2010 Annual Revision Cycle

National Electrical Code® Committee Report on Comments

NOTE: Notice of Intent to Make an NEC® Motion (NITMAM) deadline is May 7, 2010

A compilation of the documented action on comments received by the code-making panels for the 2010 Annual Revision Cycle

NOTE: The proposals contained in the NEC Report on Proposals (ROP) and the comments addressed in this Report on Comments (ROC) will be presented for action at the NFPA June 2010 Annual Association Technical Meeting to be held June 7–10 in Las Vegas, NV, only when proper Amending Motions have been submitted to the NFPA by the deadline of May 7, 2010. For more information on the new rules and for up-to-date information on schedules and deadlines for processing NFPA Documents, check the NFPA website (www.nfpa.org) or contact NFPA Standards Administration.

Information on NFPA Codes and Standards Development

I. Applicable Regulations. The primary rules governing the processing of NFPA documents (codes, standards, recommended practices, and guides) are the NFPA *Regulations Governing Committee Projects (Regs)*. Other applicable rules include NFPA *Bylaws*, NFPA *Technical Meeting Convention Rules*, NFPA *Guide for the Conduct of Participants in the NFPA Standards Development Process*, and the NFPA *Regulations Governing Petitions to the Board of Directors from Decisions of the Standards Council*. Most of these rules and regulations are contained in the *NFPA Directory*. For copies of the *Directory*, contact Codes and Standards Administration at NFPA Headquarters; all these documents are also available on the NFPA website at "www.nfpa.org."

The following is general information on the NFPA process. All participants, however, should refer to the actual rules and regulations for a full understanding of this process and for the criteria that govern participation.

II. Technical Committee Report. The Technical Committee Report is defined as "the Report of the Technical Committee and Technical Correlating Committee (if any) on a document. A Technical Committee Report consists of the Report on Proposals (ROP), as modified by the Report on Comments (ROC), published by the Association."

III. Step 1: Report on Proposals (ROP). The ROP is defined as "a report to the Association on the actions taken by Technical Committees and/or Technical Correlating Committees, accompanied by a ballot statement and one or more proposals on text for a new document or to amend an existing document." Any objection to an action in the ROP must be raised through the filing of an appropriate Comment for consideration in the ROC or the objection will be considered resolved.

IV. Step 2: Report on Comments (ROC). The ROC is defined as "a report to the Association on the actions taken by Technical Committees and/or Technical Correlating Committees accompanied by a ballot statement and one or more comments resulting from public review of the Report on Proposals (ROP)." The ROP and the ROC together constitute the Technical Committee Report. Any outstanding objection following the ROC must be raised through an appropriate Amending Motion at the Association Technical Meeting or the objection will be considered resolved.

V. Step 3a: Action at Association Technical Meeting. Following the publication of the ROC, there is a period during which those wishing to make proper Amending Motions on the Technical Committee Reports must signal their intention by submitting a Notice of Intent to Make a Motion. Documents that receive notice of proper Amending Motions (Certified Amending Motions) will be presented for action at the annual June Association Technical Meeting. At the meeting, the NFPA membership can consider and act on these Certified Amending Motions as well as Follow-up Amending Motions, that is, motions that become necessary as a result of a previous successful Amending Motion. (See 4.6.2 through 4.6.9 of *Regs* for a summary of the available Amending Motions and who may make them.) Any outstanding objection following action at an Association Technical Meeting (and any further Technical Committee consideration following successful Amending Motions, see *Regs* at 4.7) must be raised through an appeal to the Standards Council or it will be considered to be resolved.

VI. Step 3b: Documents Forwarded Directly to the Council. Where no Notice of Intent to Make a Motion (NITMAM) is received and certified in accordance with the Technical Meeting Convention Rules, the document is forwarded directly to the Standards Council for action on issuance. Objections are deemed to be resolved for these documents.

VII. Step 4a: Council Appeals. Anyone can appeal to the Standards Council concerning procedural or substantive matters related to the development, content, or issuance of any document of the Association or on matters within the purview of the authority of the Council, as established by the *Bylaws* and as determined by the Board of Directors. Such appeals must be in written form and filed with the Secretary of the Standards Council (see 1.6 of *Regs*). Time constraints for filing an appeal must be in accordance with 1.6.2 of the *Regs*. Objections are deemed to be resolved if not pursued at this level.

VIII. Step 4b: Document Issuance. The Standards Council is the issuer of all documents (see Article 8 of *Bylaws*). The Council acts on the issuance of a document presented for action at an Association Technical Meeting within 75 days from the date of the recommendation from the Association Technical Meeting, unless this period is extended by the Council (see 4.8 of *Regs*). For documents forwarded directly to the Standards Council, the Council acts on the issuance of the document at its next scheduled meeting, or at such other meeting as the Council may determine (see 4.5.6 and 4.8 of *Regs*).

IX. Petitions to the Board of Directors. The Standards Council has been delegated the responsibility for the administration of the codes and standards development process and the issuance of documents. However, where extraordinary circumstances requiring the intervention of the Board of Directors exist, the Board of Directors may take any action necessary to fulfill its obligations to preserve the integrity of the codes and standards development process and to protect the interests of the Association. The rules for petitioning the Board of Directors can be found in the *Regulations Governing Petitions to the Board of Directors from Decisions of the Standards Council* and in 1.7 of the *Regs*.

X. For More Information. The program for the Association Technical Meeting (as well as the NFPA website as information becomes available) should be consulted for the date on which each report scheduled for consideration at the meeting will be presented. For copies of the ROP and ROC as well as more information on NFPA rules and for up-to-date information on schedules and deadlines for processing NFPA documents, check the NFPA website (www.nfpa.org) or contact NFPA Codes & Standards Administration at 617-984-7246.

Chapter 6. Special Equipment

Chapter 7. Special Conditions

Chapter 8. Communications Systems

Chapter 9. Tables

Key to Comment Headings

The first line of every proposal includes the following information:

Document No.	Proposal No.	Log No.	Paragraph Reference	Committee Action
101	6	38	3.4	Accept

Example: 101-6 Log #38 **Final Action: Accept (3.4)**

TYPES OF ACTION

P Partial Revision **C** Complete Revision **N** New Document **R** Reconfirmation **W** Withdrawal

The following classifications apply to Committee members and represent their principal interest in the activity of the Committee.

1. M Manufacturer: A representative of a maker or marketer of a product, assembly, or system, or portion thereof, that is affected by the standard.

2. U User: A representative of an entity that is subject to the provisions of the standard or that voluntarily uses the standard.

3. IM Installer/Maintainer: A representative of an entity that is in the business of installing or maintaining a product, assembly, or system affected by the standard.

4. L Labor: A labor representative or employee concerned with safety in the workplace.

5. RT Applied Research/Testing Laboratory: A representative of an independent testing laboratory or independent applied research organization that promulgates and/or enforces standards.

6. E Enforcing Authority: A representative of an agency or an organization that promulgates and/or enforces standards.

7. I Insurance: A representative of an insurance company, broker, agent, bureau, or inspection agency.

8. C Consumer: A person who is or represents the ultimate purchaser of a product, system, or service affected by the standard, but who is not included in (2).

9. SE Special Expert: A person not representing (1) through (8) and who has special expertise in the scope of the standard or portion thereof.

NOTE 1: “Standard” connotes code, standard, recommended practice, or guide.

NOTE 2: A representative includes an employee.

NOTE 3: While these classifications will be used by the Standards Council to achieve a balance for Technical Committees, the Standards Council may determine that new classifications of member or unique interests need representation in order to foster the best possible Committee deliberations on any project. In this connection, the Standards Council may make such appointments as it deems appropriate in the public interest, such as the classification of “Utilities” in the National Electrical Code Committee.

NOTE 4: Representatives of subsidiaries of any group are generally considered to have the same classification as the parent organization.

FORM FOR FILING NEC® NOTICE OF INTENT TO MAKE A MOTION (NITMAM) AT AN ASSOCIATION TECHNICAL MEETING 2010 ANNUAL REVISION CYCLE

FINAL DATE FOR RECEIPT OF NEC® NITMAM: 5:00 pm EDST, May 7, 2010 (NEC only)

If you have questions about filling out or filing the NEC® NITMAM, please contact the Codes and Standards Administration at 617-984-7249

For further information on the Codes- and Standards-Making Process see the NFPA website (www.nfpa.org)

FOR OFFICE USE ONLY

Log #:_____

Street Address 9 Seattle Street **City** Seattle **State** WA **Zip** 02255

1. (a) NFPA Document (include Number and Title) National Fire Alarm Code/NFPA 72 1999ed

(b) Proposal or Comment Number **72-5**

(c) Section/Paragraph 1.5.8.1

2. Motion to be made. Please check one (See also 4.6 of the Regulations Governing Committee Projects):

(a) Proposal

X (1) Accept. ____ (2) Accept an Identifiable Part.*

____ (3) Accept as modified by the TC. ____ (4) Accept an Identifiable Part as modified by TC.*

(b) Comment

____ (1) Accept. ____(2) Accept an Identifiable Part. * ____(3) Accept as modified by the TC.

____ (4) Accept an Identifiable Part as modified by TC.* ____(5) Reject ____(6) Reject an Identifiable Part.*

(c) Return Technical Committee Report for Further Study

____(1) Return entire Report. ____ (2) Return a portion of a Report in the form of a proposal and related comment(s).

____(3) Return a portion of a Report in the form of identifiable part(s) of a proposal and related comment(s). (Identify the specific portion of the proposal and the related comments below)*

*** Clearly identify the Identifiable Part(s) indicated above (use separate sheet if required).**

3. I am entitled to make this motion in accordance with 4.6.8 of the Regulations Governing Committee Projects, as follows [check (a), (b), or (c)]:

(a) X This motion may be made by the original submitter or their designated representative, and I am the [if you check (a) indicate one of the following]:

X I am the original submitter, or

___I am the submitter's designated representative (attach written authorization signed by the original submitter), or

(b)____This motion may be made by a Technical Committee Member and I am a Member of the responsible Technical Committee.

(c)____This motion may be made by anyone.

(Form continued on next page)

NEC® NITMAM form (continued)

4. Comments or Clarification (optional): This NEC® NITMAM will be reviewed by a Motions Committee. In addition to determining whether your Amending Motion is proper, the Panel may take other actions as described in 2.3 of the Technical Meeting Convention Rules as follows:

> **Restating and Grouping of Motions. Upon request or on its own initiative, and in consultation with the mover(s), the Motions Committee may: (a) restate an Amending Motion to facilitate the making of a proper motion or to clarify the intent of the mover; and (b) group Amending Motions that are dependent on one another into a single Amending Motion. Dependent motions are motions that the mover(s) wish to be considered by the assembly and voted on as single up or down package. In addition to the foregoing, the Motions Committee may take such other actions or make such other recommendations as will facilitate the fair and efficient consideration of motions within the available time.**

The NFPA Staff may contact you to clarify your motion or to consult on the permitted actions in 2.3. If you have any comments, suggestions or requests of the Motions Committee as it reviews your NITMAM and considers actions permitted in 2.3, please provide them below. (Use additional sheet if necessary):

Sequence of Events Leading to Issuance of an NFPA Committee Document

Step 1 Call for Proposals

▼ Proposed new document or new edition of an existing document is entered into one of two yearly revision cycles, and a Call for Proposals is published.

Step 2 Report on Proposals (ROP)

▼ Committee meets to act on Proposals, to develop its own Proposals, and to prepare its Report.

▼ Committee votes by written ballot on Proposals. If two-thirds approve, Report goes forward. Lacking two-thirds approval, Report returns to Committee.

▼ Report on Proposals (ROP) is published for public review and comment.

Step 3 Report on Comments (ROC)

▼ Committee meets to act on Public Comments to develop its own Comments, and to prepare its report.

▼ Committee votes by written ballot on Comments. If two-thirds approve, Report goes forward. Lacking two-thirds approval, Report returns to Committee.

▼ Report on Comments (ROC) is published for public review.

Step 4 Association Technical Meeting

▼ *"Notices of intent to make a motion"* are filed, are reviewed, and valid motions are certified for presentation at the Association Technical Meeting. ("Consent Documents" that have no certified motions bypass the Association Technical Meeting and proceed to the Standards Council for issuance.)

▼ NFPA membership meets each June at the Association Technical Meeting and acts on Technical Committee Reports (ROP and ROC) for documents with "certified amending motions."

▼ Committee(s) vote on any amendments to Report approved at NFPA Annual Membership Meeting.

Step 5 Standards Council Issuance

▼ Notification of intent to file an appeal to the Standards Council on Association action must be filed within 20 days of the NFPA Annual Membership Meeting.

▼ Standards Council decides, based on all evidence, whether or not to issue document or to take other action, including hearing any appeals.

The Association Technical Meeting

The process of public input and review does not end with the publication of the ROP and ROC. Following the completion of the Proposal and Comment periods, there is yet a further opportunity for debate and discussion through the Association Technical Meeting that takes place at the NFPA Annual Meeting.

The Association Technical Meeting provides an opportunity for the final Technical Committee Report (i.e., the ROP and ROC) on each proposed new or revised code or standard to be presented to the NFPA membership for the debate and consideration of motions to amend the Report. The specific rules for the types of motions that can be made and who can make them are set forth in NFPA's rules, which should always be consulted by those wishing to bring an issue before the membership at an Association Technical Meeting. The following presents some of the main features of how a Report is handled.

The Filing of a Notice of Intent to Make a Motion. Before making an allowable motion at an Association Technical Meeting, the intended maker of the motion must file, in advance of the session, and within the published deadline, a Notice of Intent to Make a Motion. A Motions Committee appointed by the Standards Council then reviews all notices and certifies all amending motions that are proper. The Motions Committee can also, in consultation with the makers of the motions, clarify the intent of the motions and, in certain circumstances, combine motions that are dependent on each other together so that they can be made in one single motion. A Motions Committee report is then made available in advance of the meeting listing all certified motions. Only these Certified Amending Motions, together with certain allowable Follow-Up Motions (that is, motions that have become necessary as a result of previous successful amending motions) will be allowed at the Association Technical Meeting.

Consent Documents. Often there are codes and standards up for consideration by the membership that will be noncontroversial and no proper Notices of Intent to Make a Motion will be filed. These "Consent Documents" will bypass the Association Technical Meeting and head straight to the Standards Council for issuance. The remaining documents are then forwarded to the Association Technical Meeting for consideration of the NFPA membership.

What Amending Motions Are Allowed. The Technical Committee Reports contain many Proposals and Comments that the Technical Committee has rejected or revised in whole or in part. Actions of the Technical Committee published in the ROP may also eventually be rejected or revised by the Technical Committee during the development of its ROC. The motions allowed by NFPA rules provide the opportunity to propose amendments to the text of a proposed code or standard based on these published Proposals, Comments, and Committee actions. Thus, the list of allowable motions include motions to accept Proposals and Comments in whole or in part as submitted or as modified by a Technical Committee action. Motions are also available to reject an accepted Comment in whole or part. In addition, Motions can be made to return an entire Technical Committee Report or a portion of the Report to the Technical Committee for further study.

The NFPA Annual Meeting, also known as the NFPA Conference & Expo, takes place in June of each year. A second Fall membership meeting was discontinued in 2004, so the NFPA Technical Committee Report Session now runs once each year at the Annual Meeting in June.

Who Can Make Amending Motions. NFPA rules also define those authorized to make amending motions. In many cases, the maker of the motion is limited by NFPA rules to the original submitter of the Proposal or Comment or his or her duly authorized representative. In other cases, such as a Motion to Reject an accepted Comment, or to Return a Technical Committee Report or a portion of a Technical Committee Report for Further Study, anyone can make these motions. For a complete explanation, the NFPA Regs should be consulted.

Action on Motions at the Association Technical Meeting. In order to actually make a Certified Amending Motion at the Association Technical Meeting, the maker of the motion must sign in at least an hour before the session begins. In this way a final list of motions can be set in advance of the session. At the session, each proposed document up for consideration is presented by a motion to adopt the Technical Committee Report on the document. Following each such motion, the presiding officer in charge of the session opens the floor to motions on the document from the final list of Certified Amending Motions followed by any permissible Follow-Up Motions. Debate and voting on each motion proceeds in accordance with NFPA rules. NFPA membership is not required in order to make or speak to a motion, but voting is limited to NFPA members who have joined at least 180 days prior to the Association Technical Meeting and have registered for the meeting. At the close of debate on each motion, voting takes place, and the motion requires a majority vote to carry. In order to amend a Technical Committee Report, successful amending motions must be confirmed by the responsible Technical Committee, which conducts a written ballot on all successful amending motions following the meeting and prior to the document being forwarded to the Standards Council for issuance.

Standards Council Issuance

One of the primary responsibilities of the NFPA Standards Council, as the overseer of the NFPA codes and standards development process, is to act as the official issuer of all NFPA codes and standards. When it convenes to issue NFPA documents, it also hears any appeals related to the document. Appeals are an important part of assuring that all NFPA rules have been followed and that due process and fairness have been upheld throughout the codes and standards development process. The Council considers appeals both in writing and through the conduct of hearings at which all interested parties can participate. It decides appeals based on the entire record of the process as well as all submissions on the appeal. After deciding all appeals related to a document before it, the Council, if appropriate, proceeds to issue the document as an official NFPA code or standard. Subject only to limited review by the NFPA Board of Directors, the decision of the Standards Council is final, and the new NFPA code or standard becomes effective twenty days after Standards Council issuance.

Christopher Coache, Senior Electrical Engineer
Jean O'Connor, Electrical Projects Specialist and Support Supervisor
Lee Richardson, Senior Electrical Engineer
Richard Roux, Senior Electrical Specialist
Jeffrey Sargent, Senior Electrical Specialist

These lists represent the membership at the time each Committee was balloted on the text of this report. Since that time, changes in the membership may have occurred. A key to classifications is found at the front of the document.

Committee Scope: This Committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions. It shall also be responsible for text to minimize the propagation of fire and explosions due to electrical installations.

This portion of the National Electrical Code Committee is presented for adoption.

This Report on Comments was prepared by the **National Electrical Code Committee**, and documents its action on the comments received on its Report on Proposals on NFPA 70, **National Electrical Code**, 2011 edition, as published in the Report on Proposals for the 2010 Annual Revision Cycle.

This Report on Comments has been submitted to letter ballot of the **National Electrical Code Committee**. The results of the balloting, after circulation of any negative votes, can be found in the report.

This Report on Comments has also been submitted to the **Technical Correlating Committee on the National Electrical Code®** (TCC) in two Parts. Part 1 is a letter ballot on the TCC Actions, if any; and Part II is a letter ballot Authorizing the Release of the Report. The TCC, which consists of 11 voting members, votes as follows:

Part 1: 11 voted affirmatively

Part 2: 11 voted affirmatively

9-1 Log #46 NEC-P09 **Final Action: Reject**
(Entire Document)

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 9-1
Recommendation: Accept the proposal. Change terms "high voltage" and "medium voltage" to correlate with new proposed definitions in Article 100. This is a companion proposal to a proposal to add definitions for low voltage, medium voltage, and high voltage to Article 100.
Substantiation: If the proposal for adding the definitions in Article 100 is accepted, this proposal must be accepted as well to correlate between all chapters of the NEC.

I agree with the panel that the terms for high voltage and medium voltage are inconsistent within various standards. This is the very issue I'm trying to rectify with this proposal. Also, the terms mean different things to different people. For instance, if you're discussing voltage levels with an instrument technician, he may think that 120V is high voltage. Whereas, if you're discussing high voltage with a utility, they're probably thinking in terms of voltages above 69kV. I feel that if the NEC is going to use the terms "medium voltage" and "high voltage" that there must be some consistency.

I also understand that for many years the NEC has been mainly concentrated on non-industrial areas, such as trailer parks, swimming pools, health care facilities, residential, and commercial installations. Hence, 490.2 defines "high voltage" as more than 600V, nominal. Since the NEC is trying to incorporate more medium and high voltage requirements into the document, as evidenced through the high voltage task group that I was a part of this cycle, I think it's important that we establish in terms of how it is used in the NEC, that "high voltage" doesn't really start at the 600V level.

As far as the panel statement goes that I didn't specify where and in what form the revisions should be made, my thought was that if the definitions that I had submitted were accepted, then many various adjustments would have to be made throughout the NEC. Staff members would have to go through the entire document and edit the phrases according to the definition parameters.
Panel Meeting Action: Reject
Panel Statement: CMP 9 does not support changing these definitions until and unless it is presented with a coordinated set of proposals generated by a task group specifically formed for that purpose and operating under the aegis of the Technical Correlating Committee.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 90 — INTRODUCTION

1-1 Log #509 NEC-P01 **Final Action: Accept**
(90.1(C))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-9
Recommendation: Continue to reject this proposal. The concept of a 'service point' does not apply, or applies differently, to communications systems than to a power utility interface.
Substantiation: The text proposed in the original submission is not applicable to communications as the terms 'service point' and 'load side' do not apply. Mr. LaBrake, in his 'explanation of negative', proposed revised text that continues to use the term 'service point'. In addition, where telecom and CATV are concerned, there may be communications wiring on the premises that is not "… on the premises wiring side of the service point". Such is the case when communications cables enter the building and the Network Interface Device (NID), Network Interface Unit (NIU) or Optical Network Terminal (ONT) is located within the building.

Although we believe that this proposal should continue to be rejected, we would like to express our support for the NEC/NESC Ad Hoc Task Group and the harmonization of the NEC and NESC.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-3.

1-2 Log #511 NEC-P01 **Final Action: Accept**
(90.1(C))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-11
Recommendation: Continue to reject this proposal. The concept of a 'service point' does not apply, or applies differently, to communications systems than to a power utility interface.
Substantiation: The text proposed is not applicable to communications as the terms 'service point' and 'load side' do not apply. In addition, where telecom and CATV are concerned, there may be communications wiring on the premises that is not "… on the premises wiring side of the service point". Such is the case when communications cables enter the building and the Network Interface Device (NID), Network Interface Unit (NIU) or Optical Network Terminal (ONT) is located within the building.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-3.

1-3 Log #1373 NEC-P01 **Final Action: Reject**
(90.1(C))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-9
Recommendation: Change 90.1(C) to read as follows.
90.1(C) Intention. This Code applies to the design and installation of electrical and communications systems and equipment on the premises wiring side of the service point. This Code is not intended as a design specification or an instruction manual for untrained persons.
Substantiation: Edison Electric Institute recommends Proposal 1-9 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to 90.1(C).
Panel Meeting Action: Reject
Panel Statement: The panel reiterates that the comment does not enhance clarity or usability. The proposed text is a scope statement, that is already addressed in 90.2, and it should not be repeated in a different form in 90.1(C).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: As was stated in the substantiation to the original Proposal, "Specifically, the rationale for this change is to state what the Code intends in positive language". Additionally, it was to provide harmonization with text in the NESC so that a clear demarcation between the applications of the two codes is possible.

1-4 Log #1217 NEC-P01 **Final Action: Reject**
(90.1(C) and FPN)

Submitter: David E. Shapiro, Safety First Electric
Comment on Proposal No: 1-8
Recommendation: Resive as follows:
...users such as qualified inspection authorities... FPN...~~as a design specification or as an instruction manual for untrained person.~~ ... to serve as a complete set of design specifications, nor as an instruction manual.
Substantiation: This Code is not intended to serve as a complete set of design specifications, nor as a design or instruction manual for *anyone*.
I just left a meeting where the County lawyer was confronted by seasoned contractors and inspectors on the issue of eliminating the chief electrical inspector, using an unqualified person for his duties. He told the Council that he would "look it up." Unfortunately, he undoubtedly considers himself a "trained person."
Panel Meeting Action: Reject
Panel Statement: The comment does not conform with 4.4.5(d) of the NFPA Regulations Governing Committee Projects. The substantiation fails to explain how the proposed text changes will solve the alleged problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-5 Log #517 NEC-P01 **Final Action: Accept**
(90.2)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-12
Recommendation: Continue to reject this proposal.
Substantiation: The proposed figure is inappropriate for communications as the concept of 'line side' and 'load side' does not apply. Further, the term 'service point' does not apply, or applies differently to communications systems than to a power utility interface. Additionally, communications wiring covered by the NEC may not be completely located on the 'premises side of the service point'. Such is the case when communications cables enter the building and the Network Interface Device (NID), Network Interface Unit (NIU) or Optical Network Terminal (ONT) is located within the building.

Although we believe that this proposal should continue to be rejected, we would like to express our support for the NEC/NESC Ad Hoc Task Group and the harmonization of the NEC and NESC.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Comment 1-6.

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-6 Log #1374 NEC-P01 **Final Action: Reject**
(90.2)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-12
Recommendation: Add the Informational Annex proposed text:
Annex "TBD": "General Information Regarding Utility Electric Supply to Premises Wiring"
1. The following is a general illustration of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2. Local conditions of service may locate the utility metering at any point on either side of the service point; see 90.2(B)(5). Conditions of electric service are based on governmental laws or regulations that determine the utility authority to provide electric service under their tariffs. These conditions of electric service affect the location of the service point and facilities under the local serving utility's exclusive control.

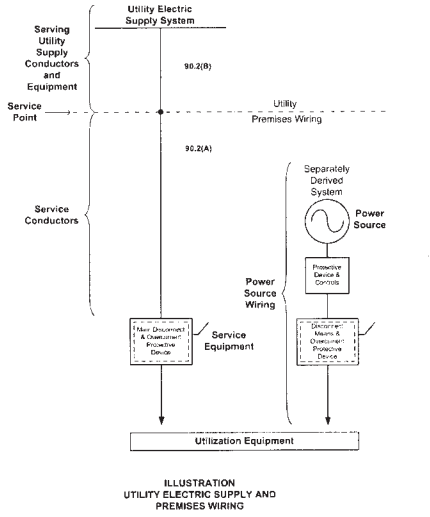

ILLUSTRATION
UTILITY ELECTRIC SUPPLY AND PREMISES WIRING

(ROP 1-12, 1-23)

2. The following are terms for general understanding of where utility electric supply and premises wiring meet for what is covered and what is not covered by this Code as described in 90.2.
Area Lighting. A lighting distribution system that provides lumens on public or private property.
Advisory Note: See 90.2(A) where area lighting is not under the exclusive control of utilities. ANSI C2-2007, *National Electrical Safety Code* contains information that covers area lighting under the exclusive control of utilities.
(ROP 1-53)
Exclusive Control. Generally covers installation, ownership, restricted access, operation, and maintenance by qualified and authorized persons.
(ROP 1-79)
Premises. The land and buildings of a user located on the user side of the service point to electric supply, communication or signal premises wiring.
Advisory Note: For communication wiring, service point is sometimes called the utility-user network point of demarcation.
(ROP 1-101)
Restricted Access. Areas that are separated from public access by a spatial or physical barrier, such as an equipment enclosure, and that are accessible only under exclusive control.
(ROP 1-104)
Supervised Installation. Conditions of maintenance and engineering supervision ensure that only qualified persons monitor and service the system continuously provided by a single building management.
(ROP 1-106)
Substantiation: Edison Electric Institute recommends Proposal 1-12 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include it as a new Informational Annex to describe general information regarding utility electric supply to premises wiring. In recognition of Mr. McCarver's affirmative ballot statement on this proposal, the recommended Annex covers only the electrical service point as discussed in 90.2(B)(5) rather than including communications systems discussed in 90.2(B)(4) since these systems differ from each other and have differing terminology. Refer to the attached Informational Annex that would contain this proposal's recommendation along with companion comments on Proposals 1-16, 1-53, 1-79, 1-101, 1-104, and 1-106.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its panel statement on Proposal 1-12. The proposed informational annex does not enhance clarity or usability.

The proposed Figure is too general for practical application to all installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ANTHONY, M.: Almost all of APPA.ORG's comments on Edison Electric Institute or the American Public Power Association's positions, and other safety concepts reflected in comments:

1,2,3,5,7,11,12,14,15,16,17,18,19,21,22,23,24,25,27,29,30,33,38,40,57,58,71, 72,73, and 74 will be referred back to this statement.

In its rejection of this comment 1-6, our committee has missed an opportunity to accumulate into one annex, at least a decade's worth of debate on Sections 90.2(A) and 90.2(B). Observers of the scope and jurisdiction debate over the past 4 code cycles have seen dozens, if not hundreds, of proposals and comments in these two subsections alone. Most of the proposals involved the four code canonicals -- access, disconnect, grounding, and overcurrent protection -- at least implictly.

Had the comment been at least accepted in principle, a work group could have been formed to prepare a draft for CMP 1 to review. Admittedly, time needed to conform to the rules for writing an informative annex would have been a significant constraint.

Our hope is that we will see a draft of Informative Annex U (call it U, for "utility" for the moment) well before the beginning of the 2014 ROP. Within Annex U the work group could write in a more relaxed fashion, to capture as many of the 30-odd issues that came before our committee, as well as related issues that were presented to other technical panels. Here is a partial list of concepts that have appeared before our committee in this cycle alone: Premises, premises wiring(system), area lighting, tariff-based lighting, engineering supervision, service point, telecommunications demarcation, voltage nomenclature, backup generation, interactive systems, "other agreements", etc.

Even as we prepare to send the 2011 edition of the NEC out into the world there are a lot of very smart people who are in full motion, looking at our industry as a mad contraption. They see our the energy problem as a "network problem". They see the flashpoints where power and telecommunications technology converges. They want that convergence. They draw from their experiences of layered development of the internet over the past 15 years as their working metaphor.

Even if they are only partially right, and all this talk about an energy web and a smart grid is only speculative hype, we still need Annex U as a platform away from the restrictions involved in writing model law. In just such an annex we could clear up many of the paradoxes in the NEC that are at the root of so many proposals and set ourselves up for the next leg of its development.

LABRAKE, JR., N.: This diagram and the associated definitions are proposed for an Annex where they would not be considered mandatory but could provide valuable information concerning the application of the NEC.

I disagree with the Panel statement that the diagram is "too general" for application in the NEC. Similar "general" diagrams exist in Section 210.52(C) (1), 410.2, and 514.3. This diagram (and the others) provides valuable guidance for the application of the NEC. Similarly, I disagree that the diagram does not provide additional clarity and usability to the NEC.

1-7 Log #2855 NEC-P01 **Final Action: Reject**
(90.2)

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council
Comment on Proposal No: 1-12
Recommendation: The panel action should have been to Accept In Principle, with the principle being to show the proposed figure as a FPN to 90.2(B)(5) so that it is not considered mandatory text.
Substantiation: The drawing is a good representation of the Service Point definition and shows that this point is not defined by a specific piece of equipment like a disconnecting means, but will change depending on the utility/custom arrangements. The coverage of the Code and where it applies versus the NESC is a complex one. Even though this figure may not perfectly apply to all examples, it is better than what we have available today.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 1-12.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-8 Log #435 NEC-P01 **Final Action: Reject**
(90.2(A))

Submitter: Thomas R. Sanders, Kellog Brown & Root
Comment on Proposal No: 1-14
Recommendation: Revise text to read as follows:
Accept the proposal so the 2011 NEC will read as follows:
"**90.2(A) Covered.** This *Code* covers the installation and use of electrical conductors, equipment and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following:" no further changes
Substantiation: In addition to 110.3(B), see the 2009 UL White book, Marking Guides, and correlation between these documents via the internet.
http://www.ul.com/global/eng/pages/offerings/perspectives/regulator/ccd/
http://www.ul.com/global/eng/pages/offerings/perspectives/regulator/electrical/
Panel Meeting Action: Reject
Panel Statement: The word "use" is included in 110.3(B) to ensure compliance with listing requirements which include intended product usage (application).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
HICKMAN, P.: We reaffirm our statement in the ROP on Proposal 1-14. We conclude that the submitters reference to 110.3(B) was offered as an example of where "and use" is used to substantiate the recommendation and agree with the submitter that the Scope of the document should include "and use" since the NEC does, as it should, include installation as well as use in a number of instances.
HITTINGER, D.: The suggested revision of the Scope 90.2(A) to add "in use" is appropriate and better describes the intent of what the Scope covers, the Code provides the rules for installation of electrical conductors, equipment, and raceways and their "use". There are numerous places in the Code that specifically state this such as the Scope of Article 110, section110.3, the Scope of Article 455 and section 490.51(A) to name a few. The panel statement is correct in identifying 110.3(B) for product compliance rules however, the Code clearly covers installation and "use".

1-11 Log #512 NEC-P01 **Final Action: Accept**
(90.2(A))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-15
Recommendation: Continue to reject this proposal.
Substantiation: The term 'service point' does not apply, or applies differently, to communications systems than to a power utility interface (see last paragraph of submitter's substantiation). Additionally, communications wiring covered by the NEC may not be completely located on the 'premises side of the service point'. Such is the case when communications cables enter the building and the Network Interface Device (NID), Network Interface Unit (NIU) or Optical Network Terminal (ONT) is located within the building.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: Based on discussion in the Panel, the original Proposal text "covers requirements of" could have been changed to "establishes requirements for" to provide the clarity the Panel seeks. The addition of the text "premises wiring systems" in the proposal provides for clear understanding that the itemized list that follows pertains to what is covered by the NEC.
The premises wiring system for the communications devices described by the Submitter begins at those devices within the building.

1-12 Log #1375 NEC-P01 **Final Action: Reject**
(90.2(A))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-16
Recommendation: Change text to read as follows:
Informational Note: See Informational Annex "TBD" on general information regarding utility electric supply to premises wiring.
Substantiation: Edison Electric Institute recommends Proposal 1-16 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include an Informational Note reference to a new Informational Annex based on our companion comment on Proposal 1-12.
Panel Meeting Action: Reject
Panel Statement: Since the panel has rejected the inclusion of the Informational Annex, the addition of an Informational Note is a moot point.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-13 Log #1978 NEC-P01 **Final Action: Accept**
(90.2(A))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 1-14
Recommendation: This proposal should be rejected.
Substantiation: This proposal should be rejected. The AHJ does not have access or authority to enforce usage rules and at least one Code Making Panel is on record stating that unenforceable rules cannot be included in the NEC. The following is from the panel statement for comment 3-30 in the 70-A207 ROC.
"Unenforceable requirements must not be inserted into the NEC."
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
ANTHONY, M.: Mr. Hickman and Mr. McMahill correctly diagnosed the problem with the substantiation of the original proposal. The change proposed by Mr. Tedesco is not conceptual but editorial in nature and should have been accepted as such.
HICKMAN, P.: See explanation of negative on comment 1-8.
HITTINGER, D.: See my Explanation of Negative on 1-8.

1-14 Log #2387 NEC-P01 **Final Action: Reject**
(90.2(A))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 1-15
Recommendation: Accept the proposal as written.
Substantiation: Many colleges and universities are running "utility-like" enterprises and many are their own inspection authority. State utility regulations are uneven and not ready for a "one-size-fits-all" safety rule for the type of electrical installations that will be possible in distributed resource power delivery regimes. This proposal, along with Proposal 1-17, makes an important distinction for our industry.
Many colleges and universities have complicated relationships with municipal and investor-owned power utilities. Most have "systems-within-a system" that form a microgrid; with wiring and equipment on either side of a boundary governed by standard easement and right-of-way agreements. Safety concerns along this boundary typically involve area lighting, emergency power sources, site placement of transformers and generators and alternative energy sources, metering, operation and maintenance of high voltage overhead and underground supply at the service point.
The Panel Statement, "The proposed changes do not add clarity to the existing scope statement in 90.2(A)", is a reminder that "clarity" may lie in the eye of the beholder -- if the beholder chooses to see. In our view, the adding this language clarifies 90.2(A). So does the Fine Print Note Figure 90.2 proposed in Proposal 1-16.
Panel Meeting Action: Reject
Panel Statement: The proposed revisions are unnecessary and do not provide further clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-11.

1-15 Log #513 NEC-P01 **Final Action: Accept**
(90.2(A), FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-16
Recommendation: Continue to reject this proposal.
Substantiation: The proposed figure is inappropriate as it does not cover communications. The term 'service point' does not apply, or applies differently, to communications systems than to a power utility interface (see last paragraph of submitter's substantiation). Additionally, communications wiring covered by the NEC may not be completely located on the 'premises side of the service point'. Such is the case when communications cables enter the building and the Network Interface Device (NID), Network Interface Unit (NIU) or Optical Network Terminal (ONT) is located within the building.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-16 Log #1376 NEC-P01 **Final Action: Reject**
(90.2(A)(2), FPN (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-17
Recommendation: Please reconsider the original proposal. The text of the Fine Print Note should read as follows:
FPN to (2): For additional information concerning such installations in an industrial or multibuilding complex, see ANSI C2-2007, *National Electrical Safety Code.*
Substantiation: Edison Electric Institute recommends Proposal 1-17 be accepted in principal and supports the negative ballot statements written by Messrs. Anthony and LaBrake for this reinstatement of the FPN to add clarity for the differentiation of the scopes of two ANSI codes. The text for the requested FPN is included in the legislative text above which includes the correct year of the current edition of the National Electrical Safety Code.
Panel Meeting Action: Reject
Panel Statement: The proposed FPN does add confusion when one considers that the NEC is an enforcement document that is adopted by jurisdictions in the US. The proposed FPN reference as a source from the NEC implies that it is capable of being used without interfering with the use of the NEC, and that the code loses nothing by deleting the reference, but has increased confusion/ conflict with the reference included.
Sufficient substantiation has not been provided to substantiate this fine print note referencing the NESC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: I disagree that this Note adds confusion. It is similar in wording to a number of existing Notes in Chapter 5 of the NEC. It also provides a reciprocal reference to a similar Note in the NESC.
In addition, there are and have been a significant number of Proposals and Comments to revise and include all or parts of the NESC in the NEC. This Note would add a reference to that document without making it mandatory, thus including the requested information.

1-17 Log #1377 NEC-P01 **Final Action: Reject**
(90.2(A)(3))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-19
Recommendation: Please reconsider this proposal and accept it.
Substantiation: Edison Electric Institute recommends Proposal 1-19 be accepted and supports the negative ballot statements by Messrs. Anthony and LaBrake on this proposal and on Proposals 1-17 and 1-29 for this needed change as requested in the panel statement for proposal 1-19.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 1-18.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-18.

1-18 Log #2856 NEC-P01 **Final Action: Reject**
(90.2(A)(3))

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council
Comment on Proposal No: 1-19
Recommendation: The panel action should have been to Accept in Part, accepting re-inserting the FPN reference to the NESC in 90.2(A)(3) but not the remainder of the proposal.
Substantiation: Since electrical installations in the US must be installed in accordance with the NEC or the NESC, depending on the location of the installation in relation to the service point, it is appropriate for the NEC to reference the NESC, and likewise for the NESC to reference the NEC. The NESC provides important installation requirements on the utility side of the service point.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 1-16.
The submitter's substantiation states in part: "electrical installations in the US must be installed in accordance with the NEC or the NESC." This is not entirely correct since there are jurisdictions that do not use either document.
The Scope of 90.2(A)(3) establishes what is covered in the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: This Comment should have been accepted. While the Submitter's substantiation may not have been completely accurate, it does note that the NESC can provide important guidance about the installation of utility equipment. In addition, see my explanation of negative vote for Comment 1-16.

1-19 Log #1378 NEC-P01 **Final Action: Reject**
(90.2(B))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-23
Recommendation: Change text to read as follows:
Informational Note: See Informational Annex "TBD" on general information regarding utility electric supply to premises wiring.
Substantiation: Edison Electric Institute recommends Proposal 1-23 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include an Informational Note reference to a new Informational Annex based on our companion comment on Proposal 1-12.
Panel Meeting Action: Reject
Panel Statement: Since the panel has rejected the inclusion of the Informational Annex, the addition of an Informational Note is a moot point.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-20 Log #515 NEC-P01 **Final Action: Accept**
(90.2(B)(4), FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-28
Recommendation: Continue to reject this proposal.
Substantiation: The proposed FPN is misleading as written and cannot be broadly applied to all communications facilities identified in 90.2(B)(4) as not covered. For example, it would not apply to a communications closet of less than 500 square feet on a customer premises (e.g., office building or shopping center). It would also not apply to service to a PBX located on a customer premises.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-21 Log #514 NEC-P01 **Final Action: Accept**
(90.2(B)(4) and (5), FPN)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-27
Recommendation: Continue to reject this proposal.
Substantiation: The concept of a "service point" does not apply, or applies differently, to communications systems than to a power utility interface. Further, the communications utility may not own (as suggested in the submitter's added second-to-last sentence) the facility under their 'exclusive control' such as a communications closet located in an office building or shopping center.
Although we believe that this proposal should continue to be rejected, we would like to express our support for the NEC/NESC Ad Hoc Task Group and the harmonization of the NEC and NESC.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-22.

1-22 Log #1379 NEC-P01 **Final Action: Reject**
(90.2(B)(4) and (5), FPN)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-27
Recommendation: Change the last sentence of the original proposal as follows and retain the rest of the proposal to read as follows:
FPN to (4) and (5): Examples of utilities may include those public or private entities that are typically designated or recognized by governmental law or regulation by public service/utility commissions and that install, operate, and maintain electric supply (such as generation, transmission, or distribution systems) or communication systems (such as telephone, CATV, Internet, satellite, or data services) to the service point. Utilities may be subject to compliance with codes and standards covering their regulated activities as adopted under governmental law or regulation. Additional information can be found through consultation with the appropriate governmental bodies, such as state regulatory commissions, the Federal Energy Regulatory Commission, and the Federal Communications Commission. Exclusive control generally covers installation, ownership, restricted access, operation, and maintenance by qualified and authorized persons. Restricted access generally covers areas that are separated from public access by a spatial or physical barrier, such as an equipment enclosure, and that are accessible only under exclusive control.
Substantiation: Edison Electric Institute recommends Proposal 1-27 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance clarity or usability. The concept of a service point does not apply to communications systems or applies differently than to a power utility interface.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: This should have been accepted in part and changed to apply only to 90.2(B)(5) to satisfy the concerns expressed in Comment 1-21.

1-23 Log #1753 NEC-P01 **Final Action: Accept**
(90.2(B)(5))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 1-29
Recommendation: This proposal should be accepted in principle as follows:
Change 90.2(B)(5) to read as follows:
(5) Installations under the exclusive control of an electric utility where such installations
a. Consist of service drops or service laterals, and associated metering, or
be. Are on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy, or
cb. Are located in legally established easements or rights-of-way, or

d. Are located by other written agreements either designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations. These written agreements shall be limited to installations for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy where legally established easements or rights-of-way cannot be obtained. These installations shall be limited to Federal Lands, Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs, Military bases, lands controlled by port authorities and State agencies and departments, and lands owned by railroads.

Substantiation: Members of an Ad Hoc group representing the committees of the NEC and NESC have deliberated in good faith to resolve conflicts between the NEC and NESC documents primarily with the location of utility facilities on Federal Lands, Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs, Military bases, lands controlled by port authorities and State agencies and departments, and lands owned by railroads.

The voting members of this Ad Hoc group reached consensus and recommend Proposal 1-29 be accepted-in-principle using the proposed revised text in this comment. This group's voting members are: James Dollard, Jr., David Hittinger, Michael Johnston, Alan Manche, Richard Owen, James Carpenter, Alan Clapp, Michael Hyland, Michael Pehosh, Jim Tomaseski, and Neil LaBrake, Jr.

This proposed text addresses Code-Making Panel No. 1's concern for clarity and usability, substantiation, and identifying the issues.

1. Clarity and usability is established by:

a. Providing clear and unambiguous text for 90.2(B)(5) with respect to utility installations where easements and rights-of-way cannot legally be obtained.

b. Clarifying the text in the 2005 NEC edition where the 2008 NEC change action was concerned. This is accomplished by rearranging the order of the list and appropriately associating text that was specific only to "other agreements".

2. The following Substantiation addresses the issue.

a. Recognizing that there are areas in which an easement or right-of-way cannot legally be obtained. This comment provides text to permit "other written agreements" for those installations as well as a prescriptive list of the locations. This restricted list is provided to aid the code user in determining where this permission will apply.

b. The following list identifies where the problem lies, along with a rationale for each item. This list is provided to support the assertion of utilities that it is necessary to include the proposed text for locations where typical easements or rights-of-way are unobtainable on property for utility installations.

Item / Location / Rationale

1. Federal Lands. The Federal government permits electric utility serving installations on their property such as National Forests only by written agreement.

2. Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs. The U.S. Department of the Interior Bureau of Indian Affairs permits electric utility serving installations on Native American Reservations only by written agreement.

3. Military bases. The U.S. Department of Defense permits electric utility serving installations on their property only by written agreement.

4. Lands controlled by port authorities and State agencies and departments. Departments of Transportation and State Game Lands for instance permit electric utility serving installations on their property only by written agreement. Utilities have experienced trouble gaining right-of-ways in these areas. Most are done through a permitting process not a right-of-way process.

5. Lands owned by railroads. Railroad companies under federal government regulation permit electric utility serving installations on their property only by written agreement.

The Ad Hoc group recognizes that the text of 90.2(B)(5)(b) should be modified as suggested to eliminate potential problems where electric utilities provide service to owners, as listed, who do not grant easements or allow rights-of-way to utilities. This proposed revision will avoid conflict at regulatory bodies, the state, and local jurisdictional levels. Further, this proposed revision avoids utility interest to modify 90.2(B)(5) by local revision of the NEC scope in its adoption process, which has already occurred in some areas for the 2008 NEC. As such, confusion will be avoided in the field regarding installations where legally acquired easements and rights-of-way cannot be obtained.

The Ad Hoc group has submitted this comment in a consensus based effort to resolve this issue. This group urges CMP-1 to accept this comment in an effort to provide clarity and usability and to permit specified locations of utility supply facilities under "other agreements" as not covered by the NEC.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ANTHONY, M.: The work of the NESC-NEC Ad Hoc Task Group is significant and appreciated. Please also refer to my statement on Comment 1-6.

LABRAKE, JR., N.: EEI accepts the consensus of the NEC-NESC Ad Hoc for this Comment. It is important to note that property rights have no bearing on safe wiring installations.

1-24 Log #1976 NEC-P01 **Final Action: Reject**
(90.2(B)(5))

Submitter: Neil F. LaBrake, Jr., National Grid USA

Comment on Proposal No: 1-29

Recommendation: Accept the proposal in principle relative to the need for other written agreements and utility street and area lights as being not covered by the NEC in 90.2(B)(5).

Substantiation: Two points substantiating this comment are:

1. I support the work of the NEC-NESC Ad Hoc Task Group endorsing a comment on this proposal to include other written agreements by a utility's condition of service for utility facilities not covered by the NEC where the locations make easements and rights-of-way unobtainable.

2. In the original proposal item 90.2(B)(5)b, the word "utility" should precede "street" to clarify that street and area lights referenced are those that are exclusively owned, operated, and maintained by utilities.

For further information regarding this comment, please refer to the article on "Connecting Premises Wiring to Supply Lines" published by the International Association of Electrical Inspectors in their September/October 2009 magazine (http://www.iaei.org/magazine/?p=4329#more-4329) on page 93. I have provided copies of figures 4 and 5 of the article that illustrate examples of utility exclusively owned, operated, and maintained area lighting on private property that are covered by the NESC. Street lighting under the exclusive control of utilities are typically in the public domain and part of a utility distribution system covered by the NESC.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The comment does not provide the proposed text including the wording to be added, revised (and how revised), or deleted as per 4.4.5(c) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Comment 1-6.

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-25.

1-25 Log #2463 NEC-P01 **Final Action: Accept in Principle in Part**
(90.2(B)(5))

Submitter: Michael Hyland, American Public Power Association / Rep. IEEE NESC Committee

Comment on Proposal No: 1-29

Recommendation: Change 90.2(B)(5) to read as follows:

(5) Installations under the exclusive control of an electric utility where such installations

a. Consist of service drops or service laterals, and associated metering, or

be. Are on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy, or

c. Are utility-owned street or area lighting luminaires providing a supply of lumens, where such luminaires are operated and maintained by the utility, supplied directly from utility wiring, and supported on utility station, line, or service structures, or

db. Are located in legally established easements or rights-of-way, or

e. Are located by other written agreements either designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction for such installations. These written agreements shall be limited to installations for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy where legally established easements or rights-of-way cannot be obtained. These installations shall be limited to Federal Lands, Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs, Military bases, lands controlled by port authorities and State agencies and departments, and lands owned by railroads.

Substantiation: This comment is in two parts. The first addresses utility provided street and area lighting, while the secondary addresses areas where utilities do not have easements as a result of practical restrictions.

Part 1.

The proposed new item "c" text addresses concerns expressed by NEC panel members of the NEC-NESC Ad Hoc Task Group that the previous wording "or by other agreements" [that was removed from

90.2(B)(5) in the 2008 NEC] may have inadvertently allowed utilities to provide lighting in or on customer structures. The proposed language limits application of the exemption to the customary practice of supplying lighting from luminaires mounted on utility structures and fed directly from the utility system with no control by any party other than the utility involved.

Lighting is not just supplied from utility poles on distribution lines—it is also supplied from utility towers, station structures, meter service poles, and lighting service poles (the latter may have no other electrical utility facility on them). In addition, to avoid the issue of whether a lighting pole is a line pole, the language that is proposed is specific and reflects actual practice—it specifically includes utility service poles used for lighting service or metering of electricity service.

In addition, in some cases, the actual lighting fixtures may be originally provided by a municipality or other entity and then accepted by the utility, operated by the utility, and maintained by the utility. This is particularly the case where the particular fixture is not a regular utility offering but is a special design used in historic districts, etc. As a result, it is not appropriate to require that the utility originally supply the fixture and this has not been done for that reason. It is, however, appropriate to require that the utility luminaires meeting the NESC be fed directly from utility structures and not be either supported on a customer building or supplied through customer wiring; lighting installations supported on customer buildings or supplied through customer wiring should meet the NEC.

See ANSI C2-2007, National Electrical Safety Code for information that covers utility street and area lighting that are a lighting distribution system under the exclusive control of utilities providing lumens on public or private property.

Part 2.

There are areas in which an easement or right-of-way cannot legally be obtained. The new item "d" text in this comment permits "other written agreements" for those installations as well as a prescriptive list of the locations. This list provides the determination where this permission will apply. The rationale for each item that utilities reason that it would be necessary where typical easements or rights-of-way are unobtainable on property for utility installations typically covered by the NESC are:

Item	Location	Rationale
1	Federal Lands	Federal government permits electric utility serving installations on their property such as National Forests only by written agreement.
2	Federal government permits electric utility serving installations on their property such as National Forests only by written agreement.	U.S. Department of the Interior Bureau of Indian Affairs permits electric utility serving installations on Native American Reservations only by written agreement.
3	Military bases	U.S. Department of Defense permits electric utility serving installations on their property only by written agreement.
4	Lands controlled by port authorities and State and Municipal agencies and departments	Department of Transportation and State Game Lands for instance permit electric utility serving installations on their property only by written agreement. Utilities have experienced trouble gaining right-of-ways in these areas. Most are done through a permitting process not a right-of way process. In some cases, rights can only be obtained permanently on state lands through a constitutional amendment. For certain rivers in the State of New York, rights can only be acquired through the state office of General Services. For NY prisons, the same is true. For crossings of the NYS Barge Canal System and Thruway, the Thruway authority or NYSDOT grant permits. Permits can only be obtained for state highway crossings also from the NYSDOT. In the Adirondack Park, rights can be typically acquired from private landowners, but construction activities are restricted by the Adirondack Park Agency (APA) in accordance to rules of the agency. Municipal governments who own electric T&D in their jurisdictions site their utility facilities on their own lands without need of easements, rights-of-way, or agreements that supply their buildings on the line side of the service point.
5	Lands owned by railroads	Railroad companies under federal government regulation permit electric utility serving installations on their property only by written agreement.
6	Lands owned by members of utility cooperatives	Electric and communication membership cooperative utilities site utility facilities on member lands in accordance with the permission granted as a condition of service. Specific easements are not issued.

