(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
Exception: Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, and 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.
(b) Type MI cable ~~with termination~~ terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Zone 1, or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor (s) in accordance with 250.122, and ~~provided~~ terminated with ~~termination~~ fittings listed for the application.
Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.
~~FPN: See 330.12 for restrictions on use of Type MC cable.~~
(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable, listed for use in Class I, Zone 1, or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and ~~provided~~ terminated with ~~termination~~ fittings listed for the application, and installed in accordance with the provisions of Article 727.

~~*FPN: See 727.4 and 727.5 for restrictions on use of Type ITC cable.*~~
(2) Flexible Connections. *Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for ~~Class I, Division 1 locations~~ the location or flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location shall be permitted.*
(3) Boxes and Fittings. *All boxes and fittings shall be approved for Class I, Division 1.*
Panel Statement: As there is no "Article" for Type MC-HL Cable, a reference to Part II of Article 330 (Type MC Cable) is required to specify what installation requirements are to be applied for Type MC-HL Cable. (Add Part II, as shown.) The panel believes that a reference to all of Article 727 is appropriate as the application of ITC-HL cable requires the application of all sections of Article 727.

Ballot Results: Affirmative: 14

14-28 Log #2621 NEC-P14 **Final Action: Reject**
(501.10(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-43
Recommendation: Accept the proposal in principle.
In 501.10(B)(1)(4) change "with the provisions of Article 725 …" to "with the provisions of 725.154 and 725.179…".
Substantiation: This change will bring the panel action into compliance with the whole-article reference prohibition in the NEC Style Manual, at 4.1.1.
Panel Meeting Action: Reject
Panel Statement: Panel 14 has determined that a reference to all of Article 725 is appropriate, as the application of PLTC and PLTC-ER cable requires the application of all parts of Article 725.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-29 Log #1402 NEC-P14 **Final Action: Reject**
(501.10(B)(1)(2))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 14-47
Recommendation: The panel should reject the proposal.
Substantiation: While we agree that the permission to use rigid metal conduit and intermediate metal conduit is covered by 501.10(B)(1)(1), it does not add to the user-friendliness of the NEC to remove 501.10(B)(1)(2). This (2) takes up one and a half lines in the NEC and is hardly responsible for contributing to the bulk of the Code. When the 2011 NEC is printed, this section will be highlighted to show that a change was made. As a CMP user member stated during the ROP meetings, it could appear as if these wiring methods are no longer allowed in these locations. There was no Panel Statement to explain the deletion. It is much more user-friendly to leave the text in rather than to send the reader back to another section.
Panel Meeting Action: Reject
Panel Statement: The redundancy does not improve "user-friendliness" or clarity of the Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-30 Log #1560 NEC-P14 **Final Action: Reject**
(501.10(B)(2)(5))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-49
Recommendation: Accept the proposal with the following revisions:
Extra-hard usage flexible cords or cables that comply with 400.3 and contain an equipment grounding conductor, and are provided with listed bushed fittings where entering enclosures. The flexible cord or cable shall not be longer than necessary, and installed in a manner so there is no strain on terminations, or provided with approved strain relief.
Substantiation: Article 400 does not specify listing and there is no Table comparable to Table 400.4 for listed cords. Reference to 400.3 requires consideration for wet locations, sunlight resistance, and use. All extra-hard usage types may not be suitable, e.g., EV, EVE, EVT and those without a W in their designation.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-31 Log #1559 NEC-P14 **Final Action: Reject**
(501.10(B)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-50
Recommendation: Accept the proposal with the following revisions:
(B)(3) Nonincendive field wiring shall be permitted using any wiring method suitable for the use and conditions.
(B)(3)(1) In separate cables or raceways.
Substantiation: "Any" wiring methods permitted for unclassified locations includes many which may not be suitable or permitted such as open wiring on insulators, concealed knob and tube wiring, and may modify "not permitted" use since it modifies those provisions per 90.3. Separate raceways should be included with separate cables.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-32 Log #2158 NEC-P14 **Final Action: Accept**
(501.10(B)(3))

Submitter: Jeremy Neagle, Intertek Testing Services
Comment on Proposal No: 14-50
Recommendation: Revise the second paragraph of 501.10(B)(3) as follows:
"Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:
(1) In separate cables
(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
(3) In multiconductor cables or raceways, where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)"
Retain first paragraph and FPN.
Substantiation: I agree with the panel action and statement. However, it is noted that the current text of 501.10(B)(3) inadvertently omits the permission to run separate non-incendive field wiring circuits as discreet conductors in a single raceway, the proposed change corrects this.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-33 Log #1105 NEC-P14 **Final Action: Reject**
(501.15(B)(2) Exception No. 4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-52
Recommendation: Accept the proposal with the following revisions:
(2) The conduit system segment is entirely in outdoor locations not enclosed by walls or other structures which would prevent natural air ventilation and permit accumulation of flammable gases or vapors.
Substantiation: Outdoor locations may be closely confined by solid walls or structures that impede dispersion of gases and vapors.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

(501.15(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-195
Recommendation: Accept the panel action in principle.
In 505.15(C)(1)(d) change "the provisions of Article 725" to "the provisions of 725.154 and 725.179."
Substantiation: This comment resolves a violation of the whole article referencing prohibition in the NEC Style Manual at 4.1.1.
Panel Meeting Action: Reject
Panel Statement: Panel 14 has determined that a reference to all of Article 725 is appropriate, as the application of PLTC and PLTC-ER cable requires the application of all parts of Article 725.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-35 Log #2622 NEC-P14 **Final Action: Reject**
(501.15(D)(1) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-54
Recommendation: Accept the proposal.
Substantiation: When the gas exposure is limited to a twisted pair, that pair with or without shielding applied to the pair will pass a leak test. However, when the shielding is applied to plural twisted pairs, the opportunity for gas migration is far greater as the shielding creates a miniature hose. The ubiquitous Ethernet cabling is a good example, since the shielded types generally apply the shielding around the entire assembly of eight conductors (four pairs). This is especially true with the advent of modern configurations to reduce cross-talk in the higher communication categories. These configurations apply a different twist pitch to each pair, with the result that the pairs do not nest and the passage of gas is even more severe as a result. The permission to avoid separating cable components must be strictly limited.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided data to support the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-36 Log #2623 NEC-P14 **Final Action: Reject**
(501.15(D)(2) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-57
Recommendation: Accept the proposal.
Substantiation: The panel statement refers to the statement on the submitter's Proposal 14-54, which references "all types of shielded cables – pairs, triads, quads, etc." but the intent of the proposal was only to reach that which is covered in the final sentence of the exception, namely, twisted-pair cables. When the gas exposure is limited to a twisted pair, that pair with or without shielding applied to the pair will pass a leak test. However, when the shielding is applied to plural twisted pairs, the opportunity for gas migration is far greater as the shielding creates a miniature hose. The ubiquitous Ethernet cabling is a good example, since the shielded types generally apply the shielding around the entire assembly of eight conductors (four pairs). This is especially true with the advent of modern configurations to reduce cross-talk in the higher communication categories. These configurations apply a different twist pitch to each pair, with the result that the pairs do not nest and the passage of gas is even more severe as a result. The permission to avoid separating cable components must be strictly limited.
Panel Meeting Action: Reject

14-38 Log #6 NEC-P14 **Final Action: Accept in Principle**
(501.17)

TCC Action: The Technical Correlating Committee directs that the panel action on Comment 14-38 be reported as "Accept in Principle" by accepting all the proposed text changes and also by adding the date of the ANSI Standard.
This action will then correlate with Comment 14-37, which was an "Accept" by accepting the addition of the date of the ANSI document.
The Technical Correlating Committee also directs that the phrase "need not be provided with an additional means of sealing." be changed to: "... shall not be required to be provided with an additional means of sealing." to conform with the NEC Style Manual.
Submitter: Ted H. Schnaare, Rosemount Incorporated
Comment on Proposal No: 14-60
Recommendation: Revise text to read as follows:
501.17 Process Sealing
This section applies to process connected equipment which includes, but is not limited to, canned pumps, submersible pumps, flow,pressure, temperature, or analysis measurement instruments, A process seal is a device to prevent the migration of process flu ids from the designed containment into the external electrical system.
Process connected electrical equipment that incorporates a single process seal, such as a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure, The additional means may include, but is not limited to the following: ~~One of the following means shall be provided to prevent process fluids from entering the electrical raceway or cable system:~~
~~(1) Process connected electrical equipment that incorporates a single process seal, such as single compression seal, diaphragm, or tube to isolate flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure. The additional means may include, but is not limited to the following:~~
(1) ~~a.~~ A suitable barrier meeting the process temperature and pressure conditions that the barrier will be subjected to upon failure of the single process seat There shall be a vent or drain between the single process seal and the suitable barrier. Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
(2) ~~b.~~ A listed Type MI cable assembly, rated at not less than 125 percent of the process pressure and not less than 125 percent of the maximum process temperature (in degrees Celsius), installed between the cable or conduit and the single process seal.
(3) ~~c.~~ A drain or vent located between the single process seal and a conduit or cable seal. The drain or vent shall be sufficiently sized to prevent over-pressuring the conduit or cable seal above 6 in. water column (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.
~~(2)~~ Process-connected electrical equipment that does not rely on a single process seal or is listed and marked - single "seal" or "dual seal" need not be provided with an additional means of sealing.
FPN: For construction and testing requirements for process sealing for listed and marked "single seal" or "dual seal" requirements refer to ANSl IISA-12.27.01, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.

Substantiation: The addition of 501.17 does much to improve the clarity of the process sealing issue. However, the new text eliminates an important provision of the current and past Codes. In the current Code, only equipment that relies on a single seal is subject to the additional sealing requirements. Removing this provision will dramatically impact current and future installations without any significant justification.
Panel Meeting Action: Accept
Number Eligible to Vote: 14

14-39 Log #455 NEC-P14 **Final Action: Reject**
(501.20)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 14-61
Recommendation: The Proposal action should have been to Accept in Principle in Part and changed to read as follows:
Where condensed vapors or liquids ~~may~~ are capable of collecting on, or come in contact with, (the remainder of the Section to be unchanged).
Continue to Reject the change of the word "suitable" in 502.100(A)(1).
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.
However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms *may* or *can* shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term *may* shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Since the use of the term *may* in this Section does not meet these either of these criteria, it should be changed.
Panel Meeting Action: Reject
Panel Statement: The term "may" is the correct term and it is not a violation of the style manual as it is not used as part of the mandatory rule. It is part of the conditional statement that sets up the mandatory rule.

(501.30)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-63
Recommendation: Accept the proposal with the following revisions:
Grounding and Bonding Class 1, Division 1 and 2. Electrical wiring and equipment in Class 1, Division 1 and 2 locations shall be grounded and bonded in accordance with 501.30(A) and (B).
Exception: Nonincendive field wiring.
(A) Bonding. The single locknut, double-locknut, and locknut bushing type connections shall not be permitted to be the sole bonding means, but bonding jumpers with approved fittings, threaded metal raceway connections to thread couplings, explosion-proof unions, threaded bosses or openings of equipment or other approved means shall be used. Such means of bonding shall also apply to intervening metal raceways, cables, boxes and other enclosures, and other equipment between Class 1 locations and the point of grounding of service equipment of separately derived systems.
Exception: The specific bonding means of this section shall be required only to the building or other structure disconnecting means grounding terminal(s) or bus(es), if branch circuit(s) overcurrent protecton is provided on the load side of the building disconnecting means.
FPN: No change.
Substantiation: This provision should exempt nonincendive field wiring since it poses no-fire or explosion hazard for Class 1 atmospheres.
(A) presently does not prohibit single-locknut connections normally used with connectors for flexible conduits and Type MI cable. Since locknuts do perform a bonding function "sole" is added in (A). Threaded raceway connections to threaded couplings, threaded hubs, bosses and openings should be noted, as their absence begs the question, "are these other approved means?" There may not be a grounded circuit conductor in the supply circuit to a building disconnecting means if it is an ungrounded system or doesn't include a grounded circuit conductor, or there is no grounding electrode conductor per 250.32(A), Exception.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. Ballot Results: Affirmative: 14

14-47 Log #1102 NEC-P14 **Final Action: Reject**
(501.105(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-77
Recommendation: Accept the proposal with the following revised portions:
(B)(1) Exception: Other approved types of enclosures shall be permitted if current interrupting contacts comply with one or more of the following:
(1) Are immersed in oil
(2) Are enclosed in a hermetically sealed chamber
(3) Are in nonincendive circuits
(4) Are listed for Class 1, Division 1 and 2
(B)(2) Exception: Other approved types of enclosures shall be permitted... (remainder unchanged).
(B)(3) Transformer windings, impedence coils, solenoids, and other windings that do not incorporate sliding or make-or-break contacts shall be provided with approved enclosures (remainder unchanged).
(B)(4) Assemblies. Where an assembly is made up of components covered in 501.195(B)(1), (B)(2), and (B)(3), a single assembly shall be permitted (remainder unchanged).
(B)(5) Fuses. Where enclosures covered in 501.105(B)(1) through (B)(4) are permitted, fuses for overcurrent protection of instrument circuits not subject to overloading in normal uses shall be permitted to be installed in such enclosures if each fuse or group of fuses is provided with a disconnecting means complying with 501.105(B)(1).
Substantiation: In (B)(1) Exception, “sealed against the entrance of gases or vapors” is superfluous; hermetically sealed is defined as impervious to external influences. In (B)(1), Exception No. 4 should include Class 1, Division 1; Class II and III have Division 2 locations. In (B)(5), groups of fuses should be included and disconnecting means other than a “switch” such as a circuit breaker should be noted. Although “general purpose” may or may not be understood to mean the same thing as the proposal, it is not NEC defined; “approved” is defined in Article 100.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must “include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted”. The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-48 Log #1097 NEC-P14 **Final Action: Reject**
(501.105(B)(6))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-78
Recommendation: Accept the proposal with the following revisions:
Connections. Process control instruments shall be permitted to be connected by a flexible cord that complies with 400.3 and 501.140(B)and a locking and grounding type attachment plug and receptacle if all the following apply:
(1) A disconnecting means in accordance with 501.105(B) is provided that simultaneously disconnects all ungrounded conductors supplying the receptacle(s).
(2) The rated current and voltage of the process control instrument(s) does not exceed 3 amperes and 120 volts, nominal.
(3) The flexible cord does not exceed 900 mm (3 ft) in length and contains an equipment grounding conductor.
(4) The receptacle(s) does not supply other equipment.
(5) A durable label is provided at the receptacle(s) warning: “Do not unplug under load.”
Substantiation: Editorial. The disconnecting means should include circuit breakers. The provision will facilitate replacement so that the statement is superfluous. The 3 ampere, 120 volt requirement should clearly apply to the instruments; present wording applies to the cord since that is the main subject of the provision. Present wording requires the receptacle(s) itself to bear the label.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must “include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted”. The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

Ballot Results: Affirmative: 14

14-49 Log #1135 NEC-P14 **Final Action: Reject**
(501.105(B)(6))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-78
Recommendation: Accept the proposal with the following revisions:
Connections. Process control instruments shall be permitted to be connected by a flexible cord(s) that complies with 400.3, and attachment plug and receptacle in accordance with the following:
(1) A disconnecting means complying with 501.105(B)(1) is provided to disconnect the receptacle(s).
(2) The current and voltage do not exceed 3 amperes at 120 volts, nominal.
(3) The flexible cord does not exceed 900 mm (3 ft).
(4) The flexible cord is an extra-hard or hard usage type containing an equipment grounding conductor.
(5) The flexible cord is protected by location or other approved means.
(6) The flexible cord is not subject to strain on terminations or is provided with approved strain relief means.
(7) The receptacle and attachment plug are locking and grounding type.
Substantiation: Cords should comply with 400.3; all extra-hard or hard usage types may not be suitable. An equipment grounding conductor should be required.
Panel Meeting Action: Reject

Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

Ballot Results: Affirmative: 14

14-50 Log #1116 NEC-P14 **Final Action: Reject**
(501.140)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-83
Recommendation: Accept the proposal with the following revisions:
Flexible Cords and Cables. Flexible cords and cables used in Class 1, Division 1 and 2 locations shall only be permitted as follows:
(1) In accordance with 400.3 and 501.10(A)(2), (B)(2), (B)(3), and 501.105(B)(6).
(2) For connections between portable lighting or other portable utilization equipment to the fixed portion of the supply circuit.
(3) For electric submersible pumps with means for removal without entering the wet pit. The flexible cord or cable shall be permitted to be installed in an approved raceway from the edge of the wet pit to the fixed wiring if the cord or cable is continuous without splice and the length of the cord or cable from the edge of the wet pit does not exceed 3.0 m (10 ft).
(5) The cords or cables are extra-hard usage type that comply with 400.3 and contain an equipment grounding conductor.
(6) Approved bushings are provided where cords or cables enter enclosures not required to be explosion-proof, and conduit seals are provided where the cords or cables enter an explosion-proof enclosure.
(7) The flexible cords and cables are installed or supported by approved means so there is no strain on terminations.
(8) Cord and cable lengths are continuous without splice.
Exception: This section does not apply to flexible cords and cables used for nonincendive field wiring.
FPN: No change.
Substantiation: "Shall be permitted" does not impose a requirement and is not enforceable per 90.5(B). This section doesn't include 501.10(A)(2)(2), (B)(2), (B)(3) and 501.105(B)(6)(6). There should be a length provision for wet pit cords to prevent unlimited length. All extra-hard usage type cords may not be suitable for the conditions, i.e., wet locations and sunlight resistance, electric vehicle cables. An EGC should be specified. Cords in nonincendive circuits should be exempt.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

(501.140(B)(5))

Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-88
Recommendation: Instead of the action taken on Proposal 14-88, replace the text accepted by Proposal 14-88 with the following:
(5) In Division 1 locations or in Division 2 locations where the boxes, fittings, or enclosures are required to be explosionproof, the cord shall be terminated with a cord connector or attachment plug listed for the location or a cord connector installed with a seal listed for the location. In Division 2 locations where explosionproof equipment is not required, the cord shall be terminated with a listed cord connector or listed attachment plug.
Delete the existing exception to (5).
Substantiation: The text recommended in this comment clarifies the difference in requirements between Class I, Division 1 and Class I, Division 2.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-54 Log #1648 NEC-P14 **Final Action: Accept in Principle**
(501.140(B)(6))

Submitter: A. W. Ballard, Phoenix, NY
Comment on Proposal No: 14-89
Recommendation: Revise 501.140(B)(6) to add "except as provided in 501.140(A)(5)."
Substantiation: The Panel's acceptance of proposal (No. 14-85) to 501.140(A)(5) is meaningless unless 501.140(B)(6) is revised. The proposed revision will make it useful and address the concerns in the Panel Statement.
Panel Meeting Action: Accept in Principle
Revise 501.140(B)(6) reads as follows:
"(6) Be of continuous length. Where 501.140(A)(5) is applied, cords shall be of continuous length from the power source to the temporary portable assembly and from the temporary portable assembly to the utilization equipment."
Panel Statement: The panel agrees with the submitter's intent and has revised 501.140(B)(6) to apply positive language to the concept.
Number Eligible to Vote: 14

ARTICLE 502— CLASS II LOCATIONS

14-55 Log #150 NEC-P14 **Final Action: Accept**
(502)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-90
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relative to the requirements for Class II, Division 2.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The Panel requests the TCC to refer to the text of 502.150(B) as shown in the Preprint. The action of the Panel is correctly reflected in that document. However, the text of 502.150(B) was inadvertently omitted from the ROP.
See the text of Article 502, Part III as shown in Comment 14-62.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-55a Log #CC1401 NEC-P14 **Final Action: Accept**
(502.10(A)(2)(5))

Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-95
Recommendation: Revise action on Proposal 14-95 from Accept to Accept in Principle.
Revise the Accepted wording as follows:
(5) Flexible cord listed for extra-hard usage and terminated with listed dusttight fittings ~~listed for the location~~. Where flexible cords are used, they shall comply with 502.140.
FPN: See 502.30(B) for grounding requirements where flexible conduit is used.
Substantiation: The comment clarifies the specific requirements between Class II, Division 1 and Class II, Division 2 by preserving the reference to section 502.140 for sealing. "Listed for the location" is addressed under Panel comment 14-64a on section 502.140.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-56 Log #2161 NEC-P14 **Final Action: Accept**
(502.10(B)(3))

Submitter: Jeremy Neagle, Intertek Testing Services
Comment on Proposal No: 14-98
Recommendation: Revise the second paragraph of 502.10(B)(3) as follows:
(Retain first paragraph and FPN).
"Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:
(1) In separate cables
(2) In multiconductor cables where the conductors of each circuit are within a grounded metal shield
(3) In multiconductor cables or raceways, where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)"
Substantiation: I agree with the panel action and statement. However, it is noted that the current text of 502.10(B)(3) inadvertently omits the permission to run separate non-incendive field wiring circuits as discreet conductors in a single raceway, the proposed change corrects this.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-57 Log #2141 NEC-P14 **Final Action: Accept**
(502.10(B)(7))

Submitter: Thomas Guida, TJG Services, Inc. / Rep. Champion Fiberglass, Inc.
Comment on Proposal No: 14-96
Recommendation: The Panel Action on this proposal should be Accept in Principle with the following action:
Add the following text to read as follows:
(7) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC) factory elbows, and associated fittings, all marked with suffix -XW, and Schedule 80 PVC Conduit, factory elbows and associated fittings shall be permitted.
Substantiation: The potential for a corrosive atmosphere is present in many industrial applications and is not necessarily connected to the nature or level of the hazard present.
Panel Meeting Action: Accept
Add the proposed text as new 502.10(B)(1)(7).
Panel Statement: The panel notes that the correct location for the accepted new text is 502.10(B)(1)(7).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-58 Log #1118 NEC-P14 **Final Action: Reject**
(502.30(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-104
Recommendation: Accept the proposal with the following revisions:
(B) Types of Equipment Grounding and Bonding Conductors. Liquidtight flexible metal conduit and dusttight flexible connectors shall contain or provide a separate equipment grounding or bonding conductor.
Substantiation: Bonding conductors should be included in the heading. "Separate" covers "wire type." 250.102 already applies.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

Ballot Results: Affirmative: 14

14-59 Log #456 NEC-P14 **Final Action: Reject**
(502.100)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 14-111
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:
(3) Metal Dusts. No transformer or capacitor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be are capable of being present.
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.
However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Since the use of the term may in this Section does not meet these either of these criteria, it should be changed.
Panel Meeting Action: Reject
Panel Statement: The term "may" is the correct term and it is not a violation of the style manual as it is not used as part of the mandatory rule. It is part of the conditional statement that sets up the mandatory rule.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-60 Log #1810 NEC-P14 **Final Action: Reject**
(502.100)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 14-90
Recommendation: As indicated in the following text revisions, for added user and code practitioner clarification, reinsert as applicable the terms "Group E", "Group F", and "Group G" into the action proposal modified texts as shown below:
502.100 Transformers and Capacitors.
(A) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with 502.100(A)1) through (A)(2~~3~~).
(1~~3~~) Group E. No transformer or capacitor shall be installed in a Class II, Division 1, Group E location.
(2~~1~~) Group F or Group G, ~~Containing Liquid That Will Burn.~~
(a) Transformers and capacitors containing a liquid that will not burn shall be installed only in vaults complying with 450.41 through 450.48, or be identified as a complete assembly, including terminal connections for Class II locations.
(b) Transformers and capacitors containing a liquid that will burn shall be installed only in vaults complying with 450.41 through 450.48, and, in addition, (1), (2), and (3) shall apply.
(1) Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.
(2) Vent openings and ducts shall communicate only with the outside air.
(3) Suitable pressure-relief openings communicating with the outside air shall be provided.
~~(2) Group F or Group G, Not Containing Liquid That Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 450.41 through 450.48 or be identified as a complete assembly, including terminal connections for Class II locations. (3) Group E. No transformer or capacitor shall be installed in a Class II, Division 1, Group E location, where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.~~

Substantiation: 502.100 order was changed making Group E first, with its condition of not permitting the installation. Then Group F and Group G was clarified and the text was consolidated into the renumbered (a) and (b) paragraphs.
Panel Meeting Action: Reject
Panel Statement: While it appears that the submitters intent was only to provide clarification using the defined Group terms, the submitter has altered the texts in a number of areas which has created new material which has not been subject to public review, but also was probably not the intent of this submission.

502.115 Switches, Circuit Breakers, Motor Controllers, and Fuses.
(A) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures identified for the location ~~dust ignitionproof enclosures.~~
(B) Class II, Division 2. In Class II Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, ~~shall be dusttight or otherwise~~ identified for the location.
502.120 Control Transformers and Resistors.
(A) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall be provided with ~~have dust ignitionproof~~ enclosures identified for the ~~Class II~~ locations.
(B) Class II, Division 2. In Class II, Division 2 locations, transformers and resistors shall comply with 502.120(B)(1) through (B)(3).
(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with enclosures ~~that are dusttight or otherwise~~ identified for the location.
(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with enclosures ~~that are tight metal housings without ventilating openings or shall be installed into dusttight or otherwise~~ identified for the location.
(3) Resistors. Resistors and resistance devices shall have ~~dust ignitionproof~~ enclosures ~~or otherwise~~ identified for the location ~~enclosures identified for Class II locations.~~
502.130 Luminaires. Luminaires shall comply with 502.130(A) and (B).
(B)(2) Fixed Lighting. Luminaires for fixed lighting shall be provided with enclosures that are ~~dusttight or otherwise~~ identified for the location ~~enclosures.~~
Substantiation: This action provides consistent language for Class II, Division 1 and Division 2 loations for the proposed text changes made during the ROP action.
Panel Meeting Action: Accept in Principle in Part
Art. 502 Part III
III. Equipment
502.100 Transformers and Capacitors.
(A) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with 502.100(A)(1) through (A)(3).
(1) Containing Liquid That Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in vaults complying with 450.41 through 450.48, and, in addition, (1), (2), and (3) shall apply.
(1) Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.
(2) Vent openings and ducts shall communicate only with the outside air.
(3) Suitable pressure-relief openings communicating with the outside air shall be provided.
(2) Not Containing Liquid That Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 450.41 through 450.48 or be identified as a complete assembly, including terminal connections ~~for Class II locations~~.
(3) Group E. No transformer or capacitor shall be installed in a Class II, Division 1, Group E location.
(B) Class II, Division 2. In Class II, Division 2 locations, transformers and capacitors shall comply with 502.100(B)(1) through (B)(3).
(1) Containing Liquid That Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with 450.41 through 450.48.
(2) Containing Askarel. Transformers containing askarel and rated in excess of 25 kVA shall be as follows:
(1) Provided with pressure-relief vents
(2) Provided with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vents shall be connected to a chimney or flue that will carry such gases outside the building
(3) Have an airspace of not less than 150 mm (6 in.) between the transformer cases and any adjacent combustible material
(3) Dry-Type Transformers. Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.
502.115 Switches, Circuit Breakers, Motor Controllers, and Fuses.
(A) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures identified for the location.
(B) Class II, Division 2. In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight or otherwise identified for the location.
502.120 Control Transformers and Resistors.
(A) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall be provided with enclosures identified for the location.
(B) Class II, Division 2. In Class II, Division 2 locations, transformers and resistors shall comply with 502.120(B)(1) through (B)(3).
(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with enclosures that are dusttight or otherwise identified for the location.
(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with enclosures that are dusttight or otherwise identified for the location.
(3) Resistors. Resistors and resistance devices shall have dust-ignitionproof enclosures that are dusttight or otherwise identified for the location.
502.125 Motors and Generators.
(A) Class II, Division 1. In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be in conformance with either of the following:
(1) Identified for the location
(2) Totally enclosed pipe-ventilated, meeting temperature limitations in 502.5
(B) Class II, Division 2. In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water-air-cooled, totally enclosed fan-cooled or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with 500.8(D)(2) for normal operation when operating in free air (not dust blanketed) and shall have no external openings.
Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:
(1) Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices
(2) Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings
(3) Self-cleaning textile motors of the squirrel-cage type
502.128 Ventilating Piping.
Ventilating pipes for motors, generators, or other rotating electrical machinery, or for enclosures for electrical equipment, shall be of metal not less than 0.53 mm (0.021 in.) in thickness or of equally substantial noncombustible material and shall comply with all of the following:
(1) Lead directly to a source of clean air outside of buildings
(2) Be screened at the outer ends to prevent the entrance of small animals or birds

(3) Be protected against physical damage and against rusting or other corrosive influences

Ventilating pipes shall also comply with 502.128(A) and (B).

(A) Class II, Division 1. In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:

(1) Be riveted and soldered

(2) Be bolted and soldered

(3) Be welded

(4) Be rendered dusttight by some other equally effective means

(B) Class II, Division 2. In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

502.130 Luminaires.

(A) Class II, Division 1. In Class II, Division 1 locations, luminaires for fixed and portable lighting shall comply with 502.130(A)(1) through (A)(4).

(1) Luminaires. Each luminaire shall be identified for the location and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed.

(2) Physical Damage. Each luminaire shall be protected against physical damage by a suitable guard or by location.

(3) Pendant Luminaires. Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed for the location shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted with a listed cord connector that maintains the protection technique where the cord enters the luminaire and the outlet box. Flexible cord shall not serve as the supporting means for a luminaire.

(4) Supports. Boxes, box assemblies, or fittings used for the support of luminaires shall be identified for Class II locations.

(B) Class II, Division 2. In Class II, Division 2 locations, luminaires shall comply with 502.130(B)(1) through (B)(5).

(1) Portable Lighting Equipment. Portable lighting equipment shall be identified for the location. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed.

(2) Fixed Lighting. Luminaires for fixed lighting shall be provided with enclosures that are dusttight or otherwise identified for the location. Each luminaire shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with 500.8(D)(2) under normal conditions of use.

(3) Physical Damage. Luminaires for fixed lighting shall be protected from physical damage by suitable guards or by location.

(4) Pendant Luminaires. Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of an identified fitting or a flexible connector shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted when terminated with a listed cord connector that maintains the protection technique. Flexible cord shall not serve as the supporting means for a luminaire.

(5) Electric-Discharge Lamps. Starting and control equipment for electric-discharge lamps shall comply with the requirements of 502.120(B).

502.135 Utilization Equipment.

(A) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall be identified for the location.

(B) Class II, Division 2. In Class II, Division 2 locations, all utilization equipment shall comply with 502.135(B)(1) through (B)(4).

(1) Heaters. Electrically heated utilization equipment shall be identified for the location.

Exception: Metal-enclosed radiant heating panel equipment shall be permitted to be dusttight and marked in accordance with 500.8(C).

(2) Motors. Motors of motor-driven utilization equipment shall comply with 502.125(B).

(3) Switches, Circuit Breakers, and Fuses. Enclosures for switches, circuit breakers, and fuses shall be comply with 502.115(B).

(4) Transformers, Solenoids, Impedance Coils, and Resistors. Transformers, solenoids, impedance coils, and resistors shall comply with 502.120(B).

502.140 Flexible Cords — Class II, Divisions 1 and 2.

Flexible cords used in Class II locations shall comply with all of the following:

(1) Be of a type listed for extra-hard usage

Exception: Flexible cord listed for hard usage as permitted by 502.130(A)(3) and (B)(4).

(2) Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23

(3) Be connected to terminals or to supply conductors in an approved manner

(4) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections

(5) Be provided with suitable seals to prevent the entrance of dust where the flexible cord enters boxes or fittings that are required to be dust-ignitionproof

502.145 Receptacles and Attachment Plugs.

(A) Class II, Division 1. In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the equipment grounding conductor of the flexible cord and shall be identified for Class II locations.

(B) Class II, Division 2. In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provides for connection to the equipment grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.

502.150 Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays.

FPN: See Article 800 for rules governing the installation of communications circuits.

(A) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(A)(1) through (A)(3).

(1) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures identified for the location.

Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(2) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified for the location.

Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(3) Rotating Machinery. Motors, generators, and other rotating electrical machinery shall comply with 502.125(A).

(B) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B)(1) through (B)(4).

(1) Contacts. Contacts shall comply with 502.150(A)(1) or shall be installed in enclosures that are dusttight or otherwise identified for the location.

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall comply with 502.120(B)(2).

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.120(B)(3).

(4) Rotating Machinery. Motors, generators, and other rotating electrical machinery shall comply with 502.125(B).

Panel Statement: The intent of the submitter to provide consistent language in the revised 14-90 panel action had been addressed in the Draft of the Proposed 2011 edition of NFPA 70, National Electrical Code, which accurately reflects the Panel's action at the ROP meeting. However, the released ROP document did not reflect the Panel actions accurately. The text shown here as the Panel Meeting Action is the correct Panel action.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-63 Log #457 NEC-P14 **Final Action: Reject**
(502.115(A)(2))

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 14-115
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:

(2) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics ~~may be~~ are capable of being present, (remainder of the text to remain the same).

Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms *may* or *can* shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term *may* shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term *may* in this Section does not meet these either of these criteria, it should be changed.

Panel Meeting Action: Reject
Panel Statement: The term "may" is the correct term and it is not a violation of the style manual as it is not used as part of the mandatory rule. It is part of the conditional statement that sets up the mandatory rule.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-63a Log #CC1402 NEC-P14 **Final Action: Accept**
(502.130(A)(3))

Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-117, 14-118
Recommendation: Revise text to read as follows:

(3) Pendant Luminaires. Pendant luminaires shall be suspended by threaded rigid metal conduit stems, by threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.), permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed for the location shall be provided not more than 300 mm (12 in.) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant luminaire is not enclosed in conduit, flexible cord listed for hard usage shall be permitted to be ~~when terminated with a listed cord connector that maintains the type of protection~~ used in accordance with section 502.10(A)(2)(5) ~~where the cord enters the luminaire and the outlet box~~. Flexible cord shall not serve as the supporting means for a luminaire.

Substantiation: The comment addresses a concern that the proposal would exclude the use of a separate seal that is listed for the location. The reference to 502.10(A)(2)(5) ensures compliance with the methods in section 502.140 for sealing of the cord.

The removal of "where the cord enters the luminaire and the outlet box" was done as the existing wording "Where wiring between an outlet box or fitting and a pendant luminaire" is self evident as to where the termination is being accomplished.

This comment also addresses a correlation problem between the Accepted in Principle text for proposals 14-117 and 14-118 and also addresses the 14-64 comment from the TCC.

ARTICLE 503 — CLASS III LOCATIONS

14-68 Log #1812 NEC-P14 **Final Action: Reject**
(503.6)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 14-130
Recommendation: Delete 503.6 Zone Equipment.
Substantiation: The scope of Article 503 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class III, Division 1 and 2 locations where fire or explosion hazards may exist due to ignitable fibers/flyings. Unlike Article 506 which addresses both combustible dusts and ignitable fibers/flyings, Article 503 does not deal with combustible dusts. Article 503 as currently written does not deal with any Zone concept. The Class III, Divisions are defined in Article 500.5(D) and a careful comparison between a defined Class III location and a Zone 20 location will reveal differences. For instance:
(1) Class III locations are not likely to have fibers/flyings in suspension in air in quantities sufficient to produce ignitable mixtures, while Zone 20, 21 and 22 may have fibers/flyings present in air in quantities sufficient to produce ignitable mixtures.
(2) A Class III, Division 1 location is a location in which easily ignitable fibers/flyings are handled, manufactured, or used; whereas, a Zone 20 is a location in which ignitable fibers/flyings are present continuously.

This proposal to create a new section attempts to create an equipment installation equivalency between Class III and the Zone 20, 21, and 22 concepts without providing sufficient justification for this action. It is our assertion that those wishing to apply the Zone concept under Article 506 should stay in Article 506, and not apply Article 503.

Panel Meeting Action: Reject
Panel Statement: The panel has determined that there are no adverse safety implications by adding this Section and recognizing the equipment being added by the original proposal as equivalent or superior to that currently permitted in a Class III location.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

WECHSLER, D.: The Panel action should have been to accept this comment and not included this section in this code.

While the panel action states that 'the panel determined that there are no adverse safety implications by adding this Section', the Panel continues to support separation under Articles in 502 for combustible dusts and 503 for ignitible flyings. Article 502 has been provided with correlation with Article 506.

Proposal 14-130 was substantiated on the basis that a Zone 20 could be alternatively classified as Class III, Division 1, and Zone 22, as Class III, Division 2. However there has been no technical substantiation made to correlate Zone 20 or 22 with Class III materials. Additionally no technical information has been provided to substantiate that the materials addressed under Article 503 are in fact the same as those addressed under Article 506.

The scope of Article 503 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class III, Division 1 and 2 locations where fire or explosion hazards may exist due to ignitable fibers/flyings. Unlike Article 506 which addresses both combustible dusts and ignitable fibers/flyings, Article 503 does not deal with combustible dusts. Article 503 as currently written does not deal with any Zone concept. The Class III, Divisions are defined in Article 500.5(D) and a careful comparison between a defined Class III location and a Zone 20 location will reveal differences. For instance:

(1) Class III locations are not likely to have fibers/flyings in suspension in air in quantities sufficient to produce ignitable mixtures, while Zone 20, 21 and 22 may have fibers/flyings present in air in quantities sufficient to produce ignitable mixtures.

(2) A Class III, Division 1 location is a location in which easily ignitable fibers/flyings are handled, manufactured, or used; whereas, a Zone 20 is a location in which ignitable fibers/flyings are present continuously.

Those wishing to apply the Zone concept under Article 506 should stay in Article 506, and not apply Article 503.

14-69 Log #594 NEC-P14 **Final Action: Accept in Part**
(503.10(A))

TCC Action: The Technical Correlating Committee directs that the changes made by Code-Making Panel 14 appear in 503.10(A)(1)(1), and that the wording of parts (2), (3) and (4) of 503.10(A) remain as Accepted in Principle by Proposal 14-131, since the code panel did not indicate any changes to these parts, but also did not indicate in their panel action what should be done with them.

The Technical Correlating Committee also directs that the word "Type" be inserted in front of the words "PVC" and "RTRC" in the modified language as accepted in this comment.

Submitter: John L. Simmons, Florida East Coast JATC / Rep. IBEW
Comment on Proposal No: 14-131
Recommendation: Revise the proposed text to read as follows:

(A) Class III, Division I.

(1) In Class III, Division 1 locations the following wiring method shall be permitted:

(1) Rigid metal conduit ~~rigid nonmetallic~~ Schedule 80 PVC conduit, XW-type RTRC conduit, intermediate metal conduit electrical metallic tubing, dusttight wireways, or...

Substantiation: This comment was generated by a Task Group from CMP-14. The 2008 NEC changed the term rigid nonmetallic conduit to rigid polyvinyl chloride conduit; Type PVC. The change also moved RTRC conduit to a new Article 355. The 2005 NEC Handbook references the 2004 UL General Information for Electrical Equipment Directory (White Book) in its commentary under the definition of Rigid Nonmetallic Conduit in 352.2. "The White Book describes two types of rigid nonmetallic conduct recognized for use in accordance with 352.1. Rigid nonmetallic Schedule 40 and Schedule 80 PVC conduit, (DZYR) and 2, reinforced thermosetting resin conduit (DZKT)." The 2008 NEC gave RTRC its own article and revised the title of Article 352, but it did not change the fact that both are still rigid nonmetallic conduit. This is evidenced by the fact that the definition of PVC in 352.2 states that it is a "rigid nonmetallic conduit" and the definition of RTRC in 355.2 states that it is a "rigid nonmetallic conduit".

Schedule 80 PVC is being specified to be consistent with rigid metal conduit, IMC, and EMT, all of which can be used where subject to physical damage. XW-Type RTRC is suitable according to the UL "White Book", for use in locations subject to physical damage. The revised text corrects and brings the section up-to-date with the changes made in the 2008 NEC and includes both rigid nonmetallic types.

Panel Meeting Action: Accept in Part

Revise 503.10(A) to read:

Class III, Division 1. In Class III, Division 1 locations, the wiring method shall be rigid metal conduit, ~~rigid nonmetallic~~ PVC conduit, RTRC conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, or Type MC or MI cable with listed termination fittings.

Panel Statement: The Panel agrees with the submitter's revision, but does not believe that the substantiation provides a reason to restrict PVC conduit to Schedule 80 or RTRC to type XW. As such, the Panel accepts the proposal with Schedule 80 and XW type references removed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-69a Log #CC1404 NEC-P14 **Final Action: Accept**
(503.10(A)(3)(4))

Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-131
Recommendation: Revise the wording Accepted in Principle via Proposal 14-131as follows:
(4) Interlocked armor Type MC cable having an overall jacket of suitable polymeric material and ~~provided~~ installed with listed dusttight termination fittings ~~listed for the location~~.
Substantiation: The comment addresses the minimum requirement for an MC cable fitting when flexible connections are required and correlates with the requirements for MC cable fittings in section 503.10(A)(1).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-70 Log #2139 NEC-P14 **Final Action: Accept in Principle**
(503.10(B))

Submitter: Thomas Guida, TJG Services, Inc. / Rep. Champion Fiberglass, Inc.
Comment on Proposal No: 14-132
Recommendation: The Panel Action on this proposal should be Accept in Principle with the following action:
Revise 503.10(A) by replacing the generic term "rigid nonmetallic conduit" with "rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit.
Substantiation: This change aligns the description of these conduits with their description in this Code in Articles 352 and 355.
Panel Meeting Action: Accept in Principle
See Comment 14-69.
Panel Statement: See Comment 14-69.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-71 Log #1101 NEC-P14 **Final Action: Reject**
(503.10(B) Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-133
Recommendation: Accept the proposal.
Substantiation: "Likely" is a term used many times in the NEC. See Explanation of Negative Vote for Proposal 7-9, 320.12(1) in the 2010 ROP.
Panel Meeting Action: Reject
Panel Statement: No new substantiation to support a change was provided. CMP 14 also reviewed the negative comment on 7-9 and could not find any substantiation there either.
Number Eligible to Vote: 14

Recommendation: Accept the proposal with the following revisions:
Change "identified" to "approved" in the proposal.
Substantiation: The panel statement did not address why lampholders, signs, should not be included. This type of equipment can be hazardous if infiltrated with combustible fibers/flyings or if sparks can escape. "Likely" is a term used many times in the NEC.
Panel Meeting Action: Reject
Panel Statement: The substantiation does not support the recommendation to change "identified" to "approved".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-76 Log #460 NEC-P14 **Final Action: Reject**
(503.130(B))

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 14-143
Recommendation: The Proposal action should have been to Accept in Principle in Part and changed to read as follows:
(B) Physical Damage. A luminaire that ~~may be~~ is exposed to physical damage shall be protected by a suitable guard.
Substantiation: Continue to reject the change for 503.130(A).
This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.
However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Since the use of the term may in this Section does not meet these criteria, it should be changed.
Panel Meeting Action: Reject
Panel Statement: The term "may" is the correct term and it is not a violation of the style manual as it is not used as part of the mandatory rule. It is part of the conditional statement that sets up the mandatory rule.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-77 Log #461 NEC-P14 **Final Action: Reject**

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 14-144
Recommendation: The Proposal action should have been to Accept in Principle in Part and changed to read as follows:
(B) Physical Damage. A luminaire that ~~may be~~ is exposed to physical damage shall be protected by a suitable guard.
Substantiation: Continue to reject the change for 503.130(A).
This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The submitter of the proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.
However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms *may* or *can* shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term *may* shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Since the use of the term *may* in this section does not meet these criteria, it should be changed.
Panel Meeting Action: Reject
Panel Statement: The term "may" is the correct term and it is not a violation of the style manual as it is not used as part of the mandatory rule. It is part of the conditional statement that sets up the mandatory rule.

(503.135(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-151
Recommendation: Accept the proposal and revise as follows:
In (A), change "acceptable" to "approved."
In (B) Contact conductors shall be accessible only to authorized or qualified persons, or guarded.
Substantiation: Unnecessary references increase the bulk of the NEC which I have seen grow from a 5 in. by 7 in. size that fit in a hip pocket to the size of a large telephone book. "Acceptable" does not specify to whom; "approval" is by the Authority Having Jurisdiction. "Guarded" in Article 100 provides for noncontact by persons or objects.
Panel Meeting Action: Reject
Panel Statement: The panel notes that this comment was submitter on Proposal 14-151, and the correct code reference is 503.155(A) and (B).
The recommended text does not add clarity to the Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-79 Log #779 NEC-P14 **Final Action: Reject**
(503.140)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-145
Recommendation: Accept the proposal with the following revisions:
(1) Be of an extra-hard usage type in accordance with 400.3.
(2) No change.
(3) Be installed or supported in a manner to prevent strain on terminations.
(4) Be provided with approved means to prevent entrance of fibers/flyings, where the cord enters boxes or other enclosures or fittings.
Substantiation: All extra-hard usage cords may not be suitable for the application; e.g., where not designated with "W" for wet locations and sunlight resistance, or those with EV designations. Some installations can be such, without clamps so there is no tension on terminations.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

(504.60(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-164
Recommendation: Accept the proposed text.
Substantiation: Reference is unnecessary and the NEC Style Manual 4.1 states: "Do not use a reference if already covered by 90.3, whether or not related to locations." This provision is also covered by 504.3, Article 250, Part V, 501.30, 502.30, and 503.30.
Panel Meeting Action: Reject
Panel Statement: The reference to 250.100 is necessary, since it deals specifically with hazardous (classified) locations. It does not improve the usability of the Code to delete this reference.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-85 Log #1119 NEC-P14 **Final Action: Reject**
(504.80(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-166
Recommendation: Accept the proposal with the following revisions:
Wiring. Raceways, cables, cable trays and other wiring methods and enclosures for intrinsically safe systems shall be identified with permanently affixed durable labels with the wording "Intrinsic Safe Wiring." The labels shall be visible after installation and placed so the wiring method can be easily traced through the entire accessible length of the wiring method including the portions that are separated by walls, ceilings, floors, or partitions. Spacing between labels shall not exceed 7.5 m (25 ft).
Exception: As otherwise permitted in 504.80(C).
FPN No. 1 and 2 no change.
Substantiation: Labels should only be required where the wiring method is accessible. Color coding per 504.80(C) should be included. "Accessible" length removes need for the exception.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

Comment on Proposal No: 14-170
Recommendation: Proposal 14-170 should be accepted as ISA-60079-11 and UL 60079-11 have been approved by their respective organizations and are published.
Substantiation: Proposal 14-170 should be accepted as ISA-60079-11 and UL 60079-11 have been approved by their respective organizations and are published.
Panel Meeting Action: Accept
Panel Statement: See also Panel Comment 14-88a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COSPOLICH, J.: The IEEE is concerned regarding the way in which combustible dust and ignitable fibers and flyings are addressed in ISA-60079-0 and ISA -60079-11 and the suggestion that this is contrary to the current NEC and NFPA 499 standards. ISA-60079-0 and ISA-60079-11 applies to Zone 20, Zone 21, and Zone 22.

14-88 Log #1813 NEC-P14 **Final Action: Reject**
(505.4)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 14-171
Recommendation: Restore the publication and revision dates for referenced documents mentioned in the Fine Print Notes (FPNs) as they appeared in 505.4 of the 2008 NEC,.
Substantiation: While fine print notes are intended to provide reference information only, document publication and revision dates are important. Just like the date of the NEC revision needs to be retained for general information affecting designs and installations made at a point in time. These dated references also serve an important task. Deleting the publication and revision information would be a disservice for uses and practitioners of this Code.
Panel Meeting Action: Reject
Panel Statement: See Panel Comment 14-88a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

JONES, R.: CMP-14's action on this comment was appropriate. Members of a technical committee are not required to purchase a document that is being requested to be referenced. The entity submitting the proposal is required to include copies of the document with the proposal. The NFPA Regulations Governing Committee Projects, section 4.3.3(f), states: "Two copies of any document(s) (other than an NFPA document) being proposed as a reference standard or publication are to be submitted with the proposal."

At the ROP stage, CMP-14 agreed that an updated version of the ISA standard would be appropriate; however, the proposed version had not been published. The ten members involved with the development of the ANSI/ISA 60079 series of standards were not in agreement at the ROC stage, therefore, all members of CMP-14 needed to review the proposed standard in order to determine if it was proper to reference the new version in the NEC.

14-88a Log #CC1406 NEC-P14 **Final Action: Reject**
(505.4 (A))

TCC Action: The Technical Correlating Committee directs that this comment and Proposal 14-171 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative on the comment.

The Technical Correlating Committee notes that consensus was not achieved to support the original proposal.

Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-171
Recommendation: Revise the reference to ANSI/ISA-60079-0 in FPN No. 7 of 505.4(B) to read as follows:
ANSI/ISA-60079-0 (12.00.01)-2005, *Electrical Apparatus for Use in Class I, Zones 0, 1, and 2 Hazardous (Classified) Locations: General Requirements.*
Substantiation: The 2005 edition date is being retained because some members of Panel 14 have not had the opportunity to review the 2009 published document. The published copy is still not available for sale as of the time of the ROC meeting. ANSI/ISA standards in Fine Print Notes in the affected sections of this ROC having edition dates shall reflect the current edition date, except for the ANSI/ISA 60079-0 document. Where there are no edition dates, no action will be taken.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 5
Explanation of Negative:

BRIESCH, E.: The Comment should be rejected. The Panel's substantiation suggests that Panel members have not had the opportunity to review the 2009 edition of ANSI/ISA-60079-0. There are dozens of referenced standards in Articles 500-516 and I'm sure the Panel members have not reviewed most of them. They are accepted in acknowledgement of the fact that they are developed by a group of experts on the particular subject under an accredited standards development process. The 2009 edition of ANSI/ISA-60079-0 has been developed under the ANSI accredited process just as have all of the other referenced product standards. To single out this one standard is inappropriate. In addition, all of the other 2009 editions of the ANSI/ISA-60079 series of standards were accepted and they must be used in conjunction with the general requirements found in the 2009 edition of ANSI/ISA-60079-0. Furthermore, product certifiers will be using the current editions of the standards to evaluated equipment. If the 2005 edition of ANSI/ISA-60079-0 is referenced in the NEC this will create confusion to users of the Code especially since product markings required by the standard will not be reflected in the Code text. Articles 505 and 506 require that equipment be listed and, although the product standards are only found in Fine Print Notes, they do provide the guidance as to what requirements listed equipment should meet.

KUCZKA, J.: The comment should be rejected. Standards committees are comprised with members that are considered to be subject matter experts. The basis to accept the comment on the premise that the code panel members have not had time to review the standard is not a valid argument in that many of the members on this panel that supported the change to update the reference date did serve on the standards develop committee. As there are multiple references in FPN's to national standards this basis to not support an update to the most current standard could be used in any argument where the dissenter wishes to exclude requirements based on the content of any particular national standard. These arguments are better left to the full membership of the standards development committees.

LAWRENCE, JR., W.: This Panel comment should be rejected.

(1)The substantiation states that the Panel had not had the opportunity to review the 2009 edition of ANSI/ISA 60079-0. Note that 7 members of Panel 14 are also members of the ISA Technical Committee that developed and balloted on that standard, so those Panel 14 members had reviewed the document and confirmed that fact at the meeting. When the Panel was queried during the discussion as to which members had reviewed the prior (2005) edition of ANSI/ISA 60079-0, it was those same Panel 14 members who confirmed that they had reviewed it. The remainder of the Panel 14 members had not reviewed the 2005 edition. It would appear that the fact that Panel members only had 7 weeks to review the 2009 edition was not a factor in their failure to do so. To single out this one standard is not appropriate as I doubt that the majority of the dozens of other reference standards in Articles 505 and 506 have been reviewed by the Panel members. These documents have been processed through the ANSI consensus process and therefore represent an agreed position, noting that consensus does not require unanimity.

(2) The statement made regarding the document not being available for sale was not true. An on-line search made at the meeting did not show the 2009 edition, but a subsequent call to ISA revealed a data entry error as the cause. ISA later confirmed availability as shown below:

Eliana Beattie states:

Just to clarify, ANSI/ISA-60079-0 (12.00.01)-2009 has been available for purchase since the ISA S&P Board approval on 14 October 2009. Unfortunately, we were delayed over coordination of the ISA and UL standards' covers and by data entry on our end. However, any customer who e-mailed, phoned, faxed, or mailed in an order for the 2009 edition of ISA-60079-0 would have been able to place an order for the standard.

MASSEY, L.: This panel action should be REJECTED based on the following:

1. The 2009 edition of ANSI/ISA 60079-0 was available for review by the entire panel several weeks prior to the ROC meeting. Contrary to the statement made during the meeting, the published standard was available from ISA as of October 14, 2009. In addition, of the current CMP14, there are ten members directly involved in the development of the ANSI/ISA 60079 series of standards who had ample time to review these documents during the development process.

2. The applicable panel statement for rejecting the inclusion of updated ISA standards was "The panel agrees with the concept of the proposal, but cannot accept it because the standard involved has not been published." This requirement has been satisfied with the publication of the subject standard. As no other objections were included in the ROP, the most current ISA standard should be referenced in the FPNs. Section 4.3.5.1 of the NFPA Regulations Governing Committee Projects clearly indicates that the panel statement shall be "...sufficiently detailed so as to convey the TC's rationale for its action so that rebuttal may, if desired, be submitted during the Comment period." Considering that the CMP-14 concerns related to Proposal 14-171 (as modified by subsequent CMP14 and TCC rulings) have been FULLY SATISFIED, one could infer that the only logical CMP-14 action is to REJECT Comment 14-88a.

NEAGLE, J.: The panel action should be to reject this comment. The substantiation for the comment indicates that ANSI/ISA 60079-0 was not available at the time of the ROC meeting and that panel members had not had an opportunity to review the document. As confirmed by the standard publisher the document was available as of October 14, 2009, which should have allowed ample time for review.

Comment on Affirmative:

JONES, R.: CMP-14's action on this comment was appropriate. Members of a technical committee are not required to purchase a document that is being requested to be referenced. The entity submitting the proposal is required to include copies of the document with the proposal. The NFPA Regulations Governing Committee Projects, section 4.3.3(f), states: "Two copies of any document(s) (other than an NFPA document) being proposed as a reference standard or publication are to be submitted with the proposal."

At the ROP stage, CMP-14 agreed that an updated version of the ISA standard would be appropriate; however, the proposed version had not been published. The ten members involved with the development of the ANSI/ISA 60079 series of standards were not in agreement at the ROC stage, therefore, all members of CMP-14 needed to review the proposed standard in order to determine if it was proper to reference the new version in the NEC.

(505.9(C)(2), FPN)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 14-179
Recommendation: Delete FPN 4.
Substantiation: The 'EPL' concept is not recognized in the National Electrical Code. There is also no US Code requirement for this marking. The Code uses fine print notes as a means of alerting and providing additional information to requirements within this Code. If this marking is used, it is applied just like any other supplemental added non-required marking. The US Code does not need to address this non-requirement by a fine print note. Therefore, this FPN should be deleted.
Panel Meeting Action: Reject
Panel Statement: The Fine Print Note adds clarity for the marking that will be found on the equipment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
WECHSLER, D.: The Panel action should have been to accept this comment and not include this FPN in this code.

The Equipment Protection Level or EPL concept is not currently recognized in the NEC nor any other NFPA standard.

It is also difficult to understand the benefit for including a new fine print note which informs, but does not define what to do about a very high, high or enhanced level of ignition sensitivity protection, which would normally be of concern in working with hazardous classified locations.

Lastly, this added note does not even state that this marking is not a required US marking and therefore can be ignored totally.

In actual fact, the EPL was developed by the IEC in response to actions taken by the European Legislative action, ATEX, which was attempting to deal with the fact that under that hazardous area classification identification system, equipment formerly was marked for the protection design applied and not for the hazardous area classification. The IEC created this additional scheme to address that which simply existed in the US Class-Division scheme. Example, equipment designed and listed as a protection under explosionproof can be used in a Class I, Division 1 location and it so marked Class I, Division 1. The EPL concept is addressed to some degree in IEC 60079-0, and in the 2009 revision of ISA 60079-0. However it was the action of CMP-14 under CP1406 not to recognized ISA 60079-0 2009 but only 60079-0, 2005 which did not support EPL.
Comment on Affirmative:
SIMMONS, J.: The addition of the new FPN is for design purposes and not in concert with the intention of the NEC, as stated in 90.1(C). The continual addition of FPNs to refer the reader to other standards is creating confusion. References to other standards should be restricted to Annex A.

With the ever-changing technology of the electrical industry, the tendency to add FPNs will continue. As this continues, the NEC will become more like a design manual than a document for the "practical safeguarding of persons and property". It is already difficult to keep the documents listed in the FPNs up to date. Confusion is generated where a document date listed in the NEC is not the current document date.

Some users will point out that FPNs are not enforceable. This being true, why do we have so much unenforceable information in the NEC? This comment should be accepted and the proposed FPN should not be added to the NEC.

14-93 Log #1817 NEC-P14 **Final Action: Reject**
(505.9(C)(5), FPN 1)

Submitter: Michael P. Walls, American Chemistry Council

WECHSLER, D.: The Panel action should have been to accept this comment and not include this FPN in this code.

The Equipment Protection Level or EPL concept is not currently recognized in the NEC nor any other NFPA standard.

It is also difficult to understand the benefit for including a new fine print note which informs, but does not define what to do about a very high, high or enhanced level of ignition sensitivity protection, which would normally be of concern in working with hazardous classified locations.

Lastly, this added note does not even state that this marking is not a required US marking and therefore can be ignored totally.

In actual fact, the EPL was developed by the IEC in response to actions taken by the European Legislative action, ATEX, which was attempting to deal with the fact that under that hazardous area classification identification system, equipment formerly was marked for the protection design applied and not for the hazardous area classification. The IEC created this additional scheme to address that which simply existed in the US Class-Division scheme. Example, equipment designed and listed as a protection under explosionproof can be used in a Class I, Division 1 location and it so marked Class I, Division 1. The EPL concept is addressed to some degree in IEC 60079-0, and in the 2009 revision of ISA 60079-0. However it was the action of CMP-14 under CP1406 not to recognized ISA 60079-0 2009 but only 60079-0, 2005 which did not support EPL.
Comment on Affirmative:
SIMMONS, J.: The addition of the new FPN is for design purposes and not in concert with the intention of the NEC, as stated in 90.1(C). The continual addition of FPNs to refer the reader to other standards is creating confusion. References to other standards should be restricted to Annex A.

With the ever-changing technology of the electrical industry, the tendency to add FPNs will continue. As this continues, the NEC will become more like a design manual than a document for the "practical safeguarding of persons and property". It is already difficult to keep the documents listed in the FPNs up to date. Confusion is generated where a document date listed in the NEC is not the current document date.

Some users will point out that FPNs are not enforceable. This being true, why do we have so much unenforceable information in the NEC? This comment should be accepted and the proposed FPN should not be added to the NEC.

14-94 Log #153 NEC-P14 **Final Action: Accept**
(505.9(D)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-183
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with regard to the accepted language in Proposal 14-184.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel confirms that the word "additional" has been deleted.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-188
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered since it violates the Manual of Style for NFPA Technical Committee Documents section 2.3.1.2.4 which requires dates of publication for referenced documents.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: ASME date is 1983, ISO dates are 1980, ignore 60079-1 date.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-97 Log #11 NEC-P14 **Final Action: Reject**
(505.9(F))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 14-189
Recommendation: Accept this proposal in principle in part by accepting the recommended text for 505.9(F) with the reference to 506.15 corrected to 505.16 and continuing to reject the recommendation for a fine print note.
Substantiation: The panel statement about adding conductive optical fiber cables assumes that conductive optical fiber cables are not already covered. The current text covers optical fiber cables that have "conductors that are capable of carrying current". See the definition of conductive optical fiber cable in 770.2; a cable that has "conductors that are capable of carrying current" is a conductive optical fiber cable. A typical conductive optical fiber cable has a metallic strength member.
Composite optical fiber cables have electrical conductors that are intentionally current-carrying. Section 770.3(A) states that conductive optical fiber cables are classified as electrical cables in accordance with the type of electrical conductors.
Panel Meeting Action: Reject
Panel Statement: No additional substantiation provided for the addition of "conductive optical fiber cable".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Ballot Results: Affirmative: 14

14-99 Log #157 NEC-P14 **Final Action: Accept**
(505.15(B))

TCC Action: The Technical Correlating Committee directs that this comment continue to be reported as "Accept", with the notation that the Informational Note for Part (B)(1)(c) will be maintained for the final text of this section.
The Informational Note was deleted at the proposal stage, and reinstated at the comment stage, without any panel comment for so doing.
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-191
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text as follows:
(B) Class I, Zone 1.
(1) General. In Class I, Zone 1 locations, the wiring methods in (B)(1)(a) through (B)(1)(f) shall be permitted.
(a) All wiring methods permitted by 505.15(A).
(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,
and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and terminated ~~provided~~ with ~~termination~~ fittings listed for the application.
Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.
~~FPN: See 330.12 for restrictions on use of Type MC cable.~~
(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,
and where the cable is not subject to physical damage, Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and terminated ~~provided~~ with ~~termination~~ fittings listed for the application.
FPN: See 727.4 and 727.5 for restrictions on use of Type ITC cable.
(d) Type MI cable terminated with ~~termination~~ fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.
(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.
(2) Flexible Connections. Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection shall be permitted.

Panel Statement: As there is no "Article" for Type MC-HL Cable, a reference to Part II of Article 330 (Type MC Cable) is required to specify what installation requirements are to be applied for Type MC-HL Cable. (Add Part II, as shown.) The panel believes that a reference to all of Article 727 is appropriate as the application of ITC-HL cable requires the application of all sections of Article 727.

(505.26)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Accept in Principle" by accepting all the proposed changes indicated by the panel, except revising the last sentence to read as follows:

"Process-connected electrical equipment that does not rely on a single process seal or is listed and marked "single seal" or "dual seal" shall not be required to be provided with an additional means of sealing." to conform with the NEC Style Manual.
Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-204
Recommendation: Revise text to read as follows:

505.26 Process Sealing

This section applies to process connected equipment which includes, but is not limited to, canned pumps, submersible pumps, flow, pressure, temperature, or analysis measurement instruments. A process seal is a device to prevent the migration of process fluids from the designed containment into the external electrical system.

Process connected electrical equipment that incorporates a single process seal, such as a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure. The additional means may include, but is not limited to the following: ~~One of the following means shall be provided to prevent process fluids from entering the electrical raceway or cable system:~~

~~(1) Process connected electrical equipment that incorporates a single process seal, such as single compression seal, diaphragm, or tube to isolate flammable or combustible fluids from entering a conduit or cable system capable of transmitting fluids, shall be provided with an additional means to mitigate a single process seal failure. The additional means may include, but is not limited to the following:~~

(1) ~~a.~~ A suitable barrier meeting the process temperature and pressure conditions that the barrier will be subjected to upon failure of the single process seal. There shall be a vent or drain between the single process seal and the suitable barrier. Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.

(2) ~~b.~~ A listed Type MI cable assembly, rated at not less than 125 percent of the process pressure and not less than 125 percent of the maximum process temperature (in degrees Celsius), installed between the cable or conduit and the single process seal.

(3) ~~c.~~ A drain or vent located between the single process seal and a conduit or cable seal. The drain or vent shall be sufficiently sized to prevent overpressuring the conduit or cable seal above 6 in. water column (1493 Pa). Indication of the single process seal failure shall be provided by visible leakage, an audible whistle, or other means of monitoring.

~~(2)~~ Process-connected electrical equipment that does not rely on a single process seal or is listed and marked "single seal" or "dual seal" need not be provided with an additional means of sealing.

FPN: For construction and testing requirements for process sealing for listed and marked "single seal" or "dual seal" requirements refer to ANSI/ISA-12.27.01:2003, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.
Substantiation: This is a companion comment to 14-38 which addressed the same issue in Article 501. The changes indicated will maintain alignment between identical process sealing requirements that exist in Article 501 and 505.
Panel Meeting Action: Accept
Number Eligible to Vote: 14

ARTICLE 506 — ZONE 20, 21, AND 22 LOCATIONS FOR COMBUSTIBLE DUSTS, FIBERS, AND FLYINGS

14-104 Log #1282 NEC-P14 **Final Action: Reject**
(506.1)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Eliana Beattie, ISA
Comment on Proposal No: 14-218
Recommendation: Proposal 14-218 should be accepted. This proposal was rejected since it was contingent upon acceptance of Proposal 14-228. Proposal 14-228 was rejected since the standard involved was not published. ISA-60079-0 and UL 60079-0 have been approved by their respective organizations and are now published.
Substantiation: Proposal 14-218 should be accepted. This proposal was rejected since it was contingent upon acceptance of Proposal 14-228. Proposal 14-228 was rejected since the standard involved was not published. ISA-60079-0 and UL 60079-0 have been approved by their respective organizations and are now published.

Panel Meeting Action: Reject
Panel Statement: See Panel Comment 14-88a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 5
Explanation of Negative:

BRIESCH, E.: The Comment to accept Proposal 14-218 should be accepted. See my explanation of Negative on Comments 14-88a and 14-114.

KUCZKA, J.: The comment should be Accepted. The panel statement to reject proposal 14-218 was contingent upon acceptance of proposal 14-228. The panel statement to reject proposal 14-228 indicated that the proposal could not be accepted because the standard involved had not yet been published. Since the standard is now published the panel's action to reject this comment offers a new substantiation to reject based on a total different statement in that the panel members had not had time to review the standard. See explanation of negative on comment 14-88a.

LAWRENCE, JR., W.: The comment to accept Proposal 14-218 should be accepted. See my reasons for vote on Comment 14-88a and Comment 14-114.

MASSEY, L.: This panel action should be REJECTED based on the following:
1. The 2009 edition of ANSI/ISA 60079-0 was available for review by the entire panel several weeks prior to the ROC meeting. Contrary to the statement made during the meeting, the published standard was available from ISA as of October 14, 2009. In addition, of the current CMP14, there are ten members directly involved in the development of the ANSI/ISA60079 series of standards who had ample time to review these documents during the development process.
2. The applicable panel statement for rejecting the inclusion of updated ISA standards was "The panel agrees with the concept of the proposal, but cannot accept it because the standard involved has not been published." This requirement has been satisfied with the publication of the subject standard. As no other objections were included in the ROP, the most current ISA standard should be referenced in the FPNs. Section 4.3.5.1 of the NFPA Regulations Governing Committee Projects clearly indicates that the panel statement shall be "...sufficiently detailed so as to convey the TC's rationale for its action so that rebuttal may, if desired, be submitted during the Comment period." Considering that the CMP-14 concerns related to Proposal 14-218 have been FULLY SATISFIED, one could infer that the only logical CMP-14 action is to ACCEPT Comment 14-104.

NEAGLE, J.: This comment was rejected based on the action on comment 14-88a. The standard in question was available as of October 14, 2009. See reasons for negative vote on comment 14-88a.

Comment on Affirmative:

JONES, R.: CMP-14's action on this comment was appropriate. Members of a technical committee are not required to purchase a document that is being requested to be referenced. The entity submitting the proposal is required to include copies of the document with the proposal. The NFPA Regulations Governing Committee Projects, section 4.3.3(f), states: "Two copies of any document(s) (other than an NFPA document) being proposed as a reference standard or publication are to be submitted with the proposal."

At the ROP stage, CMP-14 agreed that an updated version of the ISA standard would be appropriate; however, the proposed version had not been published. The ten members involved with the development of the ANSI/ISA 60079 series of standards were not in agreement at the ROC stage, therefore, all members of CMP-14 needed to review the proposed standard in order to determine if it was proper to reference the new version in the NEC.

14-105 Log #1815 NEC-P14 **Final Action: Accept**
(506.1, FPN)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 14-217
Recommendation: Restore the publication and revision dates for referenced documents mentioned in the Fine Print Notes (FPNs) as they appeared in 506.1of the 2008 NEC.
Substantiation: While fine print notes are intended to provide reference information only, document publication and revision dates are important. Just like the date of the NEC revision needs to be retained for general information affecting designs and installations made at a point in time, these dated references also serve an important task. Deleting the publication and revision information would be a disservice for users and practitioners of this Code.
Panel Meeting Action: Accept
Panel Statement: The correct dates are 2004.

14-108 Log #1293 NEC-P14 **Final Action: Reject**
(506.2.Combustible Dust)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 14-221
Recommendation: We request CMP-14 reconsider the action on Proposal 14-221 and reject the proposal.
Substantiation: The definition of combustible dust is covered in NFPA 499, which is referenced in 500.4(B). The classification of the area should be determined by professionals using NFPA 499. That complete process is required to be documented in accordance with 500.4(A). The area classification process and documentation is supposed to occur as part of the design process and prior to the installation. NEC 90.1(C) indicates this "Code" is not intended as a design manual. NEC 90.2(A) indicates the "Code" covers installation requirements for electrical systems. The proper place for the definition of "Combustible Dust" is NFPA 499. In an effort to minimize the chance of owner/operators assuming area classification is an installation responsibility, enforcement recommends this information be excluded from the NEC and remain in NFPA 499. Including the definition in multiple locations, including the NEC, increases the number of correlation responsibilities required as documents are revised without increasing safety.
Panel Meeting Action: Reject
Panel Statement: See Panel Statement on Comment 14-7.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:

JONES, R.: See negative explanation on Comment 14-7.

OFFERDAHL, D.: See My Explanation of Negative on 14-7.

Comment on Affirmative:

SIMMONS, J.: James Carpenter is correct in his assessment of the negative effects of adding this definition to the NEC. Section 90.1 tells us, in subsection (A) that "the purpose of this Code is the practical safeguarding of persons and property from the hazards arising from the use of electricity." The addition of the definition does not increase the safety of Class II installations. Subsection (C) (Intention) of Section 90.1 goes on to indicate that "this Code is not intended as a design specification or an instruction manual for untrained persons."

The addition of a definition that states a combustible dust is "any finely divided solid material that is 420 microns or smaller in diameter and presents a fire or explosion hazard" does nothing to help an inspection agency insure the safety of a Class II installation. It also does not help the installer have a better understanding of what is required to safely install Class II wiring.

Area classification is a design function which requires the use of many standards in addition to the NEC. Typically the design professional determines the area classification and provides that information to the inspection agency and installer in the form of plans and specifications. The design professional may need to refer to more than one standard to determine the appropriate area classification.

The inclusion of selected references from other standards in the NEC could, in some cases, lead to unsafe installations where uninformed designers rely strictly on the NEC to design projects for hazardous locations believing that the important parts of the other standards have been referenced in the NEC. There has been a tendency in the past few code cycles to add more and more "design" references, particularly in the form of FPNs, to the NEC. As the number of design references increase, the NEC becomes more difficult for inspectors and installers to use. As 90.1 indicates, the NEC is not intended to be used as a design manual.

Comment on Proposal No: 14-226
Recommendation: Revise text as follows:

FPN No. 2: Zone 22 locations usually include outlets from bag filter vents, because in the event of a malfunction there can be emission of combustible mixtures; locations near equipment that has to be opened at infrequent intervals or equipment that from experience can easily form leaks where, due to pressure above atmospheric, dust will blow out; pneumatic equipment, flexible connections that can become damaged, etc.; storage locations for bags containing dusty product, since failure of bags can occur during handling, causing dust leakage; and locations where controllable dust layers are formed that are likely to be raised into explosive dust –air mixtures. Only if the layer is removed by cleaning before hazardous dust–air mixtures can be formed is the area designated as unclassified.
Substantiation: Adding the term "as" as shown provides greater clarity and understanding in the context.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that adding the word "as" adds clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-114 Log #1283 NEC-P14 **Final Action: Reject**
(506.6)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Eliana Beattie, ISA
Comment on Proposal No: 14-228
Recommendation: Proposal 14-228 should be accepted as ISA-60079-11 and UL 60079-11 have been approved by their respective organizations and are published.
Substantiation: Proposal 14-228 should be accepted as ISA-60079-11 and UL 60079-11 have been approved by their respective organizations and are published.
Panel Meeting Action: Reject
Panel Statement: The Technical Committee on Electrical Equipment in Chemical Atmospheres is responsible for Group definitions in combustible dust atmospheres.

See also action on Panel Comment 14-88a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 5
Explanation of Negative:

BRIESCH, E.: This Comment to accept Proposal 14-228 should be accepted. Proposal 14-228 was rejected based on the fact that the 2009 editions of ANSI/UL60079-0 and ANSI/ISA-60079-0 had not yet been published. These documents are now published. In addition, the Panel Statement rejecting this Comment is incorrect. The Standards Council ruling of April 27, 1995 states, "the National Electrical Code has the authority to establish classifications, divisions and group structure. The Technical Committee on Electrical Equipment in Chemical Atmospheres has the authority to classify chemical hazards into the appropriate Groups, including the criteria providing the basis for group structure such as test methods for determining the chemical atmospheres." Therefore, CMP14 is acting within its authority in establishing the dust groups in Article 506.

KUCZKA, J.: The comment should be Accepted. The panel statement to reject proposal 14-228 indicated that the proposal could not be accepted because the standard involved had not yet been published. The panel statement to reject the comment stipulates that the Technical Committee on Electrical Equipment in Chemical Atmospheres is responsible for Group definitions in combustible dust atmospheres, however the NFPA Standards Council has previously ruled that the NEC has the authority to establish such classification groups.

LAWRENCE, JR., W.: The comment to accept Proposal 14-228 should be accepted.

The Panel statement on Proposal 14-228 was "The panel cannot accept the proposal because the standard involved has not been published." Comment 14-114 confirmed that the standards in question had been published, thus addressing the Panel statement as shown in the ROP. The NFPA Regulations Governing Committee Projects includes requirements for statements as follows: "… shall include a statement, preferably technical in nature, on the reason for the TC action. Such statement shall be sufficiently detailed so as to convey the TC's rationale for its action so that rebuttal may, if desired, be submitted during the Comment period…." It would appear that the Panel statement was addressed by the submitted comment. However, in rejecting the comment, a new and different Panel statement was prepared. Was the initial statement then not in conformance with the Regulations? Did it represent the position of the Panel? Further complicating the issue is that fact that this new Panel statement that "The Technical Committee on Electrical Equipment in Chemical Atmospheres is responsible for Group definition in combustible dust atmospheres" is not correct. Panel 14 members were misled at the ROC meeting by incorrect quoting of the NFPA Standards Council direction regarding "groups". NFPA Standards Council Decision SC 95-6 states "…the *National Electrical Code* has the authority to establish classification, divisions, and group structure. …" Panel 14 therefore does have the authority to establish the dust Groups in Article 506 and should do so.

MASSEY, L.: This panel action should be REJECTED based on the following:

1. The 2009 edition of ANSI/ISA 60079-0 was available for review by the entire panel several weeks prior to the ROC meeting. Contrary to the statement made during the meeting, the published standard was available from ISA as of October 14, 2009. In addition, of the current CMP14, there are ten members directly involved in the development of the ANSI/ISA60079 series of standards who had ample time to review these documents during the development process.

2. The applicable panel statement for rejecting the inclusion of updated ISA standards was "The panel agrees with the concept of the proposal but cannot accept it because the standard involved has not been published." This requirement has been satisfied with the publication of the subject standard. As no other objections were included in the ROP, the most current ISA standard should be referenced in the FPNs. Section 4.3.5.1 of the NFPA Regulations Governing Committee Projects clearly indicates that the Panel statement shall be "...sufficiently detailed so as to convey the TC's rationale for its action so that rebuttal may, if desired, be submitted during the Comment period." Considering that the CMP-14 concerns related to Proposal 14-228 have been FULLY SATISFIED, one could infer that the only logical CMP-14 action is to ACCEPT Comment 14-114. The new concerns raised by CMP-14 in the Panel Statement to Comment 14-114 were not part of the original Panel Statement on Proposal 14-228 and, therefore, should not be used as a basis to reject this comment as they were not subject to rebuttal during the Comment period as required by section 4.3.5.1 of the NFPA Regulations Governing Committee Projects.

3. Even if it were appropriate to include an entirely new technical justification during the comment period, the Panel Statement to Comment 14-114 is inaccurate. The panel was presented with a misrepresentation of fact contrary to the unsubstantiated statement included in the ROC regarding responsibility for defining material groups, NFPA Standards Council Decision SC 95-6 makes it clear that "... the National Electrical Code has the authority to establish classifications, divisions, and group structure." The same decision made it clear that "...The Technical Committee on Electrical Equipment in Chemical Atmospheres has the authority to CLASSIFY chemical hazards in the appropriate Groups." Based on this, Comment 14-114 should be ACCEPTED.

NEAGLE, J.: The panel statement states that material Group definitions are the responsibility of the Technical Committee on Electrical Equipment in Chemical Atmospheres. The NFPA Standards Council has previously confirmed that CMP-14 has the responsibility for establishing material Groups.

Comment on Affirmative:

JONES, R.: CMP-14's action on this comment was appropriate. Members of a technical committee are not required to purchase a document that is being requested to be referenced. The entity submitting the proposal is required to include copies of the document with the proposal. The NFPA Regulations Governing Committee Projects, section 4.3.3(f), states: "Two copies of any document(s) (other than an NFPA document) being proposed as a reference standard or publication are to be submitted with the proposal."

At the ROP stage, CMP-14 agreed that an updated version of the ISA standard would be appropriate; however, the proposed version had not been published. The ten members involved with the development of the ANSI/ISA 60079 series of standards were not in agreement at the ROC stage, therefore, all members of CMP-14 needed to review the proposed standard in order to determine if it was proper to reference the new version in the NEC.