The IEEE NESC Committee anticipates an altruistic approach in this regard toward harmonization of the two codes. Like the NEC, the NESC is in the process of a public comment period and comments from all concerned parties are invited and needed. See the preprint draft of the 2012 NESC now available for public comment at http://standards.ieee.org/nesc/nesc_preprint.html.

Panel Meeting Action: Accept in Principle in Part

In the recommended wording, the panel Rejects the language of proposed "c.", and Accepts in Principle the remainder of the comment.

Panel Statement: The panel recognizes that the NEC/NESC Task Group (as identified in the substantiation of Comment 1-23) considered this issue and did not reach consensus to add the proposed text in "c.".

The proposed "c." does not improve clarity or enhance usability. "Area Lighting" is not defined in the NEC, and the proposed wording may introduce confusion about the applicability of requirements to a particular installation.

The remainder of the recommended wording was Accepted in Principle by the panel action taken on Comment 1-23.

In addition, the panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Comment 1-6.

LABRAKE, JR., N.: This Comment should have been "accepted-in-principle" and the term "area lighting" revised to something acceptable to the Panel. Although the term "area lighting" is not presently defined, there was a Proposal and subsequent Comment submitted in conjunction to do just that. To reject the definition and then reject the text as being "undefined" seems self-serving.

Although outreach efforts continue, more is needed for proper code application where area lighting is installed by utilities. Compliance is enforced rather than legislated.

1-26 Log #2857 NEC-P01 **Final Action: Accept in Principle (90.2(B)(5))**

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council

Comment on Proposal No: 1-30

Recommendation: The panel action should have been to Accept proposal 1-30.

Substantiation: During the 2008 Code cycle, Panel 1 removed the phrase "other agreements" because it was vague and unenforceable. The submitter has provided clarification of what "other agreements" cover in this proposal.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel actions and statements on Comments 1-23 and 1-25.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-27 Log #1380 NEC-P01 **Final Action: Accept in Principle (90.2(B)(5) and 90.2(B)(6))**

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force

Comment on Proposal No: 1-29

Recommendation: Change 90.2(B)(5) to read as follows with a new item 90.2(B)(6):

(5) Installations under the exclusive control of an electric utility where such installations

a. Are for utility facilities and functions for the purpose of communications, metering, generation, control, transformation, transmission or distribution of electric energy, lumens, communications data, or signals, or

b. Are for street and area lights providing a supply of lumens where these facilities are supplied by underground or overhead conductors, or

c. Consist of service drops or service laterals, and associated metering.

(6) Locations of utility supply conductors and equipment on the line side of the service point that are an integral part of the exclusive control of an electric utility where such installations

a. Are on property owned or leased by the electric utility, or

b. Are located in legally established easements or rights-of-way, or

c. Are located by other agreements, written or by condition of service, that meet the requirements that are either designated by or recognized by public service commissions, utility commissions, or other regulatory agencies having jurisdiction, or governing bodies where unregulated, provided further that such installations are outside a building or terminate immediately inside a building wall.

Agreements include locating utility supply facilities where typical easements or rights-of-way are unobtainable on property for Federal Lands, Native American Reservations through the U.S. Department of the Interior Bureau of Indian Affairs, military bases, lands controlled by port authorities and State agencies and departments, and lands owned by railroads.
Informational Note: See ANSI C2-2007, *National Electrical Safety Code* for information that covers utility street and area lighting that are a lighting distribution system under the exclusive control of utilities providing lumens on public or private property.
Substantiation: Edison Electric Institute recommends Proposal 1-29 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change.
Panel Meeting Action: Accept in Principle
See the panel actions and statements on Comments 1-16 and 1-18, regarding the Rejection of the Informational Note, and 1-23 and 1-25, regarding the remainder of the text.
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.

Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.

1-28 Log #2471 NEC-P01 **Final Action: Accept in Principle**
(90.2(B)(5)(b))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-31
Recommendation: Accept the proposal.
Substantiation: The panel action and statement to reject this proposal failed to respond to its technical merit, which had much to do with a drawing that unfortunately did not publish in the ROP. For the benefit of the readers of this document, a verbal description follows. The drawing showed a drugstore with a parking lot out back. At the far end of the parking lot there was a rear exit onto a public street with two conventional street lighting luminaires. On a utility pole, also within the public way and to the rear of the parking lot, the drug store leased from the serving utility a 250W HPS luminaire. The drug store owners decided they wanted additional light, so they leased a second 250 W HPS luminaire, mounted to an existing utility pole midway into and on one side of the parking lot. This pole was not in a public way, and the drop to this luminaire did not pass over a legally defined easement; it was placed through an "other agreement", specifically, an established tariff recognized by the relevant agency of the state government. Ownership of and the service responsibilities for all four luminaires under discussion remained with the serving utility. Under the current NEC, the additional luminaire, but not the three within the public way, must have a service, grounding electrode, overcurrent protection, disconnecting means, etc., etc.

The proposal concluded: "If CMP 1 chooses to reject this proposal, the submitter expects to read the panel statement with great interest in the hope of learning exactly why the luminaire nearest the drug store, but not the other three luminaires, presents such a hazard that the NEC would try to overturn established utility practice going back over a century." Pursuant to the NFPA Regulations Governing Committee Projects, which indicate a strong preference for a response that is technical in nature to such proposals and comments, the submitter is still awaiting a technical response. The submitter refers CMP 1 to the comments in the voting on the proposal for the complete details with respect to this lack of responsiveness. The proposal goes to the heart of a jurisdictional conflict between two ANSI standards that may not end well for NFPA's continuing stewardship of the NEC unless this is resolved in a technically credible manner.

The other objection to the service point demarcation objective focuses on certain utility activities that seem to be squarely within the province of the NEC. For example, at the recently concluded IAEI Eastern Section Meeting it was asserted by a very reliable source that a certain utility apparently believes it can wire motor control centers to the NESC or whatever, and declare that the various load connections within or adjacent to each bucket constitute a multiplicity of service points. This practice, where it is occurring, needs to be stopped, period. Very few utilities are trying to attempt this type of business. The wording of the proposal being supported by this comment plainly states that such activities would violate the NEC.

The larger issue, however, is whether the NEC can ever be written in a way that will stop it. Electric utilities are natural monopolies with respect to distribution activities, and for that reason those activities are regulated by public entities. If a utility is wiring motor control centers wearing its utility hat, and not as an electrical contractor working on the same playing field as such contractors generally, then it can only be doing so pursuant to a tariff approved by a regulatory agency. Such activities usually, upon close examination, reveal that the utility is milking its rate base to capitalize these ventures. As such, they raise, or should raise, serious public policy concerns within the regulating authority. In the end, this is a political question regarding competition and the abuse of a rate base. Interested parties should shine a very bright spotlight on any public authority that is permitting such misbehavior to proceed, and force its discontinuance.

This proposal is carefully drawn to prohibit that which should be prohibited, and allow that which has been allowed for over a century. It coordinates well with the NESC, and should be accepted to finally put this problem behind the NEC Committee and bring it out into the political arena where applicable.
Panel Meeting Action: Accept in Principle
See the panel actions and statements on Comments 1-23 and 1-25.

(90.2(B)(5), FPN (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-23
Recommendation: Continue to reject this proposal.
Substantiation: The proposed figure is inappropriate as it does not cover communications. The term 'service point' does not apply, or applies differently, to communications systems than to a power utility interface (see last paragraph of submitter's substantiation). Additionally, communications wiring covered by the NEC may not be completely located on the 'premises side of the service point'. Such is the case when communications cables enter the building and the Network Interface Device (NID), Network Interface Unit (NIU) or Optical Network Terminal (ONT) is located within the building.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.

1-30 Log #1381 NEC-P01 **Final Action: Reject**
(90.2(C))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-34
Recommendation: Change the new last paragraph in the original proposal to read as follows:
Within this Code's requirements, other codes and standards and good engineering practice shall be permissible by the authority having jurisdiction to apply to specific systems having supervised installation that are under engineering supervision and the control of qualified persons authorized by a regulating or controlling body, such as systems associated with an industrial complex or utility interactive system.
Substantiation: Edison Electric Institute recommends Proposal 1-34 be accepted-in-principle and supports Mr. LaBrake's negative ballot statement. Remove the word "governmental" and change "such as those" to "such systems".
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 1-34 that the language does not provide further clarity. In addition, this is already covered in 90.4.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: I disagree that this is already covered by 90.4. That Section details how enforcement of the Code is accomplished and allows Special Permission. Section 90.2(C) details what Special Permission is and, as such, the additional details outlined in this Comment are needed in that Section.

This is an example where the Proposals and Comments to add definitions for "engineering supervision" and "supervised installations" would support special permission by an AHJ.

1-31 Log #1466 NEC-P01 **Final Action: Reject**
(90.2(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-33
Recommendation: In panel action add "other" between "building or" and "structure."
Substantiation: Edit. A building is defined as a structure but all structures are not buildings.
Panel Meeting Action: Reject
Panel Statement: The additional text is unnecessary and does not enhance clarity or usability.

Comment on Proposal No: 1-35
Recommendation: Continue to reject this proposal.
Substantiation: The submitter has provided no technical justification to eliminate the independent status of Chapter 8, *Communications Systems*. Communications systems are uniquely and significantly different from power systems. Communications systems cables, conductors and equipment operate at current and power levels much less than those of power circuits and are power-limited, thereby greatly reducing the likelihood of electrical fire. The grounding requirements of Chapter 8 have been in place for many years, yielding an exemplary safety record. Many grounding and bonding considerations are unique to Chapter 8; it is appropriate that communications systems have their own grounding requirements. However, where the requirements of Article 250 apply, they are referenced (see for example 800.100(B)(1), 800.100(B)(2), 800.100(C), 800.106(A) and similar sections in 820 and 830). The submitter cites Network-Powered Broadband Communications Systems power as support for his position. The power levels of these circuits (see Table 830.15) are nominal power source ratings; the actual power available on the network is greatly reduced by the resistance of the network conductors. The submitter implies that electrical safety considerations exceed the capabilities of Panel 16 members. Panel 16 contains a broad, balanced representation from the electrical industry including enforcement (electrical inspection), manufacturing, installation, labor, power distribution, research/testing and communications, and is well suited to the task. The proposed revision is over simplified. To do as the submitter proposes will result in total confusion. Each and every requirement in Chapters 1 through 6 would need to be considered by Panel 16 and all that do not apply identified and referenced as such in Chapter 8.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-36 Log #2849 NEC-P01 **Final Action: Reject**
(90.5)

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 1-38
Recommendation: The Panel should accept this proposal.
Substantiation: While the panel disagrees that adding the proposed annex will improve usability, I recommend that the panel actually refer to the following sections of the Code to understand the need to consolidate duplicative FPN references into an informative annex.
[725.179(A), 725.179(B), 725.179(C), 725.179(D), 725.179(E), 725.179(F), 725.179(H), 725.179(J), 725.179(K), 760.176(C), 760.176(D), 760.176(E), 760.176(F), 760.179(D), 760.179(E), 760.179(F), and 760.179(G)]
Panel Meeting Action: Reject
Panel Statement: The panel continues to disagree that the proposed annex will improve usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-37 Log #2859 NEC-P01 **Final Action: Reject**
(90.8)

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council
Comment on Proposal No: 1-44
Recommendation: The panel action should have been to Accept in Principle, with the principle being to delete both 90.8 (A) and (B).
Substantiation: Section 90.8 should be removed or relocated. It is out of place in Article 90. Sections 90.2-90.9 cover administration of the code such as scope, arrangement, enforcement, explanation of mandatory and permissive material, interpretations, units of measure. 90.8 which covers general information for wiring planning has nothing to do with the objective of administering the code and therefore doesn't belong here.
Panel Meeting Action: Reject
Panel Statement: Deletion of 90.8 would not improve the content of the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
Comment on Affirmative:
FISKE, W.: We agree with CMP-1 that both 90.8(A) and 90.8(B) should not be removed from the NEC. We offer the following comment in hopes that someone will take the initiative to submit a better proposal (than 1-44) in the 2014 Code cycle. 90.8(A) is unenforceable as written. At the time of installation, no one can foresee what "future expansion" may require of a building's wiring system. In view of the current trend toward more energy-efficient equipment, it is even conceivable that a given building's electrical infrastructure could become less heavily loaded in the future, rather than more so. 90.8(B) is entirely explanatory in nature, and it should not be a Code rule. The most logical action seems to be changing both 90.8(A) and 90.8(B) to explanatory notes; however, it would appear that the Rules Governing Committee Projects preclude such action at this stage in the Code cycle.
LABRAKE, JR., N.: For a future proposal to the 2014 NEC, sections 90.6 through 90.8 could be reorganized into a single section along with the information suggested by the Submitter on this Comment. Since there are no requirements specified in these sections, they could be considered all as general information.

1-38 Log #1979 NEC-P01 **Final Action: Accept**
(90.10 (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 1-46
Recommendation: Continue to reject.
Substantiation: This would be too restrictive and the existence of detailed construction documents or the lack there of does not impact the safety of the installation.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.

ARTICLE 100 — DEFINITIONS

3-1 Log #25 NEC-P03 **Final Action: Reject**
(100.Air Duct)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 3-3
Recommendation: Accept this proposal.
Substantiation: The term "air duct" is used in Article 100 in the definition of a plenum in Article 100 and in sections 250.104(B), 454.58, 551.56(F) and 552.57(F).
It needs to be defined in the NEC.
Apparently NFPA staff has decided that panel 3 is the appropriate panel to handle this proposal notwithstanding the fact that the term is not used in any of the articles under its jurisdiction. If panel 3 is responsible for the definition of a plenum, (which uses the term "air duct") it might logically follow that it should also be responsible for the definition of an air duct.
Panel Meeting Action: Reject
Panel Statement: The phrase "air duct" is not used in any of the articles under the jurisdiction of Panel 3. In addition, the proposed definition uses the word "conduit" to describe the transfer of air from one location to another which could be mistakenly be applied as a type of raceway, such as rigid metal conduit and intermediate metal conduit.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

6-1 Log #2473 NEC-P06 **Final Action: Accept**
(100.Ampacity)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-3
Recommendation: Accept the proposal in part. Insert the word "maximum" ahead of the word "current" in the definition. Do not insert the word "allowable".
Substantiation: The word "allowable" is technically incorrect. Ampacity is governed solely by thermodynamics, and not by a tabulated value in a code table, however well substantiated. For example, look at 3-conductor 2 AWG XHHW aluminum in a SEU configuration buried in cellulose insulation. Research in the 1980s clearly demonstrated that this cable would operate above 90°C when carrying approximately 65 amperes of current (and literally incinerate itself at the nominally allowable ampacity of 100 amperes). The true ampacity of this wire, in accordance with the definition and as reflected in 310.10, is about 60 amperes under the stipulated conditions of use.
This, in turn, is why the ampacity tables all include the term "allowable" in their titles. The numbers therein are the allowed numbers for installation and inspection purposes, and they work unless some anomaly (thermal insulation in this case) leads to a different result (and thereby invokes 310.10). The Code would be unusable without those allowable ampacity tables. The definition as written is essentially correct and differs from prescriptively established values, as it should. "Ampacity" reminds one of "capacity" (from which it is derived) and is generally understood to be a maximum value just as capacity is inherently a maximum value. Adding the word "maximum" does no harm; adding the word "allowable" on the other hand would do great harm.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
PICARD, P.: The Panel should have noted that it did not agree with all of the submitter's substantiation. In particular, the "research" referred to is unavailable to the Panel.

1-39 Log #1980 NEC-P01 **Final Action: Accept**
(100.Arc Flash Hazard)

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 1-52
Recommendation: Continue to reject.
Substantiation: Leave the installation rules to the NEC and keep the electrical safe work rules in NFPA 70E. The rules and definitions in NFPA 70E are not required to install an electrical system that is in full compliance with rules that are found in the NEC.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-40 Log #1382 NEC-P01 **Final Action: Reject**
(100.Area Lighting (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-53
Recommendation: Edison Electric Institute recommends Proposal 1-53 be accepted and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include it as a new Informational Annex to describe general information regarding utility electric supply to premises wiring.
Substantiation: Refer to the Informational Annex provided with companion comment submitted on Proposal 1-12 that would contain this proposal's recommendation along with companion comments on Proposals 1-79, 1-101, 1-104, and 1-106.

Panel Meeting Action: Reject
Panel Statement: Since the panel has rejected the inclusion of the Informational Annex, the addition of a definition is a moot point.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comments 1-6 and 1-25.

18-1 Log #1465 NEC-P18 **Final Action: Reject**
(100.Attachment Plug (Plug Cap) (Plug))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-3
Recommendation: Accept the proposal.
Substantiation: Present wording implies a connection to an attached cord but does not specify it. Attachment plugs are also used with cord connector bodies and flanged surface outlets. Whether a flanged surface outlet is a code-defined term, is irrelevant; the term is sued in several places in the NEC. Many terms are not NEC defined: locknut, bushing, etc. While cord connector bodies and flanged surface outlets serve similar functions as receptacles, they are distinct separate devices.
Panel Meeting Action: Reject
Panel Statement: The submitter has again failed to provide reasoning sufficient to convince the panel to change this definition. The submitter is encouraged to review the definition of a receptacle in Article 100 which states: "A receptacle is a contact device installed at the outlet for the connection of an attachment plug." This definition covers his recommended changes.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
WELLS, J.: The Panel rejected the comment. While I concur with the action, I believe a portion of the proposal improves the definition. The reference to "flanged surface outlet" is not necessary because such devices are already covered under the definition in Article 100 for "receptacle".

16-1 Log #49a NEC-P16 **Final Action: Reject**
(100.Barrier (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-8
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 3 and 16 for action within their respective Articles.
This action will be considered by Code-Making Panels 3 and 16 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Reject
Panel Statement: The panel accepts the direction of the TCC to consider Proposal 9-8 as it relates to Articles 770, 800, 820 and 830.
The panel agrees with the action of CMP 9 to reject this proposal. Barriers used within the scope of CMP 16 responsibilities are in accord with dictionary definitions, and therefore do not need to be defined in Article 100.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Esemplare, R.

3-2 Log #49 NEC-P03 **Final Action: Accept**
(100.Barrier (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-8
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 3 and 16 for action within their respective Articles.
This action will be considered by Code-Making Panels 3 and 16 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the NEC Technical Correlating Committee to act on Proposal 9-8 as it relates to articles under the jurisdiction of Panel 3 and continue rejecting the proposal.
There are over 55 references to "barrier" throughout the NEC with many of these "barriers" used for different applications, such as fixed barriers in the cable trays used in 230.44, Exception and the permanent barriers in boxes used in 314.28(D). The proposed definition does not provide any more information of what constitutes a barrier for separation between power conductors and Class 2 or Class 3 circuit conductors than the definition of a barrier in Webster's Dictionary. Each individual section references require a barrier for specific purposes and specific construction. For example "to physically separate" and "of non-conductive material." Establishment of a general definition will not address the specific barriers for respective sections of articles.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

2-1 Log #1949 NEC-P02 **Final Action: Accept in Part**
(100.Bathroom)

Submitter: D. Jerry Flaherty, Electrical Inspection Service, Inc. / Rep. New York Solar Industries Association (NYSEIA) & Long Island Solar Industries Association (LISEIA)
Comment on Proposal No: 2-6
Recommendation: Revise text to read as follows:
Bathroom. An area including ~~a basin with one~~ two or more of the following: a basin, a toilet, a tub, or a shower, a urinal, ~~a foot bath~~, or a bidet.
Substantiation: The above changes better define a modern bathroom, but "a foot bath" should not be included. Foot baths are most often located in nail salons along with a basin for washing hands. This proposed change would redefine many nail salons as bathrooms. This is not the intent of this change.
Panel Meeting Action: Accept in Part
In the text of the Report on Proposals, the panel Accepts the deletion of the words "a foot bath" and Rejects the remainder of the comment.
Panel Statement: The panel agrees that the addition of the words "foot bath" could be interpreted to include locations beyond that intended by the panel.
The remainder of the comment is rejected because it would expand the definition of bathroom to areas where there was no basin. The fundamental basis for the definition of bathroom and the associated requirements is related to having a basin.
For example, with the change proposed by the submitter a location in a dwelling with only a toilet and a shower would now be a bathroom - 210.52(D) requires a receptacle in the bathroom within three feet of the basin which would not exist in this instance.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-2 Log #2747 NEC-P02 **Final Action: Reject**
(100.Bathroom)

Submitter: Mark Lambert, Farmington, NH
Comment on Proposal No: 2-6
Recommendation: Add new and revise text to read as follows:
Bathroom. An area including ~~a basin with one~~ two or more of the following: a basin, a toilet, a tub, or a shower basin., a urinal, a foot bath, or a bidet.
Substantiation: The definition is restrictive to the items that would define a
Bathroom. The intent of the change is to extend the definition to cover all items
that one might encounter in a room that would make a bathroom. This revision would ultimately aid in the placement of receptacles, especially if a bathtub was considered as a basin.
Panel Meeting Action: Reject
Panel Statement: The fundamental basis for the definition of bathroom and the associated requirements is related to having a basin. For example, with the change proposed by the submitter a location in a dwelling with only a toilet and a shower would now be a bathroom - 210.52(D) requires a receptacle in the bathroom within three feet of the basin which would not exist in this instance. A "basin" is well defined in the construction industry and the panel sees no basis for interpreting the bathtub as a basin as stated in the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-1 Log #2329 NEC-P05 **Final Action: Accept in Principle in Part**
(100.Bonder Jumping, Supply-Side (SSBJ))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-5
Recommendation: Revise this definition as follows:
Bonding Jumper, Supply-Side (SSBJ). A ~~reliable~~ conductor installed on the supply side of a service, or between a separately derived system and the first disconnecting means of such system, ~~to~~ that ensures the required electrical conductivity between metal parts required to be electrically connected.
Substantiation: The deletion of the word "reliable" is for the same reason CMP-5 deleted "effectively grounded." The change regarding separately derived systems is based on the fact that the SSBJ is not on the supply of the SDS (the primary winding), but rather it is between the SDS and its first disconnecting means. The commas were added to help clearly differentiate the service location and the SDS location of the SSBJ.
Panel Meeting Action: Accept in Principle in Part
Accept the deletion of the word reliable. The panel did not accept the added wording as it provides no clarity to the definition.
Panel Statement: See panel action and statement on Comment 5-4. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-2 Log #50 NEC-P05 **Final Action: Accept**
(100.Bonding Jumper, Equipment)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 5-5
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting and clarify whether it is the Panel's intent to replace the definition "Bonding Jumper-Equipment" with "Supply-Side Bonding Jumper (SSBJ)".
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel action was reconsidered and as evidenced by the action on Comment 5-3 the definition for the Supply Side Bonding Jumper was intended to be a new definition and not a replacement for the Equipment Bonding Jumper.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-3 Log #1718 NEC-P05 **Final Action: Accept**
(100.Bonding Jumper, Equipment)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-5
Recommendation: Retain the existing text of the 2008 NEC as follows:
Bonding Jumper, Equipment. The connection between two or more portions of the equipment grounding conductor.
Substantiation: This action will restore the existing definition of equipment bonding jumper to Article 100. In creating the definition of Supply Side Bonding Jumper, I do not believe it was the intent of CMP-5 to delete the definition of Equipment Bonding Jumper.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-4 Log #1716 NEC-P05 **Final Action: Accept in Principle**
(100.Bonding Jumper, Supply-Side)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-5
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
Bonding Jumper, Supply-Side (SSBJ). A reliable conductor installed on the supply side of a service or for a separately derived system to ensure the required electrical conductivity between metal parts required to be electrically connected.
Move the definition of "Supply-Side Bonding Jumper (SSBJ) to 250.2.
Substantiation: The addition of the words "for a" is proposed to be added for separately derived systems to clarify the application of the definition. It seems less clear what the supply side of a separately derived system is than for services. Is the supply side of a transformer-type separately derived system the primary?
The term is used in only Article 250 and thus should be located in 250.2 to comply with the NEC Style Manual.
Panel Meeting Action: Accept in Principle
Revise ROP draft text as follows:
"Bonding Jumper, Supply Side. A conductor installed on the supply side of a service or within a service equipment enclosure(s), or for a separately derived system, that ensures the required electrical conductivity between metal parts required to be electrically connected."
Panel Statement: The text revisions add clarity that this is a specific conductor, wire or metal raceway and its function. The panel agrees this definition should be relocated from Article 100 to Section 250.2.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-4a Log #2895 NEC-P05 **Final Action: Accept in Principle**
(100.Bonding Jumper, System (New))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 5-6
Recommendation: Add definition to read as follows:
Bonding Jumper, System - The connection between the grounded circuit conductor and the equipment grounding conductor at any single point on a separately derived system from the source to the first system disconnecting means or overcurrent device or at the source of a separate derived system that has no disconnecting means of overcurrent devices.
Substantiation: I am aware that a similar definition appears in 250.2, but it would be more appropriate and helpful if located in Article 100.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-37.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

2-3 Log #2475 NEC-P02 **Final Action: Accept**
(100.Branch Circuit, Individual)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-9
Recommendation: Continue to reject the proposal.
Substantiation: The proposal submitter cites a valid concern relative to continuing controversies regarding duplex receptacles being installed where individual branch circuits are required. The new requirement in 422.16(B)(4)(5) is a case in point, where a receptacle is to be installed in a kitchen cabinet over a range. Only one utilization equipment would be connected initially, but who knows what use might be made of the additional receptacle. Some inspectors will allow this and others won't. This topic provoked considerable discussion at the 2008 IAEI Eastern Section meeting, resulting in an overwhelming vote that the duplex receptacle was not permitted for this application. I have suggested that the only use of a duplex receptacle that would clearly meet the terms of the definition would be one supplying a single utilization equipment equipped with two supply cords, which would be rare but not impossible. Clarification is in order.
Unfortunately, the required clarification cannot be achieved within the boundaries of a definition. The clarification must occur through additional language within Article 210, presumably by slightly broadening the scope of 210.21(B)(1). Unfortunately, there is no suitable proposal available that would provide the required public review, so this will have to wait for the 2014 NEC cycle.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-40a Log #CC100 NEC-P01 **Final Action: Accept**
(100. Building)

Submitter: Code-Making Panel 1,
Comment on Proposal No: 1-55
Recommendation: Reject Proposals 1-55 and 1-56.
Substantiation: After reconsideration of the actions taken on Proposals 1-55 and 1-56, the panel has determined that the definition of "Building" as it appears in the 2008 NEC is more appropriate and adequately addresses the uses of the term in the NEC.

The panel has carefully reviewed the recommendation in Comment 1-44, and has determined that the proposed text of the comment would be in conflict with the intended use of the definition in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Note: Sequence 1-41 was not used)

1-42 Log #2239 NEC-P01 **Final Action: Reject**
(100.Building)

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 1-55
Recommendation: Revise the submitter's recommended wording as follows: "BUILDING. A structure that stands alone or that is cut off from adjoining structures by firewalls (~~or fire barriers~~) with all openings therein protected by approved fire doors." Alternatively, as suggested in the panel statement for Proposal 1-56, simply use the preferred definition from NFPA 220 which states as follows: "A permanent structure having a roof and walls and used to enclose an occupancy."
Substantiation: A companion and preferred comment has been submitted for companion Proposal 1-56. The NFPA 220 definition closely mirrors the definition of "Building" in the 2006 International Building Code as follows: "Building. Any structure used or intended for supporting or sheltering any use or occupancy." The NEC needs to have a generic definition for buildings in support of electrical authorities having jurisdiction for those areas where the NEC has been adopted, but where a building code has not been adopted. However, for those areas where a building code has been adopted over and above or in addition to the NEC, the building code, not the NEC, should be used for determining whether or not a particular structure is a building, a portion of a building, an occupancy within a building, or similar. Fire barriers, fire partitions, fire doors, occupancy separations, and other construction elements are used for increasing the allowable height of a building, for increasing the allowable area of a building, to stop or mitigate the spread of fire and smoke, and for other purposes, but they generally do not create "separate buildings" for the purpose of supplying a building with more than one electrical supply in the form of a service drop or service lateral. Generally, separate buildings are not created until such time that "exterior wall protection" requirements in the building code have been met, where those walls must meet stringent fire resistive requirements, they cannot have any openings, they are vertical not horizontal construction elements, and where those walls follow real or assumed property lines. The NEC would have improved usability with a simplified definition that does not compete with the definitions and concepts found in building codes. In other words, it's better to have a simple definition in the NEC that can be interpreted by the local authority having jurisdiction, than for the NEC to now specifically dictate building code concepts and what constitutes separate buildings.

When it comes to allowing only one service drop or lateral to a building, the rules in 230.2 are restrictive for good reason. However, the rules in 230.40 for service-entrance conductors are more permissive and offer numerous opportunities for electrical installations to be configured in a variety of ways and yet provide the necessary electrical safety for persons and property.
Panel Meeting Action: Reject
Panel Statement: See the panel action and substantiation on comment 1-40a.

(100.Building)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-56
Recommendation: Accept the panel action in principle. Reorganize the wording so as to be closer to the NFPA Glossary, as follows:

"A permanent structure having a roof and walls that are used to enclose an occupancy and that stands alone, or that is cut off from adjoining structures by fire walls or fire barriers with all openings therein protected by approved fire doors."
Substantiation: The "permanent structure" opening, the "roof and walls" provision, and the occupancy enclosure provision all hang together to describe the overall structure. The description of how the overall structure is separated from other structures is a separate consideration. This rewording groups the concepts properly. The fire doors and fire barriers have nothing to do with the occupancy enclosure parameter, only the integrity of the separation. When I first read the new definition, I couldn't figure out how a fire door could enclose an occupancy. Then I read the panel statement that reiterated the NFPA Glossary definition and realized what was intended. For further clarification, this rewording includes a comma after "stands alone", which clarifies that the cut-off provision is self-contained.
Panel Meeting Action: Reject
Panel Statement: See the panel action and substantiation on comment 1-40a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-1 Log #431 NEC-P08 **Final Action: Reject**
(100.Cable Tray)

Submitter: Terry Peters, The Society of the Plastics Industry
Comment on Proposal No: 8-4
Recommendation: Accept this proposal.
Substantiation: SPI requests that the panel reconsider and accept this proposal because the definition of a cable tray is not in Section 392.2. Section 392.2 defines a "cable tray system", not a "cable tray". "Cable tray" is not defined anywhere in the NEC.
Panel Meeting Action: Reject
Panel Statement: The definition found in Section 392.2 is adequate. Cable tray is installed as a system whether it consists of a single piece or multiple sections as defined in Section 392.2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

5-5 Log #1986 NEC-P05 **Final Action: Reject**
(100.Common Neutral (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 5-7
Recommendation: The proposal should be accepted in principal with the following wording change.
Common Neutral: A neutral conductor used in circuits with two or more ungrounded conductors having no potential between them.
Substantiation: The term is used in two current code articles and may be used in a third if proposal 5-49 is accepted. In the field the term common neutral is most often used for the neutral conductor of a multi-wire circuit. That is not its use in 215.4 and 225.7(B), where the common neutral is used with more than one multi-wire circuit. There are also field installations where two or more conductors of the same phase or leg are used with an oversized grounded conductor. (example: two #12s from 20 amp circuit breakers on "A" phase with a #8 grounded conductor). This type of installation is not prohibited by the current code. The combination of this new definition and the new rule in 200.8 would prohibit this type of common neutral circuit.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that a definition of a common neutral is not necessary as the proper usage of a common neutral is adequately covered in 215.4 and 225.7(B). The panel reaffirms that Section 215.4 deals with multiple feeder circuits using one neutral and not one circuit as implied in the proposed definition. See panel action and statement on Comment 5-33.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

1-45 Log #2476 NEC-P01 **Final Action: Accept**
(100.Concealed Space (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-58
Recommendation: Continue to reject the proposal.
Substantiation: In addition to the issues raised in the panel statement where increased limitations are expected to apply to areas within suspended ceiling cavities, there are also unique permissions that apply to these areas. By virtue of the wording of the definition of "exposed", the new definition would turn those allowances on their heads. For example, 250.52(A)(1) Exception permits the remote connection to water piping being used as a grounding electrode in certain occupancies contingent on it being exposed. This word was specifically chosen so as to recognize this permission even where the water piping was not immediately visible, particularly including where it ran above a suspended ceiling.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-2 Log #1464 NEC-P09 **Final Action: Reject**
(100.Conduit Body)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-22
Recommendation: Accept the proposal.
Substantiation: A conduit body complies with the definition of fitting. Conduit bodes are not always attached to a raceway as stated by the panel. A cord may enter a conduit body attached to a motor, box, or other enclosure where Code compliant, without involvement of a raceway.
Panel Meeting Action: Reject
Panel Statement: CMP 9 disagrees that a conduit body performs a primarily mechanical function as opposed to an electrical function, and therefore the terms of the definition of a fitting are not met. It is true that until the 1990 NEC, the scope of what is now Article 314 included a final sentence that read "Fittings such as capped elbows and service-entrance elbows are not classified as conduit bodies." This sentence was removed in the 1993 NEC because these items in fact met the conduit body definition, and a new section (314.5) was created to cover their use. With respect to a conduit body attached to a motor terminal housing or other enclosure as described in the substantiation, such a conduit body would almost necessarily be connected using a chase or close nipple, which for these purposes would still qualify as a raceway. The paragraph proposed for change by this comment has been in the NEC without modification since the 1975 edition, and there is no evidence that it is causing confusion or difficulties in the field.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-4 Log #1462 NEC-P02 **Final Action: Reject**
(100.Connected Load (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-12
Recommendation: Accept the proposal.
Substantiation: Connected load and calculated load are not distinguished. Connected load implies actually connected to a supply conductor; while computed load may be applied to outlets for receptacles, lighting or square foot area where no load is actually connected.
Panel Meeting Action: Reject
Panel Statement: The submitter's revision does not add any clarity to the application of the rules within the NEC. A search of the NEC for the term "connected load" shows that the usage of the term is consistent with the context of the rule and is not confused with calculated load.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-5 Log #1463 NEC-P02 **Final Action: Reject**
(100.Continuous Load)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-13
Recommendation: Accept the proposal.
Substantiation: A continuous load requires a 125 percent ampacity factor. Continuous duty motors already require this ampacity factor. Without exempting a motor the ampacity factor is 250 percent since there is nothing that exempts a continuous duty motor operating for 3 hours or more. "Likely" although a term to be avoided is used many times in the NEC and is specific to the condition of 3 hours or more.
Panel Meeting Action: Reject
Panel Statement: The definition is clear as currently written. The factors for calculating continuous loads are specifically identified in Article 220 and other parts of the NEC.
For example, 220.14(C) clearly points to 430.22 and 430.24 for calculation of motor loads.
In addition, 210.2 makes it clear that Article 430 is followed for motors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-6 Log #2187 NEC-P02 **Final Action: Reject**
(100.Continuous Load)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-13
Recommendation: Accept revised as follows:
Equipment, other than motors, that is supplied by its uninterrupted rated full-load current for 3 hours or more.
Substantiation: Many motors operate for 3 hours or more; their supply conductors are required to have an ampacity not less than 125 percent of the motor full-load current. If they are included as "continuous" load the 125 percent factor for such loads is in addition to the 125 percent factor specified in 430.22(A) and requires excessive conductor ampacity. Conductors rated for 125 percent of the largest motor or continuous load, whichever is larger, will accommodate the temporary 125 percent overload current permitted by the overload device and reduce heating effect at terminals of overcurrent devices. The term being defined should not be used in the definition (load).
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-7 Log #2477 NEC-P02 **Final Action: Accept**
(100.Continuous Load)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-13
Recommendation: Continue to reject the proposal.
Substantiation: The panel statement is correct as far as it goes, but it may lead some readers to believe that if a motor operates routinely for more than three hours at a time, then a double deduction applies to sizing the circuit components. Sections 430.22 and 430.24 (as applicable) apply, and only the 25 percent imposed within Article 430 affects the circuit components. This correlation is achieved through the operation of 210.2 and Table 210.2, and it is the reason that the motor loads in Annex D, Example 3(a) are (1) not categorized as noncontinuous loads, but (2) grouped with noncontinuous loads for that part of the feeder load calculations.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-2 Log #1461 NEC-P18 **Final Action: Reject**
(100.Cord Connector (Body))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 18-4
Recommendation: Accept the proposal.
Substantiation: Cord connector is a term used many times in the NEC and should be distinguished from a connector used to secure a cord to a box or other enclosure.
Panel Meeting Action: Reject
Panel Statement: The substantiation for this proposal simply stated that this definition should be added because there presently is none. In the panel statement in rejecting the proposal, the panel indicated that there was no statement of the problem nor was there any justification as to why a definition is needed. The substantiation for this comment is similarly lacking. What is the problem? How are people confused? What hazard results from the confusion?
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

1-46 Log #1257 NEC-P01 **Final Action: Reject**
(100.Disconnect Means, Lockable (New))

Submitter: Stanley J. Folz, Morse Electric, Inc.
Comment on Proposal No: 1-63
Recommendation: Disconnect Means, (Lockable): A disconnecting means ~~with provisions for~~ capable of being locked in the open position ~~by either a keyed or combination lockout device in which the~~ with provisions for applying a ~~the~~ lockout device that remains ~~in place~~ on the disconnecting means whether a lock is installed or not. ~~and the disconnecting means remains operable until the lockout device is applied.~~
Substantiation: The panel's rejection of this new definition was based on 2.2.2 of the NEC NFPA Style Manual (Definitions shall not contain requirements or recommendations.). I have revised the new definition to mimic the wording of similar definitions that seem to have specific "requirements". Such as Bathroom, Cabinet, Ground Fault Protection of Equipment, Guest Room, Guest Suite, In Sight From, Kitchen, etc. All of these items are specific in nature and cannot be defined without using some terms that may be construed as requirements. The same would hold true for Lockable Disconnecting Means. This term would replace "Lockable Disconnect" and its many different definitions throughout the NEC with one single codified definition that could be understood and practiced by all.
This proposal would also provide a reduction in words from the current NEC. An Example would be ROP 18-190 which is one of the many companion proposals to this proposal.
Please reconsider and approve this proposal.
Panel Meeting Action: Reject
Panel Statement: The proposed text places requirements in a definition that is in violation of 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-47 Log #1458 NEC-P01 **Final Action: Reject**
(100.Disconnecting Means)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-60
Recommendation: Accept the proposal with the following revisions:
A device, or group of devices identified as suitable for the purpose of isolating electric conductors or equipment from the electric supply.
Substantiation: Where not indicated to be "approved" or a specific type, disconnecting means can include wire connectors, terminal lugs, attachment plugs, links, etc.
Panel Meeting Action: Reject
Panel Statement: The comment is not supported by substantiation as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-48 Log #1460 NEC-P01 **Final Action: Reject**
(100.Disconnecting Means, Lockable)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-63
Recommendation: Accept the proposal with the following revisions:
A device, or group of devices provided with approved permanent provisions for locking in the open (off) position or closed (on) position.
Substantiation: Acceptance would permit deletion of unnecessary similar requirements throughout the NEC and provide specifics for the locking means.
Panel Meeting Action: Reject
Panel Statement: The comment is not supported by adequate substantiation and fails to justify why the term must be defined.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-49 Log #2478 NEC-P01 **Final Action: Hold**
(100.Disconnecting Means, Lockable (New))

TCC Action: The Technical Correlating Committee will appoint a Task Group to study this issue for the 2014 Code cycle.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-63
Recommendation: Accept the proposal in principle. Relocate this material as 110.20 (now vacated as per the action on Proposal 1-172, so this location is now a vacant location in Part I of the article), reworded as a requirement as follows:
110.20 Disconnecting Means, Lockable. Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied.
Substantiation: This comment addresses the formatting errors in the original proposal, which included requirements in a definition. CMP 1 was correct to reject this formulation, as was it correct to suggest that it was within the scope of Article 110. This requirement should fall within the general part of Article 110, and now there will be an open location. This rewording allows other panels to address the unique issues that may apply to this concept within their articles if required, and allows a default wording that will be accurate in the overwhelming majority of cases. As an example of specialized requirements which this wording would not disturb, 490.46 addresses some unique features of drawout mechanisms for medium voltage circuit breakers; because this wording slightly modifies the general requirement, the proposed wording in this comment takes care to not interfere.
Panel Meeting Action: Hold
Panel Statement: The panel is holding the comment in accordance with 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.
As pointed out in the submitter's substantiation, the revised requirement may have unintended consequences with "unique issues" that appear in other articles. The Code-Making Panels with the responsibility for those other articles have not had time to review this matter.
The panel is not holding Proposal 1-63 as it was rejected.
The panel requests that the Technical Correlating Committee appoint a Task Group to review this as a general requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-50 Log #2192 NEC-P01 **Final Action: Reject**
(100.Distribution Equipment (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-64
Recommendation: Accept revised as follows:
Electrical apparatus such as switchboards, motor control centers, control centers, switchers, circuit breakers, overcurrent devices, generators, transformers, and the like where a branch circuit(s), or feeder(s) originate.
Substantiation: The term should be defined. Conductor, raceways, cable, boxes, and fittings are equipment that "distributes" electrical power.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.
In addition, the substantiation fails to justify why the term must be defined.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-51 Log #1456 NEC-P01 **Final Action: Reject**
(100.Enclosed)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-69
Recommendation: Accept the proposal with the following revisions:
Surrounded by a case, housing, fence, or wall(s) designed and intended to protect equipment, to deter accidental contact by persons, animals, or objects, and prevent unauthorized access to equipment.
Substantiation: Enclosures may be designed and intended to prevent contact, but do not always do so as shown by electrocutions of persons and animals that climb or penetrate fences around high-voltage installations. Enclosures are also used to deter or prevent unauthorized access.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation for the proposed change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-52 Log #2193 NEC-P01 **Final Action: Reject**
(100.Enclosed)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-69
Recommendation: Accept revised as follows: A case, housing, fence, wall(s), screen, raceway, cable covering, or other means designed and intended to prevent accidental contact with energized parts.
Substantiation: An enclosure can be designed and intended to prevent accidental contact, but not necessarily actually prevent such contact, as evidenced by reports of electrocutions where persons have cut or climbed fences at high voltage installations or cut or drilled into raceways.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation for the proposed change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-53 Log #47 NEC-P01 **Final Action: Reject**
(100.Engineering Supervision (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 1-72
Recommendation: Accept the proposal.
Add new definition:
Engineering Supervision. The direct work by, or under the direct supervision of a qualified, licensed, professional engineer who is engaged primarily in the design or maintenance of electrical installations.
Substantiation: The term "Engineering Supervision" is used many places throughout the Code. Per the Style Manual the term should be included in Art. 100. Ref. Style Manual Section 2.2.2.1: "Article 100. In general, Article 100 shall contain definitions of terms that appear in two or more other articles of the NEC."
There are several reasons I propose the term "engineering supervision" to define that the person must be a qualified, licensed, professional engineer engaged primarily in electrical work.
1) There are some states that do not state "Electrical Engineer" on the P.E. stamp. I've seen cases in the field where engineering work was stamped by a P.E. yet after researching why the drawings were in error, it was discovered that the P.E. was actually a civil engineer.
2) There are professional electrical engineers that do primarily electronic circuit board design, for instance, that have no business designing a high voltage substation, if they're not experienced and qualified to do such.
3) Anybody, either qualified, licensed or not, can "engineer" something and supervise the installation, but that doesn't make it safe.
I believe that if the NEC tightens the definition on what "engineering supervision" means, it'll help the inspection community greatly and provide for better, safer installations.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 1-55.
Number Eligible to Vote: 12

Explanation of Negative:
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-55.

1-54 Log #1383 NEC-P01 **Final Action: Reject**
(100.Engineering Supervision (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-69a
Recommendation: Change original proposed text as follows:
Engineering Supervision: The technical oversight by an individual having practical skills for applying scientific principles and practices in the design, construction, maintenance, operation and performance of an installation, equipment, or system.
Informational Note: By law, many governmental jurisdictions require individuals to be licensed to practice engineering.
Substantiation: Edison Electric Institute commends the panel for addressing this definition of the term "engineering supervision". We believe it is needed and we recommend the proposed text contained in Mr. LaBrake's negative ballot statement as a recommended result of the panel discussion. This definition is necessary as it recognizes the need for the term "engineering supervision" to be defined for consistent and uniform application of its meaning used throughout the NEC in such articles as 240, 250, 310, 500, 501, 505, 625, and 708.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 1-55.
Number Eligible to Vote: 12

Explanation of Negative:
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-55.

1-55 Log #2864 NEC-P01 **Final Action: Reject**
(100. Engineering Supervision)

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council
Comment on Proposal No: 1-71
Recommendation: The panel action should have been Accept in Principle with "Engineering Supervision" defined as "Technical oversight by one thoroughly familiar with ~~scientific~~ engineering principles and practices in the design, construction, maintenance, operation and performance of an installation, equipment, or system."
Substantiation: I agree with Mr. Floyd's affirmative ballot comment that the term "engineering principles" is more appropriate and more restrictive than "scientific principles".
Panel Meeting Action: Reject
Panel Statement: "Engineering Supervision" is highly situational. All proposals relating to the A2010 NEC "Engineering Supervision", including Proposal 1-71 have one thing in common, none has substantiated that people or property would be "more safe" if "Engineering Supervision" were defined than if it were left undefined.
The term "Engineering Supervision" is more appropriately defined by applicable jurisdictions.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LABRAKE, JR., N.: One of the desires of the electrical community is the consistent application of any requirements such as the NEC. The Panel statement that a term such as "Engineering Supervision" is "more appropriately defined by [multiple] applicable jurisdictions" is a direct contradiction of the need for consistency. The fact that some form of the term is used in several locations in the NEC (e.g. 225.32, Exception #1, 230.72(C), Exception, Article 240, Part VIII) indicates that there is a need for a common term and a common definition in Article 100 and avoid conflicts within the Code.
Comment on Affirmative:
BARRIOS, L.: During the past two code cycles, individual panels and multi-panel task groups have struggled with establishing a definition for "Engineering Supervision" that is acceptable for the NEC as a whole. CMP1's panel statement that the term "is more appropriately defined by applicable jurisdictions" is an important statement which may explain why the panels have failed to establish a single applicable definition.

1-56 Log #2860 NEC-P01 **Final Action: Accept**
(100. Equipment)

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council
Comment on Proposal No: 1-73
Recommendation: The panel action should have been to Accept in Part, accepting the deletion of the word "material" and not accepting the remainder of the proposal.
Substantiation: The term "material" is too vague and should not be considered as "equipment". For example, pulling compound used to simplify pulling conductors and cable through a conduit could be referred to as material used in the electrical installation, but I'm not sure the compound could be referred to as "equipment".
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We are concerned with the implications associated with the removal of the word "material" from the definition in that its removal is too broad and far reaching.

17-1 Log #51 NEC-P17 **Final Action: Accept**
(100.Equipotential Plane (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 5-8
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel's 17 and 19 for action to decide whether or not the definition should stay in the individual articles or be moved to Article 100.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP 17 accepts the direction of the TCC to act on Proposal 5-8, and the panel rejects the proposal.
A characterizing definition identifies cause and effect (objective). The proposed definition addresses the cause ("difference in voltage") but the effect (safety objective), missing in the definition, differs from Article to Article. Equipotential bonding in Articles 680 and 682 is concerned about the LETHALITY of drowning due to loss of muscle control and of shock due to stray earth currents. Equipotential bonding in Article 547 is concerned about PRODUCTIVITY LOSSES in dairy operations and animal husbandry. Equipotential bonding in Articles 501 and 505 (overlooked by the TCC Comment but also contains equipotential bonding reference) is concerned about IGNITION and EXPLOSION of combustibles. These differences in objectives for equipotential bonding render a common definition in Article 100 for "Equipotential plane" as inadequate and as misleading generalization.
"Equipotential plane" is used in Article 682. "Equipotential bonding" rather than "Equipotential plane" is the term used throughout Article 680. A PLANE is defined as a TWO-dimensional (i.e., flat) surface consisting of a point and two vectors lying on the surface. Unlike floors in agricultural buildings, pool surfaces (shells, walls, decks, etc.) are seldom flat and are frequently highly contoured shapes (3-dimensional) other than planes.
Required equipotential bonding in Articles 680 and 682 is not limited to CONCRETE surfaces or even to paved surfaces.
Equipotential bonding MITIGATES voltage gradients rather "PREVENTS a difference in voltage" in absolute terms.
The mitigation of voltage gradients is not limited to WITHIN THE PLANE but also benefits ADJACENT TO (above, aside of, below). If this were not the situation, then the stepping or touch surfaces above (not "WITHIN the plane") the buried or embedded equipotential bonding method would not provide safety benefits.
When the equipotential bonding method is a loop or ring of copper conductor, "within the plane" is confusing and ambiguous at best. The same is true relative to metal fittings [680.26(B)(5)] located outside of the plane and to pool water [680.26(C)].