14-115 Log #1284 NEC-P14 **Final Action: Accept**
(Table 506.9(C)(2)(2))

Submitter: Eliana Beattie, ISA
Comment on Proposal No: 14-230
Recommendation: Proposal 14-230 should be accepted as ISA-60079-11 and UL 60079-11 have been approved by their respective organizations and are published.
Substantiation: Proposal 14-230 should be accepted as ISA-60079-11 and UL 60079-11 have been approved by their respective organizations and are published.
Panel Meeting Action: Accept
Panel Statement: See Panel Comment 14-88a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-116 Log #1921 NEC-P14 **Final Action: Accept**
(Table 506.9(C)(2)(2))

Submitter: Evans Massey, Baldor Electric Company
Comment on Proposal No: 14-230
Recommendation: Recommendation: Change order of marking for Zone Equipment in 506.9(C)(2) to match US convention established in Article 505 where Zone precedes Symbol AEx proposed order would be (1) Zone; (2) Symbol " AEx" ; (3) Protection technique(s) in accordance with Table 506.9(C)(2)(2) ; (4) Temperature classification, marked as a temperature value, in degrees C, preceded by T; (5) Ambient temperature marking in accordance with 506.9(D)
Substantiation: Inconsistency between Article 505 and 506, comment provided to correct inconsistency.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-117 Log #12 NEC-P14 **Final Action: Reject**
(506.9(F))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 14-233
Recommendation: Accept this proposal in principle in part by accepting the recommended text for 506.9(F) with the second reference to 506.15 corrected to 506.16 and continuing to reject the recommendation for a fine print note.
Substantiation: The panel statement about adding conductive optical fiber cables assumes that conductive optical fiber cables are not already covered. The current text covers optical fiber cables that have "conductors that are capable of carrying current". See the definition of conductive optical fiber cable in 770.2; a cable that has "conductors that are capable of carrying current" is a conductive optical fiber cable. A typical conductive optical fiber cable has a metallic strength member.

Composite optical fiber cables have electrical conductors that are intentionally current-carrying. Section 770.3(A) states that conductive optical fiber cables are classified as electrical cables in accordance with the type of electrical conductors.
Panel Meeting Action: Reject
Panel Statement: No additional substantiation has been provided for the addition of "conductive optical fiber cable".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-118 Log #163 NEC-P14 **Final Action: Accept**
(506.15(A))

TCC Action: The Technical Correlating Committee understands that the words "gas/vaportight", in the first sentence of (3), are deleted to correlate with the panel action on Comment 14-119.
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 14-234
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action as it relates to 4.1.1 of the NEC Style Manual concerning references to entire articles.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise text to read as follows:
506.15 Wiring Methods. Wiring methods shall maintain the integrity of the protection techniques and shall comply with 506.15(A), (B), or (C).
(A) Zone 20. In Zone 20 locations, the wiring methods in (1) through (5) shall be permitted.
(1) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
(2) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
Exception: MI cable and fittings listed for Class II, Division 1 locations are permitted to be used.
(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation,
Type MC-HL cable, listed for use in Zone 20 locations, with a gas/vaportight continuous corrugated metallic sheath and overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and ~~provided with termination~~ terminated with fittings listed for the application, shall be permitted.
Exception: Type MC-HL cable and fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.
~~FPN: See 330.12 for restrictions on use of Type MC cable.~~
(4) Fittings and boxes shall be identified for use in Zone 20 locations.
Exception: Boxes and fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.
(5) Where necessary to employ flexible connections, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed fittings shall be used. Where flexible cords are used, they shall also comply with 506.17. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath.
Exception: Flexible conduit and flexible conduit and cord fittings listed for Class II, Division 1 locations ~~are~~ shall be permitted to be used.
FPN: See 506.25 for grounding requirements where flexible conduit is used.
Panel Statement: As there is no "Article" for Type MC-HL Cable, a reference to Part II of Article 330 (Type MC Cable) is required to specify what installation requirements are to be applied for Type MC-HL Cable. (Add Part II, as shown.) The Panel believes that a reference to all of Article 727 is appropriate as the application of ITC-HL cable requires the application of all sections of Article 727.

14-123 Log #1115 NEC-P14 **Final Action: Reject**
(506.17)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-238
Recommendation: Delete and substitute the following text to read as follows:
(1) Be an extra-hard usage type that complies with 400.3.
(2) Be installed in a manner that prevents strain on terminations or be provided with approved strain relief.
(3) Be provided with approved seals to prevent the entrance of combustible dust and ignitable fibers/flyings where the flexible cord enters fittings, boxes, or other enclosures.
Substantiation: All extra-hard usage cords may not be suitable for the use and conditions: e.g., electric vehicle type, and those not suitable for wet locations or sunlight resistance (without a W designation).
Panel Meeting Action: Reject
Panel Statement: The submitter has provided insufficient information to support the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-124 Log #508 NEC-P14 **Final Action: Reject**
(506.20(E))

Submitter: Edward M. Briesch, Underwriters Laboratories Inc.
Comment on Proposal No: 14-220
Recommendation: Revise 506.20(E) and add a new 506.20(E)(3) as follows:
(E) Temperature. The temperature classification marking specified in 506.9(~~C~~D)~~(2)(5)~~ shall comply with (E)(1), (E)(2) or (E)(2~~3~~):
(1) For combustible dusts, less than the lower of either the layer or cloud ignition temperature of the specific combustible dust. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165°C (329°F).
(2) For ignitible fibers/flyings, less than 165°C (329°F) for equipment that is

not subject to overloading, or 120°C (248°F) for equipment (such as motors or power transformers) that may be overloaded.

(3) For types of protection "i", "m", "p", or "t" the temperature marking shall not exceed 75C less than the values in (E)(1) or (E)(2).

FPN: See NFPA 499-2004, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Processing Areas*, for minimum ignition temperatures of specific dusts.

Substantiation: The applicable product standards specified in Proposal 14-220 do not account for the temperature rise on equipment for Zone 20 and 21 when blanketed with dust or fibers as do the product standards for Class II, Division 1 and Class III, Division 1. The product standards for Zones 20 and 21 are based on the IEC61241 series of standards. These standards rely on IEC60079-14 (formerly IEC61241-14) for proper installation. IEC60079-14 requires that the marked operating temperature on the equipment be 75C less than the ignition temperature of the combustible material. This is done to account for the fact that the operating temperature of the equipment is determined in air and not with a dust blanket. The reference to 506.9(C)(2)(5) was revised to 506.9(D) since that is where the subject of temperature classification is addressed.

Panel Meeting Action: Reject

Panel Statement: This comment introduces new material that has not had public review. Also, the product standards, as published, do address this topic.

Number Eligible to Vote: 14

14-127 Log #1122 NEC-P14 **Final Action: Reject**
(506.25)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-244
Recommendation: Accept the proposal with the following revisions:

Grounding and Bonding. Grounding and bonding shall comply with applicable provisions of Article 250 and 506.25(A) and (B).

Exception: Nonincendive field wiring.

(A) Bonding. The single locknut, double-locknut, and locknut/bushing types of connections shall not be the sole means of bonding. Bonding jumpers with approved fittings, threaded metal raceway connections to threaded fittings, threaded openings or bosses or other approved means shall be used. Such means of bonding shall also apply to all intervening metal raceways, cables, boxes, and other enclosures and equipment between Zone 20, Zone 21, and Zone 22 locations and the point of grounding for service equipment and separately derived systems.

Exception: The specific bonding means of this section shall be required only to the building or other structure disconnecting means grounding terminal(s) or bus(es), provided branch circuit overcurrent protection is located on the load side of such disconnecting means.

FPN: No change.

Substantiation: Nonincendive wiring should be excluded as it poses no fire or explosion hazard. (A) presently does not prohibit single locknut connections normally used with Type MI and MC cables, LFMC, FMC permitted in 506.15. Threaded raceway connections should be noted; their absence begs the question: are these "other approved means?" Regarding the Exception, there may not be a grounded circuit conductor (ungrounded system, or not provided), or a grounding electrode, per 250.32(A), Exception.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

(511.3)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-248
Recommendation: Accept the proposal.
Substantiation: "Mechanical" implies nonelectrical and includes louvers and roof turbines which are not reliable for ventiation. Malfunction of ventilation systems should be indicated, since it may result in hazardous conditions.
Panel Meeting Action: Reject
Panel Statement: The substantiation provided with this comment provides no additional justification for the recommendation than was submitted with the original proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-131 Log #383 NEC-P14 **Final Action: Accept**
(511.3(C)(1)(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-249
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-132 Log #987 NEC-P14 **Final Action: Accept in Principle in Part**
(511.3(C)(1)(a))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 14-249
Recommendation: In Principal by changing "…one cubic foot per minute…" to "…one ft3/min…". In Part by Accepting the proposed revision "…four air changes each ~~per~~ hour…".
Substantiation: The NEC Style Manual, Annex B, Units of Measurement (page 31) specifies that "In the Code text, all units of measurement, when accompanied by a number value, will be styled as follows:" and shows "ft^3/ min".

The second revision uses a more appropriate term for a standard and conveys the same meaning. "Per" is not included as a recommended word in either the NEC Style Manual nor the Manual of Style for Technical Committee Documents.
Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

"The floor area shall be unclassified where there is mechanical ventilation providing a minimum of four air changes per hour or 0.3 m^3/ min / m^2 (1 cfm / ft2) ~~one cubic foot per minute~~ of exchanged air for each square foot of floor area. Ventilation shall provide for air exchange across the entire floor area, and exhaust air shall be taken at a point within 0.3 m (12 in.) of the floor."
Panel Statement: The changes accepted here align with the text in 511.3(C)(2)(a). The recommendation to replace "per" with "each" is not accepted, as it would change the meaning of this provision. The intent of the requirement is require a flow rate, not a specific volume.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-133 Log #384 NEC-P14 **Final Action: Accept**
(511.3(C)(3)(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 14-251
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept

(513.8(A))

Submitter: James S. Conrad, Tyco Thermal Controls
Comment on Proposal No: 14-265
Recommendation: This proposal should be accepted in part as follows: 513.8 (A) Wiring and Equipment ~~Embedded~~, Under Slab, or Under Ground
All wiring installed ~~in or~~ under the hangar floor shall comply with the requirements for Class 1, Division 1 locations. Where such wiring is located in vaults, pits, or ducts adequate drainage shall be provided.
Substantiation: Delete "Embedded" and "in or" from 513.8(A) only. Cables and conduits embedded (or encased) in the concrete floor do not meet the definition of a hazardous location. Section 5.9.2 NFPA 409 is only concerned with electrical equipment below the hangar floor level where vapors or fuel can accumulate such as in a pit, duct or tunnel. A sealed conduit or MI heating cable embedded in the concrete floor does not pose a hazard and should not be classifies as hazardous equipment.
Panel Meeting Action: Reject
Panel Statement: Because this represents a special application, the submitter should direct his proposals to the NFPA Technical Committee on Airport Facilities and other affected committees and should address specific applications of the product. Panel 14 would then be in a position to consider appropriate changes to Chapter 5 of the Code.

ARTICLE 514 – MOTOR FUEL DISPENSING FACILITIES

14-144a Log #CC1407 NEC-P14 **Final Action: Accept**
(Table 514.3(B)(1))

Submitter: Code-Making Panel 14,
Comment on Proposal No: 14-273
Recommendation: Replace the current version of Table 514.3(B)(1) with the new version of Table 8.3.1 of NFPA 30A that has been issued as Tentative Interim Amendment 30A-08-1, shown here:
See Table 514.3(B)(1) on Pages 350 and 351

Substantiation: NFPA 30A has issued a TIA 30A-08-1 to amend Table 8.3.1. Panel 14 has created this comment to Proposal 14-273 to include the applicable portions of the revised table relevant to Article 514 in the 2011 edition of the Code. This is done to avoid conflicts between the two documents and recognize the importance of consistent information. This represents a coordinated effort between Panel 14 and the AUV to ensure correlation. Panel 14 encourages the establishment of a Task Group consisting of members of Panel 14 and the AUV to develop proposals related to Articles 511 and 514 for the next Code cycle.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
BRIESCH, E.: While I agree with the Panel Action, the introduction of Zone classified locations into Article 514 requires revisions to Sections 514.3(B)(2) and 514.8 and Figure 514.3 as well as Table 514.3(B)(1). Applying Table 514.3(B)(1) without revisions to these other Sections and the Figure may present a problem since requirements relative to Zone classified areas are not addressed in them. Since much of this is extracted text from NFPA30A, the TC on Automotive and Marine Service Stations needs to revise NFPA30A to completely address Zone classified locations and submit a TIA for Article 514 to address these other Sections before the 2014 Code cycle.

14-145 Log #595 NEC-P14 **Final Action: Accept in Part**
(514.8 Exception No. 2)

TCC Action: The Technical Correlating Committee directs that the word "Type" be inserted prior to "PVC" and "RTRC" in this section to conform with the NEC Style Manual.
Submitter: John L. Simmons, Florida East Coast JATC / Rep. IBEW
Comment on Proposal No: 14-274
Recommendation: Revise the text to read as follows:
Exception No. 2: ~~Rigid nonmetallic~~ Schedule 80 PVC, conduit and XW-type RTRC conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where ~~rigid nonmetallic~~ Schedule 80 PVC conduit or XW-type RTRC conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (2 ft) of the underground run to emergence or to the point of connection to the aboveground raceway, and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.
Substantiation: This comment was generated by a Task Group from CMP-14. The submitter of Proposal 14-274 is absolutely correct in recognizing that the terminology associated with rigid nonmetallic conduit has changed. His proposed change, however, only addressed one of the wiring methods that were included in the 2005 NEC under Article 352. The 2005 NEC Handbook references the 2004 UL General Information for Electrical Equipment Directory (White Book) in its commentary under the definition of Rigid Nonmetallic Conduit in 352.2. "The White Book describes two types of rigid nonmetallic conduit recognized for use in accordance with 352.

Table 514.3(B)(1) Class I Locations — Motor Fuel Dispensing Facilities

Location	Class I		Extent of Classified Location[1]
	Division (Group D)	Zone (Group IIA)	
Dispensing Device (except Overhead Type) [2,3]			
Under dispenser containment	1	1	Entire space within and under dispenser pit or containment
Dispenser	2	2	Within 450 mm (18 in.) of dispenser enclosure or that portion of dispenser enclosure containing liquid handling components, extending horizontally in all directions and down to grade level
			Up to 450 mm (18 in.) above grade level, extending 6m (20 ft) horizontally in all directions from dispenser enclosure
Outdoor	2	2	Up to 450 mm (18 in.) above floor level, extending 6m (20 ft) horizontally in all directions from dispenser enclosure
Indoor - with mechanical ventilation	2	2	Up to 450 mm (18 in.) above floor level, extending 7.5 m (25 ft) horizontally in all directions from dispenser enclosure
- with gravity ventilation	2	2	
Dispensing Device — Overhead Type[4]	1	1	Space within dispenser enclosure and all electrical equipment integral with dispensing hose or nozzle
	2	2	Within 450 mm (18 in.) of dispenser enclosure, extending horizontally in all directions and down to grade level
	2	2	Up to 450 mm (18 in.) above grade level, extending 6m (20 ft) horizontally in all directions from a point vertically below edge of dispenser enclosure
Remote Pump —			
Outdoor	1	1	Entire space within any pit or box below grade level, any part of which is within 3 m (10 ft) horizontally from any edge of pump
	2	2	Within 900mm (3 ft) of any edge of pump, extending horizontally in all directions
	2	2	Up to 450 mm (18 in.) above grade level, extending 3m (10 ft) horizontally in all directions from any edge of pump
			Entire space within any pit
Indoor	1	1	Within 1.5 m (5 ft) of any edge of pump, extending in all directions
	2	2	Up to 900 mm (3 ft) above floor level, extending 7.5 m (25 ft) horizontally in all directions from any edge of pump
	2	2	
Sales, Storage, Rest Rooms including structures (such as the attendant's kiosk)on or adjacent to dispensers	unclassified	unclassified	Except as noted below
	1	1	Entire volume, if there is any opening to room within the extent of a Division 1 or Zone 1 location
	2	2	Entire volume, if there is any opening to room within the extent of a Division 2 or Zone 2 location

Table 514.3(B)(1) Class I Locations — Motor Fuel Dispensing Facilities *continued*

Location	Class I Division (Group D)	Class I Zone (Group IIA)	Extent of Classified Location[1]
Tank, Aboveground			
Inside tank	1	0	Entire inside volume
Shell, ends, roof, dike area	1	1	Entire space within dike, where dike height exceeds distance from tank shell to inside of dike wall for more than 50 percent of tank circumference
	2	2	Entire space within dike, where dike height does not exceed distance from tank shell to inside of dike wall for more than 50 percent of tank circumference
			Within 3m (10 ft) of shell, ends, or roof of tank
Vent	2	2	Within 1.5 m (5 ft) of open end of vent, extending in all directions
	1	1	Between 1.5 m and 3 m (5 ft and 10 ft) from open end of vent, extending in all directions
	2	2	
Tank, Underground			
Inside tank	1	0	Entire inside volume
Fill Opening	1	1	Entire space within any pit or box below grade level, any part of which is within a Division 1 or Division 2 classified location or within a Zone 1 or Zone 2 classified location
	2	2	Up to 450 mm (18 in.) above grade level, extending 1.5m (5 ft) horizontally in all directions from any tight-fill connection and extending 3m (10 ft) horizontally in all directions from any loose-fill connection
			Within 1.5 m (5 ft) of open end of vent, extending in all directions
Vent	1	1	Between 1.5 m and 3 m (5 ft and 10 ft) from open end of vent, extending in all directions
	2	2	
Vapor Processing System			
Pits	1	1	Entire space within any pit or box below grade level, any part of which: (1) is within a Division 1 or Division 2 classified location; (2) is within a Zone 1 or Zone 2 classified location; (3) houses any equipment used to transfer or process vapors
Equipment in protective enclosures	2	2	Entire space within enclosure
Equipment not within protective enclosure	2	2	Within 450 mm (18 in.) of equipment containing flammable vapors or liquid, extending horizontally in all directions and down to grade level
	2	2	Up to 450 mm (18 in.) above grade level within 3 m (10 ft) horizontally of the vapor processing equipment
			Entire space within enclosure, if flammable vapor or liquid is present under normal operating conditions
- Equipment enclosure	1	1	Entire space within enclosure, if flammable vapor or liquid is not present under normal operating conditions
	2	2	Within 450 mm (18 in.) of blower, extending horizontally in all directions and down to grade level
- Vacuum assist blower	2	2	Up to 450 mm (18 in.) above grade level, extending 3m (10 ft) horizontally in all directions
	2	2	
Vault	1	1	Entire interior space, if Class I liquids are stored within

[1]For marine application, *grade level* means the surface of a pier, extending down to water level.
[2]Refer to Figure 514.3 for an illustration of classified location around dispensing devices.
[3]Area classification inside the dispenser enclosure is covered in UL 87, *Standard for Power-Operated Dispensing Devices for Petroleum Products.*
[4]Ceiling-mounted hose reel.

1. Rigid nonmetallic Schedule 40 and Schedule 80 PVC Conduit (DZYR) and,

2. Reinforced thermosetting resin conduit (DZKT).” The 2008 NEC gave RTRC its own article and revised the title of Article 352, but it did not change the fact that both are still rigid nonmetallic conduit. This is evidenced by the fact that the definition of PVC in 352.2 states that it is a “rigid nonmetallic conduit” and the definition of RTRC in 355.2 states that it is a “rigid nonmetallic conduit”. Schedule 80 PVC is being specified to provide protection where subject to physical damage. Historically conduit used in hazardous locations has been metal which will provide protection from physical damage. Plastic conduits, when used, should provide the same protection, SW-type RTRC conduit is suitable, according to the UL “White Book”, for use in locations subject to physical damage.

The revised text will address the proposer’s concern with the existing ext, but will not eliminate the use of RTRC conduit for the application described in 514.8, Exception No. 2.

Panel Meeting Action: Accept in Part

Revise text to read as follows:

Exception No. 2: ~~Rigid~~ PVC ~~nonmetallic~~ conduit and RTRC conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where ~~rigid~~ PVC ~~nonmetallic~~ conduit or RTRC conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (2 ft) of the underground run to emergence or to the point of connection to the aboveground raceway, and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

Panel Statement: The Panel agrees with the submitter’s revision, but does not believe that the substantiation provides a reason to restrict PVC conduit to Schedule 80 or RTRC to type XW. As such, the Panel accepts the proposal with Schedule 80 and XW type references removed.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-146 Log #599 NEC-P14 **Final Action: Accept in Principle in Part**
(514.8 Exception No. 2)

TCC Action: The Technical Correlating Committee directs that the word “Type” be inserted before “PVC” and “RTRC” in this section to conform to the NEC Style Manual.

Submitter: John L. Simmons, Florida East Coast JATC

Comment on Proposal No: 14-277

Recommendation: Revise the proposed text to read as follows:

Exception No.2: ~~Rigid Type~~ Schedule 80 PVC conduit, or XW-type RTRC ~~or HDPE nonmetallic conduit~~ shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where ~~rigid Type~~ Schedule 80 PVC conduit, or XW-type RTRC, ~~or HDPE nonmetallic conduit~~ is used...

Substantiation: This comment was generated by a Task Group from CMP-14. The proposed changes will make the terminology consistent with Article 352 and Article 355. The 2005 NEC Handbook references references the 2004 UL General Information for Electrical Equipment Directory (White Book) in its commentary under the definition of Rigid Nonmetallic Conduit in 352.2. “The White Book describes two types of rigid nonmetallic conduit recognized for use in accordance with Article 352.

1. Rigid nonmetallic Schedule 40 and Schedule 80 PVC conduit (DZYR), and

2. Reinforced thermosetting resin conduit (DZKT).”

The 2008 NEC gave RTRC its own article and revised the title of Article 352, but it did not change the fact that both are still rigid nonmetallic conduit. This is evidenced by the fact that the definition of PVC in 352.2 states that it is a “rigid nonmetallic conduit” and the definition of RTRC in 355.2 states that it is a “rigid nonmetallic conduit”. HDPE is not defined as rigid nonmetallic conduit in 353.2. The 2008 NEC 518.8(C) text uses the term “rigid nonmetallic conduit”. HDPE should not be included.

Historically, conduit used in hazardous locations has been metal which will provide protection from physical damage. Plastic conduits, when used, should provide the same protection. XW-Type RTRC conduit marked as AG, XW, RTRC is suitable according to the UL “White Book” for use in locations subject to physical damage.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed text to read as follows:

Exception No.2: ~~Rigid Type~~ Schedule 80 PVC conduit, or ~~XW-type RTRC or HDPE nonmetallic~~ conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where ~~rigid Type~~ Schedule 80 PVC conduit, or ~~XW-type~~ RTRC, ~~or HDPE nonmetallic~~ conduit is used...

Revise Proposal 14-277 to read:

Exception No. 2: ~~Rigid~~ PVC *conduit* or RTRC *~~nonmetallic~~ conduit shall be permitted where buried under not less than 600 mm (2 ft) of cover. Where ~~rigid~~* PVC *conduit* or RTRC *~~nonmetallic~~ conduit is used...*

Panel Statement: The panel agrees with the submitter’s revision, but does not believe that the substantiation provides a reason to restrict PVC conduit to Schedule 80 or RTRC to type XW. As such, the panel accepts the proposal with Schedule 80 and XW type references removed. The word “conduit” has been added for consistency with other provisions of Chapter 5.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-147 Log #1142 NEC-P14 **Final Action: Reject**
(514.8 Exception No. 2)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 14-275

Recommendation: Accept the proposal with the following revisions:

Exception No. 2: Type PVC conduit containing an equipment grounding conductor shall be permitted where buried under not less than 600 mm (2 ft) of earth cover or 102 mm (4 in.) of cement concrete or encased in not less than 50.8 mm (2 in.) of cement concrete.

Substantiation: Cement concrete slab or encasement should be suitable protection. Threaded connection should be specified for RMC and IMC. Aboveground wiring may not be a raceway, it may be a cable or enclosure. The purpose of an EGC is defined in the Article 100 definition of “EGC.”

Panel Meeting Action: Reject

Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must “include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted”. The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-148 Log #1140 NEC-P14 **Final Action: Reject**
(514.11)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 14-279

Recommendation: Add the following to the panel action text:

The disconnecting means shall be provided with an approved permanent means for locking in the open (off) position.

Substantiation: The panel action did not require the disconnecting means to be within sight of dispensers or indicate whether 430.102(B)(1) or the Exception to (1) and (2) of that section is intended to apply.

Panel Meeting Action: Reject

Panel Statement: The Panel notes that this device is referred to in NFPA 30A as an “emergency electrical disconnect” and is intended as an emergency power off device to be used should an emergency, such as a fuel spill, occur. The lockable disconnect means is addressed in 514.13.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-149 Log #1141 NEC-P14 **Final Action: Reject**
(514.13)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 14-280

Recommendation: Delete or revise current text as follows:

Where the disconnecting means is not within sight of the dispensing equipment, each equipment shall be provided with approved means to simultaneously disconnect all circuit conductors installed to or through the dispensing equipment and it shall be within sight of the dispensing equipment. The disconnecting means for each dispensing equipment shall be provided with approved permanent means for locking in the open (off) position.

Substantiation: “During periods of maintenance and service” is irrelevant. This section apparently requires an additional disconnecting means which can be provided by 514.11.

Panel Meeting Action: Reject

Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must “include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted”. The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-152 Log #596 NEC-P14 **Final Action: Accept in Part**
(515.8(A))

TCC Action: The Technical Correlating Committee directs that the word "Type" be inserted before the words "PVC" and "RTRC" in this section to conform to the NEC Style Manual.

The Technical Correlating Committee notes that all other wording changes indicated by the panel action are accepted.
Submitter: John L. Simmons, Florida East Coast JATC / Rep. IBEW
Comment on Proposal No: 14-288
Recommendation: Revise the text to read as follows:

515.8 Underground Wiring.

(A) Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 600 mm (2 ft) of cover, shall be permitted in ~~rigid nonmetallic~~ Schedule 80 PVC conduit XW-type RTRC or a listed cable. Where ~~rigid nonmetallic~~ Schedule 80 PVC conduit or XW-type RTRC is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for not less than the last 600 mm (2 ft) of the conduit run to the conduit's point of emergence from the underground location or to the point of connection to ~~the~~ an aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from the point of lowest buried cable level to the point of connection to the aboveground raceway.
Substantiation: This comment was generated by a Task Group from CMP-14. The revised wording addresses some of the submitter's concerns and corrects the misuse of the term rigid nonmetallic conduit. The 2008 NEC changed the term rigid nonmetallic conduit to rigid polyvinyl chloride conduit: Type PVC. The change also moved RTRC conduit to a new Article 355. The 2005 NEC Handbook references the 2004 UL General Information for Electrical Equipment Directory (White Book) in its commentary under the definition of Rigid Nonmetallic Conduit in 352.2. "The White Book describes two types of rigid nonmetallic conduit recognized for use in accordance with Article 352.

1. Rigid nonmetallic Schedule 40 and Schedule 80 PVC conduit (DZYR) and,

2. Reinforced thermosetting resin conduit (DZKT)." The 2008 NEC gave RTRC its own article and revised the title of Article 352, but it did not change the fact that both are still rigid nonmetallic conduit. This is evidenced by the fact that the definition of PVC in 352.2 states that it is a "rigid nonmetallic conduit" and the definition of RTRC in 355.2 states that it is a "rigid nonmetallic conduit". Historically conduit used in hazardous locations has been metal which will provide protection from physical damage. Plastic conduits should, when used, should provide the same protection, SW-type RTRC conduit is suitable, according to the UL "White Book" for use in locations subject to physical damage.
Panel Meeting Action: Accept in Part

Revise (A) to read as follows:

(A) Wiring Method. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 600 mm (2 ft) of cover, shall be permitted in ~~rigid nonmetallic~~ PVC conduit, RTRC conduit, or a listed cable. Where ~~rigid nonmetallic~~ PVC conduit or RTRC conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for not less than the last 600 mm (2 ft) of the conduit run to the conduit point of emergence from the underground location or to the point of connection to an ~~the~~ aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from the point of lowest buried cable level to the point of connection to the aboveground raceway.
Panel Statement: The Panel agrees with the submitter's revision, but does not believe that the substantiation provides a reason to restrict PVC conduit to Schedule 80 or RTRC to type XW. As such, the Panel accepts the proposal with Schedule 80 and XW type references removed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-153 Log #1191 NEC-P14 **Final Action: Reject**
(515.8(A) and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-288
Recommendation: Accept the proposal with the following revisions:

Underground wiring shall be installed in a threaded rigid metal conduit or threaded steel intermediate metal conduit, with threaded fittings, or where buried under not less than 600 mm (2 ft) of cover or encased in cement concrete envelope not less than 50.8 mm (2 in.) thick shall be permitted to be Type PVC conduit or Type MI cable or other approved cable. Where Type PVC conduit is used, rigid metal conduit or steel intermediate metal conduit shall be used for the last 600 mm (2 ft) or more of the underground conduit run to the aboveground wiring method. Where cable is used, it shall be enclosed in rigid metal conduit or steel intermediate metal conduit from the lowest required direct-burial depth of the cable, or where concrete encasement ends, to the point of connection to an aboveground wiring method or connection to an enclosure or other equipment.
Substantiation: A concrete encasement should permit a lesser burial depth. Underground runs do not necessarily connect to an above ground wiring raceways; they may connect to other approved wiring methods or terminate at aboveground equipment. The proposed deletion for part of (C) is superfluous; the purpose of an EGC doesn't need explanation, it is covered in the Article 100 definition.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-154 Log #597 NEC-P14 **Final Action: Accept**
(515.8(C))

Submitter: John L. Simmons, Florida East Coast JATC / Rep. IBEW
Comment on Proposal No: 14-289
Recommendation: Revise the text to read as follows:

(C) Nonmetallic Wiring. Where PVC ~~rigid nonmetallic~~ conduit, RTRC conduit or cable with a nonmetallic sheath is used, an equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.
Substantiation: This comment was generated by a Task Group from CMP-14. The submitter of Proposal 14-289 is absolutely correct in recognizing that the terminology associated with rigid nonmetallic conduit had changed. His proposed change, however, only addressed one of the wiring methods that were included in the 2005 NEC under Article 352. The 2005 NEC Handbook references the 2004 UL General Information for Electrical Equipment Directory (White Book) in its commentary under the definition of Rigid Nonmetallic Conduit in 352.2. "The White Book describes two types of rigid nonmetallic conduit recognized for use in accordance with Article 352.

1. Rigid nonmetallic Schedule 40 and Schedule 80 PVC conduit (DZYR), and

2. Reinforced thermosetting resin conduit (DZKT)." The 2008 NEC gave RTRC its own article and revised the title of Article 352, but it did not change the fact that both are still rigid nonmetallic conduit. This is evidenced by the fact that the definition of PVC in 352.2 states that it is a "rigid nonmetallic conduit" and the definition of RTRC in 355.2 states that it is a "rigid

nonmetallic conduit".

The revised text will address the proposer's concern with the existing text, but will not eliminate the use of RTRC conduit for the application described in 515.8(C) as the proposal would do. It also makes this section consistent with the text found in 501.10(A)(1), exception.

Panel Meeting Action: Accept

Panel Statement: The panel agrees with the submitter's revision, but does not believe that the substantiation provides a reason to restrict PVC conduit to Schedule 80 or RTRC to type XW. As such, the panel accepts the proposal with Schedule 80 and XW type references removed.

Number Eligible to Vote: 14

ARTICLE 516 — SPRAY APPLICATION, DIPPING, AND COATING PROCESSES

14-155 Log #1818 NEC-P14 **Final Action: Reject**
(516.4(D) Exception No. 2)

Submitter: Michael P. Walls, American Chemistry Council

Comment on Proposal No: 14-297

Recommendation: Change 'vehicle' to 'automotive', so that this exception reads as follows (2008 NEC text):

Exception No. 2: Where portable electric drying apparatus is used in automotive ~~automobile vehicle~~ refinishing spray booths and the following requirements are met:

Substantiation: The Panel action should have been to accept in principle. As suggested by the Proposer, 'automobile' was not the correct word. However, neither was 'vehicle', which the panel action accepted. The correct term is 'automotive' refinishing.

Panel Meeting Action: Reject

Panel Statement: See Comment 14-156.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-156 Log #2156 NEC-P14 **Final Action: Accept**
(516.4(D) Exception No. 2)

Submitter: Jeremy Neagle, Intertek Testing Services

Comment on Proposal No: 14-297

Recommendation: 516.4(D) Exception No. 2 should be revised as follows:

"Exception No. 2: Where portable electric drying apparatus is used in ~~automobile refinishing~~ spray booths and the following requirements are met:…"

Retain items (a) through (d).

Substantiation: The provision for portable electric drying apparatus should not be limited to use in automotive refinishing type spray booths. Such equipment has application in industrial and other spray coating operations also falling within the scope of NFPA 33 and NEC Article 516.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-157 Log #598 NEC-P14 **Final Action: Accept**
(516.7(A))

Submitter: John L. Simmons, Florida East Coast JATC / Rep. IBEW

Comment on Proposal No: 14-298

Recommendation: Revise the text to read as follows:

(A) Wiring. All fixed wiring above the Class I and II locations shall be in metal raceways, ~~rigid nonmetallic~~ PVC conduit, RTRC conduit or electrical nonmetallic tubing ~~or~~ where cables are used, they shall be Type MI, Type TC, or Type MC cable. Cellular metal floor raceways shall only be permitted ~~only for supplying~~ to supply ceiling outlets or as extensions to the area below the floor of a Class I or II location~~, but such~~. Where cellular metal raceways, are used, they shall ~~have no~~ not have connections leading into or passing through the Class I or II location ~~above the floor~~ unless suitable seals are provided.

Substantiation: This comment was generated by a Task Group from CMP14. The submitter's concern appears to be the clarity of the wording of the subsection. The revised text will provide clarity. It will also correct the misuse of the term rigid nonmetallic conduit. The 2008 NEC changed the term rigid nonmetallic conduit to rigid polyvinyl chloride conduit: Type PVC. The change also moved RTRC conduit to a new Article 355. The 2005 NEC Handbook references the 2004 UL General Information for Electrical Equipment Directory (White Book) in its commentary under the definition of Rigid Nonmetallic Conduit in 352.2. "The White Book describes two types of rigid nonmetallic conduit recognized for use in accordance with Article 352.

1. Rigid nonmetallic Schedule 40 and Schedule 80 PVC conduit (DZYR,) and

2. Reinforced thermosetting resin conduit (DZKT)." The 2008 NEC gave RTRC its own article and revised the title of Article 352, but it did not change the fact that both are still rigid nonmetallic conduit. This is evidenced by the fact that the definition of PVC in 352.2 states that it is a "rigid nonmetallic conduit" and the definition of RTRC in 355.2 states that it is a "rigid nonmetallic conduit".

Panel Meeting Action: Accept

Panel Statement: The panel agrees with the submitter's revision, but does not believe that the substantiation provides a reason to restrict PVC conduit to Schedule 80 or RTRC to type XW. As such, the panel accepts the proposal with Schedule 80 and XW type references removed.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Proposal No: 14-298

Recommendation: Accept the proposal with the following revisions:

Change "suitable" to "approved" and "may" to "is likely to."

Substantiation: "Suitable" is not defined and a term not to be used without conditions. "May" is a discretionary term to be used by the AHJ. "Likely" is a term used over 80 times in the NEC.

Panel Meeting Action: Reject

Panel Statement: The current text is correct. "May" is not subjective, but denotes physical possibility and is the appropriate term. The term "is likely to be" denotes probability, or a greater chance of occurrence. The word "suitable" as used in this section is not unenforceable and does not create confusion, as indicated in the requirements of the NEC Style Manual. As such, it does not need to be replaced.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-159 Log #765 NEC-P14 **Final Action: Reject**
(516.10(A)(2) and (3))

ARTICLE 517 — HEALTH CARE FACILITIES

15-1 Log #166 NEC-P15 **Final Action: Accept**
(517.2 (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 15-3a
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comment expressed in the voting.

In addition, the Technical Correlating Committee directs the panel to clarify the action on this proposal as it relates to 2.2.2 of the NEC Style Manual concerning the use of mandatory text in a definition.

This action shall be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise text to read as follows:

Battery Powered Lighting Units.

Individual unit equipment for back up illumination consisting of the following:

(1) A rechargeable battery

(2) A battery charging means

(3) Provisions for one or more lamps mounted on the equipment, or with terminals for remote lamps, or both

(4) A relaying device arranged to energize the lamps automatically upon failure of the supply to the unit equipment.

Panel Statement: The panel accepts the direction of the TCC to clarify the action on this proposal as it relates the use of mandatory text in a definition.

The panel has eliminated the mandatory text in the definition.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-2 Log #924 NEC-P15 **Final Action: Reject**
(517)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: N/A
Recommendation: Reject all proposals in Article 517 that were intended to maintain consistency between the revisions to the next edition of NFPA 99 and the 2011 NEC (NFPA 70).
Substantiation: The NEC Technical Correlating Committee identified several proposals to revise Article 517 that were the direct result of proposed changes to NFPA 99. Since NFPA 99 was not accepted and turned back to the committee at the 2009 NFPA Annual Meeting, the appropriate course of action would be to reject all proposals related to the NFPA 99 development process.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation did not provide the specific references as required by the Regulations Governing Committee Projects, Section 4.4.5(c), to allow the panel to act.

The panel has acted on the comments in Article 517 that were intended to maintain consistency between the proposed revisions to NFPA 99 and the NEC (NFPA 70) individually.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

LIPSTER, S.: In fact, the comment meets the requirements of 4.4.5(c) of the Regulations Governing Committee Projects. The comment should be accepted, the submitters substantiation is valid as evidenced by the action taken by this panel on all comments identified by the TCC as linked to NFPA 99.

15-3 Log #766 NEC-P15 **Final Action: Reject**
(517.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-3a
Recommendation: Accept or delete.
Substantiation: Section 90.3 states the NEC is an installation code. The interpretation of 2.2.2 of the NEC Style Manual that mandatory text shall not be used in a definition should not apply to a description. Many definitions have mandatory text, e.g., accessible, readily, ampacity, automatic, bonded, branch circuit, branch circuit overcurrent device, cabinet, circuit breaker, conduit body, cooking unit counter mounted, disconnecting means, enclosure, explosionproof apparatus, exposed, externally operable, grounded, solidly, etc.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide any clear direction. The recommendation to accept or delete is unclear.

See panel action and statement on Comment 15-1.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-4 Log #925 NEC-P15 **Final Action: Accept**
(517.2)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 15-7
Recommendation: Reject the proposal and restore to the 2008 NEC language. Restore all instances of the term "emergency system" back in the sections where it was removed resulting from this action.
Substantiation: The NEC Technical Correlating Committee identified several proposals to revise Article 517 that were the direct result of proposed changes to NFPA 99. NFPA 99 was not accepted and returned back to the committee at the 2009 NFPA Annual Meeting, the appropriate course of action is to reject all proposals related to the NFPA 99 development process, since it is uncertain how those requirements appear in the final accepted version of NFPA 99. The substantiation indicates that the proposal "eliminates an unnecessary hierarchal level." This is not substantiated and, in fact, the three branches addressed in Article 517 have worked well for NEC cycles. Why is the need for differentiating between the branches of the essential system different now? Deleting the definition of the term "emergency system" from Article 517 has unintended consequences that lessen the current requirements without technical substantiation. Whether addressing a performance requirement or an installation requirement, the terms should be clear and be accurate in describing how a system functions. Other Codes and Standards are impacted by such a drastic change, such as product standards that evaluate and list equipment as suitable for use on "emergency systems" and "identified for use on emergency systems" as required by Article 700 (for example, see 700.6). 700.4, 700.7, 700.9, 700.12, 700.16, 700.18, 700.25 and 700.27 all include requirements that must be applied to health care facilities. No such requirements currently exist in Article 517. Building codes and other standards use the term "emergency system" when addressing health care facilities, deleting this term from Article 517 has unintended and far-reaching correlation consequences between codes and standards as a result. The substantiation includes removing essential requirements that should apply to the respective branches (including the critical branch) of the essential system in health care facilities. As stated in Proposal 15-7, "the fundamental purpose of this proposal is to coordinate with the 2010 version of NFPA 99." NFPA 99 has problems (including the electrical provisions) as evidenced at the 2009 Annual meeting action to return the document back to the committee. The appropriate action is to restore the 2008 NEC requirements that were deleted or modified in Article 517 as directed by the NEC TCC.
Panel Meeting Action: Accept
Panel Statement: The panel elected to return to the 2008 NEC text because NFPA 99 was returned to committee. This action was taken without deliberation on other substantiation offered in the comments.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-5 Log #1158 NEC-P15 **Final Action: Reject**
(517.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-10
Recommendation: Accept the proposal with the following revisions:
A system comprised of one or more of the following:
(1) An isolation transformer(s)
(2) A generator(s)
(3) An electrically isolated battery
(4) A combination of such equipment.
Substantiation: "Equivalent" is not specific as in 517.160(A)(1).
Panel Meeting Action: Reject
Panel Statement: The panel upholds its position on Proposal 15-10. The recommended change does not add clarity.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-6 Log #1193 NEC-P15 **Final Action: Reject**
(517.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-10
Recommendation: Accept the proposal.
Substantiation: There is an NEC definition for "Isolating Transformer", but the definition immediately following Isolated Power Systems is the definition for isolation transformer; are they different? The secondary should be specified as ungrounded since ungrounded conductors can be supplied from a grounded secondary, as commonly done with a 2-wire 240 volt secondary which complies with this section, but doesn't meet the intent. A consistent use of "isolation" would be clearly understood by Code users who may not be versed in the fine points of the panel statement. The proposed definition is descriptive as almost all definitions in Article 100 contain requirements, but are not Code "rules", per se.
Panel Meeting Action: Reject
Panel Statement: The existing text is clear and concise. The submitter has no new substantiation.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-7 Log #2174 NEC-P15 **Final Action: Accept**
(517.2)

Submitter: Barry F. O'Connell, Tyco Thermal Controls
Comment on Proposal No: 15-6
Recommendation: These proposals should be rejected because of the implication in regard to life safety in hospitals.
Substantiation: These proposals are apparently all about aligning with NFPA 99, but have far-reaching consequences in the breaking of the tie to Life Safety Circuits in Article 700. Revising the definition for the Life Safety Branch, and the other proposals that in effect break the link to Article 700, does not remove the fundamental need for Emergency Systems in hospitals.
The intent of Emergency Systems is described in the scope of Article 700:
Emergency systems are those systems legally required and classed as emergency by municipal, state, federal, or other codes… intended…in the event of failure of the normal supply... to supply, distribute, and control power and illumination essential for safety to human life.
FPN No. 3: Emergency systems are generally installed in places of assembly where artificial illumination is required
for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels,
theaters, sports arenas, health care facilities, and similar institutions. Emergency systems may also provide power
for such functions as ventilation where essential to maintain life, fire detection and alarm systems, elevators, fire pumps,
public safety communications systems, industrial processes where current interruption would produce serious life
safety or health hazards, and similar functions.
The NEC is a minimum requirement. In a hospital in particular, removing the tie-in to Article 700 is a serious disconnect and should be reconsidered.
Note: Supporting Material is available for review at NFPA headquarters.
Panel Meeting Action: Accept
Panel Statement: The panel elected to return to the 2008 NEC text because NFPA 99 was returned to committee. This action was taken without deliberation on other substantiation offered in the comments.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
LIPSTER, S.: Health care facility staff, patients, and visitors must be afforded the life-safety protection essential for human life described in the scope of Article 700. The submitter is correct stating health care facilities should continue to be included in the scope of Article 700.

15-8 Log #2328 NEC-P15 **Final Action: Reject**
(517.2)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 15-16
Recommendation: Continue to accept this proposal, but substitute the term "patient care area" with "patient care room" in the following areas: 517.2Reference Grounding Point; 517.10(A); 517.13 and 13(A); 517.18(C); 517.20(A); 517.30(C)(3)(1), (C)(3)(2) and FPN; 517.33(A)(3); 517.43(A)(1); 517.80; 517.81; 517.82(A) FPN.
Substantiation: The ROP draft seemed only to replace this term in a few instances and missed the above stated areas. This comment is intended only to assist in correlating and should not be considered a technical change.
Panel Meeting Action: Reject
Panel Statement: This comment is moot as the result of the return of NFPA 99 to committee.
See panel action on Comment 15-26.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(517.2.Emergency Systems)

Submitter: Stephen M. Lipster, The Electrical Trades Center / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 15-7
Recommendation: Reject this proposal and restore the 2008 NEC text.
Substantiation: The submitters substantiation for this proposal relies on two points. One point claims the conditions of Article 700 are not easily applicable to health care facilities “essential” electrical systems and these systems should be relieved of the Article 700 requirements. The second point asserts that the 2010 Edition of NFPA 99 as already made the change and the NEC should accept this proposal for coordination purposes.
The panel statement affirms *“The panel does not necessarily agree with the substantiation provided by the submitter with regard to Article 700.”* The clear implication is that the panel action relied solely on the coordination point raised by the proposal. The 2010 Edition of NFPA 99 was returned to committee at the June 2009 NFPA Technical Association Meeting in Chicago, therefore the coordination issue is moot and the proposal should be rejected and text restored to the 2008 NEC.
Panel Meeting Action: Accept

15-35 Log #2445 NEC-P15 **Final Action: Accept**
(517.13(B))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 15-25
Recommendation: Revise the text of the 2008 NEC ROP Draft as follows:

(B) Insulated Equipment Grounding Conductor.

(1) General. The following shall be directly connected to an insulated copper equipment grounding conductor that is installed with the branch circuit conductors in the wiring methods as provided in (A) ~~metal raceways or as a part of listed cables having a metallic armor or sheath assembly with the branch-circuit conductors supplying these receptacles or fixed equipment~~:
Exception: An insulated equipment bonding jumper that directly connects to the equipment grounding conductor is permitted to connect the box and receptacle(s) to the equipment grounding conductor.

(1) The grounding terminals of all receptacles.

(2) Metal boxes and enclosures containing receptacles.

(3) All non–current carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personal contact, operating at over 100 volts.

~~Exception No. 1 to (1): The equipment grounding terminal of a receptacle shall be permitted to be connected to an insulated equipment bonding jumper that extends from a metal box or enclosure that is connected to an insulated equipment grounding conductor.~~
~~Exception No. 2 to (2): Metal boxes and enclosures containing an isolated ground receptacle(s) as permitted by 250.146(D).~~
Exception No. 1 ~~3~~ to (3): Metal faceplates shall be permitted to be connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.
Exception No. 2 ~~4~~ to (3): Luminaires more than 2.3 m (71/2 ft) above the floor and switches located outside of the patient care vicinity shall be permitted to be connected to an equipment grounding return path complying with 517.13(A).

(2) Sizing. Equipment grounding conductors and equipment bonding jumpers shall be sized in accordance with ~~Table~~ 250.122.

Substantiation: This Comment intends to make editorial improvements to the changes made by The Panel in the ROP. The opening paragraph of (B)(1) needs to simply refer to the wiring methods covered in 517.13(A) rather than restate them in (B)(1). This allows each section to stand alone and yet allow (B) to supplement the rules in (A).

The exception to (B)(1) as suggested in this Comment is needed as requiring the equipment grounding conductor to connect directly to a metal box and then a bonding jumper be installed to the receptacle is overly restrictive. The rule, without the exception, unnecessarily restricts a long-standing installation practice of connecting an equipment bonding jumper from the equipment grounding conductor to the receptacle and box. Another problem the exception suggested in this Comment prevents is stacking of equipment grounding conductor connections to the metal box. Metal boxes used at switch and receptacle outlets typically have only one threaded hole for a grounding screw. Another option that might remove the necessity for the proposed exception to (B)(1) is to remove the word "directly" in the first line.

Exception No. 1 following the list is not needed with the addition of the exception suggested to follow (B)(1) and is recommended for deletion.

Exception No. 2 following the list is not needed since the Panel removed the permission to install isolated grounding receptacles in the ROP.

The final two exceptions in the proposed text have been renumbered.

Finally, it is suggested that the reference be to 250.122 rather than to Table 250.122 as some rules such as increasing the size of the equipment grounding conductor if the ungrounded conductors are increased in size have application in this installation.

Comment on Proposal No: 15-27
Recommendation: Revise the proposed new 517.15 to be Section 517.3 and to read:

517.13 Panelboard Location. Panelboards in other than clinics, and medical offices, and dental offices, shall not be located in public access spaces. Isolated power panels shall be permitted to be located in patient care rooms.

Substantiation: As proposed, the new requirement, numbered as 517.15, falls within part II of Article 517. Section 517.10(A) states that Part II only applies to patient care areas. That does not include hallways. See also 517.10(A) which states that corridors are not covered.

Section 517.10(B) further states that Part II does not apply to "clinics, medical and dental offices". The proposed new words preserve that exclusion.

Panel Meeting Action: Reject
Panel Statement: This comment is moot as the result of the return of NFPA 99 to committee.

See panel action on Comment 15-36.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-38 Log #1427 NEC-P15 **Final Action: Accept**
(517.15 (New))

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 15-27
Recommendation: Reject the proposed new 517.15.
Substantiation: Even the best intentioned actions have unintended negative consequences. The practical result of this proposal would be to create electrical closets for panelboards. Unfortunately, "electrical" closets do not exist. (And I, for one, have certainly tried.) When the electricians move all of the stored junk and materials out of the way of the panels in order to work in them, where the materials be moved? Out into the hallways; thus creating the same obstructions and traffic jams in the hallways that the proposal is trying to avoid.

Furthermore, all an architect needs to do to comply with the requirement to keep panelboards out of hallways, is to create a closet that is a few inches deep – which still leaves the electricians working in the hallway.

Panel Meeting Action: Accept
Panel Statement: The panel elected to return to the 2008 NEC text because NFPA 99 was returned to committee. This action was taken without deliberation on other substantiation offered in the comments.
Number Eligible to Vote: 13

15-40 Log #446 NEC-P15 **Final Action: Reject**
(517.16)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 15-28
Recommendation: Accept the proposal and revise as follows:

517.16 Receptacles with Insulated Grounding Terminals.

(A) Identification. Receptacles with insulated grounding terminals, as permitted in 250.146(D), shall be identified; such identification shall be visible after installation.

(B) Equipment Grounding Conductors. Isolated ground receptacles installed in branch circuits for patient care areas shall be connected to an insulated equipment grounding conductor in accordance with 250.146(D) in addition to the insulated copper equipment grounding conductor required in 517.13(B).

(C) Equipment Grounding Conductor Identification. The equipment grounding conductor installed for isolated grounding receptacles in patient care areas shall be clearly identified in accordance with 250.119 so as to distinguish it from the insulated equipment grounding conductor required by 517.13(B).
Substantiation: Section 4.3.2.2.7.1 of NFPA 99 continues to address isolated grounding circuits (quiet grounds) and receptacles in health care facilities. Proposal 15-28 addresses the confusion that currently exists regarding installations of isolated grounding receptacles and circuits installed in patient care locations. The proposal removes the need for the current FPN following 517.16 and provides users with clear direction regarding the installation and use of IG receptacles and circuits in patient care locations. The proposed language clarifies that the two equipment grounding conductor paths required by 517.13(A) and (B) create the redundant equipment grounding necessary to ensure equipment grounding and an effective ground fault current path in patient care locations. Where engineering designs or manufacturers of medical equipment require use of IG circuits and receptacles, the installation of the insulated and isolated equipment grounding conductor should be in addition to the two equipment grounding conductors required in 517.13 without disturbing them. Isolated grounding circuits and receptacles, when properly installed, do not offer the functional benefits of two equipment grounding conductors as required in 517.13 because the IG equipment grounding conductor is not in parallel with the metal equipment grounding conductor path addressed in 517.13(A). I encourage CMP-15 to reconsider its initial action on Proposals 15-28 and 15-29 to preserve current provisions in the NEC that are still necessary for branch circuits serving patient care locations that are required to provide isolated grounding benefits that are often specified by manufacturers or engineered designs for health care facilities.
Panel Meeting Action: Reject

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-41 Log #447 NEC-P15 **Final Action: Reject**
(517.16)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 15-29
Recommendation: Reject the proposal.
Substantiation: Accepting this proposal removes provisions for installing isolated grounding receptacles and IG circuits without technical substantiation. Chapter 4 of NFPA 99 (the current edition and the proposed revised standard) still includes provisions and requirements for IG circuits and receptacles (quiet grounds) installed in health care facilities. Medical equipment and appliance manufacturers continue to produce equipment that recommends use of isolated ground receptacles and circuits in their installation instructions. Electrical device manufacturers continue to produce hospital grade IG receptacles for use in patient care areas when required according to design and performance specifications and engineered plans. Removing the provisions for installing isolated grounding receptacles and circuits in patient care areas also appears to create a conflict with NFPA 99 (both the current edition and the proposed revised edition that was returned to committee during the 2009 NFPA Annual Meeting and Conference). I recommend CMP-15 carefully consider its action on this proposal and accept this comment to reverse the acceptance of this proposal and reconsider its action on Proposal 15-28. Section 4.3.2.2.7.1 of NFPA 99 continues to address isolated grounding circuits (quiet grounds) and receptacles in health care facilities.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the substantiation brought forth in Proposal 15-29.

The panel does not agree with the submitter's substantiation regarding NFPA 99. NFPA 99 states "quiet grounds, if used, shall not defeat the purposes of the safety features of the grounding systems herein."

The panel contends that one cannot have a redundant ground system and at the same time adequately maintain an isolated ground system.

The panel further contends that patient safety should take precedence over noise reduction.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-42 Log #1248 NEC-P15 **Final Action: Reject**
(517.16)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 15-29
Recommendation: The panel should reject the proposal and revise the FPN as follows:

FPN: Caution is important in specifying such a system with receptacles having insulated grounding terminals since the grounding impedance is controlled only by the equipment grounding conductors. ~~and does not benefit functionally from any parallel grounding paths~~. Isolated ground receptacles would require two insulated grounding conductors connected to the receptacle grounding terminal to maintain the functional benefit of the parallel grounding paths. This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary ~~and parallel grounding paths are to be avoided~~.
Substantiation: Acceptance of this proposal prohibits the installation of Isolated Ground (IG) receptacles in patient care areas of Health Care Facilities. The substantiation for this proposal asserts that existence of the FPN implies that the installation of IG receptacles in patient care areas is a "bad idea" without clearly describing the hazard that may be associated with the installation of IG receptacles in patient care areas. The reduction of electrical noise provided by Isolated Ground receptacles may be critical to the proper operation of sensitive medical instrumentation. If the installation of IG receptacles were to be prohibited the result may be the additional hazard to patient safety introduced by the possible malfunctioning of sensitive medical instrumentation due to electrical noise.

The proposal substantiation is based on the FPN stating that caution must be used when installing IG receptacles. As noted in the NEC Handbook, 517.16 is intended to prevent indiscriminate use of IG receptacles in patient care areas. The FPN expresses the need for caution when installing IG receptacles in patient care areas. Due to construction features of the IG receptacle that isolate the receptacle grounding terminal from the receptacle strap caution must be exercised when installing IG receptacles where redundant grounding is required by 517.13. The proposed connection of two insulated grounding conductors to an IG receptacle provides the redundant grounding scheme required by 517.13.
Panel Meeting Action: Reject
Panel Statement: The panel agrees with the substantiation brought forth in Proposal 15-29.

The panel contends that one cannot have a redundant ground system and at the same time adequately maintain an isolated ground system.

(517.17(B))

Submitter: Vincent J. Saporita, Cooper Bussmann
Comment on Proposal No: 15-39
Recommendation: Modify the wording of the proposed new text and place it as a new item (2) after the list of three conditions where ground fault protection is not allowed. Change the current material in (B) to (B) (1) and add the new paragraph as (B) (2).
(B) Feeders.
(1) Additional Level of Ground Fault Protection Required. Where ground-fault protection is provided for operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the feeder disconnecting means to open.
The additional levels of ground fault protection shall not be installed as follows:
(1) On the load side of an essential electrical system transfer switch
(2) Between the on-site generating unit(s) described in 517.35(B) and the essential system transfer switch(es)
(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase
(2) Additional Level of Ground Fault Protection Not Required. Ground fault protection shall not be required on feeders where the ground fault selectivity requirements are met by the feeder's phase protection without the need for the additional level of dedicated ground fault protection.
Substantiation: CMP 15 was correct in its statement "The submitter's proposal prohibits this arrangement.", because, as written, the original proposal indeed prohibited the second level of ground fault protection. This comment removes that prohibition and makes the second level of ground fault protection optional when the overcurrent protective devices (circuit breakers or fuses) provide the required selective coordination. This eliminates the redundant need for a second level of ground fault protection and enhances overall system reliability.
Panel Meeting Action: Reject
Panel Statement: The proposed change to the original proposal diminishes rather than enhances protection. The substantiation does not justify the proposed change.

(517.17(E))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 15-43
Recommendation: Continue to reject the proposal.
Substantiation: This proposal should continue to be rejected, not only for the reasons given in the panel statement, but because it jeopardizes life-safety. The reasons for requiring ground-fault protection of equipment in certain applications are well documented. The damage than can result from a ground fault on such a system may render a substantial portion of the system inoperative, resulting in a lengthy outage potentially worse than that envisioned by the submitter, or worse yet start a life threatening fire. Further, restraint of the GFPE may increase the downstream arc flash hazard for maintenance workers.
The late J.R. Dunki-Jacobs, a recognized authority on ground-fault protection, stated in his book *Industrial Power System Grounding Design Handbook* (pages 186, 189) that, "If an arcing line-to ground fault is initiated in a solidly grounded system on one of three bare buses in a metal enclosure, the hot ionized gases that are developed by the fault can be expected to cause escalation to an arcing multi-phase fault within 1 or 2 cycles (0.0167 to 0.033 sec) of time." He went on to state, "Escalating arcing-ground faults have shown themselves to be extremely devastating…" and "Unquestionably then, engineering attention to their immediate suppression must be proactive and immediate, rather than reactive. Not only for reason of minimizing the released arc energy to maximize personnel safety, but also to avert arcing-fault escalation." The suggestion that an audible and visual signal device would be of any value is ludicrous.
System reliability and blackout prevention can be achieved by proper system design, equipment selection and coordination. The GFPE restraint called for in this proposal is unnecessary and a potential threat to life-safety.

15-51 Log #2228 NEC-P15 **Final Action: Reject**
(517.17(E))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association
Comment on Proposal No: 15-43
Recommendation: Modify, for improved clarity, the proposed text to read:
(E) Restraint. Normal Source ground fault protection on the line side of a transfer switch supplying essential systems shall be permitted to be restrained for ground faults on the loadside of the transfer switch, provided that audible and visual signal devices indicate whenever a ground fault relay has been restrained, and instructions, on the course of action to be taken in the event of an indicated ground fault, are located at or near the sensor location.
Substantiation: This proposal should be accepted for the following safety and reliability reasons: Safety and reliability are improved whenever both levels of ground fault protection are on the normal side of the transfer switch and a ground fault occurs on the load side of the transfer switch, causing the downstream ground fault protective device to open, potentially blacking out life-safety related loads. Additionally, this causes the transfer switch to transfer to the alternate source. Designers need to utilize ground fault protection for the normal source, and at the same time, provide selective coordination for essential system devices with all overcurrent devices on their line side. This can be readily accomplished by allowing the normal side ground fault protection to be restrained for all ground faults on the load side of the transfer switch. It provides a provision, similar to that found in 700.26 and 701.17. These sections permit ground fault protection to be totally omitted on the alternate source side of emergency and legally required standby systems.

This comment provides additional design flexibility that improves safety and reliability of the total system. The requirement for indication is included to correlate with the requirement found in 700.7(D).

(517.19(B))

Submitter: Stephen M. Lipster, The Electrical Trades Center / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 15-55
Recommendation: Accept the proposal in part with the following revision: (Legislative text removed for clarity)
(B) Patient Bed Location Receptacles

(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of fourteen receptacles at least four of which shall be connected to either of the following:

(a) The normal system branch circuit required in 517.19(A)

(b) An emergency system circuit supplied by a different transfer switch than the other receptacles at the same patient bed location

(2) Receptacle requirements. The receptacles required in 517.19(B)(1) shall be permitted to be single, duplex or quadruplex types or any combination thereof. All receptacles shall be listed "hospital grade" and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of a insulated copper equipment grounding conductor.
Substantiation: The substantiation for this proposal is primarily based on coordination with the 2010 Edition of NFPA 99. The coordination issue is now moot since NFPA 99 was
returned to committee at the June 2009 NFPA Technical Association Meeting. With that being said, the proposal does have considerable merit when considering
increasing the number of receptacles in patient bed locations. The language proposed in this comment returns the text to the 2008 NEC version, yet increases the
number of required receptacles and allows for the use of quadruplex receptacles in these locations.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
(B) Patient Bed Location Receptacles

(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of six receptacles at least one of which shall be connected to either of the following:

(a) The normal system branch circuit required in 517.19(A)

(b) An emergency system circuit supplied by a different transfer switch than the other receptacles at the same patient bed location

(2) Receptacle requirements. The receptacles required in 517.19(B)(1) shall be permitted to be single, duplex or quadruplex types or any combination thereof. All receptacles shall be listed "hospital grade" and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of a insulated copper equipment grounding conductor.
Panel Statement: The panel does not accept changing the number of receptacles from six to fourteen and one to four.

The panel accepts the remainder of the comment proposed in this comment.

This returns the text to the 2008 NEC version and allows for the use of quadruplex receptacles in these locations as addressed in Comments 15-64 and 15-65.

15-61 Log #2125 NEC-P15 **Final Action: Reject**
(517.19(B)(1))

Submitter: James Harvey, University of Michigan Hospitals
Comment on Proposal No: 15-54
Recommendation: Accept the proposal *In Principle in Part* with the following deletion to the original 2008 text of Section 517.19(1):
Each patient bed location shall have a minimum of six receptacles, ~~at least one of~~ which shall be connected to either or the following:
Substantiation: The original wording of my proposal was rejected since "The code should not specify performance or design criteria". In that light I see the current wording as 'design criteria'. And this code provided 'design criteria' is then thrown back to the owner by construction managers and/or A/E's, as a cost savings strategy; to override owner direction to provide more emergency receptacles. The end result often is that very few emergency power receptacles, per Critical Care bed, are provided - certainly not the previously proposed 50%. Eliminating the *'at least one' of*' wording will remove this 'design criteria' from the code, and will force a better dialogue between construction managers, the A/E's, and the owner. As noted in my original proposal, the current wording could become a life and death issue, for severely ill Critical Care (ICU) patients, when insufficient outlets are available upon loss of normal power.
Panel Meeting Action: Reject
Panel Statement: See action and statement on Comment 15-60.

The submitter raises an interesting point relative to design/performance criteria in his substantiation. However, the panel upholds its position which is consistent with NFPA 99, 2005 edition, requiring at least one duplex receptacle per patient bedroom.

Comment on Proposal No: 15-57
Recommendation: Continue to Accept but revise text to read:

(B) Patient Bed Location Receptacles.

(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of six receptacles, at least one of which shall be connected to either of the following:

(1) The normal system branch circuit required in 517.19(A)

(2) An emergency system branch circuit supplied by a different transfer switch than the other receptacles at the same location.

(2) Receptacle Requirements. The receptacles required in 517.19(B)(1) shall be permitted to be of the single, duplex, or quadruplex types, or any combination of the three. ~~or duplex types or a combination of both.~~ All receptacles, whether six or more, shall be listed "hospital grade" and so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

Substantiation: "Quadplex", as proposed by the Submitter of P15-57 and as Accepted by Code Panel 15, is a registered trademark (U.S. Patent & Trademark Office No. 1,595,041) of Hubbell Incorporated for receptacles of the quadruplex construction (four contact devices on the same device mounting means). Change to generic "quadruplex" adjective and add the noun "types".

(517.26)

TCC Action: The Technical Correlating Committee directs that Comment 15-74 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
In addition, the Technical Correlating Committee directs that Proposal 15-68 also be reported as "Reject" since consensus of the panel was not reached on this issue, therefore, the text as it appears in the 2008 Edition of the NEC is retained.
Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 15-68
Recommendation: This proposal should be rejected. Restore the text to as it appears in the 2008 NEC.
Substantiation: Accepting this proposal creates an unsubstantiated disconnect between NEC Article 700 and Article 517 that results in lessening the current rules in Article 700 that are necessary for hospital essential systems (critical branch and equipment branch) design and installation. The critical branch of a hospital is necessary for life safety purposes and the safety and the health and welfare of patients. Life support equipment and other equipment for critical care in health care facilities are typically connected to the critical branch. Article 700 contains the requirements for transfer equipment to be identified for use on emergency systems. Products standards evaluate and list equipment for use on emergency systems. The critical branch of a hospital is an emergency system, no matter what it is called. 700.9(D) contains fire protection requirements for feeders of emergency systems, and this requirement must apply to the critical branch. If not, the current minimum requirements are lessened without substantiation. The critical branch of a hospital qualifies as an emergency as indicated in Article 517 by the nature of the loads supplied and how it is intended to perform during adverse conditions, no matter what it is called. Removing the reference and the tie to Article 700 for the critical branch from 517.26 lessens current requirements and has unintended consequences for systems essential for safety and health of patients in a hospital. Changing the name of a system in a hospital does not change how the system must function. 700.12 contains important requirements (not found in Article 517) related to critical branch power sources and their operation. There are other necessary requirements from Article 700 that would be lost. If a proposal like this is accepted, then all the requirements in Article 700 that are currently applied to essential systems in hospitals would have to be included in Article 517. There was no such proposal (that I am aware of) to ensure that the correlation of necessary requirements was not lost. Hospital essential systems have to be designed and installed using a defend -in place philosophy that includes selective coordination of overcurrent devices such that a ground fault or short circuit event does not cause unnecessary interruption of power to loads critical to patient safety and health. A similar proposal was attempted in the 2008 NEC cycle and ultimately rejected in the Standards Council appeal process stages, thus preserving the requirements in 517.26. Nothing has changed about how these systems are required to be installed or how they should be expected to perform since that action in the 2008 NEC cycle. The Final Action (Reject) on Proposal 15-90 also reflects the appropriate approach to not lessen current minimum requirements without technical substantiation.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 15-75.
The panel action clarifies that Article 700 is not the appropriate article to include as applicable in its entirety for the critical branch and certainly not the equipment system.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 8 Negative: 5
Explanation of Negative:
LIPSTER, S.: I strongly disagree with the panel's action and statement. My negative vote is based on four criteria:
1) The action on proposal 15-68 was undertaken in an environment that assumed NFPA 99 would be published. The understanding at the time was the nomenclature change was simply editorial to bring it in line with the substantial changes in NFPA 99. The panel statement for proposal 15-68 clearly shows the action on this proposal was taken to bring 15-68 in line with action taken on proposal 15-72. To quote the panel statement: "The panel revised the wording 'emergency' to 'essential electrical' for consistency with proposal 15-72." Proposal 15-72 dealt with the wholesale restructuring of health care essential electrical systems. NFPA 99 was returned to committee at the June 2009 Association Technical Meeting. Rejecting this comment and accepting comment 15-75 is taking the original action on proposal 15-68 completely out of context.
2) For some time there has been a conflict between certain members of this panel and certain members of the NFPA 99 electrical systems technical committee on the relationship of these two committees and indeed the relationship between Article 517 and NFPA 99. For the last several code cycles the assertion has been NFPA 99 electrical systems technical committee action on electrical design elements found in NFPA 99 would be adopted by NEC code making panel 15 into Article 517. This assertion is based on the premise that the National Electrical Code is an installation code while NFPA 99 is a design standard. While personally disagreeing with this assertion, many of my colleagues on this panel see logic in this scheme. Keeping this design - installation dichotomy in mind, the issue proposal 15-68 addresses is purely a design concern. If one truly believes that this panel should limit itself to installation issues, how can the rejection of 15-74 and the acceptance of 15-75 be seen as nothing less than hypocritical?
3) Removing the requirements of Article 700 from the critical branch without the addition of common sense restrictions on the critical branch is extremely dangerous. The panel should consider the ramifications of a critical branch without restrictions such as: Circuit identification and separation, equipment and component location, generator and transfer switch requirements and emergency duty listing requirements. Dropping the requirements of Article 700 for the critical branch provides relief from selective coordination rules, but it also loses many valuable protections that are necessary in the critical branch.
4) For many years some designers have declared that the regulations of Article 700 (particularly selective coordination) are far too restrictive for the complex electrical systems found in health care facilities. Through the years I have noted fully selective coordinated systems, every bit as complex as those found in health care facilities, installed in check processing centers, credit card processing facilities and many government/military installations. When dollars are on the line, effective systems can be designed, are installed and become operational. Why aren't human lives given the same consideration?
SAMPSON, M.: The submitter raises valid points and this comment should be accepted.

There is no substantiation to support the sudden elimination of the *equipment system* and the *critical branch of the emergency system* from the testing, maintenance, capacity, signage, selective coordination, fire protection requirements and control requirements of the emergency systems as covered by Article 700.

The requirement that all the loads connected to the essential system have a higher degree of reliability is intentional. All of the items that have been so carefully selected to be on the *essential electrical system* are vital to life safety.

The inherent flaw in the argument to have the provisions required for an Article 700 emergency system only apply to the *life safety branch of the essential electrical system*, is an assumption. That assumption is that because Article 700 applies to those systems that supply reliable power to facilitate building egress, then the provisions of Article 700 can only apply to those systems that supply reliable power to facilitate building egress.

That reasoning is backward and couldn't be further from the truth. The fact that the scope of Article 700 is the reliability of the installation, operation and maintenance of the power systems that facilitate building egress has absolutely no bearing on the fact that those same reliability requirements also apply to the entire essential electrical system of a hospital.

It is true that the *life safety branch of the essential system* of a hospital is comparable to the *emergency system* of other building types, since both provide power that affords those precious moments needed to evacuate a building in the event of an emergency.

But the more stringent requirements found in Article 700 that are necessary to guarantee power for the "life safety" of the people finding their way out of the hospital building, are also necessary to guarantee power for the "life safety" of those who will not be moving quickly, in an orderly fashion, to the nearest exit.

That "life safety" is afforded by the *critical branch* and the *equipment system*, inseparable parts of the essential electrical system - a system that must have the same dependability as an Article 700 *emergency system*.

The entire essential electrical system - not just the life safety branch - needs to meet the requirements of Article 700.

SHELLY, B.: The submitter's comment should be accepted and subsequently reject the proposal, lessening the requirements on the emergency system. The proposal would not provide the safety needed by the critical and essential branch circuits in a health care facility.

TALKA, D.: I believe Mr. Lipster makes valid points in Items 1 and 3 of his Explanation of Negative Vote. The fact that Code-Making Panel 15's actions were based upon anticipated actions within NFPA 99 makes me believe that until NFPA 99 is settled it is best to leave 517.26 as presently written.

Mr. Lipster also makes a valid point that additional guiding principles are needed if we are to remove the reference to Article 700.

WISEMAN, J.: The Panel Action results in the removal of the critical branch from the requirements for emergency systems found in Article 700. The critical branch includes task illumination and selected receptacles for critical care areas, isolated power systems, patient care areas, nurse call systems, blood banks, bone banks, tissue banks, telephone equipment rooms, and task illumination for cardiac test labs, coronary care units, emergency rooms, and intensive care units.

15-77 Log #1418 NEC-P15 **Final Action: Accept**
(517.30)

Submitter: John E. Staires, City of Tulsa, Oklahoma
Comment on Proposal No: 15-84
Recommendation: Continue to reject.
Substantiation: I agree with the committee's substantiation for rejecting Proposals 15-78, 15-81 and 15-84. Physical protection is paramount for these conductors. Far too often we see flexible raceways and cables pulled out of their connectors or with damaged side-walls. There are a number of materials and wall thicknesses used to manufacture these flexible raceways and cables. It would be difficult to control which type is being used, as they are all very similar in appearance and markings are typically on the carton or on a tape in the cable. Their use should continue to be limited, and only in protected locations where physical protection is not necessary.
Panel Meeting Action: Accept
Panel Statement: The panel understands the submitter is addressing 517.30(C)(3).

(517.30(1), (2), and (3))

Submitter: Stephen M. Lipster, The Electrical Trades Center / Rep. International Brotherhood of Electrical Workers
Comment on Proposal No: 15-72
Recommendation: Reject the proposal and restore the 2008 NEC text.
Substantiation: The proposal substantiation is based on three points: One point asserts that the requirements of Article 700 some how do not "work" in a health care facility. The second point contends that the NFPA 99 Electrical Systems Technical Committee is better able to define these systems and has taken action to eliminate emergency systems in favor of "branches". The third point states that coordination with the 2010 Edition of NFPA 99 is critical to avoid confusion. Previous panel statements (see 15-7 and 15-13) plainly state this Code Making Panel is not entirely comfortable with severing the requirements of Article 700 from emergency systems. These panel statements

cast doubt on the validity of the first point of the substantiation. Furthermore, because NFPA 99 was returned to committee at the NFPA Technical Association Meeting in June 2009 both the second and third points, namely, the action by the NFPA 99 technical committee and the coordination issue, are now moot. The proposal should be rejected and the text restored to the 2008 NEC version.
Panel Meeting Action: Accept
Panel Statement: The panel elected to return to the 2008 NEC text because NFPA 99 was returned to committee. This action was taken without deliberation on other substantiation offered in the comments.

(517.30(C)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 15-81
Recommendation: Accept the proposal in principle. Revise 517.30(C)(3) as follows:
(3) Listed flexible metal raceways and listed metal sheathed cable assemblies where not subject to physical damage. ~~in any of the following:~~
~~a. Where used in listed prefabricated medical headwalls~~
~~b. In listed office furnishings~~
~~c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage~~
~~d. Where necessary for flexible connection to equipment~~
Substantiation: The revised text adds the requirement that the wiring methods be permitted where not subject to physical damage. Flexible metal raceway and metallic sheathed cables have been permitted in essential electrical systems for hospitals where it is fished and not subject to physical damage since the 2005 NEC without any reported problems. Since these wiring methods are already permitted there is no reason to limit their use to installations where it is fished.

15-97 Log #1863 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 15-81
Recommendation: Revise the existing text of the 2008 NEC as follows:
(3) Listed flexible metal raceways and listed Type MC or Type AC cables ~~metal sheathed cable assemblies~~ if not subject to physical damage ~~in any of the following:~~
~~a. Where used in listed prefabricated medical headwalls~~
~~b. In listed office furnishings~~
~~c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage~~
~~d. Where necessary for flexible connection to equipment~~
Substantiation: Revising the text as proposed harmonizes this section with Sections 320.12(1) for Type AC cable and with 330.12(1) for Type MC cable. Both sections state the cables are not permitted to be installed where subject to physical damage. Additional restrictions are not needed in this section. Cables are evaluated for suitability for wiring of listed prefabricated medical headwalls and in listed office furnishings so the text in a. and b. is not needed.
Listed cables have been permitted where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage since the 2005 NEC with no reports of problems. It makes sense to remove the unneeded language.
These cables have to undergo extensive testing in the UL Safety Standards (UL-4 for Type AC cables and UL-1569 for Type MC Cables) and provide more than adequate mechanical protection of the life safety and critical branches of the emergency system.
Panel Meeting Action: Reject
Panel Statement: The panel contends that the action taken on Comment 15-101 provides a safer installation using flexible cable than this submitter's recommendation.
The panel continues to support items (3)a, b, c and d. Without this list, the submitter's proposed wording would be too ambiguous and would conflict with panel action on Comment 15-101.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-98 Log #2132 NEC-P15 **Final Action: Accept**
(517.30(C)(3))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 15-84
Recommendation: Continue to reject this proposal.
Substantiation: It is important to emphasize that this section of the Code does not deal with ordinary (or primary) wiring systems. This is the *Essential Electrical System.* Use of MC and AC cable should not be extended beyond the permitted uses in the 2008 Code. The Code contains many wiring methods and they provide varying degrees of protection. Making the requested changes would be tantamount to using EMT when the application required the heavier wall of GRC or IMC. This section covers one of the most critical applications in 517 – the Essential Electrical System.
The Panel was correct when they expressed concern about damage other than that caused by nail or screw penetration, both during and after installation. The proposal specifically considers damage to be interpreted as nail or screw penetration and then only if installed through or parallel to framing members. Furthermore, there is no differentiation between types of MC.
The proponent states in his substantiation, "Type MC cables are suitable to be installed in most *ordinary* locations." The Essential Electrical System is not *ordinary,* as the title indicates. (Note that although AC cable is included in this proposal it is not included in the statement, even for ordinary locations.)
In the 2998 Code cycle the proponent requested MC Cable *equivalent to EMT* (See 2008 Proposal 15-54) be permitted. There was no fact-finding investigation at that time and none has been provided this cycle. In addition, the equivalency criterion that was suggested was not complete. It was noted at the ROP meeting that criteria for comparing has not been developed. The Panel is also correct that the Code should not be changed for a product that does not exist.
It should be noted that most MC cable is aluminum and logically more subject to damage than steel. The Panel was correct that, "The proposal includes all types of MC and AC cable, "even those that did not fair well during the previously conducted fact-finding investigation."
The term not "likely" to be damaged is proposed. 517.30(C)(3) is designed to address protecting the integrity of the Essential Electrical System even in *unlikely* situations due to the critical nature of the application. Panel 7 does not permit use where the cable is subject to physical damage even in ordinary locations. The current Code text has served patient safety well for many years and should not be downgraded.
We also disagree with the proposed deletion of the reference to 517.13(A) and (B). It needs to be very clear that 517.30 *does not* override 517.13 requirements. Patient safety is primary and if healthcare facilities did not require exceptional care in the electrical system then why not just use Chapter 3. This particular proposal applies to two of the most important areas of this special article – life safety and critical care essential (emergency) systems. We urge you to continue to put patient safety first and continue to reject.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-99 Log #2133 NEC-P15 **Final Action: Accept**
(517.30(C)(3))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 15-81
Recommendation: Continue to reject this proposal.
Substantiation: This Section as it appears in the 2008 Code appropriately limits the use of flexible raceways and cables to areas requiring flexibility and where access is difficult. No testing has been supplied for AC cable, or for flexible metal raceway, even though both are proposed for unlimited use in this special application. If this proposal is accepted both would be accepted for unrestricted use. This would be without even having to comply with Chapter 3, and could be used where subject to physical damage which is not permitted in Chapter 3. The proposal does not stipulate the type of MC and these cables vary considerably in physical and grounding aspects.
Currently there has been no proof that MC would provide physical aspects equivalent to EMT. This Code Section covers mechanical protection for the crucial Essential Electrical System, and the Panel has continued to express that protection from more than nail and screw penetration is required. If this proposal is accepted that will not be accomplished. There is a use for every product in the Code, but every product is not suitable for every use. This proposal would be like saying EMT should be allowed everywhere GRC and IMC are allowed. The Code currently contains the uses necessary.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-100 Log #2134 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 15-78
Recommendation: Continue to reject this proposal.
Substantiation: This proposal was a left-over comment (15-39) to Proposal 15-54 from the 2007 ROP. Nothing has changed except that even broader use of MC and AC cable and flexible metal raceways has been requested without any valid substantiation.
It is important to emphasize that this section of the Code does not deal with ordinary (or primary) wiring systems. This is the *Essential Electrical System.* Use of MC and AC cable should not be extended beyond the permitted uses in the 2008 Code. The Code contains many wiring methods and they provide varying degrees of protection. Making the requested changes would be tantamount to using EMT when the application required the heavier wall of GRC or IMC. This section covers one of the most critical applications in 517 – the Essential Electrical System.
The Panel was correct when they expressed concern about damage other than that caused by nail or screw penetration, both during and after installation. The proposal specifically considers damage to be interpreted as nail or screw penetration and then only if installed through or parallel to framing members. Furthermore, there is no differentiation between types of MC.
The proponent states in his substantiation, "Type MC cables are suitable to be installed in most *ordinary* locations." The Essential Electrical System is not *ordinary,* as the title indicates. (Note that although AC cable is included in this proposal it is not included in the statement, even for ordinary locations.)