(100.Exclusive Control)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-79
Recommendation: Continue to reject this proposal.
Substantiation: In the case of communications utilities, the facility under "exclusive control" and "restricted access" may not necessarily be owned by the communications utility. It is typically an area of a building (e.g., closet), capable of being locked, that is set aside for communications equipment and accessible only by authorized and qualified communications personnel. The term "service point" is inappropriate in the context of communications.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-58 Log #1384 NEC-P01 **Final Action: Reject**
(100.Exclusive Control (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-79
Recommendation: Edison Electric Institute recommends Proposal 1-79 be accepted and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include it as a new Informational Annex to describe general information regarding utility electric supply to premises wiring.
Substantiation: Refer to the Informational Annex provided with companion comment submitted on Proposal 1-12 that would contain this proposal's recommendation along with companion comments on Proposals 1-53, 1-101, 1-104, and 1-106.
Panel Meeting Action: Reject
Panel Statement: Since the panel has rejected the inclusion of the Informational Annex, the addition of a definition is a moot point.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

14-1 Log #2194 NEC-P14 **Final Action: Reject**
(100.Explosionproof Apparatus (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 14-5
Recommendation: Accept the proposal with the following revisions:
A listed enclosure or fitting designed and intended to withstand an explosion of a specified gas or vapor that occurs within it and prevents the ignition of a gas or vapor outside the enclosure or fitting.
Substantiation: Apparatus is defined as equipment. The proposal used the word being defined, in the definition. (See panel statement for Proposal 1-75, Article 100, Equipment. Most (or all explosionproof equipment is required to be listed. For most equipment (other than some conduits and couplings) the AHJ should not be responsible to determine if equipment is explosionproof. Rigid metal conduit couplings, conduit unions, conduit bodies, boxes, are enclosures but not "cases". Listed apparatus for specified gas or vapor will be evaluated for ignition of surrounding atmosphere. "May" is the term reserved for discretionary use by the AHJ per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: Section 4.4.5 of the Regulations Governing Committee Projects requires that comments submitted on a Report on Proposals (ROP) must "include the proposed text of the comment, including the wording to be added, revised (and how revised) or deleted". The submitter has failed to indicate what is revised, how it is revised, and what is deleted. The Panel notes that the standard form for submitting proposals and comments recommends the use of underlines and strikethroughs (legislative text) as a method of indicating recommended changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

1-59 Log #1457 NEC-P01 **Final Action: Reject**
(100.Externally Operable)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-82
Recommendation: Accept the proposal with the following revisions:
Having integral permanent provisions for being manually operated without exposing the operator to contact with live parts.
Substantiation: Many definitions have requirements (necessarily), but they are not requirements in the sense that they are NEC "rules".
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-60 Log #2479 NEC-P01 **Final Action: Accept**
(100.Field Installed (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-83
Recommendation: Continue to reject the proposal.
Substantiation: This proposal, presumably unknowingly, invades the scope of electrical qualifications and therefore local electrical licensing and/or registration issues. One dramatic example is what is encompassed in the new Article 606, now accepted (subject, of course, to actions following public comments) for the 2011 code cycle. Is wiring accomplished at a remote location and still under the control of a manufacturer, field assembled within the meaning of the language submitted as part of this proposal? It will be subject to listing, apparently. This is a very difficult question, and one better left to local licensing authorities. The NEC should, to the extent possible, stay out of this thicket for the foreseeable future.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BOYCE, K.: Addition of the proposed definition would promote usability of the Code.
HICKMAN, P.: See our explanation of negative on Comment 1-61.

1-61 Log #2457 NEC-P01 **Final Action: Reject**
(100.Field Installed (Field Installation) (New))

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Comment on Proposal No: 1-83
Recommendation: Accept the proposal.
Substantiation: In addition to the substantiation submitted by Mr. Mello, it is important to note that NFPA has undertaken a project to create standards for field evaluations. The technical committee has been established and the draft documents are being developed. The standards to be developed are NFPA 790, Standard for Competency of Third Party Field Evaluation Bodies, and NFPA 791, Recommended Practice and Procedures for Unlabeled Electrical Equipment Evaluation. The technical committee responsible for these standards will report to the NEC Technical Correlating Committee. The proposed definition is taken from the draft standards. Ultimately, the NEC will need to recognize the existence of these standards since it uses the terms Field Installed and Field Installation and coordination of definitions between the documents will be necessary.
Panel Meeting Action: Reject
Panel Statement: The submitter has based the substantiation on two proposed NFPA standards (790 and 791) that have not yet been approved. The fact that the NFPA has undertaken a project to create standards for field evaluations does not necessitate the need for this definition.
The panel reiterates that the proposed definition could have unintended consequences as the term is used in several articles throughout the code and not always intended to mean "assembled and installed" at the final utilization site as proposed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BOYCE, K.: See my Explanation of Negative on Comment 1-60.
HICKMAN, P.: We continue to support the recommendation in Proposal 1-83 and agree that he addition of this definition would enhance the clarity and usability and provide practical information related to the use of the terms throughout the Code.

5-6 Log #2260 NEC-P05 **Final Action: Reject**
(100.Ground Fault (New))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 5-10
Recommendation: Revise as follows:
Ground Fault. An unintentional, electrically conducting connection between ~~an ungrounded~~ any conductor of an electrical circuit and ~~the~~ any normally non-current carrying ~~conductors~~, metallic enclosures, metallic raceways, metallic equipment, or earth. conductor, such as: metallic electrical system components, metallic piping, metallic structural elements, bodies of water, and earth. The fault mayor may not electrically connect to the source.
Substantiation: An unintentional connection from a grounded circuit conductor to any alternate pathway which may connect back to the source's grounded connection is also a Ground Fault for NEC uses. The fault is a connection which can present hazardous conditions through actual conduction, or through presenting touch potential (pools, etc). Even a neutral ground fault may result in a hazard, and possibly the tripping of a GFCI, or even a GFP. It seems to me that movement to Article 100 requires a more inclusive definition.
Panel Meeting Action: Reject
Panel Statement: The definition of "Ground Fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
MOHLA, D.: The Comment has merit but the wording needs revision. A ground fault should include a fault from a grounded conductor (whether neutral or not) and any non current carrying grounded material.

2-8 Log #1033 NEC-P02 **Final Action: Reject**
(100.Ground-Fault Circuit Interrupter (GFCI))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 2-18
Recommendation: The Proposal should be Accepted in Principle in Part.
Renumber the existing Informational Note (formerly FPN) as Informational Note No. 1.
Add: "Informational Note No. 2: This device will not provide personnel protection from electrocution resulting from line-to-line contact since the nature of line-to-line loads cannot be distinguished."
Continue to Reject the remainder of the Proposal.
Substantiation: Addition of Informational Note No. 2 provides valuable safety information.
The Panel is correct regarding the hyphenation and the retention of the existing FPN.
Panel Meeting Action: Reject
Panel Statement: The addition of the FPN is not necessary for the NEC, and the function of the GFCI is well understood in the context of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-9 Log #53 NEC-P02 **Final Action: Accept**
(100.Ground-Fault Circuit Interrupter (GFCI), Portable (as applied to grund-fault circuit interrupters) (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 3-4
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 2 for action.
This action will be considered by Code-Making Panel 2 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Technical Correlating Committee.
After consideration, the panel rejects the proposal as the addition of the definition is unnecessary.
Portable GFCIs are a subset of a specific type of GFCI and do not need to be defined separately. The product standards have the appropriate requirements to describe the functionality.
The submitter's concern about the use of other devices for portable applications would be better addressed by requiring a listed portable GFCI.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
KING, D.: While I agree that the product standards have the requirements to describe the functionality of portable GFCI devices, there are requirements in the NEC for "portable" GFCI protection without clarifying to the installer and the AHJ what is required above and beyond conventional GFCI protection for hard wiring. GFCI protection that the user assumes is present is in fact unavailable. As noted in the panel statement, I encourage the submitter to continue to attempt to bring clarity to this issue by suggesting a requirement for a listed portable device in those areas that require portable GFCI.

5-7 Log #520 NEC-P05 **Final Action: Reject**
(100.Grounding Conductor)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 5-13
Recommendation: Reject this Proposal.
Substantiation: The term "grounding electrode conductor" (GEC) has historically and traditionally both distinguished and identified the specific conductor that connects the grounded conductor (neutral) and equipment grounding conductor from within the power service equipment to the grounding electrode/grounding electrode system at the premises. This distinction must remain in place to identify the unique purpose of the GEC and to avoid confusion and misapplication of the numerous grounding requirements throughout the NEC.
There are very specific requirements for the material (250.62), installation, sizing and accessibility (250.64) of the GEC that are not specific to other 'grounding conductors'. It is often the access and connection point for other systems/equipment required to be grounded to the premises grounding electrode/grounding electrode system, and has the physical and electrical attributes for this function. Connection of other systems/equipment to a conductor designated as a GEC but not meeting the criteria of 250.62 and 250.64 may result is an unsafe installation.
The term "Grounding Conductor" is used over 120 times in Articles 770, 800, 810, 820 830, and proposed new Article 840. The term "Grounding Conductor" has proven a useful and well understood term within the optical fiber and communications articles and the definition should be retained in Article 100.
Neither a technical rational nor electrical safety issue has been presented to substantiate the proposed change. Without such substantiation the proposed revision becomes editorial, does not enhance NEC usability and cannot be justified.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action taken at the ROP meeting to delete the term grounding conductor. The panel understands the proposed actions of Panel 16 at the ROC meeting have addressed the concerns about the technical accuracy of terms and the issue of consistency across the code by revising language in Article 770 and Chapter 8 and adding explanatory information.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
BOWMER, T.: Affirmative Comment ---- This affirmative ballot for the Panel action on Comment 5-7 assumes that the coordinating changes under Panel 16 proposed actions on ~70 other Comments are all accepted. In particular, it is critical that the proposed Panel 16 action on 16-84a for addition of an informational note be accepted along with affirmative votes be achieved to Panel 16 proposed actions on comments 16-22, -32, -125, -135, -190, -194, -197, -220, -224, -230, -277, -282, -290, -293 and -334. If these other actions are not successful then the deletion of the definition of "grounding conductor" will cause confusion and inconsistency within the code and for users.

5-8 Log #521 NEC-P05 **Final Action: Reject**
(100.Grounding Conductor)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 5-15
Recommendation: Reject this Proposal.
Substantiation: The term "grounding electrode conductor" (GEC) has historically and traditionally both distinguished and identified the specific conductor that connects the grounded conductor (neutral) and equipment grounding conductor from within the power service equipment to the grounding electrode/grounding electrode system at the premises. This distinction must remain in place to identify the unique purpose of the GEC and to avoid confusion and misapplication of the numerous grounding requirements throughout the NEC.
There are very specific requirements for the material (250.62), installation, sizing and accessibility (250.64) of the GEC that are not specific to other 'grounding conductors'. It is often the access and connection point for other systems/equipment required to be grounded to the premises grounding electrode/grounding electrode system, and has the physical and electrical attributes for this function. Connection of other systems/equipment to a conductor designated as a GEC but not meeting the criteria of 250.62 and 250.64 may result is an unsafe installation.
The term "Grounding Conductor" is used over 120 times in Articles 770, 800, 810, 820 830, and proposed new Article 840. The term "Grounding Conductor" has proven a useful and well understood term within the optical fiber and communications articles and the definition should be retained in Article 100.
Neither a technical rational nor electrical safety issue has been presented to substantiate the proposed change. Without such substantiation the proposed revision becomes editorial, does not enhance NEC usability and cannot be justified.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-7.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-9 Log #1819 NEC-P05 **Final Action: Accept**
(100.Grounding Conductor)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 5-13
Recommendation: Continue to accept this proposal.
Substantiation: Continue to accept the deletion of the defined term "grounding conductor." Two definition and terms for the same component of the grounding and bonding system are unnecessary and lead to inconsistency. CMP-5 has responsibility for words and terms related to grounding and bonding as determined in the 2008 NEC cycle. Such words include bonding, grounding, and intersystem bonding termination, which are defined in Article 100 and used in Chapter 8. The term grounding conductor used in Chapter 8 should be revised to "grounding electrode conductor" as recommended in coordinated proposals. The revised definition of the term grounding electrode conductor (resulting from accepted Proposal 5-18) provides additional justification for changing the term "grounding conductor" to "grounding electrode conductor" where it is used throughout the Chapter 8 Articles. This comment is part of a broad effort to improve consistency in the use of defined terms related to grounding and bonding throughout the Code. Coordinated proposals have been provided to adjust rules within Chapter 8 and Article 770 where the term is used.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-10 Log #1885 NEC-P05 **Final Action: Accept**
(100.Grounding Conductor)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-13
Recommendation: Continue to delete the definition of "Grounding Conductor" in Article 100.
Substantiation: The CMP-5 and CMP-16 Task Groups have prepared comments for the individual sections of Articles 770, 800, 810, 820, 830, and 840, where the term "grounding conductor" is used in the 2008 NEC or 2011 ROP Draft and concludes the definition of "Grounding Conductor" should be deleted in Article 100.

Those from CMP-5 who voted in favor of this comment were Paul Dobrowsky, Phil Simmons, and Dave Williams. Those representing CMP-16 on the Task Group who voted against the comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-11 Log #1887 NEC-P05 **Final Action: Accept**
(100.Grounding Conductor)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-14
Recommendation: Continue to reject the Proposal.
Substantiation: The recommendation for expanding the application of the term "Grounding Conductor" is not appropriate as the term was deleted by CMP-5 by its action on Proposal 5-13. CMP-5 also expanded the definition of Grounding Electrode Conductor to include installations made in accordance with Articles 770, 800, 810, 820, 830 and 840.

The CMP-5 and CMP-16 Task Group has prepared Comments for the individual Sections of Article 770, 800, 810, 820, 830 and 840 where the term "grounding conductor" is used in the 2008 NEC or 2011 ROP Draft and concludes the definition of Grounding Conductor should be deleted in Article 100 Articles.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-13 Log #2090 NEC-P05 **Final Action: Accept**
(100.Grounding Conductor)

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 5-13
Recommendation: Continue to Accept this proposal.
Substantiation: The term Grounding Conductor has been misapplied mostly in the Chapter 7 and Chapter 8 articles. Proposals have been submitted to CMP-16 to correct the misapplied term Grounding Conductor that presently exists. CMP-5 task groups have worked to change the instances in the code when the term grounding conductor were improperly used. The change will make the document and the many terms involving grounding easier to understand for the user.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-14 Log #519 NEC-P05 **Final Action: Accept**
(100.Grounding Electrode Conductor)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 5-18
Recommendation: Reject this proposal.
Substantiation: The panel action fails to accommodate all communications hardware that may be encountered and fails to accommodate the listing requirements associated with the communications grounding conductor. Neither a technical rational nor electrical safety issue has been presented to substantiate the proposed change. NEC usability is not enhanced. See my comment to Proposal 5-13.
Panel Meeting Action: Accept
Panel Statement: See panel statement on Comment 5-16. The panel does not necessarily agree with all the substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

BOWMER, T.: Affirmative Comment - -- This affirmative ballot for the proposed actions on Comments 5-14 returns the definition of "grounding electrode conductor" to the 2008 NEC code language. The return to 2008 language is appropriate as long as the coordinating changes under Panel 5 actions on comments 5-15, 5-16, 5-17, and 5-18 as well as the Panel 16 proposed actions on other Comments are all accepted. In particular, it is critical that the proposed Panel 16 action on 16-84a for addition of an informational note be accepted to help avoid inconsistency within the code and confusion for users.

5-15 Log #1820 NEC-P05 **Final Action: Reject**
(100.Grounding Electrode Conductor)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 5-18
Recommendation: Continue to accept the proposal.
Substantiation: The revisions to the term "grounding electrode conductor" clarify its use in connecting equipment and systems covered in Chapter 8 to a grounding electrode. The term grounding conductor used in Chapter 8 should be revised to "grounding electrode conductor" as recommended in coordinated proposals. The revised definition of the term grounding electrode conductor (resulting from accepted Proposal 5-18) provides justification for changing

the term "grounding conductor" to "grounding electrode conductor" where it is used throughout the Chapter 8 Articles and Article 770. Rules should mean what they imply based on the defined terms in those requirements. This comment is part of a broad effort to improve consistency in the use of defined terms related to grounding and bonding throughout the Code. Coordinated comments have been provided to adjust rules within Chapter 8 where the term is used.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-16.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-16 Log #1889 NEC-P05 **Final Action: Reject**
(100.Grounding Electrode Conductor)

TCC Action: The Technical Correlating Committee understands that the term "Grounding Electrode Conductor" is to remain as defined in the 2008 NEC.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-18
Recommendation: Revise text to read as follows:
Grounding Electrode Conductor (GEC). A conductor used to connect the system grounded conductor, equipment, optical fiber cables and raceways, communications system protectors, antenna discharge units, communications cables, or network interface units to a grounding electrode or to a point on the grounding electrode system.
Substantiation: It is recommended that "optical fiber cables and raceways" be added to the list of applications for "grounding electrode conductor" as these provisions are included in Article 770. We are not recommending adding new Article 840 to the definition as a reference is made in 840.100 to 770.100, 800.100 and 820.100 for grounding methods.

The CMP-5 and CMP-16 Task Group has prepared Comments for the individual Sections of Article 770, 800, 810, 820, 830 and 840 where the term "grounding conductor" is used in the 2008 NEC or 2011 ROP Draft and concludes the definition of Grounding Conductor should be deleted in Article 100 Articles.

Those from CMP-5 who voted in favor of this Comment were Paul Dobrowsky, Phil Simmons and Dave Williams. Those representing CMP-16 on the Task Group who voted against the Comment were Jim Brunssen, Randy Ivans and Steve Johnson. Since this Comment did not pass ballot of the Task Group, it is endorsed by only the CMP-5 members of the Task Group.
Panel Meeting Action: Reject
Panel Statement: The term as presently defined in 2008 NEC covers a conductor from any system grounded conductor or any equipment, including all types of communications equipment, to the grounding electrode or a point on the grounding electrode system.

The panel understands the proposed actions of Panel 16 at the ROC meeting have addressed the concerns about the technical accuracy of terms and the issue of consistency across the code by revising language in Article 770 and Chapter 8 and adding explanatory information.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

BOWMER, T.: Affirmative Comment - --- This affirmative ballot for the proposed action on Comments 5-16 along with Panel 5 action on Comment 5-14 returns the definition of "grounding electrode conductor" to the 2008 NEC code language. The return to 2008 language is appropriate as long as the coordinating changes under Panel 5 actions on comments 5-14, 5-15, 5-17, and 5-18 as well as the Panel 16 proposed actions on other Comments are all accepted. In particular, it is critical that the proposed Panel 16 action on 16-84a for addition of an informational note be accepted to help avoid inconsistency within the code and confusion for users.

5-17 Log #2404 NEC-P05 **Final Action: Reject**
(100.Grounding Electrode Conductor)

Submitter: Marcus R. Sampson, Lysistrata Electric
Comment on Proposal No: 5-18
Recommendation: Revise text to read as follows:

Grounding Electrode Conductor (GEC). A conductor used to connect the system grounded conductor, equipment, communications system protectors, antenna discharge units, grounding blocks, communications cables, or network interface units to a grounding electrode or to a point on the grounding electrode system.
Substantiation: "Antenna discharge unit" is defined in ANSI/UL 452 and consists of a gap, a fixed resistance or other discharge element, or a combination of such features, connected between each antenna lead-in terminal and a grounding terminal. While these devices may still be commercially available, they are no longer used in the antenna industry – they use a simple "ground block" (which technically is not an antenna discharge unit) and which is connected to the grounding electrode system, via a GEC.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-16.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

1-62 Log #1454 NEC-P01 **Final Action: Reject**
(100.Guarded)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-88
Recommendation: Accept the proposal with the following revisions:

Covered, fenced, enclosed, or otherwise protected by means of rails, screens, posts, or other approved means, or located on platforms or heights to minimize the likelihood of accidental contact by persons and objects.
Substantiation: Panel agrees guarding does not remove possibility of contact to zero. Present wording removes the likelihood of close approach by qualified and authorized persons for the purpose of adjustment, inspection, and servicing of guarded equipment.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient technical substantiation for the change according to the panel's action and statement on Proposal 1-88.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-63 Log #1453 NEC-P01 **Final Action: Reject**
(100.Identified (as applied to equipment))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-90
Recommendation: Accept the proposal.
Substantiation: Equipment may be suitable for more than one purpose, function, or use. Application and environment should be covered in provisions that are not NEC requirements, per se.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects. In addition, the panel reaffirms its position as stated in the panel statement of Proposal 1-90.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-64 Log #1579 NEC-P01 **Final Action: Accept**
(100.Interrupting Capacity (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 1-93
Recommendation: Continue to reject this proposal.
Substantiation: The action to reject this proposal was correct, but let me suggest two additional reasons for doing so.

First, the words "interrupting capacity" were changed to "interrupting rating" in 110.9 in the 1978 NEC, recognizing that this is the correct terminology. Attempts were made in the 1993 and 1996 cycles to introduce a difference between "interrupting rating" and "interrupting capacity" in Article 240. Both attempts failed, with CMP10 stating, "The equipment is marked for its usage with its interrupting rating, as defined and required in the Code. Ratings, as marked, are developed by recognized testing requirements."

Second, no overcurrent protective device (OCPD), with the exception of those that have no "instantaneous" trip function, has the "capacity" to interrupt currents at the level of its interrupting rating. This is especially true of current limiting fuses. In order to test to see if an OCPD has an interrupting "capacity" equal to its interrupting "rating," the device would have to remain closed until the test current reached its peak, then the circuit breaker contacts would have to open or the fuse link melt. But of course this is not how OCPDs work, with the exception of those circuit breakers that have a short time withstand rating equal to their interrupting rating. In other words, a fuse with a 200kA interrupting "rating" never actually interrupts 200kA, particularly if it is current limiting. An examination of the peak current let-through curves for OCPDs makes this obvious. What the interrupting rating of an OCPD actually means is that the device has the capacity to interrupt a "prospective" fault current equal to its interrupting rating, but with the previously stated exception, the actual peak current interrupted will be less, and in most cases, far less.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-18 Log #54 NEC-P05 **Final Action: Accept**
(100.Intersystem Bonding Termination)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 5-21
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the submitter's proposed text that did not intend to delete "bonding" from the definition.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Comment 5-19.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-19 Log #522 NEC-P05 **Final Action: Accept in Principle**
(100.Intersystem Bonding Termination)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 5-21
Recommendation: Revise CMP 5's proposed text to read: "**Intersystem Bonding Termination.** A device that provides a means for connecting communications systems intersystem bonding conductors to the power grounding electrode system."
Substantiation: In revising the submitter's original text, CMP 5 has lost the concept of the bonding of communications systems to power to equalize potentials in the event of lightning or power fault events to one or both systems. Without the bond, it is possible for a difference in potential to exist between the two systems during such events, posing a potential shock hazard.
Panel Meeting Action: Accept in Principle
Revise definition to read as follows:
Intersystem Bonding Termination. A device that provides a means for connecting bonding conductors for communications systems to the grounding electrode system.
Panel Statement: The panel accepts the recommendation in principle but makes editorial revisions. The addition of the word "power" is not accepted as the term "power grounding electrode systems" is not included in any Articles under CMP 5's jurisdiction.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

2-10 Log #1569 NEC-P02 **Final Action: Reject**
(100.Kitchen)

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector / Rep. International Association of Electrical Inspectors
Comment on Proposal No: 2-22
Recommendation: Kitchens. An area with a sink and permanent facilities for food preparation and/or cooking.
Substantiation: Understanding the Committee reasoning for rejecting the proposal, the intention was to differentiate the relation between food preparation and cooking. The food preparation or cooking areas will not comply with the requirements of 210.8(B)(2), due to the fact that these areas are for either "food preparation" or "cooking", not both, as intended by the NEC. Examples of these locations include, food packing facilities, industrial cooking facilities (without food preparation), etc.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates the panel statement in Proposal 2-22 that the definition is intended to have "both" food preparation and cooking. The panel does not intend to include the areas noted in the submitter's substantiation unless they include both cooking and food preparation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: What would constitute "food preparation"? A commercial "food packing facilities" could include facilities where no food preparation (cooking) takes place. These types of situations include areas where pre-packaged food items are packed into smaller packages for grocery stores sales.

2-11 Log #1570 NEC-P02 **Final Action: Reject**
(100.Kitchen)

Submitter: Lorenzo Adam, City of Mason/Building-Electrical Inspector / Rep. International Association of Electrical Inspectors
Comment on Proposal No: 2-22
Recommendation: Kitchens. An area with a sink and permanent facilities for food preparation and/or cooking. Food preparation or cooking areas include, but are not limited to, food packing facilities, industrial cooking establishments, or similar areas.
Substantiation: Understanding the Committee reasoning for rejecting the proposal, the intention was to differentiate the relation between food preparation and cooking. The food preparation or cooking areas will not comply with the requirements of 210.8(B)(2), due to the fact that these areas are for either "food preparation" or "cooking", not both, as intended by theNEC. Examples of these locations include, food packing facilities, industrial cooking facilities (without food preparation), etc.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: A commercial "food packing facilities" could include facilities where no food preparation (cooking) takes place. These types of situations include areas where pre-packaged food items are packed into smaller packages for grocery stores sales.

1-65 Log #1459 NEC-P01 **Final Action: Reject**
(100.Lighting Outlet)

TCC Action: The Technical Correlating Committee directs that this definition be reassigned to Code-Making Panel 18.
Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-94
Recommendation: Accept the proposal.
Substantiation: The connection permitted by 410.62(C)(1), (2), and (3) (attachment plug) is not a direct connection to a lighting outlet. Many receptacle outlets in dwellings are considered outlets for general lighting (no "direct" connection).
Panel Meeting Action: Reject
Panel Statement: Receptacle outlets in dwellings used for general lighting are not lighting outlets, but are receptacle outlets that are permitted in lieu of lighting outlets in accordance with 210.70(A)(1), Exception No. 1. 410.62(C) (1), (2), and (3) do not state that the receptacle to which the electric-discharge fixture is connected by cord and plug is a "lighting outlet". This outlet is a switched receptacle outlet.
An outlet becomes a lighting outlet when a luminaire is directly wired to the branch circuit at the outlet, i.e., not connected to the branch circuit through a plug/receptacle connection.
The panel requests that the Technical Correlation Committee consider reassigning this definition to the Code-Making Panel with more direct responsibility for this definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-66 Log #2195 NEC-P01 **Final Action: Reject**
(100.Likely (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-95
Recommendation: Accept the proposal.
Substantiation: "Likely" is a term used over 80 times in the NEC. Without a definition, it is open to various subjective interpretations.
Panel Meeting Action: Reject
Panel Statement: The NEC does not define commonly used terms.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-2 Log #2304 NEC-P08 **Final Action: Reject**
(100.Multioutlet Assembly)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 8-208
Recommendation: Please move all wiring method definitions from their respective 3.xx.2 sections to Article 100.
Substantiation: If the definition of Multioutlet Assembly remains in Article 100, then all 3.xx.2 definitions should be in Article 100. Perhaps the panel can "hold" this comment for next cycle and also forward to CMP-7? Of course, a simpler solution would be to accept ROP 18-7.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 8-92. A Multioutlet Assembly is a unique wiring method that serves code applications other than the raceway function. The inclusion of "Multioutlet Assembly" in Article 100 is appropriate. See 2.2.2.1 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

5-20 Log #1018 NEC-P05 **Final Action: Reject**
(100.Neutral Conductor)

Submitter: John Stuckwisch, Barth Electric / Rep. IEJATC Local 481
Comment on Proposal No: 5-23
Recommendation: Neutral Conductor. The conductor connected to the neutral point of the system that is intended to carry <u>*unbalanced*</u> current under normal conditions.
(The word *unbalanced* is added to the definition).
- Or -
Neutral Conductor. The conductor connected to and intended to carry current <u>*away*</u> from the neutral point of the system under normal conditions.
(Rearranged current wording to accommodate the word *away*).
Substantiation: The problem with the current definition of a Neutral Conductor is that it does not differentiate between a Grounded and a Neutral conductor. If someone said: "The grounded conductor is the conductor connected to the neutral point of a system that is intended to carry current under normal conditions." This statement is most certainly true, because a grounded conductor can carry current to the neutral point under normal conditions, it can be connected to the neutral point as well. It is also the 2008 NEC definition of a Neutral Conductor. Because the neutral conductor is a grounded conductor the definition of a neutral conductor needs to further define what makes a neutral conductor unique. The words "unbalanced current" or "unbalanced load" found in 310.15(B)(4)(a) and in 220.61 define the difference between a grounded and neutral conductor. A grounded conductor cannot carry unbalanced current, it either carries all the current or none. Only a Neutral Conductor can carry and unbalanced current under normal conditions. This is why the word "unbalanced" should be added to this definition. The other possible fix is to state that the neutral conductor is the conductor that carries current **away** from the neutral point. This change would also clarify the difference between the neutral and grounded conductor.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The addition of the term "unbalanced" is only correct in parts of the application such as a home run in a multiwire circuit. In other parts, the neutral conductor as defined carries the full circuit current. The neutral current neither flows to or away from the neutral point. A/C current flows alternately in the circuit based on the frequency.
The substantiation regarding differentiating the grounded conductor from the neutral conductor is incorrect. The neutral conductor is generally a "grounded conductor" but "grounded conductors" exist in systems that do not have a "neutral".
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

1-67 Log #2480 NEC-P01 **Final Action: Accept**
(100.Nonlinear Load)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-99
Recommendation: The proposal should be rejected.
Substantiation: In today's electrical environment, the majority of loads are nonlinear to a greater or lesser degree, and any attempt to maintain a list will result in ever increasing confusion as users draw improper inferences from what will inevitably be omitted from such a list. The comment in the voting is correct.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOYCE, K.: The action taken in the ROP Phase was appropriate. Addition of the proposed text would promote usability of the Code.

1-68 Log #2861 NEC-P01 **Final Action: Accept**
(100. Nonlinear Load)

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council
Comment on Proposal No: 1-99
Recommendation: The panel action should have been to Reject the proposal.
Substantiation: Adding additional lighting examples are not necessary to improve the understanding of the term "nonlinear loads". The present FPN includes "electronic equipment, electronic/electric-discharge lighting, adjustable-speed drive systems, and similar equipment" as examples of non-linear loads. The panel action on this proposal establishes a precedence that the development of any new type of lighting or other non-linear load in the future needs to be added to this list. Panel 1 tends to do a good job rejecting the addition of lists when they do not add additional clarity to the Code. The panel's action on this proposal is an exception.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BOYCE, K.: See my Explanation of Negative on Comment 1-67.

10-1 Log #1324 NEC-P10 **Final Action: Hold**
(100.Overcurrent Protective Device, Branch Circuit)

Submitter: Glossary of Terms Technical Advisory Committee / Marcelo Hirschler,
Comment on Proposal No: 10-2a
Recommendation: Overcurrent Protective Device, Branch-Circuit. A device capable of providing protection for service, feeder, and branch circuits and equipment over the full range of overcurrents between its rated current and its interrupting rating. ~~Branch-circuit overcurrent protective devices are provided with interrupting ratings appropriate for the intended use but no less than 5,000 amperes.~~
<u>FPN: Branch-circuit overcurrent protective devices are provided with interrupting ratings appropriate for the intended use but no less than 5,000 amperes.</u>
Substantiation: The NFPA Technical Advisory Committee on Glossary of Terminology (GOT) was formed by Standards Council to ensure consistency in definitions within the NFPA system.
The Manual of Style requires that definitions be in single sentences and that they not contain requirements. The second sentence of this definition is further clarification or discussion but should not be part of the definition. Moreover it contains a requirement which should not be included in the definition.
CMP 10 might consider revising the definition to make it into a single sentence while eliminating requirements.
It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Hold
Panel Statement: The proposed revision was not suggested or addressed in the proposal stage. In accordance with the RGCP 4.4.6.2.2, this comment is held for process in the next cycle where it will receive the necessary public review.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-2 Log #1325 NEC-P10 **Final Action: Hold**
(100.Overcurrent Protective Device, Supplementary)

Submitter: Glossary of Terms Technical Advisory Committee / Marcelo Hirschler,
Comment on Proposal No: 10-6
Recommendation: Overcurrent Protective Device, Supplementary. A device intended to provide limited overcurrent protection for specific applications and utilization equipment such as luminaires and appliances. ~~This limited protection is in addition to the protection provided in the required branch circuit by the branch circuit overcurrent protective device.~~
<u>FPN: This limited protection is in addition to the protection provided in the required branch circuit by the branch circuit overcurrent protective device.</u>
Substantiation: The NFPA Technical Advisory Committee on Glossary of Terminology (GOT) was formed by Standards Council to ensure consistency in definitions within the NFPA system.
The Manual of Style requires that definitions be in single sentences and that they not contain requirements. The second sentence of this definition is further clarification or discussion but should not be part of the definition. Moreover it contains a requirement which should not be included in the definition.

CMP 10 might consider revising the definition to make it into a single sentence while eliminating requirements. An example follows:

Overcurrent Protective Device, Supplementary. A device intended to provide limited overcurrent protection, beyond that provided by the branch circuit overcurrent protection device, for specific applications and utilization equipment such as luminaires and appliances.

—It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Hold

Panel Statement: The proposed revision was not suggested or addressed in the proposal stage. In accordance with the RGCP 4.4.6.2.2, this comment is held for process in the next cycle where it will receive the necessary public review.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-69 Log #1455 NEC-P01 **Final Action: Reject**

(100.Physical Damage (New))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 1-100

Recommendation: Accept the proposal.

Substantiation: Physical damage is an often used term in the NEC but has no defining criteria to establish what constitutes physical damage to allow uniform conclusions, and allows for widely different interpretations. A slight nick, dent, or scratch constitutes physical damage. Such minor damage that doesn't impair functional qualities, should not be considered physical damage for Code purposes.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its original position of the action taken on Proposal 1-100. The submitter has not provided any evidence that a problem exists with the term as it is currently used in the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-70 Log #1495 NEC-P01 **Final Action: Reject**

(100.Physical Damage (New))

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 1-100

Recommendation: Accept the proposal with the following revisions:

An occurrence to equipment that impairs its functional qualities such as, but not limited to, protection of conductors or equipment, grounding or bonding, insertion or withdrawal of conductors or cables, proper operation, watertightness, and other functions for which it is designed or intended.

Substantiation: Physical damage can be a nick, scratch, or slight dent. What constitutes physical damage in the NEC sense is subject to wide interpretation, criteria should be provided to promote uniform interpretation.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its original position of the action taken on Proposal 1-100. The submitter has not provided any evidence that a problem exists with the term as it is currently used in the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-1 Log #55 NEC-P04 **Final Action: Accept**

(100.Power Production Equipment (New))

TCC Action: The Technical Correlating Committee understands that acceptance of this comment recognizes the panel's acceptance of the definition contained in Proposal 15-3 and concurs with its location in 705.2 per panel comment 4-124a.

The Technical Correlating Committee directs that the second sentence of the definition become an Informational Note.

Submitter: Technical Correlating Committee on National Electrical Code®,

Comment on Proposal No: 15-3

Recommendation: The Technical Correlating Committee directs that this proposal be forwarded to Code-Making Panel 4 for action in Article 705.

This action shall be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I agree with the Panel's action on this comment, however, after further review it is my opinion that the second sentence of the original proposal should either be deleted or moved to an Informational Note as it only provides examples and does not include any enforceable language.

2-12 Log #2695 NEC-P02 **Final Action: Reject**

(100.Power Safe Protector (PSP))

Submitter: Michael Baxter, Energy Safe Technologies Inc.

Comment on Proposal No: 2-27

Recommendation: Same as originally submitted.

Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such

as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent

injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The claims associated with the product are related to the construction of the receptacle itself and its ability to detect thermal failures at the receptacle and related to the "power off" features functioning as a way to meet the tamper resistant receptacle requirements. As such, unless Code-Making Panel 18 accepts comments that would require receptacles be constructed in this manner, the definition is unnecessary.

See the panel actions and statements on Comments 2-46 and 2-55.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-71 Log #1385 NEC-P01 **Final Action: Reject**

(100.Premises (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force

Comment on Proposal No: 1-101

Recommendation: Edison Electric Institute recommends Proposal 1-101 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include it as a new Informational Annex to describe general information regarding utility electric supply to premises wiring.

Substantiation: Refer to the Informational Annex provided with companion comment submitted on Proposal 1-12 that would contain this proposal's recommendation along with companion comments on Proposals 1-53, 1-79 1-104, and 1-106.

Panel Meeting Action: Reject

Panel Statement: Since the panel has rejected the inclusion of the Informational Annex, the addition of a definition is a moot point.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Comment 1-6.

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-72 Log #2462 NEC-P01 **Final Action: Reject**

(100.Premises Wiring (System))

Submitter: Michael Hyland, American Public Power Association / Rep. IEEE NESC Committee

Comment on Proposal No: 1-102

Recommendation: Maintain the proposed text of Proposal 1-102 to read as follows:

"**Premises Wiring (System).** Interior and exterior wiring, including power, lighting, control, communication and other signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed. ~~This includes~~ either (a) ~~wiring~~ from the service point or premises power source to the outlets or (b) where there is no service point, ~~wiring~~ from and including the power source to the outlets ~~where there is no service point.~~

Such wiring does not include wiring internal to appliances, luminaires, motors, controllers, motor control centers, and similar equipment, nor does it include utility equipment and wiring on the utility side of the service point."

Substantiation: Proposal 1-102 should have been accepted and the IEEE NESC Committee supports Mr. LaBrake's negative ballot statement. In addition, the proposed new NESC definition (CP3476) for premises wiring (system) for the 2012 NESC reads as follows:

"premises wiring (system). Interior and exterior wiring, including power, lighting, control, communication and other signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed either (a) from the service point or premises power source to the outlets or (b) where there is no service point, from and including the nonutility power source to the outlets. Such wiring does not include wiring internal to appliances, luminaires, motors, controllers, motor control centers, and similar equipment, nor does it include utility equipment and wiring on the utility side of the service point."

The IEEE NESC Committee anticipates an altruistic approach in this regard toward harmonization of the two codes. Like the NEC, the NESC is in the process of a public comment period and comments from all concerned parties are invited and needed. See the preprint draft of the 2012 NESC now available for public comment at http://standards.ieee.org/nesc/nesc_preprint.html.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its action and statement taken on Proposal 1-102.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Comment 1-6.

LABRAKE, JR., N.: The comment and related proposal 1-102 do provide clarity and usability for the Code relative to premises wiring beginning where the utility supply ends at the service point. By accepting this comment, there will be common definitions of this term in the NEC and NESC toward harmonization of these ANSI documents.

8-3 Log #432 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Terry Peters, The Society of the Plastics Industry
Comment on Proposal No: 8-7
Recommendation: Accept this proposal.
Substantiation: SPI requests that the panel reconsider and accept this proposal in order to incorporate changes that were made in the 2008 NEC. Specifically, Article 352 has changed Rigid Nonmetallic Conduit to Rigid Polyvinyl Chloride Conduit. Also please note the word "metal" appears to have been omitted from Liquidtight Flexible Metal Conduit.

Acceptance of this proposal will correlate with the proper names for the above mentioned raceways and in addition add mention of other raceways that have not been included. Why would the panel want to mention only selected (mostly metallic) raceways in its list of raceway types and not mention all the newer plastic raceways?

Panel Meeting Action: Reject

Panel Statement: The change proposed does not improve usability or clarity. It is not the intent of the definition to provide a list of every possible example of a raceway. The definition clearly defines a raceway and provides some examples to facilitate the users understanding of the definition.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

8-4 Log #1436 NEC-P08 **Final Action: Reject**
(100.Raceway)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-10
Recommendation: Accept the proposal.
Substantiation: Please reconsider the substantiation. The wiring methods are or are not raceways since the definition of raceway is not limited to the items listed, and interpretations whether these wiring methods constitute a raceway can vary.

Panel Meeting Action: Reject

Panel Statement: The change proposed does not improve usability or clarity. It is not the intent of the definition to provide a list of every possible example of a raceway. Additionally, attempting to list wiring methods that are not raceways would create an unwieldy list that would likely generate more confusion than clarity. The definition as it stands clearly defines a raceway and provides some examples to facilitate the users understanding of the definition.

As stated in the panels response to ROP 8-10 while cablebus and auxiliary gutters are used in some ways like raceways, their restriction of use prevents them from automatically being grouped with raceways.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

8-5 Log #2481 NEC-P08 **Final Action: Accept**
(100.Raceway)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-10
Recommendation: Continue to reject the proposal.
Substantiation: The panel statement is correct, and some historical information may prove useful to readers. The clear implication presented by the choice of wiring methods listed in the current definition is that raceways are for extended lengths of run, and that more limited enclosed channels such as those within equipment are not to be so classified. This interpretation has been thoroughly tested. If any such enclosed channel were classified as a raceway, then surely an auxiliary gutter would be so classified. In the 1993 NEC cycle CMP 8 initially accepted a proposal to place "auxiliary gutters" into the list, and then unanimously reversed course in the face of negative comments from this comment submitter, NEMA, and others. The issues of auxiliary gutters and panelboard gutter spaces is particularly pressing because 230.7 forbids the sharing of raceways between service conductors and other conductors. If such enclosures are deemed to be raceways, then much service wiring as we know it could be construed as contrary to the NEC.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

1-73 Log #1386 NEC-P01 **Final Action: Reject**
(100.Restricted Access (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-104
Recommendation: Edison Electric Institute recommends Proposal 1-104 be accepted and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include it as a new Informational Annex to describe general information regarding utility electric supply to premises wiring.
Substantiation: Refer to the Informational Annex provided with companion comment submitted on Proposal 1-12 that would contain this proposal's recommendation along with companion comments on Proposals 1-53, 1-79, 1-101, and 1-106.

Panel Meeting Action: Reject

Panel Statement: Since the panel has rejected the inclusion of the Informational Annex, the addition of a definition is a moot point.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

ANTHONY, M.: Please refer to my statement on Comment 1-6.

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

5-21 Log #1435 NEC-P05 **Final Action: Accept in Principle**
(100.Separately Derived System)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-28
Recommendation: Accept the proposal.
Substantiation: Please reconsider the substantiation. Direct electrical connections between separately derived systems and other systems are provided by metal covered cables and metal raceways between the two where connected to metal enclosures which are grounded and connected to a grounding electrode which is an electrical connection between the two systems. How can this provision be accomplished without requiring nonmetallic wiring methods between systems and separate grounding electrode systems not bonded together?

Panel Meeting Action: Accept in Principle

Revise the definition of Separately Derived System, in Article 100, to read as follows:

Separately Derived System. A premises wiring system whose power is derived from a source of electric energy or equipment other than a service. Such systems have no direct connection from circuit conductors of one system to circuit conductors of another system, other than connections through the earth, metal enclosures, metallic raceways, or equipment grounding conductors.

Panel Statement: The panel included the submitter's concerns into the revised definition to simplify it and add clarity.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

4-2 Log #1327 NEC-P04 **Final Action: Accept**
(100.Service Conductors, Underground)

TCC Action: The Technical Correlating Committee notes that the NEC Style Manual does not require that definitions be a single sentence.
Submitter: Glossary of Terms Technical Advisory Committee / Marcelo Hirschler,
Comment on Proposal No: 4-15
Recommendation: Service Conductors, Underground. The underground conductors between the service point and the first point of connection to the service-entrance conductors in a terminal box, meter or other enclosure, inside or outside the building wall. ~~Where there is no terminal box, meter, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.~~
FPN: Where there is no terminal box, meter, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.
Substantiation: The NFPA Technical Advisory Committee on Glossary of Terminology (GOT) was formed by Standards Council to ensure consistency in definitions within the NFPA system.
The Manual of Style requires that definitions be in single sentences and that they not contain requirements. The second sentence of this definition is further clarification or discussion but should not be part of the definition. Moreover it contains a requirement which should not be included in the definition.
CMP 4 might consider revising the definition to make it into a single sentence while eliminating requirements.
It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-3 Log #2256 NEC-P04 **Final Action: Accept in Principle**
(100.Service Drop)

Submitter: Roger D. McDaniel, Georgia Power Company
Comment on Proposal No: 4-8
Recommendation: Revise as follows:
Service Drop. The overhead conductors between the utility **distribution** electric supply system and the service point.
Substantiation: The panel action should have been "Accept in Part in Principle", to change "utility distribution" system to "utility electric supply" system
The term "distribution" restricts application of this definition to overhead services supplied from utility distribution systems, which typically operate at voltages up to an including 34.5 kV. The term "distribution" excludes services operating at voltages above 34.5 kV. The term "electric supply" is more general, and will include utility overhead services supplied from both distribution and transmission systems.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Service Drop. The overhead conductors between the utility ~~distribution~~ electric supply system and the service point.
Panel Statement: The panel changed the comment text to reflect the original intent of the submitter.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-4 Log #1809 NEC-P04 **Final Action: Reject**
(100.Service Drop, FPN)

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 4-5
Recommendation: Revise as follows:
FPN: For further information, see ANSI/UL 1203~~2006~~ 1999
Substantiation: The panel action should have been to accept in part as there was no justification presented in the proposal addressing the FPN document update change from the 1999 referenced document to the 2006 referenced document.
Panel Meeting Action: Reject
Panel Statement: The submitter did not submit material that relates to the current edition of the Code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-5 Log #2257 NEC-P04 **Final Action: Accept**
(100.Service Lateral)

Submitter: Roger D. McDaniel, Georgia Power Company
Comment on Proposal No: 4-16
Recommendation: Revise as follows:
Service Lateral. The underground conductors between the utility ~~distribution~~ electric supply system and the service point
Substantiation: The panel action should have been "Accept in Principle", to change "utility distribution" system to "utility electric supply" system. The proposed definition of "Service Lateral" should read as follows:
The term "distribution" restricts application of this definition to underground services supplied from utility distribution systems, which typically operate at voltages up to and including 34.5 kV. The term "distribution" excludes services operating at voltages above 34.5 kV. The term "electric supply" is more general, and will include utility underground services supplied from both distribution and transmission systems.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

10-3 Log #1719 NEC-P10 **Final Action: Reject**
(100.Short-Circuit Current Rating)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 10-5
Recommendation: Revise the text of the 2008 NEC as follows:
Short-Circuit Current Rating. The prospective symmetrical fault current at a nominal voltage the ~~to which an~~ apparatus or system is identified ~~able~~ to be supplied by ~~connected~~ without sustaining damage exceeding defined acceptance criteria.
Substantiation: This Comment intends to respond to the Panel Statement in rejecting the Proposal as well as include portions of the negative vote by Mr. Cook and Hidaka with the effort to improve the definition.
The Panel states "A component, such as a contactor, or a system, such as an industrial control panel, has a short-circuit current rating." So, the proposed revision is intended to recognize the information provided by the Panel. The phrase "identified to be supplied by" seems much more correct than "able to be connected." Mr. Hidaka states the word "able" should be replaced with the word "identified" as "able" suggests any application where a connection can be made which ignores the rating of the device. I agree!
Panel Meeting Action: Reject
Panel Statement: The proposed use of the word "identified" introduces confusion into the definition and the existing text adequately defines the term. There are a number of components that are not "identified" with a short circuit current rating such as those noted in the UL 508A SB Table 4.1. This table is used by control panel builders to assign industry accepted ratings to components that are not identified with a short circuit current rating. Panel reaffirms their rejection and statement on proposal 10-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
COOK, D.: I disagree with Panel action and Panel Statement. Panel indicates the use of the defined term "identified" introduces confusion based on the fact that some components of a control panel are not identified with a short circuit current rating. The UL White Book indicates "components" are incomplete in construction or restricted in performance capabilities and not recognized for use as field-installed components. The NEC is an installation code, not a product standard. The components without short circuit current ratings appear to become part of an overall product that will have a short circuit current rating. In the NEC context, the submitted text proposed in Comment 10-3 is clear and improves clarity.

1-74 Log #1387 NEC-P01 **Final Action: Reject**
(100.Supervised Installation (New))

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 1-106
Recommendation: Edison Electric Institute recommends Proposal 1-106 be accepted-in-principle and supports the proposed text in Mr. LaBrake's negative ballot statement for the change to include it as a new Informational Annex to describe general information regarding utility electric supply to premises wiring.
Substantiation: Refer to the Informational Annex provided with companion comment submitted on Proposal 1-12 that would contain this proposal's recommendation along with companion comments on Proposals 1-53, 1-79, 79, 1-101, and 1-104.
Panel Meeting Action: Reject
Panel Statement: Since the panel has rejected the inclusion of the Informational Annex, the addition of a definition is a moot point.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Please refer to my statement on Comment 1-6.
LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-6.

1-75 Log #2117 NEC-P01 **Final Action: Reject**
(100.Supervised Installation (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 1-105a
Recommendation: Accept the proposal in Principle in Part. Define "*supervised installation*" as follows:
Supervised installation. A facility, or portion of a facility where each of the following conditions are met:
(1) Conditions of design and installation are provided under engineering leadership and guidance.
(2) Qualified persons with documented training and experience provide maintenance, monitoring, and servicing of the system.
(3) Where electric service and electrical maintenance is continuously provided by a single building management.
Substantiation: The concept of a supervised installation is embedded in many NFPA documents and needs to be integrated into the NEC in order for the NEC users to balance risks across a broad array of installation types.

Our industry would like to leverage the advantage it has in its highly trained, 7/24/365 operations and maintenance staffs with respect to capital outlay; an extension of the "constantly attended location" concept seen in other life safety infrastructure.

A common understanding of a supervised installation will build the foundation for harmonization between the NEC and NESC.
Panel Meeting Action: Reject
Panel Statement: The proposed text in the comment places requirements in a definition that is in violation of 2.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

ANTHONY, M.: Even if I had suggested to the committee the revision shown below-- to correct the self-referencing error in the proposed definition--the committee would not have approved this proposal.

[(1) Conditions of design and installation construction are provided under engineering leadership and guidance.]

The self-referencing error is minor in comparison to the opportunity lost. The distinction between a supervised, and an unsupervised installation is a significant concept--especially in a document where both prescriptive and performance-based language appears.

We see "supervised industrial installation" explicitly defined in Article 240. My proposal was intended to accumulate all the references to a more general type of supervised installation that is not necessarily of an industrial nature. We have appearances of the term in Section 215.2(B)(3), in Section 685.1, in Section 396.10(B), and in many other places in the NEC.

The presence of supervision (i.e. hands-onmanagement) or absence of it, is significant in mediating the trade-off between first cost versus operations and maintenance; between a fully trained, on-site 7/24/365 maintenance staff and an off-site, on-call contract maintenance staff. Users of the NEC, educational facility managers among them, have to make decisions about staffing every day. They need to know whether these staffing decisions cause them to fall out of compliance with the NEC. Conversely, they need to know how NEC requirements affect their staffing. A definition like this would have helped.

A version of this proposal will be submitted to the NFPA 70B technical committee

---

12-1 Log #56 NEC-P12 **Final Action: Accept**
(100.Uninterruptible Power Supply (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 12-3
Recommendation: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with 2.2.2 of the NEC Style Manual.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to rewrite the proposal to comply with 2.2.2 of the NEC Style Manual.

See panel action on Comment 12-2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-2 Log #1326 NEC-P12 **Final Action: Accept**
(100.Uninterruptible Power Supply)

Submitter: Glossary of Terms Technical Advisory Committee / Marcelo Hirschler,
Comment on Proposal No: 12-3
Recommendation: Uninterruptible Power Supply. A power supply used to provide power to a load for some period of time in the event of a power failure. ~~In addition, it may provide a more constant voltage and frequency supply to the load, reducing the effects of voltage and frequency variations.~~

FPN: In addition, it may provide a more constant voltage and frequency supply to the load, reducing the effects of voltage and frequency variations.
Substantiation: The NFPA Technical Advisory Committee on Glossary of Terminology (GOT) was formed by Standards Council to ensure consistency in definitions within the NFPA system.

The Manual of Style requires that definitions be in single sentences and that they not contain requirements. The second sentence of this definition is further clarification or discussion but should not be part of the definition.

CMP 12 might consider revising the definition to make it into a single sentence while not including requirements.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MARCOVICI, S.: The proposed definition must be revised to reflect the definitions used by the industry and found in the technical literature. One such definition, found in the Webster's dictionary and in the PC Magazine encyclopedia reads as follows: "A devise that provides battery backup when the electrical power fails or drops to an unacceptable voltage level."

12-3 Log #2458 NEC-P12 **Final Action: Accept in Part**
(100.Uninterruptible Power Supply (New))

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Comment on Proposal No: 12-3
Recommendation: Revise the definition in the Panel Meeting action as follows inserting the words "alternating current" which were in the original proposal.