In the 2998 Code cycle the proponent requested MC Cable *equivalent to EMT* (See 2008 Proposal 15-54) be permitted. There was no fact-finding investigation at that time and none has been provided this cycle. In addition, the equivalency criterion that was suggested was not complete. It was noted at the ROP meeting that criteria for comparing has not been developed. The Panel is also correct that the Code should not be changed for a product that does not exist.

(517.30(C)(3))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Accept in Principle" by accepting the new (3) and its language, plus the renumbering of (4), (5), and (6).

The Technical Correlating Committee also directs that the remainder of the text remains as written in the 2008 Edition of the National Electrical Code.

Submitter: Richard Temblador, Southwire Company
Comment on Proposal No: 15-78
Recommendation: (3) Mechanical Protection of the Emergency System. The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and 517.13(B). The following wiring methods shall be permitted:

(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 rigid nonmetallic conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(2) Listed MC cable identified as providing crush, impact and penetration circuit protection performance comparable to electrical metallic tubing.

(~~2~~3) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid nonmetallic conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

(~~3~~4) Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:

a. Where used in listed prefabricated medical headwalls
b. In listed office furnishings
c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage
d. Where necessary for flexible connection to equipment

(~~4~~5) Flexible power cords of appliances or other utilization equipment connected to the emergency system.

(5~~6~~) Secondary circuits of Class 2 or Class 3 communication or signaling systems

Substantiation: Type MC cable can be constructed to provide enhanced mechanical protection comparable to EMT while maintaining ground path integrity before, during and after
installation. The revised proposal should be accepted. I have provided supporting information.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2

Explanation of Negative:

LIPSTER, S.: I disagree with the panel action and statement permitting an unproven wiring method not yet available to installers, with limited laboratory testing and no field installation record, to be used in health care facilities. The panel is prematurely approving a product that is not in production and not available on the market. There are several opportunities for the use of a crush resistant MC cable in other occupancies where a track record for this nonexistent wiring method can be established. Health care installations are not a place to test new cable wiring methods and hope they are safety-compatible with EMT. The panel was presented a Underwriters Laboratories fact finding report that detailed the testing of two prototype cables. The crush and impact tests of the two prototype cables vs. EMT concluded that one of the prototype cables evaluated better and one was worse than that of listed EMT, however, it is important to note that product standards do not exist for crush resistant cable so the test have limited value. The means for cable termination at a box connection (the prototype cable being much larger than standard MC cable) were not investigated by UL creating concerns about real life performance and grounding/bonding at connection points. The acceptance of this comment by the panel was clearly made with the hope and desire of a supposably cheaper alternative to EMT. It remains to be seen that a manufactured cable product with the same protective qualities as EMT can be fabricated and made available to the market. Patient safety, should be foremost over unproven installation methods.

The aforementioned Underwriters Laboratory fact finding report presented to the code making panel was dated December 3, 2009. The comment period for this code cycle closed on October 23, 2009, therefore the introduction of this material after the published comment closing date is a violation of the Regulations Governing Committee Projects, 4.4.1, 4.4.3.1, 4.4.4, 4.4.5 and 4.4.6.

SHELLY, B.: The use of MC cable identified as providing crush impact and penetration circuit protection performance equivalent to EMT is not an improvement to the codes as there will be a severe hazard created in the installation of the emergency wiring.

Field installation of EMT has an integrity that has not been maintained in the installation of MC. The areas above the drop ceilings in Health Care Facilities are burdened with many systems, and subsequently the inadequate installation methods used for MC will jeopardize the safety of the patients.

(517.30(F))

Submitter: James H. Costley, Jr., Newcomb & Boyd Consultants & Engineers
Comment on Proposal No: 15-90
Recommendation: Accept the Proposal.
Substantiation: The submitter's substantiation is sound and correct. The blanket requirement for complete selectivity is impossible to design using available engineering tools for generic devices. Specific manufacturer's test data for uniquely specified equipment is required, and even then any one manufacturer's options are limited. The number of sequential overcurrent protection devices in any design must be minimized, reducing the segmentation and isolation capabilities of distribution systems, which also reduces operational safety and reliability that multiple switching levels affords. In order to provide selectivity, upstream devices must be intrinsically slower in operation, or be Paradoxically, since one of the reasons often quoted for selective coordination is safety in an accident, the arc flash energy for a given point in a system will increase in almost every system design because of the mandate to selectively coordinate every level of the overcurrent protection.

This Comment is a companion to a similar Comment made for Code-Making Panel 13 for 700.27 referring to Proposal 13-195.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation of Proposal 15-90 was based on correlation with NFPA 99.

The panel elected to return to the 2008 NEC text because NFPA 99 was returned to committee. This action was taken without deliberation on other substantiation offered in the comments.

Comment on Proposal No: 15-90
Recommendation: Proposal 15-90 should be accepted.
Substantiation: "Selective coordination is only one of several competing factors that must be considered in the selection of appropriate over current protection devices."
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation of Proposal 15-90 was based on correlation with NFPA 99.

The panel elected to return to the 2008 NEC text because NFPA 99 was returned to committee. This action was taken without deliberation on other substantiation offered in the comments.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-106 Log #2238 NEC-P15 **Final Action: Accept**
(517.30(F))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association
Comment on Proposal No: 15-90
Recommendation: The Panel should continue to reject this proposal in the interest of safety and reliability.
Substantiation: The original proposal would allow non-coordinated operation of multiple levels of overcurrent protective devices (cascading) under fault current conditions which reduces the reliability of the system to deliver power to vital loads. This proposal permits coordination for only overloads and does not provide assurance that typical ground faults, arcing faults, and bolted faults will not cascade multiple levels of overcurrent protective devices, thereby unnecessarily losing power to critical loads.

Graphs A and B depict the time-current curves of the same 30A, 200A, and 800A system. Graph A shows the portion of the circuit breaker time-current curves that would be analyzed for this proposal (times down to 0.1 seconds). Graph B depicts the circuit breaker curves showing the crossover of the circuit breakers in their instantaneous trip region. The cross over is a lack of selective coordination for overcurrents at that level and greater. Graph B shows a lack of coordination between the 30A and 200A circuit breakers for ground, arcing, and any combination of phase faults as low as 800A. Any type of fault as low as 2200A can take out the 800A circuit breaker as well. These are low available fault currents easily achieved in almost every essential electrical system via a line-ground fault, line-line fault or three phase fault.

All circuit breakers with an instantaneous trip will open in less than 0.1 seconds when fault current is above the instantaneous trip setting. This proposal will permit the design of essential electrical systems without regard to proper engineering attention being given to the instantaneous trip region.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Panel Statement: The panel elected to return to the 2008 NEC text because NFPA 99 was returned to committee. This action was taken without deliberation on other substantiation offered in the comments.

The submitter's recommendation should not contain rationale for substantiation.

(517.33(A)(8)(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 15-100
Recommendation: The proposal should be rejected.
Substantiation: The preposition “per” in the English language carries the precise meaning of “for each” in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in “Table 3.2.1, Possibly Unenforceable and Vague Terms.” Section 3.3.4 of the same document requires that “NEC language shall be brief, clear, and emphatic.” Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: “Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel.”
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning “in accordance with” and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Reject
Panel Statement: “In each” aptly describes where this requirement applies. The change does not add clarity.

(517.80)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 15-120
Recommendation: Revise the second sentence of this section as follows:
"Circuits of ~~these~~ Class 2 and Class 3 signaling and communications systems and power-limited fire alarm systems shall not be required to... ". (remainder unchanged).
Substantiation: This is intended to provide some clarification as to the intent of this section. The assumption in this comment is that the primary issue is shock protection. The text as accepted exempts certain circuits based on power limitations and use alone (Class 2 and Class 3 circuits). If that is the intent, then power-limited fire alarm circuits should be included here. If the intent is to only exempt those circuits that are not part of the emergency system (such as the nurse call systems mentioned in the substantiation for this proposal) or do not otherwise require mechanical protection under 517.30(C)(3), then some other language change is needed. The language "Circuits of these Class 2 and Class 3 communication or signaling systems..." implies that all the circuits mentioned in the first sentence are Class 2 or Class 3 when in fact they may not be. The data and communications circuits may not be Class 2 or 3 (such as when communications and data are combined in a single cable and the Class 2 data circuits are required to be reclassified as communications), and "circuits less than 120 volts" does not say anything about power limitations and may or may not be Class 2 or Class 3. Previously it has been unclear as to what insulation, isolation, or grounding are required or how this was to be done, now it is unclear as to what circuits are covered or exempted or why. As presently worded, it cannot be only about shock hazards because Class 3 circuits may be a shock hazard even in dry locations (see Tables 11A and 11B as noted in the comment by White explaining the negative vote). It cannot be about the emergency system because some Class 2 and Class 3 circuits are part of the emergency system [see 517.32(C)(2) & (3)] as are some communications systems. I anticipate a "reject" and an explanation as to what is intended, but I am offering another comment to clarify the language to more clearly correlate this section with 517.30(C)(3).
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
"~~Circuits of these~~ Class 2 and Class 3 signaling and communications systems and power-limited fire alarm systems shall not be required to... ". (remainder unchanged).
Panel Statement: The panel accepts the submitter's text but edits for clarity. "Circuits of" is also unnecessary.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
LIPSTER, S.: See Explanation of Negative statement on comment 15-133.

15-133 Log #1071 NEC-P15 **Final Action: Accept in Principle**
(517.80)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 15-120
Recommendation: Revise the accepted text of the second sentence as follows: "Circuits of ~~these~~ those signaling or communications systems supplied solely by Class 2 or Class 3 ~~signaling and communications systems~~ power sources shall not be required...". (remainder unchanged).
Substantiation: This is intended to provide some clarification as to the intent of this section. If the intent is to only exempt those circuits that are not part of the emergency system (such as the nurse call systems mentioned in the substantiation for this proposal) or do not otherwise require mechanical protection under 517.30(C)(3), then some clarification is still needed. The language "Circuits of these Class 2 and Class 3 communication or signaling systems..." implies that all the circuits mentioned in the first sentence are Class 2 or Class 3 when in fact they may not be. The data and communications circuits may not be Class 2 or 3 (such as when communications and data are combined in a single cable and the Class 2 data circuits are required to be reclassified as communications), and "circuits less than 120 volts" says nothing about power limitations and may or may not be Class 2 or Class 3.

Previously it has been unclear as to what insulation, isolation, or grounding are required or how this was to be done, now it is unclear as to precisely what circuits are covered or exempted or why. As presently worded, or as worded in the revision in the 2008 NEC, it cannot be only about shock hazards because Class 3 circuits may be a shock hazard even in dry locations (see Tables 11A and 11B as noted in the comment by White explaining the negative vote). It cannot be about the emergency system because some Class 2 and Class 3 circuits are part of the emergency system [see 517.32(C)(2) & (3)] as are some communications systems. This will make it clearer that fire alarm systems or ordinary communications systems as defined and covered in Chapter 8 that are part of the emergency system are required to be installed in raceways per 517.30(C)(3) because they are not Class 2 or Class 3, and are also required to comply with the first sentence of 517.80 for the same reason. According to this comment or the present language as accepted, communications circuits that are powered by communications equipment as defined in Chapter 8 (communications, CATV, and some data circuits) are required to have insulation, isolation, and grounding because they are not Class 2 or Class 3, but may require raceways in patient care areas. This may be true even though raceways are often not required outside patient care areas because the telephone and CATV are not part of the emergency system.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 15-132, which is a similar comment by the same submitter. This change addresses the submitter's concern.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
LIPSTER, S.: As demonstrated in Chapter 9, Table 11(A) and Table 11(B) Class 2 and Class 3 circuits in dry locations can have resultant current levels that create a danger of electrical shock. Patient safety, not economics should be foremost in addressing patient safety. Patent bed and care locations often become wet contact areas and current levels as low as 5 mA can pose a shock danger to the patient from these circuits. Class 2 and Class 3 circuits should be both mechanically protected and grounded to protect both patients and staff. The panel should have clarified that only signaling and communication systems supplied solely by Class 2 or Class 3 power sources not part of the emergency system do not require mechanical protection under 517.30(C)(3).

15-134 Log #2167 NEC-P15 **Final Action: Reject**
(517.80 Exception No. 3)

Submitter: Patricia B. Horton, Let's Call Pat Consulting
Comment on Proposal No: 15-120
Recommendation: Delete the second sentence of the Panel revised text.
Substantiation: This proposal as revised in the first sentence by the Panel provides more assurance that the intent of the Panel regarding equivalent insulation and isolation would now be required. That aids in increasing safety as suggested in 15-116.

However, the second sentence should not be accepted. As little as 5 milliamps can cause shock for an ill person. (See Chapter 9 – Tables 11A and 11B –pages 683 and 684 of the 2008 NEC)

Class 2 and Class 3 can have 150V. Fire alarm can be 250V (12A & B). Not to require grounding or mechanical protection is not a safe application. These systems are not intrinsically safe. Patients frequently are in wet beds and such a state likely would be reason to use the nurse call device.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided evidence to support the need for mechanical protection and grounding for Class 2 and Class 3 circuits.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
LIPSTER, S.: The panel should accept this comment. See negative statement on comment 15-133.

15-135 Log #1143 NEC-P15 **Final Action: Reject**
(517.160)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-122
Recommendation: Accept the proposal with the following revisions:
(A) Installation.
(1) Isolated Power Circuits. Each isolated power circuit shall be controlled by a switch or circuit breaker that simultaneously disconnects all conductors it controls. Conductors of isolated power circuits shall not be installed in cables, raceways, or enclosures with conductors of other systems.
Substantiation: It is prudent to prohibit installation with other system conductors. The present last sentence is superfluous; covered by the definition of isolated Power System, in 517.2.
Panel Meeting Action: Reject
Panel Statement: The panel contends that requiring to "simultaneously disconnect all conductors it controls" is not the same as having an isolated pole in each conductor.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-136 Log #1152 NEC-P15 **Final Action: Accept in Part**
(517.160(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-124
Recommendation: Accept the proposal with the following revisions:
Each isolated power circuit shall be controlled by a switch or circuit breaker that simultaneously disconnects all conductors of the circuit it controls. Conductors of isolated power circuits shall not be installed in cables, raceways, or other enclosures containing conductors of another system. Isolated power circuits shall be supplied by one or more of the following:
(1) isolation transformers
(2) generators
(3) electrically isolated batteries
(4) a combination of such sources
Substantiation: Isolated power system conductors should be separate from other systems.
Panel Meeting Action: Accept in Part
Add the following as last new sentence to 517.160(A)(1) to read as follows:
Conductors of isolated power circuits shall not be installed in cables, raceways, or other enclosures containing conductors of another system.
Panel Statement: The panel agrees with the submitter's substantiation and accepts the following part of the submitter's recommendation: "Conductors of isolated power circuits shall not be installed in cables, raceways, or other enclosures containing conductors of another system."
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 518 — PLACES OF ASSEMBLY

15-137 Log #1151 NEC-P15 **Final Action: Reject**
(518.4(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-128
Recommendation: Accept the proposal with the following revisions:
The wiring method shall qualify as an equipment grounding conductor, or shall contain an insulated equipment grounding conductor, or be provided with an equipment bonding conductor in accordance with 250.102(E).
Substantiation: Bonding conductors may be enclosed with circuit conductors and do not meet the definition of equipment grounding conductor when installed as defined in Article 100 Bonding Jumper, Equipment Bonding jumpers are permitted in many occupancies and classified locations, why not for assembly occupancies?
Panel Meeting Action: Reject
Panel Statement: Section 518.4(A) covers wiring methods and allowable types of equipment grounding conductors, not equipment bonding conductors. However, the section as currently written does not prohibit the use of equipment bonding conductors.
The intent of this section is to require an equipment grounding conductor (EGC) as defined in Article 100. FPN #1 of this definition addresses bonding.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

15-138 Log #2086 NEC-P15 **Final Action: Reject**
(518.4(B))

Submitter: Jim Davis, Electrical Education Services, LLC
Comment on Proposal No: 15-131
Recommendation: Revise 518.4(B) as follows: **Nonrated Construction**.
~~Nonrated Construction. In addition to the wiring methods of 518.4(A), nonmetallic sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit~~. Any wiring method approved by this code shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.
Substantiation: The code panel is respectfully requested to reconsider this proposal which is intended to simplify the code text for all users by NOT naming all of the wiring methods (in a list) that are otherwise approved for non-rated construction as pointed out by Mr. Sampson in his Explanation of Negative Vote to the panel statement in the ROP. Simplification here will help reduce potential confusion—not to mention—save ink.
Panel Meeting Action: Reject
Panel Statement: Article 518 occupancies are special and the panel contends that not all wiring methods approved elsewhere in the Code are applicable. Furthermore, the panel believes that wiring methods acceptable for Article 518 occupancies should be specifically itemized for usability and clarity.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

ARTICLE 520 — THEATERS, AUDIENCE AREAS OF MOTION PICTURE AND TELEVISION STUDIOS, AND SIMILAR LOCATIONS

15-139 Log #1149 NEC-P15 **Final Action: Reject**
(520.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-135
Recommendation: Accept the proposal with the following revisions:
Electrical designed or intended to be moved from one location to another and supplied by flexible cords or cables.
Substantiation: Present wording indicates the portable cords are the equipment moved from one place to another and does not specify “flexible.”
Panel Meeting Action: Reject
Panel Statement: The submitter did not identify which definition he wanted changed, thereby failing to meet the requirements of clause 4.4.5(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-140 Log #1150 NEC-P15 **Final Action: Reject**
(520.2 Stand Lamp (Work Light))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-136
Recommendation: Accept the proposal with the following revisions:
A portable luminaire or lampholder with guard and self-supporting means for the purpose of providing illumination on the stage or in the auditorium.
Substantiation: A luminaire or lampholder that is specifically intended for other than “general” (not defined) illumination should be included.
Panel Meeting Action: Reject
Panel Statement: “General Purpose” is easily understood and used throughout the Code. Use of “General Purpose” specifically differentiates luminaires used in stand lamps from stage/studio luminaries.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-141 Log #2087 NEC-P15 **Final Action: Reject**
(520.5(C))

Submitter: Jim Davis, Electrical Education Services, LLC
Comment on Proposal No: 15-139
Recommendation: Revise 520.5 (C) as follows:
Nonrated Construction. ~~Nonmetallic sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic~~ conduit Any wiring method approved by this code shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.
Substantiation: The code panel is respectfully requested to reconsider this proposal which is intended to simplify the code text for all users by NOT naming all of the wiring methods (in a list) that are otherwise approved for non-rated construction as pointed out by Mr. Sampson in his Explanation of Negative Vote to the panel statement in the ROP. Simplification here will help reduce potential confusion not to mention—save ink.
Panel Meeting Action: Reject
Panel Statement: Article 520 occupancies are special and the panel contends that not all wiring methods approved elsewhere in the Code are applicable. Furthermore, the panel believes that wiring methods acceptable for Article 520 occupancies should be specifically itemized for usability and clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-142 Log #965 NEC-P15 **Final Action: Reject**
(520.21)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-183
Recommendation: Accept the proposal with the following revisions:
All metal raceways and metal-covered cables, the metal frames and enclosures of all electrical equipment including border lights and portable luminaries shall be connected to an equipment grounding conductor.
Substantiation: The permitted wiring methods in 525.5 include Types MI, MC, and AC cables. Type MI is sheathed; Type MC may be an interlocking tape type; Type AG has a flexible metallic enclosure. These are distinct types of covering.
Panel Meeting Action: Reject
Panel Statement: The submitter referred to the wrong section; 520.21 addresses dead front switchboards. The substantiation is based on another article. In addition, the comment does not meet the requirements of clauses 4.4.5(b), (c), and (d) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-143 Log #973 NEC-P15 **Final Action: Reject**
(520.21)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-143
Recommendation: Accept the proposal.
Substantiation: Since Article 400 does not require listing, how is a “user” of the NEC to determine if flexible cords and cables are suitable per 400.3 and conform to the descriptions in the Use columns of Table 400.4 without the benefit of listing protocols? Many sections re: flexible cords and cables do not specify listing which can result in some cords on the same premises being specifically required to be listed while others are not.
Panel Meeting Action: Reject
Panel Statement: The submitter suggests the acceptance of Proposal 15-143, which refers to section 520.21. Section 520.21 addresses dead front switchboards and does not contain wording on the listing of flexible cords and cables, as the comment substantiation suggests. The comment does not meet the requirements of clause 4.4.5(c) of the Regulations Governing Committee Projects.
The Task Group spent a considerable amount of time and energy to attempt to identify the actual section the submitter was requesting action on. The Task Group was unable to accomplish that.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-144 Log #1157 NEC-P15 **Final Action: Reject**
(520.27(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-144
Recommendation: Accept the proposal with the following revisions:
A single feeder that supplies no other load, provided with a disconnecting means that simultaneously disconnects all ungrounded conductors of the feeder.
Substantiation: It is not clear if a single feeder is intended to supply more than one switchboard. The standard requirements for simultaneous disconnection should be specified. This section may be deemed to modify such requirements since there is no specific section requiring other articles to apply, as is common in many articles.
Panel Meeting Action: Reject
Panel Statement: The submitter is requesting acceptance of two proposals that are in conflict with each other. Chapters 1 through 4 apply to Article 520 installations unless modified by Article 520. There is no question that Chapters 1 through 4 require simultaneous disconnection of all ungrounded conductors in the feeder. It is a common practice to feed multiple switchboards bused together from one feeder. It is not and should not be prohibited by 520.27.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-145 Log #206 NEC-P15 **Final Action: Accept**
(520.44)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 15-151
Recommendation: The Technical Correlating Committee directs that the panel clarify 520.44(B)(2) as it applies to "listed for the purpose".
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to clarify 520.44(B)(2) as it applies to "listed for the purpose".
See Comment 15-147A.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-146 Log #1156 NEC-P15 **Final Action: Reject**
(Table 520.44)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-150
Recommendation: Change "Ampacity" in the heading of "Rating of Overcurrent Devices."
Substantiation: The heading covers ampacity while the table covers overcurrent device ratings; two different things. Ampacity is related to current carrying rating of conductors.
Panel Meeting Action: Reject
Panel Statement: The headings of the columns are correct. The purpose of the right-hand column is to limit the maximum amount of current for the wire size given in the table. The purpose of Table 520.44 is to describe ampacity of cables of 75 and 90 degree temperature ratings, to limit the maximum rating of the overcurrent device for a given wire size, and to provide ampacity adjustment factors for these conductors when used at a minimum diversity of 50%.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-147 Log #772 NEC-P15 **Final Action: Reject**
(520.44(B)(1) and (B)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-149
Recommendation: Accept the proposal with the following revisions:
"(B)(1) Flexible cords and cables to supply border lights shall be an extra-hard usage type that complies with 400.3."
"(B)(2) Extra-hard usage type flexible cords and cables not in contact with...". (Remainder unchanged).
Substantiation: Flexible cords and cables should be noted to comply with 400.3 as not all of these types are suitable.
Listing is not required in Article 400.
There is no table comparable to Table 400.4 for listed cords and cables; how is the Code user to determine the characteristics and uses of listed cords and cables?
Panel Meeting Action: Reject
Panel Statement: The submitter asks that section 400.3 be applied to the selection of flexible cords and cables covered by Section 520.44(B). This is already required, since Article 520 does not modify this requirement and Chapters 1 through 4 apply to Article 520 occupancies unless specifically modified by Article 520.
The submitter points out that there is no separate table in Article 400 for listed flexible cords and cables, and suggests that this is a reason not to require listing of these cords and cables. The panel reiterates that the special occupancies covered by Article 520 require listed cords and cables and that Article 520 modifies Article 400 on this issue.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-147a Log #CC1500 NEC-P15 **Final Action: Accept**
(520.44(B)(2))

Submitter: Code-Making Panel 15,
Comment on Proposal No: 15-151
Recommendation: In 520.44(B)(2), delete "for the purpose" and substitute "as stage and studio wiring devices".
Substantiation: The change adds clarity to 520.44(B)(2) as it applies to listed products.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-148 Log #207 NEC-P15 **Final Action: Accept**
(520.45)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 15-153
Recommendation: The Technical Correlating Committee directs that this action be reconsidered and correlated with the existing text in 520.46 and 520.62(B).
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC reconsider and correlate with the existing text in 520.46 and 520.62(B).
By accepting Comment 15-149, the references to 520.45 in 520.46 and 520.62(B) are correct.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-149 Log #2626 NEC-P15 **Final Action: Accept**
(520.45)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 15-153
Recommendation: The proposal should be rejected.
Substantiation: The receptacles covered in 520.45 are of a special construction, and contrary to the proposal substantiation, are not intended to be covered by 406.2(B). They are also exempt from the usual current limitations in Table 210.21(B)(2) by virtue of an express modification in 520.9. At one time, 520.45 had additional limitations with respect to continuous loads on these devices, but those limitations were removed in the 1993 NEC after substantiation that they could function properly even if continuously loaded above 80% of their current rating. It is advisable to leave well enough alone.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-150 Log #208 NEC-P15 **Final Action: Accept**
(520.50(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 15-156
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action because the modified language that was accepted contains changes from the existing text that have not been identified.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text of 520.50(C) to read as follows:
Overcurrent Protection. The supply devices of these supplementary circuits shall be protected by branch-circuit overcurrent protective devices. ~~The individual~~ Each ~~supplemental~~ supplementary circuit, within the road show connection panel and theater, shall be protected by branch—circuit overcurrent protective devices ~~of suitable ampacity~~ installed within the road show connection panel.
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.
The panel edits 520.50(C) accordingly. These changes to the actual 2008 text meet the original submitter's intent and now properly identify the changes.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-151 Log #972 NEC-P15 **Final Action: Reject**
(520.53(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-161
Recommendation: Accept the proposal with the following revisions:
Internal surfaces of enclosures of combustible material shall be covered with sheet metal not less than 0.51mm (0.020 in.) in thickness that is galvanized, enameled, or otherwise coated with noncombustible material that is corrosion-resistant.
Substantiation: Thickness of coating should be specified, likewise, noncombustible and corrosion resistant.
Panel Meeting Action: Reject

Panel Statement: The proposed change does not offer any additional clarity. The substantiation calls for specifying the thickness of the coating, but proposed new wording does not specify such thickness. This construction is many decades old and there is no record of loss to suggest that a change to the description of the construction is needed. In addition, the submitter did not provide a technical substantiation of the change.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-152 Log #963 NEC-P15 **Final Action: Reject**
(520.53(H)(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-164
Recommendation: Accept the proposal with the following revisions:
(H) Supply Conductors.
(1) General. A portable switchboard shall be supplied from a power outlet by means of extra-hard usage flexible cords or cables that comply With 400.3 and 400.4. Multiconductor flexible cords and cables shall contain an equipment grounding conductor. The supply conductors shall terminate at an externally manually operable fused main (master) switch or circuit breaker at the switchboard or in a connector assembly identified tor the purpose. The supply conductors and connector assembly shall have current ratings not less than the master switch fuses or master circuit breaker and shall be provided with oveercurrent protection.
(2) Single-Conductor Supply. Single conductor portable flexiblepower cable circuit conductors shall not be smaller than 2 AWG and where used as an equipment grounding conductor shall not be smaller than 6 AWG. Single-conductor grounded neutrals shall comply with 520.53(O). Single conductor portable power cables shall be grouped together, but not bundled.
Substantiation: Supply conductors should be specified to comply Wwith 400.3 and 400.4 as all extra-hard usage types may not be suitable, e.g., electric vehicle cables, and those without a W in the type letter, for wet locations and sunlight resistance. Multiconductor cables should contain an EGC. The current rating of supply conductors and connector assembly should be not less than the overcurrent protection in the master switch or circuit breaker since they commonly accompany the switchboard and the total load connected can vary. Single-conductor equipment grounding conductors should be the same type as circuit conductors for flexibility; a solid or normally stranded 6 AWG conductor is not very flexible. Paralleled conductors, identification of conductors and systems are already covered elsewhere in the NEC. “Permitted to be” identified does not impose a requirement and, therefore, not enforceable per 90.5 (B) and may be deemed to amend requirements of 200.6 and 250.119. Conductors may be paralleled for reasons other than increased ampacity, e.g., availability or ease in handling.
Panel Meeting Action: Reject
Panel Statement: The submitter identified two proposals with different content, but only references one proposal in the proposed revision. However, he doesn’t identify which one. Since the comment is not in legislative format, it is not possible to determine what existing language changes and whether it is a wholesale or just a partial revision. No improvement in clarity is offered.
This comment has failed to meet the requirements of clauses 4.4.5(b) and (c) of the Regulations Governing Committee Projects.
The Task Group spent a considerable amount of time and energy to attempt to identify the actual section the submitter was requesting action on. The Task Group was unable to accomplish that.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-153 Log #1155 NEC-P15 **Final Action: Reject**
(520.53(H)(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-164
Recommendation: Accept the proposal with the following revisions:
(1) The non-fixed feeder conductors supplying a portable switchboard shall be extra hard usage types of flexible cords or cables that comply with 400.3. The supply cords and cables shall terminate wtihin the switchboard enclosure in a manually externally operable fused or circuit breaker or a connector assembly identified for the purpose. The supply cords and cables (and connector assembly) shall have ratings not less than the fusible switch or circuit breaker at the switchboard.
(2) Single Conductor Cables. Single conductor flexible cables shall not be smaller than 2 AWG. The equipment grounding conductor shall not be smaller than 6 AWG. Single conductor grounded neutral conductors shall be sized in accordance with 520.53(O)(2). Single conductor cables shall be grouped together but not bundled. The equipment grounding conductor shall be permitted to be a different type if it meets the requirements of this section, and shall be permitted to be reduced in size as permitted by 250.122.
Substantiation: While it is understood which supply conductors are intended to be covered “supply conductors” literally includes fixed feeder and service conductors. Extra-hard usage flexible cords and cables should be suitable for the use; (400.3). This section may be deemed to amend that. Some are designed as electric vehicle cables, some are not designated W for wet locations and sunlight resistance. The grounded neutral and EGC identification and system identification are covered in other NEC sections which apply as are paralleled conductors for size and length, whether paralleled for ampacity or other reasons such as availability or ease in handling.
Panel Meeting Action: Reject
Panel Statement: It was not possible to determine what existing language changes and whether it was a wholesale or just a partial revision. No improvement in clarity is offered.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-154 Log #209 NEC-P15 **Final Action: Accept**

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 15-168
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action relating to the use of the phrase “overcurrent protection device” vs. “overcurrent protective device”.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change the word “protection” to “protective” in the original proposal on 520.53(H)(3)(1) and also in 520.53(H)(3)(2).
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.
The panel edits the text to change the word “protection” to “protective” in the original proposal.
The panel also recognizes identical text in 520.53(H)(3)(2) and makes a parallel change in 520.53(H)(3)(2).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-155 Log #210 NEC-P15 **Final Action: Accept**
(520.53(H)(4)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 15-169
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action relating to the use of the phrase “overcurrent protection device” vs. “overcurrent protective device”.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change the word “protection” to “protective” in the original proposal on 520.53(H)(4)(1) and also in 520.53(H)(4)(2).
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.
The panel edits the text to change the word “protection” to “protective” in the original proposal.
The panel also recognizes identical text in 520.53(H)(4)(2) and makes a parallel change in 520.53(H)(4)(2).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-156 Log #872 NEC-P15 **Final Action: Reject**
(520.61(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-175
Recommendation: Accept the proposal and revise as follows:
(D) Flanged Surface Devices. Flanged surface devices shall be rated in amperes and voltage.
(C) Cable Management. Cable and flexible cords and cables shall be protected by approved means where they enter equipment enclosures and be arranged so that there is no tension on terminal connections, or provided with devices to prevent such tension.
Substantiation: Since Part V covers portable equipment other than switchboards, the cables of (E) are presumed to be flexible cords and cables since portable switchboards may be supplied by single conductor cables (520.53(H)(2)). If cables and flexible cords cannot be arranged to prevent tension strain relief, devices should be permitted. Flanged surface devices should be included in (D).
Panel Meeting Action: Reject
Panel Statement: The submitter’s text does not pertain to 520.61.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-157 Log #1154 NEC-P15 **Final Action: Reject**
(520.62(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-177
Recommendation: Accept the proposal with the following revisions:
Flexible cords and cables supplying pendent receptacles or cord connector bodies shall comply with 400.3.
Substantiation: All extra-hard usage types may not be suitable for such use, e.g., electric vehicle types and those without a W designation for wet locations and sunlight resistance.
Panel Meeting Action: Reject
Panel Statement: Flexible cords are already required to comply with 400.3 since there is no modification of that requirement in Article 520. There is nothing to prevent use of an extra hard usage cable that does not include a W in its designation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-158 Log #1153 NEC-P15 **Final Action: Reject**
(520.68(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-181
Recommendation: Accept the proposal with the following revisions:
(1) General. Flexible conductors, including cable extensions used to supply portable stage equipment shall be approved extra-hard usage types flexible cords or cables.
Exception: No change.
Delete (2)
Substantiation: Cords for stand lamps are covered in (1). Physical damage is covered in 400.8(7); overcurrent protection is covered in 400.5 and 210.23 which specify branch circuit ratings which encompass overcurrent protection.
Panel Meeting Action: Reject
Panel Statement: The panel contends that Article 520 venues require extra-hard usage cords and cables to be listed, not simply approved.
The intent of this section is to allow a specific exemption of extra-hard usage cord for stand lamps that are fed by branch circuits of 20A or smaller. The submitter provided no substantiation for the change except that these requirements are covered elsewhere. They are not covered elsewhere for this specific special occupancy application.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

ARTICLE 522 — CONTROL SYSTEMS FOR PERMANENT AMUSEMENT ATTRACTIONS

15-159 Log #964 NEC-P15 **Final Action: Reject**
(522.7)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-186
Recommendation: Accept the proposal with the following revisions:
Only qualified persons shall install, maintain, and service electrical installations for installed amusement attractions and associated structure whether permanent or temporary.
Substantiation: Qualified persons should be required for installation, maintenance, and service. The present wording covers permanent installation without specifying “electrical”. Some attractions may not have electrical wiring.
Panel Meeting Action: Reject
Panel Statement: This section is titled “Maintenance”.
The current wording best reflects what this Code section should read. The submitter does not clarify any portion or part of this text. The submitter also includes wording that addresses temporary structure(s) that is beyond the scope of this Code article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-160 Log #961 NEC-P15 **Final Action: Reject**
(522.23)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-189
Recommendation: Accept the proposal with the following revisions:
Overcurrent protection for Conductors. Conductors 30 AWG through 16 AWG shall have overcurrent protection in accordance with the appropriate conductor ampacity in Table 522.22 or in acordance with Table 402.5 for fixture wires or as permitted in 725.45(C) for Class 1 circuits.
Exception: Overcurrent protection shall not be required for Class 2 control systems.
Substantiation: Correlation due to different conductor insulation temperature ratings, fixture wires, conductors for general wiring, and Class 1 remote control circuits. Conductors larger than 16 AWG covered in Table 310.16 have overcurrent protection requirements already covered elsewhere in the NEC.
Panel Meeting Action: Reject
Panel Statement: The reference to 402.5 is unnecessary as these are control circuit conductors, not fixture wires.
This section applies to a very narrowly defined application with no intention of accommodating all possible wiring. The industry has not requested this additional flexibility.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-161 Log #962 NEC-P15 **Final Action: Reject**
(522.23)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-189
Recommendation: Accept the proposal with the following revisions:
Conductor Ampacity. Conductors sized 16 AWG and smaller shall have an ampacity as specified in Table 522.22. Fixture wires specified in 725.49.
(B) used for Class 1 remote control circuits shall have an ampacity as specified in Table 402.5.
Substantiation: 725.49(B) requires 18 AWG and 16 AWG conductor used for Class 1 circuits to be a fixture wire (Table 402.3). Table 402.5 ampacity for 18AWG is 6 amperes, for 16 AWG it is 8 amperes. Most fixture wires are rated higher than 75 C. Ampere ratings should not be different due to type of circuit.
Panel Meeting Action: Reject
Panel Statement: This section applies to a very narrowly defined application with no intention of accommodating all possible wiring. The industry has not requested this additional flexibility.
It should be noted that Article 522 was created because other articles did not adequately address the special needs of the equipment in permanent amusement attractions. The action by this submitter is attempting to bring in requirements that are not applicable.
The comment does not meet the requirements of Section 4.4.5(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(522.23)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 15-188
Recommendation: The Proposal should be Accepted in Principle and “Table 310.16” should be revised to read “Table 310.15(B)(16)”.
Substantiation: Panel 6 Accepted in Principal in Part Proposal 6-52 and renumbered Table 310.16 as Table 310.15(B)(16). Acceptance of this Comment will provide correlation.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-163 Log #825 NEC-P15 **Final Action: Reject**
(522.24(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-190
Recommendation: Accept the proposal and revise text to read as follows:
(B) Control Circuits With Power and Lighting Circuits. Control circuits shall be permitted to be installed in the same raceway, cable, or enclosure with power and lighting circuits where in accordance with the following:
(1) Where the circuits are functionally associated.
(2) In factory or field-assembled control centers.
(3) In a manhole or handhole enclosure where”
(a) The control circuits or power and lighting circuits are in separate raceways, metal-covered cables, or multiconductor Type UF cables durably marked as control or power and lighting circuits.
(b) The control circuits are permanently separated from the power and lighting circuits by a firmly fixed nonconductor such as flexible tubing.
(c) The control circuits and power and lighting circuits are permanently and effectively separated and securely fastened to racks, insulators, or other approved supports.
(4) In cable trays where the control circuits and power and lighting circuits not functionally associated, are separated by an approved fixed solid barrier or by raceway or metal-covered cable.
Substantiation: “Power” circuits may be deemed not to include lighting circuits. Handhole enclosures should be included; they may be installed to provide access to a junction box or conduit body installed in an underground run. Single conductor Type UF cables installed for both power and lighting and control circuits would be difficult to distinguish.
Panel Meeting Action: Reject

Panel Statement: The submitter has totally rewritten the text of his original proposal such that the panel is unable to understand what he wants done. As a result, the panel is of the opinion that the comment does not meet the requirements of Section 4.4.5(c) of the Regulations Governing Committee Projects.

The panel contends that the existing text adequately addresses control circuits with power conductors. The submitter's substantiation does not justify the change.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-164 Log #1162 NEC-P15 **Final Action: Reject**
(522.24(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-190
Recommendation: Accept the proposal with the following revisions:

Control Circuits with Power and Lighting Circuits. Control circuits and power and lighting circuits shall be permitted to occupy the same cable, enclosure, raceway, or cable tray only as permitted in 552.24(B)(1) through (B)(3).

(1) In a cable, enclosure, raceway, or cable tray where the control circuit conductors and power and lighting circuit conductors are functionally associated.

(2) In control centers.

(3) In a manhole or handhole enclosure for underground conductors in accordance with the following:

(a) The control circuit conductors or power and lighting circuit conductors are in separate raceways, metal covered cables, or multiconductor Type UF cables.

(b) The control circuit conductors or power and lighting circuit conductors are permanently and effectively separated by a continuous firmly fixed nonconductor, such as flexible tubing or permanently and effectively separated and securely fastened to racks, insulators, or other approved means.

(4) In cable trays where the control circuit conductors and the power and lighting circuit conductors are separated by a firmly fixed solid barrier compatible with the cable tray, or the control circuit conductors and power and lighting circuit conductors are in a raceway or metal covered cable.

Substantiation: "Power" may be deemed not to include lighting. Hand hold enclosures for underground conductors should be included. Conductors in manhole and handhole enclosures may also be in raceways. "Control centers" covers factory and field assembled types. Cable trays should be included as in (A). Separation in cable trays can also be accomplished by raceways. Single conductor Type UF cable used for both types of systems are difficult to distinguish.

Panel Meeting Action: Reject
Panel Statement: The submitter has totally rewritten the text of his original proposal such that the panel is unable to understand what he wants done. As a result, the panel is of the opinion that the comment does not meet the requirements of Section 4.4.5(c) of the Regulations Governing Committee Projects.

The panel contends that the existing text adequately addresses control circuits with power conductors. The submitter's substantiation does not justify the change.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

15-165 Log #960 NEC-P15 **Final Action: Reject**
(522.24(B)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-190
Recommendation: Accept the proposal with the following revisions:

(3) In a Manhole or Handhole Enclosure. Control circuits and power and lighting circuits shall be permitted in the same manhole or handhole enclosure if the installation complies with at least one of the following:

(1) The power and lighting circuit conductors are in a separate raceway(s), metal covered cable(s), or multiconductor Type UF cable(s)

(2) The control circuit conductors are in a separate raceway(s), metal covered cable(s) or multiconductor Type UF cable(s).

(3) The control circuit conductors are permanently separated from the power and lighting circuit conductors by a continuous firmly fixed nonconductor such as flexible tubing.

(4) The conductors of the different systems are effectively separated and securely fastened to racks, insulators, or other approved supports.

(5) In cable trays where the control circuit conductors are not functionally associated with the power and lighting circuit, conductors, are separated by a solid fixed barrier of an approved material or the control circuit conductors or power and lighting circuit conduclors are in a raceway(s) or metal-covered cable(s).

Substantiation: Handhole enclosures should be included. Lighting circuit conductors should be included. If single conductor Type UF cables are used for control conductors and power and lighting circuit conductors it can be difficult to discern which is which. Control circuit conductors and power and lighting circuit conductors should be included in proposed (4). Securing of only control circuit conductors doesn't prevent contact by other conductors. Raceways should be permilted as separation in cable trays.

Panel Meeting Action: Reject
Panel Statement: The submitter has totally rewritten the text of his original proposal such that the panel is unable to understand what he wants done. As a result, the panel is of the opinion that the comment does not meet the requirements of Section 4.4.5(c) of the Regulations Governing Committee Projects.

The panel contends that the existing text adequately addresses control circuits with power conductors. The submitter's substantiation does not justify the change.

15-166 Log #1161 NEC-P15 **Final Action: Reject**
(522.25)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-191
Recommendation: Accept the proposal with the following revisions:

(1) Continuity of power is required for orderly shutdown and where a ground fault(s) can result in a hazardous condition

(2) Ground detectors are installed in the control system at an approved location occupied while the amusement attraction is in operation.

Substantiation: A ground fault(s) that disables a control system designed to prevent operation of attractions unless doors, gates, or person restraints are in place can be a hazard to persons if failure allows operation with open doors, gates, or unused restraints. Ground detection is not useful if a signal device indicating the condition is not located where personnel are present.

Panel Meeting Action: Reject
Panel Statement: The current language addresses the submitter's concern. The present text adequately addresses the concern that a single ground fault may disable the control system.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 525 — CARNIVALS, CIRCUSES, FAIRS, AND SIMILAR EVENTS

15-167 Log #211 NEC-P15 **Final Action: Accept**
(525.5(B)(2))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 15-193
Recommendation: The Technical Correlating Committee directs that the panel clarify the action taken on this proposal relating to the phrase "and extending vertically to grade" by placing it after the word "horizontally" in the text.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept
Revise 525.5(B)(2) as follows:

(B) Clearance to Portable Structures.

(2) Over 600 Volts. Portable structures shall not be located under or within a space that is 4.5 m (15 ft) horizontally and extending vertically to grade of conductors operating in excess of 600 volts.

Panel Statement: The panel accepts the direction of the TCC to clarify the action.

The panel makes an editorial change to 525.(B)(2) to clarify usage of the section.

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-194
Recommendation: Accept the proposal.
Substantiation: "Mechanical" is defined as "of or relating to machinery or tools." "Likely" is used in approximately 80 places in the NEC.
Panel Meeting Action: Reject
Panel Statement: "Likely" is not prescriptive enough and is to be avoided per the NEC Style Manual. "Mechanical" is imperative as part of the application.
The existing language is clear and the submitter has not provided compelling new substantiation to change it.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

15-169 Log #773 NEC-P15 **Final Action: Reject**
(525.10(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-197
Recommendation: Accept with the following revisions:
"Service equipment shall not be installed where accessible to unauthorized persons, unless the equipment is locked to prevent access or manual operation, or the equipment is under continuous observation of a qualified person."
Substantiation: Equipment should be accessible to authorized persons; the average homeowner or business owner is not a "qualified" person, but has access to their service equipment. Many other requirements in the NEC are not enforceable when the AHJ is not present.
Panel Meeting Action: Reject
Panel Statement: Authorized Persons and Qualified Persons are not the same. An authorized person (e.g., an owner) may be unqualified. The requirement is that only qualified persons can access the equipment.
"Under continuous observation of a qualified person" is not enforceable.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

15-170 Log #1160 NEC-P15 **Final Action: Reject**
(525.10(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-196
Recommendation: Accept the proposal with the following revisions:
Service equipment shall not be installed in a location where it is accessible to unqualified persons unless it is locked to prevent manual operation of control parts and access to contained parts.
Exception: Where under constant supervision of an authorized person.
Substantiation: Having provisions for locking is not the same as being locked. Provisions alone do not deter access. Where under continuous supervision, equipment does not need to be locked, and perhaps should not be in case access is imperative and the authorized person does not have a key.
Panel Meeting Action: Reject
Panel Statement: The panel contends that locked is not enforceable and lockable is.
"Under continuous observation of a qualified person" is not enforceable.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

15-171 Log #707 NEC-P15 **Final Action: Reject**
(525.10(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-198
Recommendation: Accept the proposal and revise as follows:
(A) Guarding Service equipment shall not be accessible to unauthorized persons unless locked to prevent access to energized parts, control and switching devices, or under continuous observation and control of an authorized person.
Delete (B).
Substantiation: Service equipment may be lockable but not actually locked which doesn't deter access and defeats the purpose of the provision. The purpose of locking should be noted; the cover of an enclosed switch can be locked but doesn't prevent operation of the lever or handle. Mounting and securing of equipment is covered by 110.13; 110.13 covers wet and damp locations.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comments 15-169 and 15-170.
525.10(B) is necessary as the equipment is reinstalled at various sites – it is not permanent. The requirement for solid backing and protection from weather is necessary.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

15-172 Log #824 NEC-P15 **Final Action: Reject**
(525.20(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-201
Recommendation: Accept the proposal and the revise text to read as follows:
(A) Wiring Methods. Where wiring is installed it shall be an approved wiring method covered in Chapter 3 except that flexible cords and cables shall be permitted for use as permanent wiring if they comply with 400.3 and the following:
(1) Be an extra-hard usage type or hard usage type where protected by location or approved means.
(2) Contain an equipment grounding conductor.
(3) Be securely fastened in place.
(4) Be a continuous length between terminations.
(5) Installed in a manner or with fittings to prevent strain on terminations.
Substantiation: This section implies that Chapter 3 wiring methods are not to be used. Many portable components can be wired with permanent methods that are a fixed part of the component. The wording doesn't specifically permit the use of flexible cords. Compliance with 400.3 should be noted as all extra-hard usage type cords may not be suitable; e.g., EV series, those without a W designation for wet locations and sunlight resistance.
Panel Meeting Action: Reject
Panel Statement: The proposed language does not provide clarity, and in fact, cannot be applied. Chapter 3 addresses permanent installations and does not cover the portable nature of the equipment in Article 525 venues. Flexible cords are already required to comply with 400.3 since there is no modification of that requirement in Article 525. There is nothing to prevent use of an extra-hard usage cable that does not include a W in its designation if not used outdoors. Additionally, the "securely fastened in place" language is not applicable.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

15-173 Log #1169 NEC-P15 **Final Action: Reject**
(525.20(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-201
Recommendation: Accept the proposal with the following revisions:
(A) Type. Where methods shall be approved type covered in Chapter 3 except that flexible cords and cables that comply with 400.3 shall be permitted for use as permanent wiring where they comply with 400.3 and other applicable provisions of Article 400, and if they comply with the following:
(1) Be an extra-hard or hard usage type and protected by location or other approved means.
(2) Be securely fastened in place.
(3) Contain an equipment grounding conductor.
Substantiation: Reference to 400.3 will require that flexible cords and cables be suitable for the use and location, i.e., wet locations and sunlight resistance, where required. All extra-hard and hard usage types do not have a W designation and electric vehicle types may not be appropriate. The proposed reference to Article 400 will cover physical damage; 400.8(7) pull at joints and terminals, 400.10 overcurrent protection, 400.13 and other provisions not specified in this section, which in the absence of a section requiring compliance with applicable provisions of other articles may be deemed to modify such provisions.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 15-172.

(525.21(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-205
Recommendation: Accept the proposal with the following revisions:
(A) Disconnecting Means. Approved means shall be provided to disconnect each portable structure. Each disconnecting means shall:
(1) Simultaneously open all ungrounded conductors of the circuit it controls.
(2) Be located within sight of and within 1.8 m (6 ft) of the operator's station.
(3) Be readily accessible to the operator, including when the ride or attraction is in operation.
(4) Have approved permanent means for locking in the open (off) position (remainder unchanged).
Substantiation: Disconnecting means should be approved for the use and conditions, (ratings wet locations, etc.). Since covers and doors may be lockable, locking should clearly relate to position of the disconnecting mechanism.
Panel Meeting Action: Reject
Panel Statement: While the formatting may provide some clarity, the proposed text change is incomplete and therefore there is no assurance that the submitter's intent can be met.
The list provided by the submitter does not enhance the safety, understanding or enforcement of this provision.
This comment also does not meet the requirements of clause 4.4.5(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 17

15-176 Log #2627 NEC-P15 **Final Action: Accept in Part**
(525.21(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 15-205
Recommendation: Continue to accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110: "**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
Panel Meeting Action: Accept in Part
The panel continues to Accept Proposal 15-205.
The panel does not accept the contingency of CMP 1 accepting the companion comment.
Panel Statement: See panel action on Comment 15-174.
Number Eligible to Vote: 17

Ballot Results: Affirmative: 17

15-178 Log #2464 NEC-P15 **Final Action: Accept**
(525.21(C))

Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 15-203
Recommendation: Reject this proposal.
Substantiation: The language, although lifted from Article 530, provides permission to the essentially eliminate working space without any substantiation that safety will not be impacted. Even NFPA 79, the safety standards for industrial machinery that can have close spaces, establishes parameters that are enforceable. The language introduced in this section is not enforceable and provides the opportunity for every installation to be a point of conflict. Conflict is not an effective means for the AHJ to ensure an industry accepted level of safety or for the amusement industry to manage electrical installations across the country.
Quick example of how this language may get used. The AHJ must permit reduction of the working space, but doesn't tell him how much, so the AHJ may decide that 2ft- 11 inches instead of 3 ft is appropriate. I can't see how this benefits the amusement industry.
The proposal is not good for either the electrical safety of the operator, maintenance person or the amusement industry.
Panel Meeting Action: Accept
Number Eligible to Vote: 17

15-179 Log #2710 NEC-P15 **Final Action: Reject**
(525.23(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 15-215
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The fact finding report addressed overheating terminals and not shock protection as this section requires. The panel is also aware there is no product yet available.
The wholesale change of "Where GFCI Protection is required." to "Where Power safe protector protection is required." is not supported by the substantiation. The UL Investigation states in the Executive Summary the following:
"Preliminary Testing – A limited testing was performed to demonstrate the conceptual ability of the PSP enhanced safety receptacle design to serve as a principle safeguard to prevent overheating at the receptacle that could result in the ignition of nearby combustibles.
"Recommendations for UL Certification Process – A process was developed for evaluating these receptacles towards a Underwriters Laboratories Inc. Listing of this product." and
"Due to the limited number and prototype nature of the PSP receptacle specimens provided, a comprehensive safety evaluation was not possible."

Ballot Results: Affirmative: 17

ARTICLE 530 — MOTION PICTURE AND TELEVISION STUDIOS AND SIMILAR LOCATIONS

15-181 Log #1163 NEC-P15 **Final Action: Reject**
(530.12(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-221
Recommendation: Accept the proposal with the following revisions:
The wiring for portable stage set lighting shall be done with extra-hard usage or hard usage type flexible cords or cables covered in Table 400.4 that comply with 400.3. Splices and taps in such cords shall be permitted where made by approved means and protected in accordance with applicable provisions of 240.5.
Exception: Flexible cords and cables shall be permitted in accordance with 240.5(B).
Substantiation: Reference to 400.3 will clarify that section is not amended by lack of reference to other applicable provisions. Some extra-hard and hard usage type cord and cables may not be suitable, such as EV types and those without a W in their designation for wet locations and sunlight resistance. This section may be deemed to amend 400.3 and 240.5 since there is no provision in this article as in other articles requiring compliance with other NEC provisions. Flexible cords and cables are already required not to be subject to physical damage. Splices and taps in accordance with 110.14(B) soldered do not require listing. Listed equipment with integral cords such as lamps, radios, and appliances should be exempted from extra-hard and hard usage type cords.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed text reduces as well as weakens the requirements without technical substantiation. The panel intends these cables to be listed. Current wording clearly describes proven, industry-specific safe practice.
The submitter's substantiation indicates a lack of understanding of the operation of Article 530 venues.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-182 Log #1167 NEC-P15 **Final Action: Reject**
(530.13)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-222
Recommendation: Accept the proposal with the following revisions:
Switches used for lighting and effects on stages, lots, and on location, shall be of the externally manually operable type. Where contactors are used as the disconnecting means for fuses or panelboards, an externally manually operable switch(es) for control of the contactor(s) shall be readily accessible and at least one such switch shall be located at a distance not more than 1.8 m (6 ft) from the contactor(s) it controls. A single such switch shall be permitted to simultaneously disconnect all the contactors on any one location board.
Substantiation: The intent appears intended to require manual operation whether or not externally operable by remote control. Contactors to disconnect panelboards should be included. Where more than one switch controls a contactor, it may be impractical to locate all switches within 6 ft and negate the means or necessity for more distant switches. Readily accessible should be a requirement for such switches, as in effect they are disconnecting means, not just control switches.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed text does not provide any additional clarity and does not provide any technical substantiation. The current wording describes safe industry practice with a long established record of performance.
The submitter's substantiation indicates a lack of understanding of the operation of Article 530 venues.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-183 Log #1166 NEC-P15 **Final Action: Reject**
(530.19(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-223
Recommendation: Accept the proposal with the following revisions:
Portable portions of feeders and permanently installed feeders that supply only portable loads shall be permitted to have an ampacity not less than 50 percent of the maximum load that will be supplied.
Substantiation: Permanently installed portions of feeders that supply only portable loads should be included. A permanently installed portion of a feeder that supplies only a portable portion of the same feeder sees the same load and should be permitted the same demand factor. Connected load and calculated load are not defined; are they the same? Different terms pertaining to the same thing can be confusing.
Panel Meeting Action: Reject
Panel Statement: 530.19(B) does not apply to permanently installed feeders. Table 530.19(A) already applies to demand factors for permanently installed feeders.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-184 Log #976 NEC-P15 **Final Action: Accept in Principle**
(530.20)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-225
Recommendation: Accept the proposal with the following revisions:
Grounding. All non current-carrying conductive parts of electrical equipment shall be connected to an equipment grounding conductor. This shall not apply to pendant and portable lamps, portable stage lighting equipment and sound equipment, or to other portable and special stage equipment operating at not over 150 volts dc.
Substantiation: The proposal covers wiring methods, including Type AC cable permitted in 530.11. Stage lighting and sound equipment should be designated "portable".
Panel Meeting Action: Accept in Principle
Revise text of 530.20 to read as follows:
530.20 Grounding. Type MC cable, Type MI cable, Type AC cable containing an insulated equipment grounding conductor, metal raceways, and all non—current—carrying metal parts of appliances, devices, and equipment shall be connected to an equipment grounding conductor. This shall not apply to pendant and portable lamps, to portable stage lighting and stage sound equipment, or to other portable and special stage equipment operating at not over 150 volts dc to ground.
Panel Statement: The revised wording aligns the wiring methods of 530.11 with the grounding requirements of 530.20.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

15-185 Log #977 NEC-P15 **Final Action: Accept in Principle in Part**
(530.21(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 15-226
Recommendation: Accept the proposal with the following revisions:
(A) Rating Plugs. Receptacles, cord connector bodies and flanged surface devices shall be rated in amperes. The voltage rating of such devices shall be not less than the nominal circuit voltage. The ampere rating of such devices shall not be less than the rating of the circuit to which they are connected. Table 210.21(B)(2) shall not apply.
Substantiation: Cord connector bodies and flanged surface devices are not covered by this provision which can be a hazard.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
(A) Rating. Plugs and receptacles, including cord connectors and flanged surface devices, shall be rated in amperes. The voltage rating of the plugs and receptacles shall be not less than the nominal circuit voltage. [Remainder unchanged].
Panel Statement: The panel accepts the changes to the first two sentences with revised text for clarity.
The panel does not accept the remainder of the proposed text. The panel chooses to retain the reference to AC. No substantiation for the elimination of AC was provided.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

ARTICLE 540 — MOTION PICTURE PROJECTION ROOMS

15-186 Log #388 NEC-P15 **Final Action: Accept**
(540.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 15-228
Recommendation: The proposal should be rejected.
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.

The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

Panel Meeting Action: Accept

Panel Statement: The NEC Style Manual does not address this specifically. The NFPA 2004 Manual of Style states in Annex B:

"B.10.2.2 Quotient. Use the word *per* for unit names — for example, meters per second.

"Use a slash (/) or the appropriate power for unit symbols — for example, m/s …"

"Frames per inch" is recognized film industry nomenclature.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

ARTICLE 547 — AGRICULTURAL BUILDINGS

19-3 Log #465 NEC-P19 **Final Action: Reject**
(547.1(B)(1) and (2))

Submitter: Thomas L. Adams, Macomb, IL

Comment on Proposal No: 19-11

Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:

(1) Poultry and animal excrement ~~may~~ that cause corrosive vapors.

(2) Corrosive particles ~~may~~ that combine with water.

This text is in the Article Scope and will require approval of the TCC who has the Scope text under its purview.

Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms *may* or *can* shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term *may* shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term *may* in this Section does not meet these criteria, it should be changed.

Panel Meeting Action: Reject

Panel Statement: The panel recognizes discretionary judgment may be necessary on the part of the authority having jurisdiction to determine whether or not the environment is corrosive and whether corrosive particles may be combined with water.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-4 Log #2785 NEC-P19 **Final Action: Accept**
(547.2.Distribution Point)

Submitter: James J. Rogers, Bay State Inspectional Agency

Comment on Proposal No: 19-12

Recommendation: Continue to reject.

Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.

Panel Meeting Action: Accept

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-5 Log #1172 NEC-P19 **Final Action: Reject**
(547.5(A))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 19-17

Recommendation: Accept the proposal with the following revisions:

(A) Wiring Methods. Permanent type wiring methods employed shall be limited to the following: Galvanized steel, stainless steel, and red brass rigid metal conduit, electrical metallic tubing in accordance with 358.10(B), Type PVC conduit, Type UF cable, Type NMC cable, copper Type SE cable, Jacketed Type MC cable, Type MI cable, with additional protection, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, Type RTRC conduit, electrical metallic tubing, nonmetallic wireways, nonmetallic auxiliary gutters, cablebus, cable tray, open wiring on insulators. The wiring methods of 502.2 shall be permitted for areas described in 547.1(A). All wiring methods shall comply with their respective articles.

Substantiation: The proposal specifies additional wiring methods that are suitable for corrosive conditions and specifically indicates "other cables or raceways suitable for location." It applies to permanent wiring methods, flexible cords and cables are not affected.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its action to Reject Proposal 19-17.

The proposed changes are already covered in the existing text which states "or other cables or raceways suitable for the location." An all encompassing list of suitable wiring methods is intentionally not provided which allows for judgment by the authority having jurisdiction. Additionally, the panel notes that "permanent wiring methods" are not defined in the code.

The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-6 Log #1170 NEC-P19 **Final Action: Reject**
(547.5(C)(2))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 19-19

Recommendation: Accept the proposal with the following revisions:

Damp or Wet Locations. In damp or wet locations, including normally dry locations where surfaces or equipment are periodically washed or sprayed with liquids, boxes and other enclosures, conduit bodies and other fittings, and other electrical equipment shall be listed or approved for the conditions.

Substantiation: Building surfaces and equipment may be washed or sprayed with other than plain water. Unlisted equipment such as straps should be "approved" for the conditions. "May" is a discretionary term to be used by the Authority Having Jurisdiciton.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided additional substantiation for the panel to reconsider its action on Proposal 19-19.

Chapters 1-4 apply where not amended or replaced by requirements in Chapter 5. Support requirements for wiring methods in Chapter 3 included the use of "approved" products to perform the required support function.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

19-7 Log #1196 NEC-P19 **Final Action: Reject**
(547.5(D) and (E))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 19-21

Recommendation: Accept the proposal with the following revisions:

(D) Flexible Connections. Where necessary to employ flexible connections to equipment listed dusttight flexible connectors, extra-hard usage or hard usage type flexible cords and cables that comply with 400.3 and contain an equipment grounding conductor shall be permitted in lengths no longer than necessary.

(E) Separate Equipment Grounding Conductor. Where a separate equipment grounding or bonding conductor is installed it shall be an insulated copper conductor.

Substantiation: Dusttight flexible connectors have no article wheerin they are required to be listed. Article 400 does not require listing. Raceways are required to be listed in their respective articles. LFMC, LFNC, and Type MC cables are already permitted in 547.5(A) whether or not flexibility is required and they and associated fittings are required to be listed in their respective articles. Wiring and equipment are required to be protected by 110.27(B), 300.4 and 352.12(C) and other sections which apply, unless amended. Bonding conductors should be included in proposed (F) since they may be installed in raceways or direct buried between electrodes or equipotential grids or under earth areas where corrosive particles can percolate.

Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-21.

The existing code text already covers the proposed revised language. The recommended change does not provide additional clarity.

The submitter's reference to (E) is incomplete and ambiguous. It is unclear if the submitter intends to delete or revise the current (E) and (F).

The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-8 Log #1171 NEC-P19 **Final Action: Reject**
(547.5(D), (E), and (F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-22
Recommendation: Accept the proposal with the following revisions:

(D) Flexible Connections. Where necessary to employ flexible connections, dustight flexible connectors, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, or extra-hard usage or hard usage type flexible cords and cables that comply with 400.3 shall be used. All connectors and other fittings shall be identified for the purpose.

(E) Physical Protection. All wiring and equipment shall comply with 110.27(B).

(F) Grounding and Bonding Conductors. Where a grounding or bonding conductor is installed within a location covered by 547.1, it shall be a copper conductor, and where installed underground it shall be insulated or covered and comply with cover requirements of Table 300.5
Substantiation: Flexible cables should be included. Cords and cables should comply with 400.3 since all extra-hard and hard usage types do not have the designation W for wet locations and sunlight resistance, which may be required. Reference to 110.27(B) covers physical damage and applies where damage is likely, but not evident, at time of installation or inspection. (F) should include bonding conductors and minimum cover depths required for direct buried conductors operating at zero volts.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-22.

Chapters 1-4 apply where not amended or replaced by requirements in Chapter 5.

The existing language in 90.3 covers the proposed additional code references.

The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-9 Log #1195 NEC-P19 **Final Action: Reject**
(547.5(G)(4))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-26
Recommendation: Accept the proposal.
Substantiation: "Outdoors" includes concrete slab areas, but does not include a concrete slab in an indoor confinement area. Why not indoor slabs?
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-26.

Additional substantiation for the proposed change has not been provided.

The submitter's substantiation referencing indoor and outdoor slabs does not appear to be connected to the original Proposal 19-26. The submitter implies that indoor concrete slabs in confinement areas are not included for GFCI protection; however, indoor areas are included in 547.5(G)(1). Per 547.10, all concrete slabs in confinement areas indoor or outdoors are required to have equipotential planes.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-10 Log #871 NEC-P19 **Final Action: Reject**
(547.8(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-28
Recommendation: Accept the proposal.
Substantiation: The panel statement supports the proposal, since exposure to physical damage may not be evident at time of installation or inspection, but circumstances indicate such exposure is likely.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-28.

The panel does not agree with the submitter that the panel's statement accompanying its action to Reject Proposal 19-28 supports the proposed changes.

As explained in the panel statement on Proposal 19-212, the decision whether or not the installation will be "subject to physical damage" is evident at the point of inspection. "Likely to…" is irrelevant to the decision. "Likely to…" is good Code language to guide product standards where the final installation circumstances may not be evident. In the case of Proposal 19-89, "likely to" is acceptable since the circumstance is not expected under normal circumstances but could occur.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-11 Log #213 NEC-P19 **Final Action: Accept**
(547.8(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-29
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal as it relates to the existing "building cleansing water" vs. "building cleaning water" as accepted in the proposal.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise text to read as follows:

Luminaires exposed to water from condensation, building ~~cleaning~~ cleansing water, or solution shall be listed as suitable for use in wet locations.
Panel Statement: The panel accepts the direction of the Technical Correlating Committee to clarify the panel action.

The panel inadvertently accepted the change in terminology that was part of the original proposal but which was not substantiated. The panel has corrected the language as shown in the Panel meeting action.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-12 Log #1175 NEC-P19 **Final Action: Reject**
(547.9)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-30
Recommendation: Accept the proposal with the following revisions:

(A)(3) Operation. The site-isolating device shall simultaneously disconnect all ungrounded supply conductors from the premises wiring it controls.

(A)(8) Accessibility. Where the site-isolating device is not readily accessible, it shall be provided with an approved operating mechanism to open and close the disconnecting means from a readily accessible location. The handle of the operating mechanism shall be not more than 2 m (6 ft 7 in.) above grade or a working platform and not more than 4.57 m (15 ft) horizontally from the operating mechanism.

(B) Supply Conductors to Buildings or Other Structures. Supply conductors to buildings or other structures shall comply with 547.9(B)(1) through (B)(3). 250.32 and applicable provisions of Part F of Article 225.

Delete present (C).

(C) Direct Buried Conductors. Where direct buried conductors are run to or installed in a building or other structure covered in 547.1, they shall be insulated copper.
Substantiation: The conductors supplying pole mounted site isolating devices are not necessarily service conductors. The supply conductors to a building or other structure are feeders or branch circuits. "Other" is before "structure" since a building is a structure, but all structures are not buildings. Proposed (C) should apply to all conductors in buildings covered by 547.1
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-30.

New material has been introduced which was not included in the original proposal. The new material is either not technically substantiated or it is unclear to the panel what text is intended to be modified or where the new text is to be located.

The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-13 Log #2251 NEC-P19 **Final Action: Reject**
(547.9(A)(1))

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 19-31
Recommendation: Revise Proposal 19-31 as follows: A site-isolating device shall be installed at the distribution point where two or more agricultural buildings or structures are supplied from the distribution point. If there is more than one distribution point, the requirements of 547.9(E) shall apply.
Substantiation: The NEC does not limit the number of distribution points on an agricultural premises. NEC 547.9(E) contains rules for permanent identification plaques or directories when more than one distribution point is on the same agricultural premises. The proposed revision in the wording will be better correlated with 547.9(E).
Panel Meeting Action: Reject
Panel Statement: The proposed language is redundant as the requirements of 547.9(A) and (E) already apply. The submitter's comment does not address the panel's concern stated in its action on Proposal 19-31.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-14 Log #969 NEC-P19 **Final Action: Accept in Principle**
(547.9(A)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-16
Recommendation: Reject the proposal.
Substantiation: The submitter's substantiation is incorrect. 547.9(A)(2) does not clearly require pole-top mounting, only to meet 230.24. A pole "top" mounting could be among the open individual supply conductors supported at the top area of the pole.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 19-15.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-15 Log #2628 NEC-P19 **Final Action: Accept in Principle in Part**
(547.9(A)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-16
Recommendation: Accept the proposal in principle and in part.
Reject the change to "pole-top." Accept the specification for conductor clearances, but locate the requirement in 547.9(B)(2) by rewording this paragraph as follows:
(2) Conductor Installation and Clearances. The supply conductors on the line side of a service disconnect shall, where run as overhead conductors, meet the clearance requirements of 230.24. The supply conductors on the load side of a service disconnect shall be installed in accordance with the requirements of Part II of Article 225.
In addition, reword 547.9(A)(2) to read as follows:
(2) Location. The site-isolating device shall be pole-mounted and, ~~shall meet the clearance requirements of 230.24~~ for an overhead distribution system, be not less than the height above grade required by 230.24 for the conductors it supplies.
Substantiation: The extension of the requirements of 547.9(A) to overhead conductor clearances is beyond the scope of this part of Section 9, which only deals with site-isolating devices. This comment places the desired requirement where it belongs. In addition, 230.24 only provides clearances for conductors, not equipment. The rewording provides the appropriate context to allow 230.24 clearances to carry over to this equipment. This height may or may not be the height of the top of the pole.
Panel Meeting Action: Accept in Principle in Part
The panel rejects the revisions to (B)(2) Conductor Installation.
The panel accepts the revisions to (A)(2) Location in part as follows:
(2) Location. The site-isolating device shall be pole-mounted and~~, shall meet the clearance requirements of 230.24 for an overhead distribution system.~~ be not less than the height above grade required by 230.24 for the conductors it supplies.
Panel Statement: The panel does not agree with the proposed revisions to (B)(2) as there is not a height requirement for a service rated disconnect in this section.
In (A)(2) the panel rejects the addition of "for an overhead distribution system" as 230.24 deals only with overhead distribution systems (service drop conductors). The panel accepts all other revisions to (A)(2). The panel recognizes that the action on this comment continues to require that the device be mounted near the top of the pole without using the term "pole-top mounted."

Comment on Proposal No: 19-52
Recommendation: Accept the proposal with the following revisions:
Feeder Assembly. The conductors from the mobile home service to the mobile home distribution equipment, including the equipment grounding conductor together with necessary fittings and equipment approved for the purpose of supplying current to the main disconnecting means in the mobile home.
Substantiation: The proposal includes all supply conductors whether cord or permanent wiring. "Source" is too inclusive and includes utility, park transformers, and distribution equipment. Feeder conductors do not necessarily terminate in a panelboard (not specifically required) but may terminate in a single enclosed circuit breaker or fused switch.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-52.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-23 Log #216 NEC-P19 **Final Action: Accept**
(550.2.Distribution Panelboard)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-54
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-54 and determined that it is not in conflict with the action taken by Panel 9 on Proposal 9-130a. The term "panelboard" was retained in Proposal 9-130a and the definition of "Distribution Panelboard" in 550.2 equates with the definition of "Panelboard" in Article 100.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-24 Log #2725 NEC-P19 **Final Action: Reject**
(550.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 19-56
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: A definition is not necessary based on the action taken on Comment 19-32.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-25 Log #1194 NEC-P19 **Final Action: Reject**
(550.10(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-62
Recommendation: Accept the proposal with the following revisions:
(A) Feeder. The power supply to the mobile home shall be a feeder assembly consisting of not more than one listed 50-ampere mobile home power supply cord with an integrally molded or securely attached plug cap or a permanently installed feeder rated not less than 50 amperes.
Substantiation: Edit. Emphasizes the minimum rating of a permanently installed feeder.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-62.
The submitter has not provided substantiation to support the proposed revisions.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-26 Log #217 NEC-P19 **Final Action: Accept**
(550.11)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-63
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-63 and determined that it is not in conflict with the decisions by Panel 9 on Proposal 9-130a. The term “panelboard” was retained in Proposal 9-130a and the definition of “Distribution Panelboard” in 550.2 equates with the definition of “Panelboard” in Article 100.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-27 Log #1180 NEC-P19 **Final Action: Reject**
(550.11)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-63
Recommendation: Accept the proposal with the following revisions:
Circuit Protective Equipment. If a fusible main disconnecting means is provided, the main fuse ampere rating shall be durably marked with lettering at least 6 mm (1/4 in.) high and visible when fuses are changed. Plug fuses and fuseholders shall be Type S and in dead-front enclosures. Enclosures for circuit breakers shall be dead-front.
FPN: No change.
Substantiation: Present first sentence is superfluous; there is no prohibition of branch circuit equipment (presumably disconnecting means and overcurrent protection) from being installed in a panelboard. The requirement for maximum fuse size marking should not be limited to panelboards. Plug fuses may also be installed in fusible switches. Panelboards are not specifically required in this article.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-63.
New material has been introduced which was not included in the original proposal. It is unclear to the panel what text is intended to be modified or where the new text is to be located.
The submitter’s failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13

19-28 Log #218 NEC-P19 **Final Action: Accept**
(550.11(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-65
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-65 and determined that it is not in conflict with the decisions by Panel 9 on Proposal 9-130a. The term “panelboard” was retained in Proposal 9-130a and the definition of “Distribution Panelboard” in 550.2 equates with the definition of “Panelboard” in Article 100.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-29 Log #1177 NEC-P19 **Final Action: Reject**
(550.11(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-64
Recommendation: Accept the proposal with the following revisions:
(A) Distribution Equipment. A single main disconnecting means consisting of a readily accessible circuit breaker of fusible switch shall be provided near the entrance of feeder conductors into the mobile home, but not in a bathroom or toilet compartment. The main disconnecting means enclosure shall be plainly and durably marked “Main Disconnect” in letters at least 6 mm (1/4 in.) high. A fusible main disconnecting means enclosure shall be plainly and durably marked with the appropriate fuse rating in letters at least 6 mm (1/4 in.) high. The mobile home distribution equipment shall contain solderless type grounding terminals or bars for all grounding and bonding conductors terminated therein. The terminations of grounded circuit conductors shall comply with 550.16(A). The main disconnecting means and overcurrent protection and other distribution equipment shall have ratings not less than the feeder conductors. The bottom of the distribution equipment shall be not less than 600 mm (24 in.) above the floor or standing space. A clear working space not less than 750 mm (30 in.) wide and deep and not less than the width and height of the distribution equipment shall be provided.
FPN: No change.
Substantiation: Panelboards are not specifically required. It is impractical to mark the body of a fuse or circuit breaker, and if so marked, would not be visible with a dead-front installed. The marking would be discarded if the fuse or circuit breaker is replaced. “Durable” and “durably” are terms commonly used in the NEC. Distribution equipment should have ratings not less than the feeder conductors. Since there is no prohibition of distribution equipment on the exterior standing space, (grade) is added to the penultimate sentence.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-30.
The requirements in 550.11 pertain specifically to distribution panelboards when used but do not specifically state or imply that a distribution panelboard is required.
The submitter’s failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

19-32 Log #2723 NEC-P19 **Final Action: Reject**
(550.13(B))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 19-69
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter's referenced report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent injuries and loss. However, the report did not include an investigation of the ability of this technology to mitigate the hazards associated with wiring device failure mechanisms. Additionally, there are currently no product requirements that exist for PSP protection. As such, we will continue to support the rejection of any proposal to include requirements for PSP and similar devices in the NEC. The panel maintains that installation of these devices is not currently prohibited by the NEC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-33 Log #2181 NEC-P19 **Final Action: Reject**
(550.13(B) Exception)

Submitter: Wayne E. Morris, Association of Home Appliance Manufacturers
Comment on Proposal No: 19-71
Recommendation: The Code-Making Panel should accept the original proposal in full.
Substantiation: The revised proposal accepted by the CMP eliminates the exception for refrigerators, freezers, and laundries. Nuisance failures of GFCIs for freezers or refrigerators located in a basement or garage may be rare, but cause a great deal of damage when they occur.
Panel Meeting Action: Reject
Panel Statement: The submitter's comments are anecdotal and not technically substantiated. Technological advancement, improvement in the product standards and the involvement by the Consumer Product Safety Commission have combined to significantly enhance the reliability of GFCI's.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-37 Log #2217 NEC-P19 **Final Action: Accept**
(550.15(~~H~~))

Submitter: Ron B. Chilton, Raleigh, NC
Comment on Proposal No: 19-81a
Recommendation: This change should be accepted.
Substantiation: This change should be accepted as the mobile home industry has provided a nonmetallic conduit method as the feeder method from the mobile home panelboard and has for almost 40 years now. Schedule 80 PVC and other nonmetallic conduits are listed for use where subject to physical damage and would meet concerns. This type installation has also been the primary method of supplying the feeder between the service disconnect and the mobile home panelboard located inside the home for the same number of years.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-38 Log #1187 NEC-P19 **Final Action: Reject**
(550.16)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-84
Recommendation: Accept the proposal with the following revisions:
Grounding. Grounding in or on a mobile home by connection to a grounding bus(es) or terminal(s) in the mobile home main disconnecting means specified in 550.11(A). The grounding bus(es) or terminal(s) shall be connected by the feeder assembly equipment grounding conductor to a grounding electrode conductor in the mobile home service equipment. The metal frame of the mobile home and non current-carrying metal parts of equipment and equipment grounding conductors shall not be connected to the grounded circuit conductor(s) in or on the mobile home. Bonding screws, straps, or buses for this purpose shall be removed.
(A) Ranges and Clothes Dryers. Connections of ranges and clothes dryers with 120/240 volt ratings shall be made with a 4 conductor flexible cord and 3-pole 4-wire grounding plugs and receptacles or by Type AC cable, Type MC cable, or conductors in flexible metal conduit or liquidtight flexible metal conduit enclosing an equipment grounding or bonding conductor.
(B) Equipment Grounding Means.

(1) Feeder Assembly. The equipment grounding conductor in the feeder assembly shall be connected to the grounding bus(es) or terminal(s) in the main disconnecting means specified in 550.11(A)

(2) Electrical System. All exposed noncurrent-carrying metal parts of electrical equipment fastened in place or connected by permanent wiring methods shall comply with 250.110.

(3) Cord-Connected Equipment. Cord-connected equipment shall comply with 250.114.

Exception: Listed luminaries, lampholders and equipment with factory attached flexible cords and nongrounding-type attachment plugs.

Substantiation: A distribution panelboard (if used) may not contain the main disconnecting means specified in 550.11(A). "Feeder assembly" covers the supply cord and a permanent type feeder. References to 250.110 and 250.14 covers fixed and portable equipment and have exceptions which should apply. This section does not allow for such exceptions. Clothes dryers with a 120/240 volt rating may be connected for only 120 volts which do not require a 4-wire cord and plug. Liquidtight flexible metal conduit is suitable for connection to ranges and dryers; the conduits should contain an EGC or EBC since wording may be deemed to amend 348.60 and 350.60. An exception is warranted for listed equipment with integral nongrounding cords and plugs. This section should also clearly apply to equipment on, but not in, the mobile home.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its action to Reject Proposal 19-84.

The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

Ballot Results: Affirmative: 13

19-43 Log #1186 NEC-P19 **Final Action: Reject**
(550.16(C)(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-89

Recommendation: Accept the proposal with the following revisions:

(1) All exposed noncurrent-carrying metal parts of the mobile home that are likely to become energized shall be bonded to the grounding terminal(s) or bus(es) specified in 550.11(A). A solid copper bonding conductor sized in accordance with 250.122, but not smaller than 8 AWG shall be connected between the grounding terminal(s) or bus(es) specified in 550.11(A) and the chassis. The bonding conductor shall be routed so as not likely to be subject to physical damage or protected by approved means.

(2) Grounding and bonding terminals shall be listed and solderless type approved for the wire size and material.

Substantiation: A panelboard is not specifically required and may not contain the main disconnecting means specified in 550.11(A). The bonding conductor should be solid copper since it may be subject to corrosion by de-icing road salts. Bounding conductor size should be specified. Terminals should be approved for conductor size and material.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its action taken on Proposal 19-89. The proposed reference to 250.122 is not applicable.

New material has been introduced which was not included in the original proposal. The new material is either not technically substantiated, is already included elsewhere in the code, or does not add clarity or usability to the code. The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

19-44 Log #389 NEC-P19 **Final Action: Accept**
(550.16(C)(4)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-90
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported, including Proposal 19-102 (see companion comment). In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-45 Log #1023 NEC-P19 **Final Action: Reject**
(550.16(C)(4)(2))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-90
Recommendation: The Proposal should be Accepted and "per" changed to "for each".
Substantiation: The phrase "for each" is more appropriate for a standard.

The NEC Style Manual for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).

Most of the Panels have accepted this change and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: The proposed revision does not add clarity or improve usability. The panel agrees with the substantiation provided by the submitter of Comment 19-44.

Comment on Proposal No: 19-93
Recommendation: Continue to reject the proposal.
Substantiation: In addition to the panel objection to the abbreviation "V", which is correct, the word "per" should be retained as well, and the panel action is correct. The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.

The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
Panel Meeting Action: Accept
Number Eligible to Vote: 13

19-48 Log #1024 NEC-P19 **Final Action: Reject**
(550.18(A)(5))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-93
Recommendation: The Proposal should be Accepted in Part and "per" changed to "for each". The remainder of the Proposal should continue to be Rejected.
Substantiation: The phrase "for each" is more appropriate for a standard.

The NEC Style Manual for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).

Most of the Panels have accepted this change and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 19-47. The panel agrees with the substantiation provided by the submitter of Comment 19-47.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-49 Log #1185 NEC-P19 **Final Action: Reject**
(550.18(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-94
Recommendation: Accept the proposal to change "leg" to "each conductor."
Substantiation: The proposal is innocuous; "conductor" is the term usually used in the NEC; 550.18 uses the term "conductor."
Panel Meeting Action: Reject
Panel Statement: The panel continues to contend that the word "leg" is clearly understood. No additional substantiation has been provided by the submitter.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-50 Log #970 NEC-P19 **Final Action: Reject**
(550.18(B)(2) and (3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-94
Recommendation: Revise to read as follows:
(2) Nameplate ratings for permanently installed motors and heater loads. Omit smaller of the heating and cooling loads except blower motor, if used for evaporative cooler or air-conditioner. Where an air conditioner is not installed and a 40-ampere supply cord is provided, add 15-amperes per conductor for air conditioning.
(3) 125 percent for the largest motor or continuous load, whichever is greater. (remainder unchanged).
Substantiation: The provision should apply to permanently installed motors and heaters; portable equipment may be unknown or transient. Twenty-five percent of the largest motor or continuous load is sufficient to prevent overheating at terminals of overcurrent devices. Applying the factor to both, results in a 250 percent calculated load increase.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-94. New material has been introduced which was not included in the original proposal. The new material is either not technically substantiated, is already included elsewhere in the code, or does not add clarity or usability to the code.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

(550.24(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-103
Recommendation: Accept the proposal and revise text to read as follows:
The mobile home service equipment shall be:
(1) readily accessible
(2) Located within sight of and not more than 9 m (30 ft) from the exterior of the mobile home.
Exception: The service equipment shall be permitted to be located elsewhere on the premises if a disconnecting means listed for use as service equipment and rated not less than required in 550.32(C) and located as required by this section is provided. Such disconnecting means shall not be grounded in accordance with 250.32.
Substantiation: "Adjacent" is effectively defined by the 30 ft requirement and is a term not to be used per the NEC Style Manual. This "other" disconnecting means should be listed for use as service equipment.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-103. New material has been introduced which was not included in the original proposal. The new material is either not technically substantiated, is already included elsewhere in the code, or does not add clarity or usability to the code.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

ARTICLE 551 — RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

19-59 Log #820 NEC-P19 **Final Action: Reject**
(551.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-112
Recommendation: Accept the proposal and revise text to read as follows:
Distribution Equipment. A circuit breaker, fused switch, single equipment or group of equipment units designed for assembly in the form of a single equipment...(remainder unchanged).
Substantiation: Single enclosed circuit breakers and fused switches are not prohibited. "Panel" is not code-defined; panelboard is. A panelboard is not specified, or required where there is only one 15- or 20 ampere branch circuit (551.42(A) and (B)).
Panel Meeting Action: Reject
Panel Statement: The definition in 551.2 simply equates the term "Distribution Panelboard" with "Panelboard" as defined in Article 100 and as the term is used in Article 551.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-60 Log #223 NEC-P19 **Final Action: Accept**
(551.2.Distribution Panelboard)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-112
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-112 and determined that it is not in conflict with the actions taken by Panel 9 on Proposal 9-130a. The term "panelboard" was retained in Proposal 9-130a and the definition of "Distribution Panelboard" in 551.2 is identical to that of "Panelboard" in Article 100.

(551.20)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-119
Recommendation: Accept the proposal and revise text to read as follows:
Equipment that is suitable for use on ac and dc circuits shall be clearly marked for such use.
Substantiation: The present wording prohibits transformer ac circuits from supplying equipment marked for ac and dc. The source, whether transformer, generator, battery, or solar power, is irrelevant. The panel reference to 551.20(B) relates to dual voltage, not the type of current.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-119. The recommended change does not add clarity or improve usability of the Code.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-63 Log #819 NEC-P19 **Final Action: Reject**
(551.20(F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-121
Recommendation: Accept the proposal and revise text to read as follows:
(F) Receptacles, Plug Caps, Cord Connector Bodies, and Flanged Surface Devices. Where a recreational vehicle is equipped with a 120 volt or 120/240 volt ac system, a low-voltage ac or dc system, or a combination of such systems, receptacles, cord connector bodies, plug caps, and flanged surface devices of each system shall have a configuration that is not compatible with such devices of another system.

Where a vehicle equipped with a device or leads for connection to an external source of low-voltage ac or dc power,sources the connection device shall have a configuration that is not compatible with 120 volt or 120/240 volt systems devices. A durable warning shall be provided at the connection point stating the voltage and type of current, ac or dc, or both for which the connection is provided.
Substantiation: A configuration such as a parallel slot 15 ampere grounding type receptacle is different from the same nongrounding type receptacle, but the grounding type will accept a nongrounding type plug. The provision should also apply to cord connector bodies and flanged surface devices that may be installed.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-121.
New material has been introduced which was not included in the original proposal. No technical substantiation has been provided for adding the suggested components.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13

(551.30(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-122
Recommendation: Accept the proposal.
Substantiation: If a grounded conductor from an engine generator is connected to the grounded conductor of another system, it is not a separately derived system and system grounding requirements don't apply. "At the same time" describes 3 pm on Monday and 3 pm on Tuesday.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-121.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-65 Log #224 NEC-P19 **Final Action: Accept**
(551.30(E)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-123
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-123 and determined that it is not in conflict with the decisions by Panel 9 on Proposal 9-130a. The term "panelboard" was retained in Proposal 9-130a.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-66 Log #985 NEC-P19 **Final Action: Reject**
(551.30(E)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-123
Recommendation: Accept the proposal.
Substantiation: 551.42(A) and (B) indicate a single fused switch or a single circuit breaker may constitute the disconnecting means defined in Article 551 definitions. The reference coveres equipment that is not a "panelboard".
Panel Meeting Action: Reject
Panel Statement: A panelboard is one of the options available in 551.30(E)(1). The panel reiterates from its statement on the original proposal that the reference to 551.42 (A) and (B) is not germane to the subject of the proposal, or the comment.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-67 Log #967 NEC-P19 **Final Action: Reject**
(551.31(B) and (D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-126
Recommendation: Accept the proposal with the following revisions:
(B) Multiple Supply Sources Ratings. The multiple supply source shall not be required to have the same kW or kVA ratings.
(D) Power Supply Assemble Rated 30 Amperes or More. The power supply assembly shall be permitted to be rated less than the calculated load but not less than 30 amperes, and shall have overcurrent protection not greater than the power supply assembly.
Substantiation: Proposed kW or Kva is more clear than "capacity". Proposed (D) correlates with (C) which relates to amperes, not capacity. "External" is superfluous; power supply assemblies are basically external.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-126. The existing requirement is clear as written and the proposed revisions would not add clarity or enhance usability.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13

19-68 Log #1028 NEC-P19 **Final Action: Accept**
(551.40(C))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-127
Recommendation: The Proposal should continue to be Rejected.
Substantiation: According to the NEC Style Manual, the words "circuit" and "interrupter" are not hyphenated when used as a noun but are hyphenated when used as an adjective.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-69 Log #225 NEC-P19 **Final Action: Accept**
(551.41(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-117
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 2-274.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise the exception to 551.41(A) as follows:
(A) Spacing. Receptacle outlets shall be installed at wall spaces 600 mm (2 ft) wide or more so that no point along the floor line is more than 1.8 m (6 ft), measured horizontally, from an outlet in that space.
Exception: Bath and ~~hall~~ hallway areas.
Panel Statement: As directed by the Technical Correlating Committee, the panel has correlated the action taken on Proposal 19-117 with the action taken by Panel 2 on Proposal 2-274.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-70 Log #966 NEC-P19 **Final Action: Reject**
(551.41(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-132
Recommendation: Accept the proposal with the following revisions:
(C) Ground-Fault Circuit Interruptor Protection
Each 125-volt single-phase 15-and 20-ampere receptacle outlet in the following locations shall have ground-fault circuit interruptor protection for personnel:
(1) Within 1.8 m (6 ft) of a sink, lavatory, tub, or shower.
(2) Where installed to serve kitchen countertops.(3) On the exterior of the vehicle, including within a compartment accessible from the exterior of the vehicle
. Exception: Receptacle outlets installed for appliances in dedicated spaces, other than laundry equipment, and located more than 1.8m (6ft) from a sink or lavatory.

Substantiation: 90.1 states the NEC is for safeguarding persons and property. If the requirements of 210.8 and 210.8(7) are minimum requirements for safety in other type dwelling units why should they not apply? The rim of food waste disposers in a sink can be energized by leakage current too small to operate the overcurrent device. Appliances in dedicated spaces within 6 ft of a sink such as food waste disposers, trash compactors, and dishwashers can become energized by leakage current. A receptacle for expandable sections within 6 ft of a sink can be used for other purposes. Receptacles in compartments on the exterior can be used for other purposes than a contained appliance.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-132.

The recommended changes are considered editorial and do not add clarity or improve usability of the code. GFCI protection is required in each of the cases described.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

19-74 Log #505 NEC-P19 **Final Action: Reject**
(551.45(C) Exception (New))

Submitter: Jerome A. Hoover, Monaco RV, LLC
Comment on Proposal No: 19-137
Recommendation: I am requesting the panel reconsider the vote to reject this proposal and to change the vote to accept.
Substantiation: Not only does the proposal correctly state that an RV is temporarily connected to the utility connection by an easily detachable cord, which differs from a permanently connected residential utility connection, but the temporarily connected, easily detachable RV power supply cord serves as the main RV service disconnect. The back-fed circuit breaker can only be released from its mounting after a service technician or assembler has removed the panelboard cover with a screwdriver, wrench 01' other appropriate tool.

The RV cord connection to the campground service outlet is comparable to an appliance cord connection to a convenience outlet rather than to a residential, permanent utility connection that cannot be disconnected. The need to remove the panelboard cover with tools reminds a technician to detach the power supply cord, serving as the main RV disconnect, from the campsite electrical service outlet before performing service work, just as a repair technician would disconnect an appliance before servicing it. A residential utility connection differs from an RV connection because it depends upon the main panelboard breaker to disconnect power before performing service work.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action taken on Proposal 19-137. The substantiation does not recognize foreseen safety hazards and present UL Standard 67 requires the use of hold-downs.

19-76 Log #834 NEC-P19 **Final Action: Reject**
(551.46(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-140
Recommendation: Accept the proposal with the following revisions:

"(C) Separable Power Assembly.

(1) Units with one 15- or 20 ampere branch circuit. The flexible cord or cable shall be an extra-hard usage type that complies with 400.3, contains an equipment grounding conductor, has an ampacity not less than the branch circuit, and is equipped with an attachment plug and cord connector body in accordance with Figure 551.46(C), as applicable.

FPN: No change.

(2) Units with two to five 15- or 20-ampere branch circuits. The flexible cord or cable shall be an extra-hard usage type that complies with 400.3, contains an equipment grounding conductor, has an ampacity not less than 30 amperes, and an attachment plug and cord connector body in accordance with Figure 551.46, as applicable.

FPN: No change."
Substantiation: These provisions should specify cord type compliance with 400.3 (for example, use in wet locations and sunlight resistance (W designation). There is no specific description of the power supply assembly.

The present (C)(1) and (2) do not cover the cord connector body that connects to the flanged surface inlet of 551.46(A)(1). Figure 551.46(C) does not include 15 ampere ratings or cord connector bodies.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-140.

The intent of the submitter is unclear as he appears to be proposing to replace requirements for attachment plugs with ones for separable power supply assemblies. No technical substantiation has been provided for adding the additional components.

The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

(551.46(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-140
Recommendation: Accept the proposal with the following revisions:
Separate Power Supply Assemblies.
(1) Units with only one 15-ampere branch circuit. These units shall be provided with a separable power supply assembly consisting of the following:
(a) An extra-hard usage type flexible cord or cable with an ampacity not less than 15-amperes, that contains an equipment grounding conductor and complies with 400.3.
(b) A firmly attached 2-pole 3-wire grounding type plug and cord connector body rated 15-amperes, 125-volts as shown in Figure 551.46(C).
FPN: No change.
(2) Units with only one 20-ampere branch circuit. These units shall be provided with a separable power supply assembly consisting of the following:
(a) An extra-hard usage type flexible cord or cable with an ampacity not less than 20-amperes that contains an equipment grounding conductor and complies with 400.3
(b) A firmly attached 3-wire 2-pole grounding-type plug and cord connector body rated 20-amperes, 125-volts as shown in Figure 551.46(C).
FPN: No change.
(3) Units with two to five 15- or 20-ampere branch circuits. Such units shall be provided with a separable power supply assembly consisting of the following:
(a) An extra-hard usage type flexible cord or cable with an ampacity not less than 30-amperes, that contains an equipment grounding conductor, and complies with 400.3.
(b) A firmly attached 2-pole 3-wire grounding type plug and cord connector body rated 30-amperes, 125-volts, as shown in Figure 551.46(C).
FPN no change.
(4) Units with 50-ampere power supply assembly. Such units shall be provided with a separable power supply assembly consisting of the following:
(a) An extra-hard usage type flexible cord or cable with an ampacity not less than 50-amperes, that contains an equipment grounding conductor and complies with 400.3.
(b) A firmly attached 3-pole 4-wire grounding-type attachment plug and cord connector body rated 50-amperes, 125/250 volts as shown in Figure 551.46(C).
FPN no change.
Permanently connected power supply assemblies in accordance with 551.46(A)(2) shall comply with this section except they shall not be provided with a cord connector body.
Substantiation: This section should specify the type of flexible cord and cable, an equipment grounding conductor, and cord connector body necessary for connection to the flanged surface inlet specified in (A)(1). Reference to 400.3 clarifies not all extra-hard usage type flexible cords are suitable; e.g., wet locations and sunlight resistant. "Female connector" in (A)(1) is not defined and not specifically required. Figure 551.46(C) needs revision to indicate cord connector bodies and 15-ampere rated devices.

(551.47)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 19-142b
Recommendation: Revise the accepted text as follows: "...supports shall be provided at ~~least~~ intervals not exceeding 1.4 m (4-1/2 ft) at other places."
Substantiation: The meaning of the term "at least" is not clear. While the term is used often in casual conversation, and generally understood, the text of the code should not be so vague and should be consistent with similar requirements elsewhere. In response to ROP 19-146, the panel refers to Article 334 and states that type NMS is the most commonly used wiring method in RVs. Section 334.30 uses "intervals not exceeding" in two places and "support does not exceed" in one place. Each or either of these is clear. But literally, "at least" could mean and generally does mean "not less than." So if an installation is made with spacing at 6 ft between supports, the supports are "at least" 4-1/2 ft apart. I do not believe that was the panel intent.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-81 Log #886 NEC-P19 **Final Action: Reject**
(551.47(F) and (G))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-144
Recommendation: Accept the proposal.
Substantiation: All cables do not have sheaths, e.g., TypeAC. The provisions in (G) may be deemed to amend the provisions of 300.4 since it doesn't include cables or raceways such as Type MI, RMC, IMC, PVC, and doesn't permit notches. "Cable" in 300.4 includes optical fiber cables and coaxial cables which this provision doesnot include. References in any article may be overlooked; is that a reason not to use them? See 90.1(C). The NEC Style Manual, 4.1.2 states: "Use references to other NEC rules to avoid repeating a requirement."
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 19-144. The requirements in (G) are specific to the RV industry. Usability of the NEC by the industry by having the RV requirements maintained within Article 551 is far more important than using references where information could be overlooked.

Ballot Results: Affirmative: 13

19-84 Log #4 NEC-P19 **Final Action: Accept in Principle**
(551.47(R)(1))

Submitter: Bruce A. Hopkins, Recreation Vehicle Industry Association
Comment on Proposal No: 19-154
Recommendation: Accept original proposal.
Substantiation: The overcurrent protection mandated by this language is unnecessary and redundant because appropriate overcurrent protection is required by the two current listing standards for RV listed generator sets. (See the two listing standard excerpts below).

● ANSI/EGS-1 states in section 5.12.1 that generators shall have an integral overcurrent protection device, collapsible field or other integral overcurrent protection feature for protection of generator feeder conductors.

● UL 1248 states in section 14.1 that the generator and field conductors to the junction box for connection to the load shall be protected by an appropriately rated overcurrent protective device, except that this overcurrent protection need not be provided for generations having a collapsible field or other built-in overcurrent protection if field conductors are adequately sized for the maximum sustained current available.

I have provided three drawings that show typical installations of RV generators.

Drawing A shows a complete installation with the RV listed generator with integral overcurrent protection, and the wires to the panelboard. The integral breaker on the body of the genset protects the wires from the genset to the panelboard. Circuits downstream of the panelboard have individual branch circuit protection provided.

Drawing B shows the same in installation without a transfer switch; but the use of a receptacle. The coach owner/user can choose to plug the RVs' power cord into a shore power receptacle or can plug into the generator output receptacle. In drawing A and B, the integral overcurrent protection on the genset body is used only to protect the generator output from the genset to the panelboard.

In drawing C, the generator is not supplied by the RV manufacturer. If the consumer wants a genset, the dealer would make the installation. The NEC now requires the use of a RV listed genset that will have a collapsing field, integral OCP, or a mandate in the installation instructions to provide OCP for the genset's output wires. In our drawing C, we are showing the breaker that is currently being installed by the RV manufacturer when the genset is not installed.

When the RV manufacturer provides a prewire for a genset and a dealer subsequently installs the genset, this breaker in the j-box is discarded since the RV listed generator has the needed protection installed or is otherwise provided. This breaker in the J-box is considered by us to be redundant. Further, since the genset is not installed in a prewire application, this breaker is not really needed since this conductor between the J-box and the transfer switch is not energized or used.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment on 19-85.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

ZIEMAN, M.: Circuit over-current protection is a basic principal of electrical safety. To the best of my knowledge, the code always requires the installer of the circuit to also install overcurrent protection for that circuit. The code never permits the end user to be responsible for the overcurrent protection, especially when the end user is a consumer with no electrical expertise.

This action of the panel allows the RV manufacturer to install a 110-125 or 120/240 Volt AC circuit WITH NO OVERCURRENT PROTECTION. The circuit is intended for the future installation of a generator. In lieu of requiring overcurrent protection, the panel has approved that a label be provided to instruct the installer to install a generator with the appropriate overcurrent protection (the installer could be the RV owner, a repair shop, a RV retailer, or the RV owner's friend - Bubba). This is akin to allowing the electrical circuits in a single family residence to be run to a distribution panel with no branch circuit breakers as long as a label is provided telling the home owner to install appropriate overcurrent protection. A LABEL IS NO SUBSTITUTE FOR PROPER OVERCURRENT PROTECTION WHICH COULD BE INSTALLED BY THE RV MANUFACTURER AT MINIMUM COST.

To make the situation even worse, the ultimate overcurrent protection installed, if any, is never subject to inspection by a building official or any other knowledgeable and qualified person.

It is believed, though not known for sure, that most (NOT ALL) generators incorporate some form of overcurrent protection. In the first place, the panel's action assumes that all RV generators will incorporate overcurrent protection. Next, the panel's logic can probably best be illustrated with this example:

EXAMPLE: The RV manufacturer installs a 30-ampere circuit with no overcurrent protection and indicates on the label to provide 30 over-current protection. The RV owner later decides to install a generator. First, they will in each and every case, READ AND UNDERSTAND the label. (If you believe this, I have a bridge to sell you). Next, they will in each and every case FOLLOW the instruction on the label (if you believe that, I have a second bridge to sell you), and will purchase only a 30-ampere maximum generator (not a 50 ampere or larger one) and make the installation. We all know that many times this will not happen. Often, they will never read the label and if they do they may not understand it or may choose to ignore it anyway. If they have access to a used generator rated more than 30 amperes (their neighbor, one they pulled out of their other RV or one they found on Craig's List) they will often install it with no second thoughts.

Bottom-line this proposal WILL result in hazardous installations where the circuit has oversized overcurrent protection or in some case no circuit protection at all.

"According to the latest national statistics, there were, on average, 3,100 RV fires each year from 2002 through 2005. These fires caused seven deaths, 62 injuries and approximately $41 million in damages in each of those years."[1]

One can logically assume that a large percentage of these fires are electrical in origin. Let's not add to it by approving this ill-conceived comment.

The purpose for our code is stated in Article 90 and 90.1(A) as follows: "Practical Safeguarding. The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity." Let's live up to what it says. I, for one, will not be a part of such an ill-conceived scheme.

19-85 Log #504 NEC-P19 **Final Action: Accept in Principle**
(551.47(R)(1))

Submitter: Jerome A. Hoover, Monaco RV, LLC
Comment on Proposal No: 19-154
Recommendation: I am requesting the panel reconsider the vote to accept this proposal in part and to change the vote to accept.
Substantiation: The proposal correctly state that overcurrent protection is not needed, no current can run through the conductors, and no connection to the electrical system is provided when the OEM does not install the generator at the factory. The standard installation of RV listed generators to ensure that proper overcurrent protection is then provided.
The panel's concern about unprotected circuit conductors because of future generator installations can be alleviated without requiring that the manufacturer install redundant protection, and additional safety can be assured, by revising the label language of 551.47(R)(4) as follows;

GENERATOR CIRCUIT
ONLY INSTALL A GENERATOR LISTED
SPECIFICALLY FOR RV USE
~~GENERATOR CIRCUIT.~~ ,WITH APPROPRIATE
OVER-CURRENT PROTECTION. THIS CONNECTION
IS FOR GENERATORS RATED 1l0/125-VOLT AC,
60 HZ, _____AMPERES MAXIMUM.
OR
GENERATOR CIRCUIT
ONLY INSTALL A GENERATOR LISTED
SPECIFICALLY FOR RV USE
~~GENERATOR CIRCUIT.~~ ,WITH APPROPRIATE
OVER·CURRENT PROTECTION. THIS CONNECTION
IS FOR GENERATORS RATED 120/240·VOLT AC,
60 HZ, _____AMPERES MAXIMUM.

Revising the label language would satisfy the intent of the petitioner to provide necessary overcurrent protection at the time of generator installation, rather than installing unnecessary, redundant protection for an uninstalled generator-or may never be installed.

Panel Meeting Action: Accept in Principle

Revise existing 551.47(R)(1) to read as follows:

(1) Circuit conductors shall be appropriately sized in relation to the anticipated load as stated on the label required in (4) below. ~~and shall be protected by an overcurrent device in accordance with their ampacities. Where the generator provides overcurrent protection for the conductors, additional overcurrent protection is not required.~~

Revise existing 551.47(R)(4) as follows:

A label conforming to 551.46(D) shall be placed on the cover of each junction box containing incomplete circuitry and shall read, as appropriate, either

GENERATOR
ONLY INSTALL A GENERATOR LISTED
SPECIFICALLY FOR RV USE
~~GENERATOR CIRCUIT.~~ ,HAVING
OVER-CURRENT PROTECTION ~~THIS CONNECTION IS FOR GENERATORS~~ RATED 1l0/125-VOLT AC,
60 HZ, _____AMPERES MAXIMUM.

OR

GENERATOR
ONLY INSTALL A GENERATOR LISTED
SPECIFICALLY FOR RV USE
~~GENERATOR CIRCUIT.~~ ,HAVING
OVER·CURRENT PROTECTION. ~~THIS CONNECTION IS FOR GENERATORS~~ RATED 120/240·VOLT AC,
60 HZ, _____AMPERES MAXIMUM.

The correct ampere rating shall be legibly marked in the blank space.

Panel Statement: The panel accepts the text of Proposal 19-154 and has also revised 551.47(R)(4) to meet the intent of Proposal 19-154 and Comment 19-85.

(551.54(B))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 19-158

Recommendation: Accept the proposal with the following revisions:

(B) Distribution Equipment. The recreational vehicle distribution equipment shall have a grounding terminal(s) or bus(es) to accommodate all wire-type equipment grounding conductors and all bonding conductors.

Substantiation: A one branch circuit installation with a single fused switch or circuit breaker does not require a panelboard. Grounding terminals and buses should also accommodate all bonding conductors, such as in 551.56(B), (E), (F).

Panel Meeting Action: Reject

Panel Statement: A distribution panelboard must comply with the requirement in 551.54(B). 551.45(A) already includes "other equipment" as was stated in the panel statement on Proposal 19-158.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

19-89 Log #5 NEC-P19 **Final Action: Accept in Principle**
(551.54(C))

Submitter: Bruce A. Hopkins, Recreation Vehicle Industry Association

Comment on Proposal No: 19-159

Recommendation: Accept original proposal.

Substantiation: In a recreational Vehicle (RV) application, the term "Grounded Circuit Conductor" is misleading. This conductor, known as a neutral, in an RV electrical circuit is intentionally isolated from the ground conductor within the vehicle to prevent a possible hazardous condition. The problem occurs when the polarity of the incoming electrical current is reversed and a simultaneous fault of neutral to ground exists, which would result in the RV skin and chassis being energized. The use of an altered extension cord in conjunction with the listed shore cord or incorrectly wired adaptor cord/plug makes reversed polarity in the RV a critical safety concern. Retaining the term "neutral" will help avoid confusion, and be more consistent with RV industry terminology.

I have supplied supporting material for details and illustrations for a complete description on why the isolated neutral is not a grounded conductor within RVs.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise the title and first two sentence of 551.54(C) as follows:

"(C) Insulated Grounded Conductor (Neutral Conductor). The grounded circuit conductor (neutral conductor) shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded circuit conductor (neutral conductor) terminals in the distribution..."

Panel Statement: The panel recognizes the previous actions of the code-making panels to remove the word "neutral" and replace it with the term "grounded conductor." For education purposes in the RV industry and RV parks, the panel has added "(neutral conductor)."

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CHILTON, R.: The attempts to correlate language for usage in the National Electrical Code have been an ongoing process for many cycles. Understanding the yearn to leave wording in this Section regarding the use of the term, "neutral" instead of "grounded" speaks of more than just this Article and Industry, it relates to misunderstanding of the term itself as a "grounded conductor". For all buildings, including modular buildings, mobile homes/manufactured homes, and dwellings, this conductor referred to as the "grounded conductor" is a universal term for identification in electrical systems, even systems that are not yet energized. As the NEC is a Code for use by Qualified Persons, the emphasis on education must be applied to understanding use and function of the terms also. To leave the term "neutral" in this Section would be to regress.

19-90 Log #445 NEC-P19 **Final Action: Accept in Principle**
(551.54(C))

Submitter: Dale Jordal, Winnebago Industries, Inc.

Comment on Proposal No: 19-159

Recommendation: Keep proposal as originally submitted.

Substantiation: The panel's statement/substantiation to reject the proposal was incorrect. This is a safety issue, and the panel's statement that the white (neutral) conductor is bonded to ground as in residential applications is incorrect. Please refer to the original substantiation and Mr. Hopkins' Explanation of Negative Vote.

Panel Meeting Action: Accept in Principle

19-91 Log #503 NEC-P19 **Final Action: Accept in Principle**
(551.54(C))

Submitter: Jerome A. Hoover, Monaco RV, LLC
Comment on Proposal No: 19-159
Recommendation: I am requesting the panel reconsider the vote to reject this proposal and to change the vote to accept.
Substantiation: In deference to the panel statement that they disagree with substantiation statement that, “”.the conductor is not ‘grounded’ as in residential applications.”.” I would submit the statement is correct because the RV is only temporarily grounded through the detachable RV power supply cord and the campground system ground; whereas residential installations are permanently connected to the electrical utility.
The return buss inside panelboard is intended for the connection of insulated ground conductors-commonly known in the RV industry as the neutral bar and the return buss for equipment ground conductors-commonly known as the ground bar, are not interconnected within the RV panelboard, unlike permanent building panelboard installations. This provides separation of the equipment grounding system from the ‘neutral’ grounding system until the conductors are connected to the campground system ground. The practice of connecting easily accessible non-current carrying components to the equipment ground without interconnecting to the neutral ground until the RV is connected to an external power supply, is more like an appliance than a residence, and using the term neutral conductor in conjunction with the term insulated grounding conductor recognizes that the RV is to the campground as an appliance is to a residence; thus, the need for the additional clarity requested by the submitter.

Comment on Proposal No: 19-160
Recommendation: Accept the proposal.
Substantiation: (A) is covered by 250.110; (B) is covered by 250.119; (C) is covered by 250.118; (D) is covered by 250.148(D); (E) is covered by 250.148(B); (F) is covered by 422.16(B)(1)(1), (B)(2)(1), (B)(4)(1) and 250.114. The last sentence of (c)(3) permits luminaire attachment screws as a grounding conductor attachment; 250.148(C) requires a screw for grounding not be used for other purposes. (C)(3) indicates other than a mounting (or cover) screw be used; 314.40(D) requires a taped hole for screws, not a (self-tapping) screw threaded into the canopy. Maximizing usability of the NEC by any one industry is not purpose per 90.1. If having superfluous requirements that already apply, as noted in 90.3, is more important than references why are some provisions referenced throughout the NEC? The panel reference to dwellings is irrelevant; Articles 250 and 314 are not limited to dwellings. See 90.1(C).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its long standing position that usability of the NEC by the industry by having the RV requirements maintained within Article 551 is far more important than using references where information could be overlooked.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-93 Log #980 NEC-P19 **Final Action: Reject**
(551.55(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-163
Recommendation: Accept the proposal.
Substantiation: This provision is limited to NMSC; there is no safety reason it shouldn’t apply to an EGC in PVC, or any other raceway. Sheet metal screws in a sheet metal housing are not reliable grounding means. Other NEC provisions require a grounding screw be used for no other purpose; if this is for safety and reliability, the mounting screws for a luminaire should not be permitted as a grounding means. If this is suitable for one industry it should be permitted for all. See 90.1(C).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its long standing position that usability of the NEC by the industry by having the RV requirements maintained within Article 551 is far more important than using references where information could be overlooked.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-94 Log #981 NEC-P19 **Final Action: Reject**
(551.55(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-162
Recommendation: Accept the proposal.
Substantiation: This is already covered by Article 250. 90.3 states: “Do not repeat provisions that already apply”. See 90.1(C). Redundant provisions unnecessarily increase the bulk of the NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 19-92.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-95 Log #947 NEC-P19 **Final Action: Reject**
(551.55(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-166
Recommendation: Accept the proposal
Substantiation: This is covered by 250.48(B) and (D) which apply to all occupancies and industries unless amended. References were not proposed as implied by the panel statement. 90.3 states: Chapters 1 through 4 apply unless amended. Since 250.148(B) and (D) apply, why repeat them and unnecessarily increase the bulk of the NEC? See 90.1(C).
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 19-92.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-96 Log #949 NEC-P19 **Final Action: Reject**
(551.55(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-164
Recommendation: Reject the proposal and delete this subsection.
Substantiation: Superfluous. It is obvious that equipment grounding conductors for devices, fittings, or other equipment have to be arranged so that a connection can be made; this applies whether or not the box is nonmetallic or is not an “outlet” box, and whether or not grounding is required or done by choice.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 19-92.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-97 Log #230 NEC-P19 **Final Action: Accept**
(551.56)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-167
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-167 and determined that it is not in conflict with the actions taken by Panel 9 on Proposal 9-130a. The term “panelboard” was retained in Proposal 9-130a.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-98 Log #833 NEC-P19 **Final Action: Reject**
(551.56(F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-168
Recommendation: Accept the proposal with the following revisions:
"Metal Air Ducts. Metal circulating air ducts directly connected to electrical equipment shall be bonded and grounded. Such ducts shall be considered grounded where bonded to the grounded air moving equipment."
Substantiation: Metal air ducts connected to an air mover by a nonconductive flexible fitting to reduce vibration should not require grounding, since they are not likely to be energized.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-168. The substantiation provided appears to be an exception to the recommendation and does not support the recommended change.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-99 Log #979 NEC-P19 **Final Action: Reject**
(551.56(F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-168
Recommendation: Delete this provision.
Substantiation: This is already covered by 551.56(A) which also requires the bonded parts to be connected to a grounding terminal (grounded). Bonding in and of itself does not necessarily mean grounded. A metal duct directly connected to a (grounded) furnace will be grounded, and if the metal duct is connected to the appliance by a nonconductive flexible boot or fitting, there is no need for it to be bonded or grounded since it is not likely to become energized.
Panel Meeting Action: Reject
Panel Statement: The requirement of this section for bonding metal air ducts is industry specific to RV installations.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-100 Log #869 NEC-P19 **Final Action: Reject**
(551.60)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-170
Recommendation: Accept the proposal.
Substantiation: A visual inspection is just as practical during construction and installation as other requirements to determine if terminals are suitable for wire size and type, etc. Bonded parts should also be grounded; bonding alone doesn't prevent something from being energized. See definition of bonded in Article 100.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject 19-170. The submitter has provided no additional substantiation from that provided in the original proposal.
Electrical continuity tests are conducted at the factory as a matter of standard. Visual examination is not reliable according to the Recreation Vehicle Industry Association.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-101 Log #2629 NEC-P19 **Final Action: Accept**
(551.60)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-169
Recommendation: Accept the proposal in principle.
Change "must" to "shall be".
Substantiation: This brings the new sentence into agreement with standard NEC style for expressing a mandatory requirement.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-102 Log #2729 NEC-P19 **Final Action: Reject**
(551.71)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 19-171
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-32.
Number Eligible to Vote: 13

(Table 551.73)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-172
Recommendation: Accept the proposal.
Substantiation: The panel action did not specifically refute the substantiation.
Panel Meeting Action: Reject
Panel Statement: The submitter of the original proposal claimed the proposal to be only editorial so the panel's statement was appropriate.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-104 Log #393 NEC-P19 **Final Action: Accept**
(551.73(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-174
Recommendation: Continue to reject the proposal.
Substantiation: The panel action is correct. The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.
The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
Panel Meeting Action: Accept

Ballot Results: Affirmative: 13

19-105 Log #1029 NEC-P19 **Final Action: Reject**
(551.73(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 19-174
Recommendation: The Proposal should be Accepted and "per" changed to "for each" in four places.
Substantiation: The phrase "for each" is more appropriate for a standard.
The NEC Style Manual for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).
Most of the Panels have accepted this change and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 19-104. The panel agrees with the substantiation provided in Comment 19-104.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-106 Log #231 NEC-P19 **Final Action: Accept**
(551.73(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-175
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-175 and determined that it is not in conflict with the actions taken by Panel 9 on Proposal 9-130a. The term "panelboard" was retained in Proposal 9-130a.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-107 Log #945 NEC-P19 **Final Action: Reject**
(551.73(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-175
Recommendation: Accept the proposal.
Substantiation: Althought the term "distribution panelboard" is used in Article 551, it is not appropriate where there is one or more individually enclosed switches or circuit breakers, e.g., as covered in 551.42.
Panel Meeting Action: Reject
Panel Statement: The panel acknowledges the submitter's substantiation. However, distribution panelboards and "other equipment" are already covered in section 551.45(A).
Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

19-111 Log #843 NEC-P19 **Final Action: Reject**
(551.74)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-178
Recommendation: Accept the proposal.
Substantiation: Article 240 already applies per 90.3. The NEC Style Manual states: "Do not use references if covered by 90.3 and the NEC shall comply with the NFPA Style Manual."
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its longstanding position that usability of the NEC by the industry by having the RV requirements maintained within Article 551 is far more important than using references where information could be overlooked.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-112 Log #948 NEC-P19 **Final Action: Reject**
(551.74)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-178
Recommendation: Accept the proposal.
Substantiation: Article 240 already applies. Articles for other "specialized" industries do not have applicable provisions repeated. See 90.1(C).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-111.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-113 Log #837 NEC-P19 **Final Action: Reject**
(551.77(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-180
Recommendation: Accept the proposal and revise as follows:

A switch or circuit breaker shall be provided in the on-site equipment that simultaneously disconnects the ungrounded conductors of each circuit it conrtols.
Substantiation: "Power supply to the recreational vehicle" includes the service or other source of power for the vehicle.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action taken on Proposal 19-180. The switch or circuit breaker used is already required to be listed and used within the terms of its listing. No substantiation is given for adding the requirement for simultaneous disconnection of the ungrounded conductors.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-114 Log #944 NEC-P19 **Final Action: Reject**
(551.77(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-180
Recommendation: Accept the proposal with the following revisions:
A switch(es) or circuit breaker(s) shall be provided in the site equipment that simultaneously disconnects all ungrounded conductors of the circuit(s) it controls.
Substantiation: Simultaneous disconnection of ungrounded conductors is a standard requirement throughout the NEC as a safety measure. A switch that disconnects only one ungrounded conductor of a 125/250 receptacle leaves one conductor energized.
Panel Meeting Action: Reject
Panel Statement: The current code language accomplishes simultaneous disconnection.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-115 Log #836 NEC-P19 **Final Action: Reject**
(551.79)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-183
Recommendation: Accept the proposal.
Substantiation: This provision and the FPN are covered by 225.18, 225.19, 225.60 and 225.61. The NEC Style Manual states: "do not use a reference if covered by 90.3", and the NEC shall comply with the NFPA Manual of Style." There are no exceptions for a specialized industry. See 90.1(C).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-111.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-116 Log #838 NEC-P19 **Final Action: Reject**
(551.79)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-182
Recommendation: Accept the proposal.
Substantiation: Redundant provisions already covered elsewhere in the NEC increase the bulk of the Code. Provisions that apply are not repeated for other industries or installations. See 90.1(C).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-111.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-117 Log #835 NEC-P19 **Final Action: Reject**
(551.80(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-184
Recommendation: Accept the proposal and revise as follows:
Where direct-buried or encased in a cement or asphalt concrete slab emerging exposed conductors and cables shall be protected by approved means. Where raceways provide the protection, they shall extend to the minimum required depth of the conductors and cables.
Substantiation: The provision should cover embedment in a slab. "Approved means" covers raceways and enclosures such as open bottom pad or floor-mounted equipment, lighting poles, or emergence into stud or block wall cavities. The depth of raceway protection should comply with the minimum depth of the conductors, since that depth is required for safety.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action taken on Proposal 19-184. No technical substantiation has been provided to support the recommended change.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 552 — PARK TRAILERS

19-118 Log #842 NEC-P19 **Final Action: Reject**
(552.10(C)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-189
Recommendation: Accept the proposal.
Substantiation: 110.4 is not limited to "general" wiring methods and covers splices and other connections not addressed in this section which begs the question: is this provision intended to modify 110.4 provisions for splices and other connections?
Panel Meeting Action: Reject
Panel Statement: To answer the submitter's question, yes, the requirements in 552.10(C) modify or confirm the requirements for low voltage electrical connections in Section 110.14.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-119 Log #841 NEC-P19 **Final Action: Reject**
(552.20(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-191
Recommendation: Accept the proposal.
Substantiation: 552.40(D) referred to in the panel statement only covers 120 volt and low voltage ratings, not ac and dc ratings of the same voltage, and does not cover equipment other than luminaries or appliances, such as motors. The provision does not allow for a circuit supplied by a transformer-supplied rectifier.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action to reject Proposal 19-191. The proposal does not add clarity or improve usability of the code. Dual voltage fixtures, including luminaires or appliances, are already referenced in 552.20(D).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-120 Log #888 NEC-P19 **Final Action: Reject**
(552.27(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-231
Recommendation: Accept the proposal with the following revisions:
Bonding conductor terminals shall be of the solderless type listed as pressure terminal connectors, and approved for the wire size and material. The bonding conductors shall be minimum 8 AWG and where exposed to corrosion shall be solid and insulated or covered.
Substantiation: The conductor should be solid and insulated or covered where exposed to corrosion such as rock salt used for snow and ice clearance on roads.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-231. The concept that park trailers would be exposed to the conditions such as rock salt used for snow and ice clearance on roads is not typical. Park trailers are typically set-up for seasonal use and as such are not moved frequently. The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-121 Log #1198 NEC-P19 **Final Action: Reject**
(552.27(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-231
Recommendation: Accept the proposal with the following revisions:
Bonding conductor terminals shall be of the solderless type listed as pressure terminal connectors and approved for the wire size and material. The bonding conductors shall be minimum 8 AWG and where exposed to corrosion shall be solid and insulated or covered.
Substantiation: The conductor should be solid and insulated or covered where for snow or ice or exposed to corrosion such as rock salt used for snow and ice clearance on roads.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-120.

Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-32.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-126 Log #952 NEC-P19 **Final Action: Reject**
(552.41(D)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-197
Recommendation: Delete existing text with the following revisions:
Provided with GFCI protection if the outlet is a 125-volt 15- or 20-ampere receptacle outlet.
Substantiation: All interior branch circuits are not required to have GFCI protection; for example a 240 volt circuit. 552.4(C) makes the requirement superfluous.
Panel Meeting Action: Reject
Panel Statement: Heating cables on park trailers are not served by 240 volt circuits. GFCI protection on the exterior receptacle used for pipe heating cable is intentionally included with interior receptacles to help indicate if the circuit trips.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-127 Log #951 NEC-P19 **Final Action: Reject**
(552.41(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-198
Recommendation: Accept the proposal with the following revisions:
At least one readily accessible 125 volt single-phase 15- or 20-ampere grounding-type receptacle supplied from an interior 120-volt circuit shall be installed on the exterior of the park trailer. A receptacle installed for a pipe heating cable shall not be considered as this required receptacle outlet.
Substantiation: The circuit should be an interior circuit and receptacle type and rating specified. “Outdoors” can be complied with by a site power supply receptacle. A receptacle for general use on top of a park trailer is impractical.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-198.
This section applies to the manufacture of the park trailer itself. There is no safety reason for the receptacle to be fed from an interior circuit; it is permitted to be supplied by an individual branch circuit.
Additionally, the submitter has introduced new language that was not included in the original proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-128 Log #828 NEC-P19 **Final Action: Reject**
(552.43)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-199
Recommendation: Accept the proposal and revise text to read as follows:
(A) Feeder. The feeder to the park trailer shall be a power-supply assembly described in 551.2 that complies with 552.44 or a permanently installed feeder.
Delete (B).
Substantiation: 551.2 is applicable per 552.1; 552.44 requires a factory-installed or provided power-supply assembly which makes (B) superfluous.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 19-129.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-129 Log #2216 NEC-P19 **Final Action: Accept**
(552.43)

Submitter: Ron B. Chilton, Raleigh, NC
Comment on Proposal No: 19-199
Recommendation: This proposal should be rejected to correlate with similar remaining text found in Article 550 and Article 551.
Substantiation: Although meant to clarify this section, the Code Panel left similar text in Article 550 and 551. It would have been advisable to revise this similar text in those other Articles or leave 552.43 as it is in the 2008 National Electrical Code to correlate with those other Articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-130 Log #827 NEC-P19 **Final Action: Reject**
(552.45(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-201
Recommendation: Accept the proposal and revise text to read as follows:
Distribution Equipment.
(A) Listed distribution equipment shall be provided for the park trailer circuits and provided with grounded conductor termination terminal(s) in accordance with 552.55(C). An equipment grounding conductor terminal(s) shall be provided in the distribution equipment.
(B) Location. The distribution equipment shall be readily accessible. A clear working space at least 750 mm (30 in.) wide and high but not less than the width or height of the distribution equipment, shall be provided.
Substantiation: Same as proposal. Working space height should be specific.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its statement on the Proposal 19-201 that 552.54(A) specifies that only distribution panelboards are to be used in park trailers. The submitter has provided no technical substantiation to add additional options.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-131 Log #233 NEC-P19 **Final Action: Accept**
(552.45(A), (B) and (C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-201
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase “distribution board” in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-201 and determined that it is not in conflict with the actions taken by Panel 9 on Proposal 9-130a. The term “panelboard” was retained in Proposal 9-130a, only “distribution board” was deleted.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-132 Log #868 NEC-P19 **Final Action: Accept in Principle**
(552.46(B)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-202
Recommendation: Accept the proposal and revise as follows:
The lighting circuits shall be permitted to serve listed kitchen waste disposers, gas-fired cooking appliances for lights, clocks, timers, and ignition.
Substantiation: Counter-mounted cook tops should be included, also free standing ranges, all of which may have electric ignition. Whether or not a disposer is cord-connected is irrelevant.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
The lighting circuits shall be permitted to serve ~~built-in gas ovens with electric service only for lights, clocks or timers, or~~ listed cord-connected kitchen waste disposers and to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units.
Panel Statement: The panel action meets the submitter’s intent and correlates with the language in 210.52(B)(2) Exception 2.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-133 Log #831 NEC-P19 **Final Action: Reject**
(552.46(B)(3)(b))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-203
Recommendation: Accept the proposal.
Substantiation: Continuous currents contribute to excess heating of terminals of overcurrent devices for branch circuits, feeders, and service conductors. Examples D3 and D3(a) in Annex D, page 765, indicate 125 percent factor is applied to branch circuits, feeders, and by virtue of the examples and 215.2(A)(1) applies to service conductors. The heating effects don’t disappear at terminals of overcurrent devices for feeders and service conductors.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-203.
The submitter has not provided a revised recommendation but rather requested that the original proposal be accepted with no change. The desired effect of the submitter’s recommendation continues to be unclear to the panel. The existing text by reference to 210.19(A) appears to satisfy the submitter’s intent.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-134 Log #395 NEC-P19 **Final Action: Accept**
(552.47(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-204
Recommendation: Continue to reject the proposal.
Substantiation: The panel action is correct. The use of the word “per” in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as “VA/ft^2”. This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.
The preposition “per” in the English language carries the precise meaning of “for each” in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in “Table 3.2.1, Possibly Unenforceable and Vague Terms.” Section 3.3.4 of the same document requires that “NEC language shall be brief, clear, and emphatic.” Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: “Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel.”
Panel Meeting Action: Accept

19-136 Log #826 NEC-P19 **Final Action: Reject**
(552.48)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-206
Recommendation: Accept the proposal.
Substantiation: The panel statement that 552.48(B) addresses threaded conduit is incorrect. Threaded conduit connectors are also terminated with locknuts, bushings, as are connectors for EMT, PVC, and many cable types. An inside and outside locknut should be provided to prevent loosening due to vibration which impairs grounding continuity or exposes conductors to damage by knockout edges if a connector detaches due to vibration. (C), (D), (F), (G), (H), (I), (K), and (L) are covered elsewhere in the NEC or implied since covering of cable that is not continuous would expose conductors to damage, or cause loss of grounding/bonding. The provision for (F) doesn't include Type MI cable and should be in the respective cable articles so it will apply generally.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action and panel statement on Proposal 19-206. The requirement in 552.48(B) applies only to conduit terminated by a locknut and bushing. Nowhere in the Code is it required to otherwise apply a locknut both inside and outside.
Number Eligible to Vote: 13

19-137 Log #830 NEC-P19 **Final Action: Reject**
(552.48)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-208
Recommendation: Accept the proposal.
Substantiation: The industry may be specialized, but so are others for which the components are used and covered by other articles. See 90.1(C).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its longstanding position that usability of the NEC by the industry by having the requirements for park trailers maintained within Article 552 is far more important than using references where information could be overlooked.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-138 Log #832 NEC-P19 **Final Action: Reject**
(552.48)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-207
Recommendation: Accept the proposed text for (A).
Substantiation: "Shall be permitted" is not a requirement per 90.5(B) and not enforceable. The present (H) is covered by 552.48(A) which then permits Type MI cable to support a 6 ft, Type AC cable at 2 ft for flexibility. This section contains no similar support requirements for raceway wiring methods, since they are covered in the respective raceway articles, cable articles should also govern.
Panel Meeting Action: Reject
Panel Statement: "Shall be permitted" is intentionally permissive and means neither prohibited or required. This term is selectively used in the Code to address some gray areas that have been particularly problematic for inspection authorities or others.

The requirements in 552.48(H) intentionally contravene the requirements in the Chapter 3 Articles as indicated "except as otherwise specified", in 552.48(A).

The submitter's substantiation is incorrect as Type MI cable is not permitted to support other cables per 300.11(C).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-139 Log #829 NEC-P19 **Final Action: Reject**
(552.48(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-209
Recommendation: Accept the proposal.
Substantiation: Sections 312.2 and 314.20 are applicable to and 90.3 states: Chapter 3 applies unless amended. References are used in many places in the NEC to avoid redundancy and helps to avoid unnecessary bulk of the code even though they may be "overlooked." The panel revised 19-212a, 552.48(K) in the ROP by inserting references to replace repetition of requirements.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Comment 19-137. The panel considers the preference for particular references to Chapter 1-4 requirements during each code cycle and is acutely sensitive to the needs of the industries served by the Articles within its scope.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-140 Log #867 NEC-P19 **Final Action: Reject**
(552.48(F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-210
Recommendation: Accept the proposal and revise as follows:

The overall outer covering of cables and flexible cords and cables shall be continuous between boxes, other enclosures and terminations.
Substantiation: The provision should include all cables, all boxes and terminations such as plugs and cord connector bodies. Type NM cable may terminate without an outlet box per 334.30(C).
Panel Meeting Action: Reject
Panel Statement: The current code text is clear and the recommendation does not add clarity.

The panel concludes that the word "enclosures" addresses the point regarding NM cable and the reference to 334.30(C).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(552.48(H))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 19-211a
Recommendation: Revise the accepted text as follows "...Supports shall be provided at ~~least every~~ intervals not exceeding 1.4 m (4-1/2 ft) at other places."
Substantiation: The meaning of the term "at least" is not clear. While the term is used often in casual conversation, and generally understood, the text of the code should not be so vague and should be consistent with similar requirements elsewhere. For example, Section 334.30 uses "intervals not exceeding" in two places and "support does not exceed" in one place. Each or either of these is clear. But literally, "at least" could mean and generally does mean "not less than." So if an installation is made with spacing at 6 ft between supports, the supports are "at least" 4-1/2 ft apart. I do not believe that was the panel intent.
Panel Meeting Action: Accept

19-162 Log #235 NEC-P19 **Final Action: Accept**
(552.57)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-230
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-230 and determined that it is not in conflict with the actions taken by Panel 9 on Proposal 9-130a. The term "panelboard" was retained in Proposal 9-130a, only "distribution board" was deleted.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-163 Log #466 NEC-P19 **Final Action: Accept in Principle**
(552.57)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 19-230
Recommendation: The Proposal action should have been to Accept in Principle in Part and changed to read as follows:

(A) Required Bonding. All exposed non-current-carrying metal parts that ~~may become~~ are capable of becoming energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.

However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms *may* or *can* shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term *may* shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."

Since the use of the term *may* in this Section does not meet these criteria, it should be changed.

Panel Meeting Action: Accept in Principle

Change "that may become" to "that is likely to become."

Panel Statement: "Likely to" is good Code language to guide product standards where the final installation circumstances may not be evident. In this instance "likely to" is acceptable since the circumstance is not expected under normal circumstances but could occur. This is consistent with the panel's action on Proposal 19-89.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-164 Log #844 NEC-P19 **Final Action: Accept in Part**
(552.57)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-230
Recommendation: Accept the proposal.
Substantiation: There is no safety reason to bond metal parts of low voltage equipment not likely to become energized by 120 volt systems. "Likely" is a term used many times in the NEC. The equipment specified in 525.57(D) and (E) should be required to be bonded; bonding is only required by (A) where it "may" be energized. "May" is a discretionary term to be used by the AHJ. Metal air ducts need only be bonded where they can become energized; air duct from a roof ventilator doesn't need to be bonded, nor does duct isolated by a flexible nonmetallic connector. Park trailers provided with one branch circuit supplied from a fused switch or single enclosed circuit breaker do not need a panelboard.
Panel Meeting Action: Accept in Part

The panel accepts "are likely to" as a replacement for "may."

The remainder of the recommendation of the proposal is rejected.
Panel Statement: The substantiation suggests that this requirement applies to low voltage systems, which is not the case since this requirement falls under Part IV, Nominal 120-Volt or 120/240-Volt Systems.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-165 Log #845 NEC-P19 **Final Action: Reject**
(552.57(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-231
Recommendation: Accept the proposal and revise as follows:

Bonding terminals shall be listed as solderless (pressure) type and approved for the wire size and material used. The bonding conductor shall be minimum 8 AWG and solid copper where the bonding terminal is exposed on the underside of the park trailer.

Substantiation: Terminals should be approved for the wire size and material. Solid copper should be required where the bonding terminal is exposed on the underside of the trailer and subject to corrosion from road salts.
Panel Meeting Action: Reject
Panel Statement: The terminals are required to be "listed" as pressure type terminals. The listing standard requires markings of the types and sizes of conductors for which they are listed.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-166 Log #893 NEC-P19 **Final Action: Reject**
(552.59(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-232
Recommendation: Accept the proposal.
Substantiation: The NEC Style Manual states: "Do not use a reference if the requirement is covered by 90.3." Is that a requirement or optional?
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-138.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

19-167 Log #892 NEC-P19 **Final Action: Reject**
(552.60(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-233
Recommendation: Accept the proposal.
Substantiation: A continuity test with an ohmmeter or test lamp can indicate connections but no necessarily if "properly bonded", i.e., adequate for sufficient current to operate overcurrent devices, or whether terminal size and material is suitable. Visual inspection is not impractical when the unit is constructed and wired any more than it is for the other wiring installed.
Panel Meeting Action: Reject
Panel Statement: Park trailers are not built on the site of their use. Electrical continuity tests are conducted at the factory as a matter of standard. Visual examination is not solely reliable for park trailers according to their manufacturers.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 553 — FLOATING BUILDINGS

19-168 Log #875 NEC-P19 **Final Action: Accept in Part**
(553.1)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-234
Recommendation: Accept the proposal.
Substantiation: A Panel board, per se, is not specifically required. Distribution equipment can consist off individual enclosed switches or circuit breakers. Connection means are not specified. The NEC Style Manual 3.1.2 states "may" shall only be used where it is a discretionary judgment by the AHJ. "Likely" is a term used over 80 times in the NEC.
Panel Meeting Action: Accept in Part

The panel accepts the change from "may" to "are likely to."

The remainder of the recommendation is rejected.
Panel Statement: As in the original proposal, the submitter continues to reference section 553.1 which is not germane to the subject of the recommendation.

See panel action on Comment 19-183.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-169 Log #890 NEC-P19 **Final Action: Reject**
(553.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-236
Recommendation: Accept the proposal with the following revisions:

A building unit as defined in Article 100 that floats on water, is moored permanently or indefinitely at one location and has a premises wiring system connected to an electrical supply system not located in or on the floating building.

Substantiation: "Permanent" wiring is used many times to indicate fixed wiring methods. "Premises" is defined as a tract of land which includes the shore area adjacent to floating buildings, and is not the same as premises wiring system definition.
Panel Meeting Action: Reject
Panel Statement: The term "premises wiring system" is defined in Article 100 and the reference in 90.2(A)(1) includes floating buildings as a premise.

The proposed text is not needed to add clarity to the code.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-170 Log #1613 NEC-P19 **Final Action: Accept**
(553.4)

Submitter: Joseph P. Fello, Eaton Corp.
Comment on Proposal No: 19-241
Recommendation: 553.4 Location of Service Equipment. The service equipment for a floating building shall be located adjacent to, but not on or in, the building or any floating structure. The Main over current protective device which feeds the floating structure shall have ground fault protection not exceeding 100mA. Ground fault protection of each individual branch or feeder circuit shall be permitted as a suitable alternative.
Substantiation: Eaton appreciates that panel's recognition of the merit to requiring a level of ground fault protection on these circuits. The newly proposed maximum level is meant to address the Panel's concern around the practical application for floating building environments.
In response to the panel's request for technical substantiation, the information attached with Proposal 19-241 included documentation of incidents in which more than 50 people died and over 30 people have been injured due to leakage currents on or around marinas.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-171 Log #2787 NEC-P19 **Final Action: Accept**
(553.5)

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 19-242
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-172 Log #236 NEC-P19 **Final Action: Accept**
(553.6)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-243
Recommendation: The Technical Correlating Committee directs that this proposal be reconsidered and correlated with the action taken on Proposal 9-130a where Code-Making Panel 9 deleted the phrase "distribution board" in Article 408.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel reviewed its action on Proposal 19-243 and determined that it is not in conflict with the actions taken by Panel 9 on Proposal 9-130a. The term "panelboard" was retained in Proposal 9-130a, only "distribution board" was deleted.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-173 Log #894 NEC-P19 **Final Action: Reject**
(553.6)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-243
Recommendation: Accept the proposal with the following revisions:
Supply Conductors. Each floating building shall be supplied by one set of supply conductors from its service equipment.
Exception: Where the floating building has multiple occupancy or is supplied by different classes of service, a single set of supply conductors shall be permitted for each occupancy and class of service.
Substantiation: There is no specific requirement for a panelboard; the disconnecting means can be a switch for a single branch circuit, whereby the circuit is not a feeder. Each occupancy should be specified not each occupant (person). Different classes of service should be permitted to supply a set of supply conductors. If supplied by a feeder it will terminate in an overcurrent device(s).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-243. The submitter's substantiation for the proposed revisions is not germane to recommendation.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-174 Log #958 NEC-P19 **Final Action: Reject**
(553.6)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-243
Recommendation: Accept the proposal with the following revisions:
Supply Conductors. Each floating building shall be supplied by a single set of branch circuit or feeder conductors for each class of service.
Exception: Where the floating building has multiple occupancy each occupancy, shall be permitted to be supplied by a single set of supply conductors from each class of service.
Substantiation: A panelboard is not specifically required. and not needed where the supply is a single branch circuit and there is no overcurrent protection at the floating building. Where there are different classes of service, a set of conductors from each should be permitted.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 19-173.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-175 Log #957 NEC-P19 **Final Action: Reject**
(553.7(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-244
Recommendation: Accept the proposal with the following revisions:
Flexibility. Flexibility of the branch circuit and feeder conductors to a floating building shall be provided and maintained. Such supply conductors shall be installed so that the motion of the floating building and changes in the water level does not result in strain on the supply conductor terminations.
Substantiation: Wind can also cause movement of the floating building. There will normally be some strain on the wiring method. The provision should address strain on conductor terminations. "Unsafe" and "undue" are not germaine or defined.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action taken on Proposal 19-244. No additional technical substantiation has been submitted to support the recommended change. The recommended text does not add clarity or improve usability of the code.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-187 Log #2630 NEC-P19 **Final Action: Accept in Principle**
(555.2.Marine Power Outlet)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-249
Recommendation: Accept the panel action in principle.
Change "distribution panels" to "panelboards."
Substantiation: This comment is offered in response to the many TCC notes relative to the deletion of the terminology "distribution board" in Article 408 by CMP 9, and this comment applies equally to all such actions. The submitter is the senior member of CMP 9, and the term "distribution board" is not related in any way to the term "distribution panelboard." A "distribution board" is an item of equipment so obsolete that no current member of CMP 9 either knew or was able to discover the definitive meaning of, even after discussions spanning numerous code cycles. A "distribution panelboard" is very much in common usage, although not formally defined. However, in general it is advisable to stay with defined terms, and for NEC purposes the best course is to let the adjective "distribution" as a modifier for "panelboard" leave the Code, just as "subpanels" did many years ago. Just as all subpanels are panels, so also are all distribution panelboards. It is noted that in most instances CMP 19 has followed this approach.
Panel Meeting Action: Accept in Principle
Change "distribution panels" to "distribution panelboards."
Panel Statement: This panel action is in response to the Panel 9 action on Proposal 9-130a which eliminated the term "distribution board" but retained the word "panelboard". This panel action is believed to meet the intent of the submitter and is consistent with the term used for this equipment throughout the Article within the scope of Panel 19.

19-189 Log #1612 NEC-P19 **Final Action: Accept**
(555.3)

Submitter: Joseph P. Fello, Eaton Corp.
Comment on Proposal No: 19-252
Recommendation: **555.3 Ground Fault Protection.** The main over current protective device which feeds the marina shall have ground fault protection not exceeding 100mA. Ground fault protection of each individual branch or feeder circuit shall be permitted as a suitable alternative.
Substantiation: Eaton appreciates that panel's recognition of the merit to requiring a level of ground fault protection on these circuits. The newly proposed maximum level is meant to address the Panel's concern around the practical application for marina environments.
In response to the panel's request for technical substantiation, the information attached with Proposal 19-252 included documentation of incidents in which more than 50 people died and over 30 people have been injured due to leakage currents on or around marinas.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
CHILTON, R.: As noted in the Panel Statement for initially rejecting the proposal, it's not the idea that a greater level of protection is warranted but the availability of equipment to sufficiently address several issues as a reason for the action. To protect personnel with GFCI devices, the 6 mA level for leakage current is a proven factor and within the standards. The 100 mA Ground Fault Protection supplying a main feeder for a marina will surely provide greater flexibility for main feeders, and some protection, however there is a significant problem with practicality for marinas. Perhaps the alternative at this point would have been to require all branch circuits and individual feeders for each dock or station to have the GFCI protection, thereby lessening the seriousness of the entire power supply for the marina to be shut down which could literally be a hundred vessels or boats. Another issue is the belief that some might have that they are protected by the 100 mA device on the main, which we know is not the case as far as personnel protection is concerned. Even when the alternative for feeder and branch circuit GFCI protection is included, the use of a 100 mA device does not provide the personnel protection expected.

19-190 Log #897 NEC-P19 **Final Action: Reject**
(555.10 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-256
Recommendation: Accept the proposal with the following revisions:
Permanently installed electrical equipment on piers and docks shall be securely supported in accordance with 110.13, 314.23, and 352.10(H). Internal openings for support fasteners shall be sealed to prevent the entrance of moisture.
Substantiation: The provision should be limited to permanently installed equipment and include docks and below deck levels.. Docks may be parallel to the shore while piers extend at right angles to the shore. References to applicable provision requirements provides comprehensive requirements, which (sentence incomplete)
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-256. No new technical substantiation has been provided.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-191 Log #896 NEC-P19 **Final Action: Reject**
(555.11)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-258
Recommendation: Accept the proposal with the following revisions:
Circuit breakers and switches shall comply with 404.4 and be externally manually operable.
Substantiation: Section 404.4 has provisions that are not amended by this section. The provision for weep holes will be covered by listing protocols and is not needed for flush mounted equipment or watertight equipment.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-258. No new technical substantiation has been provided.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-192 Log #895 NEC-P19 **Final Action: Reject**
(555.13)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-260
Recommendation: Accept the proposal with the following revisions:
(A) Wiring Methods
(1) General. Wiring methods employed shall be approved for the use.
(2) Portable power cable in accordance with 400.3 that contains an equipment grounding conductor shall be permitted as follows:
(1) As fixed wiring on the underside of piers and docks (floating or fixed).
(2) Where flexibility is necessary.
(3) No change.
(B) Installation
(1) Overhead wiring. Overhead wiring shall be installed to avoid possible contact with masts and other parts of watercraft, boat hoists, movable equipment, and other structures, except at points of support. Overhead wiring shall be installed not less than 6.0 m (20 ft) from the outer edge of any portion of the yard that can be used for storage of watercraft or stepping or unstepping masts.
(2) No change.
(3) No change.
(4) Portable Power Cables.
(a) Where portable cables are used as fixed wiring, the installation shall comply with the following:
(1) Cables shall be securely supported
(2) Cables shall be located on the underside of the pier or dock.
(3) Cables shall be fastened to structural members other than deck planking by approved nonmetallic means.
(4) Cables shall not be installed where likely to be subject to physical damage.
(5) Where cables pass through structural members they shall be protected by a permanently installed sleeve of approved material.
(b) Where portable cables are used as permanent wiring an approved corrosion resistant junction box with permanently installed terminal blocks shall be provided where circuit extensions are to be connected.
(5) Protection
Except as permitted in 555.13 (A)(2)
(2) Type RMC, IMC, EMT, PVC raceways shall be the wiring method employed for fixed wiring above or below the decks of piers and docks and landing stages and shall comply with 110.11.
Exception: Where installed in dry locations within structures on the pier or dock other approved wiring methods shall be permitted.
Substantiation: Portable power cables should comply with 400.3, 3.g., be a type W for wet locations and sunlight resistance. Docks should be included as in 555.1 and 555.7(B)(4) should be limited to cables for permanent fixed wiring. Cables should contain an EGC. A reference to 110.11 covers suitability of equipment. An exception is warranted for wiring in dry locations within structures on the pier or dock. Piers and docks are not necessarily the same structure.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action to Reject Proposal 19-260.
The proposed revisions do not add clarity or usability to the code and technical substantiation has not been provided for all changes.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-193 Log #715 NEC-P19 **Final Action: Reject**
(555.13(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-262
Recommendation: Accept the proposal and revise as follows:
(A) General.
(1) Wiring methods covered in this Code that are identified as suitable for the use shall be employed.
(2) Portable power cables Portable power cables covered in Table 400.4 that comply with 400.3 and contain an equipment grounding conductor shall be permitted as follows:
(a) As permanent wiring on the underside of piers and docks (floating or fixed).
(b) Where flexibility is necessary as on piers and docks composed of floating sections.
Substantiation: The only portable power cables in Table 400.4 are Type G, GEC, and PPE. They are rated 600 volts and oil resistant which should suffice for water resistance. Since they don't have a W designation they are not sunlight or water resistant per the table. An equipment grounding conductor should be specified since for type PPE the EGC is optional. "Shall be permitted" does not impose a requirement per 90.5(B); (A)(1) cites Chapter 3 but (A)(2) allows Chapter 4 wiring methods. Article 400 does not specify listing nor do many other sections in the NEC re; cords. There is no comparable Table 400.4 for listed cords and cables; where does the Code user go for descriptions and uses for listed cords and cables?
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action to Reject Proposal 19-262.
The proposed revisions do not add clarity or usability to the code and technical substantiation has not been provided for all changes.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-194 Log #1977 NEC-P19 **Final Action: Reject**
(555.13(A)(2)(3) (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 19-263
Recommendation: Proposal should be accepted.
Substantiation: The rule in 555.13(A)(2) only permits the use of the portable power cable (1) As permanent wiring on the underside of piers (floating or fixed) or (2) Where flexibility is necessary as on piers composed of floating sections. In both cases the permission to use the portable power cable only applies on the pier itself and does not permit the use of the portable power cable as a feeder from the power source to the pier. 55.13(B)(4) only tells us how to install the cable in the two locations where it is permitted.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the action to Reject Proposal 19-263. The use of portable power cables as a feeder is not prohibited provided it is installed in accordance with the provisions of the code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-195 Log #241 NEC-P19 **Final Action: Accept**
(555.13(B)(5))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-268a
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with regard to the deleted word "full" that was left out of the revised text without explanation.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Add the word "full" to the second sentence of 555.13(B)(5) as follows:
The conduit shall be connected to the enclosure by <u>full</u> standard threads or fittings listed for use in damp or wet locations as applicable.
Panel Statement: The panel agrees with the comment and has taken action to add the word "full."
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-196 Log #1689 NEC-P19 **Final Action: Reject**
(555.15(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-269
Recommendation: Accept the proposal and revise second sentence of (B) as follows: The equipment grounding conductor contained within Type MI cable shall be identified at terminations by the insulating material of terminal seals.
Substantiation: Where the EGC is the cable sheath, it is already identified per 250.18(9). Where it is a contained conductor, it is identified by the terminal fitting insulation color since all emerging conductors are bare. "Permitted" does not impose a requirement per 90.5(B), therefore, the present provision is optional.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-269. "Shall be permitted" is intentionally permissive and means neither prohibited or required. This term is selectively used in the Code to address some gray areas that have been particularly problematic for inspection authorities or others. The existing code text is clear as written.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-197 Log #941 NEC-P19 **Final Action: Reject**
(555.15(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-271
Recommendation: Accept the proposal with the following revisions:
Delete (D) and (E).
Substantiation: 555.15(A) requires an EGC; (B) specifies the type. The EGC run with a branch circuit or feeder will terminate at a disconnecting means or other approved equipment, not necessarily a panelboard; the definition of EGC indicates its purpose and connections.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-271. No technical substantiation has been provided for the deletion of (D) and (E).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-198 Log #940 NEC-P19 **Final Action: Reject**
(555.17(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-273
Recommendation: Accept the proposal.
Substantiation: The NEC Style Manual 3.3.5 indicates lack of consistency for similar requirements and creates confusion. "Disconnecting means" can be a group of devices that don't simultaneously disconnect all conductors. The first paragraph requires isolation from all supply conductors which includes grounded circuit conductors. "Durable" is a term used in the NEC and is not included in Table 3.2.1 of the NEC Style Manual as a term not to be used.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-273.
555.17 states: "shall be provided to isolate each boat from its supply connection(s)."
Sufficient technical substantiation has not been provided to support the recommended changes.

(590.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-110
Recommendation: Accept the proposal.
Substantiation: As written, only other requirements of the NEC apply, not permissive exceptions alternatives, or other permissive provisions
Panel Meeting Action: Reject
Panel Statement: Permissive exceptions, alternatives, and other permissive rules are not required to be used but any requirements for permanent wiring located elsewhere in the NEC must be applied.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-47 Log #242 NEC-P03 **Final Action: Accept**
(590.4)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 3-111
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the actions on Proposals 1-234 and 9-130a.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the panel action in Comment 3-50. Deleting the second sentence in 590.4(B) resolves any correlation issue with Panel 1 and 9.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-48 Log #761 NEC-P03 **Final Action: Reject**
(590.4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-111
Recommendation: Accept text as revised:
"(B) Feeders. Overcurrent protection shall be provided in accordance with the applicable provisions of 240.4, 240.5, 240.100, and 240.101. Feeders shall originate in approved distribution equipment. Feeder conductors that are not to remain as permanent installations shall be within cable assemblies or extra-hard usage or hard usage type flexible cords or cables that comply with 400.3." (Remainder unchanged).
"(C) Branch Circuits. Branch circuits shall originate in approved distribution equipment. Conductors that are not to remain as permanent installations shall be within approved cable assembles or extra-hard usage or hard usage type flexible cords or cables that comply with 400.3." (Remainder unchanged).
Substantiation: Feeders and branch circuits used for temporary purposes, but that are to remain as permanent wiring should be exempt from the cable or cord assembly requirements. Flexible cords and cables should be specified to comply with 400.3 since all hard usage and extra hard usage types are not suitable, such as electric vehicle cable and those without a "W" designation for wet locations and sunlight resistance.
"Permitted" in (B) is optional per 90.5(B) and opens the door for any wiring method that complies with "Uses Permitted" and "Uses Not Permitted".
Panel Meeting Action: Reject
Panel Statement: Adding the phrase "the applicable provisions of" is unnecessary and does not add any clarity. Adding the sentence requiring feeder and branch circuits that are not to remain as permanent installations to be within approved cable assemblies or hard usage or extra hard usage would be overly restrictive since other temporary wiring methods could be used.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-49 Log #938 NEC-P03 **Final Action: Reject**
(590.4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-115
Recommendation: Accept the proposal with the following revisions:
All branch circuits shall be supplied by an approved power outlet, switchboard, panelboard, motor control center, fused switch, or circuit breaker.
Substantiation: All the items specified are suitable for supplying branch circuits, including a circuit breaker.
Panel Meeting Action: Reject
Panel Statement: The definition of "power outlet" in Article 100 and the text in 590.4(C), first sentence already covers the items requested in the proposal so a list of locations where a branch circuit can originate is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
STENE, S.: Based on the Panel Statement in this comment, it is my understanding that the Panel's intent is to not only reject this comment but to also reject Proposal 3-115 and the Panel Action text at the proposal stage.