Uninterruptible Power Supply. A power supply used to provide alternating current power to a load for some period of time in the event of a power failure. In addition, it may provide a more constant voltage and frequency supply to the load, reducing the effects of voltage and frequency variations.
Substantiation: An Uninterruptible Power Supply, as defined in the scope of UL 1778 and IEC 62040-1, Standards for Uninterruptible Power Systems, provides only alternating current power. Products which provide DC power in the event of a power failure are categorized as standby power supplies, and are covered under UL 1012, the Standard for Power units Other Than Class 2 or UL/IEC 60950-1, the Standard for Information Technology Equipment.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts insertion of the words "alternating current" as provided by the submitter.

The panel does not accept the remainder of the submitter's text. This addition of the text "alternating current" will modify the 1st sentence of the definition in Comment 12-2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-76 Log #2878 NEC-P01 **Final Action: Reject**
(100.Voltage Drop (New))

Submitter: Paul A. Keleher, Paul Keleher Electrical Services
Comment on Proposal No: 1-108
Recommendation: Accept Proposal 1-108.
Substantiation: If the inclusion of common electrical terms is not needed in the NEC, then why does it contain 3 separate definitions of the word, "voltage"? Is there any more common electrical term than that? This proposal would simply add a fourth definition to follow the other three
Panel Meeting Action: Reject
Panel Statement: The submitter has not cited any instances of persons being confused over what voltage drop is.

In addition, the comment does not conform to 4.4.5(d) of the NFPA Regulations Governing Committee Projects.

The panel also reiterates that the Scope of Article 100 excludes "commonly defined" terms.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-77 Log #48 NEC-P01 **Final Action: Reject**
(100.Voltage, Low; Voltage, Medium; Voltage, High (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 1-109
Recommendation: Accept the proposal.
Add new definitions to Article 100 as follows:
Voltage, Low. A class of nominal system voltages less than 1,000 V.
Voltage, Medium. A class of nominal system voltages equal to or greater than 1,000 V and less than 100,000 V.
Voltage, High. A class of nominal system voltages equal to or greater than 100,000 V.
Substantiation: I agree with the panel that the terms for high voltage and medium voltage are inconsistent within various standards. But, since the NEC is expanding the scope to more medium voltage and high voltage applications, I think Article 100 should define what these terms mean at least in the NEC. I think anyone on the panel would agree that "high voltage" does not start at 600V as is defined in 490.2.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.
The panel reaffirms its panel statement on Proposal 1-2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: Voltage classifications--riddled with contextual paradoxes as they are--can be regarded, if not justified, as "terms of art".

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

1-79 Log #498 NEC-P01 **Final Action: Reject**
(110.3(A), FPN)

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 1-111
Recommendation: Reconsider and reject this proposal.
Substantiation: The term "may be" leads the inspector to believe he must accept a certificate. This revised wording only confuses the present requirements in 110.3(A)(1). Current language is better. Reject this proposal.
Panel Meeting Action: Reject
Panel Statement: The submitter has presented no evidence to support the claim that "may be" leads an inspector to accept a certificate, or that it leads an inspector to do anything at all.
The proposed FPN only states that special conditions of use may be found on a certificate. This is certainly not new. Such conditions have been shown on equipment, on certificates, and in user manuals for decades.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-80 Log #1587 NEC-P01 **Final Action: Accept in Principle in Part**
(110.3(A)(1), FPN 2)

Submitter: Jim Pauley, Schneider Electric
Comment on Proposal No: 1-111
Recommendation: Revise the second sentence of the informational note as follows:
Special conditions of use or other limitations ~~and other pertinent information~~ may be marked on the equipment, included in the product instructions or included in the appropriate listing and labeling guide information. ~~or on an accompanying certificate.~~
Substantiation: As Mr. Boyce points out in his negative vote, the use of the term "certificate" creates unneeded confusion because of how the term is used with respect to some conformity assessment schemes. The suggested revision in this comment would remove that term and replace it with the more direct ways that limitations are provided. The following substantiates the changes:
- add "or other limitations" in place of "other pertinent information" to follow "special conditions of use" to specifically note that the information sources are important because they may contain limitations on the use of the product that are not evident unless the sources are consulted.
- remove the words "or on an accompanying certificate" and replace them with a reference to the product instructions and to the listing and labeling guide information. These are the two additional sources (in addition to the product markings) where the information on limitations can be found.
Panel Meeting Action: Accept in Principle in Part
In the recommended wording, revise the second sentence of the Informational Note as written in the comment to read as follows:
"Special conditions of use or other limitations and other pertinent information may be marked on the equipment, included in the product instructions or included in the appropriate listing and labeling information."
The panel does not Accept the deletion of the wording "other pertinent information".
Panel Statement: The panel accepts the revision to add "included in the product instructions or included in the appropriate listing and labeling information", and to delete "or on an accompanying certificate".
The panel deleted the use of the word "guide" as it is too restrictive.
The panel rejects the deletion of "and other pertinent information", because this phrase includes conditions such as "limitations" and allowances that may not be evident, unless the sources are consulted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-81 Log #2455 NEC-P01 **Final Action: Accept in Principle**
(110.3(A)(1), FPN 2 (New))

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Comment on Proposal No: 1-111
Recommendation: Reject the proposal.
Substantiation: The addition of new text in the FPN to address "certificates" is not needed based on the existing text in the FPN and/or 110.3(B). The proposed new FPN is extraneous and provides no added benefit to code users.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 1-80.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-82 Log #1262 NEC-P01 **Final Action: Accept**
(110.3(B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 1-118
Recommendation: We support the panel's action of rejection of this proposal.
Substantiation: Removing the wording "listing and labeling" will have many additional consequences.
An example of what could be at issue is found in Proposal 2-80, item six (6) "Many manufactures continue to stipulate in their owner's use and operation manuals that the appliance is not to be connected to GFCI-protected outlet." This would allow a manufacture's document to circumvent the National Electrical Code section 210.8(A)(2).
Instructions for listed and labeled equipment are reviewed for compatibility with the NEC. Code users are never "required" to violate Code requirements and 90.4, 110.2 and 110.3(A) clearly support this. In the event an error in instructions is identified, it should be brought to the attention of the manufacturer, the listing or labeling body, and the standards developing organization.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(110.3(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-118
Recommendation: Accept the proposal with the following revisions:
Equipment covered by this Code shall be installed and used in accordance with the listing or labeling or manufacturers' instructions, if any, provided they do not constitute a violation of Code provisions.
Substantiation: This provision should also apply to unlisted and unlabeled equipment, provided there is no code violation.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.
See the panel action on Comments 1-82 and 1-83.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-85 Log #1433 NEC-P01 **Final Action: Reject**
(110.8)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-123
Recommendation: Accept the proposal with the following revisions:
The wiring methods covered in this Code if identified for the uses shall be permitted to be installed in or on any type of
(1) Building or other structure
(2) Occupancy
(3) Premises, except as otherwise provided in this Code.
Substantiation: "Recognized" is not NEC defined. Many of the "recognized" (covered in this Code, presumably) are not suitable or permitted for all installations. Structures other than "buildings" should be noted, also, "on" buildings or other structures, and on premises where there is no occupancy or structures.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-86 Log #1720 NEC-P01 **Final Action: Reject**
(110.9)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 1-126
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
110.9 Interrupting Rating. Equipment intended to interrupt current at fault levels shall have an interrupting rating not less than the current that is available, at the nominal circuit voltage, ~~and the current that is available~~ at the line terminals of the equipment. Equipment intended to interrupt current at other than fault levels shall have an interrupting rating not less than the current that must be interrupted at the nominal circuit voltage ~~not less than the current that must be interrupted~~.
Informational Note: See 240.86 that permits the downstream circuit breaker in a series combination to have a rating lower than the available short-circuit current.
Substantiation: Since the Panel objected to including the permitted application of the lower rated circuit breaker installed in a series combination, the concept is included in a proposed Informational Note. The suggested reorganization of the sentences is intended to give emphasis to the current that must be interrupted rather than the voltage. When short circuit studies are performed, it is the current, at the operating nominal voltage, that requires emphasis.
Note also that the definition of "Interrupting Rating" in Article 100 emphasizes the current at the rated voltage.
Panel Meeting Action: Reject
Panel Statement: The proposed change does not enhance clarity or usability. In addition, the submitter has not adequately substantiated a need for revising the language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: The submitters's definition of interrupting rating is more accurate--though all Ohmic quantities during a fault vary along a continuum. For practical purposes, this is a better definition, in my view.

1-87 Log #1053 NEC-P01 **Final Action: Reject**
(110.9, FPN)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 1-128
Recommendation: Accept this proposal to add text as follows:
Providing devices that are capable of interrupting current at fault levels does not assure conductor and equipment protection.
Substantiation: The present wording of 110.9 first paragraph is very misleading. Even though the NEC is not intended as a design specification, this section indicates, that providing equipment which has an interrupting rating that is sufficient for the voltage and current that is available at the line terminals of the equipment is acceptable. This does not assure proper protection.
Panel Meeting Action: Reject
Panel Statement: The comment is not supported by adequate substantiation.
In addition, the panel directs the submitter to the stated purpose of the NEC as it appears in 90.1(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We agree with the submitters substantiation in Proposal 1-128. To achieve proper conductor and equipment protection, it is necessary to have a detailed system analysis of fault current, the operating characteristics of the overcurrent protective device and provide equipment and conductors with suitable short-circuit ratings. The addition of the FPN would alert the user of the Code that more factors must be in place to assure a safe installation that is stated in 110.9.

1-88 Log #42 NEC-P01 **Final Action: Accept**
(110.10)

Submitter: Code-Making Panel 5,
Comment on Proposal No: 1-129
Recommendation: Revise the text of 110.10 by modifying the second sentence of 110.10 as follows (first and third sentences remain as is): The overcurrent protective devices, the total impedance, the component short-circuit current ratings, and other characteristics of the circuit to be protected shall be selected and coordinated to permit the circuit-protective devices used to clear a fault to do so without extensive damage to the electrical components of the circuit. *This fault shall be assumed to be either between two or more of the circuit conductors or between any circuit conductor and the equipment grounding conductor(s) permitted in 250.118.* ~~or enclosing metal raceway~~. Listed products applied in accordance with their listing shall be considered to meet the requirements of this section.
Substantiation: CMP-5 concurs with the CMP-1 action to accept the addition of term "equipment" in the second sentence and not to include the added phrase "or metal cable tray" as proposed by the submitter. CMP-5 recommends making the term "conductor" dual plural by adding "(s)" as there may be more than one equipment grounding conductor involved in the circuit and return ground fault current path.
CMP-5 recommends deleting the existing code text "or enclosing metal raceway" and replacing it with "permitted in 250.118". 250.118 states "The equipment grounding conductor run with or enclosing the circuit conductors …. " and includes enclosing raceways and cable trays as well as others such as auxiliary gutters.
Addition of reference to 250.118 eliminates the need to create a list of menu items such as enclosing metal raceway or metal cable tray in this section since these are already included in 250.118 along with listed auxiliary gutters and metal tubing.
CMP-5 notes that the proposal as submitted and accepted in principle by CMP-1 appears to create a perception of deleting the first and third sentences. CMP 1 intent seems to be to modify current sentence two only. There was no technical substantiation provided in the proposal 1-129 by the submitter for deletion of the first and the third sentence in 110.10.
The proposed text by CMP 5 is complete for section 110.10 to ensure that first and third sentence remain in the NEC as is and only the second sentence is modified based on proposal 1-129 Log# 617.
This Comment was developed by a CMP-5 Task Group and balloted through the entire panel with the following ballot results:
16 Eligible to Vote
14 Affirmative (Alternate P.J. LeVasseur for Principal D. Hammel and Alternate P.R. Picard for Principal R. Temblador)
2 Ballots Not Returned (D. Brender and G.S. Harding)
No Comments on Affirmative Vote were received.
Panel Meeting Action: Accept

(110.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-129
Recommendation: Accept revised as follows:
This fault shall be assumed to be between two or more circuit conductors, or between any circuit conductor, grounding or bonding conductor, grounded metal raceway, grounded metal cable, or other grounded metal enclosures.
Substantiation: A ground fault can occur to other grounded equipment. Overcurrent devices do not detect a fault to ungrounded equipment.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 1-88.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-90 Log #2812 NEC-P01 **Final Action: Accept**
(110.10)

Submitter: Jay Tamblingson, Rockwell Automation
Comment on Proposal No: 1-130
Recommendation: Revise accepted new text as follows:
110.10 Circuit Impedance, Short-Circuit Current Ratings, and Other Characteristics. The branch circuit protective devices, the total impedance, the ~~component~~ equipment short-circuit current ratings, and other characteristics of the circuit to be protected shall be selected and coordinated to permit the branch circuit protective devices used to clear a fault to do so without extensive damage to the electrical ~~components~~ equipment of the circuit. This fault shall be assumed to be either between two or more of the circuit conductors or between any circuit conductor and the grounding conductor or enclosing metal raceway. Listed ~~products~~ equipment applied in accordance with their listing shall be considered to meet the requirements of this section.
Substantiation: The present use of the term "component" and "product" may be interpreted as requiring evaluation of individual internal components of equipment even when the equipment is marked with an overall short circuit current rating as required by other articles or product standards. Changing to the defined term "equipment" provides needed clarity and consistency.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Comment on Proposal No: 1-139
Recommendation: Continue to reject this proposal.
Substantiation: Panel 12 rejected similar proposals 12-114, 12-146 with the statement. "The requirement is unenforceable. Disposition of removed materials is not a code responsibility. The remaining installation is required to be in accordance with 110.3, which is enforceable."
Panel 3 rejected similar proposals 3-173 and 3-253 with the statement. "The submitter has not provided technical substantiation for the proposed change, and compliance with this requirement would be unenforceable. This is already covered under 90.4 and 110.2.
Panel 16 rejected similar proposals 16-24, 16-122, 16-241 and 16-305 with the statement. "This is an unenforceable requirement. Removing abandoned cable involves pulling unused cable and wiring from conduit, raceways, ducts, shafts and drop ceilings. The objective of the original text is directed at the final installation, that it be "neat and workmanlike", not necessarily the installation (in this case, removal) process. The submitter has provided no substantiation for additional requirements during the removal process."
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12

1-93 Log #525 NEC-P01 **Final Action: Accept**
(110.12)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 1-139
Recommendation: Continue to reject this proposal.
Substantiation: Removing abandoned cable involves pulling unused cable and wiring from conduit, raceways, ducts and drop ceilings that, by its very nature, cannot realistically be performed in a "neat" manner. The objective of the original text is that the final installation be "neat and workmanlike", not necessarily the installation process. The affirmative comment by Mr. Anthony encouraging the submitter to consider proposing a new NEC section to deal with "… demolition hazards, workmanlike electrical demolition with emphasis on abandoned cables …" is inappropriate. The NEC "… covers the installation of electrical conductors, equipment …" [see 90.2(A)] for the purpose of "… safeguarding of persons and property from hazards arising from the use of electricity" [see 90.1(A)]. It is not intended as an instruction manual [see 90.1(C)] for either the installation or the demolition processes.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-94 Log #1432 NEC-P01 **Final Action: Reject**
(110.12)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-135
Recommendation: Accept the proposal.
Substantiation: "Neat and workmanlike" are not NEC defined, are subjective, and per the NEC Style Manual to be avoided without further specifics. If an installation fully complies with the NEC, it is presumed to be safe which is the stated purpose in 90.1. Aesthetics should not be a safety code requirement.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on Proposal 1-135.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-95 Log #1204 NEC-P01 **Final Action: Accept**
(110.12(A))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 1-141
Recommendation: This proposal should have been Rejected.
Substantiation: This comment supports the "Explanation of Negative Vote" by panel members Mr. Hickman, Mr. Hittinger, and Mr. Labrake for this proposal. Panel 1 removed language for 110.12(A) that protected the user from electrical shock without any substantiation to ensure a safe installation. Metal plugs or metal plates can become energized by incidental contact when installed in nonmetallic enclosures.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-96 Log #2357 NEC-P01 **Final Action: Reject**
(110.12(A))

Submitter: Marcus R. Sampson, Lysistrata Electric
Comment on Proposal No: 1-141
Recommendation: The panel should continue to reject this proposal.
Substantiation: Metal covers and cover plates on non-metallic boxes are required to be bonded to the equipment grounding conductor because of the possibility of becoming energized by a conductor or splice failure within the enclosure. If metal plugs or plates are used to close unused openings and they are not bonded to the equipment grounding conductor, they need to at a minimum, be recessed 1/4-inch to help avoid shock hazard.
Panel Meeting Action: Reject
Panel Statement: The intent of the submitter is unclear. The recommendation is to continue to reject Proposal 1-141, however, the action on this proposal was to accept.
See the panel action on Comment 1-95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-97 Log #2482 NEC-P01 **Final Action: Accept**
(110.12(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-141
Recommendation: The proposal should be rejected.
Substantiation: The comments in the voting are correct. Until the 2002 NEC the requirement was within the scope of CMP 9, and has actually been in the NEC for over 72 years. When CMP 9 entrusted this requirement to CMP 1, it did so because the centralization in one location of a general requirement served code usability. It never imagined that provisions would be unraveled without technical substantiation. This particular requirement is reflected in the relevant product standards, and directly applies to the common usage of metal cable clamps in fiberglass boxes; if no cable enters the box at such an opening, the metal clamp secures the opening and must not be exposed to routine contact because it would be liable to become energized (defined as capable of energization upon the failure of a single element of insulation). There are many NEC requirements that have stood the test of time and therefore are not the subject of proposals for change; to suggest that a requirement be removed for this reason stands the usual understanding that code changes follow technical substantiation on its head.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-98 Log #2483 NEC-P01 **Final Action: Reject**
(110.12(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-142
Recommendation: The proposal should be accepted.
Substantiation: How can a proposal that adds an additional permission (to add weep holes in the field) be "too restrictive" when such proposals are necessarily less restrictive than the existing text? The panel statement makes no sense. Electricians have added weep holes in the field since electrical enclosures were first used in wet locations, and will continue to do so. Their use improves the safety and durability of electrical installations. How many times have we seen the inside of cast aluminum boxes thoroughly degraded over time when moisture condensed within the enclosure; experienced electricians routinely provide weep holes in the underside that provide enough ventilation to avoid such damage. The rule in 230.53 is merely one example, albeit one with an express code mandate. The Code should say what it means and mean what it says.

As noted in the comment by this submitter on Proposal 1-141, this section was originally within the scope of CMP 9. In the 1996 code cycle (Proposal 9-33) CMP 9 limited the unused opening provision to cable and raceway openings precisely to accommodate weep holes. The submitter of that proposal, the late Creighton Schwan, was one of the greatest participants in the code process in the history of the document. He correctly pointed out that such opening should be clearly permitted, and it is frankly astonishing that CMP 1 is now resisting fixing this oversight. If this is not done, this submitter will seriously consider restoring this allowance through proposals directed at Articles 312 and 314 in the 2014 code making cycle.
Panel Meeting Action: Reject
Panel Statement: Acceptance of the proposed text without any parameters placed on field installed drain holes would result in inconsistent or impossible enforcement of 110.12, e.g.: a 1/2 in. hole could be drilled into an enclosure and called a drain hole by the installer.

In addition, adding a blanket allowance for weep holes in enclosures could inadvertently encourage violation of other code provisions regarding drainage, such as 501.15(F).

(110.14)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-148
Recommendation: Accept the proposal in principle, using the text as proposed but changing the word "listed" to "identified."
Substantiation: This wording improves on the panel action taken under Proposal 1-149 in two ways. First, it is correctly located as part of the parent text in 110.14, ahead of 110.14(A). This is because the guide card limitations

apply to both "terminal connectors" and "splicing wire connectors" and there is no technical reason to limit the application of this rule to one or the other. Second, the proposed language expressly cites the stranding to be addressed, as requested (correctly) in the NEMA comment in the voting.

CMP 1 may want to consider a delayed effective date for this, the fact that these rules are already enforceable under 110.3(B) notwithstanding. The electrical industry is not remotely prepared for routine enforcement. There are almost no mechanical connectors that meet the guide card limitations, only crimping connectors or ferrules. Most motor leads use finer stranding than Class C concentric, and they are made up by the millions with mechanical connections in the terminal housings. Flexible cords exclusively use fine stranding for obvious reasons and when they land in cord caps and receptacle bodies, they do so in devices that do not have the required markings for stranding class, even on the boxes they come in. All of this can be fixed, and the panel action to go to "identified" as the standard of product acceptance helps in this regard, but it will take some time to get everything in place.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Comment 1-101.

Number Eligible to Vote: 12

MONIZ, G.: See My Explanation of Negative to NEMA vote on 1-101.

1-101 Log #1588 NEC-P01 **Final Action: Accept in Principle (110.14(A))**

Submitter: Jim Pauley, Schneider Electric

Comment on Proposal No: 1-149

Recommendation: Replace the 3rd paragraph of 110.14(A) in the ROP draft with the following:

"Connectors and terminals for conductors more finely stranded than Class B and Class C stranding as shown in Chapter 9, Table 10 shall be identified for the specific conductor class or classes and the number of strands."

Add a new Table 10 in Chapter 9 as follows:

Table 10 – Conductor Stranding

Conductor Size		Number of strands		
		Copper		Aluminum
AWG or kcmil	(mm^2)	Class B	Class C	Class B
24 – 30	0.20 – 0.05	[a]	–	–
22	0.32	7	–	–
20	0.52	10	–	–
18	0.82	16	–	–
16	1.3	26	–	–
14 – 2	2.1 – 33.6	7	19	7 [b]
1 – 4/0	42.4 – 107	19	37	19
250 – 500	127 – 253	37	61	37
600 – 1000	304 – 508	61	91	61
1250 – 1500	635 – 759	91	127	91
1750 – 2000	886 – 1016	127	271	127

[a] Number of strands vary.

[b] Aluminum 14 AWG (2.1 mm^2) is not available.

Substantiation: The term "fine stranded conductor" has no meaning in the NEC or in the product standards. If the panel is intent on adding a rule for specification of terminals for other than the standard conductor stranding, it will be necessary to use the same terminology as the product standard. This comment would revise the added paragraph to specifically reference Class B and C stranding. The added paragraph is consistent with 10.12 of UL 486A-B which requires that connectors for other than Class B or C stranding be marked with the conductor class and the number of strands.

In order to define Class B and C stranding, it is necessary to add a table to the NEC that is consistent with the product standards. A new Table 10 to Chapter 9 is proposed. This table comes from UL 486A-B - Table 14. Without this table, Class B and C stranding will have no meaning unless you have a copy of the product standard.

Without providing the full details that can be applied in the field and by the AHJ, the requirement should not appear at all in the NEC.

Panel Meeting Action: Accept in Principle

The panel accepts the placement of the additional text to address fine stranded conductors.

The panel moves the text of the comment from 110.14(A) to the parent paragraph of 110.14 following the existing paragraph.

In addition, the existing FPN will follow the newly recommended text.

Table 10 will be placed in Chapter 9 as proposed by the submitter.

Panel Statement: The recommended text improves clarity and enhances usability.

The placement of this information in 110.14 is more appropriate as it pertains to electrical connections generally.

The panel notes that "Table 10 - Conductor Stranding" is the copyrighted property of UL, and permission for usage has been requested.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MONIZ, G.: Both the comment and the proposal to which it refers should be rejected. ANSI class designations can include more than one stranding count, and this can create confusion.

1-102 Log #2485 NEC-P01 **Final Action: Accept in Principle (110.14(A))**

Comment on Proposal No: 1-155

Recommendation: Accept this proposal to add the following new text t:

Conductors extended between devices that have terminals which have differing temperature ratings shall have an ampacity that is based on the lowest temperature rating.

Substantiation: The revised wording is definitely more direct than the present wording and easier to understand and apply.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

ANTHONY, M.: This is a clean cut, "silver bullet" statement, in an industry that is in need of silver bullets.

1-105 Log #57 NEC-P01 **Final Action: Accept**
(110.16)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 1-164
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Per the actions taken on Comments 1-106 and 1-107, the final wording of 110.16 is to read as follows:
"110.16 Arc-Flash Hazard Warning. Electrical equipment, such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling units, and are likely to require examination,
adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be
located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment."
Panel Statement: The panel accepts the direction of the Technical Correlating Committee. The term "dwelling unit" refers to a single dwelling that may be within a two-family or multifamily dwelling.
The panel reaffirms its action on Proposal 1-162. Thus, Proposal 1-164 was "Accepted in Principle".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-106 Log #438 NEC-P01 **Final Action: Accept**
(110.16)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 1-166
Recommendation: Recommendation is to Accept in Part Proposal 1-166.
Revise the title of the section to "Arc-Flash Hazard Warning" as proposed for subdivision (A) in this proposal.
Reject the remainder of the proposal for the reasons stated by CMP-1 in their original action.
Substantiation: The current title of this section is not accurate. This section does not deal with all aspects of Flash Protection. This section provides a requirement for a warning label on equipment. The proposal introduced a more accurate term in subdivision (A) that is consistent with the requirement in this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-107 Log #1721 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 1-165
Recommendation: Revise the existing text of the 2008 NEC as follows:
110.16 Flash Protection. For other than one and two-family dwellings, electrical ~~Electrical~~ equipment, such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that ~~are in other than dwelling occupancies, and~~ are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.
Substantiation: This section, as revised in the ROP by replacing the term "dwelling occupancies" with "dwelling units," can still lead to varying interpretations. The term "dwelling units" can be interpreted to include, one-family, two-family, and multifamily dwellings as all contain one or more dwelling units. Thus, the phrase "For other than one and two-family dwellings" should be used as shown in the Proposal and in this Comment. These terms are defined in Article 100 and thus the application of the rule is much less likely to be misinterpreted.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action on Proposal 1-162. The term "dwelling unit" refers to a single dwelling that may be within a two-family or multifamily dwelling.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Ballot Results: Affirmative: 12

1-110 Log #1722 NEC-P01 **Final Action: Reject**
(110.22(B))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 1-177
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:

CAUTION — ENGINEERED SERIES COMBINATION SYSTEM. COMPLY WITH ENGINEER'S INSTRUCTIONS DATED ~~RATED~~ _____ ~~AMPERES~~. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED.
Substantiation: The marking requirements of engineered series-combination systems need to be clarified. The previously accepted markings are far too general to be of value to those who are likely to be replacing components after the original installation or modification.
The engineer will include a requirement for a specific overcurrent device, often by make and model or operating characteristic that must be used at both ends of the series-combination. The simple "RATED ____ AMPERES" does not require or provide the information needed for proper replacement of component(s) to ensure the safety contemplated in this rule.
Panel Meeting Action: Reject
Panel Statement: The proposed additional language would be redundant to "Identified replacement components required".
The prescriptive requirements for documentation and marking of the rating are contained in 240.86(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-112 Log #648 NEC-P01 **Final Action: Hold**
(110.23)

TCC Action: The Technical Correlating Committee will appoint a Task Group to study this issue for the 2014 Code cycle.
Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 1-62
Recommendation: Renumber existing 110.23 as 110.24, and install new 110.23 to read as follows:
110.23 Lockable Disconnecting Means. If a disconnecting means is required to be lockable in the open (off) position it shall have the provision for locking or adding a lock to the disconnecting means remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker do not meet the standard of this rule and shall not be permitted.
Substantiation: I have to agree with the Code-Making Panel 1's statement that the proposed definition is not appropriate for Article 100. I believe that the present wording and location in Article 110 should be accepted as held for the 2014 NEC code cycle. It is still my opinion that this will allow elimination of repetition in at least 27 code sections over three chapters. Article 110 and its Part I are both titled "General" so including this rule here would allow it to apply to Chapters 1 through 7 inclusive, unless otherwise modified by Chapters 5, 6, and 7.
Panel Meeting Action: Hold
Panel Statement: See the panel action and statement on Comment 1-49.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

FISKE, W.: The comment is being held. This action by CMP-1 makes the comment a proposal for NEC 2014 Code cycle. We note that the proposed Code rule - as expressed in Comment 1-112 - conflicts with the OSHA lockout/tagout rule, as expressed in 29CFR1910.147. In employee workplaces, 29CFR is national law. A different proposal, better aligned with 29CFR1910.147, would better serve Code users.

1-114 Log #487 NEC-P01 **Final Action: Reject**
(110.24)

Submitter: Pete Baldauf, City of Vandalia
Comment on Proposal No: 1-183
Recommendation: CMP-1 should reject Proposal 1-183 in its entirety.
Substantiation: Proposed 110.24 as written does not increase electrical safety. Fault current is not a static value for two primary reasons:

1. Electrical utilities seldom inform the end user of changes to the distribution system. Routine utility maintenance procedures will often change the available fault current, invalidating a previously posted value.
2. Relatively minor changes to the premises wiring system will often change the available fault current, invalidating a previously posted value.

The proposed text is not retroactive and doesn't address utility changes or changes in the premises wiring. Without provisions requiring re-calculating and re-posting when these types of changes are made, the posted value of the available fault current will often be inaccurate providing a false sense of security. This severely compromises electrical safety.

The ROP for the 2005 edition of the NEC contained a proposal (1-172a) for a similar label to be field applied. This labeling, if it had been approved, would have required that it contain the incident energy available or the level of PPE to be selected to perform work on electrical equipment. The change was proposed to 110.16. It was rejected by the CMP at that time.

Here are some of the explanations for the negative from the panel members at that time:

TROGLIA: EEI agrees that this proposal does identify a safety issue for the electric industry. However, the proposed approach is flawed in that it requires equipment to be marked based on a particular calculation of incident energy made at one moment in time and then expect it to be valid at some future time. This proposed labeling is not reasonable, practical, nor does it provide for adequate personnel safety. In addition, it may result in a false sense of security and a safety hazard in the future. In fact, any calculation or determination of work conditions, as required by the proposal, actually needs to be made and assessed each time and immediately prior to conducting work on energized equipment if personnel safety is to be assured. The current proposal raises several critical questions, for example.

1. Who is responsible for ensuring accurate calculations are made initially and in the future (i.e., AHJ)?
2. Is relabeling required each time the utilities or the customer's system is modified?
3. Is the customer responsible for recalculating the value every time they want to work on an energized system?
4. What obligation does the qualified worker have to verify that the posted values are current and accurate?
5. What obligation does the employer or the qualified worker have to verify their safety and the accuracy of the label?

The issue that is actually raised by this proposal is Safe Work Practices and Procedures; something the utility industry is readily familiar with and for which it has adopted standards for its employees who may be subject to similar or the same work conditions. The millions of existing electrical installations worldwide will not benefit from the labeling of incident energy. Only safe work practice and procedures will assure the safety of the qualified worker for both new and existing installations. While some persons may advocate prohibiting the practice of working on energized equipment, it is realized that it is not practical as there will be some situations where that practice is unavoidable. It is time for the electric industry to establish a good and reasonable set of Safe Work Practices and Procedures for personnel working on energized equipment; practices that, based on evidence provided by the proposer; it has evidently failed to do. The requirements are identified in NFPA 70E and it is a good document to provide and to enforce to accomplish the recognition and use of these Safe Work Practices and Procedures. Some may argue that the work practice requirements would not be applicable for all cases, or may be extreme for some cases, but a good field standard needs to be developed and used. It should be considered reasonable and appropriate to develop a general standard practice to be used instead of trying to "tailor" requirements on a specific basis. While it may be considered extreme for some situations, it would provide a general level of safety for all situations. This is similar to what utilities have done for some time. For example, utility work practices and procedures are the same for its personnel whether they are working on an urban or rural installation of the same type. Therefore, the use, application, reference to or extraction of the requirement of NFPA 70E is recommended either as a stand-alone document or for development of industry wide safe work practices and procedures, especially for working on energized equipment.

STAUFFER: Requiring detailed arc-flash hazard information on electrical distribution equipment is not practical because the incident energy available depends on many factors. It is also subject to change over time due to modifications of the electrical distribution system, or changes by the supplying utility. I addition, the proposed revisions to 110.16 do not specify who is responsible for calculating the incident energy, labeling the equipment, and verifying the available incident energy and labeling. This proposal creates potential legal liability problems for designers, installers, owners, and authorities having jurisdiction.

MINICK: NEMA is a strong supporter of NFPA 70E and safe work practices. However, the proposed revision will create an untenable situation in the context of the NEC. NFPA 70E is only useful if the ENTIRE document is understood and followed. Adding a label to equipment will only serve as a means for individuals to "short-cut" the process and assume they know more than they really do about proper work practice.

The NEC is an installation code and NOT a work practice document. Inspectors cannot reasonably inspect to this requirement. Is the value of the label correct? Which calculation is acceptable? What if the value is wrong? Has the installing contractor and approving inspector taken on the liability for a work practice issue that is not normally in their domain? What if the transformer is changed and the fault current goes up?

Proper work practice requires that the worker understand the present situation he or she is faced with and develop a work plan that is appropriate. Part of that work practice is to do analysis and calculations before you perform the work. The information proposed for the label may make sense for a large industrial that has complete control over their system and has procedures in place to properly utilize the information. But the NEC is not a document just for large industrials, it is applied everywhere. It is difficult to understand, what a typical installer is going to do for the panelboard installed at a convenience store to apply the proper labeling, or if that labeling will mean anything to the individual that may do maintenance work in such a location.

The revision is not appropriate for the NEC.

Although Incident Energy and Available Fault Current are two separate considerations it should be recognized that neither value is static. The values are subject to change and the change can, and usually does, take place without anyone's knowledge.

The logic applied by the panel members in their explanation of the negative vote for the proposal to 110.16 for the 2005 NEC is synonymous to the logic that the panel members should apply to the proposed 110.24. The concerns for safety haven't changed.

Panel Meeting Action: Reject
Panel Statement: The panel continues to support the concepts in Proposal 1-183 as evidenced by its action on Comment 1-115.
Number Eligible to Vote: 12

Comment on Affirmative:

ANTHONY, M.: See my statement on Comment 1-115.

1-115 Log #605 NEC-P01 **Final Action: Accept**
(110.24)

Submitter: Donald R. Cook, Pelham, AL
Comment on Proposal No: 1-183
Recommendation: Accept this proposal in principle.

The task group identified in the following substantiation recommends rejection of Proposal 10-72 to achieve correlation with Proposal 1-183. The task group recommends the proposal be accepted in principal as follows:

110.24 Available Fault Current.

(A) Marking. Service equipment in other than dwelling units shall be legibly marked in the field with the maximum available fault current. The field marking(s) shall include the date the fault current calculation was performed and be of sufficient durability to withstand the environment involved.

(B) Modifications. When modifications to the electrical installation occur, that affect the maximum available fault current at the service, the maximum available fault current shall be verified or recalculated as necessary to ensure the service equipment ~~interrupting~~ ratings are sufficient for the maximum available fault current at the line terminals of the equipment. The required field markings(s) in (A) above shall be adjusted to reflect the new level of maximum available fault current.

Exception: The field marking requirements in (A) and (B) shall not be required in industrial installations where conditions of maintenance and supervision ensure that only qualified persons service the equipment.

Substantiation: Proposals 1-183 and 10-72 propose an available short circuit current marking requirement for electrical equipment. Both were Accepted in Principle by CMP-1 and CMP-10, respectively. The Technical Correlating Committee directed a Task Group be formed to determine if comments could be submitted to correlate the two actions. The Task Group was made up of Neil LaBrake, Michael Anthony, Mike Johnston, Vince Saporita, Alan Manche, Carl Fredericks, Jim Dollard, Gil Moniz, and Donny Cook. The task group compared the two Panel Actions and developed Public Comments for each action. The Task Group recommends the marking requirement be located in 110.24 rather than 240.35 based on short circuit current requirements that currently exist in 110.9 and 110.10 and marking requirements that currently exist in 110.22. Based on that consensus, the Task Group recommends Proposal 1-183 be accepted with recommended modifications. The word "maximum" was added in an attempt to clarify the requirements as an equipment rating consideration and not for use in conjunction with arc flash hazard analysis. The other revisions suggested are an attempt by the Task Group to include areas of general agreement into this section after reviewing the actions of both CMP-1 and CMP-10. The Task Group encourages CMP-1 to take all public comments and the CMP-10 action on Proposal 10-72 (copy provided) into consideration in developing this section. See the companion comment for Proposal 10-72.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-117.

Comment on Affirmative:

ANTHONY, M.: Considerable thought has been given to the consequences of our industry's acceptance of this proposal. Educational facility electrical professionals have been polled on this issue several times over the past 10 years. APPA.ORG has entered abstentions for the past three code cycles and now the time is right to submit a clear Yes or No.

These previous abstentions were significant because our vote was the determining vote in forestalling the mandatory requirement for calculating incident energy numbers and placing them on every piece of electrical equipment over 50V, in every building, in every school and campus in America. Even if we could afford it, and electrical safety was the only safety issue we had to deal with, the undertaking was incomprehensibly large.

We also found electrical professional in our industry divided; with opinions lining up pretty much along the same 7-4-1 voting pattern as the interest groups on CMP-1 itself. Flash hazard analysis, asserted through NFPA 70E and carried through on a label required in 110.16, was appreciated -- if for no other reason than it was a way to justify a budget for get circuit diagrams drawn and maintained.

Now comes a proposal with more modest aims (i.e., scalable, more affordable) but with pitfalls of its own. We have had plenty of time -- since about 1999 -- to adjust to the budget impact. It is our hope that acceptance of this proposal will serve the purpose of accelerating development of real-time impedance instrumentation that can be a point on a smart grid just as easily as ammeters and voltmeters. Please refer to the attachment, and IEEE paper, authored by Thomas L. Baldwin, Michael J. Hittel, Lynn F. Saunders and Frank Renovich Jr. titled, "Using a Microprocessor-Based Instrument to Predict the Incident Energy From Arc-Flash Hazards". In case the attachment cannot be duplicated in the ROC document itself, the abstract of this paper is reproduced below:

"To assess the potential arc hazards of a workspace, workers must rely on engineering fault studies to provide vital fault-current data. An instrument, based on a network impedance analyzer, determines the maximum flash-arc incident-energy exposure at a worksite within a few seconds. The digital analyzer measures the power system source impedance, ratio, and the system voltage to predict the bolted fault current and incident energy, while the power distribution system is energized and in normal operation. The instrument computes the incident energy for standard electrical workspaces of an open-air arc and an enclosed box with one open side. Experiments have been conducted to verify the accuracy of the impedance and ratio measurements."

How many of these instruments do we need to build before they become economical enough to include in a standard metering package? Related to the matter or scale is whether an impedance measuring instrument, applied where fault current varies widely, is more cost effective than IEEE 1584 calculation methods. As a respected voice in our industry writes in Comment 119 regarding the practicality of a label for fault current that varies widely: "…The single group of users that might actually be able to have a full understanding of system changes over time is the large industrial users – yet, the panel has exempted them from the requirement. They are actually the ONLY group that could benefit from a label…"

This is an accurate observation, one that applies to many of 100+ small and medium sized district energy cogeneration systems run by the education and health care facilities industry. In other words, where dynamic impedance measuring instrumentation would be most likely to be applied is where it may least be needed because of the knowledgeable staffs that run low and medium voltage installations of about 1-100 megawatts.

The relevance of the NEC as an asset to our industry can be no greater than the new ideas we try to drive through it every three years. The "impedance meter" seems credible enough for a broader industry discussion. We have seen solutions-looking-for-problems in the past. Zone-selective interlocking (ZSI), for example. ZSI's first applications were intended to reduce fault current stress on a bus. Applications were generally sparse. In retrospect, it seems that ZSI-variants have been more widely adapted to solve the electrician safety problem.

In prospect, the NFPA 70-series of documents are on the verge of needing to adapt to greater public focus on the last mile of power distribution, so-called smart grid technology, a re-scaling of the normal and backup power system availability on either side of what, for the moment, is agreed as the demarcation point between serving utility and building premises wiring.

The electrical industry needs to roll in these innovations at greater pace. We'll still need a budget for keeping circuit diagrams up to date, though.

The IEEE document has been submitted to the NFPA 70 staff as part of this proposal is available for public review.

BARRIOS, L.: Although a label will not ensure compliance with the requirements of 110.9, the ACC supports this comment because it includes necessary changes to the language accepted in Proposal 1-183 during the proposal stage. Failure of this comment, developed by a TG consisting of CMP1 and CMP10 members, would result in acceptance of the language approved during the proposal stage, which is not desirable. Additional modifications that would address some of the concerns stated in the numerous comments on this proposal include 1) locating the proposed language in 110.9, which would clarify that the labeled fault current applies to the interrupting rating of equipment only and therefore not appropriate to use in arc flash calculations, and 2) limiting the scope to services 600V nominal or less.

NEWMAN SCEARCE, S.: While I support the work of the task group, I also feel there is a need to specify the label type, size and location of the information required.

1-116 Log #1222 NEC-P01 **Final Action: Reject**
(110.24)

Submitter: Ron Shapiro, HP Critical Facilities Services Delivered by EYPMCF
Comment on Proposal No: 1-183
Recommendation: Delete text as follows:

~~**110.24 Available Fault Current**~~

~~**(A) Field Marking. Service equipment in other than dwelling units shall be legibly marked in the field with the available fault current. The field marking(s) shall include the installation date and be of sufficient durability to withstand the environment involved.**~~

~~**(B) Modifications. When modifications to the electrical installation occur, that affect the available fault current at the service, the available fault current shall be verified or recalculated as necessary to ensure the service equipment interrupting ratings are sufficient for the available fault current at the line terminals of the equipment. The required field marking(s) in (A) above shall be adjusted to reflect the new level of available fault current.**~~

Substantiation: If available fault current is marked on equipment, it will almost always be established conservatively, so that the value is artificially high. Often it will be calculated using an infinite primary transformer calculation. This is satisfactory for interrupting capacity and withstand comparisons for equipment selection, but could result in death to an electrical worker that uses this information to determine incident energy values. When marked fault current is artificially high, it will often result in theoretically faster acting inverse time overcurrent protective device; lower incident energy and eventually a lower PPE requirement will result. An electrical worker performing testing or other energized work may be hurt or killed from inadequate PPE selection stemming from the use of artificially high fault current values.

1-117 Log #1322 NEC-P01 **Final Action: Reject**
(110.24)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Comment on Proposal No: 1-183
Recommendation: Reject this proposal and delete suggested text.
Substantiation: This proposal should be rejected based on the following rationale.

1. Some utilities publish tables of available fault current at the secondary terminals of the lowest impedance transformers they provide based on an infinite supply bus of radial distribution systems. These are usually for service voltages below 600 volts. For example, see Section 9.3 of our Company's ESB 750 (http://www.nationalgridus.com/electricalspecifications). Higher voltage services, i.e. greater than 1000 volts are engineered where the utility would provide available characteristics at the time of design/installation from the supply at the service point. These two provisions can change, as the utility system is dynamic. Those described for under 600 volts are now being changed in our Company to reflect the new efficiency standards of distribution transformers.

2. With the advent of Smart Grid systems, the available fault current can change very quickly. Posting of the maximum available fault current supports the mistaken belief that that is the worst case. While it is for equipment ratings, it is not for arc hazard analysis. It can be likely that posted values on the equipment would be used for arc hazard energy calculations rather than equipment upgrades. It is better for a customer to be talking with the utility when upgrades are planned rather than assuming the posted values on the equipment can be used.

3. A customer is responsible to consult with their serving utility when working on their service connection that includes the premises service equipment. There are just too many variables that can change when making fault current calculations.

4. For equipment ratings, the maximum available fault current at any location would need to be considered and include motor and parallel generator contributions from the connections to premises wiring on the load side of the service point. This is something the premises owner will need to calculate based on their connected equipment.

5. Field marking equipment whether at the service equipment or elsewhere in the premises wiring would need to consider points 1 and 4 above.

6. Since NEC sections 90.8, 110.9, and 110.10 apply whether it is a new installation or altering of premises wiring, it should be sufficient for enforcement and examination under 90.4 and 90.7 to ensure equipment meets the capability of the maximum available fault current at any location within. Dated field marking is not necessary in this regard and its information could be misapplied in the future if values are not verified or used for other purposes than the intent of the equipment's withstand rating.

Although the concept of the proposal is plausible, it appears this field marking requirement is a design and/or work practice issue that is not covered by the NEC (see 90.1(C) and 90.2(A)).
Panel Meeting Action: Reject
Panel Statement: The panel continues to support the concepts in Proposal 1-183 as evidenced by its action on Comment 1-115.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

LABRAKE, JR., N.: This Comment should have been accepted. There are too many variables for this number to be consistently calculated. As was stated in the Comment and during the Panel discussion, the maximum value of the fault current can change moment to moment. Consider also momentary interrupting and short time duty ratings of equipment. In addition, this is a work practice issue that is not covered by the NEC.

Comment on Affirmative:

ANTHONY, M.: The submitter raises important points about the variability of fault current but the prospect for innovation is worth the risk, in my view. Acceptance of the proposal takes us up onto the other side of the service point; into the realm of that richly interconnected last mile of power distribution, under the purview of state utility commissions, which is part of the present smart metering and energy security zeitgeist. See my statement on Comment 1-115 and Comment 1-118.

Additionally, I have provided the following:

(a) an IEEE paper titled, "Impact of Available Fault Current Variations on Arc-Flash Calculations", and

(b) NEMA's Publication: "Arc Flash Analysis -- Utility System Parameters Critical for Accurate PPE", as part of this comment.

Note: Supporting Material is available for review at NFPA Headquarters.

1-118 Log #1492 NEC-P01 **Final Action: Reject**
(110.24)

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 1-183
Recommendation: Please reconsider these two proposals and reject them.
Substantiation: I would like to commend both CMP-1 and CMP-10 for trying to resolve this issue. We agree that the issue of incident energy poses a potential hazard for electrical workers working on exposed and energized electrical components of electrical equipment. However, marking of the equipment will not resolve this issue. This is because the electrical supply system is a dynamic electrical system and source fault current will not be a constant. With the pressure on the electric utility to have dynamically reconfigurable supply systems through "smart-grid" technologies, the dynamics of the electrical supply system and the resultant changes in source fault current will be occurring. Rather than a marking, which will be wrong and will lead the qualified person into a false situation, we recommend the electrical industry develop a dynamic fault current and incident energy measuring device.

This device could be portable or permanently wired and work very similarly to a SureTest branch circuit analyzer (example Model 61-165). It can measure available short circuit current on a branch circuit without tripping a circuit breaker or operating a fuse. Rather than relying on a "marking" on the equipment, a device such as this one at the service will tell the actual available short circuit current available. Knowing the actual short circuit current available will provide the qualified electrical person the correct information about the potential hazard the individual situation poses.

A companion comment has been sent to Code-Making Panel 10 regarding the rejection of Comment 10-72 to section 240.35.
Panel Meeting Action: Reject
Panel Statement: The panel continues to support the concepts in Proposal 1-183 as evidenced by its action on Comment 1-115.

Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-117.

Comment on Affirmative:

ANTHONY, M.: See my statement on Comment 1-115 and 1-117

In my research on proposal 1-183 I wanted to explore a hunch -- described in my abstention in the ROP -- that dynamic impedance information required to conform to the intent of Proposal 1-183 a requirement may cause "staffing up" at many serving utilities; a cost claim which would then be conveyed into public utility commissions. The following is a summary of how some of them handle engineering specifics for building a new, or altering, an existing service:

1. Florida Power & Light - Utility will inform Customer of fault current availability.
2. Pacific Gas & Electric - Customer shall inform the Utility of the service equipment interrupting rating.
3. Gulf Power - Utility will inform Customer of available short circuit current
4. Electrical District No. 3 (Arizona) - Fault Current Tables + Utility Guidance
5. City of Fort Collins (Colorado) - Tables + Customer shall inform Utility using Tables
6. City of Mountain Lake Terrace (Washington) - Customer shall compute service equipment interrupting rating assuming Utility infinite bus.
7. Nova Scotia Power - Tables + Utility Consultation assuming Utility infinite bus
8. Arizona Power (APS) - Customer shall request available fault current from the Utility but some tables provide some data assuming Utility infinite bus.
9. Progress Energy (Carolina Service Area)- Utility provides short circuit information for limited class of cases. Utility supplies information to Customer for all others.
10. Ameren Energy - Utility shall inform Customer

It should be plain from this limited sample, that utility practice in delivering fault current information spans across three distinct possibilities depending upon the characteristics of the utility and the customer load. In all cases, its appears that an NEC requirement for fault current availability will raise utility costs -- but the cost for documenting the last mile of distribution would have to have been done anyway in light of regulatory and market initiatives to advance progress of the Smart Grid.

1-119 Log #1589 NEC-P01 **Final Action: Reject**
(110.24)

Submitter: Jim Pauley, Schneider Electric
Comment on Proposal No: 1-183
Recommendation: Reject the proposal.
Substantiation: The panel is accepting a marking that will have no meaning and not serve a useful purpose. Consider the following:

· As the utility members have pointed out on numerous occasions, the marking is only as good as the information being supplied. A marking that states 22,000A today could easily be 30,000A or 15,000A a year later. As such, what good does a specific marking do for the installer, the inspector or the user? What is more important is that the equipment has a proper rating for the available fault current at the time of installation. If the system parameters change later, then everything has to be re-evaluated, including the new available fault current.

· The value provided on the label WILL end up being used in arc flash analysis. As the panel is well aware, using an inaccurate value in the arc flash calculation can result in assumptions regarding personnel protective equipment being wrong. Utilities will generally provide fault current values and parameters that are almost always higher than what is available. In an arc flash calculation, having a lower than expected fault current can actually result in higher arc flash energies due to the longer opening times for the overcurrent devices.

· What value does the label serve? If the inspector is relying on what is written on the label to determine whether the equipment is properly rated, then he/she still has no confidence in the actual value. Why couldn't an installer just write in a value that is always under the equipment rating? If the answer is that the inspector will need to check the calculations that result in the value, then why does it have to be put on a label? The inspector simply needs to check the equipment rating against the calculations. The label serves no value to any "future" user or installer. Why? Because there is absolutely no way for the future person to know if the system parameters are still the same. Even though the label requires an installation date, it still doesn't change the fact that the label may or may not be correct. If the user has to re-verify the fault current a year later in order to add a breaker or do some other work, then what purpose does the label serve?

· The single group of users that might actually be able to have a full understanding of system changes over time is the large industrial users – yet, the panel has exempted them from the requirement. They are actually the ONLY group that could benefit from a label.

I am concerned that the panel may not have a full understanding of the implications of adding these types of labels to products. It exposes the installer, the inspector and the utility to significantly increased liability – and it increases that exposure in a documented manner. Are the numbers correct? Who says they are correct? If they are on the label, the utility, the installer and the inspector have all had a hand in the number and are on the hook for the documented value. Consider a label that says 40,000A because that is what the contractor believed to be correct. Further assume that the actual fault current is 48K. Since the equipment is rated 50K, the installation is actually safe. However, the 40K marking on the equipment can create a decision path that leads to increased exposure. If a future installer relies on the 40,000A marking and installs a device into the equipment that meets 40K, but is under the 48K. That inaccurate marking has now created the path of liability for the utility, inspector and installer.

The marking adds no value to the system. It provides nothing to the initial installer or inspector and its lack of presumed accuracy makes it of no value to the future user or installer.

1-120 Log #1714 NEC-P01 **Final Action: Reject**
(110.24)

Submitter: John Hiller, Omaha, NE
Comment on Proposal No: 1-183
Recommendation: Delete Section 110.24 in its entirety.
Substantiation: 1) Sections 110.9 & 110.10 already address determining the fault current and matching that fault current to the electrical distribution equipment.
Marking the fault current at a given date would decrease safety with respect to future installations, maintenance, and analysis that would use this value as a starting point.

2) What role does the Authority Having Jurisdiction (AHJ) have in verifying the fault current is correct? The AHJ would not have the information or the ability to make these calculations. Enforcement of this proposal would be nearly impossible.

3) There was some question it appears among the CMP as to what fault current should be marked - the available fault current from the utility or the calculated fault current. If this marking can have multiple answers, what value does the marking provide?

4) The marking will represent the fault current on a specific date only and may not truly represent the fault current at another time due to changes to the utility system. What reward does a correct marking provide? What safety risk does an incorrect marking cause? Is the risk worth the reward?

1-121 Log #2266 NEC-P01 **Final Action: Accept in Principle**
(110.24)

Submitter: Michael J. Farrell, III, Lucas County Building Regulations
Comment on Proposal No: 1-183
Recommendation: Continue to Proposal accept 1-183 as modified by the panel.
Substantiation: There has been "discussion" about the potential of people incorrectly using the maximum available short-circuit current for arc-flash hazard calculation purposes. A recent IEEE paper introduced new calculation methods so that this potential is no longer an issue.

An IEEE paper, "Impact of Available Fault Current Variations on Arc-Flash Calculations", by Eaton Electrical, was presented at the Petrochemical Industries Committee (PCIC) meeting in September, in Anaheim, CA. The point of the paper is that accurate arc-flash hazard calculations can be performed without knowing the precise available short-circuit current from the utility. In fact, the calculations work well without knowing anything about the availability from the utility. (This very powerful paper may very well change the way NFPA 70E approaches arc-flash hazards).

As far as Proposal 1-183 is concerned, and with the procedures introduced by this paper, available short-circuit current marking can easily be utilized for equipment ratings only, without worry that someone will mistakenly use the values for arc-flash calculations.

Note: Supporting material is available for review at NFPA Headquarters.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-183
Recommendation: Reject the proposal.
Substantiation: The proposed text is beyond the scope of the NEC because it addresses grandfathered installations. This is one of the areas where NFPA 70E diverges in scope, and properly so, from the NEC. No NEC provision requires an action to be taken on an electrical installation simply because some external actor (in this case an electrical utility, presumably) changes a parameter. Even 406.3(D)(2), covering receptacle replacements where current NEC rules require GFCI protection, does not invade the domain of grandfathered requirements because the site electrical installation is being worked on in the process covered. The rule proposed here as 110.24(B) would require an action to be taken on an electrical installation even if no activity, by reason of simple maintenance or otherwise, were performed on site. As such, the proposed rule does not fall within 90.1(B), where it is recognized that that the initial installation will be "essentially free from hazard" but that a compliant installation will not be "necessarily efficient, convenient, or adequate for good service or future expansion of electrical use."

This wording is also unenforceable because the labeling that it will require may or may not become obsolete after it is applied, through no fault of any party to the process. The most frequent source of increased available fault currents is utility activities on their networks. If the day after the final inspection the utility upgrades its transformers and primary distribution outside the facility, the labeling will be obsolete from that day forward.
In this case, the obsolescence of the labeling creates a direct hazard, because those servicing the equipment will tend to believe the label; they will have entered a fool's paradise. There does not appear to be any way to make this proposal practicable, unfortunately. There is no substitute for contemporaneous application of 110.9 and 110.10, which in turn requires communication with the utility.

Panel Meeting Action: Reject

Panel Statement: The panel continues to support the concepts in Proposal 1-183 as evidenced by its action on Comment 1-115.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-117.

Comment on Affirmative:

ANTHONY, M.: See my statement on Comment 1-115. The submitter's comment about un-enforceability is not to be taken lightly. When set against the prospect for innovation in predicting flash hazard with cost-effective instrumentation, acceptance of Comment 1-115 is worth the risk in the short run, in my view.

1-123 Log #2885 NEC-P01 **Final Action: Reject**
(110.24 (New))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Comment on Proposal No: 1-182
Recommendation: PLEASE REJECT THIS PROPOSAL.
Substantiation: WAY TOO COSTLY TO IMPLEMENT ON A MINOR MODIFICATION OR SIMPLE ADDED CIRCUIT TYPE JOB. IT CAN BE UpDATED WITHOUT EVEN KNOWING IT, IF THe UTILITY CHANGES A TRANSFORMER. A NEW LOWER FAULT CURRENT COULD IN FACT –PRODUCE A HIGHER RATED ARC FLACH BECAUSE OF THE LENGTH OF TIME NEEDED FOR A DEVICE TO SENSE THE PROBLEM AND OPEN. WHETHER WE LIKE IT OR NOT, OTHERS WILL SEE THIS AND USE IT TO (WRONGLY) CALCULATE ARC FLASH PROTECTION NEEDED, WHEN IT COULD BE VERY VERY WRONG, ALMOST AS SOON AS IT WAS POSTED.

Panel Meeting Action: Reject

Panel Statement: The panel continues to support the concepts in Proposal 1-182 as evidenced by its action on Comment 1-115.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

LABRAKE, JR., N.: See my explanation of negative ballot on Comment 1-117.

1-124 Log #2883 NEC-P01 **Final Action: Reject**
(110.24, FPN)

Submitter: Timothy D. Curry, Curry Electric, Inc.
Comment on Proposal No: 1-183
Recommendation: ADD A FPN to read as follows:

FPN: THIS VALUE SHALL NOT BE USED TO CALCULATE PROPER PPE, PER NFPA 70E.

Substantiation: WHETHER THE PANEL ACCEPTS IT OR NOT, THIS VALUE WILL BE USED TO CALCuLATE "A PARTICULAR LEVEL OF PPE".

THE FPN MAKES IT CLEAR THAT THIS IS NOT THE CASE.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide a statement of an alleged problem, or substantiate that the comment would resolve the problem, as required by 4.4.5(d) of the NFPA Regulations Governing Committee Projects.

In addition, the comment does not conform with 3.1.3 of the NEC Style Manual that states that Fine Print Notes cannot contain requirements or be written in mandatory language.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-125 Log #2274 NEC-P01 **Final Action: Reject**
(110.24(A))

Submitter: Harold F. Willman, Colorado Code Consulting
Comment on Proposal No: 1-183
Recommendation: Revise to read as follows:

(A) Marking. Electrical equipment such as switchboards, panelboards, industrial control panels, motor control centers, and HVAC equipment, that are in other than dwelling occupancies, shall be field marked with the available short-circuit current and the date the label was applied. The label shall include the available short-circuit as stated by the utility company and the size of the transformer.

Substantiation: Transformers are changed out by the utility company for various reasons. When someone works on the electrical equipment and the transformer has been changed, the label will identify the short-circuit rating and size of the old transformer. Those working on the electrical equipment should realize that the short-circuit rating has also changed for the electrical equipment.
Panel Meeting Action: Reject
Panel Statement: The intent of the submitter's recommendation was unclear to the panel.

In addition, see the panel action and statement on Comment 1-115.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

FISKE, W.: We are in complete agreement with CMP-1 vote to Reject this comment, but make one additional observation about the comment and Proposal 1-183 on which it is based. Proposal 1-183 adds "HVAC equipment" to the originally-proposed list of items needing arc-flash warning, i.e. the same equipment list as appears in 110.16. Neither the proposal nor the comment contains a single word of substantiation for adding HVAC equipment to the list of equipment that could present an arc-flash hazard. Items identified in 110.16 are devices, but HVAC equipment is utilization equipment. That part of the proposal puts an apple into a bowl of oranges, so to speak.

1-126 Log #1703 NEC-P01 **Final Action: Reject**
(110.26)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-186
Recommendation: Delete text.
Substantiation: Access and working space is covered by specific provisions elsewhere in the NEC, including equipment to which it applies. This provision is general, nonspecific, and applies to all equipment such as raceways and cables which do not require personnel access and working space for safe operation.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide the proposed text to be deleted as required by 4.4.5(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-127 Log #2118 NEC-P01 **Final Action: Reject**
(110.26 (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 1-192
Recommendation: Accept the Proposal in Principle. Integrate the illustration into the text as a Fine Print Note at the end of Section 110.26(A) and Section 110.26(A).
FPN: The two distinct indoor installation spaces required by 110.26(A) and 110.26(F): the working space and the dedicated electrical space.
Substantiation: Of the four proposals submitted to this committee suggesting the use of some illustrations for this article, this is the one illustration that would have the most impact illustrating the concepts of working and dedicated space. The submitter and the committee should bear an equal burden of proof for technical substantiation. As the NFPA Regulations Governing Committee Projects makes plain in Section 4.4.4.d, "technical substantiation" is, itself, unsubstantiated.

The NEC Style Manual permits the addition of illustrations as long as they are identified as a Fine Print Note. For the convenience of the Committee, the rules for using illustrations is reproduced below:
2.3.2 Nonmandatory. When the *NEC* is adopted into law, graphics in the text of the document become mandatory. If a Code-Making Panel wishes to use a table or figure to illustrate only a typical situation, not a mandatory requirement, that table or figure shall be identified as a fine print note or be placed in an annex. Each table shall have a title and each figure shall have a caption.

As stated in the original proposal, users should not have to purchase the NEC Handbook in order to understand the NEC. Quite possibly, judicious use of one or two illustrations in this section, leavening the look and feel of the NEC, might provide technical substantiation in terms of market penetration. Illustrations are already present in Figure 410.2, illustrating closet storage space and Figure 515.3, illustrating Marine Terminal Handling Flammable Liquids, for example.
An illustration from the NEC Handbook has been provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided as to why this information is necessary in the code. The submitter has indicated that the information is available in the NEC Handbook.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

ANTHONY, M.: I do not think NEC Handbook purchase should be necessary to understand the NEC and the workspace/dedicated space rules of this Article are not easy to visualize without the NEC Handbook. Some argue that because the NEC is not a document for persons untrained in its use, its writers are under no obligation to make such rules easy to visualize. I think a compromise is possible with judicious use of illustrations in Chapter 1.

Some states want to make consensus documents like the NEC "freeware" wherever consensus documents are adopted as public law. They argue that all laws -- even those that promulgate such laws by reference to ANSI consensus documents -- should be available at no cost to the citizenry. Anyone familiar with ANSI processes understands the enormous costs involved in preparing any ANSI-conforming document. New revenue models would have to be put in place. New document, development, delivery and enforcement models would have to be invented.

In the intervening time, it seems that a fair argument can be made that judicious use of illustrations in the NEC could forestall advancement of the freeware position because the laws that reference the NEC would not require yet another document to understand the NEC itself. Rejection of this proposal is an opportunity missed.

1-128 Log #1981 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 1-196
Recommendation: This proposal should be accepted.
Substantiation: The issue is the use of the word "require" in the existing text. This word limits the enforcement of the working space rules as there is nothing that "requires" someone to "examine, adjust, service, or maintain" electrical equipment while it is energized. In fact there are standards and safety rules that prohibit doing most types of work on energized electrical equipment. The elimination of the word "require" will improve the enforceability of this very important code rule.
Panel Meeting Action: Reject
Panel Statement: The submitter misunderstands use of the word "require" as it is used in 110.26(A). In this context, "require" means "need". If it is probable that examination, adjustment, servicing or maintenance will need to be performed on energized equipment, then 110.26 applies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-129 Log #2190 NEC-P01 **Final Action: Reject**
(110.26(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-195
Recommendation: Accept revised as follows:

Working space required by 110.26 for switches, (except snap switches), circuit breakers, contactors, motor starters, transfer switches, panelboards, switchboards, motor control centers, control panels, service equipment, and the like, operating at 600 volts, nominal, or less, shall comply with dimensions of 110.26(A)(1)(2) and (3,) unless required or permitted otherwise in this Code.
Substantiation: "Equipment" includes motors and other types of equipment. The equipment in the proposal is almost certain to require examination, adjustment, or maintenance while energized, to check for line voltage, load voltage (open fuses), conductor and terminal temperature, etc. "While energized" has apparently been used to avoid compliance with work space requirements where disconnecting means have been installed for air conditioners, heat pumps with very little space between the two, with an assertion that they can be deenergized by the branch circuit, feeder, or service disconnecting means. This assertion can be applied to service disconnecting means since they can be deenergized by removing a plug-in watt hour meter or a call to the serving utility. "To ground" is superfluous.
Panel Meeting Action: Reject
Panel Statement: Listing examples of the equipment requiring examination, adjustment, servicing, or maintenance while energized does not enhance clarity or usability, but may lead the user of the Code to believe equipment not so listed are not included.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-130 Log #2743 NEC-P01 **Final Action: Reject**
(110.26(A)(2))

Submitter: Randal Hunter, City of Las Vegas
Comment on Proposal No: 1-203
Recommendation: Revise text to read as follows:
(2) Width of Working Space. The width of the working space in front of the electrical equipment shall be the width of the equipment or 762 mm (30 in.), whichever is greater. In all cases, equipment doors or hinged panels shall open at least 90 degrees and the work space shall permit at least a 90 degree opening of equipment doors or hinged panels.
Substantiation: This has been brought forward again at the suggestion of some of the UL staff, after they had expressed disagreement amongst their own staff as to whether or not a door actually has to open 90°. After receiving the official interpretation from the UL PDE that doors don't actually have to open 90 degrees, only the UL standard and the code require the "space" to allow a door to open 90 degrees, I felt the language needed to be made clearer, and less interpretive. The changes above leave no doubt as to the requirement that we must have the doors open 90 degrees.
As to the panel's statement that this requirement belongs in product standards, I agree. However, the basic requirement for 90 degrees should appear in the NEC to allow safe working space for electricians, and the product standard should contain specific information about how the equipment will comply with this requirement.
Panel Meeting Action: Reject
Panel Statement: The requirements in 110.26 address working space rather than product features. The equipment requirement issue is being actively addressed in applicable product standards.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: Product features are implicit in other parts of NEC.

1-131 Log #58 NEC-P01 **Final Action: Accept**
(110.26(A)(3) Exception)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 1-208
Recommendation: The Technical Correlating Committee directs that the panel reconsider the panel action to comply with the NEC Style Manual regarding the word "allowed".
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the panel action and statement on Comment 1-132 that meets the request of the Technical Correlating Committee.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-132 Log #2488 NEC-P01 **Final Action: Accept in Part**
(110.26(A)(3) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-208
Recommendation: Accept the proposal in principle. Reword as follows:
Exception: Electric meters shall be permitted to extend into a vertical working space more than 150 mm (6 in.).
Substantiation: This wording is simple, resolves the TCC complaint regarding the word "allowed", and corrects another Style Manual issue in that "this section" cannot be used. A meter socket enclosure, covered in Article 312, plainly is subject to the normal requirements in this section, and the verb chosen accentuates this because although a meter might "extend" into a vertical working space (its base would always be within such a space) a meter socket enclosure would not customarily be understood in the field as something that extended or projected in this context. Note that electric meters are plainly "associated with the electrical installation" and therefore this exception only applies to meters that extend more than 6 inches from the face of the meter socket enclosure (or other electrical equipment in a given installation space). The proposed wording makes this context clear.
Panel Meeting Action: Accept in Part
The panel accepts changing "allowed" to "permitted" and rejects the remainder of the proposed wording.
Panel Statement: "Shall be permitted" is the preferred language for permissive rules per 3.1.4.1 of the NEC Style Manual. With the exception of the word change, the panel reaffirms its action on Proposal 1-208.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-133 Log #1702 NEC-P01 **Final Action: Reject**
(110.26(C)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-210
Recommendation: Accept revised as follows: At least one entrance not less than 610 mm (24i.n) wide and 2 m (6[1]/2 ft) high shall be provided to provide access to and egress from the required working space.
Substantiation: The provision should relate to the required space covered by this section. All electrical equipment does not require personnel working space, such as raceways and cables after installation. Working space requirements should apply as specified in the first paragraph of 110.26 (A).
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide adequate technical substantiation for the change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-134 Log #1754 NEC-P01 **Final Action: Reject**
(110.26(C)(3))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 1-218
Recommendation: This proposal should be accepted in principle as follows:
110.26(C)(3) Personnel Doors. Where equipment rated 800 A or more that contains overcurrent devices, switching devices, or control devices is installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure."
Substantiation: This comment and associated proposal seek to reduce the ampere threshold in 110.26(C)(3) for personnel doors. This comment does not constitute new material as the proposed action is seen in the ROP negative statement of Mr. Hickman. As stated by Mr. Hickman there are serious safety concerns due to the personnel door requirement being tied to the equipment threshold of 1200-amps.
As illustrated in the ROP by Mr. Hickman:
Consider two separate installations; (1) a 277/480-volt, 1200-amp feeder supplying a switchboard and (2) a 277/480-volt, 800-amp feeder supplying a switchboard. The present text would require personnel door(s) to open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure for the 1200-amp feeder but not the 800-amp feeder. The 277/480-volt, 1200-amp feeder would require ground-fault protection of equipment in accordance with 215.10 but the 277/480-volt, 800-amp feeder would not.
It is well understood that the above scenario is a serious safety concern. It is prudent to recognize the GFP provisions of 230.95 and 215.10 at 1000 amps and reduce the personnel door threshold to the next smaller standard OCPD size in 240.6. Reducing this value from 1200-amps to 800-amps enhances safety for the installer/maintainer and is not overly restrictive.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated that there is a need to lower the existing 1200 A threshold, or that, if so, 800 A is the correct threshold.
In addition, the substantiation does not include reports of accidents or near-misses involving switchgear rated less than 1200 A.
The submitter cited 215.10 and 230.95 as precedent for a 1000 A threshold, then without further explanation, recommends 800 A.
The submitter has not established the need for linking the requirement for panic hardware with the need for ground fault protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

ANTHONY, M.: The submitter has raised two points worth repeating:

1. It is "common knowledge" that serious injuries and fatalities occur from arc flash/blast in equipment rated 30 to 1000 amps.

2. While the trigger of 1200 amps may be appropriate for the need for two doors, it is not substantiated with respect to personnel safety. Serious injury and fatalities have, and continue to occur in equipment rated at levels far below 1200 amps.

The 800A ampere limit is a reasonable threshold because it tends to be the ampere rating designers select when they want to avoid the cost of ground fault protection. I personally like building distribution feeders in 400A and 800A runs because I have a sense that feeders of this size are most economical. This tendency, not documented but frequently seen, meets the substantiation criterion, in my view.

The committee is asking the submitter to produce data on near-misses. Near misses are hard to count; bodies are not. The Common knowledge that forms the bedrock of the NEC is hardly estimable. It is the sum total of each other's experience that we have to count on when evaluating proposals and comments and I would put the submitter's experience ahead of my own.

One other fine point that was not raised in either the proposal or comment phase is the mounting style of equipment 1200A and below; i.e. free-standing switchboard or wall mounted. For 480V equipment, for example, 800A is the upper limit for wall-mounted equipment. The enclosure construction, the physical space occupied by the enclosure differs, and thus the hazards, differ.

HICKMAN, P.: We believe that this comment should have been accepted. The submitter of Proposal 1-134 and this comment has correctly identified a serious safety concern. Panel 1 correctly asked that additional substantiation be presented in a comment and the submitter has done so.

We agree with the substantiation recognizing the reduction of the 1200-amp threshold to the next level below the industry-recognized 1000-amp threshold for ground-fault protection of equipment (to the next smaller standard OCPD size below 1000 amp in 240.6; 800-amps). This recommendation does not specifically tie the need for panic hardware to the need for GFP but rather identifies an example of a level of equipment ampacity size that is a logical balance between always requiring panic hardware at any ampacity level of equipment (such as on 30 amp equipment) and an ampacity level modestly below the present level of 1200 amps.

HITTINGER, D.: This comment should have been accepted. The submitter has identified a serious safety concern in the original proposal and did submit substantiation in the comment. The Panel can debate the merit of the substantiation and what amperage would be appropriate but listing any amperage may be the problem. To provide a safer work space for building owners, maintenance personnel and employees, door panic hardware would be a benefit to any work space regardless of the amperage threshold so removing this value would make the work space safer. This cannot happen at this stage of the Code development process but establishing the 800 ampere threshold would be a step in the right direction.

Comment on Affirmative:

BOYCE, K.: The concept of reducing the current rating value may have merit. We look forward to reviewing additional technical substantiation to identify and support the reduced value.

NEWMAN SCEARCE, S.: While supporting the work of the committee, I agree with the "Recommendation" and "Substantiation" provided by the submitter of the ROC.

1-135 Log #1701 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 1-225
Recommendation: Accept the proposal revised as follows: A fixed lighting outlet(s) shall be installed to provide illumination for all working spaces about service equipment, switchboards, panelboards, motor control centers, and industrial control panels.
Substantiation: Working space is required for safety; how can it not be required for outdoor equipment when it is required for indoor equipment? Potential hazards would be greater for non-illuminated servicing/maintenance during darkness or inadvertently operating the wrong switching or disconnecting devices.
Panel Meeting Action: Reject
Panel Statement: Adequate technical substantiation has not been provided.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

HICKMAN, P.: We are in general agreement with the recommendation in the Proposal 1-225 and Comment 1-135, but recognize that adequate technical substantiation has not been provided. In addition, the substantiation that was provided primarily discusses the importance of work space rather than illumination (the topic of (D)).

1-136 Log #2382 NEC-P01 **Final Action: Reject**
(110.26(D)(1) (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 1-188
Recommendation: Accept the proposal with the following modifications:

Illumination Emergency Power. In the event of power supply failure, an emergency system shall automatically illuminate the areas

around electrical **service** panels **greater than 200 amperes**. The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment, or an on-site generator. This requirement is for buildings that are required to have emergency egress illumination by the building code.

Substantiation: The submitter's original proposal has been modified to restrict its application to service panels only. To repeat the submitter's original substantiation for the convenience of the Panel:

"The safety of the electrician has been overlooked in the electrical panel areas in the past. Emergency lighting needs to be installed in the areas where electrical panels are located for egress of someone that may have been injured from an electrocution. The building code has not addressed this location and the safety of those working on this type of equipment needs to be addressed by the electrical code."

To repeat the Panel 1 statement answering Mr. Williams' proposal*:*

"It is not reasonable to require emergency lighting of all the equipment listed at a particular facility. There is insufficient substantiation for this major change. The panel concludes that the proposed requirement for areas to be provided with illumination by emergency power is under the scope of the building codes. The panel refers the submitter to Article 700 of the NEC."

Another, similar proposal, submitted to Panel 13 (covering Article 700) came back rejected with the following Panel Statement:

"There was no technical substantiation provided justifying the foot-candle level for all electrical service equipment and emergency switchgear. There was no indication of whether these requirements applied to indoor or outdoor locations. There was no technical explanation for the required illumination for the service switchgear. Service switchgear is covered in Article 230, not in Article 700."

What this substantiation intends to document is that emergency illumination for electrical switchgear rooms has been placed before two committees, four Articles, for over three NEC cycles. With the submission of this concept to NFPA 110 and NFPA101, the concept will have traveled among the committees of three NFPA document committees, thus forming what appears to be a near-perfect circle of fingers

The video showing the electrician killed while racking out a breaker is available on YouTube with the search term: "Arc Flash while racking a breaker". Note that the switchgear installation did not have emergency illumination. Did it not turn on within 10 seconds? Was it because the space in front of the switchgear was not on the primary or secondary egress path? Was the concept of "ingress" ever discussed? Did the codes permit emergency illumination for electricians' as a "design choice"?

Panel Meeting Action: Reject
Panel Statement: The submitter did not provide adequate substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

ANTHONY, M.: The submitter thanks Panel 1 for its respectful and detailed consideration of this proposal. A version of it has since been submitted to the NFPA 70E committee and the outcome of the NFPA 101 committee's work on the same safety concept will be known later in 2010. We already know that the International Code Council has rejected it. If the concept of mandatory emergency illumination for electricians working on switchgear does not find a place in either NFPA 101, NFPA 70E, NFPA 70B, or in any building code, it will be re-submitted to this committee during the 2014 NEC revision cycle.

1-137 Log #1700 NEC-P01 **Final Action: Reject**
(110.26(F)(2))

1-139 Log #2119 NEC-P01 **Final Action: Reject**
(110.26(O) (New))

Submitter: Michael A. Anthony, University of Michigan
Comment on Proposal No: 1-249
Recommendation: Accept the Proposal.
Substantiation: The Panel Statement, "*Emergency illumination requirements are a function of the building codes and NFPA 101, Life Safety Code*", ignores the fact that NFPA 101 does not recognize electrical switchgear rooms as an occupancy type. Nevertheless, at the suggestion of the committee, the submitter submitted a proposal covering this issue to the applicable NFPA 101 technical committee on July 31, 2009. NFPA 101 is now in the middle of its 2012 update cycle and that proposal will be available for public review on the NFPA web site in the near future.

The only existing section of NFPA 101 that came close to applying to the electrical equipment space that is the subject of this proposal has been reproduced below:

==========EXTRACT FROM NFPA 101-2009 ==========

Chapter 9 Building Service And Fire Protection Equipment
9.1 Utilities.
9.1.1 Gas. Equipment using gas and related gas piping shall be in accordance with NFPA 54, *National Fuel Gas Code*, or NFPA 58, *Liquefied Petroleum Gas Code*, unless such installations are approved existing installations, which shall be permitted to be continued in service.
9.1.2 Electrical Systems. Electrical wiring and equipment shall be in accordance with *NFPA 70* , *National Electrical Code*, unless such installations are approved existing installations, which shall be permitted to be continued in service.
9.1.3 Emergency Generators and Standby Power Systems. Where required for compliance with this *Code*, emergency generators and standby power systems shall comply with 9.1.3.1 and 9.1.3.2.
9.1.3.1 Emergency generators and standby power systems shall be installed, tested, and maintained in accordance with NFPA 110, *Standard for Emergency and Standby Power Systems*.
9.1.3.2 New generator controllers shall be monitored by the fire alarm system, where provided, or at an attended location, for the following conditions:
- (1) Generator running
- (2) Generator fault
- (3) Generator switch in nonautomatic position

9.1.4 Stored Electrical Energy Systems. Stored electrical energy systems shall be installed, tested, and maintained in accordance with NFPA 111, *Standard on Stored Electrical Energy Emergency and Standby Power Systems*.

==========

See anything here in NFPA 101 that resembles the space around service/transfer/generator control switchgear that an electrician might need to get to in diagnosing an outage? See anything here in NFPA 101 that requires lighting an ingress path to a darkened room from, say, the parking lot where an ambulance might be waiting for a downed electrician? I found nothing in Chapter 7 of NFPA 101 or in NFPA 110 either. That may because this requirement belongs in the National Electric Code.

To restate the original substantiation: This proposal provides both an illuminated egress and ingress path for a) the electrician who is working in the service equipment area without a flashlight, b) for the maintenance mechanic who may neither be an electrician nor familiar with the electric service equipment to work on it in the dark. Electric service panels are not always installed along either the primary or secondary egress path required by the Life Safety Code and this panel should not leave it to Architects to remember that there may be someone stuck in the dark in the electrical room, or that the path to the electrical room ought to be illuminated in order to diagnose a power outage. This should be a General Requirement as much as marking of disconnects or the guarding of live parts. The 3 footcandle requirement matches the illumination levels required in 7.3.1 of NFPA 110 for Level 1 emergency power systems and follows NESC practices for vertical illumination.

Because the lack of electricity is as great a hazard to the built environment as the presence of electricity was 100 years ago, this proposal really does belong in a document that states its purpose as related to the practical and safe use of electricity arising when it is not there at all.
Panel Meeting Action: Reject
Panel Statement: The information provided is relative to NFPA 101, Life Safety Code, as stated in to the panel's action and statement on Proposal 1-249.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ANTHONY, M.: The submitter thanks Panel 1 for its respectful and detailed consideration of this proposal. A version of it has since been submitted to the NFPA 70E committee and the outcome of the NFPA 101 committee's work on the same safety concept will be known later in 2010. We already know that the International Code Council has rejected it. If the concept of mandatory emergency illumination for electricians working on switchgear does not find a place in either NFPA 101, NFPA 70E, NFPA 70B, or in any building code, it will be re-submitted to this committee during the 2014 NEC revision cycle.

1-140 Log #1955 NEC-P01 **Final Action: Accept in Principle in Part**
(110.28)

Submitter: John R. Kovacik, Underwriters Laboratories Inc.
Comment on Proposal No: 1-251
Recommendation: Revise the recommendation for Proposal 1-251 to move the proposed new text from the body of the NEC to a new Annex and add a Fine Print Note to Table 110.20 to reference this Annex.

SUMMARY of REVISIONS

1. Revise existing Fine Print Note to Table 110.20 from "FPN:" to "FPN No. 1:"

2. Add the following new Fine Print Note No. 2 to Table 110.20.

FPN No. 2: Ingress Protection (IP) ratings are not a substitute for Enclosure Type Ratings. See Annex X for an explanation of IP Ratings which may be marked on enclosures or enclosing parts of electrical equipment.

3. Add new Annex as follows.

Annex X (NEW) Ingress Protection (IP)

This annex is not a part of the requirements of this NFPA document but is included for informational purposes only.

Tables X.1, X.2 and X.3 provide the basis for determining the protection provided by products marked with Ingress Protection (IP) ratings. Ingress Protection ratings classify the degrees of protection provided by enclosures and enclosing parts of electrical equipment for two conditions: 1) the protection of persons against access to hazardous parts and protection of equipment against the ingress of solid foreign objects and 2) the ingress of water. The degree of protection against these two conditions is designated by an IP Code. Products claiming ingress protection are marked with the letters IP followed by two characteristic numerals, either of which may be replaced by an "X", with or without suffix letters. The first characteristic numeral indicates the degree of protection provided by the enclosure or enclosing part with respect to persons and solid foreign objects entering the enclosure. The second characteristic numeral indicates the degree of protection provided by the enclosure or enclosing part with respect to the harmful ingress of water. The optional suffix letters indicate protection of persons against access to hazardous parts if higher than that indicated by the first characteristic numeral.

IP ratings do not specify degrees of protection against damage of equipment, risk of explosions, or conditions such as moisture (produced for example by condensation) or corrosive vapors.

IP ratings are not to be used as a substitute for Enclosure Type Ratings specified in Table 110.20.

Table X.1 IP Rating - First Characteristic Numeral

Ingress of Human Body Parts, Tools and Solid Objects		
Numeral	**Protection against Human/Tool Contact**	**Protection against the ingress of solid objects (foreign bodies)**
0	No protection	
1	Back of hand, Fist	Large foreign bodies, diameter greater than 50mm
2	Finger	Medium-sized foreign bodies, diameter greater than 12.5
3	Tools and wires with a thickness greater than 2.5mm	Small foreign bodies, diameter grater than 2.5mm
4	Tools and wires with a thickness greater than 1mm	Granular foreign bodies, diameter greater than 1mm
5	Complete protection, (limited ingress permitted)	Dust protected; dust deposits are permitted, but their volume must not affect the function of the equipment
6	Complete protection	Dust-proof

Table X.2 IP Rating - Second Characteristic Numeral

Ingress of Water		
Numeral	**Protection against the ingress of water**	**Protection for a Specific Condition**
0	No special protection	
1	Water dripping/falling vertically	Condensation/Light rain
2	Water sprayed at an angle (up to 15º degrees from the vertical)	Light rain with wind
3	Water sprayed at an angle (any direction up to 60º degrees from the vertical)	Heavy rainstorm
4	Water sprayed from all directions, (limited ingress permitted)	Splashing
5	Low pressure water jets from all directions, (limited ingress permitted)	Hosedown, residential
6	High pressure jets from all directions, (limited ingress permitted)	Hosedown, industrial
7	Temporary immersion, 15 cm to 1m	Temporary immersion in water
8	Permanent Immersion, under pressure	Continuous immersion in water,

Table X.3 IP Rating – Optional Suffix Letters

Letter	Protection against Human/Tool Contact
A	Back of hand, Fist
B	Finger
C	Tools and wires with a thickness greater than 2.5mm
D	Tools and wires with a thickness greater than 1mm

Notes to Tables X.1, X.2 and X.3

1. Where a characteristic numeral is not specified, it is replaced by the letter "X" ("XX" if both numerals are omitted).

2. Additional letters may be omitted without replacement.

3. An enclosure or enclosing part marked with a first characteristic numeral indicating a degree of protection also complies with all lower degrees of protection for the first characteristic numeral.

4. An enclosure or enclosing part marked with a second characteristic numeral of 6 or lower indicating a degree of protection complies with the requirements for all lower degrees of protection for the second characteristic numeral. An enclosure or enclosing part designated with second characteristic numeral 7 or 8 may be unsuitable for exposure to water jets (designated by second characteristic numeral 5 or 6) and may not comply with requirements for numeral 5 or 6 unless it is dual coded such as IPX5/IPX7.

5. If an enclosure or enclosing part provides different degrees of ingress protection for different intended mounting arrangements, the relevant degrees of protection related to the respective mounting arrangements are indicated in the instructions provided with the product.

6. Where one part of an enclosure has a different degree of protection to that of another part of the same enclosure, the enclosure is marked to indicate the degree of protection for the specific parts of the enclosure.

7. For products marked with the second characteristic numeral 8, the maximum immersion depth and time are indicated in the instructions provided with the product.

Substantiation: In the panel statement for the rejection of Proposal 1-251, CMP 1 stated that this information (the proposed new text) might be suitable for inclusion in an Annex. Following this advice, the proposal has been revised to recommend that the text be included as a new Annex to the NEC. This should remove any doubt from a Code user that the added text is not a requirement. Annexes are not a part of the requirements of the NEC and are included for informational purposes only. This new Annex would be no different. The lead in sentence at the beginning this new Annex will clearly state that it is not part of the NEC and provided for informational purposes only. As Annex material the information provided does not mandate the marking of an IP rating on any product. It is intended to provide guidance in understanding the meaning of IP ratings and to raise the level of awareness of the existence of the IP rating system. The information proposed to be added will provide Code users an explanation of the protection afforded by products and equipment marked with IP ratings. It is understood US standards which require enclosed products to be marked with an enclosure type rating specify that the rating shall be from the NEMA/UL enclosure type rating system covered in 110.20 and Table 110.20 of the NEC.

Further substantiation which was provided with proposal 1-251 is stated below.

The number of products and equipment being marked with Ingress Protection (IP) ratings has increased significantly over the past few years. Although there are few products which are required to be marked with an IP rating, manufacturers are optionally applying an IP rating to many industrial, commercial and residential products, in most cases to satisfy customer needs. The IP rating system not only applies to enclosures, but also any enclosing part of electrical equipment. This translates into the opportunity to specify a level of ingress protection for open products. This system can designate a degree of protection against contact with live electrical parts, for example, contact by human body parts such as a fist, back of hand or a finger and contact by tools or wires. The IP rating system is defined in the ANSI/NEMA Standard 60529. This standard was adopted as a US National Standard in 2004. It is an adoption of IEC 60529, Degrees of protection provided by enclosures (IP Code). The ANSI/NEMA standard contains no deviations from the IEC version. However, it is understood that US standards which require enclosed products to be marked with an enclosure type rating specify that the rating shall be from the NEMA/UL enclosure type rating system covered in 110.20 of the NEC. Ingress Protection (IP) ratings has increased significantly over the past few years. Although there are few products which are required to be marked with an IP rating, manufacturers are optionally applying an IP rating to many industrial, commercial and residential products, in most cases to satisfy customer needs. The IP rating system not only applies to enclosures, but also any enclosing part of electrical equipment. This translates into the opportunity to specify a level of ingress protection for open products. This system can designate a degree of protection against contact with live electrical parts, for example, contact by human body parts such as a fist, back of hand or a finger

and contact by tools or wires. The IP rating system is defined in the ANSI/ NEMA Standard 60529. This standard was adopted as a US National Standard in 2004. It is an adoption of IEC 60529, Degrees of protection provided by enclosures (IP Code). The ANSI/NEMA standard contains no deviations from the IEC version.

Panel Meeting Action: Accept in Principle in Part

In the recommended text, the panel Rejects the addition of the Annex and Accepts in Principle the addition of the FPN to read as follows:

"FPN: Ingress protection (IP) ratings may be found in ANSI/NEMA 60529, Degrees of Protection Provided by Enclosures. IP ratings are not a substitute for Enclosure Type ratings."

The revised FPN is to be placed immediately after the existing FPN in Table 110.28.

Panel Statement: The text of the proposed Informational Annex contains mandatory language that is not permitted per the NEC Style Manual.

In addition, the proposed Annex does not enhance usability and could create confusion with respect to the requirements for Enclosure Type designations for specific protection from various environmental conditions identified in Table 110.28.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-141 Log #2 NEC-P01 **Final Action: Accept in Principle**
(110.31(A))

Submitter: Palmer L. Hickman, National Joint Apprentice & Training Committee

Comment on Proposal No: 1-253

Recommendation: Accept Proposal 1-253 which will, in turn, modify the accepted action on Proposal 1-252. In addition, the "(A)" of 110.31(A) should not have been deleted (as shown by the recommended strike through by the submitter in Proposal 1-252 and as accepted by Code Panel 1). This comment is to have 110.31(A) and 110.31(A)(1) read as follows (remainder of Proposal 1-252 is not shown and is not intended to be changed by this comment):

(A) Electrical Vaults. Where an electrical vault is required or specified for conductors and equipment operating at over 600 volts, nominal, the following shall apply.

(1) Walls and Roof. The walls and roof shall be constructed of materials that have adequate structural strength for the conditions, with a minimum fire rating of 3 hours. For the purpose of this section, studs and ~~wallboards~~ wallboard construction shall not be considered acceptable.

Substantiation: The recommendation in Proposal 1-253 should have been accepted and integrated into the action of Proposal 1-252. Panel 1 rejected Proposal 1-253 by saying that it was not substantiated. The recommendation in Proposal 1-252 is substantiated. The recommended text is used in 450.42 as the submitter of 1-253 pointed out. In addition to providing the benefit of consistency of terminology for related information, it would appear that the term "wallboard construction" (rather than "wallboards") is really the intent of the term and is, in fact, more technically correct.

Panel Meeting Action: Accept in Principle

See the panel action on Comment 1-142.

Panel Statement: The panel understands that "(A)" remains.

Number Eligible to Vote: 12

1-144 Log #2862 NEC-P01 **Final Action: Accept**
(110.34(A))

Submitter: Louis Barrios, Shell Global Solutions / Rep. American Chemistry Council

Comment on Proposal No: 1-197

Recommendation: Please note that NFPA incorrectly stated the recommendation in this proposal, which was a HOLD on Comment 1-77 from the 2008 Code Cycle.

The panel action should have been Accept in Principle. The second sentence in the exception to Article 110.34(A) should read as follows: "Where rear access is required to work on ~~de-energized~~ nonelectrical parts on the back of enclosed equipment, a minimum working space of 762mm (30in.) horizontally shall be provided."

Substantiation: The recommendation in this proposal was incorrectly stated from NFPA. Proposal 1-197 was a HOLD on Comment 1-77 from the 2008 Code Cycle. Comment 1-77 proposed to change "de-energized" to "non-electrical" in the Exception to 110.34A in order to correct an inconsistency in the requirements for safe work clearance behind electrical equipment that presently exists between equipment operating 600V and below, and equipment operating above 600V. The panel considered the proposed change in Comment 1-77 as new material and acted to HOLD this comment for the 2011 Code cycle. Justification for change: Section 110.26(A)(1)(a), which covers equipment rated 600V nominal and less states, "Where rear access is required to work on nonelectrical parts on the back of enclosed equipment, a minimum horizontal working space of 762 mm (30 in.) shall be provided". The exception to Section 110.34A, which covers equipment rated over 600V nominal states, "Where rear access is required to work on de-energized parts on the back of enclosed equipment, a minimum working space of 762mm (30 in.) horizontally shall be provided. Changing "de-energized parts" to "nonelectrical parts" will remove the inconsistency between the two requirements.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: Changing "de-energized parts" to "nonelectrical parts" is a significant change that has not been adequately substantiated. De-energized is not the same as locked and tagged and/or electrically safe. Adequate technical substantiation has not been provided to support changing from electrical non nonelectrical, that there is not a need for this work space, or that the technical committee did not intend that the requirements be different at different voltage levels.

(110.74)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 1-260
Recommendation: The proposal as modified in the ROP should be accepted in principle. Rearrange the material and add headings as follows:
110.74 Conductor Installation. Conductors installed in manholes and other enclosures intended for personnel entry shall be cabled, racked up, or arranged in an approved manner that provides ready and safe access for persons to enter for installation and maintenance. The installation shall comply with 110.74(A) or (B) as applicable:
(A) 600 Volts, Nominal, or Less. Wire bending space for conductors operating at 600 volts or less shall be provided in accordance with the requirements of 314.28.
(B) Over 600 Volts, Nominal. Conductors operating at over 600 volts shall be provided with bending space in accordance with 314.71(A) and 314.71(B), as applicable.
Exception: Where 314.71(B) applies, each row or column of ducts on one wall of the enclosure shall be calculated individually, and the single row or column that provides the maximum distance shall be used.
Substantiation: The racking requirement applies to all installations, regardless of voltage, and therefore belongs in the parent language. The panel ROP wording would have it apply only "as applicable" which is completely unclear in the context provided in the ROP. In addition, the ROP wording located the medium voltage exception after the racking requirement. In the interest of clarity, exceptions should directly follow the rule under exception, and if otherwise, they must contain explicit language pointing to the language they modify (See the Style Manual at 2.6.1). The wording in this comment correctly locates the material and provides the subheadings as directed by the TCC and the NEC Style Manual.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.

ARTICLE 200 — USE AND IDENTIFICATION OF GROUNDED CONDUCTORS

5-22 Log #2191 NEC-P05 **Final Action: Reject**
(200.1)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-29
Recommendation: Accept the proposal.
Substantiation: The panel is correct that a grounded conductor is connected to earth, which includes equipment grounding conductors and grounding electrode conductors, which are not "circuit" conductors. They are covered by Article 250; Article 200 is limited to circuit conductors.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms the panel statement to Proposal 5-29. By definition a grounded conductor is a circuit or system conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-23 Log #603 NEC-P05 **Final Action: Accept in Principle**
(200.2)

Submitter: Robert J. Walsh, City of Hayward
Comment on Proposal No: 5-31
Recommendation: Revise text to read as follows:

"All premises wiring systems, other than circuits and systems specifically exempted or prohibited by other sections of this Code ~~210.10, 215.7, 250.21, 250.22, 250.162,~~ 430.21, 430.25, ~~503.155, 517.63,668.11, 668.21, and 680.41, Exception~~, shall have a grounded conductor that is identified in accordance with 200.6. The grounded conductor shall comply with 200.2 (A) and (B). For premises wiring systems. a grounded conductor shall not be required to be installed with the ungrounded conductors of a feeder or branch circuit where it is unnecessary based upon the load served."

Substantiation: I agree with Mr. Harding's comments on ROP 5-31 Log 315# NEC-P05 and the new sentence should be provided.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-25.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-24 Log #1823 NEC-P05 **Final Action: Accept in Principle**
(200.2)

Submitter: G. Scott Harding, F. B. Harding, Inc.
Comment on Proposal No: 5-31
Recommendation: Continue to Accept in Principle and add a new sentence to read as follows:

For premises wiring systems, a grounded conductor shall not be required to be installed with the ungrounded conductors of a feeder or branch circuit where it is unnecessary based on the load served.

Substantiation: Removal of the list in 200.2 does not completely address the concerns of the submitter. The submitter is concerned that this requirement, as currently indicated in the NEC, could be misconstrued to require a grounded conductor in applications whether it is required by the load or not.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-25.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-25 Log #2332 NEC-P05 **Final Action: Accept in Principle**
(200.2)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-31
Recommendation: Delete as follows:
~~**200.2 General.** All premises wiring systems, other than circuits and systems specifically exempted or prohibited by other sections of this *Code* shall have a grounded conductor that is identified in accordance with 200.6. The grounded conductor shall comply with 200.2(A) and (B).~~
Substantiation: This section can be deleted in its entirety, as it is already covered and dealt with in 250.24(C). With the acceptance of proposed 5-31, this section really becomes quite useless—"All systems must have a grounded conductor unless they don't have to" isn't helpful and doesn't seem to contain any requirement that isn't found elsewhere.
Panel Meeting Action: Accept in Principle
Revise 200.2 General to read as follows:
200.2 General. Grounded conductors shall comply with 200.2(A) and (B).
Panel Statement: There is no substantiation to remove subsections (A) and (B). CMP 5 has reconsidered the general requirement in 200.2. The requirement to install a grounded conductor is adequately covered in 250.24 (C) and 250.30 (A).
This action does not remove subsections (A) and (B).

Ballot Results: Affirmative: 16

5-26 Log #2275 NEC-P05 **Final Action: Reject**
(200.2(B), FPN (New))

Submitter: Joseph A. Hertel, Safety and Buildings / Rep. State of Wisconsin
Comment on Proposal No: 5-32
Recommendation: Revise to read as follows:
(B) Continuity. The continuity of a grounded conductor shall not depend on a ~~connection to a~~ metallic enclosure, raceway, or cable armor.
Substantiation: Removal of the words (connection to a) eliminates the ambiguity where a threaded fastener connected to a panelboard holds the components of the grounded conductor bus system together, providing mechanical and electrical continuity. The word "connection" adds no value to the statement. The continuity of a grounded conductor may depend on the connection to a metallic enclosure but not use the enclosure as a conductor.
Panel Meeting Action: Reject
Panel Statement: No evidence of a problem was provided in the substantiation. Accepting this comment would restrict the use of currently listed products with no evidence of a problem. A significant portion of this requirement includes the concept of a connection to an enclosure. The continuity of the grounded conductor must be made by using something other than just the enclosure. A connection to the enclosure is not prohibited.

Comment on Proposal No: 5-39
Recommendation: Accept the proposal as originally submitted:
(B) Sizes 4 AWG or Larger ~~Than 6 AWG~~. An insulated grounded conductor ~~larger than 6 AWG~~ 4 AWG or larger shall be identified by one of the following means:
Substantiation: The panel rejected the proposal because it neglected to include a 5 AWG conductor. The proposal used the normal size of conductors that are covered and used in the general rules of the Code. If Article 610 needed to amend the general rules, that could be accomplished. A 5 AWG is only used in Article 610 for Cranes and Hoists. This section has seen similar proposals from others over the years to indicate that this issue needs to be made clearer. The proposed wording would clear up this requirement and make the code more user friendly. Why would we say that the rule applies to conductors larger than a 6 AWG when we mean for conductors 4 AWG or larger.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-30 Log #2744 NEC-P05 **Final Action: Reject**
(200.6(D))

Submitter: Randal Hunter, City of Las Vegas
Comment on Proposal No: 5-42
Recommendation: Revise text to read as follows:
(D) Grounded Conductors of Different Systems. Where the premises wiring system has grounded conductors of different systems ~~are installed in the same raceway, cable, box, auxiliary gutter, or other type of enclosure~~, each grounded conductor shall be identified by system. Identification that distinguishes each system grounded conductor shall be permitted by one of the following means:
Substantiation: This was presented originally due to the fact that we are currently having to accept jobs which have different voltages both with the same colored neutrals. The current code language allows the same color neutrals within the same premise as long as they are not in the same raceway(120/208 and 277/480 within the same building both with white neutrals). This has lead to confusion for both the inspectors and the contractors, especially when performing service work at a later date. This proposal will match the language in 210.5 and 215.12
Panel Meeting Action: Reject
Panel Statement: If the grounded conductors of different systems are not in the same enclosure then connecting to one from a different system is not likely to occur. In each application one can differentiate the grounded conductor from the ungrounded conductor(s).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRETT, JR., M.: I agree with the submitter, although the committee has moved towards marking requirements based on good substantiation. I feel we still fall short of providing the safe guards available to us. We still permit white and gray to be used interchangeably, for example a facility with three systems 480/277, 208/120 and 240/120 could all use white or gray in each system as long as they don't share the same enclosure, raceways etc. this I believe is unsafe. During the initial installation separation can be controlled however, revisions to the original installation may unintentionally mingle these systems. For this reason I believe requiring the identification of each system grounded conductor is an appropriate safety issue that needs to be addressed.

5-31 Log #2490 NEC-P05 **Final Action: Accept in Principle**
(200.7(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-44
Recommendation: The proposal should be rejected.
Substantiation: The panel action diminishes safety. A cable with a white (or gray) wire reidentified in a switch loop, as it must be in the current wording, still presents a generally white or gray finish at the outlet. It is crucial on grounded circuits where the grounded conductor is used at the outlet that the actual grounded conductor be used for this purpose. The current requirement, dating back many generations, assures that where outlet connections are made, the ungrounded wire connected at the outlet is an unambiguously black (or other color) wire, because the white wire went to the switch. This provides additional contrast with the white (or gray) wire to be connected to the other side of the equipment supplied. It the ROP wording stands, the two wires arriving at a typical luminaire could be white and white with a piece of black tape to reidentify it. This is simply not as clear and will lead to confusion.
CMP 5, over this submitter's adamant objections, required some time back that the white wire in a cable assembly be reidentified if used in a switch loop. The sole substantiation for this change was based on field confusion by a manifestly untrained installer who didn't understand the function of the white

wire in such a switch loop. Very well, now the NEC avoids this problem, to the extent an installation code can be written for untrained individuals. It makes no sense to first (1999 NEC) add the requirement for reidentification of a white wire in a switch loop, to reduce confusion among inadequately trained persons, and then (Proposal 5-44) subtract the requirement that the real black wire actually arrive at the outlet connection, thereby increasing confusion among the same individuals.

The proposal substantiation mentioned the acceptance (also dating back generations) of reidentified white wires in other applications, such as electric heat and water heaters. These applications seldom involve the simultaneous terminations of grounded circuit conductors to terminals where the improper connection point could lead to disastrous results, such as could easily happen with an energized screw shell of a luminaire. In addition, these applications clearly deserve some relief where the only practical alternative would be the use of cable with an additional conductor (white or gray) that would not be used except as a waste of good copper. A switch leg does not involve such problems, only care in making the conductor selection. CMP 5 should continue the present requirement.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-32.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-32 Log #2333 NEC-P05 **Final Action: Accept in Principle**
(200.7(C)(1))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-44
Recommendation: Revise 200.7(C)(1) as follows:

(1) If part of a cable assembly that has the insulation permanently reidentified to indicate its use as an ungrounded conductor by marking tape, painting, or other effective means at its termination and at each location where the conductor is visible and accessible. Identification shall encircle the insulation and shall be a color other than white, gray, or green. Where used for single-pole, 3-way or 4-way switch loops, the conductor with white or gray insulation or a marking of three continuous white stripes shall be used for the supply to the switch but not as a return conductor from the switch to the switched outlet.

Substantiation: The submitter is correct that (previous) (C)(2) is not necessary, but by removing it altogether the requirement for the white conductor to be the supply to the switch has been lost. That provision had merit and should be retained. This proposed text borrows language from previous editions of the Code, but modifies it very slightly in order to make a more appropriate sentence in the context of the new paragraph.