3-50 Log #939 NEC-P03 **Final Action: Accept**
(590.4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-111
Recommendation: Accept the deletion of the second sentence of (B).
Substantiation: Article 240 already applies unless amended by Section 90.3 that states: Chapters 1-4 apply unless amended. The NEC Style Manual states in 4.1 "Do not use a reference if the requirement is already covered by 90.3."
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-51 Log #984 NEC-P03 **Final Action: Reject**
(590.4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-112
Recommendation: Accept the proposal with the following revisions:
(H) Protection from Accidental Damage. Temporary wiring shall be protected from accidental damage by location or other approved means. Where passing through doorways or other pinch points, conductors shall be protected.
(I) Terminations. Flexible cords and cables shall enter boxes or other enclosures through bushed fittings.
(J) Support. Temporary wiring that is fixed in place shall be securely fastened to supports at approved intervals with staples, cable ties, straps, or other approved means, installed so as not to damage the wiring.
Substantiation: Protection can be provided by elevation, as indicated elsewhere in the NEC.
(H) should indicate wiring methods other than flexible cords and cables such as NM and NMC, and single conductors permitted in 590.4(B) and (C). Support does not secure protection from physical damage, that is covered elsewhere in the NEC.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided technical substantiation in the comment to justify any of the suggested changes provided in either the original proposal or the comment. The submitter did not answer any of the issues detailed in the panel statement in the rejected proposal. In addition, the panel had difficulty in determining what changes were made in the comment so the panel could not readily see what text was new and what was existing. The panel notes that submitter deleted the vegetation prohibition without substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-52 Log #927 NEC-P03 **Final Action: Reject**
(590.4(B) and Exception and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-114
Recommendation: Accept the proposal with the following revisions:
(B) Feeders. Feeder conductors shall be within approved cable assemblies or multiconductor extra-hard or hard usage type flexible cords or cables that comply with 400.3. (remainder unchanged).
Substantiation: All extra-hard usage and hard usage cords and cables may not be suitable, e.g., electric vehicle cable, those without a type letter W for use in wet locations and sunlight resistant. The present first sentence is superfluous; the definition of feeder includes origination at service equipment, separately derived system, or other source. "Permitted" doesn't impose a requirement per 90.5(B); it is allowed but not required.
Panel Meeting Action: Reject
Panel Statement: The comment text does not apply to the proposed changes to 590.4(B), Exception or the text within 590.4(C) in the proposal and introduces new suggested changes that have not had public review. The suggested text in the comment referencing 400.3 is already required by any installation utilizing flexible cords or cables so adding it to 590.4 is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-53 Log #1072 NEC-P03 **Final Action: Reject**
(590.4(C))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 3-115
Recommendation: This proposal should have been Accepted in Principal and the sentence revised to read: "...or fused switch or circuit breaker enclosure" as suggested by Mr. Pace in his comment on Negative.
Substantiation: While the panel statement may be correct that a branch circuit does not originate in a circuit breaker, certainly a branch circuit can originate at a circuit breaker that is in a circuit breaker enclosure. No reason was given to prohibit the use of enclosed circuit breakers for this purpose.
Panel Meeting Action: Reject
Panel Statement: See the panel statement in Comment 3-49.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-54 Log #243 NEC-P03 **Final Action: Accept**
(590.4(D))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 3-122
Recommendation: The Technical Correlating Committee directs this proposal be reconsidered and correlated with the action taken on Proposal 18-54.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Technical Correlating Committee. See the action and statement on Comment 3-56.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-55 Log #943 NEC-P03 **Final Action: Reject**
(590.4(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-121
Recommendation: Accept the proposal with the following revisions:
Branch circuits that supply temporary lighting shall not supply receptacle or other equipment. GFCI protection shall not be installed for branch circuits or feeders that supply temporary lighting.
Substantiation: Temporary lighting circuits on sites other than construction such as demolition, and where permitted for emergencies, tests, experiments, and development work as covered in 590.3(C) and remodeling, maintenance, repair or demolition as covered in 590.3(A) should be included, as outages can also be hazardous.
Panel Meeting Action: Reject
Panel Statement: The second to last sentence in the existing Code text states receptacles on construction sites shall not be installed on branch circuits that supply temporary lighting. This subsection does not cover "other electrical equipment" as alluded to in the proposed new text. The proposed GFCI protection for temporary lighting is inappropriate within this section since it only covers receptacles, not temporary lighting.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-56 Log #1228 NEC-P03 **Final Action: Accept in Principle**
(590.4(D))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 3-122
Recommendation: This Proposal should be accepted to add new text to the requirement in Section 590.4(D).
Substantiation: In its statement for rejecting proposal 3-122, the sole rationale given for the rejection by CMP 3 was that the proposal in 406.8(B)(1) must first be accepted. Proposal 18-54, in 406.8(B)(1), has been accepted by CMP 18. Therefore, CMP 3 now should consider accepting this proposal in 590.4(D) based on the substantiation given.
Panel Meeting Action: Accept in Principle
In the recommendation of Proposal 3-122, accept the proposal revision in (D)(1) as is and change the text in (D)(2) in the proposal to read as follows:
(2) Receptacles in Wet Locations. All 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall comply with Section 406.8(B)(1).
Panel Statement: The word "all" provides an adjective to start the sentence, rather than a number, and the word "Section" has been deleted in compliance with the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-57 Log #1428 NEC-P03 **Final Action: Reject**
(590.4(D))

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 3-123
Recommendation: Accept the proposal as originally submitted:
Receptacles on construction sites shall not be installed on connected to the same individual, general purpose, or multiwire branch circuits that supply temporary lighting.
Substantiation: The panel's rewording of the proposal was, "Receptacles on construction sites shall not be installed on any branch circuit that supplies temporary lighting." This negates the intent of keeping temporary lighting and other loads separate. That is because 210.4(A) states that, "A multiwire circuit shall be permitted to be considered as multiple circuits."
I read that as saying that I may install a multiwire branch circuit, with one phase for lights and another for receptacles, and still comply with the proposed wording because I would consider each half of the circuit separately.
Panel Meeting Action: Reject
Panel Statement: The panel's acceptance of "any branch circuit" applies to individual or multiwire branch circuits so the list of various types of branch circuits is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-58 Log #2631 NEC-P03 **Final Action: Accept in Part**
(590.4(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-123
Recommendation: Continue to accept the proposal in principle, but insert the words "or on any leg of a multiwire branch circuit" after "installed on any branch circuit" and before "that supplies temporary lighting."
Substantiation: Although the panel action is generally technically valid, it is important to recognize that 210.4 does not require multiwire circuits to be considered as one circuit; in fact it says such circuits "shall be permitted to be considered as multiple circuits." Therefore it may very well not occur to many installers or inspectors that a connection to an opposing leg of a multiwire circuit is intended to be a violation. Now that there is a common disconnecting requirement for all multiwire circuits, it is crucial that this be applied correctly.
Panel Meeting Action: Accept in Part
Accept the recommendation to continue accepting the proposal in principle and reject the remainder of the comment.
Panel Statement: Any branch circuit includes a single branch circuit, an individual branch circuit, and a multiwire branch circuit so adding the suggested text is unnecessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-59 Log #873 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-125
Recommendation: Accept the proposal and revise as follows:
Approved disconnecting means shall be provided for each temporary circuit, that simultaneously disconnects all ungrounded conductors of the circuit it controls.
Substantiation: Suitable is subjective and not limited to the AHJ; whereas "approved" is. Simultaneous disconnection of ungrounded conductors is a standard requirement throughout the NEC; this section may be deemed to amend that requirement.
Panel Meeting Action: Reject
Panel Statement: Removing "suitable" and replacing it with "approved" is not necessary since 110.2 already requires the installation to be approved. Any two or three phase ungrounded conductors must be able to be disconnected by circuit breaker or fusible switch but simultaneous disconnection is an important safety consideration where the neutral conductor of a multiwire branch circuit may still be carrying current as noted in 210.4(B).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-60 Log #942 NEC-P03 **Final Action: Reject**
(590.4(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-126
Recommendation: Accept the proposal with the following revisions:
An approved disconnecting means that simultaneously disconnects all ungrounded conductors of the circuit it controls shall be provided. Common trip multipole circuit breakers shall be permitted as the disconnecting means.
Substantiation: "Suitable" is a term to be avoided per the Style Manual. Handle ties that are field installed can be removed.
Panel Meeting Action: Reject
Panel Statement: See the panel statement in Comment 3-59. Adding a permissive statement permitting common trip circuit breakers is unnecessary since handle ties are permitted by 240.15. In addition, 210.4(B) requires simultaneous disconnection of multiwire branch circuits.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-61 Log #678 NEC-P03 **Final Action: Reject**
(590.4(G))

Submitter: Bob Fahey, City of Jamesville
Comment on Proposal No: 3-132
Recommendation: Revise text to read as follows:
(G) Splices. On construction sites, a box shall not be required for splices or junction connections where the circuit conductors are multiconductor cord or cable assemblies, provided (1) the splices are a minimum of 2.5m (8 ft) above the floor or finished grade, and (2) that the equipment grounding continuity is maintained with or without the box. See 110.14(B) and 400.9. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made to a conduit or tubing system or a metal-sheathed cable system.
Substantiation: I have modified my language from my original Proposal 3-132, the new language specifically requires these splices to be located away from where the trade or the general public would commonly come in contact with such a splice if these open splices were required to be located above 8 feet. I have taken the 8' requirement from NEC 300.5(D)(1) for the protection of conductors emerging from grade outside. The splice I had noted in my substantiation on ROP #3-132 was located outside on the earth, where it was accessible to the general public, this type of installation should not be allowed, if we are to adequately protect the public and others who could easily come in contact with this open splice. With the present language in 590.4(G), this type of open splice can occur anywhere on a construction site, including areas accessible to the general public. I would encourage the Code panel to please take another look at this section and require open splices to be located above 8' on construction sites to better protect the construction workers and in the case I inspected, the general public. I do not have any documentation of injuries or deaths caused by the open splice located where they are readily accessible to all workers and the public, but my instinct is to assume if this practice is allowed to continue, there would be someone who would become injured due to these open splices allowed anywhere on a construction site. As an AHJ, the present language does not allow me to require that these splices be located where the splice is not a danger to others on the site, the proposed language would give the AHJ an enforcement tool to require these splices be located in areas not readily accessible and definitely not allow these open splices to be located on the floor or outside on the earth.
Panel Meeting Action: Reject
Panel Statement: Splices on construction sites can be accomplished where the splice is not a danger to the general public or the construction personnel without requiring the splice to be located above 8 feet or in a not readily accessible location.

Ballot Results: Affirmative: 14

3-62 Log #930 NEC-P03 **Final Action: Reject**
(590.4(G))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-131
Recommendation: Accept the proposal with the following revisions:
A box or fitting shall not be required for splices where the circuit conductors are single insulated conductors as permitted in the Exception for 590.4(B), or multiconductor flexible cord or cable in accordance with 400.3, nonmetallic covered multiconductor cable assemblies, provided equipment grounding conductor continuity is maintained and there is no strain on the splices. A box, conduit body, or fitting having a separate bushed hole for each single conductor shall be provided where a change is made to a raceway system or metal-covered cable system.
Substantiation: This provision should apply to temporary wiring covered in 590.3(C) and Exception for 590.4(B), and for demolition, remodeling, repair, maintenance, as noted in 590.3(A), there should be no strain on open splices. 110.14(B) and 400.9 already apply. Flexible cord and cable should be specifically included and noted to comply with 400.3.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided for any of the proposed changes. There also was no technical substantiation provided to expand this permitted use from construction sites to other types of temporary installations. There is no guarantee that other temporary installation sites will have qualified electricians installing and supervising the continuing maintenance of these circuits as will be done on construction sites. The suggested text in the comment referencing 400.3 is already required by any installation utilizing flexible cords or cables, therefore, adding it to 590.4 is unnecessary.

Submitter: Andrew S. McConnell, Boyle Fredrickson SC
Comment on Proposal No: 3-140
Recommendation: Proposal 3-139 should be rejected.
Substantiation: 90.2 specifically defines the National Electrical Code as an installation code, and Article 90.1(c) specifically indicates the National Electrical Code is not intended as a design specification. However, the proposed change to 590.6 concerns the design of portable generators, not their installation. This is a substantial departure from the historical intent and purpose of the National Electrical Code.
Under conventional and accepted use of the Code for safe installation practices, the NFPA would not have product liability exposures in the event a manufacturer produce a product that possesses some hidden safety flaw,. However, under the proposed product design specification of 590.6, it is possible that the NFPA could be subjected to exposure in product liability litigation. For example, a manufacturer may comply with Code requirements and produce a generator with an on-board GFCI. In the event the configuration has a safety flaw and does not prevent all possible ground faults, resulting in injury or death, the NFPA could be named as a defendant in a product liability lawsuit because the generator was designed to the required design specifications of 590.6.
The NFPA should give careful thought to the significant departure in the intent and purpose of the National Electrical Code reflected by the proposed change to 590.6, and should avoid acting in a manner that could expose it to potential liability resulting from the specification of product design features.
Panel Meeting Action: Reject
Panel Statement: The requirements for GFCI protection on certain receptacles concerning portable generators does not deal with product design or product specification, any more than requiring a GFCI receptacle for a bathroom receptacle deals with product design. This deals with GFCI protection for personnel for any temporary power used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities no matter if the power originates from the power company or from a generator.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:

AYER, L.: While it may seem like a good idea at first, there are numerous issues that must be studied prior to requiring GFCI protection for all 125V 15A, 20A, and 30A receptacles on portable generators. This requirement should be rejected until these issues have been resolved.

First, OSHA requires GFCI protection for receptacles on generators that are larger than 5 kW. This is required since larger units can have capacitive coupling between the generator frame and the winding causing a shock hazard and a complete path for the current to flow back to the generator. Units smaller than 5 kW are less of a concern since there is less risk for capacitive coupling. Allowing the text to go through as written will create conflict with the OSHA standards.

There are numerous instances in which having GFCI protection may create more harm than good. Individuals use portable generators for a wide variety of reasons beyond providing power for electrical construction tools. Connecting a generator to power a furnace during an ice storm, or using a portable generator with 300 foot long extension cords to power temporary lighting may be an issue if GFCI protection is mandated. Inrush currents on motors and leakage currents in long extension cords may cause inadvertent nuisance tripping. Contractors and maintenance personnel should be afforded the opportunity to place GFCI protection at the best possible location given the situation for which the generator is being used.

Portable generators are used in harsh environments. It is quite realistic that a lifespan of a GFCI device would be shortened due to the harsh conditions in which it would operate. Should this requirement pass workers may rely more heavily on the perception that they are protected by the generator rather than providing cord sets and external GFCI receptacle devices. Cord sets and external GFCI receptacles are much more likely to be either be tested prior to use or be replaced on a more frequent basis.

A study completed by the Construction Safety Association of Ontario (CSAO) in 1997 reviewed two different grounding schemes for portable generators: floating-neutral and bonding-neutral. The floating neutral is used mainly for generators 5 kw or less. The study concludes that floating neutral generators should have GFCI protection closest to the tool being used while bonding-neutral generators can have GFCI protection at the generators. These differences do not bode well to required GFCI protection at all portable generators regardless if the neutral-ground bond exists.

EASTER, L.: See NEMA's Explanation of Negative on Comment 3-83.

OWEN, S.: I agree with Mr. Pauley's comment 3-83. It is not within the purview of CMP-3 to require GFCI protection as an integral part of a generator. Further, I do not believe that there is substantiation provided to warrant the changes proposed requiring GFCI protection to be an integral part of a generator. I wish to apply this reasoning for comments 3-65 through 3-80, and 3-82 through 3-89.

3-67 Log #1414 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: James Hendricks, Hendricks Hardware Co.
Comment on Proposal No: 3-140
Recommendation: Delete 590.6(3) as follows:

~~590.6(3) Receptacles an 15 kW or less Portable Generators. All 120 and 120/240 volt, single phase, 15,20, and 30 ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground fault circuit interrupter protection for personnel.~~
Substantiation: Most of the commercially available small inverter generators like the Honda EU2000 (Honeywell, ETQ, and Onan are just a few of the others) feature a floating neutral. Tens of thousands of these are sold every year. Adding a GFCI to the receptacles will serve no purpose, as it will be completely ineffective on a floating neutral generator because the ground and neutral are not tied together. How can the NEC mandate a "safety" measure that won't work?
Panel Meeting Action: Reject
Panel Statement: A GFCI receptacle monitors the amount of current that goes out on the ungrounded conductor and then comes back on the neutral conductor and if there is leakage of 6 milliamps or greater that does not come back through the GFCI comparison device, then the GFCI device will trip. GFCIs will trip without the benefit of an equipment grounding conductor path back to the source but obviously having a lower impedance path back to the source is much more desirable since the equipment grounding conductor path back to the frame of the generator and then back to the source on the system bonding jumper to the neutral provides a much lower impedance path.
Section 250.20(B)(1) requires any AC system of 50 volts to 1000 volts to be grounded where the system can be grounded so that the maximum voltage to ground on the ungrounded conductor does not exceed 150 volts. Section 250.20(D) requires any separately derived system, as covered by 250.20(B) to be grounded in accordance with 250.30(A) of which a portable generator would be covered under this section.
In addition, 250.34 does not require the frame of a portable generator to be connected to a grounding electrode if the portable generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both. In addition, the normally non-current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are required to be connected to the generator frame. This section does not state that floating the neutral in the generator is acceptable since the generator is a separately derived system and must have a system bonding jumper installed from the equipment grounding system in the generator to the grounded or neutral conductor within the generator.
The 1975 NEC Section 210-8(b) required "all 120-volt single phase 15 and 20 ampere receptacle outlets which are not part of the permanent wiring of the building or structure, shall have ground fault circuit interrupters for personnel protection." An exception was inserted into 210-8(b) that permitted "receptacles on a portable generator rated not more than 5 kW, where the circuit conductors of the generator are insulated from earth and the generator frame is insulated from earth and all grounded surfaces."
This section and exception was moved to 305-4(a) in 1984 and the text in the exception was changed to "receptacles on a 2-wire, single-phase portable or vehicle-mounted generator rated not more than 5 kW, where the circuit conductors of the generator are insulated from the generator frame and all other grounded surfaces" need not be GFCI protected. This exception existed with similar wording until the 2002 NEC when it was removed by Panel 3 from 527-6(A) with the intent to require GFCI protection of all generator receptacles based on temporary installations on constructions sites.
Section 406.3(B), Exception No. 1 permits receptacles mounted on portable and vehicle mounted generators to comply with 250.34 but does not permit the equipment grounding conductor to just connect to the frame of the generator since there must be a complete path for fault current back to the generator coils based on 250.20(B) and (D) as well as 250.30(A) as stated above. Section 250.21 and 250.22 do not permit an ungrounded neutral for a 120 and 120/240 volt system.

3-68 Log #1598 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Kurt von Eckroth, Eckroth Engineering, LLC
Comment on Proposal No: 3-139
Recommendation: This proposal should be rejected.
Substantiation: Please see below for substantiation to reject Proposals 3-139 and 3-140.

· According to 90.2 of the NEC, the NEC is an installation code, not a construction code. As an installation code, the NEC can mandate that a particular feature exists (a disconnect at a certain location, for example), but not how it is to be achieved (circuit breaker, switch, properly rated plug-and-connector, etc.). Therefore, while the NEC can mandate ground fault protection for particular circuits, it is not within its authority to mandate that ground fault protection be, necessarily, provided by a GFCI outlet **Integral** to the generator. There are many different ways to achieve ground fault protection (GFCI outlet, GFCI circuit breaker, GFCI cord set, portable personal GFCI protection device, etc.). The only way the Code can mandate integral GFCI outlets in generators is if it becomes a product design and performance code, and 90.2 clearly states it is not.

This change creates the following consequences:

· It would effectively eliminate all other forms of personal GFCI protection for personnel on jobsites (GFCI cord set, portable personal GFCI protection device, GFCI protected spider boxes, etc.), replacing all with a GFCI device installed in a high vibration and heat environment, and far removed from the point of ground-fault.

·It would mandate the use of a product that currently does not exist—a high vibration/high temperature hardened GFCI.

· It would effectively eliminate all floating neutral generators (the most common kind), as the generator-mounted GFCI will not function unless the neutral and the ground are bonded together at the generator.

· It would force all generators to be tied to their own 6-foot ground rod. Without it, the GFCI will not function.

· Present lethality rates are extremely low to nonexistent under the present system. Generators are often used under conditions of duress in hurricanes, tornadoes, earthquakes, and ice storms. Most are portable. To provide the consumer with power supplies not easily set up (a ground rod must be driven) serves no prudent purpose in such events and may well cause more deaths as a result of spoiled food, lack of light and/or heat. We can well imagine the local fire marshal shutting down small generator sets using new "The New Codes" and employing the "force of law."

· When not allowed to purchase and freely employ generators people will heat with open gas burners.

· Under conditions of emergency consider the downside to driving the required ground rod into a local utility; particularly a gas main. These rods ARE eight feet long! Will they wait for "Diggers Hotline"?

3-69 Log #1646 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Michael Flegel, Reliance Controls Corporation
Comment on Proposal No: 3-140
Recommendation: Reject the proposal.
Substantiation: Statement of Problems Proposal 3-140

Substantiation for Problems 1, 2, 3, 6, 8 and 9 is listed below:

1. It is impossible to have a ground fault back to the generator if it is not bonded and grounded, so GFCI protection on the generator doesn't make sense since no requirement exists for bonding and grounding. In complex systems and in harsh environments, neutrals can be pulled to ground beyond the generator. GFCI protection on generators that are not bonded and grounded does not protect people against these ground faults but they may believe it does. This may encourage bad safety practices and/or discourage people from taking further steps to protect themselves against ground faults.

2. The bonding and grounding needed in Problem 1 will create ground fault hazards. Why intentionally create a hazard and then have to add a device to protect against it, especially when the added device is an electronic device on a piece of hot, vibrating equipment which adds to the likelihood of its failure? It makes more sense to float the system. A floating neutral portable generator without GFCI protection is safer than a bonded neutral portable generator with GFCI protection in stand alone applications even if the latter if properly grounded. There is no need to have GFCI protection in stand alone applications even if the latter is properly grounded. There is no need to have GFCI protection built into a floating neutral generator.

3. Stand alone portable generator applications currently used for Temporary Installations are not required to be grounded making GFCI protection more effective closer to the individual performing the work. The protection should not be on the generator.

4. In paragraph 590(A)(3) conflicts with the Exception in 590(A) in the Proposal. If the Temporary Installation is powered by a portable generator 15 kW or less, people cannot substitute an assured equipment grounding program in lieu of GFCI protection because no non-GFCI outlet is available on the generator.

5. 90.2 of the National Electrical Code states that the Code only covers the installation of electrical conductors, equipment, and raceways, etc. It does not cover the design of equipment such as having GFCI protection built into a portable generator. The Code can and does address the following installation aspects of a portable generator:

a. Adding downstream GFCI protection—Article 590 (2008)

b. Bonded or not bonded—There are several sections addressing Separately and Non-separately derived systems

c. Receptacles connected to the frame— 250.34

In each case, the Code does not dictate that the generator has these design features but rather it instructs on how to install it when a generator has these features. The NEC does not develop product standards for the equipment that is installed. The NEC can specify how to install a bonded neutral generator with GFCI protection, or a floating neutral generator without GFCI protection but it shouldn't require that the generator have the protection built in.

6. 590.6 requires receptacles, installed as part of the permanent wiring of the building or structure and that are used for temporary electric power, to have ground-fault circuit-interrupter protection for personnel. It allows the use of cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use to meet this requirement. It does not require people to replace permanently installed non-GFCI with GFCI receptacles in Temporary Installations. Why should permanently installed receptacles in portable generators be any different than those in a building or structure? If anything, the utility system has more reasons to replace non GFCI receptacles with GFCI protected receptacles because the system is always bonded and grounded.

7. 525.23 (C) clearly states that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. The purpose of this is to assure that egress lighting is always available. Since egress lighting can be powered by portable generators at these sorts of events, the proposal will not allow compliance to this Article.

8. Off-generator GFCI protection adds an additional level of protection to all portable generator applications but yet the proposal infers it should not be used on generators manufactured after January 1, 2011.

9. The proposal has not substantiated a safety problem; it just incorrectly states there is one. GFCI protection on the generator would ensure that people would use it but is only effective if people properly bond and ground the generator and is not as effective as other alternatives as stated above in Problems 1 and 2 and 3. Generally people are more concerned about the live cords and devices they contact on a regular basis like the ones connected to the power tools they are using and the power tools themselves. This is where downstream, personal GFCI devices really are more effective in harsh environments. Power cords to distribution boxes are seldom handled, or seldom need to be handled, when they are under power.

Do you know for a fact that the current safety record isn't due to the fact that very few portable generators are grounded and has nothing to do with the fact that some have GFCI protection or that people use other forms of GFCI protection with them**? Isolation is a powerful safety device and should not be ignored. Isolation and the extra protection of downstream GFCI protection is even better and it is essentially what is being done today since the generator is not required to be grounded.** Has somebody provided data to show that what is being done now is not safe?

Bonding and Grounding—Utility vs. Portable Generators

OSHA requires bonded neutral generators in their regulations for construction sites. In reading these regulations, they appear to be identical to the NEC requirements except for this bonding requirement. The interpretation in Appendix A explains their position. To completely understand OSHA's response, please read the request letter by Mr. Iwasa. It appears OSHA incorrectly interprets the NEC. It says a generator in stand alone use is a separately derived system (see Article 100) and as such needs to be bonded. Please note the interpretation does not have any safety arguments other than misinterpreting the NEC which leaves it with no technical merit. As such it has no relevance in this discussion.

Generators used in simple stand alone applications, operate in a much different environment than a premises wiring system being fed from the utility. There is no huge generator capable of outputting high fault current, no transformers and switchgear, and no large, elevated distribution system subject to lightning strikes all of which can create surges in the system. Such surges must be addressed through bonding and grounding rather than having them go through appliances and endanger safety. The reason for bonding and grounding is substantially reduced when utility power is removed. As a matter of fact, Article 250 agrees and does not require the grounding of a generator in stand-alone applications. This allows a floating system using either floating neutral generators or bonded-neutral generators that are not grounded.

Bonding and grounding have some pitfalls that are tolerated in order to get the desired protection described above from utility systems. **A bonded and grounded system creates numerous pathways for current to flow back to the power source (substantiation for Problem 6). These include the ground, and any metal object connected to the ground such as plumbing fixtures and popes and heating ducts. If someone comes in contact with a hot wire from the power source and one of these objects, the circuit is completed with disastrous results to the individual.** In fact, people did realize that these pitfalls created very dangerous situations for premises wiring systems. Products and systems were developed to mitigate the safety risks. Grounding wires were added to appliance plugs and grounding terminals were added to receptacles so that a hot wire faulting to the case of an appliance would cause a short, tripping the circuit breaker. This protected the user in case he touched the case and one of the extensive return paths to the power source created by bonding and grounding the system. The GFCI was invented to interrupt the current flow when the current out of a receptacle isn't the same amount as the returning current. If it isn't returning thro ugh the receptacle, then it probably is returning through a person that is touching one of those many objects that have a path back to the power source, again, as a result of bonding and grounding the system.

Why create a more dangerous situation by connecting multiple objects to a return path back to the source if there are no advantages in doing so like in stand alone portable generator applications? Some people would argue that the devices used to protect people in bonded and grounded systems no longer would work in a floating situation. **This is true but they fail to understand they are not necessary.** The circuit breaker tripping in the fault-to-case example above and the GFCI protection are two of the safety devices in bonded and grounded systems mentioned earlier. In the first case, the fault to the case represents only a connection of the person to one wire from the source in a floating system. Because there is no path back to the source, the individual holding the tool is not injured. Similarly, a GFCI would never trip because there is never a ground path available back to the generator i.e. a ground fault can never occur back to the source. **This truly is a paradigm shift in the way we think about electrical systems and it is important for people to understand they have to look at portable generator applications differently.**

Temporary Installations

For the casual user such as a camper of home owner working in the back yard, the floating neutral generator is the safest and most cost effective application that does not require additional ground fault protection using GFCIs. But what about harsher environments where multipoint failures occur like in more complex systems such as Temporary Installations? **The floating system still seems to be the safer of the two alternatives as shown in Appendix B (substantiation for Problems 1, 2, and 9).** As you know, Temporary Installations can have lots of exposed cords that come in contact with exposed beams, piping, sharp objects and other metal objects that create a higher probability that neutral will be pulled to ground somewhere in the system. Article 590 wisely requires GFCI protection on receptacles. If the receptacles do not have GFCI protection, people must use GFCI protection that is built in to extension cords or other GFCI devices. No doubt this is an excellent idea for installations using grounded and bonded utility power but is it really necessary for the protection to be built into portable generators? The answer depends on whether the generator is bonded and grounded. If it is, then the GFCI protection on the generator is needed but grounding the generator is unlikely since the NEC does not require it. If not grounded, the protection is unnecessary on the generator because you have a system that does not intentionally create any paths back to the source. If you are concerned that a neutral to ground fault would likely occur downstream from the generator receptacle because of the harsh environment, then adding GFCI protection with cord devices or other downstream GFCI devices is a good idea. See Figure supplied as supporting material.

The Figures also demonstrate that the closer the GFCI protection is to the person in a floating system, the more protection that person has (substantiation for Problems 3 and 8). A Temporary Installation should be either a bonded and grounded system with GFCI protection on the generator or a floating system without GFCI protection on the generator. For both and depending on the harshness of the environment, one may consider having additional ground fault protection close to the workers either in a distribution box in which the tools they are using are plugged or in belt mounted GFCIs. **The extra protection would protect them in the grounded system in case the GFCI on the generator failed or if the generator was not properly grounded and a neutral was accidentally pulled to ground elsewhere in the system. It would protect them in the floating system in case a neutral was accidentally pulled to ground in the system (substantiation for Problems 8 and 9)**

(590.6)

Submitter: Nick Weinkauf, Industrial Sales Tech Inc.
Comment on Proposal No: 3-140
Recommendation: This proposal should be rejected.
Substantiation: GFCI protection integral to a generator may not necessarily ensure adequate personnel protection. In particular, a poorly grounded bonded-neutral generator may not provide a ground path adequate to allow the GFCI to trip. In such cases, a user would mistakenly be led to believe that he was adequately protected when, in fact, he was not. GFCI protection, when required by Code, is beset provided independently of the generator.
Panel Meeting Action: Reject
Panel Statement: See the panel statement in Comment 3-67.

3-71 Log #2003 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Jerry Qian, All Power America
Comment on Proposal No: 3-140
Recommendation: Proposal 3-140 should be rejected entirely.

Proposal 3-140 will add this Article to the NEC:

590.6(3). Receptacles on 15 kW or less Portable Generators used in Temporary Installations.

We have been made aware that this pending code proposal will require GFCI protection to be integral to all portable generators smaller than 15 kW, regardless of whether or not GFCI protection will perform as intended.

Proposal 3-140 should be rejected entirely.

Proposal 3-140 will the following to the NEC:

590.6(3). Receptacles on 15 kW or less Portable Generators used in Temporary Installations.

We have been made aware that this pending code proposal will require GFCI protection to be integral to all portable generators smaller than 15 kW, regardless of whether or not GFCI protection will perform as intended.

Substantiation:

Proposal 3-140 should be rejected entirely for the following reasons, including but not limited to:

1. GFCIs on generators will not function reliably unless the neutral and ground conductors are connected to a functional grounding system, which they generally are not.

The NEC does not require the grounding of portable generators when used in stand-alone applications. This becomes extremely important for workers at temporary installations, where GFCI protection is required by the NEC. In such cases, ineffective protection given by the GFCI protection on the portable generator can mistakenly lead personnel to believe that they are protected by the generator GFCI, and discontinue the use of personal or other supplemental GFCI protection that has kept them safe for years. This could be a serious mistake.

2. This Proposal would create at least two Code conflicts.

525.23(C) clearly states that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. The purpose of this is to assure that egress lighting is always available. Since egress lighting is often powered by portable generators at these sorts of events, the proposed additional Articles cannot mandate GFCI outlets on portable generators.

In addition, proposed 590.6(A)(3) and the Exception under 590.6(A) are mutually exclusive. The Exception allows 590.6(B)(2) under circumstances that are "not compatible with GFCI protection" but the proposal does not provide for a portable generator where non-GFCI protection is allowed.

3. If floating neutral generators are used, there is no need for the GFCI.

In a system as complex as premises wiring, full isolation is not possible, and the reasons for grounding such unique electrical systems are spelled out in 250.4(A)(1). In such a case, the GFCI is necessary to protect the user from being injured or killed by the utility power since exposed metal parts are intentionally electrified through the bonding and grounding process. However, with a stand-alone portable generator, bonding and grounding is not required by the NEC, and full isolation is easily achievable. Therefore, public safety for portable generators is best served by protecting the user through the use of simple, dependable basic insulation and isolation, instead of through a process that deliberately:

(a) creates a ground path,
(b) allows the electrocution to begin and then,
(c) attempts to stop it before lethality is complete using a complicated and fragile electronic sensing and interrupting device.

Quite simply, if there is no ground fault path, then there can be no ground fault.

4. This proposal is clearly outside of the scope of the National Electrical Code.

UL addresses applications of small portable generators such as lighting on camp sites, powering table saws and hand-held tools, and so on. However, 90.2 of the National Electrical Code states that the Code only covers the installation of electrical conductors, equipment, and raceways, etc. It does not cover electrical equipment that is not installed. Neither the portable generator used in a stand-alone application nor the appliances it powers are installed. As a result, the NEC clearly has no jurisdiction over portable generators used in stand-alone applications.

5. The NEC cannot mandate design or construction requirements for equipment.

As an installation code, the NEC can mandate that a particfular feature exists (disconnect at a certain location, for example), but not how it is to be achieved (circuit breaker, switch, properly rated plug-and-connector, etc.). Therefore, while the NEC can mandate ground fault protection for particular circuits, it is not within its authority to mandate that said ground fault protection must be provided by a GFCI outlet integral to the generator.

We believe that this proposal is ill-conceived (even though well-intended) and will lead to confusion at the user level, will not improve portable generator safety as intended, or are better addressed by existing code requirements.

3-72 Log #2126 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Lora Christensen, Reliance Controls Corp.
Comment on Proposal No: 3-140
Recommendation: Revise text to read as follows:

(3) Receptacles on 15 kW or less Portable Generators. All 125-volt and 125/250-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are a part of a 15 kW or smaller bonded-neutral portable generator shall have listed ground-fault circuit interrupter protection for personnel. Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be ~~permitted~~ required for use with ~~15kW or less~~ all portable generators ~~manufactured or remanufactured prior to January 1, 2011~~ except bonded-neutral generators with built in GFCI protection that are grounded in accordance with Article 250.

Substantiation: If there is no neutral connection to the ground, ground faults back to the source are impossible. Bonded-neutral generators have the frame of the generator tied to the neutral of the generator but if the frame is not properly grounded, no path exists for ground faults. Floating-neutral generators only have the grounding conductors tied to the frame isolating the neutral from any contact with the ground, even if the generator is grounded. No need to have GFCI protection built into a floating neutral generator. There is a need for a bonded-neutral generator but only if it is properly grounded. Since neutrals can be pulled to ground away from the generator in harsh applications, the use of off-generator GFCI protection should be encouraged for all generators not grounded, whether or not the generator has GFCI protection built in.

3-73 Log #2185 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Jeffrey Flegel, Reliance Controls Corp.
Comment on Proposal No: 3-140
Recommendation: This proposal should be rejected.
Substantiation: This proposal will cause mass confusion in the marketplace. The installed base of double-pole, 120/240V manual transfer switches will not operate with generators with GFCI outlet protection and with the neutral bonded to the generator frame. Hundreds of thousands of double-pole manual transfer switches would be rendered inoperable and require replacement with more expensive three-pole transfer switches. These applications go far beyond home standby use and agricultural applications. For example, from New York to Florida, traffic signals along storm and flood evacuation routes are equipped with manual transfer switches that will not work with GFCI protected portable generators. Many of these routes are critical for Homeland Security and may be subject to the requirements of Article 708. Therefore, the NEC should consider the severe economic and safety impact on the public sector and reject this proposal.

Panel Meeting Action: Reject
Panel Statement: The requirement in 590.6 only applies to generators used for temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities and would not apply to home standby power and agricultural applications. See the panel statement in Comment 3-67.

3-74 Log #2517 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Bill Johnson, Champion Power Equipment
Comment on Proposal No: 3-140
Recommendation: Reject Proposal 3-140.
Substantiation: Requiring the addition of GFCI receptacles to portable generator panels rather than relying on GFCI cord sets may introduce safety hazards. GFCI receptacles are not reliable when exposed to the vibration and environment of portable generators powered by single cylinder reciprocating engines. Loss of electrical power to lighting (visibility) or power to tools caused by false tripping of generator mounted GFCI receptacles can create safety hazards. Also, panel mounted GFCI receptacles require bonding one hot leg of a 2-wire single phase 120 volt generator output to the generator frame in order to sense a ground fault. Many portable generators are designed for other markets, including emergency back up power and recreational activity. The use of floating neutrals in these applications is common in order to eliminate a return path, preventing an otherwise lethal condition in the event of an equipment short circuit. There is no guarantee that these floating neutral generators will not end up at job sites with GFCI receptacles installed, resulting in a false sense of security and a safety hazard.

Panel Meeting Action: Reject
Panel Statement: The requirement in 590.6 only applies to generators used for temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities and would not apply to other applications. 3-75 Log #2520 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: James Jongkind, American Honda Motor Co., Inc.
Comment on Proposal No: 3-140
Recommendation: Please do not accept the proposal as it could be misinterpreted as requiring that all portable generators be installed with GFCls as original equipment. Mandatory wide-spread application of GFCls to portable generators could have serious unintended consequences.
Substantiation: This section already wrongly requires floating neutral generators to utilize GFCls when used for temporary power during certain professional use activities. See also
comment to Proposal 3-19. The proposal requires that GFCls be located at the source, but it does not clarify that this is an installation requirement in as much that an approved corded GFCI can satisfy the requirement.

3-76 Log #2448 NEC-P03 **Final Action: Reject**
(590.6(3))

Submitter: Jack Mandula, GenTran Corp.
Comment on Proposal No: 3-140
Recommendation: Delete entire proposal.
Substantiation: 1. Portable generators 15kW or smaller with GFCI protection will not operate with the installed base of non-automatic transfer switches used for standby power applications. Over 3/4 of portable generators sold are used at one time or another for standby power applications, connected to a manual transfer switch, to provide standby power to buildings. Adopting the proposal will create field user issues not solvable without modification to existing, installed equipment.

2. GFCIs on portable generators will not operate properly unless the generator ground and neutral are connected to grounding system, which is not required by the NEC in temporary applications, leading to false sense of security and defeating the possible GFCI protection benefits.

3. This proposal is not within the scope of the NEC. The NEC covers the installation, not the design of equipment. This proposal attempts to mandate certain designs for portable generators, the NEC does not apply.
Panel Meeting Action: Reject
Panel Statement: The requirement in 590.6 only applies to generators used for temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities and would not apply to other applications. 3-79 Log #2524 NEC-P03 **Final Action: Reject**
(590.6(3))

Submitter: Howard Heaner, Howard Electric
Comment on Proposal No: 3-140
Recommendation: Delete as follows:
~~590.6 (3) Receptacles an I5 kW or less Portable Generators. All 120 and 120/240 volt, single phase, I5,20, and-30 ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground fault circuit interrupter protection fur personnel. Listed cord sets or devices incorporating listed ground fault circuit interrupter protection for personnel identified for portable use shall be permitted for use with 15 kW or less portable generators manufactured or remanufactured prior to January 1, 2011.~~
Substantiation: This would create a real mess. In the field, we use personal GFCI protection with portable generators because the safest place for it is as close to the user as possible. This is common knowledge and common practice. The proposal moves the GFCI as far away from the user as possible and suggests that personal protection is no longer necessary. How are we supposed to know when a generator was manufactured? There is no date on them. And what about floating neutral generators? The GFCIs won't work. This irresponsible proposal jeopardizes my safety by moving the GFCI away from me and leaving unanswered questions about implementation and enforcement
Panel Meeting Action: Reject
Panel Statement: The requirement in 590.6 only applies to generators used for temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities and would not apply to other applications. There is no restriction in the NEC that would keep someone from also using portable personnel protection in addition to the GFCI requirement on the generator. Manufacturers of motors and countless other electrical appliances mark manufacturing dates on nameplates to indicate the date of manufacture of the equipment. See the panel statement in Comment 3-67.

3-81 Log #1229 NEC-P03 **Final Action: Accept in Principle**
(590.6(A))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 3-141
Recommendation: This Proposal should be accepted to add new text to the requirement in Section 590.6(A).
Substantiation: Receptacles provided with equipment such as portable generators in temporary installations require the same degree of protection as for fixed installations according to 406.8. UL 2201, Portable Engine-Generator Assemblies, First Edition dated March 4, 2009, is up to date on the requirements of 406.8, requiring that all "15- and 20-A, 125 and 250 V non-locking receptacles shall be of the weather resistant type". UL 2201 also requires, in clause 15.7.6, that "Receptacles shall be protected from exposure to weather". The requirements in 406.8(A) provide the appropriate requirements to support the standard.

The Panel statement that this requirement would be "unenforceable" seems to imply that the protection needs to be added to the generator at the point of use. In fact, with the force of the Code, generator manufacturers and producers of other separately derived equipment would be compelled to provide the required protection, and thus the degree of safety required by 406.8. NEMA would like to point out that thousands of portable engine-generators are purchased by the general public each year. The requirement described in the new UL 2201 standard for portable generators is an example of how this standard has anticipated the necessity of this Code direction.
Panel Meeting Action: Accept in Principle

Add the following revised text as a second sentence to the accept in principle text 590.6(A)(3) in Proposal 3-140 to read as follows: All 15- and 20-ampere, 125- and 250-volt receptacles, including those that are part of a portable generator, used in a damp or wet location shall comply with Section 406.8(A) and (B).
Panel Statement: The word "all" provides an adjective to start the sentence, rather than a number, and the word "Section" has been deleted in compliance with the NEC Style Manual. Specific subsections (A) and (B) were added since most portable generators would not be applicable for 406.8(C) through (E). The panel added "including those that are part of a portable generator", and "used" instead of "installed" to more accurately reflect the scope of the equipment covered.
Number Eligible to Vote: 14

3-83 Log #1593 NEC-P03 **Final Action: Reject**
(590.6(A)(3))

Submitter: Jim Pauley, Schneider Electric
Comment on Proposal No: 3-140
Recommendation: Delete the section (3) added in the panel action text.
Substantiation: CMP 3 has stepped out of their scope with this requirement. The issue of whether or not a generator should have GFCI provided as part of the generator set is rightly under the purview of CMP 13 with Article 445 that covers generators. As it stands, CMP 3 has written a requirement that is in conflict with the provisions under review by CMP 13.

The issue for CMP 3 is ensuring that GFCI protection is provided for the worker under temporary wiring installations. Whether that is provided with a GFCI as part of the generator set or a GFCI that is part of the cord set, or a GFCI that is part of a spider box arrangement should not matter to the panel. As long as the GFCI is anywhere between the person being protected and the source of power, the GFCI can do its job.

Adding a requirement for GFCI protection as part of the generator creates a number of other issues that should not be ignored. Because of Y2K, ice storms, hurricanes and other natural disasters the industry has worked hard to get users to install proper transfer equipment so that generators can be connected. The vast majority of these installations are installed with a solidly grounded (not switched) neutral. When the portable generator with GFCI is properly connected to the transfer equipment, the GFCI will trip due because it will see a grounded neutral downstream. So the result then becomes using extension cords from the generator into the house, removing the equipment grounding connection and isolating the generator from ground to avoid in order to keep the GFCI from tripping.

CMP 3 should stick with their basic requirement that the receptacle being used for the temporary wiring must have GFCI protection and not attempt to be specific as to where that protection must be provided.
Panel Meeting Action: Reject
Panel Statement: In the 1984 NEC process, Section 210-8(b) and the exception covering the exclusion of GFCI protection on 5 kW and smaller portable generators was moved to 305-6(a) and came under the jurisdiction of Panel 3. The exception stated as follows: "Receptacles on a 2-wire, single-phase portable or vehicle-mounted generator rated not more than 5 kW, where the circuit conductors of the generator are insulated from the generator frame and all other grounded surfaces." The text clearly addresses receptacles on the 5 kW and smaller generator not being required to have GFCI protection. This exception was removed by Panel 3 during the 2002 NEC with the intention of requiring all sizes of generators and all sources of power on construction sites to have GFCI protection for personnel and this was further reinforced in the last sentence in 590.6 as follows: This section shall apply to power derived from an electric utility company or from an on-site generated power source." To say that Panel 3 does not have jurisdiction over this issue for temporary construction sites and that it is outside the scope of Panel 3 would mean that none of the actions or involvement of Panel 3 since it was moved into Article 305, 527, or 590 was correct. The text in the 1983 TCR stated that the NEC TCC was transferring GFCI requirements and the exception for 5 kW and smaller generators for construction sites to Article 305 and Panel 3.
See the panel statement in Comment 3-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
AYER, L.: See negative statement on comment 3-65.
EASTER, L.: Neither the code nor the proposal contains any grounding requirements for a generator in stand alone use. Without grounding, a ground fault back to the generator is impossible so that the GFCI protection on the generator is useless and so it should not be required. Grounding away from the generator in Temporary Installations can occur by a neutral contacting the ground downstream from the generator. GFCI protection on the generator will protect no one in this instance and will be useless. People seeing GFCI on the generator will make no further effort to protect themselves.

There is a correlation issue that should be addressed by the TCC. The requirements for a generator itself belong to CMP 13 and not CMP 3. CMP 3 should only specify that GFCI protection is required and the protection can be provided in various ways.

No substantiation was provided suggesting that a safety problem exists with the way portable generators are now used in Temporary Installations nor was substantiation provided to show that proposal 3-140 will improve safety.

The panel members considered only grounded systems and did not consider a floating system.

OWEN, S.: See comment on 3-65.

3-84 Log #1659 NEC-P03 **Final Action: Reject**
(590.6(A)(3))

Submitter: Bryan Landerman, Milwaukee, WI
Comment on Proposal No: 3-140
Recommendation: This proposal should be rejected.
Substantiation: Proposed 590.6(A)(3) and the Exception under 590.6(A) are contradictory. The Exception allows "an assured equipment grounding program as specified in 590.6(B)(2)" under circumstances that "would create a greater hazard if power were interrupted or having a design that is not compatible with GFCI protection." The proposal does not provide for a portable generator where GFCI protection is not present.
Panel Meeting Action: Reject
Panel Statement: Section 590.6(A)(3) and the exception in 590.6(A) are not contradictory since there are many generators on job sites that are larger than 15 kW and would not be required to comply with 590.6(A)(3) and could use the assured grounding program. See the panel statement in Comment 3-67.

Comment on Proposal No: 3-140
Recommendation: This proposal should be rejected.
Substantiation: There is a large installed base of transfer switches for switching only the hot leg of a 120 volt utility and portable generator source. These appear in numerous municipal and state traffic signal installations that have been designed for portable generator backup during a power outage, many of which are located on hurricane evacuation routes. GFCI receptacles on bonded neutral generators will trip if an attempt is made to use them on these systems, thereby creating the possibility of a safety threat far more serious than that which the GFCI is intended to prevent. GFCI protection, when required by the Code, can be easily added independent of the generator.
Panel Meeting Action: Reject
Panel Statement: The requirement in 590.6 only applies to generators used for temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities and would not apply to other applications. See the panel statement in Comment 3-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3

3-86 Log #1874 NEC-P03 **Final Action: Reject**
(590.6(A)(3))

Submitter: Robert Hamilton, Osprey, FL
Comment on Proposal No: 3-140
Recommendation: Delete text.
~~**590.6(A)(3) Receptacles on 15kW or less Portable Generators.** All 125 volt and 125/250 volt, single phase, 15, 20, and 30 ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground-fault circuit-interrupter protection for personnel. Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted for use with 15 kW or less portable generators manufactured or remanufactured prior to January 1, 2011.~~
Substantiation: This proposal should be rejected. Here in Florida, there are many single pole transfer switches installed by municipalities and the state for backup 120-volt generator control of traffic signals. The GFCIs on bonded-neutral generators will trip if used under these circumstances, thereby, causing a loss of generator power and resulting in consequences that could be far more serious than those which the GFCI was intended to prevent, especially during an emergency evacuation.
Panel Meeting Action: Reject
Panel Statement: The requirement in 590.6 only applies to generators used for temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities and would not apply to other applications. 3-87 Log #1877 NEC-P03 **Final Action: Reject**
(590.6(A)(3))

Submitter: David Flegel, Reliance Controls Corp.
Comment on Proposal No: 3-139
Recommendation: Delete text.
~~**590.6(A)(3) Receptacles on 15kW or less Portable Generators.** All 125 volt and 125/250 volt, single phase, 15, 20, and 30 ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground-fault circuit-interrupter protection for personnel.~~
Substantiation: 590.6(A)(3) should be rejected. 590.6(A)(3) and 590.6(A)(4) are mutually exclusive. 590.6(A)(4) allows 590.6(B)(2) under circumstances that are "not compatible with GFCI protection," but the proposed 590.6(A)(3) does not provide for a portable generator where non-GFCI protection is allowed. Additionally, this proposal conflicts with 525.23(C) which requires that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected.
Panel Meeting Action: Reject
Panel Statement: Section 590.6(A)(3) and (A)(4) are not mutually exclusive since there is not a 590.6(A)(4). See the panel statement in Comments 3-67 and 3-78.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
AYER, L.: See negative statement on comment 3-65.
EASTER, L.: See NEMA Explanation of Negative on comment 3-83.
OWEN, S.: See comment on 3-65.

3-88 Log #1878 NEC-P03 **Final Action: Reject**
(590.6(A)(3))

Submitter: David Flegel, Reliance Controls Corp.
Comment on Proposal No: 3-140
Recommendation: Delete text.
~~**590.6(A)(3) Receptacles on 15kW or less Portable Generators.** All 125 volt and 125/250 volt, single phase, 15, 20, and 30 ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground-fault circuit-interrupter protection for personnel. Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted for use with 15 kW or less portable generators manufactured or remanufactured prior to January 1, 2011.~~
Substantiation: This proposal should be rejected for the following reasons:

1) 590.6(A)(3) and the exception under 590.6(A) are mutually exclusive. The exception allows 590.6(B)(2) under circumstances that are "not compatible with GFCI protection," but the proposal fails to allow for a small portable generator where GFCI protection is not present.

2) There is no means for a user or AHJ to determine a generator manufacture date, and no proposal to require such a date to be shown. As such, any reference to a generator manufacture date is meaningless.

3) This proposal conflicts with 525.23(C) which requires that egress lighting circuits for carnivals, circuses, fairs, and similar events cannot be GFCI protected. Small portable generators are frequently used in this type of application.

4) It is doubtful that GFCI protection would be at all effective if a generator is not properly grounded, and there is no provision in the code to require grounding [see 250.34(A)]. This is hardly comforting for the user and certainly not an improvement over existing code requirements for GFCI protection.

5) 90.1(C) clearly states that the Code is not intended as a design specification. Accordingly, the Code is clearly not intended to direct a manufacturer to design their product in a particular manner, including making GFCI outlets integral to a generator. This proposal should be rejected at least until all the negative consequences of undertaking the responsibilities of product design are thoroughly evaluated.

6) There is a very large installed base of municipal traffic signal transfer switches that are single-pole 120-volt. A bonded neutral generator with GFCIs integral to the generator will not work in these applications. This is because generator bonding will cause a small amount of current to return to the generator through the grounding conductor, creating an imbalance that will always trip the GFCI. Thus, GFCIs under power will not be able to establish a non-tripped condition. Failure to establish temporary backup power for traffic signals (particularly those located on emergency evacuation routes) would disrupt "public health and safety", a condition that is not permitted under the scope of 708.1.

7) This proposal should be rejected at least until all the conflicting issues, a number of which have been described above, can be examined. The use of portable generators for a variety of power purposes (stand-alone, temporary, stand-by, etc.) and at a variety of locations, creates a variety of situations that are at the same time simple, complex, common, and unique. All are addressed in at least two sections, and maybe more, of the Code. Declaring that all small portable generators be integrally GFCI-equipped (especially without substantiating that any electrical ground-fault safety problem with non-GFCI-equipped generators exists) is premature, and time should be taken to examine closely all the conflicting issues.

Panel Meeting Action: Reject

Panel Statement: Section 590.6(A)(3) and the exception in 590.6(A) are not mutually exclusive since there are many generators on job sites that are larger than 15 kW and would not be required to comply with 590.6(A)(3) and could use the assured grounding program. Manufacturers of motors and countless other electrical appliances mark manufacturing dates on nameplates to indicate the date of manufacture of the equipment. See the panel statement in Comment 3-67.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

3-89 Log #1879 NEC-P03 **Final Action: Reject**

(590.6(A)(3))

Submitter: David Flegel, Reliance Controls Corp.

Comment on Proposal No: 3-140

Recommendation: Revise to read as follows:

590.6(A)(3) Receptacles on 15kW or less Portable Generators. All 125 volt ~~and 125/250 volt,~~ single phase, -15, -20, and 30-ampere receptacle outlets that are a part of a 15 kW or smaller portable generator shall have listed ground-fault circuit-interrupter protection for personnel. ~~Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted for use with 15 kW or less portable generators manufactured or remanufactured prior to January 1, 2011.~~

Substantiation: 1) As written, this proposal conflicts with Proposal 13-19, which intentionally does not require GFCI protection on 20- and 30-ampere 125/250 volt receptacles. This is specifically for the purpose of permitting a portable generator to be used for supplying power to a residential or small commercial system during a utility power outage according to text that appears in the substantiation:

"By limiting GFCI protection only to 15, 20-, and 30-ampere, single phase, 120 volt circuits, these small portable generators can still be used for supplying standby power for non-GFCI protected 20- and 30-ampere, and larger 120/240 single phase, 3-wire with ground... for houses and small commercial buildings. " While Proposal 13-19 and its substantiation may not appear to have an impact on Proposal 3-140, the fact remains that this will lead to considerable confusion in the marketplace. It will be quite possible to have two identical-appearing portable generators, one with GFCI protection on the 125/250 volt twistlock, and the other without.

2) All other means of supplemental GFCI protection for personnel should then continue to be allowed in view of the fact that the 125/250-volt receptacle is not GFCI protected.

3) There is a huge installed base of 2-pole residential transfer switches used for establishing a non separately derived system with a floating neutral portable generator. Generator manufacturer research has shown that the most common application for portable generators is for home standby systems (in excess of 70% of small portable generators sold.) A bonded neutral generator with GFCIs integral to the generator will not work at all on these systems. This is because generator bonding will cause a small amount of current to return to the generator through the grounding wire, causing an imbalance that will always trip the GFCI. Thus, GFCIs under power will not be able to establish a non-tripped condition. At a minimum, some provision should be made to allow for a non-GFCI protected 125/250 volt twist lock outlet which would then allow a generator to be used in this type of application.

Panel Meeting Action: Reject

Panel Statement: The requirements in the accept in principle in Proposal 3-140 are not in conflict with Proposal 13-19 since Proposal 3-140 applies only to construction installations and not to optional standby power for commercial and residential applications. A generator manufacturer may elect to manufacture a construction site generator and an optional standby power generator. The optional standby generator would not require GFCI protection on 30 ampere 125/250 volt four-wire power wiring to a residential or small commercial application.

The requirement in 590.6 only applies to generators used for temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities and would not apply to other applications. See the panel statement in Comment 3-67.

Number Eligible to Vote: 14

ARTICLE 600 — ELECTRIC SIGNS AND OUTLINE LIGHTING

18-65 Log #590 NEC-P18 **Final Action: Reject**

(600.2)

Submitter: Mark E. Duffy, GE Consumer & Industrial

Comment on Proposal No: 18-201

Recommendation: Revise to read as follows:

Neon or LED tubing that is itself the sign or outline lighting and is not attached to an enclosure or sign body.

Substantiation: Skeleton tubing can now also be done using LEDs. There are products that GE offers that fit this definition and are not made of glass. The definition should be updated to include "LEDs" also.

Panel Meeting Action: Reject

Panel Statement: Neon tubing is defined in 600.2. LEDs may simulate neon outline lighting but they do not fit definition/description of a neon tube. LEDs are not electric discharge lighting or filled with inert gases.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-66 Log #1933 NEC-P18 **Final Action: Accept**

(600.2 Neon Tubing)

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association

Comment on Proposal No: 18-200

Recommendation: Revise text to read as follows:

Neon Tubing. Electric-discharge luminous tubing that is manufactured into shapes ~~that~~ to illuminate signs, form letters, part of letters, skeleton tubing, outline lighting, other decorative elements, or art forms and filled with various inert gases.

Substantiation: Grammatical correction to more clearly represent action/intended use of neon tubing. Restore same word used in original ISA proposal.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-67 Log #397 NEC-P18 **Final Action: Accept**

(600.4(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 18-203

Recommendation: Reject the proposal.

Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

WELLS, J.: Benedictum, aestimo ooratoris cogitabundum et penitus investigatum argumentum una cum documento Latine subtiliter incluso.

18-68 Log #1183 NEC-P18 **Final Action: Reject**
(600.5(C)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-209
Recommendation: Accept the proposal with the following revisions:
Enclosures for signs and associated transformers and ballasts shall be permitted to be used for conductors supplying other signs, outline lighting systems, luminaires, and lampholders that are a part of a sign system.
Substantiation: Enclosures should be part of the sign system, not just part of a sign (singular). "Conductors" covers feeder, branch, and secondary wiring. Luminaires and lampholders that are not "floodlights" should be included.
Panel Meeting Action: Reject
Panel Statement: The recommended language is incomplete and in conflict with the submitter's Comment 18-69. The panel is not able to determine what parts of the two comments the submitter wishes to offer.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-69 Log #1688 NEC-P18 **Final Action: Reject**
(600.5(C)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-209
Recommendation: Accept the proposal revised as follows: Signs and enclosures for transformers, ballasts, and other equipment shall be permitted to enclose conductors associated with the sign(s) or outline lighting system if they comply with 110.3 and 110.26.
Substantiation: Reference to these two sections will specifically indicate those sections are applicable and not amended by this section.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 18-68.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-70 Log #763 NEC-P18 **Final Action: Reject**
(600.6)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-211
Recommendation: Accept the proposal.
Substantiation: The disconnecting means should be required for both branch circuits and feeders, not branch circuit OR feeder. The disconnecting means should be manually operable; remote control is "externally" operable.
Reflecting pools should be included; many do not have fountains.
The present wording of Exceptions No. 1 and No. 2 delete the requirements for a branch circuit disconnecting means.
Exception No. 1 should provide for directional signs that are not an exit, such as directions to the elevators, stairs, and "Do not use elevator in case of fire."
"Will" does not comply with 3.3.1 of the NEC Style Manual which states: "Do not write in the future tense."
Panel Meeting Action: Reject
Panel Statement: The additional substantiation provided with this comment is not sufficient for the panel to change their original panel action on Proposal 18-211. The panel's action on Proposal 18-210 adequately conveys the intent of this requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-71 Log #1675 NEC-P18 **Final Action: Reject**
(600.6)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-210
Recommendation: Accept the proposal with the following revisions:
Disconnects. Each sign and outline lighting system or each branch circuit and that portion of a feeder terminated at a sign or outline lighting system shall be controlled by an externally manually operated switch or circuit breaker that controls no other load and simultaneously opens all ungrounded conductors of the circuit it controls. Signs and outline lighting systems installed in pools or fountains shall have the disconnects located in accordance with 680.12.
Exception No. 1: A disconnecting means other than the branch circuit disconnecting means shall not be provided for exit signs or other directional signs.
Exception No. 2: A disconnecting means other than the branch disconnecting means shall not be required for cord-and-plug connected signs.
(A) Location.
(1) Within Sight of the Sign. The disconnecting means shall be within sight of the sign or outline lighting system it controls. Where the disconnecting means is not within sight from any section of the sign or outline lighting system, it shall be provided with an approved permanent means for locking the open (off) position.
(2) Within Sight of the Controller. The following shall apply for signs and outline lighting systems operated by electronic or electromechanical controllers located external of the sign or outline lighting system.
(a) A switch or circuit breaker shall be provided within sight of the controller or within the controller enclosure.
(b) The disconnecting means shall simultaneously disconnect all ungrounded conductors supplying the sign or outline lighting system and the controller.
(c) The disconnect means shall be provided with an approved permanent means for locking in the open (off) position.
Substantiation: The panel action requires a feeder disconnect that controls no other load which in effect requires a dedicated feeder. Feeders are generally not restricted to one type of load. Switches and circuit breakers should be specified as externally manually operable and providing simultaneous disconnection of ungrounded conductors.
In Exception No. 1, a branch circuit disconnecting means is required for exit signs.
In Exception No. 2, normally the cord, not the sign, has the attachment plug.
In (A)(2)(1), "permitted" does not impose a requirement per 90.5(B) and is not enforceable.
Proposed (A)(2)(3) reduces unnecessary verbiage.
Panel Meeting Action: Reject
Panel Statement: In the case of large signs, feeders are used to supply the sign and therefore there are installations where a dedicated feeder is required for some large signs. If no directional signs are required to have a disconnect then the sign in the parking lot that says "park here" in the shape of an arrow would not require a disconnect. The proposed change to Exception No. 2 is redundant. "Permitted in (A)(2)(1)" recognizes the fact that there are other means of disconnecting the sign feeder or circuit. The rewrite of (A)(2)(3) is not necessary as the panel intends for the requirements to be stated in full.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-72 Log #1934 NEC-P18 **Final Action: Accept**
(600.6)

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-210
Recommendation: Revise text to read as follows:
600.6 Disconnects. Each sign and outline lighting system, feeder circuit, or branch circuit supplying a sign, outline lighting system, or skeleton tubing shall be controlled by an externally operable switch or circuit breaker that will open all ungrounded conductors. The switch or circuit breaker shall open all ungrounded conductors simultaneously on multi-wire branch circuits in accordance with 210.4(B). Signs and outline lighting systems located within fountains shall have the disconnect located in accordance with 680.12.
Substantiation: A Multiwire branch circuit, as defined in the 2008 NEC is a common branch circuit supplying signs and outline lighting, and poses a significant safety hazard because it exposes sign service personnel to servicing equipment that may be only partially de-energized. In the 2008 Code Cycle, 210.4(B) was introduced and adopted to mitigate this potential shock and arc hazard. A special condition for disconnecting signs in fountains is included in 600.6. A multiwire branch circuit supplying a sign is also a special situation for a sign disconnecting means. Logically, this special requirement for disconnects should be referenced in 600.6. CMP 18 applied the disconnect rule for multiwire branch circuits to luminaires. (410.130(C)(2))Including the reference to 210.4(B) is necessary because unlike a disconnect located on a sign, the *disconnect for a multiwire branch circuit must be at the location where the branch circuit originates*. Including a reference for the disconnecting requirement for multi-wire branch circuits will contribute to the safety of sign personnel servicing signs and outline lighting just as it has for safe maintenance of luminaires covered in 410.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-73 Log #244 NEC-P18 **Final Action: Accept**
(600.6(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 18-213
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered by Code-Making Panel 18 based upon the action of Code-Making Panel 1 taken on Proposal 1-63.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the Technical Correlating Committee direction to review their action on Proposal 18-213 and rejects that action.

Panel Statement: Because Proposal 1-63 was rejected, the term "lockable" is not an appropriate substitute for the text of 600.6(A) contained in the 2008 edition of the NEC. The panel directs staff to restore the 2008 text for this section.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-74 Log #929 NEC-P18 **Final Action: Reject**
(600.6(A))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 18-213

Recommendation: Accept the proposal with the following revisions:

Location. (1) Within sight of the sign. The disconnecting means shall be within sight of the sign(s) or outline lighting system(s) that it controls, and where not in or on the sign shall be readily accessible. Where the disconnecting means is not within sight of any part of an electric sign or outline lighting system it shall be provided with an approved permanent means for locking in the open (off) position.

(2) Within sight of the Controller. The following shall apply for signs and outline lighting systems operated by electronic or electromechanical controllers located remote from the sign or outline lighting system:

(1) The disconnecting means shall be readily accessible and located within sight of the controller or in the controller enclosure.

(2) The disconnecting means shall simultaneously disconnect all ungrounded conductors supplying the controller.

(3) The disconnecting means shall be provided with an approved permanent means for locking in the open (off) position.

Substantiation: Disconnecting means not in or on the sign should be readily accessible. The present "external" implies "remote." If the disconnecting means disconnects the controller, it will likely disconnect the sign. The proposal for locking is concise and requires locking in the open (off) position, not open cover or door position. (A)(2)(1) permits, but does not require the disconnect in sight of the controller. See 90.5(B).

Panel Meeting Action: Reject

Panel Statement: The panel rejects the recommendation based on their action on Comment 18-72. The concept of requiring the controller disconnecting means to be readily accessible is introducing a concept that was not discussed in Proposal 18-213. Although the panel is of the opinion that this provision is warranted, it needs to be submitted as a Proposal with technical substantiation for the 2014 edition of the NEC and subjected to public review and comment.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-75 Log #2632 NEC-P18 **Final Action: Reject**
(600.6(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 18-213

Recommendation: Accept the proposal as written, contingent on the companion comment to this being accepted by CMP 1.

Substantiation: The additional material need not be duplicated if the relevant text enters Chapter 1. The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:

"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 18-73.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-76 Log #1935 NEC-P18 **Final Action: Reject**
(600.6(A)(1) and 600.6(A)(2)(3))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association

Comment on Proposal No: 18-213

Recommendation: Revise text to read as follows:

600.6(A)(1) The disconnecting means…shall be ~~lockable~~ capable of being locked in the open position.

600.6(A)(2)(3) The ~~lockable~~ disconnecting means shall be designed such that no pole can be opened independently and shall be capable of being locked in the open position.

Substantiation: The TCC has recommended that CMP 18 reconsider its inclusion of *Lockable* in 600.6(A) because the proposal to add *lockable* to the Article 100 definitions was rejected by CMP-1. (1-63 Log #156, NEC-P01). I agree with Mr. Carpenter's conclusion, as noted in the Explanation of the Negative Vote, the terminology should not be used in 600.6.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 18-73.

Ballot Results: Affirmative: 12

18-77 Log #2633 NEC-P18 **Final Action: Accept**
(600.6(A)(1) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 18-214

Recommendation: Continue to reject the proposal.

Substantiation: The panel has cured the problem by placing a "no other load" provision in 600.6 under Proposal 18-210. This was the single most essential characteristic of Proposal 18-214. The reason this comment is submitted is to take exception to the panel statement that the proposal was substantiated by a code violation. The scenario described was not a violation of the literal text of the current code, as the substantiation carefully set forth, step by step, showing how every provision of the rule was literally satisfied, however outrageous the result. The litigating attorney had the same problem.

It would be a violation of the code as now will amended by CMP 18, and that was the point. The proposal, in effect, was accepted in principle, at least in the most relevant part. This submitter is satisfied that the concern has been adequately addressed, but the panel statement required a response on the written record.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-78 Log #1181 NEC-P18 **Final Action: Reject**
(600.7(A)(1) Exception)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 18-216

Recommendation: Accept the proposal with the following revisions:

(A)(1) Exception: Listed cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation and durably marked to indicate such protection.

Substantiation: 250.110, Exception No. 3 requires double-insulated equipment to be listed which includes the double insulation. This section appears to amend the listing requirement with no substantiation. If the sign is listed, the listing protocol will include the double insulation. Such double insulation, not part of listed equipment, cannot be evaluated by the installer or Authority Having Jurisdiction. (A)(2) and (B)(2) are already covered by Article 250. See 90.3

Panel Meeting Action: Reject

Panel Statement: Adding "listed" is redundant. 600.3 requires all electric signs to be listed. The cord is an integral part of a sign that would have to be listed under the requirement in 600.3 and the sign safety standard.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

18-79 Log #1199 NEC-P18 **Final Action: Reject**
(600.7(A)(1) Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-216
Recommendation: Accept the proposal with the following revisions:
Exception: Listed cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation and durably marked to indicate such protection.
Substantiation: 250.110, Exception No. 3 requires double-insulated equipment to be listed which includes the double insulation. This section appears to amend the listing requirement with no substantiation. If the sign is listed, the listing protocol will include the double insulation. Such double insulation is not part of the listed equipment and cannot be evaluated by the installer or AHJ.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Comment 18-78.

Ballot Results: Affirmative: 12

18-80 Log #903 NEC-P18 **Final Action: Reject**
(600.8(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-226
Recommendation: Accept the proposal with the following revisions:
(A) Strength. Enclosures shall have mechanical strength and durability that provides protection for the enclosed equipment.
Substantiation: 110.3 uses the phrase that is proposed which is more specific than "ample" which is subjective and not Code defined.
Panel Meeting Action: Reject
Panel Statement: The substantiation has not demonstrated that the use of "ample" in this section is not clearly understood by qualified persons.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-81 Log #764 NEC-P18 **Final Action: Reject**
(600.8(A) and (D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-266
Recommendation: Accept with the following revisions:
"(A) Enclosures shall comply with 110.3(A)(1) through (8) and (B).
(D) Metal parts shall be corrosion resistant or protected from corrosion by approved means."
Substantiation: Section 110 provides specific provisions, whereas "ample strength and rigidity" is subjective.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 18-80.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-82 Log #928 NEC-P18 **Final Action: Reject**
(600.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-227
Recommendation: Accept the proposal with the following revisions:
In (A) Support. Portable and mobile signs shall be securely supported.
Delete (B).
(C)(1) Cords. Flexible cords shall comply with 400.3, contain an equipment grounding conductor, and not exceed 4.5 m (15 ft) in length.
(2) Ground-Fault Circuit Interrupter. Portable and mobile signs in wet locations shall be provided with GFCI protection.
Delete (D).
Substantiation: Other type cords that comply with 400.3 should be acceptable. Many small portable signs with cords are directly connected, the present (C) doesn't address cord length in wet locations. Mobile signs that are on vehicles with integral self-contained power supply such as a generator or solar panels commonly used in highway and other construction are directly wired without cords or plugs. Proposed (C)(1) covers present (D).
Panel Meeting Action: Reject
Panel Statement: The substantiation included in this comment does not provide additional information to support the recommended change and does not demonstrate that the current requirement is being misapplied. See the panel statement on Proposal 18-227.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-83 Log #1182 NEC-P18 **Final Action: Reject**
(600.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-227
Recommendation: Accept the proposal with the following revisions:
In (A), change "adequately" to "securely".
(B) Attachment Plug. A grounding type attachment plug shall be provided for each portable or mobile sign equipped with a flexible cord.
(C)(1) All cords shall be a hard usage or extra-hard usage type that contains an equipment grounding conductor and complies with 400.3.
Exception: In dry locations, cords shall be permitted to be SP2, SPE-2, or SPT-2.
Delete (D).
Substantiation: "Adequately" is subjective and a term to be avoided per the NEC Manual. "Secured" and "securely" are terms used many times in the NEC. Cords should be noted to comply with 400.3, since all are not suitable for wet locations or sunlight resistance and this section may be deemed to amend 400.3.
Panel Meeting Action: Reject
Panel Statement: The substantiation has not demonstrated that the use of the cited terms in this section is not clearly understood by qualified persons. The product standard adequately addresses the types of cords that are acceptable for this application and again, the substantiation does not demonstrate that there are hazards created by the current requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(600.12(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 18-232
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the direction of the Technical Correlating Committee to review the comment made on the affirmative vote and amends the panel action on Proposal 18-232 to reference 600.24 in 600.12(C)(2).
Panel Statement: The panel has reviewed the comment expressed in the Panel voting and agrees that the panel action refers to the incorrect section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-86 Log #1936 NEC-P18 **Final Action: Accept in Principle**
(600.12(C))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-232
Recommendation: Revise text to read as follows:

600.12(C) Class 2. Secondary Class 2 circuit wiring shall be installed in accordance with ~~either of~~ the following:

~~(1) Any wiring method included in 600.33 and in Chapter 3 suitable for the conditions~~

(~~2~~1) Where the power source provides Class 2 output and complies with 600.2~~433~~, any wiring method identified in 600.33, Chapter 3 or 725.III, as determined by the installation conditions, shall be permitted.

Substantiation: The notation by the TCC suggests the final wording of 600.12(C) will be corrected during the public comment stage. The comment by P. Costello is valid. Class 2 power sources are covered in 600.24, not 600.33. But solely making that correction is not sufficient. Use of the term "suitable" in (C)(1) is a term that is vague and possibly unenforceable, as described in the NEC Style Manual. Two subsections are redundant and not necessary to state the rule for Class 2 *field installed wiring*.

725.III contains wiring rules that most closely match Class 2 circuit *field wiring* for LED illuminated signs. Rules in 725.III have been incorporated in Article Article 600 since 2005. The Code Panel Meeting Action this code cycle indirectly refers to Article 725 in ROP 18-241. Additionally, a reference to Article 725 is in new 600.33 [ROP 18-249a].

It appears contradictory for CMP 18 to apply the rationale that Article 725 does not apply to electric signs [18-245] while globally incorporating references to Chapter 3 in 600. As defined by the *Code*, both electric signs and appliances are utilization equipment. Chapter 3 and 725 do not pertain to wiring that is part of utilization equipment but both are referenced throughout Article 600 because they contain rules generally applicable to *field installed wiring* in signs.

Panel Meeting Action: Accept in Principle

Revise 600.12(C) to read as follows:

600.12(C) Where the installation complies with 600.33 and the power source provides a Class 2 output that complies with 600.24 either of the following wiring methods shall be permitted as determined by the installation conditions.

(1) Wiring methods identified in Chapter 3
(2) Class 2 cables complying with Part III of Article 725.

Panel Statement: The panel action clarifies the permitted wiring methods and installation requirements for circuits on the secondary side of a Class 2 power supply.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

WRIGHT, R.: The agreed action was to use the "wiring methods" (wire and cable) from 725 Part III not the requirements. This will only confuse the reason for 600.33 and the installation requirements placed in this section to regulate Class 2 secondary wiring in signs. The Panel Statement is clear and clarifies the intent. 725 Part III is combined with Class 2 and Class 3 requirements. Class 3 is a higher low voltage requirement and is not intended to allow the equipment grounding conductor exception we allowed for Class 2 only. See 600.7 (B) 1 Exception. (2010 Draft)

18-87 Log #902 NEC-P18 **Final Action: Reject**
(600.22(B) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-236
Recommendation: Accept the proposal with the following revisions:

Add new Exception after (B) to read as follows:

Exception as specified in 410.130 (E).

Substantiation: The panel reference to 410.30 is irrelevant; it relates to support; the proposal relates to 410.130. This section amends 410.130 and and can result in thermal protection deenergizing exit fixtures and luiminaries necessary for safe egress.
Panel Meeting Action: Reject
Panel Statement: The submitter has not documented a problem to substantiate a change in the Code. See Section 90.3. Article 600 modifies Chapters 1 thru 4 of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-88 Log #1937 NEC-P18 **Final Action: Reject**
(600.23(F))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-238
Recommendation: Revise text to read as follows:

~~600.23(F) Marking. Transformers and electronic power supplies that are equipped with secondary-circuit ground-fault protections shall be so marked.~~

Substantiation: All transformers and electronic power supplies are required to be listed. (600.23(A). Labeling of transformers and electronic power supplies is a requirement of an electrical product standard and listing. UL2161 adequately details transformer marking and labeling. 600.23(B) clearly identifies types of transformers that do not require secondary ground fault equipment protection. This addition is redundant and should be removed.
Panel Meeting Action: Reject
Panel Statement: Retention of the marking requirement is considered necessary to ensure that these special units are marked. This provides direction to the power supply manufacturer, sign manufacturer, follow-up services, and electrical inspector that helps eliminate any confusion or misapplication of product.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-89 Log #1938 NEC-P18 **Final Action: Accept in Principle**
(600.24(A))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-241
Recommendation: Revise text to read as follows:

600.24 (A) Listing. Class 2 power supplies and power sources shall be listed or identified for use with electric signs and outline lighting systems.

Substantiation: Class 2 power supplies and power sources used in UL listed signs are not listed, but are "Recognized Components" within an Underwriter Laboratories procedure for listing Class 2 LED sign illumination systems. Compliance with the rule as written is not possible. The use of non-listed "Recognized Component" Class 2 power sources in UL Listed signs raises a compliance issue for the AHJ and sign company.

Qualified electrical testing laboratories other than UL employ different protocols for listing Class 2 sign systems and are not bound by UL's proprietary Recognized Component procedure. They should have the latitude to accept a Listed Class 2 power source, that is not limited to use in signs and outline lighting, but meets the voltage and load requirements of a low voltage sign illumination system.

Adding "identified" can lead to a resolution of these issues because it will provide the latitude to use either a listed Class 2 power source or a Recognized Component with its limited use, in a sign listed by a qualified testing laboratory.

"Identified", is defined in 100 as "recognizable as suitable for the specific purpose, function, use, environment, application…" This definition closely matches the procedure employed by UL for Class 2 LED illumination systems. UL's "Component Recognition" and proprietary *Sign Component Manual* (SAM) is an example of the circumstance alluded to in the Informational Note accompanying the definition for "Identified". Suitability for a specific purpose has been determined under a system employed by a qualified electrical testing laboratory. Adding "identified" will clarify for the AHJ that the use of UL Recognized Component Class 2 power supplies and power sources meets the *Code* requirement for listing while at the same time providing an option to use a listed general use Class 2 power source in LED sign and outline lighting installations.
Panel Meeting Action: Accept in Principle

Revise the recommendation to read:

600.24 (A) Listing. Class 2 power supplies and power sources shall be listed for use with electric signs and outline lighting systems or shall be a component in a listed electric sign.

Panel Statement: The panel action covers listed power supplies and power supplies that are recognized components in an electric sign that has an overall listing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-90 Log #1939 NEC-P18 **Final Action: Reject**
(600.24(B))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-241
Recommendation: Revise text to read as follows:
600.24(B) Grounding. Metal parts of Class 2 Power Sources and enclosures ~~signs and outline lighting systems~~ shall be grounded and bonded in accordance with 600.7.
Substantiation: CMP 18 member Wright called attention to a potential misunderstanding and problem regarding the grounding of Class 2 sign illumination systems. The title of this Section is "Class 2 Power Sources" and the grounding rule in this Section should be specific to these devices, not a description of sign or outline lighting system metal parts, such as in Section Letters remote from the power source. A modification of the text is needed to more clearly harmonize the rule with the Section Title.
Some Class 2 Power Sources are non-metallic with hubs for the attachment of a conduit assembly or box for the connection of the branch circuit with the equipment ground to the Class 2 Power Source. Other Class 2 Power Sources have no hub for the connection of the branch circuit and must be installed in a metal enclosure which is required to be bonded to the equipment ground conductor. The same applies to the majority of the power sources having metal bodies that are bonded to the branch circuit equipment ground even though no bonding will be required for remote metal parts on the load side under the provisions of 600.7(B)(1). [ROP 18-223].
Modifying the syntax of 600.24(B) will address this concern and contribute to a clearer understanding that grounding rules in this section apply to Class 2 power sources and their associated metal parts whether located as a remote subsection of a Section Sign or located within a metal Section Letter sign body.
Panel Meeting Action: Reject
Panel Statement: The word "systems" includes the enclosures and power supplies. Acceptance of the recommendation does not provide additional clarity to the grounding and bonding requirements.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-91 Log #767 NEC-P18 **Final Action: Reject**
(600.32(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-248
Recommendation: Accept the proposal.
Substantiation: See the Explanation of Negative Vote for Proposal 7-9 for 320.12(1) of the 2010 Report on Proposals.
Panel Meeting Action: Reject
Panel Statement: Until such time that each change or maintenance done on the electrical of a facility and has an inspection, "likely" still remains subjective and unenforceable. The panel concurs with the action of CMP 7 taken on Proposal 7-9.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(600.32(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-248
Recommendation: Accept the proposal.
Substantiation: Conductors may not be subject to physical damage when first installed, but conditions may indicate that damage is likely to occur. "Likely" is a term used more than 80 times in the NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 18-91.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-93 Log #1940 NEC-P18 **Final Action: Accept in Principle**
(600.33)

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-249a
Recommendation: Revise text to read as follows:
600.33 LED Sign Illumination Systems, Secondary Wiring. The wiring methods and materials shall be installed in accordance with the sign manufacturer's installation instructions using any applicable wiring methods from Chapter 3 and 725.III.
Substantiation: Solely referencing Chapter 3 is inadequate because Chapter 3 does not contain requirements for Class 2 circuits. Only 725.III contains wiring that most closely matches Class 2 circuit field installed wiring for LED illuminated signs. The Code Panel Meeting Action indirectly refers to Article 725 in 18-241 Log #3548. [ROP 18-241] Additionally a reference to 725 is in new 600.33(A). [ROP 18-249a].
As far as the applicability of 725 to electric signs, the rationale employed by CMP 18 as the basis for rejecting 18-245 Log #4039 (600.24(D) is inconsistent with its other current and prior actions during the 2005 and 2008 *Code* cycles, incorporating references to 725 in 600. The rationale for rejecting references to 725 appears contradictory while globally incorporating references to Chapter 3 in 600. As defined by the *Code*, both electric signs and appliances are utilization equipment. Chapter 3 and 725 do not pertain to wiring that is part of utilization equipment but both are referenced throughout 600 because they contain basic rules for installing field wiring in signs. In as much as it is not feasible to copy all the rules in 725.III that fit Class 2 field wiring in signs, including a reference to 725.III will point the Code user to these additional rules for an electrically safe installation.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
600.33 LED Sign Illumination Systems, Secondary Wiring. The wiring methods and materials shall be installed in accordance with the sign manufacturer's installation instructions using any applicable wiring methods from Chapter 3 and the requirements for Class 2 circuits contained in Part III of Article 725.
Panel Statement: The panel action clarifies the intent that only the requirements for Class 2 circuits contained in Article 725 are applicable.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
WRIGHT, R.: I believe the work "requirements" was substituted for "wiring methods". The agreed upon action was to use only Class 2 wiring methods(wire and cable) as referenced in 725 Part III. The installation procedures shall be taken from 600.33.

18-94 Log #2892 NEC-P18 **Final Action: Accept in Principle**
(600.33)

Submitter: Randall K. Wright, RKW Consulting
Comment on Proposal No: 18-249a
Recommendation: Revise text as follows:
600.33 LED Sign Illumination Systems, Secondary Wiring. The wiring methods and materials shall be installed in accordance with the sign manufacturer's installation instructions using any applicable wiring methods from Chapter 3~~:~~ or the wiring methods in 600.33 for the secondary wiring of LED sign illumination systems where supplied by a listed Class 2 power source.
Substantiation: To clarify the wiring methods need to be from Chapter 3 and when secondary wiring is provided from a listed Class 2 power supply this wiring can be modified as outlined in 600.33. The task group wanted to keep the wiring methods in Article 600 for use in signs and channel letters.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Comment 18-93 addresses this recommendation and substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
CARPENTER, F.: The comment referenced in the panel statement is incorrect; it should be Comment 18-93. The panel statement should read, "The panel action on Comment 18-93 addresses this recommendation and substantiation."
WRIGHT, R.: The reference to 18-94 in the Panel Statement is incorrect. It should refer to 18-93.

18-95 Log #1941 NEC-P18 **Final Action: Accept in Principle**
(600.33(A))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-249a
Recommendation: Revise text to read as follows:
600.33(A) Insulation and Sizing of Class 2 Conductors. Listed Class 2 cable that complies with Table 725.154(G) shall be installed on the load side of the Class 2 power source. The conductors shall be sized for the load and not be smaller than 22 AWG.
Substantiation: Improperly sized conductors on the load side can result in over-heating and pose a fire safety hazard. The secondary circuit load is the accepted basis for determining the conductor size.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
600.33(A) Insulation and Sizing of Class 2 Conductors. Listed Class 2 cable that complies with Table 725.154(G) shall be installed on the load side of the Class 2 power source. The conductors shall have an ampacity not less than the load to be supplied and shall not be sized smaller than 22 AWG.

Panel Statement: The panel action revises the text to use language regarding the sizing of conductors that is used elsewhere in the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-96 Log #2890 NEC-P18 **Final Action: Accept in Principle**
(600.33(A))

Submitter: Randall K. Wright, RKW Consulting
Comment on Proposal No: 18-249a
Recommendation: Revise text as follows:
(A) Insulation and Sizing of Class 2 Conductors. Listed Class 2 cable that complies with Table 725.154G shall be installed on the load side of the class 2 power source. The conductors shall be sized for the load and shall not be smaller than 22 AWG.
Substantiation: For clarity as a reminder to size the wire for the load.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 18-95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-97 Log #1942 NEC-P18 **Final Action: Accept in Principle**
(600.33(A)(1) and (2))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-249a
Recommendation: Revise text to read as follows:
600.33(A)(1) Wet Locations. Class 2 cable used in a wet location shall be identified for use in wet locations. ~~or have a moisture impervious metal sheath.~~
600.33(A)(2) D~~amp~~ry Locations. Class 2 cable used in a d~~amp~~ry location shall be identified for use in a ~~damp~~ dry location. ~~or shall have the outer jacket of sunlight and moisture resistant nonmetallic material.~~
Substantiation: Describing the cable construction is a function of the entity that has identified the cable as suitable for use in the environment it is installed in. Specifying the cable design is superfluous and not necessary since its identification will be the result of third party evaluation.
The FPN (Informational Note] to the *Code* definition of *Identified* states that suitability for the environment includes "investigations by a qualified testing laboratory, listing and labeling, an inspection agency or other organizations concerned with product evaluation."
With all due respect to Mr. Carpenter, the Explanation of Negative is not a historically valid reason for rejecting a *Code* rule. There is a long *Code* history of adopting rules requiring electrical equipment and devices that are not in production at the time a *Code* rule is adopted. If this rationale would have been used in 1996 by CMP 18, there would be no GFPE neon transformers. In more universally recognized rules that preceded the availability of a *Code* compliant devices, GFCI Receptacles, Combination GFCI and Arc Fault Receptacles, and Tamper Resistant Receptacles are examples.
Amending "Damp" to "Dry" simplifies the requirements for Class 2 secondary cable, providing two alternatives for the sign designer and installer, easily associated with indoor and outdoor installations of exposed Class 2 cable.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 18-98 addresses the intent of the recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-98 Log #2891 NEC-P18 **Final Action: Accept**
(600.33(A)(2))

Submitter: Randall K. Wright, RKW Consulting
Comment on Proposal No: 18-249a
Recommendation: Delete text as follows:
~~**(2) Damp Locations.** Class 2 cable used in a damp location shall be identified for use in a damp location or shall have the outer jacket of sunlight- and moisture-resistant nonmetallic material.~~
Substantiation: The task group removed this cable since it does not currently exist; the wire will need the same characteristics as used in a wet location when used in a damp location. The section "other" will allow any new or other cables to be developed or used in a specific use.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-99 Log #1932 NEC-P18 **Final Action: Accept**
(600.33(B))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-249a
Recommendation: Revise text to read as follows:
600.33(B) Installation. ~~Circuits~~ Wiring shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D).
Substantiation: Wiring makes up a Class 2 illumination circuit, and *wiring* more appropriately describes the content of the rule. *Wiring* harmonizes with the title of the section, "Secondary Wiring" and is consistent with the other sections under Part II covering installation of field installed secondary wiring.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-100 Log #1931 NEC-P18 **Final Action: Accept**
(600.33(B)(1))

Submitter: David Servine, Channelume/Let-R-Edge Co. / Rep. International Sign Association
Comment on Proposal No: 18-249a
Recommendation: Add new text to read as follows:
600.33(B)(1) Connections in cable and conductors shall be made with listed insulating devices and be accessible after installation. Where made in a wall, connections shall be enclosed in a listed box.
Substantiation: Connections in Class 2 cable are likely. 110.14(A) and (B) contains rules for terminating and splicing conductors, and by *Code* structure applies to wiring in 600.33. The goal of placing all requirements, as is practical, for field wiring Class 2 sign illumination in 600.33 requires addition of a rule for splicing Class 2 Cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-101 Log #758 NEC-P18 **Final Action: Reject**
(600.41)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-252
Recommendation: Accept revised as follows:
"Field-installed skeleton tubing shall not be installed where likely to be subject to physical damage. Where readily accessible to other than qualified persons, it shall be guarded by approved means."
Substantiation: Tubing may not be subject to physical damage at the time of installation or inspection, but conditions may indicate the likelihood of damage. The definition of "Guarded" in Article 100 is clear and comprehensive regarding purpose and uses the term "likelihood." "Likely" is used over 80 times in the NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 18-252. Additionally, the submitter does not identify the subsections in 600.41 to which the recommended changes would apply.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 604 — MANUFACTURED WIRING SYSTEMS

19-201 Log #27 NEC-P19 **Final Action: Reject**
(604.6(A)(2) Exception No. 2)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 19-294
Recommendation: Accept the proposal
Substantiation: Accepting this proposal will make the text of 604.6(a)(2) exception 2 correlate with the title of Article 800. "Communications Circuits".
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to reject Proposal 19-294.
The submitter has not provided any additional substantiation for the proposed revision.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-202 Log #2634 NEC-P19 **Final Action: Accept**
(604.6(A)(2) Exception No. 3 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-295
Recommendation: Accept the proposal in principle.
Change "permitted in Article 348 when supplied with fittings and conductors" to "permitted by 348.20(A) provided the wiring systems are supplied with fittings and conductors at the time of manufacture."
Substantiation: This wording avoids the whole-article reference prohibition in the NEC Style Manual at 4.1.1, as well as an incorrect use of the word "when" because this is not a condition of time. This wording also clarifies that the special fittings are to be supplied by the system manufacturer.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-203 Log #246 NEC-P19 **Final Action: Accept**
(604.6(A)(2) Exception No. 3 to (2) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-295
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal regarding 4.1.1 of the NEC Style Manual to not reference an entire article.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 19-202.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-204 Log #780 NEC-P19 **Final Action: Reject**
(604.6(A)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-293
Recommendation: Accept the proposal with the following revisions:
Hard usage and extra-hard usage types, flexible cords and cables not exceeding 1.8 m (6 ft) in length that comply with 400.3, with an equipment grounding conductor, and minimum 12 AWG conductors shall be permitted as part of a listed factory-made assembly where making a transition between components or a manufactured wiring system and utilization equipment not permanently secured in place. The flexible cord and cable shall be visible for its entire length and not subject to strain on terminations or physical damage.
Substantiation: Flexible cables should be permitted and cords and cable should be noted to comply with 400.3, since this section may be perceived as amending it. All hard usage and extra-hard usage type cords and cables may not be suitable, e.g., electric vehicle cables and those not designated "W" for wet locations and sunlight resistance. An EGC should be specified. "Not subject to strain" permits use of strain relief devices. The 6 ft restriction should specifically apply to the flexible cord, not the factory made assembly.
Panel Meeting Action: Reject
Panel Statement: Article 400 applies except as amended according to 90.3. so there is no need to refer to 400.3. To reiterate the panel statement on Proposal 19-293: "flexible cord is only permitted to be used as part of a listed factory made assembly...". Therefore, its suitability for the intended application will be determined as part of its listing. Flexible cord always contains an equipment grounding conductor. Other flexible cables either have an equipment grounding conductor or are recognized as an equipment grounding conductor in 250.118. The requirement to always provide strain relief makes it unnecessary to determine if strain will be present or not. No substantiation was provided to limit the 6 ft length to flexible cord only.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-205 Log #1617 NEC-P19 **Final Action: Accept**
(604.6(A)(4))

Submitter: Thomas R. Lichtenstein, Underwriters Laboratories Inc.
Comment on Proposal No: 19-296
Recommendation: Revise text to read as follows:
604.6(A)(4) Busways. Busways shall be listed ~~plug-in or~~ continuous plug-in type containing factory mounted, bare or insulated conductors, which shall be copper or aluminum bars, rods, or tubes. The busway shall be ~~grounded and~~ provided with an equipment ground ~~busbar equivalent in size to the ungrounded busbar~~. The busway shall be rated nominal 600 volts, 20, 30, or 40 amperes. Busways shall be installed in accordance with 368.12, 368.17(D), and 368.30.
Substantiation: Manufactured Wiring Systems are typically comprised of modular connector, plug together type systems. They are installed in locations that are accessible to the general public. They are found in Computer Rooms, Libraries and Universities on chair and table systems to power laptop computers and other electronic devices. The traditional "plug-in" busway that ROP Proposal 19-296 wants to include, requires the removal of a cover to make a plug in connection to the busway. When the cover is removed, there is full access of the unisulated live bus bars by users. To allow the use of plug-in busway has the potential to expose the general public to an electrical shock hazard.
The addition of busways to Article 604 in the 2008 Code was specifically limited to Continuous Plug-in Busway because of the more restrictive accessibility requirements (UL 857 Standard for Safety for Busways, Articulated Finger Probe - Figure 2 below). UL 857 defines Continuous plug-in busway as suitable for use within the reach of persons. Other busway types are not required to meet the more restrictive accessibility requirements to uninsulated live parts. The panel must reject plug-in type busways to protect the public from a potential shock hazard. See information provided below.
Panel Statement From 2008 Cycle.
2008 19-132 Log #1710
Panel Statement: The panel accepts in principle the addition of busway as a wiring method and describing construction, ratings and use of the busways. The panel replaced "trolley type" busway with "continuous plug-in type" busway because trolley type may be provided with accessible uninsulated live parts and is not intended to be placed within reach of individuals. A continuous plug-in busway has no exposed bus bars, and is intended for general use, including installation within the reach of persons. Busway is not sized in AWG so guidance on the acceptable ampacity of the branch circuit busway is required. 20 – 40 amps falls within the current 12 - 8 AWG wire range accepted in Article 604.
Included below are references from UL 857 to support the above statements.
ANSI/UL 857 Thirteenth Edition Dated March 25, 2009
2.3.4.3 Continuous plug-in busway
2.3.4.3.1 In Canada and Mexico, a continuous plug-in busway is rated at 400 A or less, has no exposed bus bars, and is intended for general use, including installation within the reach of persons. In the United States, a continuous plug-in busway is rated at 225 A or less.
7.2.5 An opening for a plug-in device in other than a continuous plug-in busway or a lighting busway shall:
a) Be provided with a cover that is hinged, sliding, or otherwise secured against removal and with a latch or the equivalent to hold the cover in a closed position or
b) Have each uninsulated live part inside the enclosure recessed behind the plane of the opening by a distance no less than the smaller dimension of the opening, and
1) The opening is no larger than 9.5 mm by 15.9 mm (3/8 in by 5/8 in) or
2) If the opening has one dimension larger than 15.9 mm (5/8 in), it will not admit a 6.7 mm (17/64 in) diameter rod.
7.2.6 In a continuous plug-in busway or a lighting busway that is not also rated as a trolley busway, the size of the openings that accommodate plug-in devices, the insulation on the bus bars, or both, shall be such that adequate guarding against unintentional contact with a bare live part will be provided.
7.4.5 For a continuous plug-in busway, an uninsulated live part shall be located or shielded so it is not accessible to unintentional contact by persons during intended use.
7.4.6 An uninsulated live part shall be considered inaccessible if a probe as illustrated in Figure 2 cannot be made to touch any part that involves the risk of electric shock to earth ground or to another uninsulated live part when the system is completely installed as intended. No force shall be used when placing the probe in the opening.
We support the rewording of the section addressing the ground bus bars and equipment grounding.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 8 Negative: 1

Explanation of Negative:
MCNEIVE, T.: In discussion leading to the decision to accept comment 19-205, which results in rejection of proposal 19-296, the submitter of the comment and the code-making panel agreed in principle that plug-in type busway is not intrinsically less safe than continuous busway when installed for normal use as a manufactured wiring system. The panel's conclusion was based solely on unwarranted concerns that by design, plug-in type busway may permit access by maintenance personnel to current carrying components on the interior of the busway if the doors or covers are not closed. It is true that one of the features of plug-in type busway is its versatility that enables outlets (taps) the be added or removed. However, by their very nature and definition, manufactured wiring systems are typically designed for a single use and are not expected to be modified or to require maintenance, except perhaps complete replacement, over their life time. The panel also conceded that the uses of manufactured wiring systems constructed of busway are typically such that they are located out of the reach of unqualified personnel, even though Article 368 does not require such placement for busway.

19-206 Log #247 NEC-P19 **Final Action: Accept**
(604.6(A)(5) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-297
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal regarding complete sentences to comply with 3.3.1 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Revise (5) to read as follows:
(5) Raceway. Prewired, modular, surface mount raceways shall be listed for the use, rated nominal 600 volts, 20 amp, and installed in accordance with 386.12, 386.30, 386.60 and 386.100.

ARTICLE 605 — OFFICE FURNISHINGS (CONSISTING OF LIGHTING ACCESSORIES AND WIRED PARTITIONS)

18-102 Log #900 NEC-P18 **Final Action: Reject**
(605.6)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-258
Recommendation: Accept the proposal.
Substantiation: There is nothing in this article that specifically requires a panelboard, and no prohibition of a branch circuit supplied by a single enclosed circuit breaker or fused switch.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 18-257 has removed the second sentence of 605.6, thus this comment is not applicable.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-103 Log #714 NEC-P18 **Final Action: Reject**
(605.7)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-263
Recommendation: Accept the proposal and revise as follows:
Partitions of the free-standing type (not fixed) shall be connected to the building wiring system by an approved wiring method that includes an equipment grounding conductor.
Substantiation: Chapter 3 does not include Article 4 which is permitted by 605.8. The wiring method should provide an EGC.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 18-262 has removed the second sentence of 605.7, thus this comment is not applicable.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-104 Log #899 NEC-P18 **Final Action: Reject**
(605.7)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-263
Recommendation: Accept the proposal.
Substantiation: "Permitted" does not impose a requirement per 90.5(B) and is optional and not enforceable. There is no specific requirement in this article to provide a panelboard, and no prohibition of a branch circuit supplied by an individual enclosed circuit breaker or fused switch.
Panel Meeting Action: Reject
Panel Statement: The panel action on Proposal 18-262 has removed the second sentence of 605.7, thus this portion of the comment is not applicable. "Shall be permitted" is perfectly acceptable code language and is enforceable.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 606 — PREFABRICATED (WIRING) ASSEMBLIES

19-207 Log #248 NEC-P19 **Final Action: Accept**
(606 (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 19-298
Recommendation: The Technical Correlating Committee requests that the panel clarify the need for the Article, since it appears the installation requirements of the product are already covered in the Code. The remaining requirements are prescriptive and are better suited for a product standard.
The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Rejects the panel action related to the Scope. As written, the Scope more clearly defines what a prefabricated wiring assembly is not, rather than what it is.
The Technical Correlating Committee notes that the proposed Scope will appear in the NEC ROP Draft so that it is available for public comment.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel agrees with the Technical Correlating Committee that the installation requirements of the product are already covered in the Code. The proposed requirements may be better suited for a product standard.
See panel action on Comments 19-208, 209, 210, 211, 212, 213, 214, and 215.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-208 Log #1266 NEC-P19 **Final Action: Accept**
(606 (New))

Submitter: David L. Hittinger, Independent Electrical Contractors of Greater Cincinnati
Comment on Proposal No: 19-298
Recommendation: Delete the entire proposed article.
Substantiation: The installation requirements of the product are already covered in the Code. The prescriptive requirements are better suited for a product standard. There are many companies that have a prefabricated wiring assemblies for years without a specific Code article to describe what they do. These products are listed for the application and sold nationally in electric supply houses and recognized by the inspection community when installed on the jobsite. The substantiation does not identify a problem that the proposed article will solve. The scope clearly defines what a prefabricated wiring assembly is not rather than what it is. This proposed article does not add clarity to the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-209 Log #1290 NEC-P19 **Final Action: Accept**
(606 (New))

Submitter: Jerome Perrone, America Cable Systems
Comment on Proposal No: 19-298
Recommendation: Reject the proposal. Do not add a new NEC Article on Prefabricated (Wiring) Assemblies.
Substantiation: The proposed new article will introduce limitations on product design and listing. This new article will not increase safety and provides no benefit to AHJs or installers. At present prewired assemblies are permitted either assembled on site or as a listed product under UL category QQYZ:

As per the UL Directory: "This category [QQYZ] covers prefabricated wiring systems comprised of Listed electrical components that could be field assembled and inspected by an Authority Having Jurisdiction (AHJ), but are assembled in the factory prior to field installation. Prefabricated wiring assemblies incorporate Listed conduit, tubing or cable, conductors and fittings intended for field installation in accordance with ANSI/NFPA 70, "National Electrical Code" (NEC)."

1) The requirements for installation are already contained within the NEC.

2) The addition of this Article does not clarify or add any additional value. However it will limit listing of prewired assemblies to only constructions permitted by the new article requiring a code revision in order to obtain listing on new constructions that deviate from the new Article.

3) The requirements of the Article impose additional restrictions on listed assemblies that are not imposed on unlisted assemblies.

4) The requirements of the article includes requirement that prewired assemblies be disassembled to assure the secureness of connections. This defeats the purpose for having a listed prewired assembly in the first place.
Panel Meeting Action: Accept
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-210 Log #1618 NEC-P19 **Final Action: Accept**
(606 (New))

Submitter: Thomas R. Lichtenstein, Underwriters Laboratories Inc.
Comment on Proposal No: 19-298
Recommendation: The panel should reject Article 606.
The Technical Correlating Committee comments are accurate and should be accepted by the panel. The requirements specified in the proposed new article are either already addressed within the code, are best addressed by a product safety standard or are unenforceable by the inspection authority. Examples are provided below. The article as written does not belong in the National Electric Code and should be rejected.
Substantiation: 1. Scope. The scope of the article and definition of a Prefabricated wiring assembly is vague. Most assembled products and assemblies fit the definition proposed for Article 606. No unique property is identified that places an assembly or subassembly into this article. An inspection authority is left with which article applies to the assembly they inspecting as other articles address the same assemblies in a more complete manner. Example: Luminaires, Industrial Control Panels.
2. Construction - 606(A)(3) Exception: "*Exception: A component of a listed prefabricated (wiring) assembly is not required to comply with a specific requirement that involves a feature or characteristic not required in the specific application for which the assembly is identified and marked. Such component(s) shall be factory assembled."*
This phrase is used within product standards where the testing laboratory can investigate a component in accordance with its intended use. An inspection authority has no method of determining its acceptability other than having to accept the construction because it was assembled in the factory. Assembly in the factory does not insure a safe construction.
3. (B) Assembly 606(B)(3). "*(3) Assemblies of permanently connected components shall be listed. Examples of permanent connections include factory applied rivets, or specialty tool applied fasteners"*
The assembly statement is unclear. Is this addressing electrical components, devices, fasteners? Not all components (screws, rivets, etc.) have standards or requirements that would currently require listing. What is a specialty tool?
4. (C) Protection of Wiring Devices and Conductors *" A prefabricated (wiring) assembly that includes an outlet box, device box or junction box or other enclosure intended for flush mounting, that contains conductors or wiring devices shall be provided with a protective cover that will prevent damage to the conductors and wiring devices during preparation and installation of the finished wall or ceiling surface. The protective cover if metallic, need not be electrically bonded or fixed by screws to the box but shall remain in place. The protective cover shall provide mechanical protection equivalent to the enclosure to which it is attached and shall be able to be easily removed without damage to the box or enclosure, the enclosed conductors or wiring devices."*
The requirements "*with a protective cover that will prevent damage", "but shall remain in place" The protective cover shall provide mechanical protection equivalent to the enclosure"* are unenforceable by the inspection authority. There are no listed covers nor a standard to evaluate them. *"The protective cover if metallic, need not be electrically bonded"*. There is a potential shock hazard if the system is energized and the covers are not bonded. Protective covers were rejected by code panel 3 during the 2008 NEC process. Refer to 3-32 Log #147.
606.7(B) Secureness of Connections. *"The secureness of all pre-assembled mechanical and electrical connections shall be verified at installation."*
This provision requires that all electrical and mechanical connections be verified at the installation site. While this may be well intentioned this is not practical for an inspection authority to verify. All factory assembled products are shipped and do not become loose and disassembled in the process. The need for this requirement is questionable.

(606 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-298
Recommendation: Accept the proposal in principle.

Retain the protection rule in 606.5(C), and locate the new article in Chapter 7, possibly as Article 735.

Substantiation: These assemblies are shipped in interstate commerce and the protection rule is justified in this case, whether or not it may be justified in Chapter 3 for wiring generally. Although it is true that CMP 9 continues to reject these plates as a mandatory feature, an article in Chapters 5, 6, or 7 can amend or impose such a provision. The principal focus of this comment will be the TCC concerns, which deserve very careful thought. The wiring covered by this article will test the flexibility of the NEC process because it has the capability to unsettle established procedures with respect to licensing and field inspection of electrical work. These topics will need to be addressed by the various jurisdictions, but the protection of the market share of local labor is not a legitimate NEC target.

It is quite correct that this article addresses wiring that in almost every particular will simply comply with current NEC requirements, although assembled off site. However, if this technology is to become available on a routine basis, a protocol must be in place to assure disinterested third party inspection at the assembly site. Section 606.5(B)(3) contains that requirement through the listing process. The fact that there are no special features of this equipment leads to the conclusion that this article does not describe equipment, but rather a special condition, and therefore a Chapter 7 location is more appropriate.

In regard to the general question, lessons can be drawn from the market for manufactured buildings, which are not disassembled on site to repeat rough inspections. Instead, third party inspection agencies cover the assembly facility and certify the results. Admittedly, the comprehensiveness of these inspections and the competence of the supervision exercised, particularly with respect to electrical work, has been a recurring issue. If this article is accepted, the testing laboratories will need to step up their follow-up work so as to make sure no comparable issues arise. The fact that these assemblies are also capable of field inspection on site [see 606.5(A)(4)] will assist in this process.

We cannot say whether this construction method will succeed in the market or not, any more than we could predict in the 1987 NEC whether smart homes would succeed. The National Electrical Code Committee did the correct thing at that time and accepted Article 780. This meant that technology could move forward with the NEC neither helping nor hindering the effort. And when that market failed, the NEC removed Article 780 in the 2008 edition. This was as it should have been, and as it should be now with this new article.

19-215 Log #2741 NEC-P19 **Final Action: Accept**
(606 (New))

Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 19-298
Recommendation: Delete entire new Article 606, Prefabricated (Wiring) Assemblies.
Substantiation: This article is unnecessary and the need for the new requirements included has not been substantiated. The requirements for installation are already contained within the NEC in the appropriate articles for wiring methods, boxes, etc. This new article attempts to include requirements that are more appropriately considered in a product standard.

The addition of this Article does not increase safety. Because of the prescriptive requirements in the new language, it will hinder innovation by requiring code revisions each time a change is made to a listed system.

This new Article includes a requirement that prewired assemblies be disassembled to assure the secureness of connections. This defeats the purpose for having a listed prewired assembly and essentially indicates that the listing process is inadequate and unreliable. Since our electrical system is in large part based on reliance of the suitability of listed products, this Article is the first step down the road to completely changing our product acceptance practices in the United States.

Comment on Proposal No: 12-4
Recommendation: The Technical Correlating Committee directs that the last two sentences in proposed 610.2 be deleted from the definition to comply with 2.2.2 of the NEC Style Manual.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Add the following “Informational Note” after the new definition for Festoon Cable.

Informational Note: Festoon cable consists of one or more insulated conductors cabled together with an overall jacket. It is rated 60°C (140°F), 75°C (167°F), 90°C (194°F), or 105°C (221°F) and 600 V.

Panel Statement: The panel accepts the direction of the TCC to review the proposal to comply with the NEC Style Manual.

The panel accepts the deletion of the last two sentences in the definition of festoon cable from Proposal 12-4 and adds an informational note containing the deleted text. The informational note provides characteristics of festoon cable and complies with the NEC Style Manual.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-6 Log #898 NEC-P12 **Final Action: Reject**
(610.11(C), (D), and (E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-11
Recommendation: Accept the proposal with the following revisions:

Wiring Method.

Conductor shall be in approved raceways, or be Type AC or Type MC cable with insulated grounding conductor, or Type MI cable unless otherwise permitted or required in 610.11(A) through (E).

(A) no change.

(B) No change

(C) Flexible Connections. Where flexible connections are required, flexible stranded conductors shall be used.

(D) Pushbuton Station. Where multiconductor cable of flexible cord or cable is used with a suspended pushbutton or other device, the control station or other device shall be supported by approved means that prevents strain on the conductor terminals.

(E) Moving Parts. Where flexibility is required for moving parts a flexible cord or cable that complies with 400.3 and contains an equipment grounding conductor shall be permitted in accordance with the following:

(1) Approved strain relief and protection from physical damage is provided.

(2) In Class I Division 2 locations the flexible cord or cable is an extra- hard usage type that complies with 400.3 and contains an equipment grounding conductor.

Substantiation: Raceways should be approved for the use; this section may be deemed to amend “uses not permitted.” (C) should not be limited to motors and similar equipment. (D) should include devices other than pushbuttons. All flexible cords and cables should comply with 400.3. This section may be deemed to amend that section. Equipment grounding conductors should be specified for flexible cords and cables. Present wiring methods in (C) are covered in the first paragraph.

Panel Meeting Action: Reject
Panel Statement: The submitter’s text does not comply with 4.4.5(c) and (d) of the Regulations Governing Committee Projects in that the statement of the problem and substantiation for the comment do not contain a statement of the problem including a rationale to change the present requirements. The submitter just restated the same assertion in the comment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-7 Log #908 NEC-P12 **Final Action: Reject**
(610.22)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-12
Recommendation: Delete existing test and revise as follows:
Class III Locations. Collectors shall be designed so as to minimize sparking between them and the contact conductor and where located in Class III locations shall comply with 503.155.
Substantiation: The provision should apply where the location is classified, which is determined by the degree of hazard. "Minimum" is not defined; minimum would be zero.
Panel Meeting Action: Reject
Panel Statement: As revised, the text applies to only Class III locations whereas the original text applied anywhere and had special provisions in Class III locations.
The submitter has not provided definitive substantiation to justify limiting the requirements of 610.22 to Class III locations only.
Section 610.22 is not intended to apply solely to Hazardous (Classified) areas. The definition of minimum in this context is the least quantity assignable, admissible, or possible. Accordingly, the object is to minimize sparks to the lowest possible value.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-8 Log #2636 NEC-P12 **Final Action: Reject**
(610.31(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-13
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:
"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
The submitter of this comment, the senior member of CMP 9, absolutely agrees with CMP 12 that every panel must have the ability to customize this rule to meet the actual context as necessary. CMP 9 has done exactly that in 490.46 and this wording carefully preserves the ability of a panel to craft such language. It is also true, however, that in the great majority of cases the simple requirement to be placed in Article 110 will work and avoid endless repetition of similar text.
Panel Meeting Action: Reject
Panel Statement: The panel is not obligated to accept a comment that is contingent on another panel accepting it.
The panel continues its opposition to establishing one global requirement for "disconnecting means, lockable" as each individual chapter and article has special considerations that need to be considered. A global requirement will not be able to cover all these considerations.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-11 Log #2702 NEC-P12 **Final Action: Reject**
(620.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 12-17
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter's comments are not persuasive. The NEC does not currently prohibit installation of these devices and insufficient substantiation has been provided to exclude other well established receptacle options.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
HITTEL, M.: UL researched advanced receptacles, but there is no product listing or certification requirements regarding these type of advanced receptacles.

12-12 Log #2638 NEC-P12 **Final Action: Reject**
(620.20(A)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-20
Recommendation: Accept the proposal in principle.

Do not delete 620.20(A)(1)(a). Do not create the exception as proposed. Instead, revise (d) by deleting (d)(1), (d)(2), and (d)(3) and making (d)(4) into the entirety of (d) as follows:

"(d) Flexible cords and cables, or conductors grouped together and taped or corded, shall be permitted to be installed without a raceway in lengths not to exceed 1.8 m (6 ft)."

Change the designation of the list items following from a., b., and c. to 1., 2., and 3.

Substantiation: This is a far simpler method to accomplish the intent of the proposal, for which there is no technical objection. Retaining 620.20(A)(1)(a) retains the flexible wiring methods, and nothing in Article 348 (or 350, or 356 for the "B" style) limits the allowable length of these flexible wiring methods, so a statement waiving a length limitation becomes unnecessary. when these wiring methods are removed from 620.20(A)(1)(d), which in turn leaves only the flexible cord provision. This then becomes the entirety of (d), with the 6-ft limitation added in order to avoid changing the requirement. The result is much simpler and meets all the objectives of the proposal submitter.
Panel Meeting Action: Reject
Panel Statement: The submitter's text would permit the use of unlimited lengths of FMC, LFMC and LFNMC anywhere in the hoistway. It is the intention to only continue to permit unlimited lengths of these wiring methods only between risers and limit switches, interlocks, operating devices and similar equipment.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-13 Log #712 NEC-P12 **Final Action: Reject**
(620.21(A)(1)(b))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-22
Recommendation: Accept the proposal and revise as follows:

(b) Cables of a jacketed and flame-retardant type used in Class 2 power-limited circuits shall be permitted to be installed between risers and signal equipment and operating devices if the cables are supported by approved means and protected where likely to be subject to physical damage.

Substantiation: Physical damage may not be a factor at time of installation or inspection, but may be likely. "Likely" is a term used many times in the NEC.
Panel Meeting Action: Reject
Panel Statement: The submitter has still provided no definitive substantiation that changes are necessary. This wiring is installed in a protected space that is accessible to only elevator personnel and no known problems have arisen that would warrant changing the existing wording.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-14 Log #907 NEC-P12 **Final Action: Reject**
(620.23)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-27
Recommendation: Accept the proposal.
Substantiation: "Minimum" is defined as the least possible, which is zero.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided definitive substantiation that the changes are necessary. The current wording is well understood and has withstood the test of time.

The definition of minimum is the least quantity assignable, admissible, or possible. Accordingly, the objective is to minimize the likelihood of damage.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-15 Log #2639 NEC-P12 **Final Action: Reject**
(620.51 Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-28
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:

"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."

The submitter of this comment, the senior member of CMP 9, absolutely agrees with CMP 12 that every panel must have the ability to customize this rule to meet the actual context as necessary. CMP 9 has done exactly that in 490.46 and this wording carefully preserves the ability of a panel to craft such language. It is also true, however, that in the great majority of cases the simple requirement to be placed in Article 110 will work and avoid endless repetition of similar text.
Panel Meeting Action: Reject
Panel Statement: The panel is not obligated to accept a comment that is contingent on another panel accepting it.

The panel continues its opposition to establishing one global requirement for "disconnecting means, lockable" as each individual chapter and article has special considerations that need to be considered. A global requirement will not be able to cover all these considerations.

12-18 Log #2642 NEC-P12 **Final Action: Reject**
(620.51(C)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-31
Recommendation: Accept (in the order the changes were proposed) the insertion of "lockable" (two locations), the deletion of the word "non-fused", and the insertion of "non-fused lockable". Reject the insertion of "disconnecting means", and the deletion of "motor circuit switch". Accept the deletion of "being capable of being locked in the open position". Reject the insertion of "motor circuit". Accept the deletion of the final paragraph.
Substantiation: The rejected language restores all provisions of the 2008 NEC, for which the panel correctly objected that no substantiation was offered. What remains is the lockable disconnect rule exactly as it is in the current NEC, except the characteristics of the disconnect are transferred to Article 110.

The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:

"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."

12-22 Log #1914 NEC-P12 **Final Action: Reject**
(620.62 Exception (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 12-38
Recommendation: Accept the proposal in principle, revising the exception as follows:

Exception: Where the elevator system electrical design is under the control of a licensed professional engineer engaged in the design or maintenance of electrical installations, the selection of overcurrent protective devices shall be permitted to coordinate to the ~~extent practicable~~ level required. The design shall be documented, stamped by the professional engineer, and made available for review by the authority having jurisdiction.
Substantiation: This proposal should be accepted in principle for a number of reasons:

1. A licensed engineer should be able to optimize protection and coordination as recommended in the various IEEE *Color Books* that address the issue of coordination and as is allowed in NFPA 110 and in the electrical codes in Phoenix, Wisconsin and Massachusetts.

2. The actions of the panel seem inconsistent. In rejecting both this proposal and 12-37 the panel is saying that licensed engineers cannot design coordination to the level required but unlicensed facility operators and elevator service personnel can defeat coordination at will while live work is performed, a time when the likelihood of a power disrupting incident occurring is probably at its highest.

3. The use of an incident energy reduction system (see ROP 12-37) requires engineering. A maintenance switch type system requires a second coordination study to determine if the system can still operate properly at the lower instantaneous trip setting. If it is acceptable for an engineer to coordinate the system to the level required under maintenance conditions, why is it not also permitted under normal operating conditions?

Finally, the panel should note that the text of this exception is similar to that in 240.86(A).
Panel Meeting Action: Reject
Panel Statement: The proposed language is unenforceable and reduces the safety of elevator systems by limiting the selectivity of overcurrent devices without providing any technical substantiation to support the request for the reduction in safety for these elevator circuits. An exception to the main rule including the wording "coordinate to the level required" is not needed since selective coordination for the full range of overcurrents is achievable. The proposed language "coordinate to the level required" does not provide sufficient specificity as to what constitutes an acceptable selectively coordinated installation and would permit systems to cascade overcurrent protective devices for any level of overcurrent for any reason, such as cost, effort, expertise, or space. Selective coordination for the full range of overcurrents is required and provides the desired level of system reliability necessary for elevator circuits.

ARTICLE 625 — ELECTRIC VEHICLE CHARGING SYSTEM EQUIPMENT

12-24 Log #1404 NEC-P12 **Final Action: Accept**
(625.2.Electric Vehicle)

TCC Action: The Technical Correlating Committee notes that only the legislative text changes were to be incorporated into this definition.
Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Plug-In Hybrid & Electric Vehicle Working Group
Comment on Proposal No: 12-44
Recommendation: Revise text to read as follows:
Electric Vehicle. An automotive-type vehicle for on-road use, such as passenger automobiles, buses, trucks, vans, neighborhood electric vehicles, electric motorcycles and the like, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array, or other source of electric current. For the purpose of this article, ~~electric motorcycles and similar type vehicles and~~ off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.
Substantiation: Battery capacities of vehicles for on-road use are not covered under the scope of the NEC. EVs can be charged using 120 VAC, 15A receptacles as are electric motorcycles using similar EVSE. Several electric motorcycles currently on the market can be charged by either 120 or 240 VAC, 15A supply. Adopting similar requirements for electric motorcycles would allow them to use the same public infrastructure as EVs.
Panel Meeting Action: Accept

12-26 Log #2646 NEC-P12 **Final Action: Accept in Principle in Part**
(625.2 Electric Vehicle)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-43
Recommendation: Accept the proposal in principle.
Do not insert the sentence as written by CMP 12. Instead, revise the new definition of PHEVs (Proposal 12-42a) to read as follows:
A form of electric vehicle intended for on-road use with the ability to store and use off-vehicle electrical energy in the rechargeable energy storage system, and having a second source of motive power.
Substantiation: This approach improves both definitions by avoiding the statement of requirements and/or using the defined terms within the definitions, all as proscribed by 2.2.2 of the NEC Style Manual.
Panel Meeting Action: Accept in Principle in Part
Revise definition of Plug-in Hybrid Electric Vehicle (PHEV) to read as follows:
Plug-in Hybrid Electric Vehicle (PHEV). A type of electric vehicle intended for on-road use with the ability to store and use off-vehicle electrical energy in the rechargeable energy storage system, and having a second source of motive power.
Panel Statement: The panel accepts in principle the submitter's definition of PHEV as recommended in the comment and edits for clarity.
The panel does not accept the deletion of the text "Plug-in hybrid electric vehicles (PHEV) are considered electric vehicles." in Proposal 12-43. Removing this sentence would break the association between PHEVs and electric vehicles.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MARCOVICI, S.: The term "off-vehicle" should be replaced with the term "off-board" which is used by the automotive industry. See sections 625.26 and 626.27, and the definition for Electrified Truck Parking Space under 626.2.

12-27 Log #1405 NEC-P12 **Final Action: Accept**
(625.13)

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. Plug-In Hybrid & Electric Vehicle Working Group
Comment on Proposal No: 12-54
Recommendation: We support the committee's action on this proposal.
Substantiation: EVSE meeting the requirements of 625.18, 625.19, and 625.29 can be cord-and-plug connected even when it is greater than 120 VAC.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-28 Log #2121 NEC-P12 **Final Action: Reject**
(625.13)

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 12-54
Recommendation: Accept in Principle. Modify 625.13 as written by the submitter, Mr. Lambert, as shown below:
Electric vehicle supply equipment rated at 125 volts, single phase, 15 or 20 amperes shall be permitted to be cord-and-plug-connected. EVSE rated greater than 20 amperes and not more than 250 volts and or a part of a system 625.18, 625.19, and 625.29 shall be permitted to be cord-and-plug-connected. All other electric vehicle supply equipment shall be permanently connected and fastened in place. This equipment shall have no exposed live parts.
Substantiation: This is an important proposal and I would not like to see its core concept lost because of a technicality. Equipment run at 250V and 20A is very common and concern over voltage and current charging platform should not impede development of this technology in households, schools, or elsewhere.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action on this proposal. An EVSE meeting the requirements of 625.18, 625.19, and 625.29 can be cord-and-plug connected even when the voltage is greater than 120 VAC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(625.22)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 12-60
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 12-11.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
HITTEL, M.: UL researched advanced receptacles, but there is no product listing or certification requirements regarding these type of advanced receptacles.

12-32 Log #906 NEC-P12 **Final Action: Reject**
(625.23)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-62
Recommendation: Accept the proposal with the following revisions:
The disconnecting means for vehicle supply equipment shall be readily accessible and provided with approved permanent means for locking in the open (off) position.
Substantiation: More than 60 amperes or 150 volts should not have any bearing on being readily accessible which present wording implies. "Open position" should be specifically "off"; open position can apply to the door or cover of the disconnnecting means.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the requirements should be extended below 60 amps. The submitter has not provided any evidence of a problem.
The term "Open" with regard to disconnecting means is used throughout the Code and is widely understood.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-33 Log #2647 NEC-P12 **Final Action: Reject**
(625.23)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-61
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:

"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."

The submitter of this comment, the senior member of CMP 9, absolutely agrees with CMP 12 that every panel must have the ability to customize this rule to meet the actual context as necessary. CMP 9 has done exactly that in 490.46 and this wording carefully preserves the ability of a panel to craft such language. It is also true, however, that in the great majority of cases the simple requirement to be placed in Article 110 will work and avoid endless repetition of similar text.
Panel Meeting Action: Reject
Panel Statement: The panel is not obligated to accept a comment that is contingent on another panel accepting it.

The panel continues its opposition to establishing one global requirement for "disconnecting means, lockable" as each individual chapter and article has special considerations that need to be considered. A global requirement will not be able to cover all these considerations.

Ballot Results: Affirmative: 14

12-34 Log #2405 NEC-P12 **Final Action: Accept**
(625.29(B))

Submitter: Brian E. Rock, Hubbell Inc.
Comment on Proposal No: 12-64
Recommendation: I support the panel action.
Substantiation: This Comment is provided to aid Panel 12 with regard to the accuracy of the Panel Statement for P12-84. As one of the co-authors (along with Tim Croushore, Greg Nieminski, Charlie Claar, Craig Toepfer, etc.) under EPRI IWC Task Force Chair Dave Brown of the original Article 625, I can provide insight as to the technical basis for the 18-inch lower height limit that the Submitter sought to change.

The primary purpose of the National Electrical Code® is to insure installations safe from the risk of fire and shock. To the extent that other mandates unrelated to this primary purpose (such as ADA), those were taken into account, as reflected by 4-foot upper height limit from ADA. Where those mandates for other purposes leava a "gap" in terms of electrically safe installations, the primary purpose must predominate.

For the lower limit, however, the use of electric vehicle charging equipment is highly likely in a mixed environment of electric-powered and gasoline-powered vehicles. This mixed usage environment includes refueling/recharing of gasoline- and electric-powered vehicles.

Section 625.28 requires that EVSE installed in Hazardous (Classified) Locations must comply with Articles 500 through 516, specifically Article 514 for Motor Fuel Dispensing Facilities. Table 514.3(B)(1) establishes an upper gasoline fume height limit of 18 inches, this was taken by the Task Force to establish the lower limit for nonhazardous (unclassified) ordinary locations so that there would be no "gray areas" with regard to this boundary between potential gasoline fume accumulation and where EVSE could be safely located in ordinary locations.

12-35 Log #398 NEC-P12 **Final Action: Accept**
(Table 625.29(D)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-66
Recommendation: The proposal should be rejected.
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "m^3/min" at the end of the line. This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.

The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

ARTICLE 626 — ELECTRIFIED TRUCK PARKING SPACES

12-39 Log #905 NEC-P12 **Final Action: Reject**
(626.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-70
Recommendation: Accept the proposal with the following revisions:
Separable Power Supply Cord or Cable Assembly. A flexible cord or cable assembly that complies with 400.3, containing an equipment grounding conductor, provided with a firmly attached grounding-type attachment plug and cord connector body, and all other fittings and devices designed and installed for supplying electric current to the truck or TRU flanged surface inlet.
Exception: Where the flexible cord or cable is permanently attached as part of a cable management system as specified in 626.23(A) an attachment plug shall not be provided.
Substantiation: The cord or cable should be noted to comply with 400.3, and contain an EGC. An attachment plug is not used where the cord or cable is permanently attached as part of a management system.
Panel Meeting Action: Reject
Panel Statement: The submitter's text does not comply with the NEC Style Manual, 3.2.1 because "firmly" is a vague term and 2.2.2 because the submitter's definition contains requirements.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-40 Log #904 NEC-P12 **Final Action: Accept in Principle in Part**
(626.4(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-71
Recommendation: Accept the proposal with the following revisions:
The provisions of this article do not apply to that portion of equipment on premises that requires electric power to load or unload cargo, operate conveyors, hoists, and other equipment used on the site or truck.
Substantiation: "Premises" includes all classifications, including governmental. The definition of device indicates it is an item that does not require power (watts) but carries electric current.
Panel Meeting Action: Accept in Principle in Part
Revise 626.4(A) to read as follows:
(A) Not Covered. The provisions of this article shall not apply to that portion of other equipment in residential, commercial,
or industrial facilities that require electric power used to load and unload cargo, operate conveyors and for other equipment used on the site or truck.
Panel Statement: The panel accepts in principle the submitter's comment as related to "device" and "devices" and changes to "equipment" and edits for clarity.
The panel does not accept the remainder of the comment.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-41 Log #402 NEC-P12 **Final Action: Accept**
(626.11(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-72
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-42 Log #911 NEC-P12 **Final Action: Accept in Principle in Part**
(626.22(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-77
Recommendation: Accept the proposal with the following revisions:
All electrical truck parking space equipment shall be readily accessible and provided with working space not less than 600 mm (2 ft) wide or the width of the equipment whichever is greater, and not less than 2.0 m (6 ft 6 in.) high or the height of the equipment, whichever is greater.
Substantiation: "Readily accessible" encompasses "unobstructed entrance or passageway", working space, not just the entrance. A limit to not more than 6 ft 6 in. high does not appear related to safety; what safety is diminished by a space height more than 6 ft 6 in.?
Panel Meeting Action: Accept in Principle in Part
Revise 626.22(C) to read as follows:
(C) Access to Working Space. All electrified truck parking space supply equipment shall be accessible by an unobstructed entrance or passageway not less than 600 mm (2 ft) wide and not less than 2.0 m (6 ft 6 in.) high.
Panel Statement: The panel accepts changing "more" to "less" in 626.22(C) as requested by the submitter in his comment. The panel also changes the title to "Access to Working Space" to clarify that (C) only pertains to access.
The panel does not accept the remainder of the comment because the proposed change does not reflect the actual allowable truck parking space equipment configuration.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
HITTEL, M.: Since the title has been changed to clarify that 626.22(C) applies only to access to the working space and not the working space itself, the change to "not less than 2.0 m (6 ft 6 in)" could impact many existing truck stop parking space equipment designs where there is not a defined working space within the equipment and the configuration is such that the area requiring access is reached thru an open panel has been removed for servicing. By requiring a minimum access height of 2 m (6 ft 6 in) the size and configuration of the equipment may have to be increased unnecessarily to meet this minimum dimension.

12-43 Log #910 NEC-P12 **Final Action: Reject**
(626.22(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-79
Recommendation: Accept the proposal with the following revisions:
The disconnecting means shall be readily accessible and have approved permanent provisions for locking in the open (off) position.
Substantiation: The first sentence already requires a disconnecting means to be provided. "Approved permanent means" eliminates unnecessary wordage. Open (off) should be specified, covers and doors can be locked open.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The term "open" with regard to disconnecting means is used throughout the Code and is widely understood.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-44 Log #2648 NEC-P12 **Final Action: Reject**
(626.22(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-78
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:
"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
The submitter of this comment, the senior member of CMP 9, absolutely agrees with CMP 12 that every panel must have the ability to customize this rule to meet the actual context as necessary. CMP 9 has done exactly that in 490.46 and this wording carefully preserves the ability of a panel to craft such language. (626.24(B))

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC / Rep. Chairman, EPRI IWC Transportation Electrification Committees Code Task Force
Comment on Proposal No: 12-82
Recommendation: Revise as follows:
(B) Receptacle. All receptacles shall be listed and of the non-locking and grounding type. Every truck parking space with electrical supply shall be equipped with (B)(1) and (B)(2).
Substantiation: The use of a non-locking type receptacle in the truck parking space supply equipment is in the Fine Print Note but was not included in the requirement of the paragraph above addressing the receptacle construction. A Fine Print Note is not enforceable. A locking type receptacle would transfer forces to the receptacle should the cable be abruptly pulled, tugged on, or stressed, permanently damaging the receptacle and resulting in exposure of live parts.
Presently, all of the installed equipment employ non-locking type receptacles and have been used successfully without damage.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided definitive substantiation to justify the limitation to non-locking receptacles.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
HITTEL, M.: This non-locking type receptacle requirement was inadvertently placed in the FPN during the initial development of this section. The reason that it is desirable to have a non-locking type is that driving off with the connection in place or someone tripping over the cords are a real possibility and this requirement would reduce the probability of damage to the receptacle which could result in exposing energized conductors inside the receptacle enclosure. The non-locking type plug and receptacle is more suitable for the specific application than the locking type. While it is not designed specifically for the purpose of performing the "break-away" function, it is certainly more probable to pull out without damaging the plug or receptacle than the locking type, which is very likely to damage the receptacle and expose energized parts when the plug is pulled out.
WARD, R.: This non-locking type receptacle requirement was inadvertently placed in the FPN during the initial development of this edition. The reason that it is desirable to have a non-locking type is that driving off with the connection in place or someone tripping over the cords are a real possibility and this requirement would avoid the damage to the receptacle which could result in exposing energized conductors inside the receptacle enclosure. The non-locking type plug and receptacle is more suitable for the specific application than the locking type. While it is not designed specifically for the purpose of performing the "break-away" function, it is certainly more probable to pull out without damaging the plug or receptacle than the locking type, which is very likely to expose energized parts when the receptacle is pulled out.

12-45a Log #CC1200 NEC-P12 **Final Action: Accept**
(626.24(B)(1))

Submitter: Code-Making Panel 12,
Comment on Proposal No: 12-84
Recommendation: Revise 626.24(B)(1) to read as follows:
A maximum of three receptacles, each 2-pole, 3-wire grounding type and rated 20 amperes,125 volts, and two of the three connected to two separate branch circuits.
Substantiation: The panel revises section 626.24(B)(1) by removing the word "duplex" to allow single or duplex receptacles and revises the language in order to match existing field conditions utilizing GFCI receptacles.
The revised text clarifies the intent of the current requirement.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-46 Log #1317 NEC-P12 **Final Action: Accept in Principle**
(626.24(B)(1))

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC / Rep. Chairman, EPRI IWC Transportation Electrification Committees Code Task Force
Comment on Proposal No: 12-84
Recommendation: Revise as follows:
Two single receptacles, two duplex receptacles or a combination thereof, not to exceed four outlets, each receptacle a 2-pole, 3-wire grounding type and rated 20 amperes, 125 volts, and each receptacle connected to an individual ~~separate~~ branch circuit ~~that shall have no other outlets~~.
Substantiation: The intent of the original article requiring two single receptacles was to minimize the number of connections from the truck parking space supply equipment to the truck or trucks in adjacent parking spaces. Each receptacle was intended to be connected to its own individual branch circuit.
The submitter recognizes that duplex receptacles are more commonly available and may be used as an alternative provided each duplex receptacle continues to be connected to a separate branch circuit. Ground fault circuit interrupter protection may still be provided in various forms as specified in 626.24(D). Using a duplex receptacle with GFCI protection is one option for providing protection for personnel.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on 12-45a.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
HITTEL, M.: This change appears to permit a total of 6 outlets for a electrified truck parking space supply which potentially creates a cord management problem for pedestal-type or raised concrete pad design styles as stated in the submitter's substantiation.

12-47 Log #2407 NEC-P12 **Final Action: Accept in Principle**
(626.24(B)(1))

Submitter: Brian E. Rock, Hubbell Inc.
Comment on Proposal No: 12-84
Recommendation: I support the Proposal but revise the proposed text to read as follows:

Three duplex receptacles, each 2-pole, 3-wire grounding type and rated 20 amperes,125 volts, and one of the three connected to a separate branch circuit that shall have no other outlets.

Substantiation: The respected Submitter of P12-84, as part of his Substantiation, cites "In addition, a widely circulated color photo of one of these umbilical assemblies clearly shows GFCI duplex receptacles." If the Submitter's and Panel's intent is in part to accommodate the installed base of electrified truck parking space equipment, the Panel should be aware that that umbilical assembly has a THIRD duplex receptacle connected "downstream" (same circuit) to one of the GFCI two duplex receptacles. Not visible in that widely circulated color photo mentioned by the Submitter, this third receptacle is accessible only from the portion of the umbilical EXTERNAL to the truck cab and serves to supply power to the supply cord of the engine block heater. Photos of THIRD duplex receptacle on the umbilical external to the truck and of the FIRST and SECOND duplex (GFCI) receptacles on the umbilical used in the truck cab's interior accompany this Comment.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on 12-45a.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:

HITTEL, M.: The submitter mentions in his substantiation that the "umbilical cord style of truck supply equipment "has a THIRD duplex receptacle connected "downstream" (same circuit) to one of the GFCI two duplex receptacles." This is not entirely accurate. The third receptacle on the umbilical assembly accessible from outside of the cab of the truck is actually powered from BOTH of the GFCI's mounted inside. This receptacle has two outlets that are individually and separately supplied.

Comment on Proposal No: 12-86
Recommendation: Accept the proposal.
Substantiation: The entire point of the proposal is to permit exactly what the panel wants to permit, with simpler wording. Any receptacle with a rating that is within the listing parameters for servicing a 30 amp circuit taken from a three-phase wye distribution with a neutral and operating 120 volts to ground is acceptable. That could be a pin-and-sleeve receptacle or a conventional NEMA 14-30 straight blade device; which are used by the millions on these very circuits as demonstrated in the substantiation.
Panel Meeting Action: Reject
Panel Statement: The wording is adequate as it stands. The suggested language would preclude the use of a 125/250 NEMA receptacle on a 120/208 Y single phase circuit. It is inappropriate to move this allowance to the FPN where it is only explanatory. There is no NEMA 120/208 Y single phase receptacle configuration. This is why the 125/250 NEMA receptacle is permitted.

Furthermore, the NEC Style Manual, Table 3.2.1 deems the word "appropriate" as a vague and unenforceable term.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-49 Log #909 NEC-P12 **Final Action: Reject**
(626.24(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-88
Recommendation: Accept the proposal with the following revisions:

The electrified truck parking space supply equipment shall be provided with a switch or circuit breaker that simultaneously disconnects all ungrounded conductors of the power supply for the electrified truck parking space. This disconnecting means shall be readily accessible and have approved permanent means for locking in the open (off) position.

Substantiation: Simultaneous disconnection should be specified as is required in many other sections. The proposal eliminates unnecessary wording re: locking and specifies "open" to be "off" not the cover or door of the disconnecting means.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided definitive substantiation to justify the removal of the detailed requirements for the disconnect locking means.

The proposed change does not reflect the actual allowable truck parking space equipment configuration.

The term "Open" with regard to disconnecting means is used throughout the Code and is widely understood.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-50 Log #914 NEC-P12 **Final Action: Reject**
(626.25)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-89
Recommendation: Accept the proposal with the following revisions:

Separable Power Supply Cable Assembly. A flexible cord or cable with a cord connector body, and attachment plug intended for connection with a truck flanged surface inlet. The power supply cord or cable assembly shall be one of the types and ratings specified in 625.25(A) and (B). Flexible cords and cables with adapters, pigtail ends, or extension cords and similar items shall not be used.

(A) Ratings.

(1) Twenty-Ampere Power Supply Cable Assembly. Assemblies supplied by receptacles specified in 626.24(B)(1) shall be rated 20 amperes.

(2) Thirty Ampere Power Supply Cable Assembly. Assemblies supplied by receptacles specified in 626.24(B)(2) shall be rated 30-amperes.

(B) Power Supply Flexible Cord or Cable. The power supply assembly flexible cord or cable shall be an extra-hard usage type that complies with 400.3, containing an equipment grounding conductor and with a securely attached grounding-type plug and cord connector body. The exposed length of the flexible cord or cable shall not exceed 7.5 m (25 ft) unless part of a cord or cable management system or take-up system. A right-angle plug shall not be used unless the orientation of the supply receptacle permits the cord or cable to hang freely downward without a bend.

Substantiation: The exceptions permit a 15 ampere assembly which, if connected to a single receptacle on an individual circuit per 626.24(B) rated 20 amperes is a violation of 240.5(A). 400.3 requires flexible cords and cables to be suitable for the use, which imposes a requirement to be sunlight resistant, suitable for wet locations, and other conditions where they are a factor. All cords and cables are not suitable, e.g., electric vehicle cables and those without a W designation for wet locations and sunlight resistance. The orientation of the receptacle determines if the cord hangs straight down. Extra-hard usage cords of Table 400.4 are rated 600 volts. Attachment plugs are already require to be listed by 406.2(A)
Panel Meeting Action: Reject
Panel Statement: The panel does not accept the submitter's substantiation. The rating of the cord set is determined by the flexible cord rating and also by the plug rating and/or the connector rating on the other end (the rating of the assembly is the lower of the rating of the individual components making up the assembly).

(626.25(A)(1) Exception)

Submitter: Gery J. Kissel, General Motors Corporation / Rep. Chairman, SAE J1772, SAE Electric Vehicle Conductive
Charge Coupler
Comment on Proposal No: 12-91
Recommendation: Revise as follows:
Exception: It shall be permitted to use a listed separable power-supply cable assembly, either hard service or extra-hard service and rated 15 amperes, 125 volts for connection to an engine block heater for ~~existing~~ legacy vehicles.
Substantiation: The comment on the affirmative was correct in that the reference was intended to refer to these legacy vehicles.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-52 Log #1318 NEC-P12 **Final Action: Accept**
(626.26)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC / Rep. Chairman, EPRI IWC Transportation Electrification Committees Code Task Force
Comment on Proposal No: 12-99
Recommendation: No change to original wording.
Substantiation: The submitter agrees with the comment made as an explanation of the negative vote. The means for preventing back-feed or the use of equipment intended for interactive systems are undergoing continual changes in development as new forms of communications between the utility and end-user equipment are being developed. Therefore, the means to provide this function in "identified" equipment may change as new forms of communications and control systems are developed.
Panel Meeting Action: Accept
Revise text to read as follows:
626.26 Loss of Primary Power.
Means shall be provided such that, upon loss of voltage from the utility or other electric supply system(s), energy cannot be back-fed through the truck and the truck supply equipment to the electrified truck parking space wiring system unless permitted by 626.27.
Panel Statement: The panel understands the intent of the submitter is to Reject Proposal 12-99.
The panel understands the submitter's intent is to revert back to the 2008 text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-53 Log #1927 NEC-P12 **Final Action: Reject**
(626.28 (New))

Submitter: Greg Ward, IdleAire Inc.
Comment on Proposal No: 12-100
Recommendation: Add new text to read as follows:
626.28 Means to Prevent Connection or Disconnection Under Load. Each 30 ampere receptacle required by 626.24(B)(2) shall meet one of the following requirements:
(A) Include an interlocked receptacle with an associated switching device of an interlocking type,
(B) Be provided with a switch rated receptacle-plug combination, or
(C) Be provided with a comparable means identified and listed for the purpose to prevent connection or disconnection under load.
The means to prevent connection or disconnection under load shall prevent user access to live parts.
Substantiation: The original proposal's substantiation was based upon the use of interlock devices in port staging areas (primarily for TRUs - transport refrigerated units) as well as the reduction of injuries by the use of such interlocked devices. However, in discussions with operators, even at staging areas with interlock devices and users specifically trained to use/operate them, there were still accounts of serious injuries where the interlock failed.
Further review of OSHA and NFPA 70E documents revealed that there is a requirement to identify all possible electrical hazards, mitigation of these hazards, and the training of employees and issuance of protective equipment for them. In our experience, most of the truck drivers do not have protective equipment and most do not appear to be trained in the handling of high voltage equipment. We find many of them messing with standard electrical plugs (120v 20 ampere) while standing in the rain. These higher voltage connections (30 ampere) have serious potential for arc flash or shock if not properly connected or disconnected.
There are real dangers around the use of this type of equipment. Lack of training and proper equipment further compound that danger. Truck drivers are tired from driving all day and often are looking for a short cut. They just want to eat, shower and go to bed. The best case would be to require the receptacle connection to be a type of interlocking mechanism that would allow the plug to become energized only after the locking mechanism is engaged. This would greatly reduce the potential danger for the truck driver.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position that there is insufficient technical substantiation to justify the limitation to interlocking type, switch-rated receptacles or with a comparable means identified and listed to prevent connection or disconnection under load. The current requirement does not restrict the use of these type of devices if desired.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:
HITTEL, M.: The appropriate action should be Accept in Principle. The options proposed are an effective means to manage the hazards and risks unique to the specific application's typical use and foreseeable misuse. A proactive approach is necessary given that this is a developing and proliferating type of construction. While formal, documented cases have not been presented indicating that these hazards have occured, it is my opinion that they are likely to occur. The companies that are building and installing these systems are best suited to assess the conditions of use and service and the associated risk factors.
It remains questionable whether the UL Standards which evaluate plugs and receptacles on their ability to "rupture" (break) current effectively, address the specific application's typical use and foreseeable misuse under both normal and fault conditions. Further, the EPRI-IWC working group did perform some research and found some incidents of injury to an operator involving a similar application that did occur in which this change could have prevented. Regretfully, the source of these incidents did not agree to be quoted or go on record, but it did confirm our concerns. Further, the proposal does not give a proprietary advantage to any one manufacturer as options for accomplishing this feature are given.
KOVACIK, J.: See my Explanation of Negative Vote and substantiation on Comment 12-54.
MARCOVICI, S.: In order to increase the safety of the wiring system at the electrified truck parking space, an interlocking mechanism is mandatory. A requirement similar to those found in sections 625.18 and 625.19 must be introduced. As a result, the proposal should be accepted.
WARD, R.: The appropriate action should be Accept in Principle. The options proposed are an effective means to manage the hazards and risks unique to the specific application's typical use and foreseeable misuse. A proactive approach is necessary given that this is a developing and proliferating type of construction. While formal, documented cases have not been presented indicating that these hazards have occurred, it is our opinion that they are likely to occur. The companies that are building and installing these systems are best suited to asses the conditions of use and service and associated risk factors. It remains questionable whether UL 498 and 1682, which evaluate plugs and receptacles on their ability to "rupture" (break) current effectively, address the specific application's typical use and foreseeable misuse. Further, in the rejection to Proposal 12-100, the committee used the statement "There is insufficient technical substantiation to justify the limitation…" As a result, the EPRI working group did perform some research and found some incidents involving a similar application that did occur in which this change could have prevented (in Comment 12-59 Substantiation). Regretfully, the source of these incidents did not agree to be quoted or go on record, but it did confirm our concerns. Further, the proposal does not give a proprietary advantage to any one manufacturer as options for accomplishing this feature are given.

12-54 Log #2152 NEC-P12 **Final Action: Reject**
(626.28)

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Comment on Proposal No: 12-100
Recommendation: Modify the original proposal as follows and place the revised text directly after the FPN for 626.24(B)(2):
~~626.28 Means to Prevent Connection or Disconnection Under Load. Each~~ The 30 ampere receptacle required by 626.24(B) shall ~~meet~~ be one of the following ~~requirements~~ constructions:
(A) Include a An interlocked receptacle with disconnect ~~an associated switching device of an interlocking type~~.
(B) ~~Be provided with a~~ A switch rated receptacle-plug combination, or
(C) ~~Be provided with a~~ A comparable means identified and listed ~~for the purpose~~ to prevent connection or disconnection under load. The means to prevent connection or disconnection under load shall prevent user access to live parts.
Substantiation: For Proposal 12-100, the Panel Action should have been Accept in Principle. The Submitter, representing the EPRI National Electric Transportation Infrastructure Working Council, proposed to add to Article 626 an additional safeguard that likely would reduce potential hazards involved with electrical loads and associated components being disconnected under load (potentially up to 30 amps). The Submitter provided realistic and likely scenarios that substantiate such an additional safeguard. Also, generally, electrical components should be designed/rated for the intended application, including typical use and foreseeable misuse, and the options proposed by the Submitter for demonstrating compliance are compatible with this principle. Finally, since Electrified Truck Parking Spaces covered by Article 626 are a relatively new form of construction, it should not be expected that the Submitter would have to provide specific field incidents as principal technical substantiation. We support an Accept in Principle committee action since we agree with the intent of the Submitter, but believe relocation of the proposed requirement in 626.24(B) and slightly modified wording is more appropriate. The revised wording in part (A) more accurately describes the type of devices on the market, and the phrase "for the purpose" in part (C) is not needed since the purpose of the comparable means is stated.
Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its position that there is insufficient technical substantiation to justify the limitation to interlocking type, switch-rated receptacles or with a comparable means identified and listed to prevent connection or disconnection under load. The current requirement does not restrict the use of these type of devices if desired.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 10 Negative: 3
Explanation of Negative:

HITTEL, M.: The appropriate action should be Accept in Principle. The options proposed are an effective means to manage the hazards and risks unique to the specific application's typical use and foreseeable misuse. A proactive approach is necessary given that this is a developing and proliferating type of construction. While formal, documented cases have not been presented indicating that these hazards have occurred, it is my opinion that they are likely to occur. The companies that are building and installing these systems are best suited to assess the conditions of use and service and the associated risk factors.

It remains questionable whether the UL Standards which evaluate plugs and receptacles on their ability to "rupture" (break) current effectively, address the specific application's typical use and foreseeable misuse under both normal and fault conditions. Further, the EPRI-IWC working group did perform some research and found some incidents of injury to an operator involving a similar application that did occur in which this change could have prevented. Regretfully, the source of these incidents did not agree to be quoted or go on record, but it did confirm our concerns. Further, the proposal does not give a proprietary advantage to any one manufacturer as options for accomplishing this feature are given.

KOVACIK, J.: The submitter of Proposal 12-100 provided realistic and likely scenarios that substantiate the need for an additional safeguard that would reduce potential hazards involved with electrical loads and associated components being disconnected under load. Electrical components should be designed/rated for the intended application, including typical use and foreseeable misuse, and the options proposed by the submitter for demonstrating compliance are compatible with this principle.

Panel members representing the Electrified Truck Parking Spaces Industry described field incidents where injuries occurred as a result of components being disconnected under load. Lacking any attention to this problem, there is clear evidence that hazards and potential harm will continue to exist for users of this equipment.

WARD, R.: The appropriate action should be Accept in Principle. The options proposed are an effective means to manage the hazards and risks unique to the specific application's typical use and foreseeable misuse. A proactive approach is necessary given that this is a developing and proliferating type of construction. While formal, documented cases have not been presented indicating that these hazards have occurred, it is our opinion that they are likely to occur. The companies that are building and installing these systems are best suited to asses the conditions of use and service and associated risk factors. It remains questionable whether UL 498 and 1682, which evaluate plugs and receptacles on their ability to "rupture" (break) current effectively, address the specific application's typical use and foreseeable misuse. Further, in the rejection to Proposal 12-100, the committee used the statement "There is insufficient technical substantiation to justify the limitation…" As a result, the EPRI working group did perform some research and found some incidents involving a similar application that did occur in which this change could have prevented (in Comment 12-59 Substantiation). Regretfully, the source of these incidents did not agree to be quoted or go on record, but it did confirm our concerns. Further, the proposal does not give a proprietary advantage to any one manufacturer as options for accomplishing this feature are given.

12-57 Log #913 NEC-P12 **Final Action: Reject**
(626.31(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-102
Recommendation: Accept the proposal with the following revisions:

(A) An approved disconnecting means shall be provided to simultaneously disconnect all ungrounded conductor of each branch circuit supplying a refrigerated unit. The disconnecting means shall be readily accessible, within sight and not more than 750 mm (30 in.) from the receptacles specified in 626.24(B)(2), and provided with approved permanent means for locking in the open (off) position. Circuit breakers or switches located in power outlets complying with this section shall be permitted as the disconnecting means.

Delete (B).
Substantiation: The second sentence requirement to provide a disconnecting means is redundant, already required by the first sentence. "Receptacles required by 626.24(B)(2)" is more specific than "the receptacle it controls." Locking means should specify an "off" position; doors and covers can be locked. open.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided definitive substantiation to justify the removal of the detailed requirements for the disconnect locking means.

The term "Open" with regard to disconnecting means is used throughout the Code and is widely understood.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-58 Log #912 NEC-P12 **Final Action: Reject**
(626.32)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-104
Recommendation: Accept the proposal with the following revisions:

Separable Power Supply Cable Assembly. A separable power supply cable assembly shall be one of the types and ratings specified in 626.32(A,) (B), and (C). Cords with adapters, pigtail ends, extension cords, and similar items shall not be used.

(A) Ratings. The power supply cable assembly shall be rated in accordance with (1) or (2):

(1) 30-ampere 480-volts 3-phase

(2) 60-ampere 208-volts 3-phase

(B) Cord. The flexible cord or cable shall contain four conductors, one of which shall be an equipment grounding conductor. Cords shall be an extra-hard usage type that complies with 400.3.
Substantiation: A redescription of what constitutes a power supply assembly is superfluous and redundant; the definition in 626.2 provides the definition. All extra-hard usage type flexible cords and cables may not be suitable such as those without a W designation for wet locations and sunlight resistance; 400.3 covers that. Extra-hard usage types are rated 600 volts. "Shall be permitted" is not a requirement per 90.5(B) and, therefore, not enforceable.
Panel Meeting Action: Reject
Panel Statement: The comment removes language that protects against the use of "home made" cord and cable assemblies and extension cords. This is important language to retain. The panel does not consider this information to be superfluous and redundant.

Further, references to material such as described in 400.3 are contained within the first four chapters of the NEC and are discussed in 90.3.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-59 Log #1320 NEC-P12 **Final Action: Reject**
(626.33 (New))

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC / Rep. Chairman, EPRI IWC Transportation Electrification Committees Code Task Force
Comment on Proposal No: 12-105
Recommendation: Revise as follows:

626.33 Means to Prevent Connection or Disconnection Under Load Each receptacle provided by the electrified truck parking space supply equipment shall meet one of the following requirements:
(A) Include an interlocked receptacle with an associated switching device of an interlocking type,
(B) Be provided with a switch rated receptacle-plug combination, or
(C) Be provided with a comparable means identified and listed for the purpose to prevent connection or disconnection under load.
The means to prevent connection or disconnection under load shall prevent user access to live parts.

Substantiation: The substantiation for the original proposal was based on the use of interlocked equipment used in staging areas for transport refrigerated units (TRUs) in ports and the significant reduction of electric shock and injuries prevented by the use of "interlocked" mechanisms. Even with properly protected equipment and users that are trained and qualified to operate such equipment, recent reports at these locations indicate that where a failure of the interlock occurred, one operator was injured resulting in the loss of some fingers due to electrical burns. Another operator at a different location suffered severe burns to the hands.

OSHA and NFPA 70E require the identification of any and all possible electrical hazards, the reduction or elimination of these hazards, the training and qualification of employees, and the provision of personal protective equipment (PPE) of sufficient quality to protect them from all hazards. The truck operator, on the other hand, cannot be assumed to be specifically trained or qualified to connect and disconnect a "live" connection that may be under load at voltages where a shock or arc flash hazard can occur, nor will the truck operator be provided with PPE necessary to protect him. Furthermore, these connections will be made outdoors, in the rain, and with standing ground water in some parking areas.

The dangers surrounding this type of electrical equipment, even among trained personnel at the ports, are serious. Working with energized equipment without the proper protection in place at the truck parking sites can be extremely dangerous. When the truck operator is plugging into an energized receptacle, there is a chance for serious hazards to occur. This needs to be addressed in the design of the plug-receptacle connection. An interlocking mechanism that would only allow the plug to be energized once interlocked would significantly reduce the dangers addressed above for the truck operator. An interlocking mechanism or its equivalent, as proposed, would help in preventing dangers associated with connecting to equipment that is energized.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its position that there is insufficient technical substantiation to justify the limitation to inter-locking type, switch-rated receptacles or with a comparable means identified and listed to prevent connection or disconnection under load. The current requirement does not restrict the use of these type of devices if desired.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:

HITTEL, M.: The appropriate action should be Accept in Principle. ARTICLE 630 — ELECTRIC WELDERS

12-60 Log #403 NEC-P12 **Final Action: Accept**
(630.31(B), FPN No. 3)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-108
Recommendation: The proposal should be rejected.
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.

The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

(630.32(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-109
Recommendation: Accept the proposal.
Substantiation: This provision relates to an overcurrent device,which is rated in amperes; conductor rating to correlate with the ampere rating of an overcurrent device is ampacity, not other ratings such as voltage or insulation temperature rating. See NEC Style Manual 3.2.5.1.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 12-62.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-62 Log #2153 NEC-P12 **Final Action: Accept**
(630.32(B))

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Comment on Proposal No: 12-109
Recommendation: Accept the proposal.
Substantiation: The Submitter proposed to replace the existing term conductor "rating" with conductor "ampacity." "Ampacity'" is defined in Article 100. "Rating" is a general term that is not defined. Also, conductors typically are only individually `rated' for Voltage and Temperature. The text of 630.32(B) applies to conductor ampacity, not conductor voltage or temperature While the term "rating" is correct in the context of 630.32 (Overcurrent Protection), it is not in 630.22(B) (For Conductors), and the term "rating" should be changed to "ampacity." It is noted that for most other uses of the term "conductor rating" in the NEC (e.g., 400.5(A), 610.14(B)), the term is used in conjunction with supplementary information that clarifies the context of the use of the term. The use of the term `conductor rating' in 630.32(B) does not provide this supplementary context.

Ballot Results: Affirmative: 15

ARTICLE 640 — AUDIO SIGNAL PROCESSING, AMPLIFICATION, AND REPRODUCTION EQUIPMENT

12-63 Log #36 NEC-P12 **Final Action: Accept**
(640.2 and 645.2)

Submitter: Stanley Kaufman, CableSafe Inc. / Rep. The Society of the Plastics Industry
Comment on Proposal No: 12-110
Recommendation: Continue to reject these proposals.
Substantiation: The current definitions abandoned cables are based on proposals and comments submitted for the 2002 and 2008 NEC. The table below shows the definitions of abandoned cables currently in the NEC and their genesis.

See Genesis of Abandoned Cable Definitions Table on Page 449

A single definition of "abandoned cable" is inappropriate to cover signaling, fire alarm, optical fiber, communications, CATV and network-powered broadband because each of these cable types has its own installation practices that must be accommodated in the definition of "abandoned cable" to avoid inappropriate and unnecessary removal.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-64 Log #2650 NEC-P12 **Final Action: Accept in Principle**
(640.3(M))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-112
Recommendation: Accept the proposal in principle.
Change "should be per Article 650" to "shall be in accordance with 650.4 through 650.8."
Substantiation: There are two violations of the NEC Style Manual in the accepted proposal, namely, the whole-article reference problem and the lack of mandatory language (4.1.1 and 3.1.1). This comment corrects both.
Panel Meeting Action: Accept in Principle
Change (M) to read as follows:
(M) Organ Pipes. Additions of pipe organ pipes to an electronic organ shall be in accordance with 650.4 through 650.8.
Panel Statement: The panel agrees with the submitter to reference 650.4 through 650.8. The panel notes that the submitter did not quote the correct text by using the word "should".
The panel added a title as required by the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-65 Log #633 NEC-P12 **Final Action: Accept**
(640.6(C))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 12-114
Recommendation: Continue to reject this proposal.
Substantiation: Panel 1 rejected similar Proposals 1-139 and 1-146 with the statement "The submitter has not substantiated that a problem exists, or that the problem would be alleviated by removing abandoned cables and equipment neatly. Rather, the panel concludes, that in some cases, abandoned cables and equipment are best left abandoned. The proposed text is unnecessary as the section more appropriately applies to "Requirements for Electrical Installations" and "Mechanical Execution of Work.""
Panel 12 rejected similar Proposals 12-114, 12-146 with the statement. "The requirement is unenforceable. Disposition of removed materials is not a code responsibility. The remaining installation is required to be in accordance with 110.3, which is enforceable."
Panel 16 rejected similar Proposals 16-24, 16-122, 16-241 and 16-305 with the statement. "This is an unenforceable requirement. Removing abandoned cable involves pulling unused cable and wiring from conduit, raceways, ducts, shafts and drop ceilings. The objective of the original text is directed at the final installation, that it be "neat and workmanlike", not necessarily the installation (in this case, removal) process. The submitter has provided no substantiation for additional requirements during the removal process."
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-66 Log #1691 NEC-P12 **Final Action: Reject**
(640.6(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-113
Recommendation: Accept the proposal and revise as follows: The accessible (as applied to wiring methods) of audio distribution cables not on raceways shall be removed.
Substantiation: Accessible (as applied to wiring methods) requires cables in raceways to be removed which does not seem warranted due to any hazard.
Panel Meeting Action: Reject
Panel Statement: The submitter's text does not provide a clear specific recommendation as required by 4.4.5(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-67 Log #752 NEC-P12 **Final Action: Reject**
(640.8)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 12-115
Recommendation: The Proposal should be Accepted.
Substantiation: The revised wording still permits the conductors to be "physically tied, wrapped, taped, or bound together" but it also permits the conductors to be installed in the same raceway or other enclosure without that requirement.
The existing text that states "…to be in close physical contact with each other…" does not necessarily require that they be "physically tied, wrapped, taped, or bound together".
Panel Meeting Action: Reject
Panel Statement: The term "bundled" is clear. It is a well established term and is consistent with other uses of the term in several places throughout the Code and is appropriate in this application. The word "installed" adds no additional clarity to the Code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-68 Log #1692 NEC-P12 **Final Action: Reject**
(640.45)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-120
Recommendation: Delete or revise as follows: Extra-hard usage type flexible cords and cables that comply with 400.3 shall be permitted to be direct-buried in the earth if:
(1) The minimum cover above the top of the flexible cords and cables is not less than 152 mm (6 in.)
(2) The flexible cords and cables are not installed under buildings or other structures
(3) The flexible cords and cables are not likely to be subject to physical damage
(4) The direct buried portion is continuous, and
(5) The flexible cords and cables are removed when no longer utilized.
Substantiation: Direct buried includes a concrete or asphalt slab. This wiring method is not suitable for direct burial and begs the question why not be permitted for other venues? Table 300.5, Column 1 has cover requirements for 0 volts conductors which includes grounding electrode conductors and equipment grounding and bonding conductors. not under a building which vary from 18 to 24 inches. Presumably, flexible cords and cables will operate with an unspecified voltage that may be as high as the cord or cable rating (600 volts for extra hard usage types). Cords and cables may continue to be energized during periods of non-use and a burial depth of $^{1}/_{4}$ in. is an invitation to hazard and subject to damage. Installation underground can be in a raceway.
Panel Meeting Action: Reject
Panel Statement: Extensive burial instructions are not required. Protection suitable for the conditions and acceptable to the AHJ is sufficient.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 645 — INFORMATION TECHNOLOGY EQUIPMENT

12-69 Log #2651 NEC-P12 **Final Action: Reject**
(645.Long-Time Rating (X-Ray Equipment) and Momentary Rating (X-Ray Equipment))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-122
Recommendation: Accept the proposal in principle.