Panel Meeting Action: Accept in Principle
Revise text to read as follows:

(1) If part of a cable assembly that has the insulation permanently reidentified to indicate its use as an ungrounded conductor by marking tape, painting, or other effective means at its termination and at each location where the conductor is visible and accessible. Identification shall encircle the insulation and shall be a color other than white, gray, or green. If used for single-pole, 3-way or 4-way switch loops, the reidentified conductor with white or gray insulation or three continuous white stripes shall be used only for the supply to the switch but not as a return conductor from the switch to the outlet.

Panel Statement: The panel makes only editorial revisions to the recommended language.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-33 Log #1987 NEC-P05 **Final Action: Accept in Principle**
(200.8 (New))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 5-49
Recommendation: The proposal should be accepted as submitted.
Substantiation: There are cases where multiple ungrounded conductors having no potential between them are being installed with a single oversized grounded conductor. (example: Two #12s on 20 amp breakers both installed on A phase with a #8 grounded conductor. There is no code rule that prohibits this practice in the 2008 code. The two specific provisions that use the currently undefined term of “common neutral, only apply to multi-wire type circuits. If this proposal is accepted proposal 5-7 must also be accepted.

Panel Meeting Action: Accept in Principle
Revise the ROP draft text to read as follows:
200.4 Neutral Conductors. Neutral conductors shall not be used for more than one branch circuit, multiwire branch circuit, or for more than one set of ungrounded feeder conductors unless specifically permitted elsewhere in this Code.
Panel Statement: The revised text clarifies that the restriction on use of the neutral in more than one branch circuit is prescriptive and not permissive. The panel concludes these changes resolve the issues raised by the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-34 Log #2334 NEC-P05 **Final Action: Accept in Principle**
(200.8 (New))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-49
Recommendation: Accept the proposal as originally submitted.
Substantiation: Having spoken with the submitter of this proposal, it seems the panel action does not address the concerns of the submitter. This proposal is intended to prohibit the practice of using two ungrounded conductors of the same phase or line from sharing a grounded conductor. As currently written, the only rule that comes close to addressing this is 310.10, which basically just requires a larger grounded conductor for this type of scenario.
The text that was modified by the panel refers only to multiwire branch circuits, which does not include the type of circuit discussed in this substantiation, as the ungrounded conductors do not have a voltage between them.
Alternatively, the panel could accept the following text:
Neutral conductors shall not be permitted to be used for more than one ~~multiwire~~ branch circuit or for more than one set of ungrounded feeder conductors unless specifically permitted elsewhere in this *Code*.
This proposed text removes the word “multiwire”, because a multiwire branch circuit is a single circuit, per the definition. By accepting this changed language, the concern of the submitter is met, and the requirement is bit more obvious.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-33.
Number Eligible to Vote: 16

ARTICLE 210 — BRANCH CIRCUITS

2-13 Log #1200 NEC-P02 **Final Action: Accept**
(Table 210.2)

Submitter: Michael Flegel, Reliance Controls Corporation
Comment on Proposal No: 2-29
Recommendation: Reject the proposal.
Substantiation: Paragraph 445.20 has no reference or information pertaining to branch circuits and should not be referenced in this table. People may mistakenly interpret this to mean the circuit on the generator with GFCI protection is a branch circuit.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

KING, D.: This comment should have been rejected. All 125 volt receptacles installed in locations that are required to have GFCI protection under 210.8 should be provided with GFCI protection regardless of the power source or the designation of the circuit which supplies the receptacle outlet. Rejecting this comment would ensure that the same level of safety is provided for persons utilizing 125 volt receptacles supplied by generators as those supplied from branch circuits as required by 210.8.

LAROCCA, R.: The receptacles contained on the generator are provided with over current protection that very easily could be the only as well as the final over current protective device. This fits within the definition of a branch circuit.

Additionally, in the 1975 NEC, Section 210-8(b) required “all 120-volt single phase 15 and 20 ampere receptacle outlets which are not part of the permanent wiring of the building or structure, to have ground fault circuit interrupters for personnel protection.” An exception was inserted into 210-8(b)in the 1975 NEC that permitted “receptacles on a portable generator rated not more than 5 kW, where the circuit conductors of the generator are insulated from earth and the generator frame is insulated from earth and all grounded surfaces.” The original text requiring GFCI protection and the exception for 5 kW and smaller generators was covered as a branch circuit within Article 210.

The text was only transferred to Panel 3 for inclusion in Article 305 since Panel 3 had jurisdiction over temporary power on construction sites. The text in the 1983 TCR stated that the NEC Technical Correlating Committee was transferring GFCI requirements and the exception for 5 kW and smaller generators for construction sites to Article 305 and Panel 3. This section and exception was moved to 305-4(a) in 1984 and the text in the exception was changed to “receptacles on a 2-wire, single-phase portable or vehicle-mounted generator rated not more than 5 kW, where the circuit conductors of the generator are insulated from the generator frame and all other grounded surfaces” need not be GFCI protected.”

2-14 Log #2330 NEC-P02 **Final Action: Accept**
(210.2)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 2-29
Recommendation: Reject this Proposal.
Substantiation: Mr. Pauley's comment is in the ROP is quite correct. The provisions in 445.20 do not have anything to do with specific branch circuits, rather they address receptacles. Rules such as these do not belong in 210.2.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-13.
LAROCCA, R.: See my Explanation of Negative on Comment 2-13.

2-15 Log #2521 NEC-P02 **Final Action: Accept**
(Table 210.2)

Submitter: James Jongkind, American Honda Motor Co., Inc.
Comment on Proposal No: 2-29
Recommendation: Please do not accept the proposal.
Substantiation: As explained in a related comment to proposal 13-19, adding a GFCI requirement for all portable generators could have serious unintended consequences. As such I this proposal to add section 445.20 to table 210.2 should be rejected.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-13.
LAROCCA, R.: See my Explanation of Negative on Comment 2-13.

2-16 Log #2083 NEC-P02 **Final Action: Reject**
(210.4(A))

Submitter: Jim Davis, Electrical Education Services, LLC
Comment on Proposal No: 2-30
Recommendation: Add a new last sentence as follows:
210.4 Multiwire Branch Circuits.
(A) General. Branch circuits recognized by this article shall be permitted as multiwire circuits. A multiwire circuit shall be permitted to be considered as multiple circuits. All conductors of a multiwire branch circuit shall originate from the same panelboard or similar distribution equipment. Multiwire circuits shall be permitted only in supervised industrial installations as defined in 240.2.
Substantiation: The code panel is respectfully asked to reconsider its action on this proposal. The items identified as potential sources of hazard to personnel in the proposal substantiation are not addressed in the panel statement. Beyond that, in some states, licensing ("qualified installers") of electrical workers is not required for residential property owners, so the impact of this proposed change has little effect on those workers. In any occupancy, the pressure on electrical workers to minimize disruption to building users (by not turning off three circuits) during routine maintenance work is the primary issue that could lead to increased equipment damage, injury, or death.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is not practical. Adding such a sentence would eliminate the ability to supply any device that needed a multi-wire circuit such as a dryer or range in a dwelling unit. The revisions made by the panel in the 2008 Edition of the NEC to require common disconnect of the ungrounded conductors as well as the grouping requirements for the conductors address many of the concerns stated in the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-17 Log #60 NEC-P02 **Final Action: Accept**
(210.4(B), FPN (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-37
Recommendation: The Technical Correlating Committee directs the panel to reconsider the panel action on this proposal and consider deleting the mandatory phrase "required by this section" to comply with 3.1.3 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise the text from the proposal to read as follows:
"Informational Note: See 240.15(B) for information on the use of single pole circuit breakers as the disconnecting means."
Panel Statement: The revision addresses the issue raised by the Technical Correlating Committee.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-18 Log #486 NEC-P02 **Final Action: Reject**
(210.4(C) Exception No. 2)

Submitter: Pete Baldauf, City of Vandalia
Comment on Proposal No: 2-40
Recommendation: CMP-2 should reconsider deleting exception #2 to 210.4(C).
Substantiation: Exception No. 2 to 210.4(C) is redundant to 210.4(B). Exhibit 210.2 from the 2008 NEC Handbook gives a pictorial example of where Exception No. 2 to 210.4(C) is applicable. The requirement for simultaneous disconnection of all ungrounded conductors of a multi-wire branch circuit found in 210.4(C) Exception No. 2 is the same as that of 210.4(B).
The last sentence of the panel statement to Proposal 2-39 reinforces this point. I quote: "The second exception permits multiple pieces of utilization equipment that may be line-to-line connected to be supplied, but ONLY WHERE THE OVERCURRENT DEVICE IS COMMON TRIP." (Emphasis added).
The requirement found in 210.4(B) covers this adequately without undermining the importance of 210.4(C) as it relates to line-to-neutral loads for multi-wire branch circuits.
Based upon these facts, the panel should support the deletion of exception No. 2 to 210.4(C).
Panel Meeting Action: Reject
Panel Statement: Elimination of the exception would require that multi-wire branch circuits supply only line to neutral connected loads. The exception is necessary to have the ability to supply more than one line-to-line utilization equipment from a multi-wire branch circuit. The submitter is incorrect in that 210.4(B) provides the necessary text.
The main rule in 210.4(C) limits multi-wire circuits to line to neutral only, an exception is necessary for other than line-to-neutral loads.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-19 Log #480 NEC-P02 **Final Action: Reject**
(210.4(D))

Submitter: Pete Baldauf, City of Vandalia
Comment on Proposal No: 2-42
Recommendation: Revise text to read as follows:
The ungrounded and grounded conductors of each multi-wire branch circuit shall be grouped by ~~wire ties or similar means~~ approved means in ~~at least one location~~ each location that terminations, connections or splices are made.
Substantiation: The original Proposal 2-42 lacked substantiation for the addition of the phrase "approved means" to accomplish the grouping of multi-wire branch circuits as contemplated in 210.4(D). This was pointed out in the panel statement for Proposal 2-42.
The term "approved" is a defined term in Article 100. It states: "Acceptable to the authority having jurisdiction."
There is no supporting verbiage for the terms "wire ties" or "similar means". Both of these terms would be subject to be "approved". The terms "wire ties" and "similar means" are subjective without defined parameters. Further, the word "similar" is an unenforceable term in accordance with Table 3.2.1 of the NEC Style Manual.
The addition of the phrase "approved means" as shown in Proposal 2-42 utilizes verbiage that is currently defined and applied in various locations throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: As stated in 110.2, all conductors and equipment must be "approved". As such, whatever method is used is already subject to approval. The panel specifically mentions cable ties as one means because it is the most common method of meeting the rule. Changing the rule to "approved" only, does not add clarity.
See the panel action on Comment 2-22.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my explanation of negative on Comment 2-22.

2-20 Log #1621 NEC-P02 **Final Action: Reject**
(210.4(D))

Submitter: Michael L. Last, Ocean View, HI
Comment on Proposal No: 2-44
Recommendation: Accept Proposal 2-44.
Substantiation: Further consideration of this proposal is indicated by the Explanation of Negative vote by panel member King, D. Member King represents a labor organization concerned with safety in the workplace. He states, "The Submitter of this proposal has identified a common installation practice that in many cases compromises this important safety requirement." In addition, he states, "The submitter has clearly substantiated that grouping alone is not sufficient and proposes an effective and practical means to ensure that the intent of 210.4(D) is met." These statements are attributed to a representative of those who encounter the situation while actually working in the profession. These ARE the "hands-on" employees whose safety is being compromised. Further consideration is warranted.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the marking in addition to the grouping is necessary. The objective of the requirement is to find the particular grounded conductor associated with a set of ungrounded conductors that are part of a multi-wire branch circuit. Once the worker identifies the multi-wire circuit, ungrounded conductors that are intended to be worked on, it is a simple task to trace these back within the panelboard to the grouping and determine the associated grounded conductor.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This Comment should have been accepted. The panel statement does not address the submitter of this comment's concern which is proper identification of the grounded conductor of a multiwire branch circuit where multiple circuits enter a panel or box and are inadvertently grouped together. The only clear way to identify the conductors that are part of a multiwire branch circuit is by tagging or other similar methods as is recommended by the submitter in the the original proposal.

2-21 Log #1723 NEC-P02 **Final Action: Reject**
(210.4(D))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 2-42
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(D) Grouping. The ungrounded and grounded conductors of each multiwire branch circuit shall be grouped by cable ties or similar means where ~~at each location that~~ terminations, connections, or splices are made.
Substantiation: Editorial changes are suggested to improve the syntax. The word "where" should be used to indicate a location as indicated in the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: The comment does improve the syntax, however, the text associated with grouping at other than the panelboard has been deleted through the action taken on Comment 2-22. The submitter of Comment 2-22 makes a valid case for not extending the grouping requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-22 Log #2491 NEC-P02 **Final Action: Accept**
(210.4(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-42
Recommendation: The proposal should be rejected.
Substantiation: The panel action on this proposal is excessive. As the originator (Comment 2-13, 2005 and Proposal 2-17, 2008 NEC cycles) of the concept that resulted in 210.4(D) mandating that the conductors of multiwire branch circuits be grouped where they originate, I can say with authority that it was never intended that the grouping requirement be applied in other locations. The adverse comment in the voting is exactly correct. The point was to make it possible for electricians attempting to isolate a multiwire circuit for disconnecting purposes to be able to do so correctly. Not all circuit breakers supplying multiwire branch circuits are adjacent to one another and all white (or gray) wires look alike; the grouping rule makes it easy to disconnect the correct conductors and it also makes it easy for an inspector to verify that a correct selection of phases (or lines) has been achieved. Neither of these actions will normally occur at a remote location.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This comment should have been rejected. I disagree with the submitter of this comment's substantiation. It was the intent of the submitter of proposal 2-42 that the grouping requirements for multiwire branch circuits apply to other locations. Proper identification of conductors associated with multiwire branch circuits is a safety concern at all points where splices and terminations are made. Given the near unanimous support for this proposal at the ROP Meeting, Panel 2 should give this comment further consideration.

2-23 Log #2492 NEC-P02 **Final Action: Accept**
(210.4(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-44
Recommendation: Continue to reject the proposal.
Substantiation: The grouping requirement includes the neutral conductor, making the function obvious. Although it is certainly true that conductors, especially stranded ones, are commonly grouped in a panel gutter for reasons of workmanship, the current wording of 210.4(D) assures that such a grouping will be a grouping of groups, immediately apparent to a qualified electrician.
Panel Meeting Action: Accept
Panel Statement: See the panel statement on Comment 2-20.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See explanation of negative on Comment 2-20.

2-24 Log #1448 NEC-P02 **Final Action: Reject**
(210.4(D) and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-48
Recommendation: Accept the proposal with the following revisions:
Exception: The requirement for grouping shall not apply where the multiwire circuit is supplied from a single circuit breaker or single fused switch in an enclosure that does not accommodate additional circuit breakers or fused switches. A circuit breaker with approved handle ties shall be considered a single circuit breaker.
Substantiation: Grouping is not necessary where only one multiwire circuit can be installed, since there is only one set of circuit conductors.
Panel Meeting Action: Reject
Panel Statement: The situation described by the submitter is already covered by the existing exception. By definition, if only one multi-wire branch circuit is entering the enclosure it will be from a unique raceway or cable which is covered by the existing exception.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-25 Log #61 NEC-P02 **Final Action: Accept**
(210.4(D) and Exception (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-48
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with respect to the addition of the word "circuit".
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
In the wording of Proposal 2-48, add the word "circuit" between the words "ungrounded" and "conductors" in 210.4(D).
Panel Statement: The panel accepts the direction of the Technical Correlating Committee, and has clarified that the term "circuit" is to be added.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-26 Log #1045 NEC-P02 **Final Action: Reject**
(210.5(C))

Submitter: Jamie McNamara, Hastings, MN
Comment on Proposal No: 2-55
Recommendation: Mr. Don King's explanation of negative vote should be looked at again and the change he proposes accepted.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: There are numerous methods of providing such documentation that may not be "written". One example is an electronic system that would allow all of the documentation to be pulled up electronically based on the panel identification.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This comment should have been accepted. The proposed requirement for approved written documentation is to provide a consistent method for the authority having jurisdiction to be able to enforce.

(210.5(C))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 2-52
Recommendation: Add a charging statement to the text, as follows:
(C) Identification of Ungrounded Conductors. Ungrounded conductors shall be identified in accordance with (1), (2), and (3).
(1) Application. Text to remain unchanged.
(2) Means of Identification. Text to remain unchanged.
(3) Posting of Identification Means. Text to remain unchanged.
Substantiation: This change is an editorial one, intended to provide consistency with most other Code sections.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-28 Log #2493 NEC-P02 **Final Action: Reject**
(210.7(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-61
Recommendation: Accept the proposal.
Substantiation: The proposed text is neither vague nor unenforceable. It is equally prescriptive, and quite necessary. It provides a needed alternative to a multi-pole circuit breaker or an individual fused switch. It provides the equivalent in safety, because as worded if someone is attempting to disconnect the outlet for servicing, the common disconnect for the yoke will be immediately apparent to the user. Remember that 110.22(A) already requires a legible marking for such a device. It should not be necessary to send the inspector into the provisions of 90.4 to permit such an arrangement, which is arguably permitted by the current wording, depending on how broadly the word "point" in the current text is interpreted in the field. The proposal addresses a common occurrence, particularly in old work.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms it action and statement on Proposal 2-61.
The present text is clear and provides the AHJ with prescriptive requirements with which to determine what is a practical and safe installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-3 Log #62 NEC-P18 **Final Action: Accept**
(210.8)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-66
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 18 for action in Article 406.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
CMP 18 accepts the direction of the TCC to consider Proposal 2-66 and rejects this proposal.
Panel Statement: CMP 18 reaffirms its action and statement on Proposals 18-71 and 18-73. Proposal 18-73 was the companion proposal to Proposal 2-66 submitted by the same individual.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

2-29 Log #1717 NEC-P02 **Final Action: Accept**
(210.8)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 2-77
Recommendation: Move the sentence added to 210.8(A) and (B) to the opening paragraph of 210.8 and delete the sentence from existing 210.8(A) and (B) of the 2011 NEC ROP Draft to read as follows:
210.8 Ground-Fault Circuit-Interrupter Protection for Personnel.
Ground-fault circuit-interruption for personnel shall be provided as required in (A) through (C). The ground-fault circuit-interrupter shall be installed in a readily accessible location.
Informational Note: See 215.9 for ground-fault circuit-interrupter protection for personnel on feeders.
Delete the second sentence in the proposed opening paragraph from 210.8(A) and (B) in the 2011 NEC ROP Draft.
Substantiation: A new opening paragraph is suggested to introduce the section. This is intended to be an editorial improvement and not introduce a new concept. Since an identical sentence has been added to both (A) and (B), the sentence should be moved to the opening paragraph so it applies to both (A) and (B) without duplicate sentences.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-30 Log #2175 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Wayne E. Morris, Association of Home Appliance Manufacturers
Comment on Proposal No: 2-70
Recommendation: The Code-Making Panel should accept Proposal 2-70.
Substantiation: This proposal replaces the exception from GFCI requirements for large appliances located in dedicated spaces that was deleted from the 2005 NEC. Nuisance failures of GFCIs for freezers or refrigerators located in a basement or garage may be rare, but cause a great deal of damage when they occur.. No evidence has been given of a problem causing the elimination of the exceptions in the 2005 NEC. Reports are coming in of nuisance tripped breakers causing homeowners and business managers to remove the GFCI breaker outlets. The fact that some states have not adopted this provision in the 2008 NEC shows that this is still a very controversial change by Code Panel 2.
Panel Meeting Action: Reject
Panel Statement: As stated in response to the original proposal, there is no specific text provided as to what is expected to be added into the NEC. In addition, the panel was very clear in its statements in the 2008 NEC as to the rationale for removal of the exceptions. Although the submitter indicates "reports of nuisance tripped" GFCIs, he fails to indicate how many of those are due to the failure of the appliance to maintain leakage current levels below the 4mA range.
As the panel has stated previously, if an appliance is leaking current above the GFCI threshold, the appliance needs to be investigated and serviced to eliminate the potential hazard.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: This comment should have been accepted. The damage due to tripped GFCIs on refrigerators and freezers seems greater than the safety concerns with GFCIs.
Comment on Affirmative:
BROWN, L.: There still seems to be problems with GFCI protection for certain appliances that this Technical Committee refuses to believe. NFPA should do a study to substantiate the position taken by the NFPA Technical Committee.

2-31 Log #2696 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 2-72
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject

Panel Statement: The panel notes that the submitter is proposing that the subject receptacle replace the requirements for GFCI protection. The report supplied with the substantiation indicates that the electric shock provisions would be evaluated in accordance with UL 943, Standard for Safety for Ground-Fault Circuit Interrupters. If the device is evaluated to and meets these provisions, it could be applied as a GFCI under the current NEC rules. As such, the panel does not see any justification to revise the code language. As for the other features of the receptacle, temperature sensing and power off, these are specific receptacle features that are under the purview of Code-Making Panel 18.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-32 Log #2699 NEC-P02 **Final Action: Reject**
(210.8(A))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 2-71
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-12.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-33 Log #1040 NEC-P02 **Final Action: Accept in Principle**
(210.8(A) and 210.8(B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 2-77
Recommendation: Continue to accept the proposal in principle in part as outlined in the panel action text.
Substantiation: This will continue to improve the accessibility of GFCIs in all locations. Many ground fault receptacles are mounted behind large appliances making them difficult to locate for testing and resetting.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action taken on Comment 2-29. The panel has rearranged the text to place the rule into the main paragraph of 210.8.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-34 Log #2176 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

Submitter: Wayne E. Morris, Association of Home Appliance Manufacturers
Comment on Proposal No: 2-80
Recommendation: The Code-Making Panel should accept Proposal 2-80.
Substantiation: This proposal replaces the exception from GFCI requirements for large appliances located in dedicated spaces that was deleted from the 2005 NEC. Nuisance failures of GFCIs for freezers or refrigerators located in a basement or garage may be rare, but cause a great deal of damage when they occur. The GFCI is often difficult to locate behind a refrigerator or freezer, leading to difficulty in both identifying the tripped outlet and resetting the GFCI.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its statement from Proposal 2-80 that these appliances are compatible with GFCIs.
The issue of the location of the GFCI is addressed through the actions taken on Proposal 2-77 and Comment 2-29.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
BROWN, L.: There still seems to be problems with GFCI protection for certain appliances that this Technical Committee refuses to believe. NFPA should do a study to substantiate the position taken by the NFPA Technical Committee.
PURVIS, R.: This comment should have been accepted. The damage due to tripped GFCIs on refrigerators and freezers seems greater than the safety concerns with GFCIs.

2-35 Log #2358 NEC-P02 **Final Action: Accept in Principle**
(210.8(A)(2))

Submitter: Marcus R. Sampson, Lysistrata Electric
Comment on Proposal No: 2-77
Recommendation: Continue to accept this proposal.
Substantiation: The requirement to install the GFCI device in an accessible location will not only assist the user in complying with the recommended regular testing of the device, but the AHJ will be able to enforce common sense with specific Code language.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action taken on Comment 2-29. The panel has rearranged the text to place the rule into the main paragraph of 210.8.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-36 Log #2880 NEC-P02 **Final Action: Reject**
(210.8(A)(2))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" since it does not comply with 4.4.5(c) of the NFPA Regulations Governing Committee Projects.
Submitter: Timothy D. Curry, Curry Electric, Inc.
Comment on Proposal No: 2-77
Recommendation: None provided.
Substantiation: I STRONGLY AGREE THAT THIS IS A PROBLEM AND THAT THE PROPOSAL, AS IT HAS BEEN ACCEPTED, IS A GOOD REVISION AND WORTHY OF BEING ACCEPTED.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action taken on Comment 2-29. The panel has rearranged the text to place the rule into the main paragraph of 210.8.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-37 Log #2177 NEC-P02 **Final Action: Reject**
(210.8(A)(2) Exception to (2))

Submitter: Wayne E. Morris, Association of Home Appliance Manufacturers
Comment on Proposal No: 2-87
Recommendation: The Code-Making Panel should accept proposal 2-87.
Substantiation: This proposal replaces the exception from GFCI requirements for large appliances located in dedicated spaces that was deleted from the 2005 NEC. Nuisance failures of GFCIs for freezers or refrigerators located in a basement or garage may be rare, but cause a great deal of damage when they occur. The GFCI is often difficult to locate behind a refrigerator or freezer, leading to difficulty in both identifying the tripped outlet and resetting the GFCI.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its statement from Proposal 2-87 that these appliances are compatible with GFCIs. The issue of the location of the GFCI is addressed through the actions taken on Proposal 2-77 and Comment 2-29.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: This comment should have been accepted. The damage due to tripped GFCIs on refrigerators and freezers seems greater than the safety concerns with GFCIs.

2-38 Log #2406 NEC-P02 **Final Action: Reject**
(210.8(A)(2) Exception to (2))

Submitter: Brian E. Rock, Hubbell Inc.
Comment on Proposal No: 2-87
Recommendation: If the Panel revises its previous Panel Action to Reject for any reason, revise any proposed text to replace "twist lock receptacle" with "locking-type receptacle".
Substantiation: "Twist-Lock", as proposed by the Submitter of P2-87, is a registered trademark (U.S. Patent & Trademark Office Nos. 565,872, 1,800,509, and 1,845,454) of Hubbell Incorporated for receptacles, attachment plugs, cable connectors, and inlets (motor attachment plug caps) of the locking-blade construction, and for enclosures employing similar. If the Panel revises its Panel Action for any reason and decides to include the P2-87 Submitter's new text, change to generic "locking-type receptacle."
Panel Meeting Action: Reject
Panel Statement: The panel has not revised its action on Proposal 2-87, and as such, the revision is not appropriate.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-39 Log #656 NEC-P02 **Final Action: Reject**
(210.8(A)(3))

Submitter: Michael Strauss, BSafe Electrix Inc.
Comment on Proposal No: 2-89
Recommendation: BSafe Electix Inc. had requested several revisions to NFPA 70 which were Rejected by the panels responsible for evaluating them.
Substantiation: We do claim that the device will eliminate/mitigate a subset of wiring device hazards. As studied and documented in the published literature, fires do arise from overheated receptacles; these fires are the ones Integral Thermal Circuit-Interrupers offer protection from.

UL test data, as well as internal test data, support our claim that the BSafe Exectrix receptacle will interrupt electrical flow to it if a specified temperature rise is exceeded; it does not appear the the panel disagreed with this. As with any device, there well may be unanticipated failure mechanisms that can arise. We, therefore, have developed, and are offering a device that will detect receptacle overheating, interrupt further electrical flow to it, and thereby reduce the number of fires that occur. This precisely focused effort has been successful; the fact that there may be other failure mechanisms that can lead to fires does not reduce the importance of the fire reductions that will result from acceptance of the Integral Thermal Circuit-Interrupter.

As the Panel indicated, "Installation of these devices is not prohibited by the NEC." We, therefore, proceeding to market the BSafe Electrix receptacle and in addition we are offering our patented technologies for licensing at reasonable royalties. Our goal, in part, is to gain additional performance experience in a range of applications and to promote fire safety. This experience will be made available to the NFPA and the public through presentations in various venues.

Additionally, we "...specifically noted that the new device embodies one approach to detecting and reacting to overheating within a receptacle. Many other approaches may be reduced to practice and marketed by companies and individuals throughout the world, based on improved sensing, analytical and manufacturing capabilities." Our expectation is that we and others will continue to develop Integral Thermal Circuit-Interrupter technologies and, when appropriate, present additional data to the NFPA that leads to their recognition as another advance in fire protection. We will, of course, carefully consider the Panel's Statement as we collect additional data and continue with our development programs.

While disappointed, we do respect the efforts the NFPA's Panels and the entire staff expend to continually increase the safety of the public, both nationally and throughout the world; and we sincerely thank them all.
Panel Meeting Action: Reject
Panel Statement: The comment does not recommend specific code text as is required by section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-40 Log #657 NEC-P02 **Final Action: Reject**
(210.8(A)(5))

Submitter: Michael Strauss, BSafe Electrix Inc.
Comment on Proposal No: 2-92
Recommendation: BSafe Electix Inc. had requested several revisions to NFPA 70 which were Rejected by the panels responsible for evaluating them.
Substantiation: We do claim that the device will eliminate/mitigate a subset of wiring device hazards. As studied and documented in the published literature, fires do arise from overheated receptacles; these fires are the ones Integral Thermal Circuit-Interrupers offer protection from.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-41 Log #2178 NEC-P02 **Final Action: Reject**
(210.8(A)(5))

Submitter: Wayne E. Morris, Association of Home Appliance Manufacturers
Comment on Proposal No: 2-94
Recommendation: The Code-Making Panel should accept Proposal 2-94.
Substantiation: This proposal replaces the exception from GFCI requirements for large appliances located in dedicated spaces that was deleted from the 2005 NEC. Nuisance failures of GFCIs for freezers or refrigerators located in a basement or garage may be rare, but cause a great deal of damage when they occur. No evidence has been given of a problem causing the elimination of the exceptions in the 2005 NEC. Reports are coming in of nuisance tripped breakers causing homeowners and business managers to remove the GFCI breaker outlets. The fact that some states have not adopted this provision in the 2008 NEC shows that this is still a very controversial change by Code Panel 2.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its statement in Proposal 2-80 that these appliances are compatible with GFCIs. The issue of the location of the GFCI is addressed through the actions taken on Proposal 2-77 and Comment 2-29.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
PURVIS, R.: This comment should have been accepted. The damage due to tripped GFCIs on refrigerators and freezers seems greater than the safety concerns with GFCIs.

2-42 Log #1590 NEC-P02 **Final Action: Accept**
(210.8(A)(7))

Submitter: Jim Pauley, Schneider Electric
Comment on Proposal No: 2-103
Recommendation: Revise the wording to read as follows:
(7) Sinks — ~~for~~ located in areas other than kitchens ~~as covered in 210.8(A)(6)~~, where receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.
Substantiation: The revision is suggested to eliminate the possible confusion about where the new rule applies. 210.8(A)(6) applies to receptacles serving the countertop in kitchens. As worded in 210.8(A)(7), the rule seems to apply to receptacles other than the countertop receptacles and if interpreted in that manner would then place GFCI protection on the receptacles for the disposal and dishwasher which are not countertop receptacles, but are generally within 6' of the sink.

The revision modifies the wording to simply remove kitchens from consideration in 210.8(A)(7) which would seem to be the intent of the panel.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-43 Log #2494 NEC-P02 **Final Action: Accept in Principle**
(210.8(A)(7))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-103
Recommendation: Accept the panel action in principle. Revise the text to read as follows:
(7) Sinks located in areas other than kitchens, where installed within 1.8 m (6 ft), measured horizontally from the outside edge.
Substantiation: The comment in the voting is correct. In addition, it is important that the means of measuring the 6-ft dimension be spelled out. A baseboard-height receptacle 6 ft 1 in. from a countertop sink will be well within the 6-ft coverage zone if the height is measured horizontally and not on a diagonal; this comment clarifies that such a receptacle is within the coverage area. This particular topic is a routine area of controversy in the field.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action taken on Comment 2-42. The revision made by the acceptance of Comment 2-42 accomplishes the objective of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-44 Log #63 NEC-P02 **Final Action: Accept**
(210.8(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-109
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal as Proposal 2-77 addresses a different section with different text.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Technical Correlating Committee and notes that Proposal 2-77 does, in fact, address 210.8(A) and 210.8(B) in the panel action. As such, the subject of Proposal 2-109 is addressed in the action taken on Proposal 2-77.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-45 Log #2241 NEC-P02 **Final Action: Accept**
(210.8(B))

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 2-122
Recommendation: Revise the submitter's Proposal 2-122 as follows:

~~Garages, service bays, and similar areas.~~ Garages, service bays, and similar areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used.

Substantiation: The revised wording takes into account the submitter's original proposal, the panel statement, and the ballot comments. In addition to facilities where diesel-powered vehicles are parked, stored, or serviced, the expanded GFCI rules will enhance electrical safety in repair garages and similar occupancies that will increasingly be used for plug-in electric hybrid vehicles and similar new types of vehicles.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-46 Log #2697 NEC-P02 **Final Action: Reject**
(210.8(B) and Exceptions)

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 2-111
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such
as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent
injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel notes that the submitter is proposing that the subject receptacle replace the requirements for GFCI protection. The report supplied with the substantiation indicates that the electric shock provisions would be evaluated in accordance with UL 943 - Standard for Safety for Ground-Fault Circuit Interrupters. If the device is evaluated to and meets these provisions, it could be applied as a GFCI under the current NEC rules.

As such, the panel does not see any justification to revise the code language. As for the other features of the receptacle, temperature sensing and power off, these are specific receptacle features that are under the purview of Code-Making Panel 18.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-47 Log #473 NEC-P02 **Final Action: Reject**
(210.8(B)(5) (New))

TCC Action: The Technical Correlating Committee notes that Code-Making Panel 14 agreed with the action taken on Proposal 2-122.
Submitter: Code-Making Panel 14,
Comment on Proposal No: 2-122
Recommendation: CMP 14 is in agreement with the principle CMP-2 acted upon on Proposal 2-122, in that personal protection in garages is improved by the installation/use of ground-fault circuit-interrupter (GFCI) protection.
Substantiation: CMP-14 needs new recommended actions by CMP-14 within Article 511 to address improvements on GFCI issues that will be more appropriate in dealing with commercial garages.

This comment was developed by a CMP-14 Task Group and balloted through the entire panel with the following ballot results:

14 Eligible to vote
12 Affirmative
2 Ballots Not Returned (T. Beall and D.W. Zipse (Voting Alternate))
No comments on vote were received.

Panel Meeting Action: Reject
Panel Statement: The panel is unclear as to what Code-Making Panel 14 is recommending, since no specific action to either modify the text or continue with the proposed text is given.

See the panel action taken on Comment 2-45.

The panel has revised the wording to be consistent with the text of 511.12.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-48 Log #658 NEC-P02 **Final Action: Reject**
(210.8(B)(5))

Submitter: Michael Strauss, BSafe Electrix Inc.
Comment on Proposal No: 2-120
Recommendation: BSafe Electix Inc. had requested several revisions to NFPA 70 which were Rejected by the panels responsible for evaluating them.
Substantiation: We do claim that the device will eliminate/mitigate a subset of wiring device hazards. As studied and documented in the published literature, fires do arise from overheated receptacles; these fires are the ones Integral Thermal Circuit-Interrupers offer protection from.

UL test data, as well as internal test data, support our claim that the BSafe Exectrix receptacle will interrupt electrical flow to it if a specified temperature rise is exceeded; it does not appear the the panel disagreed with this. As with any device, there well may be unanticipated failure mechanisms that can arise. We, therefore, have developed, and are offering a device that will detect receptacle overheating, interrupt further electrical flow to it, and thereby reduce the number of fires that occur. This precisely focused effort has been successful; the fact that there may be other failure mechanisms that can lead to fires does not reduce the importance of the fire reductions that will result from acceptance of the Integral Thermal Circuit-Interrupter.

As the Panel indicated, "Installation of these devices is not prohibited by the NEC." We, therefore, proceeding to market the BSafe Electrix receptacle and in addition we are offering our patented technologies for licensing at reasonable royalties. Our goal, in part, is to gain additional performance experience in a range of applications and to promote fire safety. This experience will be made available to the NFPA and the public through presentations in various venues.

Additionally, we "...specifically noted that the new device embodies one approach to detecting and reacting to overheating within a receptacle. Many other approaches may be reduced to practice and marketed by companies and individuals throughout the world, based on improved sensing, analytical and manufacturing capabilities." Our expectation is that we and others will continue to develop Integral Thermal Circuit-Interrupter technologies and, when appropriate, present additional data to the NFPA that leads to their recognition as another advance in fire protection. We will, of course, carefully consider the Panel's Statement as we collect additional data and continue with our development programs.

While disappointed, we do respect the efforts the NFPA's Panels and the entire staff expend to continually increase the safety of the public, both nationally and throughout the world; and we sincerely thank them all.
Panel Meeting Action: Reject
Panel Statement: The comment does not recommend specific code text as is required by section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-49 Log #2495 NEC-P02 **Final Action: Reject**
(210.8(B)(5) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-122
Recommendation: The proposal should be rejected.
Substantiation: This material is a special requirement related to one of the enumerated occupancies in Chapter 5 of the NEC and should not be moved into Chapter 2. The comment if the voting well describes just one of the likely outcomes of such a relocation. These issues should remain with CMP 14.
Panel Meeting Action: Reject
Panel Statement: Although the panel agrees that the provision is parallel to 511.12, it does expand the GFCI protection to garages and service bays that are not covered by Article 511, such as those garages where vehicles are powered by other than flammable liquids or flammable gases.

The panel has modified the language via the action taken on Comment 2-45 to make the language consistent with 511.12.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-50 Log #1724 NEC-P02 **Final Action: Reject**
(210.8(B)(5) and Exception No. 1)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 2-121
Recommendation: Revise the existing text of the 2008 NEC as follows:

(5) Sinks — those ~~where~~ receptacles ~~are~~ installed within 1.8 m (6 ft) of the outside edge of the sink.

Exception No 1 to (5): In industrial, university, and research laboratories, receptacles shall be permitted without GFCI protection if used to supply equipment that requires continuous ~~where removal of~~ power for procedures being performed or the process involved and removal of power would introduce a greater hazard ~~shall be permitted to be installed without GFCI protection~~.
Substantiation: Some of the changes proposed to the requirement in (5) and Exception No. 1 are intended to be editorial and bring the text into compliance with the NEC Style Manual. Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if."

Similar or identical work is done in research and university laboratories as is done in industrial laboratories so the Exception should apply to those laboratories as well. The relocation of the phrase "shall be permitted to be installed without GFCI protection" is intended to improve the sentence structure.
Panel Meeting Action: Reject
Panel Statement: The submitter did not offer any additional substantiation that university and research laboratories should be considered in the same manner as industrial laboratories.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

WEBER, R.: This comment does have merit. In many cases, university and research laboratories perform similar or identical work to that of industrial laboratories. This exception would only be applicable if removal of power would create a greater hazard to persons or personnel. The option of GFCI protection in these instances should be left up to the governing body of these types of facilities. I encourage the submitter to come back with additional information for the next cycle.

2-51 Log #1725 NEC-P02 **Final Action: Reject**
(210.8(B)(5) Exception No. 2)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" to correlate with the actions taken on Comments 15-26 and 15-27.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 2-123
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
Exception No 2 to (5): For other than those receptacles covered under 210.8(B)(1), GFCI protection shall not be required for receptacles located at ~~in~~ patient bed locations ~~of~~ in basic care rooms, general care rooms, or critical care rooms ~~areas~~ of health care facilities ~~other than those covered under 210.8(B)(1), GFCI protection shall not be required.~~
Substantiation: Code Panel 15 has changed several of the definitions related to this exception. The former patient care areas consisting of general and critical care areas has been changed to three classes of rooms where different types of patient care is administered. Included are basic care room, general care room, and critical care room.

This comment intends to include these revised terms and to make editorial revisions to the sentence structure.
Panel Meeting Action: Accept
Panel Statement: The panel notes that if Code-Making Panel 15 does not maintain their definitions for the different patient care spaces, the Technical Correlating Committee should reject this comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-52 Log #2258 NEC-P02 **Final Action: Accept**
(210.8(B)(6))

Submitter: William Benard, Gemini Electric Inc.
Comment on Proposal No: 2-110
Recommendation: Revise as folows:

210.8(B)(6) Locker Rooms—with ~~adjacent~~ associated showering facilities.
Substantiation: The current proposed language does not accurately describe a distance with the use of the word "adjacent." In years past, the NEC has found it necessary to add the word "immediately" to qualify the term "adjacent" in order to determine a specific distance. In a case where the locker room is located via passage through an adjacent bathroom from the shower area would exempt the locker room from the prescribed protection. The locker room would still provide a location that promotes electrical shock due to the nature of the use as described in the substantiation of Proposal 2-110. Changing the term "adjacent" to "associated" does not place focus on a distance, but does consider the source of water carried to the drying/dressing area which is the problem.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-53 Log #1421 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(8))

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 2-122
Recommendation: Revise proposed new 210.8(B)(8) by adding the following:

(8) Garages, service bays, and similar areas.

Exception to (8): Parking garages.
Substantiation: It is not clear whether this proposed new requirement would apply to parking garages. If the panel agrees that they are not intended to be included, then this need to be made clear.

If the panel intends to include them, then make that clear by revising the proposed wording to read, "(8) Garages, parking garages, service bays, and similar areas."
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action taken on Comment 2-45.

The revisions made by the panel in Comment 2-45 address the submitter's concern by limiting the application to receptacles where portable diagnostic tools, electric hand tools or portable lighting will be used.

This action will address the submitter's concern regarding parking garages.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-54 Log #2336 NEC-P02 **Final Action: Reject**
(210.8(B)(8))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 2-122
Recommendation: Reject this proposal.
Substantiation: This new requirement results in new requirements without any technical substantiation. The substantiation was anecdotal in nature, without citing any specific incidents. 90.3 works very well when we let it do its job. Unfortunately, when the Code parrots rules from Chapter 5 in Chapter 2, conflicts often occur. For example, if the garage is governed by Article 511, do the GFCI rules in 511 modify this rule, requiring GFCIs only in the specific locations discussed in that article? This proposal seems to add more confusion than safety.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-49.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-55 Log #2698 NEC-P02 **Final Action: Reject**
(210.8(C))

Submitter: Michael Baxter, Energy Safe Technologies Inc.
Comment on Proposal No: 2-129
Recommendation: Same as originally submitted.
Substantiation: The Underwriters Laboratory completed a study of problems associated with receptacles that lead to fires as well as the effectiveness of an advanced receptacle, such as the PSP, to address these problems. This report shows that such a receptacle has the potential to make a positive difference to the rate of fires and consequent injuries and loss. The result of this work is detailed in the accompanying UL Report on Project 09CA32520 published 21 October 2009.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The panel notes that the submitter is proposing that the subject receptacle replace the requirements for GFCI protection. The report supplied with the substantiation indicates that the electric shock provisions would be evaluated in accordance with UL 943 - Standard for Safety for Ground-Fault Circuit Interrupters. If the device is evaluated to and meets these provisions, it could be applied as a GFCI under the current NEC rules. As such, the panel does not see any justification to revise the code language. As for the other features of the receptacle, temperature sensing and power off, these are specific receptacle features that are under the purview of Code-Making Panel 18.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-56 Log #1372 NEC-P02 **Final Action: Reject**
(210.9 Exception No. 2)

Submitter: Charles M. Trout, Maron Electric Company
Comment on Proposal No: 2-134
Recommendation: Delete Exception No. 2 in its' entirety.
Substantiation: The panel is attempting to shift the responsibility for providing prescriptive Code requirements to the authority having jurisdiction. It is the responsibility of the Code process to provide prescriptive requirements for the authority having jurisdiction to enforce.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the substantiation and notes that there are numerous instances where the AHJ must determine whether or not the appropriate supervision exists for an installation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: I agree with the submitter of this comment. An exception that permits a reduction in safety should include clear prescriptive language for proper interpretation by both the electrician and the AHJ. since there is no requirement for documentation that would provide evidence to the AHJ that a qualified person actually exists, this could lead to inconsistent and improper application of this section."

2-57 Log #2496 NEC-P02 **Final Action: Accept**
(210.9 Exception No. 2 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-134
Recommendation: Continue to reject the proposal.
Substantiation: This proposal was considered and rejected for the 2008 NEC. Since it is now back once again with essentially the same arguments, and as the submitter of the series of proposals and comments over several cycles that finally inserted this exception into the NEC, I thought some historical background was in order. The following paragraph of this comment recapitulates my comment in the prior cycle (Comment 2-63, 2008 NEC cycle) that was instrumental in the rejection of a similar proposal.
"I did a great deal of my initial trade work in a number of heavy industrial occupancies, all of whom were running at 600V ungrounded. It was common practice to bring in machinery rated for 480 volts, and I would be assigned the task of wiring it. I quickly discovered that there were no 600V/480V two-winding transformers commercially available. However, a 480V/120V two-winding transformer connected as an autotransformer worked very well, and saved the enormous expense and labor involved in the only alternative, two sets of two-winding transformers. Since the potential hazard in this situation consists of the equipment running at some voltage to ground greater than 480V but in this case not much more, not over 600V, and since that is well within the equipment parameters, the code making panel made a reasonable assessment and allowed it to go forward. It should continue until and unless the industry is willing to make two-winding transformers available for this duty."
With respect to providing prescriptive requirements (in reference to comments in the voting), it is important to recognize that 600V installations really do not exist outside of an industrial environment. When the proposal was originally submitted, it had no qualified supervision limitation. CMP 2 originated this requirement in the interest of increased safety. It would be highly inappropriate to remove this allowance altogether as requested in the proposal, which is routinely applied to make 480V equipment function on 600V distributions, particularly in light of the fact that the proposal submitter, in both this and the prior code cycle, failed to document a single instance of loss experience. It is clear that the real issue with this proposal is heartburn around "qualified person" allowances throughout the NEC, and not this particular exception. CMP 2 took the correct action by retaining a consistent approach as that followed by all other panels responding to similar concerns.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

3-3 Log #66 NEC-P03 **Final Action: Accept**
(210.12)

TCC Action: The Technical Correlating Committee directs that this comment to be sent to the NFPA 72 Task Group on Wiring for correlation with NFPA 72.
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-156
Recommendation: It was the action of the Technical Correlating Committee to refer this proposal to Code-Making Panel 3 for correlating action in Article 760.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the NEC Technical Correlating Committee to correlate the actions of Proposal 2-156 with requirements in Article 760 and supports the accept in principle in part of Panel 2 with no further correlation necessary.
Based on the action of Panel 2 on Proposal 2-156 and the action of Panel 3 on Proposals 3-259 and 3-280, no further correlation is necessary. Panel 3 has changed "dedicated branch circuit" to "individual branch circuit." The protection requirements for the branch circuit conductors to be installed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, and steel armored cable, as accepted by Panel 2, provide more substantial protection than less substantial metal raceways. Consequently, the less protective methods were rejected. The proposed Fine Print Note referencing Section 11.6.3(5) in NFPA 72 is unnecessary in Article 760 since Section 760.1, FPN No. 1 already references NFPA 72.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

AYER, L.: While I agree with the panel action, the statement provided by the technical committee for comment 2-156 is incorrect. The panel statement infers that CMP 3 changed "dedicated branch circuit" to "individual branch circuit" when in fact Panel 3 did not accept either of these terms. CMP 3 changed the wording to the following text: "The branch circuit supplying the fire alarm equipment(s) shall supply no other loads." This change was necessary to reflect that a "branch circuit" could supply multiple pieces of fire alarm equipment, while a "individual branch circuit" would only serve one utilization equipment.

EGESDAL, S.: The National Fire Alarm Code identifies the power for a fire alarm system as a "dedicated circuit" The term came into use in NFPA 72 after the requirement for connecting fire alarm system power ahead or the main breaker for a building was changed to permit connection on the downstream side of the main breaker panel. This subject needs further review and action to correlate the text in the NEC and NFPA 72.

KAHN, S.: Since NFPA 72 identifies power for a fire alarm circuit as being provided by a "dedicated circuit", the subject requires further review for correlation with the NFPA document that provides the performance specification.

(210.12)

Submitter: Vincent Metallo, Sr., Baltimore County Government
Comment on Proposal No: 2-170
Recommendation: After the word "dwelling" insert the following text:
"units except outlets that are required to be gfci protected in accordance with 210.8(A)."
Substantiation: The present requirement covers all outlets that are not currently required to be gfci protected in accordance with 210.8(A). As it stands now, the current wording does not require a dedicated lighting circuit that would serve the kitchen only because it is not listed as one of the rooms listed in 210.12. This change would add arc fault protection for the rooms that are excluded in 210.12 for other dedicated circuits that are not gfci protected.
Panel Meeting Action: Reject
Panel Statement: It is the intent of the panel to apply the AFCI protection requirements to the branch circuits specified by the list of rooms in 210.12. The panel does not agree with attempting to specify AFCI protection based on whether GFCI protection is included.

AFCI protection and GFCI protection are two independent protections that accomplish two different objectives.

Currently, there are areas of the dwelling that would require both forms of protection - one example is a wet bar located within a den or family room. The receptacles within 6 ft of the wet bar must have GFCI protection and the circuits supplying all outlets in the room must have AFCI protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1

2-64 Log #1205 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 2-154
Recommendation: Proposal 2-154 should be Accepted in Principle and considering the action of the TCC on proposal 2-153, the proposal should be revised to read as follows:
Exception No. 1: Where RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlet and junction boxes or Type PVC Conduit, Type RTRC Conduit, is installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
Exception No. 2: Where a listed metal or nonmetallic conduit or tubing is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
Exception No. ~~2~~3: Where a branch circuit to a fire alarm system installed in accordance with 760.41(B) and 760.121(B) is installed in RMC, IMC, EMT, or steel armored cable, Type AC, meeting the requirements of 250.118, with metal outlet and junction boxes, Type PVC Conduit, Type RTRC Conduit, AFCI protection shall be permitted to be omitted.

Substantiation: The submitter is correct in his substantiation where Type PVC Conduit and Type RTRC Conduit is an acceptable wiring method for protection of cables and conductors per 300.4 and where all types of raceways are acceptable when encased in concrete per 518.4 and 520.5. 210.12 should not discriminate against these acceptable wiring methods. The comment places the nonmetallic conduit after the grounding requirements of 250.118 which pertains to 250.118 and addresses the use of "Type PVC Conduit and Type RTRC Conduit" since the acronym "RNC" is no longer being used.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the addition of a new Exception No. 2, with the revision of "a combination AFCI" to read "an outlet branch circuit AFCI".

The panel rejects the proposed revisions of existing Exceptions No. 1 and No. 3.

Panel Statement: The submitter provided no specific information demonstrating that PVC and RTRC conduit will provide protection of the conductors, relative to arcing events, equivalent to the protection provided by steel armored cable or metal conduit.

The panel revised the type of AFCI to correlate with the action taken on Comment 2-90.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-65 Log #1274 NEC-P02 **Final Action: Hold**
(210.12)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Comment on Proposal No: 2-153

Recommendation: We support the panel's action for rejection of this proposal.

Substantiation: AFCI technology was first introduced in the early 1990s and has been included in the code development process in the 1999, 2002, 2005, and 2008 editions. AFCI requirements have been a progressive process, as well as substantiated over the past four NEC Code cycles.

Accordingly, this Code Panel has gradually expanded the AFCI protection requirements over numerous code cycles with the intent to increase electrical safety in the home, but do so on a gradual basis. However, the expansion of AFCI requirements didn't come without extensive deliberation by the panel, based on sound technical substantiation and data.

The following past ROPs & ROCs below clearly establish the Panel's long history and technical discussions, which has resulted in an equitable code that ensures a minimum level of safety.