In addition to addressing the TCC note (not part of this comment), make the following eleven changes it the accepted text:

I. In 645.3(B), change the opening from "Sections" to "The provisions of"

II. In 645.3(E), change "Article 708" to "708.2."

III. In 645.3(F), revise to read as follows: "Fire alarm systems equipment installed in an information technology equipment room shall comply with Part I of Article 760."

IV. In 645.3(G), change the first sentence to read: "Communications equipment installed in an information technology equipment room shall comply with Part I, Part III, Part IV, and 800.170 of Article 800." Change the second sentence to read: This article applies to the powering of communications equipment in an information technology room, subject to the provisions of 800.170.

V. In 645.3(H), change the first sentence to read: "Community antenna television and radio distribution systems equipment installed in an information technology equipment room shall comply with Parts I, III, and IV of Article 820." Change the second sentence to read: This article applies to the powering of communications equipment in an information technology room.

VI. In 645.4 Informational Note, delete the word "Article". Add correlating power-limited cabling references so as to read as follows "… and 725.154(A), 760.154(A), 770.154(A), 800.154(A), and 820.154(A) for power-limited wiring …"

VII. In 645.5(E)(2) Exception, change "when" to "where".

VIII. In 645.5(E)(3), revise to read "The length and arrangement for physical protection of supply cords for listed information technology equipment comply with 645.5(B)."

IX. Delete the Informational Note in 645.6.

X. In 645.10, revise the new final sentence to read as follows: "The disconnecting means shall comply with (A) unless the conditions of (B) are met.

XI. In 645.25, replace the proposal language with that accepted by CMP 12 under Proposal 12-148.

Substantiation: These changes are editorial and most reflect requirements in the NEC Style Manual (NECSM):

I. Sections are to be referred to by the numbers only (NECSM at 4.1.2).

II. Whole-article references are not permitted (NECSM at 4.1.1).

III. Whole-article references are not permitted (NECSM at 4.1.1). Since this provision only mentions "equipment" the wiring, as covered in Parts II, III, and IV of Article 760, is presumably not intended to be considered here. If it is intended, it would still be covered through the operation on 460.35 in Part I, but Part IV on cable listings would need to be added. Note that 760.154(A), in Part III, contains the same cabling instruction as 725.154(A) does for signaling circuits, and in accordance with the information conveyed in the Informational Note in 645.4 it appears that the intent is to waive compliance with Part III.

IV. Whole-article references are not permitted (NECSM at 4.1.1). Since this provision only mentions "equipment" the wiring, as covered in Parts V and VI of Article 800, is presumably not intended to be considered here. If it is intended, Parts V and VI would need to be added in lieu of the simple reference to 800.170. Alternatively, the entire reference could be deleted since the article automatically applies in its entirety unless an amendment is made, and none seem to be offered. For equipment in the room, the reference to 800.170, which requires listing for such equipment, must remain in effect unless the TCC generates some provision that results in an exception to this Chapter 8 requirement.

V. Whole-article references are not permitted (NECSM at 4.1.1). Since this provision only mentions "equipment" the wiring, as covered in Parts V and VI of Article 800, is presumably not intended to be considered here. If it is intended, Parts V and VI would need to be added.

VI. Only the numerical reference is permitted [as in "and 725.154(A) for signaling …"] (NECSM at 4.1.2). The revision adds the appropriate references to the other power-limited plenum applications.

VII. When is a condition of time, and not place. (NECSM at 3.3.4)

VIII. This wording was accepted in principle under Proposal 12-144 with the statement referencing Proposal 12-139, but the change was not made. As worded in the panel action to date, this item occurs in a list of conditions, but fails to state a condition. A verb is required for this to be worded correctly, and Proposal 12-144 supplies appropriate wording.

IX. This note contains a laundry list of whole-article reference violations (NECSM at 4.1.1). Since it adds nothing to the requirements in this article, it can be deleted. Since cabling outside the IT room must meet the conventional rules of the Code, all the referenced articles necessarily apply without amendment.

X. A disconnecting means is not implemented, but it can certainly be either in or out of compliance. No NEC provision for disconnects yet written is "implemented" but the wording in this comment is commonplace and well familiar to code users.

XI. The wording of Proposal 12-148 is much more polished and easier on users. The requirement of a PE for these calculations is excessive. The Proposal 12-148 result strikes the correct balance. Although this was presumably CMP 12's intention, there is no indication in the panel statement in either location as to which wording has preference.

Panel Meeting Action: Reject
Panel Statement: This comment contains modifications to the substantiation section of the proposal and not the recommendation.

The panel accepted different language than appeared in the substantiation to Proposal 12-122.

The panel is unsure of the title of Comment 12-69, "Long-Time Rating (X-Ray Equipment) and Momentary Rating (X-Ray Equipment))".

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-70 Log #252 NEC-P12 **Final Action: Accept**
(645.1, FPN)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 12-122
Recommendation: The Technical Correlating Committee directs that the panel reconsider its action on this proposal to comply with the 3.1.3 of the NEC Style Manual with respect to mandatory requirements in Fine Print Notes.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to reconsider its action on this proposal.

See panel action on Comment 12-71.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

12-71 Log #1406 NEC-P12 **Final Action: Accept**
(645.1, FPN)

Submitter: Robert E. Johnson, ITE Safety
Comment on Proposal No: 12-122
Recommendation: Revise proposed text as follows:

FPN: ~~Use of the requirements in Article 645 is based on the assumption that construction of the information technology equipment room complies with NFPA75.~~ For further information, see *NFPA 75-2009, Standard for the Protection of Information Technology Equipment*, that covers the requirements for the protection of information technology equipment and information technology equipment areas.

Substantiation: The revised FPN complies with the *NEC Style Manual* Section 3.1.3.

This is one of a group of comments by the CMP-12 Article 645 Task Group.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

MARCOVICI, S.: The added text is not necessary as the title of the referenced standard speaks for itself. In addition, the NEC Style Manual does not require that a standard be described when referenced in a FPN.

As a result, the proposal should be rejected.

12-72 Log #1039 NEC-P12 **Final Action: Accept in Principle in Part**
(645.2)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 12-126
Recommendation: The Proposal should continue to be Accepted in Principle and the FPN added by the Panel should be revised as follows:
~~FPN~~ Informational Note: Refer to UL 60950-1 ~~includes listing requirements~~ for additional information on both information technology equipment and communications equipment.

The last phrase in the definition should also be revised as follows: "…and ~~do~~ does not include ~~process~~ communications circuits as defined in 800.2."

Substantiation: 3.1.3 of the NEC Style Manual states "Fine print notes contain explanatory information. They shall not contain requirements and shall not be written in mandatory language."

The proposed revision still provides the user with a reference on where to find additional information while not implying that the UL standard is a requirement. The revised note complies with the NEC Style Manual.

Changing "FPN" to "Informational Note" provides correlation with the TCC Action on Proposal 1-37a.

Revising the last phrase provides additional clarity to the definition and eliminates possible confusion regarding what is meant by "and do not process communications circuits".
Panel Meeting Action: Accept in Principle in Part
The panel accepts in principle the submitter's text regarding the fine print note. The panel does not accept the revision to the definition because it confuses equipment with circuits.

Recommendation: Accept this proposal in principle by revising the text as shown:
(B) Plenums. Sections 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.113(C), & ~~770.154~~(A)~~,~~ 800.113(C), ~~800.154~~(A)~~,~~ and 820.113(C) &~~820.154~~(A) and Tables 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in a plenum (other space used for environmental air) above an information technology equipment room.
(C) Grounding. The non-current-carrying conductive members of optical fiber cables in an information technology equipment room shall be grounded in accordance with 770.101 770.114.
Substantiation: Panel 16 actions on Proposals 16-48, 56, 160 and 172 moved the installation requirements for cables in "other space used for environmental air". The requirements that are in Sections 770.154(A), 800.154(A) and 820.154(A) in the 2008 NEC will be in Sections 770.113(C), 800.113(C) and 820.113(C) and Tables 770.154(A), 800.154(A) and 820.154(A) in the 2011 NEC.

Panel 3 rejected companion proposals 3-192 and 3-198 to move the installation requirements from 725.154(A) to 725.133. If that action is changed in the ROC stage, the reference to 725.154(A) will need to be revised.

Panel 16 action on Proposal 16-41 relocated 770.101 to 770.114.
Panel Meeting Action: Accept
Panel Statement: The panel understands that these changes are intended to correlate with actions by CMP 16.

The panel understands that CMP 3 did not change its actions on Proposals 3-192 and 3-198.

(645.4)

Submitter: Robert E. Johnson, ITE Safety
Comment on Proposal No: 12-134
Recommendation: Revise proposed text as follows:

645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to ~~apply, provided~~ provide alternate wiring methods to the provisions of chapters 1 through 4 for power wiring and 725.154 and 770.113(C) and Table 770.154(A) for signaling wirng and optical fiber cabling when all of the following conditions are met:
~~FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring, and 725.154(A) and 770.154(A) for signaling wiring and optical fiber cabling, for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*.~~
(1) Disconnecting...".
Substantiation: The text clarifies the intent of the task group by editing the leading paragraph to 645.4. The FPN is deleted to comply with the TCC directive. The information that was previously in NEC 2008, 770.154(A) was relocated to 770.113(C) and Table 770.154(A) by CMP-16 action on Proposals 16-48 and 16-56.

This is one of a group of comments by the CMP-12 Article 645 Task Group.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:

645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to ~~apply, provided~~ provide alternate wiring methods to the provisions of Chapters 1 through 4 for power wiring,

725.154 for signaling wiring, and 770.113(C) and Table 770.154(A) for optical fiber cabling, when all of the following conditions are met:

~~FPN: This article provides alternate wiring methods to the provisions of chapters 1 through 4 for power wiring, and 725.154(A) and 770.154(A) for signaling wiring and optical fiber cabling, for information technology equipment rooms constructed in compliance with NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*.~~

(1) Disconnecting...".

Panel Statement: The panel accepts the submitter's text and revises for clarity.

The panel understands that the changes to the references to Article 770 are intended to correlate with actions by CMP 16.

(645.5)

Submitter: Stephen McCluer, APC by Schneider Electric
Comment on Proposal No: 12-137

Recommendation: Revise the text of the renumbered 645.5(E)(2) *Exception*

Exception: Compliance with 300.11(A) shall not be required ~~when raceway is supported by the floor of the building under the raised floor.~~ for flexible metal conduit, liquidtight flexible metal conduit, flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable, when such raceway meets both of the following conditions:

(a) The raceway is supported by the floor of the building under the raised floor; and

(b) The raceway is one continuous run with no splices or junctions.

Substantiation: See comment on Proposal 12-139. The Panel's action on this proposal was to accept in principle, for justification it said to see panel action and statement on Proposal 12-139.

The intent of the Article 645 Task Group's original proposal, as stated by the Task Group Chair's substantiation, was to fix the Code to reflect what has been a recognized industry best practice for many decades. The reason people use Article 645 is to take advantage of the leniency that allows cables to be installed in a manner to allow rapid and frequent addition, removal, or relocation – a major characteristic of Information Technology Equipment rooms. Most of the time this is done with cable installed in flexible liquidtight conduit, although other methods can also include flexible metal conduit, flexible nonmetallic conduit, Type MI cable, Type MC cable or Type AC cable. As stated by the Task Group Chair, no data has been submitted to suggest that the standard practice does not work. The existing language seems to prohibit such practice.

The main concern seems to be that if raceway is not secured to the floor it could become damaged and possibly break at junction points. Such damage could occur during activities such as cable addition, removal, or relocation, or simply by accidental bumping or kicking. The cables proposed in this "amendment to the exception" would not be prone to such damage, unless they have been spliced at some point (presumably to extend the length). This would be an unusual practice, but it is conceivable. The amended language requires that two conditions must be met:

(1) The raceway or cable must be supported by the floor of the building under the raised floor; and

(2) The raceway or cable must be one continuous run with no splices or junctions.

In all other conditions, the requirements of 300.11 shall apply.

By rejecting the proposal, the panel has effectively deleted the number 1 purpose for having Article 645 in the first place. By accepting this comment, the panel will acknowledge what has been recognized as a "best practice" for decades, and will remove an ambiguity from the Code.

Panel Meeting Action: Reject

Panel Statement: Each of the wiring methods of 645.5(E)(2) require securing and supporting in accordance with Chapter 3. In addition, 300.11(A) requires raceways, cable assemblies, boxes, cabinets, and fittings to be securely fastened in place. The submitter has not provided any substantiation to validate a claim of non-abuse or substantiation to relax these requirements. The relaxed rules in Article 645 help to facilitate the frequent ease of interchange of IT equipment. Therefore, it is not uncommon for these under-floor areas to see a lot of traffic, some of which may be by nonelectricians or IT technicians, that are under the floor running data cabling. This leads to the possible abuse of power raceway systems. Flexible wiring methods are not as robust as nonflexible raceways, thus would be subject to the same abuse.

Ballot Results: Affirmative: 15

12-86 Log #1058 NEC-P12 **Final Action: Reject**
(645.5)

Submitter: Stephen McCluer, APC by Schneider Electric
Comment on Proposal No: 12-139

Recommendation: Keep the proposed new and renumbered 645.5(E)(2) *Exception* [formerly 645.5(D)(2)] and reword it as follows:

Exception: Compliance with 300.11(A) shall not be required ~~when raceway is supported by the floor of the building under the raised floor.~~ for flexible metal conduit, liquidtight flexible metal conduit, flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable, when such raceway meets both of the following conditions:

(a) The raceway or cable is supported by the floor of the building under the raised floor; and

(b) The raceway or cable is one continuous run with no splices or junctions.

Substantiation: The panel's action was to reject a proposed exception to the requirement for supply conductors to be installed in accordance with the requirements of 300.11. The latter requires cables and conduits to be secured to the floor.

The intent of the Article 645 Task Group's original proposal, as stated by the Task Group Chair's substantiation, was to fix an ambiguity in the Code to reflect what has been a recognized industry best practice for many decades. The reason people use Article 645 is to take advantage of the leniency that allows cables to be installed in a manner to allow rapid and frequent addition, removal, or relocation – a major characteristic of Information Technology Equipment rooms. Most of the time, this is done with cable installed in flexible liquidtight conduit, although other methods can also include flexible metal conduit, flexible nonmetallic conduit, Type MI cable, Type MC cable or Type AC cable. As stated by the Task Group Chair, no data has been submitted to suggest that the standard practice does not work. The existing language seems to prohibit such practice.

The unstated concern seems to be that if raceway is not secured to the floor it could become damaged and possibly break at junction points. Such damage could occur during activities such as cable addition, removal, or relocation, or simply by accidental bumping or kicking. The cables proposed in this "amendment to the exception" would not be prone to such damage unless they have been spliced at some point (presumably to extend the length). This would be an unusual practice, but it is conceivable. The amended language requires that two conditions must be met:

(1) The raceway must be supported by the floor of the building under the raised floor; and

(2) The raceway must be one continuous run with no splices or junctions.

In all other conditions, the requirements of 300.11 shall apply.

By rejecting the proposal, the panel has effectively deleted the number 1 purpose for having Article 645 in the first place. By accepting this comment, the panel will acknowledge what has been recognized as a "best practice" for decades and will remove an ambiguity from the Code.

(645.5)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 12-139

Recommendation: This Proposal should continue to be Accept in Principle and Part. Proposed section 645.5(E)(2) should be revised to read as follows:

(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable and associated metallic and nonmetallic boxes or enclosures. These supply conductors shall be installed in accordance with the requirements of 300.11. Flexible cord or flexible cable shall be permitted when used with Power Distribution Units as defined in 645.17.

Substantiation: This comment addresses Flexible cords and flexible cables, as defined in Article 400, used in Raised Floors with Power Distribution Units. Smaller Power Distribution Units (as shown) are used in raise floor application when special permission is granted. The distribution centers allows for a single power source to be separated into multiple lower current service outlets. Flexible cord or cables are used with these units.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Hold

Panel Statement: The submitter is introducing a new concept of flexible cord or flexible cable when used with power distribution units.

It introduces a concept that has not had public review.

(647.4(A), (B), and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-150
Recommendation: Accept the proposal with the following revisions:
(A) Distribution Equipment and Overcurrent Protection. Use of standard single-phase panelboards and other distribution equipment with a higher voltage rating shall be permitted. Distribution equipment shall be clearly and durable marked to identify the system. Disconnecting means shall simultaneously disconnect all ungrounded conductors of the circuit they control.
(B) Enclosure Identification. All box covers and other enclosures and outlets shall be clearly and durably marked to indicate the system voltage and source of power.
(C) Conductor Identification. All conductors covered by this article shall be identified as to system at all splices and terminations by color that is not used for wiring elsewhere on the premises, approved marking, tagging, or other approved means. The means of identification shall be posted where the circuit originates and at the disconnecting means for the building or other premises.
Substantiation: Circuit breakers and fused switches for use at the system voltage are covered by the first sentence. Enclosures other than "junction" boxes should be covered by (B) such as switches, circuit breakers, outlets. Equipment other than panelboards are not prohibited, such as individual enclosed circuit breakers and fused switches. As referenced in (A), color identification for conductors should be unique and not used for other systems.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.

All 125-volt receptacles, attachment plugs, cord connector bodies, and flanged surface devices shall have a configuration that is not compatible with such devices connected to other systems on the premises.
Exception: Such devices of other systems that are compatible shall be permitted in areas that are restricted to authorized personnel and contain no such devices supplied by sensitive electronic equipment power sources.
Substantiation: All configurations are unique to some class and rating. Attachment plugs, cord connector bodies, and flanged surface devices should be included. Authorized personnel such as supervision and security should be specified; they may not be "qualified".
Panel Meeting Action: Reject
Panel Statement: Proposal 12-153 requires that, in order to be eligible for the exception, the limited areas prescribed therein must only be accessible by "qualified personnel," not "authorized personnel" as the submitter suggests. The comment does not provide adequate substantiation in accordance with 4.4.5(d) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-99 Log #2652 NEC-P12 **Final Action: Reject**
(647.8)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-154
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:
"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
The submitter of this comment, the senior member of CMP 9, absolutely agrees with CMP 12 that every panel must have the ability to customize this rule to meet the actual context as necessary. CMP 9 has done exactly that in 490.46 and this wording carefully preserves the ability of a panel to craft such language. It is also true, however, that in the great majority of cases the simple requirement to be placed in Article 110 will work and avoid endless repetition of similar text.
Panel Meeting Action: Reject
Panel Statement: The panel is not obligated to accept a comment that is contingent on another panel accepting it.
The panel continues its opposition to establishing one global requirement for "disconnecting means, lockable" as each individual chapter and article has special considerations that need to be considered. A global requirement will not be able to cover all these considerations.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 650 — PIPE ORGANS

12-100 Log #260 NEC-P12 **Final Action: Accept**
(650.3(B) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 12-156
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 4.1.1 of the NEC Style Manual relating to references to an entire article.
The Technical Correlating Committee further directs that the action on this proposal be rewritten to comply with the NEC Style Manual 2.1.5.2 related to titles for the first level subdivisions.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 650.3 to read as follows:
650.3 Other Articles.
(A) Electronic Organ Equipment. Installations of digital/analog sampled sound production technology and associated audio signal processing, amplification, reproduction equipment, and wiring installed as part of a pipe organ shall be in accordance with Article 640.
(B) Optical Fiber Cable. Installations of optical fiber cables shall be in accordance with Parts I and V of Article 770.
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.
The panel recognizes the reference to the entire Article 640 in the proposed text of 650.3(A) and points out that such installations of equipment and wiring discussed in (A) would be covered under the provisions of the entire article. While the NEC Style Manual does not permit such references, this reference in this case, would be applicable and correct for the types of installations discussed because they are described within the Scope of Article 640. Confusion in the pipe organ industry related to the installation of electronic organ equipment and other digital/analog sound production, signal processing, amplification and other sound reproduction technology as part of a pipe organ would indeed be subject to the provisions of Article 640. The intent of the panel is that such equipment is addressed and adequately covered within the NEC without duplication of identical material in Article 640.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-101 Log #261 NEC-P12 **Final Action: Accept**
(650.3(C) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 12-157
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with 4.1.1 of the NEC Style Manual relating to references to an entire article.
The Technical Correlating Committee further directs that the action on this proposal be rewritten to comply with the NEC Style Manual 2.1.5.2 related to titles for the first level subdivisions.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to clarify the panel action.
See panel action and statement on Comment 12-100.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 660 — X-RAY EQUIPMENT

12-102 Log #2653 NEC-P12 **Final Action: Accept**
(660.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-159
Recommendation: Reject the proposal.
Substantiation: Although it is true that the terms arise in two different articles, it does not necessarily follow that the definition must be moved to Article 100, although it is an essential qualification for such a placement. In this case the nature of the X-ray equipment covered in this article is so radically different from that in health care facilities it is appropriate to leave these terms where they are now. No code user reading about industrial X-ray equipment is going to think of going elsewhere for these definitions.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

15-187 Log #262 NEC-P15 **Final Action: Accept**
(660.2.Long-Time Rating (X-Ray Equipment) and Momentary Rating (X-Ray Equipment) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 12-159
Recommendation: The Technical Correlating Committee directs that this proposal be referred to Code-Making Panel 15 for correlating action in Article 517.
This action will be considered by Code-Making Panel 15 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC tor correlating action in Article 517.

The panel reaffirms its position as provided in the panel statement on Proposal 15-14.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-103 Log #865 NEC-P12 **Final Action: Reject**
(660.4(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-160
Recommendation: Accept the proposal and revise as follows:
Fixed and stationary X-ray equipment shall be connected to the power supply by an approved wiring method of Chapter 3.
Substantiation: "General" requirements are covered in Article 110 which does not specifically cover wiring methods. All wiring methods are not suitable.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate. The requirements proposed are covered in 90.3.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-104 Log #2654 NEC-P12 **Final Action: Accept**
(660.23(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-163
Recommendation: Accept the proposal in principle.
Change "live current-carrying parts" to "uninsulated live parts."
Substantiation: Refer to the definition of live parts in Article 100. Any energized part is live. However, the danger addressed in this section is to parts that constitute a shock hazard, that is, uninsulated. At one time the live parts definition only applied to uninsulated parts that presented a shock hazard, but as of the 2002 NEC the definition changed. Like many NEC provisions that mention live parts, this one was never correlated with that major change in the 2002 NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 665 — INDUCTION AND DIELECTIC HEATING EQUIPMENT

12-105 Log #859 NEC-P12 **Final Action: Reject**
(665.4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-167
Recommendation: Accept the proposal.
Substantiation: 500.1 indicates Articles 500 through 504 apply to Class I, II, and III locations for equipment in those locations. Some equipment permitted in those locations are not specifically designed for hazardous (classified) locations, e.g., nonincendive equipment.
Panel Meeting Action: Reject
Panel Statement: The reference to the location of the definition of Hazardous (Classified) Locations is in Article 500 and is appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-106 Log #2655 NEC-P12 **Final Action: Reject**
(665.12)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 12-168
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:
"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
The submitter of this comment, the senior member of CMP 9, absolutely agrees with CMP 12 that every panel must have the ability to customize this rule to meet the actual context as necessary. CMP 9 has done exactly that in 490.46 and this wording carefully preserves the ability of a panel to craft such language. It is also true, however, that in the great majority of cases the simple requirement to be placed in Article 110 will work and avoid endless repetition of similar text.
Panel Meeting Action: Reject
Panel Statement: The panel is not obligated to accept a comment that is contingent on another panel accepting it.
The panel continues its opposition to establishing one global requirement for "disconnecting means, lockable" as each individual chapter and article has special considerations that need to be considered. A global requirement will not be able to cover all these considerations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-107 Log #864 NEC-P12 **Final Action: Reject**
(668.15)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-170
Recommendation: Accept the proposal and revise as follows:
All equipment, apparatus, and components that are grounded shall comply with applicable provisions of Article 250 except that a metal water pipe or tubing shall not be required to be used. Grounding electrodes shall comply with 250.52
Substantiation: Equipment that is grounded, whether or not required by Article 668 should comply with Article 250. "Permitting" electrodes of 250.52 does not impose a requirement per 90.5 (B) and thus is optional.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
Section 668.15 requires the provisions of Article 250 to apply where equipment, apparatus, and structural components are required by provisions of 668 to be grounded. This section allows the use or combination of any of the electrodes prescribed by 250.52 with the exception of water piping to demonstrate compliance with this section and is not a permissive rule whether or not to ground.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 668 — ELECTROLYTIC CELLS

12-108 Log #863 NEC-P12 **Final Action: Reject**
(668.21(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-171
Recommendation: Accept the proposal and revise as follows:
Receptacles, attachment plugs, cord connector bodies, and flanged surface devices for ungrounded equipment shall be non-grounding types.
Substantiation: Cord connector bodies and flanged surface devices should be included. The configuration of a non-grounding type attachment plug, cord connector body, or flanged surface device cannot prevent its use for equipment that is required to be grounded, but not actually grounded.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
This change would eliminate the use of some standard devices or equipment within the cell line working zone. Most of the cell line apparatus is ungrounded and is at cell potential.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 669 — ELECTROPLATING

12-109 Log #862 NEC-P12 **Final Action: Reject**
(669.6(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-174
Recommendation: Accept the proposal and revise as follows:
(A) Open individual insulated conductors shall be permitted to be run without insulated support provided they are securely supported and protected from physical damage by location or approved means. Bare open individual conductors shall be permitted where securely supported on insulators.
(B) Open individual insulated conductors shall be permitted to be supported by approved insulated supports and guarded by elevation or other approved means against accidental contact up to the point of termination in accordance with 110.27.

Substantiation: Supports should be specifically approved; elevation is one means of protection.
Panel Meeting Action: Reject
Panel Statement: The existing wording is adequate.
The proposed change does not reflect the actual electroplating, anodizing, electro-polishing, and electro-stripping equipment configuration.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 670 — INDUSTRIAL MACHINERY

12-110 Log #858 NEC-P12 **Final Action: Reject**
(670.4(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-176
Recommendation: Accept the proposal and revise as follows:
A machine shall be considered as an individual unit and shall be provided with an approved readily accessible disconnecting means within sight of the machine and with approved integral means for locking in the open (off) position. The disconnecting means shall be supplied by a circuit protected by fuses or a circuit breaker. The machine disconnecting means shall not be required to incorporate overcurrent protection unless required by the manufacturer or other provisions in this Code.
Substantiation: The machine disconnecting means should be readily accessible and within sight, and provided with approved permanent means for locking in the open (off) position, since the machine disconnecting means may be the single disconnecting means permitted by the Exception for 430.112. Exception No. 2 for 430.102 permits a single disconnecting means for a machine with more than one motor and 430.102(A) requires the disconnecting means in sight from the motor controller(s).
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation would establish a conflict between Article 670 and NFPA 79 regarding the requirements for the disconnecting means.
The submitter did not provide any substantiation for removal of the term "branch circuits" in the recommendation.
The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate.
The term "open" with regard to disconnecting means is used throughout the Code and is widely understood.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-111 Log #2536 NEC-P12 **Final Action: Reject**
(670.5)

TCC Action: The Technical Correlating Committee directs the text of Proposal 12-177 be revised to read as follows since the proposal would have required industrial machinery at all locations where short-circuit current was not exceeded:
"670.5 Short-Circuit Current Rating. Industrial machinery shall not be installed where the available fault current exceeds its short-circuit current rating as marked in accordance with 670.3(A)(4)."
Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 12-177
Recommendation: Revise text to read as follows:
670.5 Short Circuit Current Rating. Industrial machinery shall be marked in accordance of 670.3(A)(4) and ~~shall be~~ installed where the available fault current does not exceed ~~it's~~ the marked short circuit current rating ~~as marked in accordance with 670.3(A)(4).~~
Substantiation: Suggesting the above rewording because first, the equipment marking needs to be known and will be on the equipment prior to the equipment installation. Secondly, the other change was to remove the words "its" for clarity of the language to "assure the available fault current does not exceed the industrial machinery short circuit rating." "Its" is difficult to enforce because of different interpretations on what "its" is intended to describe.
Panel Meeting Action: Reject
Panel Statement: The current wording is adequate and clear. The rewording does not provide any additional clarity.
The submitter has not proved any technical substantiation for the revision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 675 — ELECTRICALLY DRIVEN OR CONTROLLED IRRIGATION MACHINES

19-216 Log #756 NEC-P19 **Final Action: Reject**
(675.8(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-306
Recommendation: Accept as revised:
"Shall be readily accessible and have approved permanent means for locking in the open (off) position.
Substantiation: "Capable" is not specific; the open position should be specified (OFF), not an open door or cover.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action to Reject Proposal 19-306.
The submitter has not provided any technical substantiation to support the proposed revision.
The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-217 Log #2656 NEC-P19 **Final Action: Hold**
(675.8(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-305
Recommendation: Accept the proposal, contingent on the companion comment to this being accepted by CMP 1.
Substantiation: The concept of a central location for the characteristics of a locking disconnect is sound, although the original proposal to place the wording in Article 100 failed because rules were included in a definition. The companion comment will place the following requirement in Article 110:
"**Disconnecting Means, Lockable.** Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."
Panel Meeting Action: Hold
Panel Statement: The panel acknowledges that this is a companion comment to one submitted to Panel 1 (Comment 1-49) and the action taken by Panel 1 on Comment 1-49 was "Hold." Panel 19 also requests that the Technical Correlating Committee appoint a task group to review the use of the term "Disconnecting means, lockable" throughout the code.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9

19-218 Log #857 NEC-P19 **Final Action: Reject**
(675.8(B) and (C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 19-307
Recommendation: Accept the proposal and revise as follows:
(B) Main Disconnecting Means. An approved readily accessible main disconnecting that incorporates overcurrent protection shall be provided for the machine at the point of connection of supply conductors at the machine or it shall be within sight of and not more than 15 m (50 ft) from the machine, readily accessible, and provided with approved permanent means for locking in the open (off) position. Switches used as the disconnecting means shall have a horsepower and current rating not less than required for the main controller or group of controllers.
Delete Exceptions No. 1 and 2.
(C) Disconnecting Means for Motors and Controllers. An approved disconnecting means shall be provided to simultaneously disconnect all ungrounded conductors supplying each motor(s) and controller(s) it controls and shall be located as required by Article 430, Part IX, but shall not be required to be readily accessible.
Substantiation: A disconnecting means provides for disconnection; overcurrent protection may be incorporated. The present wording requires the disconnecting means to be visible, but not necessarily within sight of the machine. The proposed revision for the last sentence removes the need for the Exception. More than one motor and controller may be supplied by one circuit per 430.24, and 430.53, and one controller can serve more than one motor per 430.87.
Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its action to reject Proposal 19-307.

The panel disagrees with the substantiation provided. The present text requires over current protection by the main disconnecting means and requires it to be visible, located within 50 ft and readily accessible.

The submitter's failure to use legislative format, i.e., use of underscore to denote wording to be inserted and strike-through to denote wording to be deleted, makes it difficult, and sometimes impossible, for the code-making panel to determine exactly what is being proposed and how the substantiation supports the proposed change(s) or revision(s).

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

ARTICLE 680 — SWIMMING POOLS, FOUNDATIONS, AND SIMILAR INSTALLATIONS

17-33 Log #2712 NEC-P17 **Final Action: Reject**
(680.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 17-92
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This new definition is not required since the proposed code changes requiring PSP devices in Article 680 were rejected.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-34 Log #263 NEC-P17 **Final Action: Accept**
(680.3)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 17-96
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal to identify what was not accepted and the reason it was not accepted.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC.

The panel has retained 680.3 as revised because it directs the user to important requirements for underwater speakers and to Article 640 as detailed in the portions of the table that were retained.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-35 Log #2278 NEC-P17 **Final Action: Reject**
(680.3)

Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-96
Recommendation: The panel should reconsider the action on this proposal and reject.
Substantiation: The revision or removal of this table may cause misinterpretation of the installation requirements required in Article 680. In the 2005 cycle, panel 17 incorporated changes in Table 680.3 to account for the use of rigid polyvinyl chloride conduit and reinforced thermosetting resin conduit and also correlated changes for the terminology throughout Article 680. Simply leaving this table intact adds clarity for the user.
Panel Meeting Action: Reject
Panel Statement: The panel chooses to maintain the action on Proposal 17-96. See panel statement on Comment 17-34.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-36 Log #856 NEC-P17 **Final Action: Reject**
(680.4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-98
Recommendation: Accept the proposal and revise as follows:

All electrical equipment in the water, walls, or decks of pools and permanently installed fountains or directly associated with such installations shall comply with applicable provisions of this article.
Substantiation: This article contains provisions for equipment that is associated with pools but not in the water, walls, or decks, e.g., 680.8, 680.9, 680.10, 680.21, 680.22(A and(C), and680.23(A)(2).
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect, this section is for "All electrical equipment installed in the water, walls, or decks of pools, fountains, and similar installations …" per the 2008 NEC. The complete article covers items that may not be in these areas, but this section only address the approval of equipment in those areas. No substantiation has been provided to make this change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-37 Log #26 NEC-P17 **Final Action: Accept**
(680.8(B))

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 17-102
Recommendation: Accept the proposal
Substantiation: Accepting this proposal will make the text of 680.8(B) correlate with Article 800. Throughout Article 800, cables are referred to as "communications cables" not "communication cables". See, for example, 800.179
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

ROCK, B.: Annex B, "Standard Terms", of the NEC® Style Manual indicates on Page 24 explicitly for "communication" to be avoided and to use "communications" as being the sanctioned standard term.

17-38 Log #45 NEC-P17 **Final Action: Accept**
(680.10)

Submitter: Paul W. Abernathy, Electrical Service Specialists & The Electrical Guru
Comment on Proposal No: 17-103
Recommendation: Revise text as follows:

Table 680.10 Minimum Cover Depths

	Minimum Cover	
Wiring Method	**mm**	**in.**
Rigid metal conduit	150	6
Intermediate metal conduit	150	6
Nonmetallic raceways listed for direct burial under minimum of 102 mm (4 in.) thick concrete exterior slab and extending not less than 162 mm (6 in.) beyond the underground installation.	150	6
Nonmetallic raceways listed for direct burial without concrete encasement	450	18
Other approved raceways*	450	18

*Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) thick.

Substantiation: The CMP misunderstood the application of my proposal. There is no technical data that I am aware of that would support the increased depth around the outside perimeter of the pool in general directed by the current verbiage of 680.10. The proposal was to allow for a reduction of depth for circuits directly related to the pool such as wet niche luminaries and so on. The intent of the proposal, as stated, was in regards to the table itself. If the conduit is under 4 inches of concrete, in RNC Conduit and conductors rated for a wet location, I do not see the technical need to be 18 inches in depth. The CMP did not understand that the intent was to allow RNC to have a reduced depth within the 5 foot area around the pool, not under the pool. This would allow pool associated wiring to be installed without maintaining an 18 inch depth while still being afforded the protection of a 4 inch slab around the outside edge of the pool.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-39 Log #852 NEC-P17 **Final Action: Reject**
(680.12 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-105
Recommendation: Accept the proposal and revise as follows:
Approved disconnecting means shall be provided to simultaneously disconnect all ungrounded conductors of each branch circuit supplying fixed utilization equipment associated with the pool, other than lighting.
Each means shall be readily accessible and within sight of the equipment controlled and shall be located at least 1.5 m (5 ft) horizontally from the nearest pool water.
Substantiation: I believe this maintenance disconnecting means was intended for pools, not spas or hot tubs, due to drowning by suction caused by draining of a pool by a pump; “from the inside walls of a pool” doesn’t literally require a location outside of the pool
Panel Meeting Action: Reject
Panel Statement: CMP 17 rejects the submitters substantiation. This required disconnect is intended for pools, spas and hot tubs as specified in this section. The proposed text does not add clarity and in fact deletes the allowance for the shortest path measurement. The submitter has not provided additional documentation to justify this revision.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-40 Log #264 NEC-P17 **Final Action: Accept**
(680.13)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 17-106
Recommendation: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with 3.1.3 of the NEC Style Manual regarding mandatory language in Fine Print Notes.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC. The panel has relocated the material as a definition 680.2. See panel action and statement on Comment 17-41.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-41 Log #1963 NEC-P17 **Final Action: Accept in Principle in Part**
(680.13)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-106
Recommendation: Revise text to read as follows:
(New to Section 680.2 Definitions)
Wet Contact Voltage Limit
A voltage value providing acceptable protection from electric shock where there may be wet (not immersed) contact. The value is:
(1) 15 volts for sinusoidal ac,
(2) 21.2 volts peak for nonsinusoidal ac,
(3) 30 volts for continuous dc, and
(4) 12.4 volts peak for dc that is interrupted at a rate of 10 to 200 Hz.
FPN: The values are obtained from Chapter 9, Tables 11(A) and 11(B).
Substantiation: The text of proposed new 680.13 is not a requirement but a definition that is to be used elsewhere in Article 680. Modifying it editorially and moving it to the Definitions section will allow it to be referenced later in the Article. This will streamline the text of a number of other proposals relating to the use of this limit (see my comments on 17-139, 17-142, 17-159, 17-195, 17-196 and 17-215). The FPN is proposed so that the intent to correlate with the referenced Table values is clear.
Panel Meeting Action: Accept in Principle in Part
Add a new 680.2 definition (in place of the language proposed for 680.13 in Proposal 17-106) to read as follows:
Low Voltage Contact Limit
A voltage not exceeding the following values:
(1) 15 volts (RMS) for sinusoidal ac
(2) 21.2 volts peak for nonsinusoidal ac
(3) 30 volts for continuous dc
(4) 12.4 volts peak for dc that is interrupted at a rate of 10 to 200 Hz.
Panel Statement: The panel rejects the FPN because it is not needed for clarity. The panel accepts in principle the remainder. The panel has changed the term “wet contact voltage limit” to “low voltage contact limit” in order to avoid potential confusion that might occur over the use of the term “wet contact.” The panel has also modified the lead-in text for the same reason.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
MALDONADO, J.: I am voting Negative to the panels action on the expansion of low voltage lighting with no provisions for grounding, GFCI protection or the use of an isolated winding type transformer that has a metal barrier between the primary and secondary windings. As currently required in section 680.23(A)(2). It is presented that increasing these voltages are justified based on the voltage limitations obtained from Chapter 9, Tables 11(A) and 11(B). These tables are for limitations for class 2 and 3 Power Sources. These tables apply to voltages that are not approved for wet contact or immersion contact per note 2. The combination of removing or not requiring GFCI protection or shielded Isolation transformers along with increasing to higher voltages could cause a problem when a power supply shorts our or a low voltage transformer shorts across the windings. This increase has not been justified or substantiated for these locations. Many of these fixtures are also being exempted from grounding if a listed assembly.

17-42 Log #2657 NEC-P17 **Final Action: Accept in Principle**
(680.13 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-106
Recommendation: Accept the proposal in principle and revise to read as follows:
680.13. Voltages for Wet Contact. Where a requirement in this article uses a voltage limitation of 15 volts, the limitation shall be applied to sinusoidal ac. If the operating voltage is other than sinusoidal ac, the equipment shall be listed for application in the context of wet contact conditions.
Informational Note: Tables 11(A) and 11(B) in Chapter 9 provide the required power source limitations for the use of qualified testing laboratories in evaluating equipment, including equipment that will be applied in the context of wet-contact conditions.
Substantiation: The problem with this proposal is not the mandatory language in the informational note; the problem is that the entire section is really an informational note. The new section is a restatement of the wet contact rules in Tables 11(A) and 11(B). It has been long established that these tables are policy parameters for testing laboratories and not for field application. Creating this new section partially unwinds that principle.
This comment integrates the issues raised in the proposal with the appropriate application of Tables 11(A) and 11(B). It does so without the need of any additional changes throughout the body of Article 680, or the addition of any more informational notes. If non-sinusoidal voltages exist, go straight to a qualified testing laboratory for a listing. This comment uses the phrasing “in the context of wet location conditions” in order to properly cover equipment that supplies voltage but may be in a dry location. For example, suppose a manufacturer sought a listing for a pool power supply for indoor pools with the power supply to be mounted in a dry location (very unlikely, but theoretically possible). Such a power supply would not present a wet contact issue with respect to its enclosure, but its output to any pool light would need to be evaluated for wet contact conditions.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel agrees that the material in Proposal 17-106 was written in non-mandatory language and has chosen to resolve this by using a definition. See the action taken on Comment 17-41.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:
MALDONADO, J.: I am voting Negative to the panels action on the expansion of low voltage lighting with no provisions for grounding, GFCI protection or the use of an isolated winding type transformer that has a metal barrier between the primary and secondary windings. 17-43 Log #265 NEC-P17 **Final Action: Accept**
(680.20(C) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 17-107
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as the proposal does comply with the NFPA Regulations Governing Committee Projects.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accept the direction of the TCC. See the action on Comment 17-45.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-44 Log #440 NEC-P17 **Final Action: Reject**
(680.21(A)(5) and 680.7(B))

Submitter: Gary Line, Crystall Lake, IL
Comment on Proposal No: 17-108
Recommendation: Revise text to read as follows:
680.21(A)(5) Cord-and-Plug Connections. Pool-associated motors shall be permitted to employ cord-and-plug connections. The flexible cord shall not exceed 900 mm (3 ft) in length. The flexible cord shall include a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding and locking-type attachment plug. [ROP 17-108].
680.7(B) [should contain the same change in order to remain consistent].
(B) Equipment Grounding. The flexible cord shall have a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding and locking-type attachment plug.
Substantiation: The words "and locking" should be added to these sections to remain consistent with the UL Standard 1081 and with the wording of Section 2.6 Pumps, of the UL *Swimming Pool Equipment, Spas, Fountains and Hydromassage Bathtubs Marking Guide/ as contained in the UL White Book, 2009 Edition.*
Panel Meeting Action: Reject
Panel Statement: The adding of the words "Locking Type" when used for receptacles is based upon their proximity to the pool. If they are to be installed close to the pool then they need to be of the locking type, but if located enough distance away they would not have to be.
UL 1081 only requires locking type attachment plugs for pumps intended to be installed less than 10 ft from the walls of the pool. This proposed text is also not necessary in this section as the requirements for locking or non-locking receptacles are already detailed in section 680.22(A)(1).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-45 Log #2279 NEC-P17 **Final Action: Accept in Principle**
(680.21(C) (New))

Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-107
Recommendation: This proposal should have been accepted.
Substantiation: The submitter clearly meant 680.21(C). Accepting this proposal relocates requirements for swimming pool pump motors to the section that actually covers the motors described in the rule and adds clarity to part 2 of Article 680.
Panel Meeting Action: Accept in Principle
See action on Comment 17-46.
Panel Statement: See statement on Comment 17-46.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-46 Log #2658 NEC-P17 **Final Action: Accept in Principle**
(680.21(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-107
Recommendation: Accept the proposal, located as Section 680.21(C) instead of 680.20(C).
Substantiation: The submitter apologizes for the typo in the section field of the proposal form that sent this to where it could not go. The point of the proposal is to relocate the requirement from 680.22, which has nothing to do with swimming pool pump motors, to 680.21 which does cover these motors. The current Article 680 section numbers were carefully drawn at the time of the 2002 NEC rewrite to rigorously organize the content. The proposal does comply with the Regulations.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Delete 680.22(B) and add 680.21(C) to read as follows:
680.21(C) GFCI Protection. Outlets supplying pool pump motors connected to single-phase 120 volt through 240 volt branch circuits rated 15 or 20 amperes, whether by receptacle or by direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
Panel Statement: The panel has revised the requirement for clarity. Note that "208 volt" is not shown but is included in "120 volt through 240 volt" provision. The panel removed the text referring to short circuit and ground fault protection because it is inclusive in the circuit rating.
The panel has deleted 680.22(B) and replaced it with 680.21(C) in accordance with the recommendation of Proposal 17-107 as indicated in the recommendation of this comment.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-47 Log #2659 NEC-P17 **Final Action: Reject**
(680.22)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-109a
Recommendation: Reject the proposal.
Substantiation: Removing the word "Area" from the title makes the problem far worse. An underwater luminaire is not area lighting, and there is no evidence of confusion. As the panel said in its substantiation, "this section clearly does not cover underwater luminaires." Area lighting is a well known concept. In addition, removing this word leaves no modifier on the other words in the title, possibly leading to the conclusion that underwater lighting, and other unintended loads are covered here. Compare this title with that for 680.23, "Underwater Luminaires". If that title is compared with "Lighting, Receptacles, and Equipment" it looks much more overlapping than if one says "Area Lighting" and the other says "Underwater Luminaires. These titles were carefully vetted during the 2002 rewrite of the article.
Panel Meeting Action: Reject
Panel Statement: The term "area" lighting was only used in the title of this section and is not found in the text of any of its subsections, its use is not necessary.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-48 Log #706 NEC-P17 **Final Action: Reject**
(680.22(1) and (2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-116
Recommendation: Accept the proposal and revise as follows:
(1) Circulation and sanitation system, location. Receptacles, cord connector bodies, and flanged surface outlets that supply power for water pump motors or other loads directly related to the circulation and sanitation systems shall be located not less than 3.0 m (10 ft) horizontally from the pool water or not less than 1.8 m (6 ft) horizontally from the pool water if they meet all of the following conditions: (remainder unchanged).
(2) Other locations. Other receptacles, cord connector bodies, and flanged surface outlets shall be not less than 1.8 m (6 ft) horizontally from the pool water.
Substantiation: Other device that supply plug-connected loads should be included. "Horizontally" makes it clear the location cannot be in or on a structure in a pool that is 10 ft from the inside wall.
Panel Meeting Action: Reject
Panel Statement: The submitter did not clearly indicate changes. Use of "cord connector bodies" is inappropriate as these are cord-mounted devices and would be supplied on the pump. Their use would also pose a risk of electric shock should the power supply cord become detached at the pump and the cord connector body rests in standing water. The use of the term "flanged surface outlet" is unnecessary as the term "receptacle," as defined in Article 100 is inclusive of such constructions. If cord-mounted, its use poses the same potential risk of electric shock as the use of cord connector bodies.

The panel disagrees with adding "horizontally" as it is less representative than current Code text for how a power supply cord can be routed. The submitter did not provide substantiation for changing from where the measurement is to be made ("inside walls" changed to "pool water") from nor for the change in distance ("1.83" m to "1.8" m).

Ballot Results: Affirmative: 11

17-49 Log #2713 NEC-P17 **Final Action: Reject**
(680.22(A) and (B))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 17-113
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional documentation to show that this product has been listed. The companion proposals for neither 680.2 [Proposal 17-92], 680.32 [Proposal 17-193], nor the associated Article 100 Power Safe Protector definition [Proposal 2-27] do not establish limiting safe values for any protection parameters. Any device with a current-interrupting feature and red and green indicator lights could purport to provide power safe protector protection. As such, the proposed requirement is unenforceable.

The additional documentation does not provide sufficient data to show the PSP device will add any greater level of safety in regards to mitigating electrocution hazards than the currently required GFCI devices provide. The UL Research Report clearly states that its scope was to "assess the ability of the Energy Safe Technologies Power Safe Protector (PSP) receptacle design to prevent overheating and thereby mitigate the likelihood of ignition of the electrical wiring system." The requirement for using GFCI protection in this code section is to prevent electrocution where electricity is being used in wet locations. The report clearly states that "An evaluation of this "Power Off" paradigm was not included in this research investigation".

The submitter has not addressed prohibited use of a proprietary trademarked name in mandatory Code requirements (Annex A.14, Guide for Officers of Technical Committees and Technical Correlating Committees of the NFPA). U.S. Patent & Trademark Office shows a live application [USPTO Serial Number 77633351] for registration of "POWERSAFE" by the submitter's corporation Energy Safe Technologies Inc.

(680.22(A)(1))

Submitter: Thomas Valeo, Town of North Arlington, NJ
Comment on Proposal No: 17-116
Recommendation: Revise as follows:
Circulation and Sanitation System, Location. Receptacles that provide power... not less than 6 ft from the inside walls of the pool if they meet all of the following:
~~(1) consist of single receptacles.~~
~~(2) employ a locking configuration.~~
(3) Are of the grounding type.
(4) Have GFCI protection.
Substantiation: Now that the 2008 code permits "all other receptacles" to be not less than 6' from the pool and the pump motor receptacles were pushed from 5 ft to 6ft, there is no reason why the pump motor receptacles should have to comply with (1) and (2) of 680.22(A)(1) since other receptacles are now permitted at the same location.
Panel Meeting Action: Reject
Panel Statement: Sanitation system receptacles are not general use receptacles and may be a higher voltage than 125 volts.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-51 Log #1870 NEC-P17 **Final Action: Reject**
(680.22(B))

Submitter: Larry Brown, Mid Florida Pools
Comment on Proposal No: 17-130
Recommendation: Delete text.
~~**680.22(B) Outlets** supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt or 240 volt, single-phase, whether by receptacle or direct connection shall be provided with ground-fault circuit-interrupter protection for personnel.~~
Substantiation: Proposal 17-130 (Log #4401) went too far, but had the right idea. My experience wiring more that 8000 pools in Central Florida in the past 21 years has shown me that requiring GFCI protection for hard wired pool pumps would be a disaster for health and economic reasons. Nuisance trips in our area will be immense in number and green (algae ridden) pools will become commonplace. This code for 2008 should never have been allowed. The injuries reported and conclusions drawn thereby were dubious at best.

The proposed change should have been: 680.22(B) ~~Outlets~~ Receptacles supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 amperes through 20 amperes, 125 volt through 240 volt, single phase, ~~whether by receptacle or direct connection~~ shall be provided with ground-fault circuit-interrupter protection for personnel.

This would prevent the imminent nuisance trips caused by such minor things as distant lightning strikes, grasses, weeds, blowing rain and insect presence in these motors. (All common occurrences in Florida). Filtration and purification systems will be disabled by these situations on a regular basis in our environment. (I know this from personal experiences.) Due to the transient nature of pool owners in Florida, green pools and sickness will be common and untold millions of dollars will be spent due to this unnecessary code. In addition, thousands of tons of CO2 will spew from our service vehicles while trying to chase down these nuisance trips.

I stand by my testimony given to the Florida Building Commission June, 2009. "I have personally wired over 8000 pools in Florida (without Section 680.22(B) in 2008 NEC) and never had a report of a customer or service worker even being tingled. If non-GFCI circuits for pool pumps are such a hazard, then people would have been dropping like flies in Florida with over 1 million pools in our state alone and up until now 99% of these motors were wired without GFCI protection." The FBC must have believed all who showed up to contest this ill conceived code because they, for the first time ever, chose to delete something from the NEC and that was 680.22(B).

Please don't make Florida become "The Green State" because of all the green pools that would result from this poorly advised code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation to justify the elimination of this safety device. There have been documented incidences of hard wired motors creating an electrocution hazard with at least one being a fatality. CMP 17 rejects the submitters substantiation since the NEC provides for minimum requirements for electrical safety not for pool maintenance.

Also see the panel action and statement on Comment 17-46.
Number Eligible to Vote: 11

17-52 Log #2299 NEC-P17 **Final Action: Reject**
(680.22(B))

Submitter: Dana Anderson, Anderson Poolworks, The Anderson Group, Inc.
Comment on Proposal No: 17-130
Recommendation: Revise to read as follows:
(B) GFCI Protection. Receptacles ~~Outlets~~ supplying pool pump motors from branch circuits with short-circuit and ground fault protection rated 15 or 20 amperes, 125 volt or 240 volt, single phase, ~~whether by receptacle or direct connection~~, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: The GFCI protection required on pool and spa circulation and water feature pumps cause nuisance tripping, leading to expensive and potentially dangerous piping failures. This happens when a variable frequency pump drive loses power due to a GFCI circuit event, multi-level pool-spa combinations equalize their water levels, and the pump loses it prime. If the GFCI is simply re-set without regard for the water-level and priming issues, the pump will run "dry" without water, potentially causing high-temperature situations leading to piping system leaks with potentially catastrophic damages. Additionally, pools and spas without circulation and filtration can become unsafe for bathers in a short period of time.

17-53 Log #2461 NEC-P17 **Final Action: Reject**
(680.22(B))

Submitter: Jennifer Hatfield, Florida Swimming Pool Assn.
Comment on Proposal No: 17-130
Recommendation: Revise text to read as follows:
(B) GFCI Protection. Receptacles ~~Outlets~~ supplying pool pump motors from branch circuits with short-circuit and ground fault protection rated 15 or 20 amperes, 125 volt or 240 volt, single phase, ~~whether by receptacle or direct connection~~, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: This revised text clarifies that only the removal of the GFCI requirement on direct connection pump motors should occur; retaining the GFCI protection on receptacle pump motors. In Florida, there is no evidence that injury has occurred on a direct connection pump motor that is properly bonded and grounded; therefore, requiring a GFCI in this case does not create a safer environment. In fact, adding a GFCI will only cause harm due to the nuisance trips that have been known to occur. These nuisance trips can stem from lightning strikes, grass, weed and insect presence, etc during normal motor start-up. This will result in unsanitary conditions in a few short days, due to the termination of the pool systems; causing health and safety concerns, in addition to resulting in an increase in cost to the consumer to get the pool back up and running. In Florida, the large transient community and warm weather exasperates these concerns – resulting in a longer time for the nuisance trip to be found and fixed, and a greater health and safety risk. Many other sunbelt states will have these same problems. The Florida Building Commission recognized all these points and voted to adopt the 2008 NEC with the exception of this GFCI requirement on direct connection pump motors.

17-54 Log #2541 NEC-P17 **Final Action: Reject**
(680.22(B))

Submitter: Carvin DiGiovanni, Association of Pool & Spa Professionals
Comment on Proposal No: 17-130
Recommendation: Revise text to read as follows:
(B) GFCI Protection. Receptacles ~~Outlets~~ supplying pool pump motors from branch circuits with short-circuit and ground fault protection rated 15 or 20 amperes, 125 volt or 240 volt, single phase, ~~whether by receptacle or direct connection~~, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: The original proposal was submitted incorrectly, this revised text clarifies the intention of the original proposal, which was to remove the GFCI requirement on direct connection pump motors, but retain GFCI protection on receptacle pump motors. Evidence is lacking that any cases of injury have occurred on a properly bonded and grounded hardwired pump motor; therefore, requiring a GFCI in this case does not create a safer environment. Rather, it provides an opportunity for other hazards due to nuisance trips that have and will occur. This nuisance trips can stem from distant lightning strikes, grass, weed and insect presence, etc during normal motor start-up. This will result in termination of the pool filtration and purification systems causing an unsanitary pool in a few short days, especially in warmer weather. An additional factor is that in many parts of the country the transient nature of its residents (snow birds) will allow nuisance tripping to go undetected, in many cases long enough to cause consumer health problems. The unhealthy water can also create an increase in mosquitoes, as well as an inability to see the bottom of the pool clearly, causing additional safety concerns. The cost of repairing such damaged pools will also be an increased burden on consumers with no clear increase in safety resulting from a GFCI requirement on direct connection pool pump motors.

17-56 Log #1964 NEC-P17 **Final Action: Accept**
(680.23)

TCC Action: The Technical Correlating Committee revises the panel's action in 680.23(B)(3) to comply with 2.6 and 3.1.4 of the NEC Style Manual regarding exceptions and directs that the text be revised to read as follows:
"Other than listed low-voltage lighting systems not requiring grounding...".
Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-136
Recommendation: Revise text to read as follows:
(3) Equipment Grounding Provisions for Cords. Except for listed low-voltage lighting systems not requiring grounding, ~~W~~wet-niche luminaires that are supplied by a flexible cord or cable shall have all exposed non-current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than 16 AWG.
(4) Luminaire (Fixture) Grounding Terminations. The end of the flexible-cord jacket and the flexible-cord conductor terminations within a luminaire (fixture) shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the luminaire (fixture) through the cord or its conductors. ~~In addition~~ If present, the grounding connection within a luminaire (fixture) shall be similarly treated to protect such connection from the deteriorating effect of the pool water in the event of water entry into the luminaire (fixture).
Substantiation: When the Panel rejected the proposal addressing line-voltage systems, it also effectively rejected a part of the proposal addressing low-voltage systems not requiring grounding. Such systems are already acknowledged in the Forming Shell and Wiring Extending Directly to the Forming Shell requirements in 680.23(B)(1) and (2). The requested changes extend the same exceptions to the grounding requirements of 680.23(B)(3). The requested change to 680.23(B)(4) is editorial only.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the submitter's recommendation is to 680.23(B)(3) and (4). The panel accepts only those changes noted in legislative text. The word "fixture" is not intended and was not identified by legislative text.

Comment on Proposal No: 17-139
Recommendation: Revise text to read as follows:
(3) GFCI Protection, Relamping. A ground-fault circuit interrupter shall be installed in the branch circuit supplying luminaires operating at more than the Wet Contact Voltage Limit ~~15 volts~~ such that there is no shock hazard during relamping. The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the luminaire to ground.
Substantiation: Comments were made by CMP members that the proposed changes to this Section made this requirement cumbersome to implement, requiring referencing a complex table in Chapter 9. It would be make this Article easier to implement in the field if the necessary voltage limits were in Article 680. No specific voltage limits are needed here. If the text from my comment to 17-106 is adopted, all you need to do here is reference the new definition.

Panel Meeting Action: Accept in Principle

Reject Proposal 17-139 and revise the submitter's recommendation, changing the term "wet contact voltage limit " to "low voltage contact limit."

Panel Statement: The panel changed the term "wet contact voltage limit " to "low voltage contact limit" in the action on Comment 17-41. The panel accepts the submitter's recommendation to revert to the original code text and modify it.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

MALDONADO, J.: I am voting Negative to the panels action on the expansion of low voltage lighting with no provisions for grounding, GFCI protection or the use of an isolated winding type transformer that has a metal barrier between the primary and secondary windings. As currently required in section 680.23(A)(2). It is presented that increasing these voltages are justified based on the voltage limitations obtained from Chapter 9, Tables 11(A) and 11(B). These tables are for limitations for class 2 and 3 Power Sources. These tables apply to voltages that are not approved for wet contact or immersion contact per note 2. The combination of removing or not requiring GFCI protection or shielded Isolation transformers along with increasing to higher voltages could cause a problem when a power supply shorts our or a low voltage transformer shorts across the windings. This increase has not been justified or substantiated for these locations. Many of these fixtures are also being exempted from grounding if a listed assembly.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-69 Log #1968 NEC-P17 **Final Action: Accept**
(680.23(F)(2))

TCC Action: The Technical Correlating Committee revises the panel's action in 680.23(F)(2) to comply with 2.6 and 3.1.4 of the NEC Style Manual regarding exceptions and directs that the text will read as follows: "Other than listed low-voltage luminaires not requiring grounding, all...".
Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-155
Recommendation: Revise text to read as follows:
(2) Equipment Grounding. With the exception of listed low-voltage luminaires not requiring grounding, all ~~T~~through-wall lighting assemblies, wet-niche, dry-niche, or no-niche luminaires shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (F)(2)(a) and (F)(2)(b). The equipment grounding conductor shall be sized in accordance with Table 250.122 but shall not be smaller than 12 AWG.
Substantiation: When the Panel rejected the proposal addressing line-voltage systems, it also effectively rejected a part of the proposal addressing low-voltage systems not requiring grounding. The proposed change reflects similar exceptions for ungrounded low-voltage systems in Section 680.23. These are established technologies with proven field histories.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-70 Log #1969 NEC-P17 **Final Action: Accept in Principle**
(680.24(A)(2))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-159
Recommendation: Revise text to read as follows:
(2) Installation. Where the luminaire operates over the Wet Contact Voltage Limit ~~15 volts~~, the junction box location shall comply with (A)(2)(a) and (A)(2)(b). Where the luminaire operates at the Wet Contact Voltage Limit ~~15 volts~~ or less, the junction box location shall be permitted to comply with (A)(2)(c).
Substantiation: Comments were made by CMP members that the proposed changes to this Section made this requirement cumbersome to implement, requiring referencing a complex table in Chapter 9. It would be make this Article easier to implement in the field if the necessary voltage limits were in Article 680. No specific voltage limits are needed here. If the text from my comment to 17-106 is adopted, all you need to do here is reference the new definition.
Panel Meeting Action: Accept in Principle
Reject Proposal 17-159 and revise the submitter's recommendation, changing the term "wet contact voltage limit " to "low voltage contact limit."
In addition modify 680.24(A)(2)(c) to read as follows:
(c) Flush Deck Box. If used on a lighting system operating at the low voltage contact limit or less, a flush deck box shall be permitted if both of the following apply:
(1) An approved potting compound is used to fill the box to prevent the entrance of moisture.
(2) The flush deck box is located not less than 1.2 m (4 ft) from the inside wall of the pool.
Panel Statement: The panel changed the term "wet contact voltage limit " to "low voltage contact limit" in the action on Comment 17-41. The panel accepts the submitter's recommendation to revert to the original code text and modify it. The panel has also modified 680.24(A)(2)(c) to be consistent.
[The action of this comment does not affect other parts of 680.24(A)(2).]
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:
MALDONADO, J.: I am voting Negative to the panels action on the expansion of low voltage lighting with no provisions for grounding, GFCI protection or the use of an isolated winding type transformer that has a metal barrier between the primary and secondary windings. As currently required in section 680.23(A)(2). It is presented that increasing these voltages are justified based on the voltage limitations obtained from Chapter 9, Tables 11(A) and 11(B). These tables are for limitations for class 2 and 3 Power Sources. These tables apply to voltages that are not approved for wet contact or immersion contact per note 2. The combination of removing or not requiring GFCI protection or shielded Isolation transformers along with increasing to higher voltages could cause a problem when a power supply shorts our or a low voltage transformer shorts across the windings. This increase has not been justified or substantiated for these locations. Many of these fixtures are also being exempted from grounding if a listed assembly.

Comment on Proposal No: 17-159
Recommendation: Reject the proposal.
Substantiation: This is a companion comment to one submitted on the new 680.13 (Proposal 17-106) that addresses the issues raised in a better way and that does not require these modifications throughout Article 680.
Panel Meeting Action: Accept
Panel Statement: See the panel action on Comment 17-70.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-72 Log #2225 NEC-P17 **Final Action: Hold**
(680.24(A)(2)(c))

Submitter: Douglas Burnham, Splas Lights, LLC
Comment on Proposal No: 17-159
Recommendation: Revise text to read as follows:
(C) Flush deck box, if used on a lighting system operating at 15 volts or less, a flush deck box shall be permitted of both the following apply:
(1) An approved potting compound is used to fill the box to prevent the entrance of moisture.
(2) The flush deck box is located not less than 1.2 m (4 ft) from the inside wall of the pool, unless separated from the pool by an approved water tight enclosure.
Substantiation: If a flush deck box were to be contained within and additional approved water tight enclosure, it would allow for a greater flexibility in the positioning and installation of a flush deck box, allowing locations less than 1.2 m (4 ft) without compromising safety from electrical shock. An additional primary water tight enclosure would afford a similar level of safety as with underwater luminaries or greater. It would not be rational to prohibit locations less than 1.2 m (4 ft) if an appropriate barrier can be achieved.
Panel Meeting Action: Hold
Panel Statement: The panel holds the comment in accordance with Section 4.4.6.2.2(a) and (c). In addition, the submitter has not provided adequate technical substantiation for the proposed change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-73 Log #768 NEC-P17 **Final Action: Reject**
(680.24(F))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-163
Recommendation: Accept with the following revisions:
"...shall be connected to equipment grounding terminal(s) or bus(es) in the distribution equipment where the circuit originated."
Substantiation: All circuits do not originate from a panelboard; they may be supplied by a fused switch or an individually enclosed circuit breaker.
Panel Meeting Action: Reject
Panel Statement: The code does not contain the definition of the term "distribution equipment."
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
ROCK, B.: "Distribution equipment" is used 42 times and "distribution and utilization equipment" is used 3 times throughout the Code. Given that much existing usage of the term without definition, rejection on that basis is weak at best. With the additional text revisions the submitter provided in the Comment to address the Panel's legitimate concerns regarding the original Proposal wording, NEMA believes this Comment now reflects appropriate grounding practice. NEMA agrees with the submitter's substantiation that circuits originate from fused switches or individually enclosed circuit breakers as well as from panelboards. Editorially, "originated" should be "originates".

17-74 Log #769 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-164
Recommendation: Accept with the following revisions:
"Feeders shall be installed in approved rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, Type PV conduit, Type RTRC conduit, or Type MI cable. Electrical metallic tubing shall be permitted where installed within a building or other structure, and nonmetallic tubing shall be permitted within a building.
Exception: In the interior of dwelling units and associated accessory buildings, any approved wiring method of Chapter 3 that includes a separate equipment conductor shall be permitted."
Substantiation: LTFMC is permitted as protection from liquids and vapors, and in 680.21(A)(3), 680.42(A)(1), and the Exception for 680.23(F)(1).
The present Exception has a retroactive aspect. Type MI cable is permitted underground, embedded in masonry, and the copper or stainless steel sheath is as resistant to corrosion as the bare copper grounding/bonding conductors in the pool area.
Panel Meeting Action: Reject
Panel Statement: MI cable has not been identified for pool use.
The wiring methods as described in the submitter's substantiation have not been evaluated for the environment.
CMP 17 refers the submitter to Proposal 17-104 and Comment 17-84 of the last cycle.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-75 Log #1864 NEC-P17 **Final Action: Accept in Principle in Part**
(680.25(A))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 17-166
Recommendation: Revise the text of the 2008 NEC as follows:
(A) Wiring Methods. Feeders shall be installed in rigid metal conduit or intermediate metal conduit, ~~liquidtight flexible nonmetallic conduit, rigid polyvinyl chloride conduit, or reinforced thermosetting resin conduit.~~ The following wiring methods shall be permitted if not subject to physical damage:
(1) liquidtight flexible nonmetallic conduit
(2) rigid polyvinyl chloride conduit
(3) reinforced thermosetting resin conduit
(4) electrical metallic tubing ~~shall be permitted~~ if ~~where~~ installed on or within a building, ~~and~~
(5) electrical nonmetallic tubing ~~shall be permitted~~ if ~~where~~ installed within a building
(6) Type MC cable.
Aluminum conduits shall not be permitted in the pool area where subject to corrosion.
Exception: An existing feeder between an existing remote panelboard and service equipment shall be permitted to run in flexible metal conduit or an approved cable assembly that includes an equipment grounding conductor within its outer sheath. The equipment grounding conductor shall comply with 250.24(A)(5).
Substantiation: The Panel's statement for rejecting the proposal which is "The use of Type MC cable is not permitted as per 330.12" seems to be inappropriate. All wiring methods are subject to physical damage. Specifiers, installers, owners and inspectors should be able to select from those wiring methods that are suitable for the task and environment.
Present 680.25(A) permits liquidtight flexible nonmetallic conduit (LFNC) to be used without limitation. Yet, 356.12(1) states it is not permitted "where subject to physical damage." Present 680.25(A) permits rigid polyvinyl chloride conduit (PVC) to be used without limitation. Yet, 352.12(C) states it is not permitted "where subject to physical damage unless identified for such use." Schedule 40 PVC is not identified for protection against physical damage and is permitted by 680.25(A) without limitation. Electrical nonmetallic tubing is permitted by 680.25(A) within a building and yet 362.12(10) states ENT is not permitted "Where subject to physical damage." Why are these wiring methods permitted for this application and the proposal to allow the use of Type MC cable is rejected? Type MC cable is much more robust than several of the wiring methods that is presently allowed.

Type MC cable provides excellent protection from physical damage in compliance with the UL Product Safety Standard. Specific tests the cable must pass that are related to protection against physical damage include:

Impact Test
Crushing Test – All Cable
Crushing Test – Cable Marked for Direct Burial

Type MC cable must also pass a Fault Current Test and an Overload Current Test.

Obviously, wire installed in conduit or tubing is not required to pass these tests. Type MC cable is a superior wiring method and is superbly suited for installation as a feeder for panelboards used for applications covered by this section.

Ordinary Type MC cable is suitable for a dry and damp location. Type MC cable is also produced with an impervious PVC outer jacket and is suitable for installation in wet locations, for direct earth burial and for installation in poured concrete.

In addition, Type MC cable contains an insulated equipment grounding conductor that is in compliance with Section 250.122. This ensures a reliable and low impedance ground fault current return path. As a result, Type MC cable is an excellent wiring method for feeders to panelboards for swimming pool equipment.

Accept this proposal so Type MC cable can be used as it is suitable for this application.

Panel Meeting Action: Accept in Principle in Part

Revise 680.25(A) to read as follows:

(A) Wiring Methods.

(1) Feeders shall be installed in rigid metal conduit or intermediate metal conduit. The following wiring methods shall be permitted if not subject to physical damage:

(a) liquidtight flexible nonmetallic conduit
(b) rigid polyvinyl chloride conduit
(c) reinforced thermosetting resin conduit
(d) electrical metallic tubing where installed on or within a building
(e) electrical nonmetallic tubing where installed within a building
(f) Type MC cable where installed within a building and if not subject to corrosive environment

Exception: An existing feeder between an existing remote panelboard and service equipment shall be permitted to run in flexible metal conduit or an approved cable assembly that includes an equipment grounding conductor within its outer sheath. The equipment grounding conductor shall comply with 250.24(A)(5).

(2) Aluminum conduits shall not be permitted in the pool area where subject to corrosion.

Panel Statement: The panel accepts in principle everything but the addition of MC cable without condition. MC cable is not listed for corrosive environment. Refer to 330.12(2)(b). The panel added within a building and not subject to corrosive environment to reflect this limitation.

The panel changed the word "if" to "where" for situations dealing with location.

Wiring methods should not be left to installers, owners and inspectors and needs to be applied per the NEC.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-76 Log #1865 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 17-166
Recommendation: Accept the Proposal.
Substantiation: The Panel's statement for rejecting the proposal which is "The use of Type MC cable is not permitted as per 330.12" seems to be inappropriate. All wiring methods are subject to physical damage. Specifiers, installers, owners and inspectors should be able to select from those wiring methods that are suitable for the task and environment.

Present 680.25(A) permits liquidtight flexible nonmetallic conduit (LFNC) to be used without limitation. Yet, 356.12(1) states it is not permitted "where subject to physical damage." Present 680.25(A) permits rigid polyvinyl chloride conduit (PVC) to be used without limitation. Yet, 352.12(C) states it is not permitted "where subject to physical damage unless identified for such use." Schedule 40 PVC is not identified for protection against physical damage and is permitted by 680.25(A) without limitation. Electrical nonmetallic tubing is permitted by 680.25(A) within a building and yet 362.12(10) states ENT is not permitted "Where subject to physical damage." Why are these wiring methods permitted for this application and the proposal to allow the use of Type MC cable is rejected? Type MC cable is much more robust than several of the wiring methods that are presently allowed.

Type MC cable provides excellent protection from physical damage in compliance with the UL Product Safety Standard 1569. Specific tests the cable must pass that are related to protection against physical damage include:

Impact Test
Crushing Test – All Cable
Crushing Test – Cable Marked for Direct Burial

Type MC cable must also pass a Fault Current Test and an Overload Current Test.

Obviously, wire installed in conduit or tubing is not required to pass these tests. Type MC cable is a superior wiring method and is superbly suited for installation as a feeder for panelboards used for applications covered by this section.

Ordinary Type MC cable is suitable for a dry and damp location. Type MC cable is also produced with an impervious PVC outer jacket and is suitable for installation in wet locations, for direct earth burial and for installation in poured concrete.

In addition, Type MC cable contains an insulated equipment grounding conductor that is in compliance with Section 250.122. This ensures a reliable and low impedance ground fault current return path. As a result, Type MC cable is an excellent wiring method for feeders to panelboards for swimming pool equipment.

Accept this proposal so Type MC cable can be used as it is suitable for this application.

17-77 Log #2740 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 17-166
Recommendation: Accept submitter's proposal as submitted.
Substantiation: The panel's statement did not address the submitter's proposal, and incorrectly stated that 330.12 did not permit MC cable in this application.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 17-75.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-78 Log #600 NEC-P17 **Final Action: Reject**
(680.25(A)(1))

Submitter: John W. Sheesley, Pinellas County Building Department
Comment on Proposal No: 17-167
Recommendation: Add text to read as follows:

680.25(A)(1) One-Family Dwellings. In the interior of dwelling units, or in the interior of accessory buildings associated with dwelling units, any of the wiring methods recognized in Chapter 3 of this code that comply with provisions of this section shall be permitted. Where run in cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but shall be enclosed within the outer sheath of a cable assembly.

Substantiation: The proposal simply wants the FEEDER to be treated the same as the branch circuit wiring in a dwelling unit which is already permitted by exception - so the exception neuters the rule. The panel statement does not address the proposer's concerns. If the panel is concerned about "corrosive effects" on feeders, should not those same "corrosive effects" also apply to branch circuits?

Panel Meeting Action: Reject
Panel Statement: The requirements of 680.25 are intended to address both commercial installations, multifamily and single family dwellings. The panel rejects the use of lesser wiring methods for feeders for swimming pools. The submitter is incorrect, the exception only applies to existing feeders not branch circuits.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(680.25(A)(1))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Comment on Proposal No: 17-167
Recommendation: Accept the proposal.
Substantiation: The proposer simply wants the FEEDER to be treated the same as BRANCH CIRCUIT wiring in a dwelling unit.

This is already permitted by exception - if the feeder is an existing one - so the exception effectively neuters the rule.

The feeder is simply installed and inspected in advance of the pool installation.

The panel statement does not address the proposal as there are no corrosion requirements in this section.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 17-78.

(680.26(B)(1)(a))

Submitter: James Grant, Rochester, NH
Comment on Proposal No: 17-171
Recommendation: This proposal should have been accepted.
Substantiation: Welded wire mesh is not a requirement of concrete floors installed on grade. Most slabs on grade construction will only require reinforcing steel in the footings and/or walls of the foundations if any at all, none require welded wire mesh. By accepting this proposal, it would be in harmony with Article 547's requirement for the equipotential plane that is accomplishing the same electrical solution to reduce gradients. Having one article reference welded metal wire mesh and another that does not, only adds to the uncertainty to what is considered allowable. Accepting this proposal would give clear direction and would promote a uniformly enforced section.
Panel Meeting Action: Reject
Panel Statement: The welded wire allowed to be part of the equipotential bonding grid may not be required by the building code but can be provided to meet requirements for equipotential bonding.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(680.26(B)(2))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Comment on Proposal No: 17-176
Recommendation: Revise text to read as follows:
(2) Perimeter Surfaces. The perimeter surface shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall include conductive unpaved surfaces with direct contact to the earth as well as poured concrete and other types of paving. Bonding to perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or (2)(b) and shall be attached to the pool reinforcing steel or copper conductor grid at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For nonconductive pool shells, bonding at four points shall not be required.
Substantiation: If an installation is of nonconductive surfaces such a wood or plastic that is not contacting the earth such a wooden deck with a hot tub, raised plastic platform on a partly submerged in the earth pool. As an inspector I try to give the science on why the code provision is needed, a bonding conductor attached to the bottom of a wood deck or plastic platform is one I cannot explain.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional substantiation to make the proposed changes.
The 8 AWG bonding conductor can be installed in the paving material (i.e., in the concrete), or it can be buried in the material (subgrade) below the paving material. Where buried, the bonding conductor is to be not less than 4 in. and not more than 6 in. below the surface level of the subgrade. The subgrade is considered to be into the earth surface.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
WEST, L.: As was discussed at the Meeting, some inspectors in the field are requiring stapling the bond ring to the bottom of a wood or non-conducting deck, where it performs no useful safety function. In addition, similar interpretations are being made by inspectors requiring the earth to be Bonded, sometimes one or more stories below elevated decks with pools. I agree that this language provides clarification necessary to allow for proper application of the Code.