NFPA 70 1999 Proposals 2-128, 2-129, 2-130

NFPA 70 2005 Comments 2-87a, 2-93, 2-105, 2-108, 2-110

NFPA 70 2008 Proposals 2-142, 2-126

NFPA 70 2008 Comments 2-95, 2-129, 2-137

As stated by CMP 2 Members F. Coluccio, R. LaRocca and J. Pauley, acceptance of this proposal would remove AFCI protection for parallel arcing faults from the first portion of the branch circuit, which is in direct conflict to past panel actions to increase safety. Rejecting this proposal will ensure the level of safety for these branch circuits are not reduced.

The submitter's substantiation lacks merit as the Standard for AFCIs, UL 1699, doesn't consider as a component, the proximity to an arcing source. Regarding costs associated with metal raceways or cables, the submitter has not provided any cost analysis or data to demonstrate what is too cost prohibitive. In addition, CMP 2's panel statement from the 2002 ROP (2-106) further supports this concept:

"AFCIs Listed to UL 1699 are available, and the standard addresses efficacy, unwanted (nuisance) operation and operation inhibition. Cost should not be an issue for the panel to resolve. The panel reviewed a large amount of data, heard presentations on various positions on AFCIs, and received public comment on the topic. Upon that review, the panel arrived at the requirements in the 1999 NEC and continues to support that established position."

With respect to the state adoption, states throughout the U.S. continue to recognize and adopt the important safety provisions included in the 2008 NEC, despite the opposition from some industry groups. The panel needs to rise above the political battlefield and continue to move forward with what is in the best interest of safety for citizens.

In the panel statement ROP 2-166, the Code-Making Panel stresses that "AFCI protection is for protection from fire ignition for branch circuits." Consequently, with this statement and others in the past...the entire branch circuit shall be protected."

In the panel statement from ROP 2-155: "AFCI devices are widely available in the market and the panel notes that the cost has already come down since the introduction of AFCIs into the 1999 NEC." Therefore, cost should not be considered.

With regards to the substantiation that "wiring insulation has dramatically improved in the past 50 years." This is a consideration that should be addressed from the original proposal in 1999 and reviewed as to the comparison of Consumer Product Safety Commission fundamental data as to eliminate the AFCI requirement completely based on the introduction of 90 degree C insulation.

As indicated with this substantiation, the crisis with home structure fire civilian death, it appears that "Cord and Plugs" *cord-and-attachment-plug-connection* accounts for the significant share in 2002-2005 concerning this issue. If it is the cords of appliances and equipment that are of apprehension, then AFCI and/or leakage-current detector-interrupter protection may need to be applied to the product standard as with NEC section 440.64 and addressed by Code-Making Panels 17 and 18.

Should we disregard the past panel action concerning AFCI outlets many other consequences will occur. This will challenge the wisdom that the electrical industry's leaders have credible knowledge. We have discussed, assessed, informed, and legislated the concept of the entire branch circuit being protected as referenced from zone 1 Consumer Product Safety Commission study, where 36% of residential electrical fires occur. This change will provide the information for state and local jurisdictions to amend this entire section from the National Electrical Code.

Panel Meeting Action: Hold

Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1

Explanation of Negative:

KING, D.: I disagree with the panel action to place this comment on hold. This Comment should have been rejected. The submitter does not recommend any specific code text or action as is required by section 4.3.3(C) of the Rules Governing Committee Projects. Also as was noted in the submitters substantiation, requirements for AFCI devices has increased over the past several Code Cycles as more information has been made available for the panel to act on. Additional information on parallel arcing protection provided by the magnetic trip mechanism of standard circuit breakers was presented to the panel during this code cycle and should have been considered by the Panel when acting on this Comment. See my explanation of negative on Comment 2-99.

WOOD, T.: See my Explanation of Negative Vote on Comment 2-68.

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

Comment on Affirmative:

BECKER, R.: Affirmative vote of "HOLD" for the purpose of requiring further consideration of the merits of allowing protection, which is claimed to be provided by AFCI devices, to be satisfied by AFCI receptacles as proposed in 2011 ROP Proposal Number 2-153.

The advantages of allowing any protection provided by AFCI devices to be provided by AFCI receptacles include the following:

1. The risk of parallel arcing (i.e., arcing between the hot and neutral) in the 120V branch circuit premises wiring is extremely small and little or no evidence of this type of arcing has been positively attributed to loss of life or property.
2. The risk of parallel or series arcing in appliance cords and extension cords has been shown to exist and would be prevented by AFCI receptacles.
3. If AFCI receptacles are not allowed to satisfy the requirement for AFCI protection without the installation of the home-run portion of a branch circuit in conduit or steel armored cable, the demand for AFCI receptacles will continue to be extremely limited. With an extremely limited demand for AFCI receptacles, the incentive for manufactures to mass produce AFCI receptacles and for retailers to give AFCI receptacles shelf space will continue to be extremely limited. This will result in AFCI receptacles continuing to be commercially unavailable.

Without AFCI receptacles commercially available, the protection, claimed to be provided by AFCI technology, will usually be provided only for new homes and homes undergoing a major remodel.

It is instructive to consider whether GFCI protection would have been adopted as quickly and widely as it was if the NEC had required GFCI protection for the home-run portion of branch circuits and not allowed GFCI protection to be provided at the receptacle without installing the home-run portion of each branch circuit in conduit or armored cable. It is likely that GFCI receptacles would not have been mass produced and readily available to anyone wanting to provide GFCI protection in areas like bathrooms in older homes with very little effort. It is likely that GFCI protection would only exist in newer homes and homes which have undergone major remodels if the same requirements were put on GFCI protection as exist now for AFCI protection (i.e., not allowing the AFCI protection to be satisfied at the receptacle).

The benefit of allowing AFCI receptacles to satisfy the required AFCI

protection is significant. It would enable readily available AFCI receptacles capable of being installed with little effort which would result in faster and wider adoption of AFCI protection at the receptacle level, where it would protect appliance cords and extension cords, in existing homes.
Conversely, the benefit of allowing AFCI receptacles to satisfy the required AFCI protection would be sacrificed if home runs are required to be protected against parallel arcing faults in the circumstance where the parallel fault current magnitude would be so low that a conventional circuit breakers magnetic trip function would not detect and interrupt the fault.

2-66 Log #1607 NEC-P02 **Final Action: Hold**
(210.12)

Submitter: Thomas A. Domitrovich, Eaton Corp.
Comment on Proposal No: 2-153
Recommendation: Reject this proposal.
Substantiation: The elimination of physical steel protection to the first outlet as put forward in Proposal 2-153 significantly reduces the quantity of AFCI protected installed wire within residential structures. In a survey of new built homes, comprised of single family homes and townhouses ranging in size from 1,100 sq-ft to 3,300 sq-ft, it was determined that over 20% of wiring within the home is included between the first outlet and the loadcenter. Therefore, these circuits would have reduced protection should Proposal 2-153 be accepted.

The wire between the first outlet and the loadcenter is typically run between studs and inside the rafters of the residence. This wire is just as susceptible to damage that could result in an arcing condition as any other installed wiring.

Eaton recommends the panel's continued rejection of this proposal. This action will maintain the safety measures which already exist in several editions of the National Electric code.
Panel Meeting Action: Hold
Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.

(210.12)

Submitter: John W. Young, Siemens Industry
Comment on Proposal No: 2-153
Recommendation: Reject the Proposal.
Substantiation: The Code should focus on safety and not on commercial considerations to write Code language to allow or promote a product at the expense of giving up safety. This Proposal argues that the Code language needs to be written to promote receptacles and that in doing this you don't lose much protection. Why give up any protection? The code should be about safety and should promote complete protection and should not try to rationalize giving up the level of protection we now have so another product could be used. Once you start that where does it end?

A GFCI can offer the same personnel protection from different points - breaker or receptacle - but an AFCI, like a circuit breaker or fuse, can only protect the branch if it installed at the beginning of the branch circuit.

The substantiation speaks of the dramatically improved wiring insulations as the reason the AFCI protection is not needed on the branch circuit wiring and can therefore be moved to the receptacle. There is no question that wiring insulations have improved but nails and screws can still pierce the best of the insulations with no difficulty and sharp edges can still cut the best insulation with no effort.

(210.12)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 2-153
Recommendation: This proposal should be Accepted in Principle as seen in the panel action in the ROP.
Substantiation: I agree with the affirmative comments made by both Mr. Weber and Mr. King as seen in the ROP.

I agree with the comments of Mr. King that the statement to the negative submitted by Mr. Pauley, is factually inaccurate. The statement is misleading with respect to the OBC type AFCI. The statement "By allowing the AFCI to be installed at the first outlet without any protection of the wiring between the panel and the first outlet..." is factually incorrect. The reader of the ROP will clearly see that the panel specified the "Outlet Branch Circuit" type AFCI. These devices provide protection for series arcing on the home run and for series and parallel arcing downstream.

The statement "...the panel has effectively eliminated AFCI protection on 25% to 50% of the wiring that was previously covered by 210.12" is factually incorrect.

The 25% to 50% claim is undocumented and unsupportable. Electrical contractors are not in business to make home runs as long as possible. Contractors will plan on locating the service equipment and installing home runs as efficiently as possible. Arguments against the action to accept this proposal in principle claim that the action on 2-153 is a safety issue and now those home runs represent a hazard. I do not buy into that argument for the following reasons:

(1) The vast majority of fires caused by an electrical arc occur on the load side of receptacle outlets, not in the home run. This action to accept in principle provides series arcing protection for the home run.

(2) Fire science does not support the claim that an electrical arc in a 12/2 cable will ignite a fir 2 x 4 structural member.

(3) A typical 2400 square foot home would not require many AFCI circuits. The present requirement basically covers only the 3 volt-amp per square foot load as required in 210.12. When one does the calculation: 2400 x 3 = 7200, 7200 /120 (volts) = 60-amps which translates into a minimum of three 20-amp or four 15-amp circuits requiring AFCI protection. A typical 2400 square foot home will also have circuits not requiring AFCI protection for (2) small appliances, (1) laundry, (1) bathroom (in most cases more than one bathroom is installed and more than one home run is provided), (1) refrigerator, (1) microwave, (1) unfinished basement, (1) garage, (1) outdoor receptacles, (1) AC air handler, (1) AC condensing unit, (1) electric dryer, (1) electric range and (1) for heat if it is gas or oil and many more if it is electric heat. An argument that 3 or 4 home runs in a dwelling unit require parallel AFCI protection of the home run but the remainder of the home runs, (the significant majority) do not require any AFCI protection at all, is a flawed argument.

I disagree with the statement that 210.12 exists solely for the protection of the branch circuit only. The vast majority of electrically related fires start on the load side of the outlet. This is recognized by CMP-2 in the "combination type" AFCI requirement. In fact the demonstration of this device in the 1999 NEC cycle for CMP-2 was the cutting of an "extension cord" to visually show how AFCI protection could prevent a fire where such an event occurred.

I also agree with Mr. Kings statement as follows:

I agree with the Panel Action on this Proposal because it provides a more practical alternative for compliance with this section in many applications. The Panel action to revise the text to require "outlet type" AFCI protection provides series arc protection on the line side of the device eliminating the need for additional physical protection of the conductors to the first outlet. The Panel action on this Proposal allows for a more practical means of meeting the requirements of 210.12 and will extend this life saving technology to more branch circuit wiring than what is being protected by the present code text.
Panel Meeting Action: Hold
Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1
Explanation of Negative:

KING, D.: I disagree with the Panel Action to place this Comment on Hold. I agree with the submitter's recommended action and substantiation. Reports presented at the ROC Meeting showed evidence of a significant increase in the number of branch circuits that would be protected by this life saving technology had this comment been accepted. See my explanation of negative on Comment 2-99.

WOOD, T.: The Panels action to "Hold" this Comment and the associated Proposals has denied the public and all interested parties the ability to consider all sides of the argument regarding the acceptability of the possible additional safety that may have been achieved by the use of this product.
During the Panel discussions there were ample opportunities to reach a consensus regarding the use of the product described. The "hold" and the lack of finding a middle ground does not allow the additional safety that could have been provided in existing residences or additions to or alterations to existing residences.
The underlaying reason for the "hold" has little to do with Safety and a great deal to do with Product sales.

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

2-69 Log #1773 NEC-P02 **Final Action: Hold**
(210.12)

Submitter: Ed Larsen, Square D Company/Schneider Electric / Rep. American Circuit Breaker Manufacturers Assoc.
Comment on Proposal No: 2-153
Recommendation: Continue to reject this proposal.
Substantiation: The American Circuit Breaker Manufacturers Association (ACBMA), headquartered in Washington DC, is an association of American manufacturers of circuit breakers to represent and promote the interests of American circuit breaker manufacturers in areas of codes and standards, applications, safety and education. Members of the Association include Eaton Corporation, General Electric Company, Siemens Industry, Inc., and Square D/ Schneider Electric.

This proposal will reduce the level of safety from the currently required combination type AFCI protection of the entire branch circuit and should be rejected for the following reasons:

1. A survey of single and two story homes ranging in size from 1072 to 7488 sq. ft. of finished space found that the total AFCI branch circuit conductor length in the home runs ranged from 20 to 39% of the total circuit length (see attached survey summary). Fires can, and do, result from arcing in home run conductors (see attached document on fire investigations), yet the proposal specifically reduces this protection. No justification has been offered for why the current level of protection and safety for the home run should be reduced.

2. No technical documentation has been submitted to substantiate the claim that receptacle type AFCIs would be "more sensitive to hazardous vs. normal arcing."

3. Claims were made in the substantiation that wiring insulation has improved and the results of the Fire Protection Research Foundation Residential Electrical System Aging Research Project Technical Report were cited. While these statements are certainly true for properly installed and maintained systems, they ignore the damage that wiring can suffer due to improper installation, maintenance and use.

4. Contrary to the claim in the substantiation, states are readily adopting the 2008 NEC with the AFCI requirement to protect the entire branch circuit.

2-70 Log #1928 NEC-P02 **Final Action: Hold**
(210.12)

Submitter: Philip M. Piqueira, General Electric Co.
Comment on Proposal No: 2-153
Recommendation: Continue to reject this proposal.
Substantiation: Proposal 2-153 should continue to be rejected by CMP-2 because the adoption of this proposal would introduce into the code a significant reduction in safety and the substantiation for this proposal is seriously flawed.

The proposal states: "Cords and plugs accounted for the largest share of the 2005-2006 home structure fire civilian deaths." This statement blatantly ignores the fact that 30% of the electrical wiring in a house is located in the "home run" portion of the wiring (the portion left unprotected if Proposal 2-153 is accepted) and that approximately 35% of residential building electrical fires occur in the structural areas (crawl spaces, attics, walls, porches, and roofs) of the home (see Residential Building Fire Report, March, 2008, U.S. Fire Administration National Fire Data Center that I have provided).

As part of the justification to leave 30% of the house wiring unprotected, the submitter provides the rationalization that this wiring doesn't need the protection because "...wiring insulations have dramatically improved over the last fifty (50) years." While wiring insulations have certainly improved, the above statistics demonstrate that electrical fires continue to occur as a result of ignition of the electrical wire If damage occurs to the insulation, arcing, and its potentially lethal results, will occur no matter how "robust" the insulation is.

The submitter also states that" "Receptacle type AFCIs would be located closer to the probable arcing sources and be more sensitive to hazardous vs. normal arcing." This is erroneous. Physical proximity to arcing does not provide any increase in sensitivity as arc detection methods rely on current patterns and impedance and, although impedance generally varies with the length of wire, physical location of outlets to arcing is not indicative of impedance to arcing. The combination AFCI detects all types of faults as identified by UL 1699 to the same level of performance as the outlet type AFCI.

The submitter also stated: "It is evident that some states are not adopting AFCI requirements. This proposal would reduce objections...thus, resulting in increased safety." Again, a statement without basis—states are readily adopting the 2008 NEC with the AFCI requirement to protect the entire branch circuit. As of July, 2009, 33 states have adopted AFCI requirements.

Finally, comments such as "...an unintentional barrier built into the wording of this article" and "The requirement of a metal conduit or metal-jacketed cable...is, in many cases, cost prohibitive" should never be considered as part of a code substantiation. Reduction of demonstrated and established electrical safety requirements should never be justified by suggesting that they are cost prohibitive.

Note: Supporting material is available for review at NFPA Headquarters

(210.12)

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 2-153
Recommendation: This proposal should be rejected.
Substantiation: If the panel accepts this proposal they you really undermining the requirement for AFCI protection. Many of the substantiations in support of the AFCI requirement over the last 4 code cycles showed that as many as 40% of the fires of electrical origin in dwelling units were caused by the fixed wiring of the building. If AFCIs are really needed, you are taking a big step backwards by permitting extensive non-AFCI protected wiring within in the dwelling unit. The acceptance of this could leave a large portion of the fixed wiring without AFCI protection. If the "home run" portion of the branch circuit does not need AFCI protection, why does any part of the branch circuit need AFCI protection?

(210.12)

Submitter: Philip M. Piqueira, General Electric Company
Comment on Proposal No: 2-173
Recommendation: Continue to reject this proposal.
Substantiation: Proposal 2-173 should continue to be rejected by CMP 2 because the adoption of this proposal would introduce into the code a significant reduction in safety and the substantiation for this proposal is seriously flawed.
The proposal ignores the fact that 30% of the electrical wiring in a house is located in the "home run" portion of the wiring (the portion left unprotected if Proposal 2-173 is accepted) and that approximately 35% of residential building electrical fires occur in the structural areas (crawl spaces, attics. walls, porches. and roofs) of the home (see Residential Building Fire Report., March, 2008, U.S. Fire Administration National Fire Data Center that I have provided).
Although the submitter recognizes that "there would be some wire that would not have AFCI protection," it is clear that he has significantly under estimated how much wire in a typical house could be left unprotected. Further, the submitter implies that NM cable, being a "proven safe method," does not become damaged.
However, it is well known that under certain circumstances, NM cable can easily be damaged.

(210.12)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-153
Recommendation: The proposal should be accepted.
Substantiation: The arguments surrounding this issue were fully explored in the proposal submitter's Comment 2-78 in the 2002 NEC cycle. As fully documented in that comment, very few low-level parallel ground faults ever occur between the branch circuit overcurrent device and the first outlet, and series issues are detected by the devices in question. When the Commonwealth of Massachusetts adopted the 2002 NEC, effective January 1, 2002, it did so with a state amendment creating a fine print note following the NEC text mandating AFCI for the entire branch circuit, reading as follows: "Where installed as the first device on a branch circuit, some receptacles are listed as providing AFCI protection for the entire branch circuit." Massachusetts did so in order to clarify that the devices described in the subject proposal were acceptable. Unfortunately the ambiguity at the NEC level in that cycle, followed by subsequent NEC amendments that explicitly and severely limited the use of these devices, led to a continuing business decision by receptacle manufacturers that there would be and still is insufficient demand in the market to justify the production costs.
This brings us to the current unfortunate state of affairs where it is not cost effective to offer the proven safety effectiveness of AFCI protection in countless older residential occupancies where the owner is unable to pay for a service upgrade from existing overcurrent devices that are either fuses or circuit breakers of obsolete manufacture. By failing to muster the required two-thirds majority, CMP 2 has retained the intellectual purity of this rule at the expense of the only practical alternative in many older homes, where extensive research done as part of the NFPA 73 project and other investigations clearly demonstrates that genuine electrical hazards are largely a function of the age of the occupancy.

WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.
Explanation of Abstention:
BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.
Comment on Affirmative:
PURVIS, R.: See my comment with my affirmative vote on Comment 2-99.

WEBER, R.: The acceptance of proposal 2-90 should satisfy the submitters concerns with older dwelling. The issue of an additional AFCI device being cost effective should not be a concern to the code making panel. Substantiation provided in comment 2-99 by the Arc Fault Circuit Interrupter Wiring Device and Joint Research and Development Consortium indicates to this panelist that there is already a market for the development of the Outlet Branch Circuit AFCI device. Given the option, many homeowners would chose to install these devices in their personal homes if they were available today. Hopefully the code making panel will approve the allowance of the outlet branch circuit AFCI device to be installed at the first receptacle outlet of the existing branch circuit. Combined with the comments made to and approved by other code making panels the manufactures will feel there is a large enough market share to begin production of the product.

2-75 Log #2798 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-158
Recommendation: Accept Proposal 2-158.
Substantiation: Panel 2 has not taken the figures showing there is no cost-benefit to mandating AFCI's in dwellings as a serious matter. The cost-benefit studies still show well over 2 Billion dollars will be spent each year in an effort to partially eliminate losses that total only 18 Million dollars. And, "partially eliminate" is a key aspect of why these devices should not be mandated. A NAHB Research Center Survey (attached) shows these devices are not working with 100% efficacy. The problems of nuisance tripping reported when these devices were first developed continue to plague both electricians and builders. In addition, no manufacturer will claim their devises will work 100% of the time. It is proven that the lack of efficacy of these devices, along with the complete lack of a cost-benefit provides no benefit to society in any fashion and mandates for these devices should be deleted from the National Electrical Code.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel has concluded that the information provided over several code cycles indicates that AFCIs provide substantial protection against arcing incidents in the electrical system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: It was an interesting day when NEC Panel 2 was presented with presentation by the manufacturers of the different types of Arc-Fault Circuit Interrupter (AFCI) devices. What really piqued my attention was the extensive discussion on the market share the manufacturers of the AFCI breaker devices would receive vs. the manufacturers of the receptacle-type AFCI devices. Over the many hours of presentation and discussion, the non life-safety aspect of market share seemed to have been the biggest concern. It is this type of "concern" goes to directly to NAHB's position that the mandates for AFCIs should be removed from the National Electric Code. Not once in the entire development of the NEC has a Proposal to mandate AFCI's ever provided supporting information relative to a cost-benefit society would receive if these devices are installed. To the contrary, there is more data, documentation, and information that shows mandating the installation of AFCI devices will cost the U.S. billions of dollars to possibly save less than 30 million dollars of losses a year - and that is if the devices worked 100 percent of the time. More recent data from the United States Fire Administration's National Fire Incident Reporting System (NFIRS) shows that the fire-loss figures are significantly lower than the manipulated figures from the NFPA data originally used to show the huge cost-to-loss ratio. This type of mandate is unacceptable, especially in this economy. Allowing manufacturer's to mandate the purchase and installation of their products through the NEC should be looked on the same as the practices by large corporations in misusing public funds. No jurisdiction should ever adopt any industry standard that does not provide a cost-benefit to that community. If you would like more information on the NFIRS data, please contact NAHB through Steve Orlowski at (202) 266-8303 or sorlowski@nahb.org.

In addition, no documentation (information) was ever provided to the Technical Committee to prove AFCI's provide the "Substantial protection" stated in the Panel Statement. I will also note that debate on this issue was cut-off early by a call for the question.

2-76 Log #2810 NEC-P02 **Final Action: Hold**
(210.12)

Submitter: Richard W. Becker, Engineered Electrical Systems, Inc. / Rep. IEEE
Comment on Proposal No: 2-153
Recommendation: Accept the proposal.
Substantiation: The panel statement refers to "documented series arc protection benefit...", CMP-2 does not have the referenced information.
Panel Meeting Action: Hold
Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1
Explanation of Negative:
KING, D.: I disagree with the Panel Action to place this Comment on Hold. I agree with the submitter's recommended action to accept Proposal 2-153 but disagree with the submitter's substantiation. The Panel has reviewed sufficient data over several Code cycles that confirms the ability of this life saving technology to recognize and respond to arcing faults.

WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.
Explanation of Abstention:
BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.
Comment on Affirmative:
PURVIS, R.: See my comment with my affirmative vote on Comment 2-99.

2-77 Log #2811 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Richard W. Becker, Engineered Electrical Systems, Inc. / Rep. IEEE
Comment on Proposal No: 2-157
Recommendation: Delete paragraph.
Substantiation: The panel statement refers to "technical studies...", CMP-2 does not have the referenced information.
Panel Meeting Action: Reject
Panel Statement: The panel has concluded that the information provided over several code cycles indicates that AFCIs provide protection against arcing incidents in the electrical system.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-78 Log #1825 NEC-P02 **Final Action: Accept in Principle**
(210.12 Exception No. 1)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 2-182
Recommendation: Revise 210.12 Exception No.1 in the 2001 NEC ROP Draft as follows:

Exception No. 1: If ~~Where~~ RMC, IMC, EMT, ~~or steel armored~~ Type MC or ~~cable,~~ Type AC cables meeting the requirements of 250.118 and ~~using~~ metal outlet and junction boxes are ~~is~~ installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a combination type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
Substantiation: Armored cables are more than suitable to offer the physical protection needed for the branch circuit conductors between the panelboard and box where receptacle-type ACFI devices are permitted to be installed. The cables must pass rigorous testing mandated in UL-4, the UL standard that applies to Type AC cables and UL 1569, the UL standard that applies to Type MC cables.

Since the Panel's action on revisions to 210.12 (ROP 2-153) failed at the letter ballot, it has become necessary to re-submit this revision at the Comment stage of the NEC revision process.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Comment intends to use the word "if" where appropriate.

Panel Meeting Action: Accept in Principle

Revise the proposed text to read as follows:

"Exception No. 1: If RMC, IMC, EMT, Type MC or steel armored Type AC cables meeting the requirements of 250.118 and metal outlet and junction boxes are installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a outlet branch circuit Type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit."

Panel Statement: The panel accepts the addition of MC Cable meeting the requirements of 250.118, however, has maintained the requirement for Type AC Cable be of the steel armoured type due to the lack of a crush impact test.

The panel changed "combination type" to outlet branch circuit type of AFCI based on its action on Comment 2-90.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-79 Log #1619 NEC-P02 **Final Action: Accept in Principle**
(210.12 Exception No. 3 (New))

Submitter: Donald R. Cook, Pelham, AL

Comment on Proposal No: 2-160

Recommendation: Add new text to read as follows:

Exception: Where circuits and/or outlets in the rooms listed in 210.12(B) are altered, modified, extended, replaced, or revised in an existing electrical installation, the AFCI protection shall be permitted to be located at the first outlet by a Listed Combination Type AFCI Receptacle.

Substantiation: The Panel Statements for many of the proposals to revise the 2008, NEC 210.12 requirements reflect one of two positions.

One position seems to suggest the risk of parallel damage from the overcurrent device to the first outlet is minimal and permission to use device type protection would provide options to protect existing circuits that are incompatible with currently listed Combination AFCI protective devices installed at the supply end of the circuit.

The other position seems to suggest the maximum benefit to safety should include parallel and series protection of the entire branch circuit.

Panel statements for several proposals state the decision to apply the NEW CONSTRUCTION AFCI requirements, to a circuit modification, are that of the AHJ. That statement is interesting, puzzling and problematic when the text in 210.1, 210.12, 90.1, 90.2, 220.87, 250.130(C), and 406.3(D) are reviewed. Nothing in 210.1, 210.12, 90.1, or 90.2 currently limits this requirement to NEW CONSTRUCTION. Other requirements in the NEC address modifications to existing installations. Nothing in the original substantiation for AFCI protection indicates there is a reduced risk in existing installations.

The proposed text is an attempt to provide the committee a practical option to maximize protection in both new and modified electrical installations. It seems that decision should be made by the technical committee, not individual enforcement jurisdictions. Individual decisions result in extreme inconsistency causing problems for everyone involved. Where new equipment and new circuits are installed, practical safeguarding should be provided to the entire circuit. Where modifications are made to existing installations, practical safeguarding can also be provided. The proposed text is an exception to the general requirement to provide that protection.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Comment 2-90.

The panel notes that the appropriate type of receptacle AFCI is an outlet branch circuit AFCI, as specified in Comment 2-90.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

Comment on Affirmative:

KING, D.: See my affirmative with comment on Comment 2-90.

WEBER, R.: See my Explanation of Affirmative Vote on Comment 2-90.

2-80 Log #2242 NEC-P02 **Final Action: Accept**
(210.12 Exception No. 3 (New))

Submitter: John Williamson, Maple Grove, MN

Comment on Proposal No: 2-160

Recommendation: Proposal 2-160 should continue to be rejected.

Substantiation: Although not part of the NEC unless specifically adopted, NEC 80.9(B) explicitly states that "Existing electrical installations that do not comply with the provisions of this Code shall be permitted to be continued in use unless the authority having jurisdiction determines that the lack of conformity with this Code presents an imminent danger to occupants. Where changes are required for correction of hazards, a reasonable amount of time shall be given for compliance, depending on the degree of the hazard." The lack of AFCI protection in millions of existing homes does not constitute an imminent danger to the occupants. Is AFCI protection in all dwellings desirable and beneficial? Yes. However, from an enforcement perspective, this is extremely impracticable. Similar to other new technologies and code changes, enhanced NEC safety features are incorporated into existing installations over many years through remodeling, renovation, replacement, relocation, and other improvements. Patience is warranted.

Panel Meeting Action: Accept

Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation. There are applications in existing installations where the application of AFCI protection is important.

See the panel action and statement on Comment 2-90.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

Comment on Affirmative:

KING, D.: See my affirmative with comment on Comment 2-90.

2-81 Log #492 NEC-P02 **Final Action: Hold**
(210.12(B))

Submitter: Richard E. Loyd, Sun Lakes, AZ

Comment on Proposal No: 2-153

Recommendation: I support the action on the negative voting to reject Proposal 2-153 and other associated proposals.

Substantiation: I agree with the negative commenting on the voting. All data originally submitted showed infrastructure fires to be a major problem in the US today. The data showed these fires are primarily related to nonmetallic sheathed type cable damage. I have heard about and have seen many instances of damaged sheath and conductors both from damage during and after installation. It is a documented fact that rodents regularly damage thermoplastic coverings. This issue has not been solved and I disagree with the submitter that the product has improved. I believe the product is now more susceptible to damage by post installation and damage from other crafts during construction since the sheath is thinner and there are less filler materials to protect the enclosed conductors.

The monetary objections to AFCIs seems to be subsiding and had the panel accepted this Proposal 2-153, it seems to me that all the CPSC substantiation that allowed this monumental safety change to be accepted would have been rejected or ignored by this panel?

Please continue to reject this proposal until substantiation has shown the device type AFCI will provide equal circuit protection to what is presently required in the 2008 NEC, Section 210.12

Panel Meeting Action: Hold

Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1

Explanation of Negative:

KING, D.: I disagree with the panel action to place this comment on hold. I agree with the submitter that there is sufficient documentation to support the need for AFCI Protection of infrastructure wiring. Further information was presented with Comments submitted in this code cycle that support the recommended action of Proposal 2-153. See my explanation of negative on Comment 2-99.

WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

Comment on Affirmative:

PURVIS, R.: See my comment with my affirmative vote on Comment 2-99.

2-82 Log #1403 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: Lawrence S. Cross, BCIT
Comment on Proposal No: 2-165
Recommendation: Accept Proposal 2-165.
Substantiation: This proposal should be accepted.

The submitter of this proposal seeks clarification of the requirement in 210.12(B). The panel action to reject and the panel statement serve only to compound the serious confusion surrounding AFCI requirements in existing dwelling units.

CMP-2 has gone on record stating that an extension of a branch circuit does not fall under the literal text of 210.12 as this extension or modification is not "new construction." Unfortunately for the NEC user, CMP-2 does not define "new construction" nor is this term used in any requirements within their purview. When the user of the NEC or a lawyer in a civil suit reads the title and text of 210.12 they will be hard pressed to find out if those requirements apply to only "new construction." There is no such qualifier found anywhere in Article 210. The waters muddy even further as the AHJ is portrayed as the decision maker. The panel statement to reject Proposal 2-165 reads as follows: "The decision on applying the new construction AFCI requirements to a circuit modification is that of the authority having jurisdiction." This is presently resulting in some jurisdictions requiring AFCI on a branch circuit extension and across the street another jurisdiction does not. This is occurring on a daily basis in the Philadelphia five county areas. This lack of uniform enforcement is endorsed by a panel statement that claims that a branch circuit extension is not "new construction" and is further compounded by a lack of such a qualifier in any Article 210 requirement. It should be noted that CMP-2 has consistently stated that an extension of a branch circuit is not "new construction."
In essence this statement asserts that the text of 210.12 is unclear and ambiguous with respect to extensions of branch circuits in an existing dwelling unit. See the panel statement on Proposal 2-179.

This action and statement on this proposal have far deeper ramifications. CMP-2 is now on record as recognizing the provisions of 210.12 as "new construction" requirements and there is no reference in 210.12 to "new construction." Does this mean that all of Article 210 applies only to new construction? Would the requirements of 250.130(C) apply to a branch circuit extension?

Is a TIA necessary to clarify this limited scope of Article 210?

The simple fact is that an extension of a branch circuit is "new."

New branch circuit conductors are added. New junction boxes are added. New devices are added. A contractor and AHJ would be hard pressed to convince a jury that the work performed was not "new." It will be even more difficult for the contractor and AHJ to convince a jury that Article 210 including 210.12(B) did not apply.

The electrical industry cannot tolerate decisions and statements by code making panels that basically tell the installer/maintainer to "ask your local inspector'' when the "local lawyer" reading the NEC in effect will enforce the printed words.

Good code has to be: (1) Easy to read, (2) Practical and (3) Enforceable. CMP-2 should accept this proposal to make the text practical and enforceable.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 2-90 that satisfies the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

Comment on Affirmative:

KING, D.: See my affirmative with comment on Comment 2-90.

WEBER, R.: See my Explanation of Affirmative Vote on Comment 2-90.

2-83 Log #1581 NEC-P02 **Final Action: Hold**
(210.12(B))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 2-173
Recommendation: Continue to reject this proposal.
Substantiation: Unlike section 210.8 that requires receptacle protection, section 210.12 has always required branch circuit protection. The panel has affirmed this need numerous times in the past by:

· Rejecting 2002 2-104 that proposed receptacle type AFCIs, stating, "The panel does not agree that the data submitted for the 1999 NEC did not support the present AFCI requirement for branch circuit wiring."

· Rejecting 2002 comment 2-67, stating "The requirement in Section 210-12 expresses the intent of the panel, which is that the entire branch circuit be provided with AFCI protection."

· Rejecting 2002 comment 2-7, stating, "The information available to the panel during the 1999 Code Cycle shows a number of fires that are attributed to branch-circuit wiring. The present code rule expresses the panel's intent that the specified branch-circuits have AFCI protection."

· Rejecting 2002 comment 2-72, stating, "The code requirement is for an AFCI that provides protection for the entire branch circuit."

· Rejecting 2002 comment 2-76, stating, "The panel reiterates that the branch circuits must be protected with an arc-fault circuit-interrupter."

· Rejecting 2002 comment 2-78, stating, "The panel has revised the requirement from the ROP to make it clear that the AFCI must be 'listed' to protect the entire branch circuit."

· Accepting 2002 comment 2-81 that stated in part, "This comment supports the addition of the AFCI at the branch to provide protection to the fixed wiring and protection to extension and appliance wiring."

· Rejecting 2008 proposal 2-130, stating, "The panel reaffirms its position that AFCI devices are to protect the entire length of all 120 volt, 15- and 20-ampere branch circuits supplying outlets in dwelling unit bedrooms and that the AFCI devices that are used be installed at the origin of the circuit;"

· Rejecting 2008 proposal 2-139, stating, "The panel reaffirms its position that all branch circuits that supply dwelling unit bedrooms shall be protected by an AFCI device and that the device shall protect the branch circuit;"

· Rejecting 2008 proposal 2-140, stating in part that, "The protection is required for the branch circuit." Regarding this proposal, Mr. King stated, "Additional physical protection of the unprotected portion of the branch circuit wiring is also required when applying the exception due to the hazard that exists with leaving that part of the branch circuit wiring unprotected by the AFCI device."

In his statement on 2008 proposal 2-147, Mr. King also stated, "The requirement for the additional physical protection provided in exception is necessary to reduce the risk of physical damage to this portion of the branch circuit wiring that is not protected by the AFCI device. It is the intent of this section that AFCI protection is provided for the entire length of the branch circuit. An exception to allow even a small portion of this circuit to be unprotected must be supplemented with some other means of physical protection."

In the 2008 ROC the panel continued to affirm its strong position, stating in its rejection of 2-127, "The submitter's recommendation would remove AFCI protection from a significant portion of the branch circuit. Given that 210.12 is intended to provide protection for the branch circuit, the exception is in conflict with the basic intent. The submitter's claim that 'the data was clear in indicating arcs at receptacles and in branch circuit extensions' is not supported since a significant percentage of the fires are estimated to be in the distribution system itself and not just in extension and appliance cords."
Panel Meeting Action: Hold
Panel Statement: The panel "Holds" this comment and Proposal 2-173 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1
Explanation of Negative:

KING, D.: I disagree with the panel action to place this comment on hold. The submitter of this Comment has accurately documented a history of the Panel's commitment to the expansion of AFCI Protection for branch Circuit wiring based on data presented to the panel at each code cycle. Data presented to the Panel at the ROC Meeting for this code cycle showed evidence of a significant increase in the number of branch circuits that would be afforded AFCI protection if Proposal 2-153 were accepted. See my explanation of negative for comment 2-99.

WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

Comment on Affirmative:

PURVIS, R.: See my comment with my affirmative vote on Comment 2-99.

2-84 Log #1756 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 2-160
Recommendation: This proposal should be Accepted in Principle as follows:
Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit. Where a branch circuit is modified or extended, AFCI protection shall be provided for the portion of the branch circuit that is modified or extended.
Substantiation: The panel statement to reject this proposal fully recognizes that the submitter is correct. This panel statement and action create serious confusion. The panel clearly states that the provisions of 210.12(B) apply only to "New Construction." What is "New Construction" and where is this term used in Article 210"?

The statement further informs the code community that the decision to apply these "New Construction" installation requirements is that of the AHJ. This is extremely problematic. These actions place the AHJ and the installer/maintainer in a very precarious position. There are many rules for branch circuits scattered throughout the NEC including those in Article 210. Are all of these rules now applicable only to "New Construction"? Where is this term defined? Where is this term used in Article 210? Why is this term absent from 210.12? Is a branch circuit extension of new type NM, new boxes and new receptacles to supply new appliances in a new wall considered "old construction"?

The suggested text will clearly require that the modified or extended portion of the branch circuit be provided with AFCI protection.

This issue should be reviewed globally by the TCC. Where a TC rejects a proposal because the existing text applies only to "New Construction" the existing text must clearly state that fact in positive text in the applicable requirement.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Comment 2-90 that satisfies the submitter's intent.

WEBER, R.: See my Explanation of Affirmative Vote on Comment 2-90.

2-86 Log #1774 NEC-P02 **Final Action: Hold**
(210.12(B))

Submitter: Ed Larsen, Square D Company/Schneider Electric / Rep. American Circuit Breaker Manufacturers Assoc.

Comment on Proposal No: 2-173

Recommendation: Continue to reject this proposal.

Substantiation: The American Circuit Breaker Manufacturers Association (ACBMA), headquartered in Washington DC, is an association of American manufacturers of circuit breakers to represent and promote the interests of American circuit breaker manufacturers in areas of codes and standards, applications, safety and education. Members of the Association include Eaton Corporation, General Electric Company, Siemens Industry, Inc., and Square D/Schneider Electric.

This proposal will reduce the level of safety from the currently required combination type AFCI protection of the entire branch circuit and should be rejected for the following reasons:

1. A survey of single and two story homes ranging in size from 1072 to 7488 sq. ft. of finished space found that the total AFCI branch circuit conductor length in the home runs ranged from 20 to 39% of the total circuit length (see attached survey summary). Fires can, and do, result from arcing in home run conductors (see attached document on fire investigations), and not just at termination points, yet the proposal specifically reduces this protection. No justification has been offered for why the current level of protection and safety for the home run should be reduced.

2. The substantiation stated that, "Type NM Cable is the most used wiring method in dwelling units and is a proven safe method." While this is true if it is installed and maintained properly, it is well known that under certain circumstances NM cable can easily be damaged, as is illustrated in the attached document on fire investigations.

This documentation shows why combination arc fault protection at the source of supply is so important.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Hold

Panel Statement: The panel "Holds" this comment and Proposal 2-173 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1

Explanation of Negative:

KING, D.: I disagree with the Panel Action to place this Comment on Hold. I disagree with the submitter of this comment that "This proposal will reduce the level of safety from the currently required combination type AFCI protection of the entire
branch circuit." See my explanation of negative for Comment 2-99.

WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

Comment on Affirmative:

PURVIS, R.: See my comment with my affirmative vote on Comment 2-99.

2-87 Log #2004 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: James H. Maxfield, Dover, NH

Comment on Proposal No: 2-175

Recommendation: Revise text to read as follows:

(B) Dwelling Units. All 120 volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, and hallways within finished living areas, or similar habitable rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

Substantiation: I disagree with the panel's statement that "the revisions are unnecessary". This international document should be clear, concise and contain language that is understandable and enforceable. There is a significant amount of confusion regarding this section of the NEC based on the number of proposals submitted, the number and extent of discussions and debates at IAEI meetings, various building official meetings, and field inspections. Additionally, there are multiple variations by AHJs where AFCI protection is required. For example, based on the current language it is unclear if a dwelling unit with an eat in kitchen without a dining room, a breakfast room, pantry, butler's pantry or laundry room require AFCI protection. The acceptance of this proposal would appear to bring some clarity to this section of the code.

If it is the intent of the panel to only AFCI protect branch circuits covered by 210.52(A) as indicated in the panel statement, then the NEC should specifically indicate it by referencing said NEC section.

Panel Meeting Action: Reject
Panel Statement: The words "within finished living areas, or similar habitable rooms" are unnecessary because of the use of the phrase " similar rooms or areas" which provides the AHJ clarification as to what outlets require AFCI protection.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-88 Log #2188 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-176
Recommendation: Accept the proposal with the following revisions:
All 120 volt, single-phase 15-1nd 20-ampere branch circuits in a dwelling unit including bathrooms, laundry areas, garages, and accessory structures shall be protected by a listed ground-fault circuit interrupter.
Substantiation: The laundry list doesn't include unfinished basements, bathrooms, or garages. Per the panel statement, GFCI protection in those areas has no bearing on AFCI requirements.
Panel Meeting Action: Reject
Panel Statement: 210.12 does not contain requirements for GFCIs. 210.8 provides GFCI requirements.

2-89 Log #2243 NEC-P02 **Final Action: Reject**
(210.12(B))

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 2-165
Recommendation: Proposal 2-165 should continue to be rejected.
Substantiation: Although not part of the NEC unless specifically adopted, NEC 80.9(B) explicitly states that "Existing electrical installations that do not comply with the provisions of this Code shall be permitted to be continued in use unless the authority having jurisdiction determines that the lack of conformity with this Code presents an imminent danger to occupants. Where changes are required for correction of hazards, a reasonable amount of time shall be given for compliance, depending on the degree of the hazard." The lack of AFCI protection in millions of existing homes does not constitute an imminent danger to the occupants. Is AFCI protection in all dwellings desirable and beneficial? Yes. However, from an enforcement perspective, this is extremely impracticable. Similar to other new technologies and code changes, enhanced NEC safety features are incorporated into existing installations over many years through remodeling, renovation, replacement, relocation, and other improvements. Patience is warranted.
Panel Meeting Action: Reject
Panel Statement: The original proposal does not address an existing installation and, therefore, the provisions of 80.9(B) do not apply.
See the panel action and statement on Comment 2-90.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-90 Log #2393 NEC-P02 **Final Action: Accept in Principle in Part**
(210.12(B))

Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 2-179
Recommendation: Revise to read as follows:
Exception: Where circuits for the rooms and/or outlets in the rooms listed in 210.12(B) are altered, modified, extended, replaced, or revised in an existing electrical installation, the AFCI protection shall be permitted to be located at the first outlet by a listed Outlet Branch Circuit (OBC) AFCI Receptacle.
Substantiation: The exception number will need to be correlated with other actions for this section.
The Panel and Committee Member Statements for many of the proposals to revise the 2008, NEC 210.12 requirements reflect one of two positions.
One position seems to suggest the risk of parallel damage from the overcurrent device to the first outlet is minimal and permission to use device type protection would provide options to protect existing circuits that are incompatible with currently listed Combination AFCI protective devices installed at the supply end of the circuit.
The other position seems to suggest the maximum benefit to safety should include parallel and series protection of the entire branch circuit.
Panel statements for several proposals state the decision to apply the NEW CONSTRUCTION AFCI requirements, to a circuit modification, are that of the AHJ. That statement is interesting, puzzling and problematic when the text in 210.1, 210.12, 90.1, 90.2, 220.87, 250.130(C), and 406.3(D) are reviewed. Nothing in 210.1, 210.12, 90.1, or 90.2 currently limits this requirement to NEW CONSTRUCTION. Current requirements in 220.87, 250.130(C) and 406.3(D) address modifications to existing installations. I believe additional examples could be identified. Nothing in the original substantiation for AFCI protection indicates there is a reduced risk in existing installations.
The proposed text is an attempt to provide the committee a practical option to maximize protection in both new and modified electrical installations. It seems that decision should be made by the technical committee, not individual enforcement jurisdictions. Individual decisions result in extreme inconsistency causing problems for everyone involved. Where new equipment and new circuits are provided in a new installation, practical safeguarding should and can be provided to the entire circuit. Where modifications are made to existing installations, practical safeguarding can also be provided. The parallel protection of the home run in those existing installations may not be practical. However, excluding the protection of the entire circuit based on the home run does not appear to be the best option for practical safeguarding the installation. The proposed text is an exception to the general requirement to provide that protection.
Panel Meeting Action: Accept in Principle in Part
The panel Rejects the addition of the Exception and substitutes it with the following:
"(B) Branch Circuit Extensions or Modifications - Dwelling Units. In any of the areas specified in 210.12(A), where branch circuit wiring is modified, replaced or extended, the branch circuit shall be protected by:
1. A listed combination AFCI located at the origin of the branch circuit; or
2. A listed outlet branch circuit AFCI located at the first receptacle outlet of the existing branch circuit."
Panel Statement: The panel has added a new subdivision requiring AFCI protection that would apply to branch circuit extensions and modifications.
The panel did not accept the language for modification of "outlets" because the focus of 210.12 is on the branch circuit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: It was an interesting day when NEC Panel 2 was presented with presentation by the manufacturers of the different types of Arc-Fault Circuit Interrupter (AFCI) devices. What really piqued my attention was the extensive discussion on the market share the manufacturers of the AFCI breaker devices would receive vs. the manufacturers of the receptacle-type AFCI devices. Over the many hours of presentation and discussion, the non life-safety aspect of market share seemed to have been the biggest concern. It is this type of "concern" goes to directly to NAHB's position that the mandates for AFCIs should be removed from the National Electric Code. Not once in the entire development of the NEC has a Proposal to mandate AFCI's ever provided supporting information relative to a cost-benefit society would receive if these devices are installed. To the contrary, there is more data, documentation, and information that shows mandating the installation of AFCI devices will cost the U.S. billions of dollars to possibly save less than 30 million dollars of losses a year - and that is if the
devices worked 100 percent of the time. More recent data from the United States Fire Administration's National Fire Incident Reporting System (NFIRS) shows that the fire-loss figures are significantly lower than the manipulated figures from the NFPA data originally used to show the huge cost-to-loss ratio. This type of mandate is unacceptable, especially in this economy. Allowing manufacturer's to mandate the purchase and installation of their products through the NEC should be looked on the same as the practices by large corporations in misusing public funds. No jurisdiction should ever adopt any industry standard that does not provide a cost-benefit to that community. If you would like more information on the NFIRS data, please contact NAHB through Steve Orlowski at
(202) 266-8303 or sorlowski@nahb.org.
Comment on Affirmative:
KING, D.: The Panel action on this Comment is an important move in the right direction that extends this life saving technology to branch circuits that otherwise would be left unprotected. The addition of this sub-division will provide clear prescriptive requirements for AFCI protection on branch circuit extensions for both the installer and the Authority Having Jurisdiction and ultimately will protect property from fires caused by electrical arcing and save many lives.
WEBER, R.: This new exception provides relief to homeowners and installers when faced with panelboards that will not accept present day AFCI devices. Manufactures will also have an expanded market for AFCI technology when existing branch circuits are altered during remodeling. This provides the homeowner the benefit of slightly reduced AFCI protection without having to endure the cost of a service upgrade or an additional feeder panelboard being installed.

2-91 Log #2394 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 2-192
Recommendation: Revise to read as follows:
Exception: Where circuits for the rooms and/or outlets in the rooms listed in 210.12(B) are altered, modified, extended, replaced, or revised in an existing electrical installation, the AFCI protection shall be permitted to be located at the first outlet by a listed Outlet Branch Circuit (OBC) AFCI Receptacle.
Substantiation: The exception number will need to be correlated with other actions for this section.

The Panel and Committee Member Statements for many of the proposals to revise the 2008, NEC 210.12 requirements reflect one of two positions.

One position seems to suggest the risk of parallel damage from the overcurrent device to the first outlet is minimal and permission to use device type protection would provide options to protect existing circuits that are incompatible with currently listed Combination AFCI protective devices installed at the supply end of the circuit.

The other position seems to suggest the maximum benefit to safety should include parallel and series protection of the entire branch circuit.

Panel statements for several proposals state the decision to apply the NEW CONSTRUCTION AFCI requirements, to a circuit modification, are that of the AHJ. That statement is interesting, puzzling and problematic when the text in 210.1, 210.12, 90.1, 90.2, 220.87, 250.130(C), and 406.3(D) are reviewed. Nothing in 210.1, 210.12, 90.1, or 90.2 currently limits this requirement to NEW CONSTRUCTION. Current requirements in 220.87, 250.130(C) and 406.3(D) address modifications to existing installations. I believe additional examples could be identified. Nothing in the original substantiation for AFCI protection indicates there is a reduced risk in existing installations.

The proposed text is an attempt to provide the committee a practical option to maximize protection in both new and modified electrical installations. It seems that decision should be made by the technical committee, not individual enforcement jurisdictions. Individual decisions result in extreme inconsistency causing problems for everyone involved. Where new equipment and new circuits are provided in a new installation, practical safeguarding should and can be provided to the entire circuit. Where modifications are made to existing installations, practical safeguarding can also be provided. The parallel protection of the home run in those existing installations may not be practical. However, excluding the protection of the entire circuit based on the home run does not appear to be the best option for practical safeguarding the installation. The proposed text is an exception to the general requirement to provide that protection.

(210.12(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-176
Recommendation: This submitter is well aware of the distinctions that exist between AFCI and GFCI devices, and for that reason it was never asserted that they were equivalent, because they are plainly not. They are, however, at least in part, residual current devices. When CMP 2 broadened the applicability of AFCI protection from bedrooms only, it simply provided a list of rooms to be protected. It never substantiated why this room, and not that room. In so doing, CMP 2 left it to the public to try and make sense of why this room and not that room. This submitter seriously doubts that the broad applicability of GFCI protection requirements in bathrooms and kitchens did not inform the panel decision, which this comment does not challenge. This proposal is merely intended to fully implement, in a consistent and easily explainable fashion, the prior panel action that created the current room list.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided specific code text as required by 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12

Explanation of Abstention:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-94 Log #2866 NEC-P02 **Final Action: Accept in Principle**
(210.12(B))

Submitter: Don Ganiere, Ottawa, IL
Comment on Proposal No: 2-160
Recommendation: Accept in principle as shown below.

Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit. Where a branch circuit is modified or extended, AFCI protection shall be provided for the portion of the branch circuit that is modified or extended.