17-83 Log #2280 NEC-P17 **Final Action: Accept in Principle**
(680.26(B)(2))

TCC Action: The Technical Correlating Committee directs that the word "permanent" be inserted in the second sentence of the panel action, before the first use of the word "wall", to correlate with the remainder of that sentence.
Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-175
Recommendation: Revise text to read as follows:
680.26(B)(2) Perimeter Surfaces. The perimeter surface shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall include unpaved surfaces as well as poured concrete surfaces and other types of paving. Perimeter surfaces less than 1 m (3 ft) separated by a wall or building 1.5 m (5 ft) in height or more shall require an equipment bonding grid on the pool side of the permanent wall or building.
Substantiation: Removing the words "will require" and replacing them with "shall require" complies with the NEC Style Manual, section 3.1.1 regarding mandatory rules and 3.3.1 writing style guidelines.
Panel Meeting Action: Accept in Principle
Revise 680.26(B)(2) to read as follows:
680.26(B)(2) Perimeter Surfaces. The perimeter surface shall extend for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall include unpaved surfaces as well as poured concrete surfaces and other types of paving. Perimeter surfaces less than 1 m (3 ft) separated by a wall or building 1.5 m (5 ft) in height or more shall require equipotential bonding on the pool side of the permanent wall or building. Bonding to perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or (2)(b) and shall be attached to the pool reinforcing steel or copper conductor grid at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For nonconductive pool shells, bonding at four points shall not be required.
The remaining text (a) through (b)(5) is unchanged.
Panel Statement: The recommendation of comment 17-83 inadvertently changed equipotential bonding to equipment bonding. The panel has revised the text to more clearly reflect the requirement. The revised text meets the intent of the submitter.

(680.26(B)(2)(b))

Submitter: Reuben E. Clark, Raleigh, NC
Comment on Proposal No: 17-179
Recommendation: Revise text to read as follows:
680.26(B)(2)(b). Where structural reinforcing steel is not available or is encapsulated in a nonconductive compound, a ~~copper conductor(s)~~ grid shall be utilized where the following requirements are met: (1) ~~At least one minimum 8 AWG bare solid copper conductor shall be provided~~ Copper Conductor Grid. A copper conductor grid shall be utilized and shall comply with (b)(1) through (b)(5). (2) ~~The conductors shall follow the contour of the perimeter surface~~. The copper grid shall follow the contour of the perimeter surface extending 1 m (3ft) horizontally beyond the inside walls of the pool. ~~(3) Only listed splices shall be permitted~~. (3) Only listed splices shall be permitted ~~(4) The required conductor shall be 450 to 600 mm (18 to 24 in.) from the inside walls of the pool~~. (4) The copper grid shall be constructed of 8 AWG solid bare copper and be arranged in accordance with 690.26(B)(1)(b)(3). ~~(5) The required conductor shall be secured within or under the perimeter surface 100 mm to 150 mm (4 in. to 6 in.) below the subgrade~~. (5) The copper grid shall be secured within or under the deck or unpaved surfaces no more than 150 mm (4 in. to 6 in.) from the underside of the deck.

Substantiation: The vote in Hilton Head, SC on Proposal 17-179 (Log #805) by NEC-P17 was prior to comments and vote on TIA Log 936. Additional documentation from NEETRAC, as well as several Utility Companies was presented to Code Making Panel 17, which substantiated the TIA 936. The NEETRAC test was performed on an actual pool installed in the backyard of a home, with power leak from an extension cord from the home itself, 15A 110V. Results were conclusive that at one section of the deck the single wire allowed over 10V just 6" from water to over 24V at outer edge of deck, where the Bonding Grid only allowed over 1V at 3' and further out. All around the pool the test demonstrated, and the report stated, that the single wire can NOT guarantee safety, but the grid does. Since traditional concrete decks with rebar grids inside have recently started to be replaced with both paver decks or fiber reinforced decks, both with no metal, it is critical to provide this traditional level of safety to pool owners. A single wire does not provide this standard level, and occurrences of stray voltage felt on the decks will increase as new construction methods become the norm across the country. After this additional information became available, CMP17 voted in the affirmative with a substantial margin of 6-3 for the technical merits of the TIA. While the one abstention caused the lack of enough majority to pass the TIA, this amount of support under this normal code development process, should cause it to be adopted into the code, and I request a new vote to adopt this proposal.

Also, one dissenter on the TIA pointed out that the word 'solid" should be inserted when describing the wire, "8 AWG solid bare copper" so that stranded could not be utilized in the construction. This is an accurate and relevant point, and I have changed the text accordingly, and request Mr. Robinson's proposal not only be adopted, but modified to reflect "8 AWG solid bare copper wire".

Panel Meeting Action: Reject

(680.26(B)(2)(b))

Submitter: Wayne H. Robinson, Lothian, MD

Comment on Proposal No: 17-179

Recommendation: Revise text to read as follows:

680.26(B)(2)(b) *Alternate Means.* Where structural reinforcing steel is not available or is encapsulated in a nonconductive compound, a copper ~~conductor(s)~~ grid shall be utilized where the following requirements are met:

~~(1) At least one minimum 8-AWG bare solid copper shall be provided.~~

(1) The copper grid shall be constructed of 8 AWG solid bare copper and be arranged meeting the requirements of 680.26(B)(1)(b)(3).

~~(2) The conductors shall follow the contour of the perimeter surface.~~

(2) The copper grid shall follow the contour of the perimeter surface extending 1 M (3 ft) horizontally beyond the inside walls of the pool.

(3) Only listed splices shall be permitted.

~~(4) The required conductor shall be 450 to 600 mm (18 to 24 in.) from the inside walls of the pool.~~

~~(5) The required conductor shall be secured with in or under the perimeter surface 100 mm to 150 mm (4 in. to 6 in.) below subgrade.~~

(4) Be secured within or under the deck or unpaved surfaces no more than 150 mm to 600 mm (4 in. to 6 in.) from the underside of the deck.

Substantiation: Corrections to TIA Log No. 936 were implemented at the advice and suggestion of Code-Making Panel 17 after a positive vote of 6-3 for the TIA.

~~Change the 8 AWG bare copper~~ to 8 AWG solid bare copper. The vote in Hilton Head, SC on Proposal 17-179, Log 805, NEC-P17 was prior to comments and vote on the TIA Log 936. The testing documentation from NEETRAC presented to Code-Making Panel 17 substantiated that the single conductor application may not provide adequate protection that a copper grid provides. A number of shock incidents in and around pools have been recorded and addressed by Georgia Power and Singing River Utility in Mississippi which supports the copper grid over a single conductor application. These shock incidents have forced utilities to implement more stringent rules (procedures) over the present 2008 NEC application, since the single conductor falls short on providing the necessary protection.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that the submitter's substantiation provides adequate justification to change the alternate means of perimeter equipotential bonding. The submitter has not documented that the existing alternate means results in unsafe voltage gradients.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-87 Log #2789 NEC-P17 **Final Action: Reject**
(680.26(B)(2)(b))

Submitter: Gary K. Weise, American Pool and Solar Supply

Comment on Proposal No: 17-179

Recommendation: Revise text to read as follows: 680.26(B)(2)(b) *Alternate Means*. Where structural reinforcing steel is not available or is encapsulated in a nonconductive compound, a copper ~~conductor(s)~~ grid shall be utilized where the following requirements are met: ~~(1) At least one minimum 8 AWG bare solid copper shall be provided~~. (1) The copper grid shall be constructed of 8 AWG bare copper and be arranged meeting the requirements of 680.26(B)(1)(b)(3).(2) ~~The conductors shall follow the contour of the perimeter surface.~~ (2) The copper grid shall follow the contour of the perimeter surface extending 1 m (3 ft) horizontally beyond the inside walls of the pool. (3) Only listed splices shall be permitted. ~~(4) The required conductor shall be 450 to 600 mm (18 to 24 in.) from the inside walls of the pool. (5) The required conductor shall be secured with in or under the perimeter surface 100mm to 150 mm (4 in. to 6 in.) below subgrade.~~ (4) Be secured within or under the deck or unpaved surfaces no more than 150 mm to 600 mm (4 in. to 6 in.) from the underside of the deck.

Substantiation: I ask for the above proposal be reconsidered and adopted, based on the results from the NEETRAC test. It was conducted in a "real world" situation, not theory, and proved the single wire does not provide adequate protection for pool decks. Builders are beginning to move away from the time-tested method of steel rebar reinforcing in a poured concrete deck, which has provided an equipotential bonding grid with adequate protection over the years. The NEETRAC test along with common sense and a small amount of electrical theory, should eliminate a single #8 wire from consideration, as a method of providing adequate protection of a 3'+ wide deck. Problems have begun occurring in the field, and the Pool industry cannot afford negative publicity associated with these kinds of problems. Also, having the Federal Government intervene like they did with the Virginia Graeme Baker Act on the plumbing issue, will give us another black eye. We need to demonstrate that we can govern ourselves with providing adequate protection for our industry.

(680.26(B)(5))

Submitter: Carvin DiGiovanni, Association of Pool & Spa Professionals

Comment on Proposal No: 17-145

Recommendation: The original proposal and substantiation submitted contained a typographical error which referenced the incorrect section of the NEC, and was rejected by the Panel on that basis. The correct Section proposed to be amended is 680.26(B)(5), not 680.23(B)(5) as incorrectly cited in the original proposal. Reconsideration of this proposal referencing the correct Section, is respectfully requested. Proposed revised text is as follows:

(5) Metal Fittings. Metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.) shall not require bonding.

Exception: Metallic pool cover anchors intended for insertion in the deck surface, 25 mm (1 in.) or less in diameter and 51 mm (2 in.) or less in length shall not be required to be bonded.

Substantiation: Addition of this exception eliminates a requirement currently being imposed by some AHJs which cannot be met and which also addresses issues created by passage of the Virginia Graeme Baker (VGB) Act and resulting CPSC interpretive action of Section 1406 of VGB that now requires substantially expanded usage of pool covers to prevent accidental drowning. The proposed exception is clearly within the principles espoused by 680.26(B)(5). Typical pool cover anchors are approximately ¾" (19 mm) in diameter and 1-1/4" (32 mm) to 1-1/2" (38 mm) in length, substantially smaller in surface area and only slightly longer than the Section currently exempts. The anchor length cannot be reduced substantially and still withstand shear forces created by the cover. These anchors are generally installed 3-4 feet (0.9 - 1.2 m) away from the edge of the pool and are not mechanically capable of having a bond wire attached. Further, these anchors are, and are expected to be (in increasing numbers under VGB), installed in existing decks, and bonding, even if mechanically possible, would require expensive partial or total demolition of the deck with little or no increase in safety. The submitter knows of no shock or electrocution incidents involving these anchors. Further, as these anchors are installed in a deck that would already require incorporation of a bonding grid, they would be encompassed by the existing equipotential surface in the same fashion as rope anchors and other similar devices already exempt under this section, and which are allowed substantially larger exposed surfaces.

Panel Meeting Action: Reject

Panel Statement: The proposed exception is not needed since the main rule does not prohibit the allowance intended by the exception. The panel rejects the substantiation because it suggests a 2 in. penetration which has not been technically supported or justified as to why the deeper penetration would not require bonding.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
WEST, L.: This technology that has been safely employed in the industry for a number of years with no adverse safety indications.

17-89 Log #1674 NEC-P17 **Final Action: Reject**
(680.26(B)(6)(a))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-182
Recommendation: Delete the Exception and (a).
Substantiation: 680.6(3), 680.21(A), and 680.62(D)(2) do not exempt double-insulated motors from grounding. Ungrounded double-insulated motors can have the frame energized by an ungrounded conductor in the terminal enclosure that contacts the metal housing. 680.21(B)(6) should apply whether or not double-insulated motors are involved.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided documentation to show that not equipotential bonding a double-insulated motor causes a dangerous situation. The submitter misinterprets the intent of this requirement. Double-insulated motors are required to be grounded. This section deals with connection to the equipotential bond. Equipotential bonding of the double-insulated pump is not required (prohibited actually) for double-insulated equipment as doing so would require the installer to make holes in the outer supplemental insulation barrier.
The 8 AWG conductor required by this section is to address the possibility of a double-insulated pump being later replaced by one that is not double-insulated and therefore needing to be connected to the equipotential bond.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-90 Log #705 NEC-P17 **Final Action: Accept in Principle in Part**
(680.26(B)(7))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-83
Recommendation: Accept proposal and revise as follows:
Metal covered cables, metal raceways, metal piping and tubing, and all fixed metal parts shall be bonded.
Exception No. 1: Parts separated by a permanent barrier that prevents contact by a person shall not be required to comply with this section.
Exception No. 2: Those parts greater than 1.5 m (5 ft) horizontally from the pool water shall not be required to comply with this section.
Exception No. 3: Those parts that comply with clearances specified for insulated cables 0-750 volts to ground in Table 680.8 shall not be required to comply with this section.
Substantiation: Present wording implies all metal covered cables have sheaths: Type AC does not have a "sheath". Metal tubing may not be deemed "piping." A permanent barrier should specifically prevent contact by a person in the pool.
Exception No. 2 should clearly indicate the 5 ft refers to outside the pool walls, and that bonding is the equipotential bonding of this section, not other bonding that is required. Separation by clearances in Table 680.8 is suitable for metal parts.
Panel Meeting Action: Accept in Principle in Part
Revise 680.26(B)(7) Exception No 1 to read as follows:
Exception No. 1: Those separated from the pool by a permanent barrier that prevents contact by a person shall not be required to be bonded.
Reject the remainder of the recommendation.
Panel Statement: The panel notes that the related proposal is 17-183.
The changes proposed for the main rule do not add clarity. The term "sheathed" is used consistently elsewhere in the code.
The panel has revised proposed Exception No 1 for clarity.
The proposed change to Exception No. 2 does not add clarity.
The proposed change to Exception No. 3 revises the clearances without any substantiation and does not add clarity.

17-91 Log #2321 NEC-P17 **Final Action: Reject**
(680.26(B)(7))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 17-184
Recommendation: Revise the proposed text as follows:
(7) Fixed Metal Parts. All fixed metal parts shall be bonded, including but not limited to, metal sheathed cables and raceways, metal piping, ~~metal awnings~~, and metal fences~~, and metal door and window frames~~.
Exceptions remain unchanged.
Substantiation: Bonding a window frame that is completely isolated from anything conductive just doesn't make sense. The odds are very, very low that someone swimming in an electrified pool is going to touch a metal window frame. The same can be said for awnings and door frames.
Panel Meeting Action: Reject
Panel Statement: Bonding of these metal parts is not just because they can become energized but is to reduce voltage gradients in the pool area.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-92 Log #2664 NEC-P17 **Final Action: Accept in Part**
(680.26(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-188
Recommendation: Accept the proposal.
Substantiation: The proposal certainly did contain technical substantiation. Does anyone seriously doubt that a conductive object in constant contact with pool water must be evaluated for corrosion resistance under the conditions? This is why CMP 17 changed numerous instances of 8 AWG copper bonding conductors to 8 AWG solid copper conductors over several code cycles, due to the action of pool chemicals on fine strands. Does anyone seriously doubt that a conductive object just hanging in a pool could get kicked or otherwise dislodged and no longer perform its bonding function? It is irresponsible to fail to address these issues. There are now bonding plates that are listed accordingly, and then there is the old strategy of a bonded current collector in the form of a short length of bonded corrosion-resistant metal piping in the drain line, that also cannot be dislodged. The proposed requirement is just common sense, but it provides the inspection community with the tools to make it right. The proposal also addresses an obvious violation of 90.9(B); there is no credible basis for a soft conversion in this area.
Panel Meeting Action: Accept in Part
Revise "5806 mm² (9 in.²)" to "5800 mm² (9 in.²)".
Panel Statement: The panel accepts the submitter's clarification of substantiation directing the panel to 90.9(B) in Comment 17-92 rather than to 90.9(C) in Proposal 17-188 for metric conversion of 9 in.². The panel continues to reject the remainder of Proposal 17-188.
The proposed wording of Proposal 17-188 would permit pool water bonding to be implemented by connection to as few as one metal fitting per 680.26(B)(5) of a size just slightly larger than 100 mm (4 inches) in only one dimension but smaller in any other dimension, potentially far less than the existing requirement for 9 in.² of conductive surface to be in contact with pool water.
In neither Proposal 17-188 nor Comment 17-92 has the submitter provided technical substantiation to justify reduction of required conductive area in contact with pool water.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-93 Log #2714 NEC-P17 **Final Action: Reject**
(680.32)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 17-193
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional documentation to show that this product has been listed. The companion proposals for neither 680.2 [Proposal 17-92], 680.22(A) and (B) [Proposal 17-113], nor the associated Article 100 Power Safe Protector definition [Proposal 2-27], do not establish limiting safe values for any protection parameters. Any device with a current-interrupting feature and red and green indicator lights could purport to provide power safe protector protection. As such, the proposed requirement is unenforceable.

The additional documentation does not provide sufficient data to show the PSP device will add any greater level of safety in regards to mitigating electrocution hazards than the currently required GFCI devices provide. The UL Research Report clearly states that its scope was to "assess the ability of the Energy Safe Technologies Power Safe Protector (PSP) receptacle design to prevent overheating and thereby mitigate the likelihood of ignition of the electrical wiring system." The requirement for using GFCI protection in this code section is to prevent electrocution where electricity is being used in wet locations. The report clearly states that "An evaluation of this "Power Off" paradigm was not included in this research investigation".

The submitter has not addressed prohibited use of a proprietary trademarked name in mandatory Code requirements (Annex A.14, Guide for Officers of Technical Committees and Technical Correlating Committees of the NFPA). U.S. Patent & Trademark Office shows a live application [USPTO Serial Number 77633351] for registration of "POWERSAFE" by the submitter's corporation Energy Safe Technologies Inc.

(680.33(A))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-195
Recommendation: Revise text to read as follows:

680.33 Luminaires. An underwater luminaire, if installed, shall be installed in or on the wall of the storable pool. It shall comply with either 680.33(A) or (B).

(A) Wet Contact Voltage Limit ~~15 Volts~~ or Less. A luminaire shall be part of a cord-and-plug-connected lighting assembly. This assembly shall be listed as an assembly for the purpose and have the following construction features:

(1) No exposed metal parts

(2) A luminaire lamp ~~that operates at 15 volts or less~~ suitable for the voltage supply

(3) An impact-resistant polymeric lens, luminaire body, and transformer enclosure

(4) A transformer or power supply meeting the requirements of 680.23(A)(2) with a primary rating not over 150 volts

Substantiation: To be consistent with the Panel Action on 680.13, the specified voltage needs to reflect other than sinusoidal ac. My comment on 17-106 proposed that the substance of 680.13 be made a definition in 680.2. If the text from my comment to 17-106 is adopted, all you need to do here is reference the new definition and drop the 15V references.
Panel Meeting Action: Accept in Principle

Revise 680.33(A) to read as follows:

(A) Within the Low Voltage Contact Limit. A luminaire shall be part of a cord-and-plug-connected lighting assembly. This assembly shall be listed as an assembly for the purpose and have the following construction features:

(1) No exposed metal parts

(2) A luminaire lamp that is suitable for use at the supplied voltage

(3) An impact-resistant polymeric lens, luminaire body, and transformer enclosure

(4) A transformer or power supply meeting the requirements of 680.23(A)(2) with a primary rating not over 150 volts.

Panel Statement: The panel has accepted the submitter's recommendation in principle by updating the "wet contact voltage limit" term in accordance with the change made in Comment 17-41. The panel has revised the phrase "suitable for the voltage supply" for clarity.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

MALDONADO, J.: I am voting Negative to the panels action on the expansion of low voltage lighting with no provisions for grounding, GFCI protection or the use of an isolated winding type transformer that has a metal barrier between the primary and secondary windings. As currently required in section 680.23(A)(2). It is presented that increasing these voltages are justified based on the voltage limitations obtained from Chapter 9, Tables 11(A) and 11(B). These tables are for limitations for class 2 and 3 Power Sources. These tables apply to voltages that are not approved for wet contact or immersion contact per note 2. The combination of removing or not requiring GFCI protection or shielded Isolation transformers along with increasing to higher voltages could cause a problem when a power supply shorts our or a low voltage transformer shorts across the windings. This increase has not been justified or substantiated for these locations. Many of these fixtures are also being exempted from grounding if a listed assembly.

17-95 Log #2665 NEC-P17 **Final Action: Reject**
(680.33(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-195
Recommendation: Reject the proposal.
Substantiation: This is a companion comment to one submitted on the new 680.13 (Proposal 17-106) that addresses the issues raised in a better way and that does not require these modifications throughout Article 680.
Panel Meeting Action: Reject
Panel Statement: The panel has retained the changes made by the committee action on Proposal 17-195 and provided additional changes to correlate with the action on Comment 17-41. These changes better address requirements related to low voltage contact limit. See action on Comment 17-94.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-96 Log #1971 NEC-P17 **Final Action: Accept in Principle**
(680.33(B))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-196
Recommendation: Revise text to read as follows:

(B) Over the Wet Contact Voltage Limit ~~15 Volts~~ But Not over 150 Volts. A lighting assembly without a transformer and with the luminaire lamp(s) operating at not over 150 volts shall be permitted to be cord-and-plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 680.23(A)(5), and the assembly shall have the following construction features:

(No other changes)

Substantiation: To be consistent with the Panel Action on 680.13, the specified voltage needs to reflect other than sinusoidal ac. My comment on 17-106 proposed that the substance of 680.13 be made a definition in 680.2. If the text from my comment to 17-106 is adopted, all you need to do here is reference the new definition and drop the 15V references.
Panel Meeting Action: Accept in Principle

Revise 680.33(B) to read as follows:

(B) Over the Low Voltage Contact Limit But Not over 150 Volts. A lighting assembly without a transformer or power supply and with the luminaire lamp(s) operating at not over 150 volts shall be permitted to be cord-and-plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 680.23(A)(5), and the assembly shall have the following construction features:

(No other changes)

Panel Statement: The panel changed the term "wet contact voltage limit " to "low voltage contact limit" in the action on Comment 17-41. The panel added words "or power supply" to be consistent with the panel action on Proposal 17-196.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

MALDONADO, J.: I am voting Negative to the panels action on the expansion of low voltage lighting with no provisions for grounding, GFCI protection or the use of an isolated winding type transformer that has a metal barrier between the primary and secondary windings. As currently required in section 680.23(A)(2). It is presented that increasing these voltages are justified based on the voltage limitations obtained from Chapter 9, Tables 11(A) and 11(B). These tables are for limitations for class 2 and 3 Power Sources. These tables apply to voltages that are not approved for wet contact or immersion contact per note 2. The combination of removing or not requiring GFCI protection or shielded Isolation transformers along with increasing to higher voltages could cause a problem when a power supply shorts our or a low voltage transformer shorts across the windings. This increase has not been justified or substantiated for these locations. Many of these fixtures are also being exempted from grounding if a listed assembly.

Ballot Results: Affirmative: 11

17-98 Log #2667 NEC-P17 **Final Action: Reject**
(680.34)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-199
Recommendation: Accept the proposal.
Substantiation: The proposal certainly is enforceable, by the testing laboratories. The procedure would be exactly as is followed for luminaires covered in 410.74(A), where the shipping carton must be marked if the luminaire requires supply conductors rated over 60°C. What is absolutely unenforceable is the present text. These pools are cord- and plug-connected appliances. Their location is no more enforceable than a code rule attempting to specify how close a vacuum cleaner could be positioned to a nearby receptacle. The best that can be hoped for is a notice in the installation directions that directs compliance with this location provision.
Panel Meeting Action: Reject
Panel Statement: The proposed text is not enforceable by the authority having jurisdiction.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-99 Log #1208 NEC-P17 **Final Action: Accept in Principle**
(680.42(A)(1))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 17-201
Recommendation: Proposal 17-201 should be Accepted.
Substantiation: Currently, 680.42(A)(1) restricts the use of LFMC and LFNC in lengths longer than 6 feet. Articles 350 and 356 do not restrict the lengths of LFMC or LFNC when used according to the appropriate sections. The submitter is correct that LFMC and LFNC are commonly used in lengths longer than 6 feet for a liquidtight system where flexibility may or may not be required. This restriction should be removed for safer installations.
Panel Meeting Action: Accept in Principle
Revise 680.42(A)(1) to read as follows:
(1) Flexible Conduit. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted in lengths of not more than 1.8 m (6 ft) external to the spa or hot tub enclosure in addition to the length needed within the enclosure to make the electrical connection.
Panel Statement: The revised text will meet the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-100 Log #2543 NEC-P17 **Final Action: Reject**
(680.42(B))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Carvin DiGiovanni, Association of Pool & Spa Professionals
Comment on Proposal No: 17-203
Recommendation: The Panel has provided no substantiation for its action in rejecting this proposal. No verified shock incidents have been reported dealing with any listed self-contained spa or hot tub on non-bonded perimeter surfaces. There is no similar requirement for storable pools installed outdoors, although the issues are identical. The author therefore respectfully requests reconsideration of the proposal, with language modified to reflect comments of the Panel and changes made to a companion proposal (17-207) regarding indoor spas and hot tubs that was accepted in principle in part in the ROP:
(B) Bonding. Bonding by metal-to-metal mounting on a common frame or base shall be permitted. The metal bands or hoops used to secure wooden staves shall not be required to be bonded as required in 680.26. The equipotential bonding requirements for perimeter surfaces in 680.26 (B)(2) shall not apply to a listed self-contained spa or hot tub when installed on or above the ground.
Substantiation: This proposal eliminates confusion regarding bonding of listed, packaged portable spas and hot tubs (defined in the NEC as "listed self-contained spas and hot tubs") located outdoors, and was submitted concurrent with a similar proposal to clarify language in 680.43 regarding listed self-contained spas and hot tubs installed indoors. Some AHJs recently have begun requiring existing patios, floors and other surfaces (including grass yards) to be torn up and rebuilt with an equipotential bonding grid, or have required the installation of rubber "insulating" mats of unknown quality and questionable dielectric standoff characteristics under and around the spa or hot tub when the property owner purchases and installs a listed self-contained spa or hot tub. This is being done on the premise that the reference to Part II in Article 680.42 requires such arrangements. The author has seen no evidence that the CMP ever intended that the surrounding perimeter surfaces associated with these portable devices be incorporated into the equipotential bonding grid or insulated, and there is no similar perimeter bonding requirement for storable pools installed outdoors, although the equipotential bonding issues are identical. Such a perimeter bonding requirement (indoors or outdoors) is impractical and cost-prohibitive for listed self-contained spas and hot tubs, as the whole point of a listed self-contained spa or hot tub (like a storable pool) is that it can readily be moved or relocated, and is integrally bonded, grounded and GFCI-protected under other sections of Article 680 and UL 1563. A perimeter surface bonding requirement requires demolition and rebuilding of any and all patio or yard area(s) where a listed self-contained spa or hot tub is located any time it is installed or moved within the yard, with no concurrent improvement in safety. There are no verified shock or electrocution incidents reported associated with step potentials or touch potentials associated with persons making contact with the listed self-contained spa or hot tub and the surrounding perimeter surface that could be attributed to failure to bond the perimeter surface.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented substantiation to demonstrate the need for the proposed allowance.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 6 Negative: 5
Explanation of Negative:
BLEWITT, T.: The Panel Statement does not acknowledge the information presented by a manufacturer to the Panel that substantiated the proposal. The occupant of a self-contained spa or hot tub is not typically in simultaneous contact with the water and the perimeter surface. Standing on the perimeter surface and putting hand(s) in the water is possible, but there would be little consequence from a startle-reaction in that case. Listed self-contained hot tubs and spas are factory wired and reliably bonded with a number of layers of protection against electric shock hazard. We were unable to locate data indicating that perimeter equipotential bonding was needed for such listed equipment installed on or above ground. It appears from the record of prior Panel Actions that pools, and not listed self-contained hot tubs and spas, were the basis for introducing the perimeter equipotential bonding requirement.
MALDONADO, J.: I am voting Negative to the panels action on the expansion of low voltage lighting with no provisions for grounding, GFCI protection or the use of an isolated winding type transformer that has a metal barrier between the primary and secondary windings. As currently required in section 680.23(A)(2). It is presented that increasing these voltages are justified based on the voltage limitations obtained from Chapter 9, Tables 11(A) and 11(B). These tables are for limitations for class 2 and 3 Power Sources. These tables apply to voltages that are not approved for wet contact or immersion contact per note 2. The combination of removing or not requiring GFCI protection or shielded Isolation transformers along with increasing to higher voltages could cause a problem when a power supply shorts our or a low voltage transformer shorts across the windings. This increase has not been justified or substantiated for these locations. Many of these fixtures are also being exempted from grounding if a listed assembly.
RAMIREZ, M.: After reviewing the research and data from the task group on ROC 17-100, I am not able to agree or justify that a manufactured and listed self-contained spa/hot tub installed above grade or on a wooden deck should be included in a perimeter equipotential bonding system. No field reports from CPSC, UL or any other agency have documentation of safety issues with these units, also keeping in mind that a listed unit must comply to UL 1563 that produce inherently safe spa/hot tub with multiple layers of protection.
I am voting to accept ROC 17-100 and against the Panel action to reject.
SCHAPP, R.: The panel rejected the proposal based on supposed previous substantiation furnished during the 2005 code cycle. Further investigation by Jim Maldonado failed to produce any documentation to substantiate the inclusion of above ground packaged spas and hot tubs in the requirement for having the walking surfaces around these units bonded per 680.26(B)(2). We know of no other safety problems that would require bonding to the perimeter surfaces. Acceptance of this proposal makes sense. It will clear up the problem that occurs when spas and hot tubs are installed on existing concrete slabs and wooden decks.

WEST, L.: As a result of lengthy discussion, the panel voted at the meeting to reject to Proposal, but the Panel Chairman convened a task group (of which I was a member) to address whether or not there were any documented incidents supporting a position that lack of perimeter grounding on a listed self-contained spa or hot tub installed outdoors on or above the ground resulted in a safety hazard by causing or contributing to either injury or death (as opposed to comfort issues involving "tingle voltages"). The task group reviewed both CPSC data as well as the original documentation submitted during the 2005 Code Cycle regarding this matter, and the panel had input in the meeting from both the spa industry and its own Panel members who have sat on spa-related standards committees for years, supporting the premise that no documented incidents involving this equipment existed. The result of the task group investigation was that there were no such documented incidents, a position that had been proffered to the Panel in the original proposal and comment submissions. Consequently, there was never a documented basis for the Panel's rejecting either the original proposal or comment. Further, as has been pointed out several times, there is no similar requirement for storable pools, even though the electrical bonding issues are identical and listed self-contained spas are required to be internally bonded and grounded by the UL1563 Standard, generally better than a storable pool. The evidence reviewed therefore does not support rejection of either the original proposal or comment, and the Panel action should be reversed and the original proposal should be accepted.

Comment on Affirmative:

HIRSCH, B.: Code Making Panel 17 understands the challenges this requirement presents as a result of the many installation scenarios for this equipment. The EEI/EL&P Group believes, however, that eliminating the equi-potential grid requirement for this equipment in all locations is the wrong way to go. The Panel is open to discussion of alternate solutions that might better meet some of the installation challenges sited but no alternatives were proposed by the submitter.

YASENCHAK, R.: I do beluive installers are having problems with this requirement, but the Comment does not distinguish between a spa/hot tub on a wooden/raiser or non-conductive surface versus on grade or ground. I would have no problem voting to change the requirement for this equipment installed on wooden or non-conductive surfaces.

17-101 Log #271 NEC-P17 **Final Action: Accept**
(680.43)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 17-207
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal concerning the use of the word "when" since the NEC Style Manual considers "when" as a condition of time.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC. See panel action on Comment 17-102.

17-102 Log #2281 NEC-P17 **Final Action: Accept**
(680.43 Exception No. 2)

Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-207
Recommendation: Revise text to read as follows:

Exception No. 2: The equipotential bonding requirements for perimeter surfaces in 680.26(B)(2) shall not apply to a listed self-contained spa or hot tub installed above a finished floor.

Substantiation: The word "when" refers to a condition of time according to the NEC Style Manual, section 3.3.1, writing style guidelines.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-103 Log #2668 NEC-P17 **Final Action: Accept in Principle**
(680.43(D) Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-210
Recommendation: Accept the proposal.
Substantiation: The proposal removes a violation of 3.1.4.1 of the NEC Style Manual requiring complete sentences. The submitter happens to be the author of this Style Manual provision, and it is absolutely intended to address exceptions like this one. As written, it is impossible for an inspector looking at a spa or hot tub to determine what circulating system parts are required to be bonded to what and how, if the tub is listed. Is this a carte-blanche exemption from bonding these items? Is it therefore an exemption from 680.43(E)(3) and a 10 AWG bonding conductor is permitted to these items? The exception needs to provide this information so the rule will be transparent to Code users, and inspectors will know where they stand when they look under the skirt.
Panel Meeting Action: Accept in Principle

Delete 680.43(D) Exception No. 2 and revise 680.43(D)(2) to read as follows:

(2) Metal parts of electrical equipment associated with the spa or hot tub water circulating system, including pump motors, unless part of a listed self-contained spa or hot tub.

Panel Statement: The panel has revised 680.43(D)(2) so that Exception No. 2 can be deleted. This makes it clear as to the intended allowance.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-104 Log #1972 NEC-P17 **Final Action: Accept in Principle**
(680.51(A))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-215
Recommendation: Revise text to read as follows:

680.51 Luminaires, Submersible Pumps, and Other Submersible Equipment.

(A) Ground-Fault Circuit Interrupter. Luminaires, submersible pumps, and other submersible equipment, unless listed for operation at the Wet Contact Voltage Limit ~~15 volts~~ or less and supplied by a transformer or power supply that complies with 680.23(A)(2), shall be protected by a ground-fault circuit interrupter.

Substantiation: To be consistent with the Panel Action on 680.13, the specified voltage needs to reflect other than sinusoidal ac. My comment on 17-106 proposed that the substance of 680.13 be made a definition in 680.2. If the text from my comment to 17-106 is adopted, all you need to do here is reference the new definition and drop the 15V references.
Panel Meeting Action: Accept in Principle

In the submitter's recommendation replace "Wet Contact Voltage Limit" with "low voltage contact limit."

Panel Statement: The panel action correlates with the action on Comment 17-41.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-105 Log #704 NEC-P17 **Final Action: Reject**
(680.52(A)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-217
Recommendation: Accept the proposal and revise as follows:

Where the box is connected to nonmetallic conduit(s) it shall have supports and fasteners of copper, brass, or other approved corrosion-resistant material unless embedded in the pool structure.

Substantiation: Embedment in pool structure makes additional support unnecessary.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original reason for rejection as stated in Proposal 17-217. The submitter has not provided any additional substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-106 Log #1973 NEC-P17 **Final Action: Accept in Principle**
(680.54)

TCC Action: The Technical Correlating Committee revises the panel's action in 680.54 to comply with 2.6 and 3.1.4 of the NEC Style Manual regarding exceptions and directs that the text will read as follows:

"Other than listed low-voltage luminaires not requiring grounding, all...".

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Comment on Proposal No: 17-218
Recommendation: Revise text to read as follows:

680.54 Grounding. The following equipment shall be grounded:

(1) Except for listed low-voltage luminaires not requiring grounding, all ~~All~~ electrical equipment located within the fountain or within 1.5 m (5 ft) of the inside wall of the fountain

(2) All electrical equipment associated with the recirculating system of the fountain

Substantiation: When the Panel rejected the proposal addressing line-voltage luminaires, it also effectively rejected a part of the proposal addressing low-voltage luminaires not requiring grounding. The proposed change reflects similar exceptions for ungrounded low-voltage systems in Section 680.23. These are established technologies with proven field histories.

Panel Meeting Action: Accept in Principle
Revise text to read as follows:
680.54 Grounding. The following equipment shall be grounded:
(1) Except for listed low-voltage luminaires not requiring grounding, all ~~All~~ electrical equipment located within the fountain or within 1.5 m (5 ft) of the inside wall of the fountain
(2) All electrical equipment associated with the recirculating system of the fountain
(3) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the fountain.
Panel Statement: The panel added back the missing (3).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(680.56(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-221
Recommendation: Accept the proposal.
Substantiation: Cord connector bodies and flanged surface devices are devices also used with flexible cords.
Panel Meeting Action: Reject
Panel Statement: Cord connectors and flanged surface devices would conflict with the intent of this Code requirement that connections be permanent unless necessary.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-108 Log #1951 NEC-P17 **Final Action: Accept**
(680.62(B) Exception (New))

Submitter: Thomas V. Blewitt, Underwriters Laboratories Inc.
Comment on Proposal No: 17-223
Recommendation: Add new text to read as follows:
Exception: Small conductive surfaces not likely to become energized, such as air and water jets and drain fittings not connected to metallic piping, and towel bars, mirror frames, and similar nonelectrical equipment not connected to metal framing, shall not be required to be bonded.
Substantiation: The UL negative ballot had an incorrect reference to 680.42(D)(4) Exception 1. It should have referred to 680.43(D)(4) Exception 1, but otherwise correctly stated UL's position. The proposed text is the same as that of the original submitter except "where not connected to metal studs" was added in response to a Panel concern over this being a case where such parts could be inadvertently energized.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-109 Log #2669 NEC-P17 **Final Action: Accept in Principle**
(680.62(B) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-223
Recommendation: Accept the proposal.
Substantiation: As pointed out in the comments in the voting, the wording is the same as has been deemed acceptable for spa and hot tub environments [680.43(D) Exception No. 1]. In fact it has been acceptable for over 16 years as of this writing, since the publication of the 1993 NEC. If this is not technically substantiated, then by all means remove the exception for spas and hot tubs, and while doing that, remove the comparable allowance for swimming pools generally. This type of exception is simply a matter of common sense.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 17-108.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-110 Log #2689 NEC-P17 **Final Action: Accept**
(680.73)

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 17-229
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive. If the receptacle is a GFCI receptacle, then yes, it must be readily accessible, which may well preclude it from being anywhere under the skirt of the bathtub structure. If the receptacle is not a GFCI receptacle due to the protection being applied at a remote location, then there is no specific access rule. The language in the proposal addresses a safety issue because a receptacle located so as to be extremely difficult to access presents a powerful temptation to work the circuit hot. The proposal is very reasonable, easy to apply, and still allows the cosmetic concealment that most owners look for.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-111 Log #708 NEC-P17 **Final Action: Reject**
(680.74)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-231
Recommendation: Accept the proposal.
Substantiation: Sections 680.6(3) and 680.21(A) do not exempt double-insulated motors. 680.62(D)(1)(b) requires grounding; 680.26(B)(6)(a) indicated an EGC for double-insulated motors. An ungrounded double-insulated motor does not provide protection from shock if an ungrounded supply conductor in the terminal housing short-circuits to the metal housing.
Panel Meeting Action: Reject
Panel Statement: The submitter has confused bonding jumpers used for equipment grounding with those used for equipotential bonding.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-112 Log #2322 NEC-P17 **Final Action: Reject**
(680.74)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 17-230
Recommendation: Reject the proposal.
Substantiation: This change doesn't make any sense. If the motor is double insulated, the bonding jumper isn't required in the first place. As currently written, the text refers to a conductor that doesn't exist—"the bonding jumper shall…".
Panel Meeting Action: Reject
Panel Statement: The submitter is incorrect in that the 8 AWG or larger solid copper bonding jumper is in fact required to allow for replacement of the double-insulated motor with one that is not double-insulated.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 682 — NATURAL AND ARTIFICIALLY MADE BODIES OF WATER

17-113 Log #2716 NEC-P17 **Final Action: Reject**
(682.2.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 17-233
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This new definition is not required since the proposed code changes requiring PSP devices in Article 682 were rejected.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-114 Log #703 NEC-P17 **Final Action: Reject**
(682.13)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-236
Recommendation: Accept the proposal and revise second sentence as follows:
Portable power cable Type W in Table 400.4 shall be permitted for feeders and branch circuits where flexibility is required.
Substantiation: Portable power cable designated Type W is the only portable cable identified to wet locations and sunlight resistance. Article 400 does not require listing and there is no other table comparable to Table 400.4 for listed cords and cables. See Proposal 17-237, 682.14 in the 2010 ROP.
Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any new substantiation for the original recommendation. Also, limiting power cable to Type W precludes the development of future cable suitable for the application.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-115 Log #2715 NEC-P17 **Final Action: Reject**
(682.15)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 17-242
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any additional documentation to show that this product has been listed. The companion proposals for 682.2 [Proposal 17-233] nor the associated Article 100 Power Safe Protector definition [Proposal 2-27] do not establish limiting safe values for any protection parameters. Any device with a current-interrupting feature and red and green indicator lights could purport to provide power safe protector protection. As such, the proposed requirement is unenforceable.
The additional documentation does not provide sufficient data to show the PSP device will add any greater level of safety in regards to mitigating electrocution hazards than the currently required GFCI devices provide. The UL Research Report clearly states that its scope was to "assess the ability of the Energy Safe Technologies Power Safe Protector (PSP) receptacle design to prevent overheating and thereby mitigate the likelihood of ignition of the electrical wiring system." The requirement for using GFCI protection in this code section is to prevent electrocution where electricity is being used in wet locations. The report clearly states that "An evaluation of this "Power Off" paradigm was not included in this research investigation".
The submitter has not addressed prohibited use of a proprietary trademarked name in mandatory Code requirements (Annex A.14, Guide for Officers of Technical Committees and Technical Correlating Committees of the NFPA). U.S. Patent & Trademark Office shows a live application [USPTO Serial Number 77633351] for registration of "POWERSAFE" by the submitter's corporation Energy Safe Technologies Inc.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-116 Log #697 NEC-P17 **Final Action: Reject**
(682.31)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-243
Recommendation: Accept the proposal and revise as follows:
Equipment Grounding and Bonding Conductor.
(A) Type. Equipment grounding and bonding conductors shall be insulated copper conductor sized in accordance with 250.122 but not smaller than 12 AWG.
(B) Feeders and Branch Circuits Feeder and branch circuit equipment grounding conductors shall be connected to a grounding terminal(s) or bus(es) in the equipment where the feeder or branch circuit originates and terminates.
(C) Cord Connected Equipment Where grounded, flexible cord and cable connected equipment shall be grounded by an equipment grounding conductor in the flexible cord or cable.
Substantiation: Where bonding conductors are employed, they should also comply with (A). Which already requires the equipment grounding conductors of (B) and (C) to be insulated. Feeder and branch circuit conductors are not required to originate in a panelboard; they may originate in a single fused switch or circuit breaker. Present (C) should apply to cord connected equipment which are not "appliances". The attachment plug may not always be the means of attachment to a circuit. In present (B) "remote" is not defined and is irrelevant to the provision. See 17-246, 682.32 of the 2010 ROP.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original reason for rejecting the proposal. No additional substantiation has been provided.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-117 Log #696 NEC-P17 **Final Action: Reject**
(682.32)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 17-246
Recommendation: Revise panel action as follows:
All metal parts in the water, including metal piping and tubing, tanks, and noncurrent-carrying metal parts that are likely to become energized shall be effectively bonded to a grounding terminal(s) or bus(es) in the distribution equipment for the circuit(s) that can energize such material.
Substantiation: Metal tubing may not be deemed to be piping. Bonding should be to equipment. The distribution equipment should be directly associated with the circuits that can energize these components, to provide the most effective ground fault current path.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action and statement. No additional substantiation has been provided. Metal tubing is covered under "all metal parts." Bonding includes the source equipment as indicated in 250.4.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 685 — INTEGRATED ELECTRICAL SYSTEMS

12-112 Log #702 NEC-P12 **Final Action: Reject**
(685.1(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-178
Recommendation: Accept the proposal.
Substantiation: Panel statement that the scope is (only) to ensure an orderly shutdown necessary for safe operation is belied by "is required to minimize equipment damage", which also does not necessarily create a personnel hazard.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its panel statement on Proposal 12-178. Further, the submitter's text does not add clarity. The submitter has provided no new substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

12-113 Log #701 NEC-P12 **Final Action: Reject**
(685.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 12-182
Recommendation: Accept the proposal and revise as follows:
Location of overcurrent devices and disconnecting means that are critical to integrated electrical systems shall be readily accessible but shall be permitted to be locked to prevent access or operation by unauthorized personnel. Exceptions No. 1, 2, and 3 for 404.8 shall apply.
Substantiation: Disconnecting means as well as overcurrent devices can disrupt integrated electrical systems. Height cannot ensure unauthorized operation by use of ladders, or extension poles. Locking permits quicker access and less hazard by not requiring ladders or other equipment which may delay quick access for safety. A qualified person is not necessary to operate disconnecting means or reset a circuit breaker; homeowners and others do this every day.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide definitive substantiation that a problem exists in the field or with this requirement. The existing wording is adequate. The panel continues to point out that the requirements in 685.10 focus on overcurrent protection.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 690 — SOLAR PHOTOVOLTAIC SYSTEMS

4-64 Log #272 NEC-P04 **Final Action: Accept**
(690.4(B))

TCC Action: The Technical Correlating Committee directs that the proposed wording be revised to remove a redundant sentence.
The text will now read as follows:
"Photovoltaic source circuits and PV output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as conductors, feeders, or branch circuits of other non-PV systems, unless the conductors of the different systems are separated by a partition. PV system conductors shall be identified and grouped as required by 690.4(B)(1) through (4). The means of identification shall be permitted by separate color coding, marking tape, tagging, or other approved means."
The Technical Correlating Committee directs that the Exception to (3) be revised to comply with the NEC Style Manual to read as follows:
"Exception No. 3: Where the identification of the conductors is evident by spacing or arrangement, further identification shall not be required."
The Technical Correlating Committee directs that the Exception to (4) be revised to comply with the NEC Style Manual to read as follows:
"Exception No. 4: The requirement for grouping shall not apply where the circuit enters from a cable or raceway unique to the circuit that makes the grouping obvious."
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-184
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by revising the numbering and lettering of (B) since there is only a (1) and no (2). Mandatory text must be used in the text in each exception to comply with the NEC Style Manual 2.6.1.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel has revised the section, as shown below, to comply with the Technical Correlating Committee's request.
Remove the **(B)(1)** and modify the section to read:
(B) Conductors of Different Systems. Photovoltaic source circuits and PV output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as conductors, feeders, or branch circuits of other non-PV systems, unless the conductors of the different systems are separated by a partition. PV system conductors shall be identified and grouped as required by 690.4(B). PV system conductors shall be identified as required in 690.4(B)(1) through (4). The means of identification shall be permitted by separate color coding, marking tape, tagging, or other approved means.
Renumber the proposed A through D as 1 through 4.
The Exceptions to (3) and (4) are changed to read as follows:
Exception: The requirement for grouping shall not apply if the circuit enters from a cable or raceway unique to the circuit that makes the grouping obvious.
Panel Statement: The panel's revision were made in order for the ext to comply with the NEC Style Manual, and do not alter the intent of the Proposal 4-184.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-65 Log #1950 NEC-P04 **Final Action: Reject**
(690.4(B)(1)(A))

Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 4-183
Recommendation: Revise text to read as follows:
(1) Identification and Grouping.
(A) Photovoltaic Source Circuits. Where a PV system has more than one source or output circuit ~~connected in parallel, either directly or through overcurrent protective devices, the parallel connected~~ the conductors of each source or output circuit shall be identified at all points of termination, connection, and splices.
Substantiation: All source circuit conductors should be identified.
Some inverters have more then one maximum power tracking circuit and these source circuits are not in parallel, but should be individually identified.
The intent is not clear; does this mean that all the circuits are identified the same or each circuit is identified separately? To clarify this add: "each source or output circuit".
Panel Meeting Action: Reject
Panel Statement: The submitter is commenting on the original proposal, not on what was Accepted in the ROP and the material is, therefore, out of context and the panel is unable to address the matter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-66 Log #1948 NEC-P04 **Final Action: Accept**
(690.4(B)(1)(C))

Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 4-183
Recommendation: Revise text to read as follows:
(1) Identification and Grouping.
(C) Conductors of Multiple Systems. Where the conductors of more than one PV system ~~(subarray or inverter)~~ occupy the same junction box, raceway, or equipment, the conductors of each system shall be identified at all termination, connection, and splice points.
Substantiation: The words "subarray or inverter" are superfluous and should be removed.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BOWER, W.: I disagree with the proposal and panel action to delete the words "subarray or inverter". They are not superfluous. The words clarify that the junction box, raceway or equipment contains conductors associated with more than one circuit. Of note, the subarray conductors typically carry current with different characteristics than the circuits associated with the input of an inverter. One area of difference includes the fact that inverter circuits may contain energy stored in capacitors and the circuit current is not limited. Conversely the current source characteristics such as a PV subarray currents is limited and may not clear a fuse if those circuits are shorted.
ZGONENA, T.: This proposal should have been rejected since the terms "sub-array and inverter" add clarity and identify the wiring that could be interpreted as part of the same circuit. A sub-array circuit can be very different than an inverter input circuit. Many PV inverters have large capacitor banks across the input terminals and can source high backfeed currents. The original text purposely defines the need to identify these circuits separately.

4-67 Log #1947 NEC-P04 **Final Action: Accept in Principle**
(690.4(B)(1)(D))

Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 4-183
Recommendation: Revise text to read as follows:
(1) Identification and Grouping.
(D) Grouping. Where the conductors of more than one PV system ~~(subarray or inverter)~~ occupy the same junction box or raceway with removable cover(s), the ac and dc conductors of each system shall be grouped separately by wire ties or similar means at least once, and then shall be grouped at intervals not to exceed 1.8 m (6 ft).
Substantiation: The words "subarray or inverter" are superfluous and should be removed.
Panel Meeting Action: Accept in Principle
Revise the text of 690.4(B)(2) to read as follows:
(B) Identification and Grouping.
(2) Grouping. Where the conductors of more than one PV system occupy the same junction box or raceway with removable cover(s), the ac and dc conductors of each system shall be grouped separately by wire ties or similar means at least once, and then shall be grouped at intervals not to exceed 1.8 m (6 ft).
Panel Statement: The has panel corrected the section reference.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOWER, W.: See My Explanation of Negative on 4-66.

4-68 Log #1758 NEC-P04 **Final Action: Reject**
(690.4(D))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-186
Recommendation: Accept this proposal.
Substantiation: The panel statement on the action to reject this proposal recognizes that the submitter is correct. These systems demand that they be installed by qualified persons. In Pennsylvania there is an abundance of "solar installers' emerging into the market place. These solar installers are applying for and receiving grant monies to install solar grid tie systems. These new "solar installers" are landscapers, plumbers and other entities getting involved in what they believe is a new created business opportunity. This industry does not consider the installation of PV as electrical work.

I disagree with the portion of the panel statement which reads: "However, the NEC cannot contain requirements relative to the qualifications of installers for any electrical system, these requirements need to be handled by local or state qualification committees or licensing boards." A review of the NEC will reveal that the NEC does indeed include numerous installation requirements tied to "qualified persons." In fact CMP-4 includes the "qualified person" requirement in 225.32 Exception No. 1 and 230.204(C).

Panel Meeting Action: Reject

Panel Statement: See panel action on Comment 4-69.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 7 Negative: 5

Explanation of Negative:

MCDANIEL, R.: The panel action on Comment 4-68 should have been an Accept in Principle in Part. While we accept in principle the idea of a qualified person as evidenced by our action on Comment
4-69, we do not accept the part at this time as to the document trail that was included in Comment 4-68. By voting negative on Comment 4-68, this will provide clear indication to the Technical Correlating Committee as to what our intention was at the panel meeting, to accept Comment 4-69.

ROGERS, J.: While there has been much debate relative to the "Qualified Person(s)" requirements being included as a requirement for installation of PV equipment and wiring, it is my belief that the Panel must remain consistent in one direction or another. As expressed in the balloting, the tenor of the Panel appears to be in the direction of supporting the concept, at least for this code cycle.

That being said and as explained by Mr. Brian Crise, we cannot vote in opposite directions on two different comments to the same proposal as that causes confusion for everyone. Therefore, I am changing my vote to reflect consistency. The issue that comes to the forefront here is enforceability and that issue may still need to be addressed either by the Technical Correlating Committe or at the NFPA annual meeting.

STAFFORD, T.: This panel member desires a stringent verification method be specified in order to verify qualified persons only are working on photovoltaic systems. The original proposal submitted by Mr. Brand and supported by Mr. Dollard and supported by the panel comments for proposal 4-186, does provide the necessary verification method.

The panel action on Comment 4-68 should have been an Accept in Principle in Part. While we accept in principle the idea of a qualified person as evidenced by our action on Comment 4-69, we do not accept the part at this time as to the document trail that was included in Comment 4-68. By voting negative on Comment 4-68, this will provide clear indication to the Technical Correlating Committee as to what our intention was at the panel meeting, to accept comment 4-69.

TOOMER, R.: This panel member desires a stringent verification method be specified in order to verify qualified persons only are working on photovoltaic systems. The original proposal submitted by Mr. Brand and supported by Mr. Dollard and supported by the panel comments for proposal 4-186, does provide the necessary verification method.

The panel action on Comment 4-68 should have been an Accept in Principle in Part. While we accept in principle the idea of a qualified person as evidenced by our action on Comment 4-69, we do not accept the part at this time as to the document trail that was included in Comment 4-68. By voting negative on Comment 4-68, this will provide clear indication to the Technical Correlating Committee as to what our intention was at the panel meeting, to accept comment 4-69.

ZGONENA, T.: The panel action on Comment 4-68 should have been an Accept in Principle in Part. While we accept in principle the idea of a qualified person as evidenced by our action on Comment 4-69, we do not accept the part at this time as to the document trail that was included in Comment 4-68. By voting negative on Comment 4-68 this will provide clear indication to the Technical Correlating Committee as to what our intention was at the panel meeting, to accept Comment 4-69.

4-69 Log #1783 NEC-P04 **Final Action: Accept**
(690.4(D) and (E))

TCC Action: The Technical Correlating Committee directs that the Informational Note be revised to read as follows:

"Informational Note: See Article 100 for the definition of "qualified person"."

Submitter: Michael J. Johnston, National Electrical Contractors Association

Comment on Proposal No: 4-186

Recommendation: Accept the proposal in principle and include a new subdivision (E) and informational note as follows:

(D) Equipment. Inverters, motor generators, photovoltaic modules, photovoltaic panels, ac photovoltaic modules, source-circuit combiners, and charge controllers intended for use in photovoltaic power systems shall be identified and listed for the application. ~~and be installed by qualified persons with documented training and experience in the installation of and NEC requirements applicable to such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. Records of qualified persons must be furnished upon request to the local authority having jurisdiction.~~

(E) Wiring and Connections. The equipment and systems in 690.4(A) through (D) and all associated wiring and interconnections shall be installed only by qualified persons.

Informational Note: The defined term qualified person indicates that knowledge related to construction and operation of equipment and installations is necessary along with safety training to recognize and avoid hazards to persons and property.

Substantiation: There were several key points made by the submitter that members of CMP-4 agreed with as indicated in the ballot statements. In fact, the panel statement indicates that the "panel supports installations of these systems by qualified workers." The NEC is an installation Code and defines the term "qualified person" which is definitely necessary for these types of installations as indicated in the submitter's substantiation. This is specialized work and requires significant training and knowledge (including basic NEC knowledge). This comment attempts to preserve the points made by the submitter by retaining the concepts proposed while addressing the concerns of CMP-4 expressed in the panel statement. The NEC should require more specific qualifications for special equipment and systems requiring highly trained and knowledgeable workers and draw specific attention to it again within this article. Knowledge of the general requirements in the NEC (Chapters 1-4) is essential in addition to any specialty certification for installers of this type of equipment, yet in the field more PV installations are being performed by workers and electrical workers and contractors that also obtain specialty certifications beyond the minimum requirements to satisfy the criteria of qualified persons as defined in Article 100. Including the requirement that only qualified workers perform and be responsible for such installations as an NEC requirement supports what is anticipated as a general provision in the Code anyway, while at the same time helps support local regulation of qualified persons and contractors whether or not the electrical worker and contractor licensing and qualifications is regulated at the state and local levels.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

BOWER, W.: I agree with the panel action to strike the language "and be installed by qualified persons with documented training and experience in the installation of and NEC requirements applicable to such equipment. The name(s) of the qualified person(s) shall be kept in a permanent record at the office of the establishment in charge of the completed installation. Records of qualified persons must be furnished upon request to the local authority having jurisdiction." as proposed for 690.4(D). That was an overzealous proposal to begin with, and would set a precedent that every section of the code dealing with installations has similar requirements for qualified personnel spelled out.

Note that this code is written to cover installations from a few watts to multi-megawatts. Per Article 90.1(C) stating "This code is not intended as a design specification or an instruction for untrained persons," implies trained (qualified) or at least supervised persons are doing the work. I can't imagine AHJ personnel running around every small PV installation to be assured qualified persons are making every connection and running every inch of wire. This will become a huge burden in the future as PV installations amounting tera-watt cumulative power production are installed. Further, as PV systems become more plug and play using listed vertically integrated hardware, which wires and connectors will have to be installed by qualified persons?

The proposed language for 690.4(E) is "(E) Wiring and Connections. The equipment and systems in 690.4(A) through (D) and all associated wiring and interconnections shall be installed only by qualified persons. The addition of 690.4(E) as accepted by the panel may appear to attempt to improve the safety of installed PV systems, and I agree safety is paramount, but this is a dangerous precedent. NOWHERE ELSE IN THE NEC IS THERE SUCH UNENFORCABLE LANGUAGE FOR INSTALLATION OF HARDWARE BY QUALIFIED PERSONNEL. NOT FOR THE INSTALLATION OF BATTERIES, EMERGENCY SYSTEMS, EQUIPMENT IN HAZARDOUS LOCATIONS, BULK STORAGE FACILITIES, X-RAY INSTALLATIONS, AMBULATORY CARE UNITS, FIREPUMPS, SERVICE PANELS, SERVICE CONDUCTORS, TRANSFORMERS, MOTOR GENERATORS, UNINTERRUPTIBLE POWER SUPPLIES, ELEVATORS, COORDINATION EQUIPMENT, COMMUNICATIONS EQUIPMENT AND MANY MORE. Note: I recognize there are many instances in the code where equipment shall be accessible ONLY by qualified personnel or be serviced IN INDUSTRIAL SETTINGS OR THEATERS by qualified personnel, but nowhere is the installation of equipment or systems by qualified personnel CALLED OUT! THIS PROPOSAL SHOULD BE REJECTED. PV INSTALLATIONS ARE NO MORE COMPLEX THAN installations such as ELEVATATORS WITH REGENERATIVE BRAKING, UPS SYSTEMS TO BACK UP CRITICAL LOADS (and in the future to interact with the Smart Grid) OR THE MANY OTHERS MENTIONED ABOVE. If this proposal is not rejected then ONLY QUALIFIED personnel should be called out for the installation of ALL equipment.

The "Informational Note" proposed in the comment DOES NOT meet the requirements of the style manual for the NEC. This could have been a fine print note and no mandatory language should have been included. The "Informational Note" should not be allowed and the proposal/comment should be "REJECTED".

If this proposal is not rejected then ONLY QUALIFIED personnel should be called out for the installation of ALL electrical equipment. The current language in Article 690.4(D) already covers the requirement for hardware to be identified and listed for the application, and that does not need to change. Mechanisms to assure good workmanship and assuring hardware meets all the physical requirements of the code are already in place.

WILLS, R.: I do not believe that this language falls within the scope of the NEC.

ZINNANTE, V.: While I agree that "qualified persons" should install these systems, I do not feel it is necessary to redefine the term "qualified person" as an informational note in this article. The definition is clearly defined in Article 100 and needs no further clarification.

Comment on Affirmative:

ROGERS, J.: The submitter has presented a very good and workable solution to referencing a requirement for "Qualified Persons" performing work on PV systems. There was much discussion about adding these words in Article 690 even though the term is already used in five locations within the article. Some are viewing this as a restriction for those already performing these installations, it clearly is not, it is just a baseline statement that workers should be safe for their own good and for the good of the people whose property they are working on. This basic minimum level of competency goes to the very basic purpose of the NEC, the practical safeguarding of people and property. This basic premise starts with protecting the worker by making sure they are qualified to recognize and avoid any hazards they may encounter while performing their work. This is so necessary when dealing with PV systems where one commonly encounters fall hazards, lifting hazards, and electrical shock or burn hazards. Having qualified persons perform these installations is the minimum assurance that the industry owes to the consumers who own the properties where these installations are being made.

STAFFORD, T.: As the panel recognizes the need for qualified persons working upon photovoltaic systems, this panel member wants to stress that it is necessary to require electrical workers to install electrical systems. Comment 4-69 does require qualified persons to perform all work related to photovoltaic installations. The informational note provides some detail into what is considered necessary for a person to become qualified with references to: electrical safety, electrical equipment, installation standards, and operation of electrical equipment.

4-70 Log #2670 NEC-P04 **Final Action: Reject**
(690.4(E))

TCC Action: The Technical Correlating Committee directs that the panel action on Comment 4-70 be reported as "Hold" in compliance with the NFPA Regulations Governing Committee Projects, Section 4.4.6.2.2.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-187
Recommendation: Accept the proposal in principle.

Change "in and out of conduit" to read "where not run in metal raceways or Type MC cable in accordance with 690.31(E)."

Substantiation: The proposal wording effectively removes 690.31(E) from the NEC in most cases. On the literal text, running a steel raceway horizontally across a group of roof rafters in the attic (instead of the permitted "along" such structural members) is a violation. Running the same steel raceway vertically between studs in the wall (duly secured in accordance with the relevant raceway Section 30, generally within 10-ft intervals) would be a violation. In terms of the intended benefit, the closer the raceway is to the roof membrane, the more likely it would be to be in the way of fire fighting activities. In fact, a steel raceway is likely to allow ventilation activities to proceed without danger. CMP 4 has improved 690.31(E) by virtue of its action on Proposal 4-228 accordingly, and this language correlates with that action.

There are trade-offs involved here. A effective requirement to route these raceways on the outside of buildings will not be well received aesthetically and will discourage the progress of this industry. A disconnect requirement that results in a relatively inaccessible attic location is unlikely to be of much assistance during an emergency. As written the proposal is excessive.

Panel Meeting Action: Hold
Panel Statement: This is new material and the panel "Rejects" the comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-71 Log #2671 NEC-P04 **Final Action: Accept**
(690.4(F))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-188
Recommendation: Accept the panel action in principle.

Insert the word "and" after "circuits" and before "containing".

Substantiation: This will clarify that the requirement for the barrier and the requirement for the maximum voltage rating are different concepts, and that the circuits are not thought to contain a barrier. This addresses the concern expressed in the voting.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-72 Log #700 NEC-P04 **Final Action: Reject**
(690.5(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-192
Recommendation: Accept the proposal.
Substantiation: A label that is not durable (adhesion or material) is not a very effective safety measure.
Panel Meeting Action: Reject
Panel Statement: The panel has correctly referenced the general requirement for labels as stated in 110.21.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-73 Log #273 NEC-P04 **Final Action: Accept**
(690.7(E)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-194
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by complying with the NEC Style Manual 3.1 and use the term "shall be permitted" instead of "may".

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel Accepts the use of the term "shall be permitted" instead of the word "may".

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

ZGONENA, T.: There is an editorial problem with the proposed text that should be corrected by TCC. The word "to" needs to be added at the end of "shall be permitted" in order to make the sentence grammatically correct.

4-74 Log #2469 NEC-P04 **Final Action: Hold**
(690.10 (New))

Submitter: Robert H. Wills, Intergrid, LLC / Rep. American Wind Energy Association
Comment on Proposal No: 4-201
Recommendation: Move common language in Articles 690, 692 & 694 to a new common Article 70X:

Article 70X – Stand-Alone Electric Systems

70X.1 Scope. The provisions of this article apply to electric systems that supply power independent of the electric production and distribution network (utility). Stand-alone electric systems can be supplied by sources including engine generators, inverters, fuel cells, and renewable energy sources such as wind and solar-electric systems.

70X.3 Other Articles. Whenever the requirements of other articles of this *Code* and Article 70X differ, the requirements of Article 70X shall apply.

70X.2 Premises Wiring

When used to supply a building or other structure, a stand-alone electric system shall be adequate to meet the requirements of this *Code* for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this *Code* except, as modified by 690.10(A) through (D).

(A) Inverter Output. The ac output from an electrical source such as a generator or stand-alone inverter shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The electrical source output rating shall be not less than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.

(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrent in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply. The inverter output of a stand-alone solar photovoltaic system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multi-wire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING
SINGLE 120-VOLT SUPPLY. DO NOT CONNECT
MULTIWIRE BRANCH CIRCUITS!

(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies shall not be required.
Substantiation: The same language for stand-alone systems is included in the three renewable energy Articles (690, 692 and 694).
It makes sense to eliminate redundancy and to move it to a general Article so that common language can serve all three.

In addition, the permissions and safety issues resolved by this language are not solely applicable to PV, fuel cells and wind energy.
In particular, there are many houses that are powered "off-grid" by prime-power generators that are not capable of the full 100 or 200A capacity of a conventional service. Experience with the approximately 100,000 off-grid PV systems in the USA has shown the need to clarification the requirements for stand-alone systems in the *Code*. This should be extended to the general case.

There is no existing article that covers the general area of stand-alone systems:

- Article 705 covers the opposite (interconnected systems).
- These systems are not for standby use, and so do not belong in Article 702 (Optional Standby Systems).

It makes sense then to create a new article in Chapter 7 to complement Article 705. (covering essentially "non-interconnected power production sources").

The language above is based on that of Article 690.10, but with the specific references to PV power sources changed to the generic term "stand-alone electric system source". The language was also changed to make it compliant with the NEC Style Manual.

This proposal was originally rejected for not being presented as a complete article. I trust that this revision meets the panel's requirements.
Panel Meeting Action: Hold
Panel Statement: The panel Holds the comment as it would change the text to the point where the panel would have to restudy the entire subject text, and it is something that can not be properly handled in the time available to process the report.

The panel notes that Proposal 4-201 was Rejected and, therefore, is not "Held".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

BOWER, W.: I agree that a task group that consists of experts from installation AND INDUSTRY and not a single person is needed to propose such a wholesale movement of the stand-alone section of Article 690 for PV systems. It is recommended that a section on stand-alone systems remain in Article 690 to cover areas that are unique to stand-alone PV systems. Furthermore, a reference to the new locations for "universal" stand-alone requirements must be contained in Article 690. To move all language associated with stand-alone PV systems out of Article 690 will result in a code that is more difficult to understand and will create a need to search other sections of the code for requirements that will not be spelled out specifically for the PV applications but logically should reside in Article 690.

WILLS, R.: We need to move common language in Articles 690, 692 and 694 to a common location. In addition, such stand-alone systems are not properly addressed by the NEC at this point. Situations that are particular to PV (if any exist) can be addressed in a new 690.10. A task group should be appointed for this subject.

4-75 Log #699 NEC-P04 **Final Action: Reject**
(690.10(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-202
Recommendation: Accept the proposal.
Substantiation: This provision doesn't literally apply where equipment is not in the form of a "panel."
Panel Meeting Action: Reject
Panel Statement: The comment does not meet the requirements of 4.3.3(B) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-76 Log #1584 NEC-P04 **Final Action: Reject**
(690.11)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative on this comment.

The Technical Correlating Committee notes that Proposal 4-204 remains "Accepted in Principle" and that Proposal 4-205 remains "Accepted" as modified by the action taken on Comment 4-83.
Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 4-204
Recommendation: Reject this proposal.
Substantiation: While there seems little doubt that dc arc fault protection should be required in PV systems, this proposal is premature. Using the ac AFCI requirement as a model, were this proposal to have progressed in a similar manner, UL would have begun an investigation into technologies that could mitigate dc arc faults in PV systems in at least 2005, UL would have begun working with prospective manufacturers on a standard in at least 2007 and the proposed effectivity date of the requirement would be at least 2014. But in this case no product standard exists today, the only meeting UL has held on the subject was on April 7, 2009 and there isn't even agreement on the type of arc fault protection that should be provided and where in the system it should be located. All interested parties are certainly encouraged to move ahead with the work that needs to be done, however, this proposal might better be considered for the 2014 NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 5
Explanation of Negative:

BOWER, W.: I agree with the comment that the original proposal is premature. Material was presented at the panel meeting that a device to detect arc faults is currently being tested and may be ready in time for the 2011 NEC, but the applicability and range of power levels of a single device in all types of PV systems is not likely! Several panel members expressed confidence that when no commercially available product is available then the mandatory language of the code is not enforced. This is a gamble that could potentially harm the PV industry. Enforcement will be at the discretion of the AHJ and could result in costly delays, multiple appeals and interpretation misunderstandings with each installation.

I agree that all interested parties should move ahead with development of reliable and consistent dc arc fault detection methodologies and devices, but that language proposed for the 2011 NEC would best be delayed until the 2014 edition.

I also believe there should have been a panel statement on this comment to reference the "ACCEPT" on Comment 4-83.

ROGERS, J.: There is no rationale to accept this comment especially in light of the fact that comment 4-80 on the same proposal was rejected. There is definitive forensic evidence of PV ground faults causing fires, although this technology is new the ability to prevent even one fire that cause personal injury or property damage makes its acceptance well worthwhile. The basic premise of the NEC is the protection of persons and property from hazards that may arise from the use of electricity, this technology clearly meets that premise.

STAFFORD, T.: Evidence provides a definitive link to PV ground faults causing fires. This example is enough for this panel member to believe that a technology, while new, is a method that could help mitigate the direct cause of PV ground faults causing fires.

WILLS, R.: I believe that the panel was confused by the double negative involved in this comment which was to Reject Proposal 4-204.

The panel action should have been Reject with the same panel statement as used on Comment 4-80.

I support the requirement for dc arc fault detectors for PV in the 2011 NEC.

While concerned with the lack of available equipment, I believe that the rapid growth of the PV industry and the potential for fire hazard justifies acceptance of this proposal. It will give manufacturers solid reason to continue developing these detectors prior to the release of the 2011 NEC.

ZGONENA, T.: The panel action to accept 4-76 is inconsistent with the action taken on 4-77, and 4-83. The panel action should have been to reject this comment. The ROP panel action on 4-204 was to accept in principal based upon its similarity to 4-205, which was accepted by the panel. The panel actions and statements on 4-80 and 4-81 further collaborate the intent and action to be taken on 690.11.

4-77 Log #1585 NEC-P04 **Final Action: Reject**
(690.11)

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 4-205
Recommendation: Reject this proposal.
Substantiation: While there seems little doubt that dc arc fault protection should be required in PV systems, this proposal is premature. Using the ac AFCI requirement as a model, were this proposal to have progressed in a similar manner, UL would have begun an investigation into technologies that could mitigate dc arc faults in PV systems in at least 2005, UL would have begun working with prospective manufacturers on a standard in at least 2007 and the proposed effectivity date of the requirement would be at least 2014. All interested parties are certainly encouraged to move ahead with the work that needs to be done, however, this proposal might better be considered for the 2014 NEC.
Panel Meeting Action: Reject
Panel Statement: Code-Making Panel 4 affirms that PV AFCI protection is necessary as soon as possible. The safety benefits outweigh the potential challenges associated with an earlier implementation of the 690.11 requirements.

This action will allow us to achieve the earliest possible fire safety improvement, with the best protection available at the time, and to allow for future improvements as technology permits.

The submitter is directed to 90.4 relative to his concerns regarding unavailability of appropriate products.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BOWER, W.: See My Explanation of Negative on 4-76.
YOUNG, J.: As noted in the substantiation there is not a standard and there are no products available.

4-78 Log #1731 NEC-P04 **Final Action: Reject**
(690.11 (New))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Comment on Proposal No: 4-205
Recommendation: Add the term "(series arc faults)" shown with double underlining in the proposal.
690.11 Arc-Fault Circuit Protection (DC). PV systems with dc source and/or output circuits on or penetrating a building operating at a PV system maximum system voltage of 80 volts or greater shall be protected by a listed (DC) arc-fault circuit interrupter, PV type, or other system components listed to provide equivalent protection. The PV arc-fault protection means shall comply with the following requirements:
(1) The system output circuits on or penetrating a building operating at a PV system maximum system voltage of 80 volts or greater shall be protected by a listed (DC) arc fault circuit interrupter, PV type, or other system components listed to provide equivalent protection. The PV arc-fault protection means shall comply with the following requirements:
(1) The system shall detect and interrupt arcing faults (series arc faults) resulting from a failure in the intended continuity of a conductor, connection, module, or other system component in the direct current PV source and output circuits.
(2) The system shall disable or disconnect one of the following:
a. Inverters or charge controllers connected to the fault circuit when the fault is detected
b. The system components within the arcing circuit
(3) The system shall require that the disabled or disconnected equipment be manually restarted.
(4) The system shall have an annunciator that must be manually disabled.
Substantiation: The words "intended continuity of a conductor, connection, module, or other system component" do not fully convey the intent that this requirement applies only to series types of arc faults. There are parallel circuit connections in inverters, modules where the continuity of the connection, if broken, would not result in an arc, and parallel arcs of the line-to-line type are not and should not be addressed by this proposal.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any substantiation for some of the requested changes and introduce new material that has not had public review.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
YOUNG, J.: In the Panel Statement to Comment 4-80 it is noted "Therefore, the panel recognizes "parallel arc detection" as a desirable feature, but not a requirement." The proposed and accepted wording from Proposal 4-205 makes no mention of series arcing or parallel arcing. It only reads that the device shall detect and interrupt arcing faults. This would include all types of arcing. The CMP may recognize that parallel arc detection is not a requirement but the reader of the Code will not recognize that. It would be clear if the change were accepted clarifying that only series arcing faults were required to be detected.

4-79 Log #1946 NEC-P04 **Final Action: Reject**
(690.11 (New))

Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 4-205
Recommendation: Revise text to read as follows:
690.11 Arc-Fault Circuit Protection (DC). PV systems with dc source and/or output circuits on or penetrating a building operating at a PV system maximum system voltage of 80 volts or greater shall be protected by a listed (DC) arcfault circuit interrupter, PV type, or other system components listed to provide equivalent protection. The PV arc-fault protection means shall comply with the following requirements:
(1) The system shall detect and interrupt arcing faults resulting from a failure in the intended continuity of a conductor, connection, module, or other system component in the direct current PV source and output circuits.
(2) The system shall disable or disconnect one of the following:
a. Inverters or charge controllers connected to the fault circuit when the fault is detected
b. The system components within the arcing circuit
(3) The system shall require that the disabled or disconnected equipment be manually restarted.
(4) The system shall have an annunciator that must be manually disabled.
This requirement shall become effective January 1, 2014.
Substantiation: I was in the electrical field when ground fault circuits were introduced into the NEC. Manufacturers were not prepared, circuit breakers were not available, and there were problems with some that were available.
Giving the manufacturers this additional time will allow time for engineering, testing to avoid problems, and also allow time to set up production.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with delaying the effective date beyond the issuance of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
YOUNG, J.: The proposed effective date of January 1, 2014 would provide time for the standard to be developed and product to be developed. If products become available before that date they can be used but the later date does not introduce the enforcement problem if products are not available. Comments in other panel actions indicate the use is based strictly on availability of the product and not Code inclusion. If that is the case it would be expected these would be used if available even if not included in the Code.

4-80 Log #2142 NEC-P04 **Final Action: Reject**
(690.11 (New))

Submitter: Jim Eichner, Xantrex Technology, Inc.
Comment on Proposal No: 4-204
Recommendation: Reject this proposal.
Substantiation: We feel the proposal is incomplete and premature for the following reasons:
1. Basic research into PV arcing signatures is lacking or at least incomplete, and will be very difficult. For AC arc-fault detectors there are still problems in this area, and problems were caused due to the code requirement being in force before the technology was ready. PV arc signature research will be even harder in PV systems because, unlike AC appliances, inverters and charge controllers are not subject to conducted emissions requirements on the DC input circuit that the arc-fault detector would be monitoring and because DC arcs do not have the 120Hz signature that AC arcs have.
2. The development of a consensus standard for PV arc fault detectors is not very far along, and will take considerable time since that standard will have to answer all the questions in the remaining points below.
3. The proposal deals only with series arc faults, yet parallel arc faults, both line-to-line and line-to-ground (in grounded PV systems) are at least as significant in terms of the severity and likelihood of the hazard. Line-to-ground faults are a type of parallel fault and carry just as much possibility of arcing, and the number of locations for possible ground faults is very large - everywhere the ungrounded conductors are near or in contact with grounded metal such as conduit. Line-to-line parallel faults are also possible in a large number of locations: the terminal box on the back of each panel, any wire run where + and - are bundled and exposed to mechanical damage or rodents, etc.
4. The proposal seems intent on protection being on the output end of the PV system, where a single device can be used, rather than at the source, as is typically required for protective systems. Putting the protection at the source may be unpopular with panel manufacturers, but it's the right (only) way to provide protection against both series and parallel arc faults. A compromise might be to put protection against both series and parallel faults in the string combiners, which leaves a smaller portion of the system unprotected.
5. What action the protector should take isn't clear. Shorting the array may be the best approach to ensure the arc is extinguished. For a parallel arc fault, opening the circuit would unload the array and drive the voltage up, worsening the arc. It is even possible that opening the circuit could extinguish the series arc but cause a parallel arc to start.
We would like to see this proposal rejected for this code cycle, allowing time for further study of arc signatures and time for industry to come to some consensus on how and where to address parallel faults not just series faults.
Panel Meeting Action: Reject
Panel Statement: There has been an alarming increase in the number of PV arc fault fires occurring worldwide. While PV AFCI technology is relatively new, Code-Making Panel 4 concludes it is critical and necessary to address this significant void in PV system protection. Research and development of PV arc fault products and certification requirements is progressing quickly.
These efforts have resulted in a draft standard, and multiple functional prototypes from multiple manufacturers. The experience gathered from the growth and development of the AC AFCI will allow the PV AFCI to avoid similar pitfalls.
The 690.11 requirements provide protection for the most likely type of PV arc faults and allows for its implementation anywhere within a PV system. The requirements in 690.11 are written based upon the protection function and not the implementation method.