Substantiation: This needs to be addressed by the code language and not left to the installer and the AHJ. In addition, the panel statement will cause issues in the use and application of many code rule as the statement clearly and incorrectly says that the rules found in the NEC only apply to new construction I see nothing in the code anywhere, except 800.156,where the code says a rule only applies to new construction. 90.2(A) says that this code applies to "electrical installations". There is nothing to suggest that the code rules only apply to new construction and not to modifications, extensions or upgrades.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 2-90 that satisfies the submitter's intent.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

KING, D.: See my affirmative with comment on Comment 2-90.
WEBER, R.: See my Explanation of Affirmative Vote on Comment 2-90.

2-95 Log #2881 NEC-P02 **Final Action: Hold**
(210.12(B))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Comment on Proposal No: 2-153
Recommendation: THE PANEL SHOULD REJECT THIS PROPOSAL.
Substantiation: WHILE SOME AFCI DEVICES CAN DETECT ARCING ON THE LINE SIDE (IE: BETWEEN THE BREAKER AND THE1ST DEVICE) IF THE DEVICE TRIPS, IT WILL ONLY REMOVE THE LOAD FROM THE CIRCUIT. THE ARCING MAY BE A HIGH RESISTANCE FAULT TO GROUND, WHICH WILL CONTINUE, DESPITE THE AFCI DEVICE SHEDDING THE LOAD. THIS WOULD THEN LEAD THE OWNER TO BELIEVE THE PROBLEM WAS LOADSIDE (NEVER THINKING ABOUT LINE SIDE) AND HE / SHE WOULD INVESTIGATE ONLY THE LOAD SIDE. THUS, THE FAULT WOULD CONTINUE, POSING A SIGNIFICANT RISK OF INJURY OR DEATH TO THE OCCUPANTS.
Panel Meeting Action: Hold
Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1
Explanation of Negative:
KING, D.: I disagree with the panel action to place this comment on hold. This Comment should have been rejected. The submitter's substantiation is anecdotal in nature and lacks the technical documentation necessary to support his recommendation. Data presented to Panel 2 this code cycle shows evidence of parallel arc protection provided by the branch circuit overcurrent device. See my explanation of negative on Comment 2-99.
WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.
Explanation of Abstention:
BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.
Comment on Affirmative:
PURVIS, R.: See my comment with my affirmative vote on Comment 2-99.

2-96 Log #2390 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception)

Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 2-160
Recommendation: Revise to read as follows:
Exception: Where circuits and/or outlets in the rooms listed in 210.12(B) are altered, modified, extended, replaced, or revised in an existing electrical installation, the AFCI protection shall be permitted to be located at the first outlet by a Listed Combination Type AFCI Receptacle.
Substantiation: The Panel Statements for many of the proposals to revise the 2008, NEC 210.12 requirements reflect one of two positions.
One position seems to suggest the risk of parallel damage from the overcurrent device to the first outlet is minimal and permission to use device type protection would provide options to protect existing circuits that are incompatible with currently listed Combination AFCI protective devices installed at the supply end of the circuit.
The other position seems to suggest the maximum benefit to safety should include parallel and series protection of the entire branch circuit.
Panel statements for several proposals state the decision to apply the NEW CONSTRUCTION AFCI requirements, to a circuit modification, are that of the AHJ. That statement is interesting, puzzling and problematic when the text in 210.1, 210.12, 90.1, 90.2, 220.87, 250.130 (C), and 406.3 (D) are reviewed. Nothing in 210.1, 210.12, 90.1, or 90.2 currently limits this requirement to NEW CONSTRUCTION. Other requirements in the NEC address modifications to existing installations. Nothing in the original substantiation for AFCI protection indicates there is a reduced risk in existing installations.
The proposed text is an attempt to provide the committee a practical option to maximize protection in both new and modified electrical installations. It seems that decision should be made by the technical committee, not individual enforcement jurisdictions. Individual decisions result in extreme inconsistency causing problems for everyone involved. Where new equipment and new circuits are installed, practical safeguarding should be provided to the entire circuit. 2-98 Log #1580 NEC-P02 **Final Action: Hold**
(210.12(B) Exception No. 1)

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 2-153
Recommendation: Continue to reject this proposal.
Substantiation: Unlike section 210.8 that requires receptacle protection, section 210.12 has always required branch circuit protection. The panel has affirmed this need numerous times in the past by:
· Rejecting 2002 2-104 that proposed receptacle type AFCIs, stating, "The panel does not agree that the data submitted for the 1999 NEC did not support the present AFCI requirement for branch circuit wiring."
· Rejecting 2002 comment 2-67, stating "The requirement in Section 210-12 expresses the intent of the panel, which is that the entire branch circuit be provided with AFCI protection."
· Rejecting 2002 comment 2-7, stating, "The information available to the panel during the 1999 Code Cycle shows a number of fires that are attributed to branch-circuit wiring. The present code rule expresses the panel's intent that the specified branch-circuits have AFCI protection."

· Rejecting 2002 comment 2-72, stating, "The code requirement is for an AFCI that provides protection for the entire branch circuit."

· Rejecting 2002 comment 2-76, stating, "The panel reiterates that the branch circuits must be protected with an arc-fault circuit-interrupter."

· Rejecting 2002 comment 2-78, stating, "The panel has revised the requirement from the ROP to make it clear that the AFCI must be 'listed' to protect the entire branch circuit."

· Accepting 2002 comment 2-81 that stated in part, "This comment supports the addition of the AFCI at the branch to provide protection to the fixed wiring and protection to extension and appliance wiring."

· Rejecting 2008 proposal 2-130, stating, "The panel reaffirms its position that AFCI devices are to protect the entire length of all 120 volt, 15- and 20-ampere branch circuits supplying outlets in dwelling unit bedrooms and that the AFCI devices that are used be installed at the origin of the circuit;"

· Rejecting 2008 proposal 2-139, stating, "The panel reaffirms its position that all branch circuits that supply dwelling unit bedrooms shall be protected by an AFCI device and that the device shall protect the branch circuit;"

· Rejecting 2008 proposal 2-140, stating in part that, "The protection is required for the branch circuit." Regarding this proposal, Mr. King stated, "Additional physical protection of the unprotected portion of the branch circuit wiring is also required when applying the exception due to the hazard that exists with leaving that part of the branch circuit wiring unprotected by the AFCI device."

In his statement on 2008 proposal 2-147, Mr. King also stated, "The requirement for the additional physical protection provided in exception is necessary to reduce the risk of physical damage to this portion of the branch circuit wiring that is not protected by the AFCI device. It is the intent of this section that AFCI protection is provided for the entire length of the branch circuit. An exception to allow even a small portion of this circuit to be unprotected must be supplemented with some other means of physical protection."

In the 2008 ROC the panel continued to affirm its strong position, stating in its rejection of 2-127, "The submitter's recommendation would remove AFCI protection from a significant portion of the branch circuit. Given that 210.12 is intended to provide protection for the branch circuit, the exception is in conflict with the basic intent. The submitter's claim that 'the data was clear in indicating arcs at receptacles and in branch circuit extensions' is not supported since a significant percentage of the fires are estimated to be in the distribution system itself and not just in extension and appliance cords."

The past statements made by the panel on the need to protect the entire branch circuit are strong and unambiguous.

Panel Meeting Action: Hold

Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1

Explanation of Negative:

KING, D.: I disagree with the panel action to place this comment on hold. The submitter of this Comment has accurately documented a history of the Panel's commitment to the expansion of AFCI Protection for branch Circuit wiring based on data presented to the panel at each code cycle. Data presented to the Panel at the ROC Meeting for this code cycle showed evidence of a significant increase in the number of branch circuits that would be afforded AFCI protection if Proposal 2-153 were accepted. See my explanation of negative for comment 2-99.

WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

Comment on Affirmative:

PURVIS, R.: See my comment with my affirmative vote on Comment 2-99.

2-99 Log #1917 NEC-P02 **Final Action: Hold**

(210.12(B) Exception No. 1)

Submitter: Jack Wells, Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium

Comment on Proposal No: 2-153

Recommendation: The panel should accept the proposal to revise 210.12(B) Exception No.1 but change the wording to read as follows:

Exception No. 1 ~~Where RMC, IMC, EMT or steel armored cable, Type AC, meeting the requirements of 250.118 using metal outlet and junction boxes installed for the portion of the branch circuit between the branch circuit overcurrent device and the first outlet, i~~It shall be permitted to install ~~a combination~~ a listed Outlet Branch Circuit AFCI provided it is installed as the first outlet on the branch circuit and the branch circuit wiring is continuous from the service panel to the AFCI receptacle.

Substantiation: Determining whether to accept this comment and allow Outlet Branch Circuit (OBC) AFCI receptacles to be used at the first outlet in a branch circuit without the burdensome requirement of protecting the "homerun" with a metallic wiring method boils down to one consideration.

Is the increased risk of diminished protection against parallel arcs on the "home run" more than offset by the increase in use of AFCI protection afforded by the availability of OBC AFCI receptacles in the market place?

This proposal and this final comment are offered by four companies under the name of the Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium (AFCI WD Consortium). Those four companies are: Cooper Wiring Devices, Hubbell Incorporated (Delaware), Leviton Manufacturing Company, Inc., and Pass & Seymour/ Legrand.

The AFCI WD Consortium has commissioned a technical literature search by Underwriters Laboratories and an extensive market research project conducted by Parks Associates which are appended to and a part of this comment.

Based on the information developed in these two reports, The AFCI WD Consortium believes that the answer is an unequivocal yes. Most importantly, acceptance of this proposal will significantly increase the number of AFCI installations in existing older dwellings.-The increased use of AFCIs in older homes will place the protection exactly where, according to CPSC, over 90% of the residential fires of electrical origin occur.

Key points to consider and covered in more detail in this comment are:

Protection afforded by an ODC Type AFCI Receptacle:

· OBC AFCI Receptacles detect and interrupt series arcs on the entire branch circuit. (UL 1699A, Outline of Investigation for Outlet Branch Circuit Arc-Fault Circuit-Interrupters)

· OBC AFCI Receptacles detect and interrupt parallel arcing on the branch circuit downstream from the first outlet. OBC AFCI Receptacles do not detect and interrupt parallel arcing on the "home run". (UL I699A, Outline of Investigation for Outlet Branch Circuit Arc-Fault Circuit-Interrupters)

· The "home run" typically represents 35% or the 25 to 50 feet of the branch circuit closest to the circuit breaker. (parks Associates White Paper, Figures 25, 26)

· A conventional circuit breaker's magnetic trip function protects a portion of the first 50 feet of the circuit from parallel arcing. (see "Analysis of Circuit Protection of the Branch Circuit Home Run")

Increased installation of AFCI protection if ODC Type AFCI Receptacles are available:

· Consumers who own and occupy single-family existing dwellings and undertake electrical do-it yourself projects are more than twice as likely to replace receptacles compared to circuit breakers. (parks Associates White Paper, Figure 10)

· If OBC AFCI receptacles were available, 75% of consumers would add AFCI protection immediately or when remodeling or doing other electrical work. (Parks Associates White Paper, Figure 4)

· This finding factored with other research in a Risk-Benefit Analysis conclude there would be a net gain of more than 8 million additional circuits in existing homes built prior to 2002 with AFCI protection within five years. (Parks Associates White Paper, Sections 1.0, 1.4, Appendix 3)

· 83% of respondents live in homes more than 10 years old. (Parks Associates White Paper, Figure 2)

· CPSC reports that 94.5% of residential fires of electrical origin are in homes 10 years or older (US Consumer Product Safety Commission (CPSC) in 1987 and summarized in the UL Research report "Data Analysis of Fires in the residential Electrical Distribution System, Table3)

Conclusion is an increase in circuits protected with AFCI if the code is changed:

· The net protection added by approving this code proposal is the equivalent of 8.2 million circuits with a significant number going to older homes where protection is needed the most.

Acceptance of this comment and thus enabling the feasibility of developing and commercializing OBC AFCI receptacles will accelerate the installation of AFCI protection where the electrical fires are, in older homes.

Adoption of the code requirement to permit the use of the OBC AFCI for protection of the branch circuit is critical in establishing the consumer confidence that this device will provide a high level of protection against electrical fires. As noted in the Parks report, a significant number of users are likely to install a receptacle OBC AFCI, especially if the code recognizes this type of device.

This change in the code will lead to acceptance of the receptacle type OBC AFCI by consumers as a product that provides an increased level of safety for their electrical system. The study by Parks Associates demonstrates that consumers will install AFCI receptacles instead of standard receptacles in a substantial number of remodeling and replacement applications. Based on the survey conducted by Parks Associates, the installation of receptacle type AFCI's in these applications is clearly based on consumer recognition that the receptacle OBC AFCI has been accepted as a code requirement.

By accepting this code proposal, the OBC AFCI Receptacle will receive a stamp of approval from the NEC. Professional Electrical Contractors and Do-It-Yourselfers will not use the OBC AFCI Receptacle without this stamp of approval. The net result is that circuits that would have previously been unprotected will now have a level of AFCI protection.

Table 1 of the attached UL Report compares the protection provided by a Combination AFCI and an OBC AFCI. As the table indicates the only

difference between the Combination AFCI and OBC AFCI is parallel arc detection in the home run. The remainder of the circuit will be equally protected by both the Combination AFCI circuit breaker and the OBC AFCI receptacle at the first outlet, including equal series arc protection of the home run by both the circuit breaker and receptacle AFCIs.

The Summary of Findings in the UL report states that "Approximately 35% of fires occurring in the residential electrical distribution system may be attributed to fires in the fixed building wire." A survey conducted by Parks Associates indicates that the home run is typically 35% of the total length of the fixed wiring in a branch circuit. Based on this information it is apparent that the home run portion of the fixed wiring potentially exposed to parallel arcing faults is relatively small. The Park's Associates survey data indicates that the home run is commonly in the range of 25 to 50 feet.

An additional factor when considering protection against parallel faults in the home run is the protection provided by a standard circuit breaker. Since the home run is typically only 35% of the length of the branch circuit, it is likely that available short circuit current will be sufficient to cause the instantaneous trip of a circuit breaker to interrupt a parallel fault in the home run. In fact, in an AFCI protected circuit, it may be difficult to determine if the protection against any parallel fault in the home run is provided by the instantaneous trip of the circuit breaker or by the AFCI protection.

The relatively short length of the typical home run and the protection afforded by a standard circuit breaker serve to decrease the likelihood of arcing in the home run as a significant contributor to electrical fires.

It can be predicted that there will be increased use of receptacle type AFCI's if the code is changed to permit the use of these products. The Parks white paper provides data that supports the conclusion that achieving a net increase in electrical safety will be accomplished by making receptacle type AFCI's available and by increasing the awareness by homeowners and contractors of the effectiveness of receptacle type OBC AFCI's in preventing electrical fires.

There are 16million receptacle replacement occurrences annually. Based on the survey responses of home owners and contractors, 1.3 million of the receptacle replacement occurrences would be annual if these devices were available; another 826,000 would be one-time occurrences. The replacement receptacle AFCI's would be installed in existing housing.

As noted in the UL report, the frequency of fires in residential electrical systems increases as the home ages. The replacement of standard receptacles with AFCI receptacles will take place in older housing stock, where the arcing events leading to fires occur more frequently than in new housing.

The benefit of replacing standard receptacles with AFCI receptacles can be achieved by accepting the code revision that allows the OBC AFCI to provide protection of the branch circuit. The change in the code will provide receptacle manufacturers with the opportunity to introduce receptacle AFCI's into the market. The code change will also generate home owner awareness of the benefits of installing APCI protection.

We urge the panel to accept the addition to the code of Outlet Branch Circuit AFCI in order to insure an increase in safety of the electrical distribution system in homes.

(The three following documents are included as part of this comment:

- Underwriters Laboratories Inc. Research Report "Data Analysis of Fires in the Residential Electrical Distribution System"
- Parks Associates White Paper "APCI Code Change Analysis"
- The paper titled: (" Analysis of Circuit Breaker Protection of the Branch Circuit Home Run").

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Hold

Panel Statement: The panel "Holds" this comment and Proposal 2-153 under 4.4.6.2.2 and 4.4.6.2.3 of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 2 Abstain: 1

Explanation of Negative:

KING, D.: I disagree with the Panel action to place this Comment on Hold. The submitter of this comment included documentation that clearly exhibited a significant increase in the number of Branch Circuits that would be protected if this Comment were to be accepted. Further consideration should have been given by Panel 2 to the three separate reports that were included with this comment along with the presentation made by the representative of the Joint AFCI WD Consortium at the ROC meeting. An independent analysis of this proposed change by Parks Associates estimated that an additional 8 million branch circuits would be protected by allowing the installation of OBC Type AFCI devices to be installed. As was pointed out at the ROC meeting, this was an extremely conservative estimate and did not factor in the ability of OBC Type AFCI devices to detect series arcing faults in branch circuit homeruns. Furthermore the Analysis did not consider any parallel arc protection that is currently provided by the magnetic trip mechanism of a standard overcurrent device that is already required at the origin of the branch circuit. Additional Analysis that was included with this comment documented the ability of a standard overcurrent device to respond to a parallel arcing fault within the first 40 feet of a branch circuit homerun. Again this was a conservative estimate that was based on an abnormally low available fault current at the service panel of only 500 amperes. A more realistic assumption of available fault current at the service equipment greatly extends the length of the branch circuit homerun that is protected by a standard overcurrent device.

WOOD, T.: See My Explanation of Negative Vote on Comment 2-68.

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

Comment on Affirmative:

LAROCCA, R.: We understand the potential benefits of the availability of Outlet Branch Circuit Type AFCI, but do not fully agree the data presented adequately provides a factual indication of the risks associated with removing parallel protection in the home run. The Panel's action allows for the development of additional data to quantify the potential for parallel arcing faults in the home run of the branch circuit as well as the extent of the protection against parallel arcing faults provided for the home run by the over current protective device.

PURVIS, R.: This comment should have been accepted in order to increase overall safety in homes across the country by increasing the number of AFCI devices actually installed in the future. This would be in accordance with the purpose of the NEC in 90.1, "Practical Safeguarding". However, with a "Hold" both UL and the manufacturers will now have time before the next code cycle to actually verify the risks of not covering the home run with AFCI protection. It seems that the home run of each circuit required to have AFCI protection is by far the safest part of the branch circuit and these home runs are a small percentage of the entire risks to the total length of ALL branch circuits in the home. If this turns out to be true, maybe a reasonable length of the unprotected home run can also be determined by the next code cycle.

WILKINSON, R.: The panel should not risk the annual loss of hundreds of lives and billions of dollars in lost property by not demanding that the entire circuit on new homes be fully protected by AFCI's as has been this panel stated goal for four code cycles. Furthermore we should not squander the public trust in us by not providing the most advanced and comprehensive coverage available to safeguard their families and their homes.

2-100 Log #2500 NEC-P02 **Final Action: Accept**
(210.12(B) Exception No. 1 and No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-182
Recommendation: Accept the panel action as written in principle, changing the conjunction "and" to "or".
Substantiation: It is a physical impossibility for a fire alarm system to be simultaneously nonpower limited as covered in 760.41(B) and power limited as covered in 760.121(B), however all fire alarm systems will be either one or the other. This comment corrects the apparently inadvertent error that repeated the same drafting error in the proposal as submitted, as well as in the text of the 2008 NEC.

Panel Meeting Action: Accept

Panel Statement: The panel understands that the addition of the recommended text is in addition to the action taken on Comment 2-63.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

2-101 Log #2501 NEC-P02 **Final Action: Reject**
(210.12(B) Exception No. 1 and No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-183
Recommendation: The proposal should be accepted in principle and in part. Reject the modification to Exception No. 1 provided Proposal 2-153 acquires the required two-thirds majority. Accept the modification to Exception No. 2 by further limiting it to steel wireways and auxiliary gutters, and provide a list format, as follows:

Exception No. 2: Where a branch circuit to a fire alarm system is installed in accordance with one or more of the wiring methods specified in a. through g., AFCI protection shall be permitted to be omitted. The wiring methods employed shall comply with 250.118.

a. RMC
b. IMC
c. EMT
d. Type AC cable if manufactured with steel armor
e. Type MC cable if manufactured with steel armor
f. Steel wireways

g. Steel auxiliary gutters
h. Metal outlet and junction boxes.

Substantiation: The panel statement regarding wireways and auxiliary gutters is substantially true for small residential construction such as one- and two-family dwellings. However, the AFCI requirements extend far beyond such limited applications. They apply in very large multifamily applications, as well as staff apartments in university dormitories, etc. All of these applications, which are the typical ones for Article 760 fire alarm systems, very commonly involve wireways and auxiliary gutters, and it is impractical to omit them from the list. The submitter has inspected numerous examples of this work.

In the event that the modifications to Exception No. 1 do not succeed, then a comparable permission should be extended to this exception as well.

Panel Meeting Action: Reject

Panel Statement: The present format of the Exception is clear and the revision does not improve clarity or enhance usability.

The panel did not accept the addition of steel wireways and auxiliary gutters because the submitter is unclear as to their application in a fire alarm supply circuit.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

BROWN, L.: NAHB is abstaining from voting on this Public Comment as it deals with Section 210.12 - Arc-Fault Circuit Interrupters (AFCI). As a resident of a state or local jurisdiction will receive no cost-benefit from the installation of these expensive devices, as mandated through the National Electric Code (NEC), NAHB cannot support any Public Proposal or Public Comment related to AFCIs.

2-102 Log #2392 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception No. 3)

Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 2-184
Recommendation: Revise to read as follows:

Exception: Where circuits for the rooms and/or outlets in the rooms listed in 210.12(B) are altered, modified, extended, replaced, or revised in an existing electrical installation, the AFCI protection shall be permitted to be located at the first outlet by a listed Outlet Branch Circuit (OBC) AFCI Receptacle.

Substantiation: The exception number will need to be correlated with other actions for this section.

The Panel and Committee Member Statements for many of the proposals to revise the 2008, NEC 210.12 requirements reflect one of two positions.

One position seems to suggest the risk of parallel damage from the overcurrent device to the first outlet is minimal and permission to use device type protection would provide options to protect existing circuits that are incompatible with currently listed Combination AFCI protective devices installed at the supply end of the circuit.

The other position seems to suggest the maximum benefit to safety should include parallel and series protection of the entire branch circuit.

Panel statements for several proposals state the decision to apply the NEW CONSTRUCTION AFCI requirements, to a circuit modification, are that of the AHJ. That statement is interesting, puzzling and problematic when the text in 210.1, 210.12, 90.1, 90.2, 220.87, 250.130(C), and 406.3(D) are reviewed. Nothing in 210.1, 210.12, 90.1, or 90.2 currently limits this requirement to NEW CONSTRUCTION. Current requirements in 220.87, 250.130(C) and 406.3(D) address modifications to existing installations. I believe additional examples could be identified. Nothing in the original substantiation for AFCI protection indicates there is a reduced risk in existing installations.

The proposed text is an attempt to provide the committee a practical option to maximize protection in both new and modified electrical installations. It seems that decision should be made by the technical committee, not individual enforcement jurisdictions. Individual decisions result in extreme inconsistency causing problems for everyone involved. Where new equipment and new circuits are provided in a new installation, practical safeguarding should and can be provided to the entire circuit. Where modifications are made to existing installations, practical safeguarding can also be provided. The parallel protection of the home run in those existing installations may not be practical. However, excluding the protection of the entire circuit based on the home run does not appear to be the best option for practical safeguarding the installation. The proposed text is an exception to the general requirement to provide that protection.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Comment 2-90.

WEBER, R.: See my Explanation of Affirmative Vote on Comment 2-90.

2-103 Log #2745 NEC-P02 **Final Action: Accept in Principle**
(210.12(B) Exception No. 3)

Submitter: Randal Hunter, City of Las Vegas
Comment on Proposal No: 2-184
Recommendation: Add text to read as follows:

Exception No. 3: In existing dwellings, where utilizing existing wiring, it shall be permissible to install a combination AFCI device at the first outlet to provide protection for the remaining portion of the branch circuit.

Substantiation: Below are two examples of situations where we should allow the above code language, also with the continued expansion of the AFCI requirements we need to be able to look back and provide the same protection for older residences.

As inspectors we are frequently faced with a compromise situation when minor additions are done to residences, often just adding a few additional receptacles to an existing circuit, currently we have to give away the AFCI upgrade due to the fact we have a multi-wire branch circuit and it is way too destructive to require an entire new home run to be installed. By allowing a device to be installed in the first outlet of a branch circuit we have provided a safer condition without requiring unreasonable modifications to existing homes.

Due to either the style, age or other conditions of the electrical service, many have to rely on devices rather than AFCI breakers. Owners of any home built before the last two code cycles have not benefited from the safety provided by the AFCI technology. With this proposal we don't get the protection of the home run, however protection of the rest of the circuit is certainly better than none at all. The code should not discriminate against those who don't have a new residence. If this technology is as good as we believe, we should make it possible for more people to benefit from it in existing dwellings without extensive re-wiring or modifications which could include homerun replacement or panel change outs. This would allow for retro-fitting provisions similar to the GFCI methods used in Article 406.3(D)(3).

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Comment 2-90 that meets the submitter's intent.

The panel notes that the appropriate type of receptacle AFCI is an outlet branch circuit AFCI, as specified in Comment 2-90.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

Comment on Affirmative:

KING, D.: See my affirmative with comment on Comment 2-90.
WEBER, R.: See my Explanation of Affirmative Vote on Comment 2-90.

2-104 Log #1219 NEC-P02 **Final Action: Reject**
(210.12(C) (New))

Submitter: David E. Shapiro, Safety First Electric
Comment on Proposal No: 2-186
Recommendation: Revise 210.12(B) follows:

... from the first outlet on. Where a multiwire circuit splits into two or three separate branch circuits, this protection shall be provided no further downstream than the first outlet on each branch.

Substantiation: In case the CMP's action on Proposal 2-153 is not overturned, It is important that in existing wiring there be some relief for installers who otherwise would have difficulties beyond those caused by the manifold illegalities that, however large or minuscule the level of hazard they add, would cause an AFCI to trip immediately.

As the panel acknowledges, AFCIs are proven life- and property-savers. As GFCIs warranted the rare replacement requirement, so should AFCIs. However, these are a hard sell. The relief I propose would go a small way to protect Mr. Manche's proposal from local amendment.

Panel Meeting Action: Reject

Panel Statement: The present code text already allows for AFCI protection to be installed in other than the origin of the branch circuit by the Exception in 210.12(A) and the panel action taken on Comment 2-90.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-105 Log #1759 NEC-P02 **Final Action: Reject**
(210.12(C) (New))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 2-186
Recommendation: Add a new last sentence to 210.12(B) as written in the 2008 NEC as follows:
This section shall not apply to the replacement of branch circuit overcurrent devices or where a service is upgraded or replaced.
Substantiation: The panel action and statement clearly illustrate that CMP-2 recognizes 210.12 as applicable only to "New Construction." The panel statement further illustrates a desire to gain more experience with AFCI technology. The problem is that the text of 210.12 does not prescriptively exempt the AFCI requirement for replacement of overcurrent devices or a service upgrade in an existing dwelling unit. The rule is presently met with AFCI circuit breakers in "new construction". Contractors and AHJ's will find themselves the targets of lawsuits where a replacement or service upgrade is made and a fire occurs. The fact that CMP-2 has consistently rejected attempts to include prescriptive text to include replacements or service upgrades will not be an acceptable argument for not installing AFCI on a replacement or service upgrade. This issue has been kicked around for several cycles. The intent of CMP-2 must be included in the prescriptive text of 210.12 for clarity and usability.
The lack of prescriptive text in 210.12 to exclude overcurrent device replacement and service upgrades is creating serious liability for the installer/maintainer and the AHJ.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees that prohibiting the installation of AFCI devices, where the overcurrent device is replaced or the service is upgraded, applies in all cases.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Abstain: 1
Explanation of Abstention:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.
Comment on Affirmative:
KING, D.: Although I agree with the panel that prohibiting the installation of AFCI devices where services are upgraded or changed should not apply in all cases, it should have been stated that it does not apply in any case which is the basis for the concerns expressed in the submitter's substantiation. I agree with the submitter that clear prescriptive language should be included in this section that requires AFCI protective devices to be installed where services are upgraded or replaced. Also the submitter's concerns regarding liability issues for the installer, maintainer and AHJ are valid and should be addressed by Panel 2.

17-3 Log #67 NEC-P17 **Final Action: Accept**
(210.13 (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-189
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 17 and 18 for action on protection of the appliance and action related to the construction of the receptacle, respectively.
This action will be considered by Code-Making Panels 17 and 18 as public comments.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP 17 accepts the direction of the TCC to act on Proposal 2-189, and the panel rejects the proposal.
The companion proposals for neither 210.13 [Proposal 2-189] nor the associated Article 100 Electrical Fault Circuit Interrupter definition [Proposal 2-15] do not characterize the specific protection provided. With no parameters and limiting values for those parameters established, any device with a current-interrupting feature could purport to provide electrical fault circuit interrupter protection. As such, the proposed requirement is unenforceable.
CMP 17 agrees with the panel statement of CMP 2 for rejecting this proposal. This proposal did not address a cord installed EFCI device but specifically addresses receptacles, which are not in the scope of CMP 17. CMP 17 does not accept that the documentation provided justifies the requirement that these receptacles be mandatory. The FEMA report mainly points to the major cause of these fires being the build up of lint in the exhaust system. This device would not correct that specific problem.
Installation of these devices is not currently prohibited by the NEC.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-4 Log #67a NEC-P18 **Final Action: Accept**
(210.13 (New))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 2-189
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panels 17 and 18 for action on protection of the appliance and action related to the construction of the receptacle, respectively.
This action will be considered by Code-Making Panels 17 and 18 as public comments.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the TCC direction to act on Proposal 2-189 and rejects the proposal.
Panel Statement: There are no product requirements for electrical-fault circuit-interrupter protection. The Fact-Finding Investigations submitted by the two testing laboratories (CSA and Intertek) appear to be only test programs designed by the product manufacturer. They conclude that Safe Plug performs as specified by the manufacturer. A thorough study of wiring device failure mechanisms, and the ability of this technology to mitigate these hazards is warranted before such devices should be mandated in the code. Installation of these devices is not currently prohibited by the NEC.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

2-106 Log #2383 NEC-P02 **Final Action: Reject**
(210.18(C))

Submitter: Michael A. Anthony, University of Michigan
Comment on Proposal No: 2-191
Recommendation: Accept the Proposal in Principle with a new Part C in Section 210.12 instead:
(C) Student Residence Facilities. Sleeping areas in student residence facilities shall have branch circuits protected by arc-fault circuit interrupters by January 1, 2016.
Substantiation: This comment is submitted to simplify the migration to AFCI protection for our industry. We assume that adoption of this electrical safety technology will follow a trajectory similar to Ground Fault Circuit Interrupters over 30 years ago so we should not waste time getting to the ultimate destination: where this technology takes its place beside all other electrical safety technologies with known costs and benefits. Neither should we waste resources binding state legislative processes -- as other industries have -- to forestall the inevitable, either. With virally distributed acceptance and understanding forming the basis for a larger economy of scale, the cost differential between regular and AFCI breakers -- now about $20 for a 20A single pole breaker -- will narrow substantially.
This modification to the original proposal reduces difficulties in interpretation by eliminating the cooking provision criterion. Observers of student living habits in colleges and universities know that the conditions within student rooms often resemble Class II, Division II combustible dust occupancies -- whether there are permanent provisions for cooking or not. Parents wanting safety for their children, and APPA administrators wanting to protect the brand identity of their organization as a fire-safe organization, will want this change. If an electrical accident in a student dormitory occurs, we want to be already in motion to reduce the likelihood of a similar accident happening again.
The specific adoption date gives the manufacturer's time to innovate upon its performance, thus reducing nuisance trips, and getting costs down by establishing a common platform for competitions. I hope that the manufacturers will also innovate upon both ends of the electrical safety continuum as well: starting from the breaker in the panelboard in the hall and ending with safer end-use equipment coordinated with the Consumer Product Safety Council. The specific date gives designers and capital planners time to prepare programs for dormitory upgrades. The removal of uncertainty in the application of AFCI will reduce costs on many levels.
The Committee should note that APPA.ORG has submitted proposals for new chapters in the next edition of NFPA 101 and NFPA 5000 that contain definitions for "student residence facilities".
Panel Meeting Action: Reject
Panel Statement: The panel has been provided with extensive data relative to arcing conditions in dwellings.
The submitter has not provided sufficient substantiation that explains any specific events that have occurred in student resident facilities.
In addition, a clear definition of a student residence facility has not been provided.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1

Explanation of Negative:
KING, D.: I disagree with the panel action. Student Residence Facilities are clearly occupancies that should have AFCI protection. Any one that has ever lived in or visited a College /University living unit can appreciate that these areas have at least the same level of hazards that have led to the requirement for AFCI protection in dwellings.
Explanation of Abstention:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-90.

2-107 Log #1582 NEC-P02 **Final Action: Accept**
(210.19(A) (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 2-193
Recommendation: Continue to reject this proposal.
Substantiation: This proposal should continue to be rejected. The substantiation claims in #2 that, "the value of I2T conductor heating recorded by the test exceeded the maximum safe limit according to accepted industry standards for conductor heating in insulated cables, potentially compromising the insulation when power to the circuit is restored." The substantiation goes on to state that, "A proposal presently under evaluation by UL/STP-489 will, if accepted, assure that the circuit breaker performance described in the proposed Fine Print Note is assured in the future for all OCPD devices installed to meet the overcurrent protection requirements of 240.4."

The ICEA conductor damage data referenced in the substantiation of the submitters UL 489 proposal and the presentation he made to CMP2 at the ROP meeting is based on an initial temperature of the copper conductor of 75°C. It is illogical to assume that all the conductors in a home typically operate at such an elevated temperature. As a matter of fact, in its discussion of the insulation damage formula, The IEEE Green Book (IEEE Std 142-1991, pg. 116) cautions that the initial operating temperature factor in the equation is, "often taken as the conductor maximum operating temperature rating rather than the actual operating temperature. This is a conservative approach but may result in conductor oversizing by one trade size".

Testing conducted by Square D/Schneider Electric confirms that circuit breakers protect wire very well. For example, the submitter suggested in his UL 489 proposal that in some of the tests he conducted the circuit breaker let-through I^2t was allegedly 88,804. But actual laboratory testing on #14 copper wire at room temperature confirms that it can withstand as much as 250,000 I^2t without insulation damage. Residential type circuit breakers typically let through a small fraction of that amount with a full 10,000 amps of available short circuit current. The let-through in actual applications where the available short circuit current will be considerably lower will likewise be much less than this.

The problem alleged by the submitter is purely theoretical. There is no "real" problem with the products on the market today, therefore, the UL 489 proposal and this NEC proposal are unnecessary. Finally, it should be noted that while the final ballot has not been cast, the submitter's UL 489 proposal did not fair well during the comment period.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the test data that the submitter referred to in his substantiation was not submitted with his comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-108 Log #2876 NEC-P02 **Final Action: Reject**
(210.19(A) (New))

Submitter: Paul A. Keleher, Paul Keleher Electrical Services
Comment on Proposal No: 2-193
Recommendation: Revise text to read as follows:
210.19 Conductors- Minimum Ampacity and size
(A) Branch Circuits Not More Than 600 Volts.
(5) Permissible Voltage-Drop. The circuit conductors of a 15 or 20-ampere/120-volt branch circuit shall be sized such that voltage-drop measured at the rated ampacity of the circuit shall be 5 percent or less at any outlet.
Exception No. 1: Use of non-standardized circuit breakers in compliance with 240.4 shall be permitted on circuits supplying dedicated loads with high inrush or motor starting current where a circuit breaker meeting the requirements of this section can be shown to nuisance trip.
Exception No. 2: Where 240.3 or 240.4(G) applies.
FPN: Standard 120/240V circuit breakers rated from 15-50A that are listed to meet the overcurrent protection requirements of 240.4 contain a nonadjustable, instantaneous trip mechanism whose current setting will open the circuit within 1 cycle of being subjected to an overcurrent equal to or greater than 20 times their rated current. A full-load voltage drop measurement of 5% or less on a 120V branch circuit allows the system to deliver at least 20 times the rated current of the circuit to a short-circuit or bolted fault, ensuring that the circuit breaker's instantaneous mechanism will respond in compliance with other requirements of this Code.
Substantiation: The proposal has technically substantiated a problem that supports the need for this revision. CMP-2 based their action to this proposal using history and did not address the supporting evidence that this issue is a safety concern for property and persons. The NEC does not limit voltage drop at 120-volt outlets, and the product standard for standard circuit breakers does not require an instantaneous breaker response to a ground-fault or short-circuit current.1 Consequently, as recently collected short-circuit field test data indicates2, if excessive voltage-drop limits the current available to a short-circuit or ground-fault occurring on a 15 or 20A/120V branch circuit to a level that is less than that required to trigger the branch circuit breaker's magnetic (instantaneous) response, a thermal/magnetic circuit breaker protecting a 120V outlet will respond to a short-circuit or ground-fault with its intentionally delayed, thermal response. This response mechanism has been designed and is tested by the standard to respond effectively to low-level overloads. However, the product standard contains no calibrated time test within the range of fault-current typically available at 120V outlets3. Consequently, the ability of the thermal mechanism in a 15 or 20A circuit breaker protecting a 120V branch circuit to consistently protect against insulation damage from short-circuit or ground-fault current when high voltage drop limits the available fault current to a level that is insufficient to trigger the instantaneous magnetic mechanism, is not tested by the standard.

A sample of >1000 field short-circuit tests has been assembled from residential users of a field test instrument that conducts a short-circuit test at a 120V receptacle outlet, measuring and recording the short-circuit current and the response time of the circuit breaker in each test. The test results indicate that in a majority of 120 receptacle outlets tested, a short-circuit test produced a delayed, thermal response from the thermal/magnetic circuit breaker protecting the outlet-under-test. Conductor heating has been calculated from these results by applying the calculation I2T to the data in each of the 1017 tests. The results of those calculations indicate that in 10 percent of the tests the circuit conductors were overheated when compared against short-circuit withstand ratings for insulated copper cables as established by the ICEA4. The data further reveals that in all tests in which the breaker responded magnetically, conductor heating was safely limited to levels far below the I2T conductor heating allowed by the same standard.

The substantiation to proposal 2-193 explains how limiting voltage drop to 5 percent or less will ensure that sufficient current is available to produce a magnetic breaker response to a short-circuit or ground-fault at all 120V outlets, thereby addressing the questions raised by the data regarding the ability of thermal/magnetic circuit breakers to consistently protect conductors from overheating when exposed to a short-circuit or ground-fault.

The panel's rejection statement ignores both the submitter's technically substantiated argument that excessive voltage-drop is in fact a safety issue when it compromises overcurrent protection, and the supporting test data providing technical substantiation that the problem is real. Therefore, the submitter maintains that the panel's rejection statement lacks sufficient basis to reject this proposal given the technical substantiation clearly demonstrates a safety concern for property. Proposals in the past about this issue did not provide the technical evidence that clearly supports the need for including the requirement in the NEC.

This proposal should be accepted with the exceptions deleted, and as revised above. The exceptions are not applicable to the intent of the requirement. One minor correction has been inserted in the FPN. If however, after acknowledging the truth of the argument and the data that documents a real but latent problem, questions remain, the submitter suggests a compromise in the form of Acceptance in Principle and in Part. Such a resolution would mean that the panel understands the submitter's intent, but believes more study is needed, and in Part means that the proposal should include the deletions and insertions as shown in the revision accompanying this comment.
2-193 Panel Rejection statement:
"The panel reaffirms their position taken on similar proposals in previous Code cycles that voltage drop is a design consideration that must be dealt with by the installer/designer for each installation and can be specific to the involved equipment."

Note: Supporting material is available for review at NFPA Headquarters.

1UL-489, Section 7, Standard Circuit Breakers
2Residential Circuit Breaker- sorted by Short-Circuit Current
3ibid
4ibid, International Cable Engineers Association standard P32-382, Rev 2007: "Short-circuit Withstand Ratings for Insulated Copper Cables".
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided data that shows that conductors are damaged in the circumstances claimed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-109 Log #1445 NEC-P02 **Final Action: Reject**
(210.19(A)(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-194
Recommendation: Accept the proposal.
Substantiation: "Maximum" loads may be reduced by demand factors which then become "calculated" loads. Conductor ampacity may be reduced with the demand factors, but the maximum load (before demand factors) seemingly does not permit that reduction in ampacity.
Panel Meeting Action: Reject
Panel Statement: The panel maintains its position that the intent of this section is to ensure that conductors are sized to handle the maximum load.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(210.19(A)(2) [and 240.4(B)(1)])

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-200
Recommendation: Accept the proposal in principle and in part. Accept the panel action changing the title of 210.19(A)(2). Accept the assignment of jurisdiction over the subject matter to CMP 2 by the TCC. Revise the wording of 240.4(B)(1) to read as follows:
(1) The conductors being protected are not of a ~~multioutlet~~ branch circuit supplying multiple receptacles for cord- and plug-connected loads.
Substantiation: This comment is intended for the agenda of CMP 10, in response to the TCC note on Proposal 2-200 requiring action in 240.4(B)(1). The point of the original proposal, by this submitter, was to eliminate a conflict between 210.19(A)(2) and 240.4(B)(1) and this wording will accomplish the goal.
Panel Meeting Action: Accept in Principle
Revise 240.4(B) (1) to read as follows:
The conductors being protected are not part of a branch circuit supplying more than one receptacle for cord-and-plug-connected portable loads.
Panel Statement: The panel has revised the proposed text to reflect the action on proposal 2-200.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-111 Log #1443 NEC-P02 **Final Action: Reject**
(210.21(B)(2) and Table 210.21(B)(2))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-207
Recommendation: Accept the proposal.
Substantiation: If 15-ampere duplex receptacles are evaluated to supply 15-amperes through each half, why is the load limited to 12-amperes? Is safety involved? On a 20-ampere circuit, a 15-ampere receptacle supplying a 15-ampere load allows for an additional 5- ampere load; if this is exceeded, the overcurrent device will function, as with any overload. What safety is involved? A single receptacle on an individual circuit can supply its full current rating with presumably no safety concern. This rule is virtually unenforceable and violated every time a hair blow dryer or other appliance or tool rated over 12- amperes is used with a 15- ampere rated receptacle.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided the panel with any new information to support his recommendation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-112 Log #478 NEC-P02 **Final Action: Accept**
(210.23 Exception (New))

Submitter: Code-Making Panel 8,
Comment on Proposal No: 2-210
Recommendation: Code-Making Panel 8 concurs with the action taken by Code-Making Panel 2 to "Reject" Proposal 2-210.
Substantiation: Supplementary overcurrrent protection that may be provided with a luminaire that is supplied from a busway is in addition to the required overcurrent protection described in 368.17(C) and Exceptions 1, 2, and 3. Refer to Article 100 for the definition of "Supplementary Overcurrent Protective Device."
This comment was developed by a CMP-8 Task Group and balloted through the entire panel with the following ballot results:
12 Eligible to vote
12 Affirmative
1 comment on affirmative vote was received as follows:
M. Shan Griffith stated: "The original Proposal 2-210 seeks to change the meaning of the existing code text beyond that described by the submitter and without sufficient justification."
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-113 Log #1442 NEC-P02 **Final Action: Reject**
(210.23(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-212
Recommendation: Accept the proposal with the following revisions:
A 40- or 50- ampere circuit shall be permitted to supply cooking appliances that are located in dedicated spaces in any occupancy; or in other than dwelling units, a 40- or 50- ampere branch circuit shall be permitted to...(remainder unchanged).
FPN: See 422.11 for overcurrent protection.
Substantiation: Free standing electric ranges are not "fastened" in place; many countertop cooking units are set in place, but not "fastened." The provision for "in other than dwelling units" is prefaced with "or," and "such" is deleted to remove any misconception that the cooking appliance circuit can also serve such loads in addition to the cooking appliance load. 422.11 is an important consideration that may be overlooked.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation creates issues with appliances such as microwave ovens that are often in "dedicated space", but are not intended to be supplied from these circuits. The existing wording is well understood and it has not been shown to have created interpretation issues.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-114 Log #1225 NEC-P02 **Final Action: Accept in Principle in Part (210.52(I))**

TCC Action: The Technical Correlating Committee directs that the text be revised to read as follows:

"(I) Foyers. Foyers that are not part of a hallway in accordance with 210.52(H) and that have an area that is greater than 5.6 m2 (60 ft2) shall have a receptacle(s) located in each wall space 900 mm (3 ft) or more in width and unbroken by doorways, floor to ceiling windows, and similar openings."

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 2-223

Recommendation: Continue to accept in principle but reword the Panel Action as follows:

"(I) Foyers. For purposes of this section, a foyer is considered to be the entranceway or transitional space from the exterior to the interior of a dwelling unit. Foyers that have an area that is greater than 60 ft2 shall have a receptacle(s) located in each wall space ~~as defined in 210.52 (A)(2)(1)~~ 900 m (3 ft) or more in width and unbroken by doorways, floor to ceiling windows and similar openings.

Substantiation: As noted in the proposal substantiation and comments, many new homes are being built with large foyers that should be treated as separate areas requiring receptacle installation. It is not uncommon for lamps and other cord connected products to be located in these foyers. Receptacles should be available for the connections of these products. This comment addresses the concerns expressed by some of the panel members.

The lack of a receptacle within a reasonable distance from cord connected equipment leads to the use of extension cords and the attendant hazards associated with the increase use of extension cords.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed text to read as follows:

"(I) Foyers. Foyers that are not part of a hallway under 210.52(H) and that have an area that is greater than 60 ft squared shall have a receptacle(s) located in each wall space 900 mm (3 ft) or more in width and unbroken by doorways, floor to ceiling windows, and similar openings."

Panel Statement: The first sentence of the submitter's recommendation was not accepted as the proposed definition does not add any additional clarity.

The revision also includes the recommendation from Comment 2-119.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-115 Log #1883 NEC-P02 **Final Action: Reject (210.52, FPN)**

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facilities Executives

Comment on Proposal No: 2-221

Recommendation: Accept the proposal and strike the Fine Print Note completely, or edit the Fine Print Note accordingly:

FPN: Listed baseboard heaters include instructions that ~~may not~~ do not permit their installation below receptacle outlets.

Substantiation: The UL Standard, as quoted by the submitter, couldn't be clearer. But since the UL language was stated in recommended ("should") language, an alternate method of getting the point across would be an edit of the Fine Print Note as follows:

FPN: Listed baseboard heaters include instructions that ~~may not~~ permit restrict their installation below receptacle outlets.

Panel Meeting Action: Reject

Panel Statement: The panel maintains that the Fine Print Note is still accurate and it is important in order to draw attention to the instructions.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-116 Log #2184 NEC-P02 **Final Action: Reject (210.52(1))**

Submitter: Tom Studer, Electric Inspection Agency of Northern Kentucky

Comment on Proposal No: 2-233

Recommendation: Delete the following text:

~~210.52(1) Foyers. Foyers that have an area that is greater than 60 ft2 shall have a receptacle(s) located in each wall space as defined in 210.52(A)(2)(1).~~

Substantiation: This proposal should be rejected. First, the lack of a definition of a foyer within the NEC invites inconsistent enforcement of this rule throughout the industry. Without a definition of a "foyer", we need to use the commonly defined general term of "an entrance hallway" as defined in Webster's dictionary. In addition, the sixty square feet requirement will include foyers/hallways that are too small to place furniture within them. In the substantiation for this proposal, the statement: "Today's homes are being built with large foyers some being as large as other rooms in the dwelling" was made, and while this may be true for some homes, it is only a small percentage of the total. There are many home plans that include a hallway that runs from the front of the house towards the rear of the house to which the front door opens into, thereby becoming a foyer, and this foyer/hallway can easily be over sixty square feet in area. Within these hallways are doors to closet(2), bathrooms, garages, and laundry rooms, creating numerous wall spaces 2 ft or more in length which will not require a receptacle. Since the width of these hallways precludes the placement of furniture within these numerous wall spaces, the added receptacles will have no practical use. The need for receptacles in wall spaces of large foyers may be warranted, however, a home that would contain such a hallway is typically constructed as a custom home, and custom homes are rarely wired only to meet the minimum code requirements, with the owner knowing the placement of furniture and intended use of wall spaces and having the opportunity to add receptacles in these spaces. Mandating a requirement for receptacles that will be rarely used accomplishes little other than adding costs without producing a real benefit to the majority of homeowners or occupants.

Panel Meeting Action: Reject

Panel Statement: The term "foyer" is a generally understood term.

See the panel action and statement on Comment 2-114.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-117 Log #69 NEC-P02 **Final Action: Accept (210.52(A))**

TCC Action: The Technical Correlating Committee directs that 210.52(A)(4) be revised as follows to provide a title in compliance with the NEC Style Manual:

"(4) Countertop Receptacles. Receptacles installed for countertop surfaces as specified in 210.52(C) shall not be considered as the receptacles required by 210.52(A)."

Submitter: Technical Correlating Committee on National Electrical Code®,

Comment on Proposal No: 2-228

Recommendation: It was the action of the Technical Correlating Committee that this action be rewritten to comply with the NEC Style Manual.

The panel action did not include a title for the new subdivision (4).

This proposal will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-118 Log #2503 NEC-P02 **Final Action: Reject (210.52(A))**

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 2-228

Recommendation: The proposal should be rejected.

Substantiation: Countertop receptacles have been used to comply with the perimeter spacing rules for generations. Remember that any receptacle placement not exceeding 5½ feet above a floor qualifies as a perimeter receptacle per 210.52(4). At one time, there were no prescriptive rules for receptacle placements on countertops and the only requirements that applied were the customary 6- and 2-foot rules. The receptacles so installed met the perimeter spacing rules due to their height. When the 2- and 1-foot limits entered the NEC, kitchen counters became much more heavily populated with receptacles (and justifiably so), but the perimeter spacing rules never failed to apply. In the case cited in the substantiation, the counter receptacle does now and should continue to count as the required receptacle. Before prohibiting this long-standing practice, CMP 2 should consider that the absence of an additional receptacle in the three-foot area adjacent to the counter could be legally cured by installing a receptacle in that space 5 feet above the floor. Imagine explaining to ordinary people that the counter receptacle some 3 feet above the floor doesn't count, but the other one would.

The comment in the voting addresses only one unintended consequence of this proposal; there are many others. For example, a receptacle placement adjacent to a refrigerator cut-out (instead of within the cut-out) becomes a code violation unless an additional receptacle is placed within the cut-out, since this will now be wall space over two feet wide. The same could be said for stove locations. Peninsular and island counters would be required to have additional receptacles below those installed to service the countertop above, in some cases even if cabinets are exempted. The problems go on and on, and no technical substantiation in the way of loss experience or engineering judgment was supplied to support such an extreme change.

Panel Meeting Action: Reject

Panel Statement: Receptacles that are intended to serve countertops are dedicated for appliances utilized in that countertop space and are not intended to serve other loads. Receptacles installed to meet the requirements of 210.52(A) are separate from those installed to meet the requirements of 210.52(C).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-119 Log #2802 NEC-P02 **Final Action: Accept in Principle**
(210.52(A))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-223
Recommendation: Revise text to read as follows:
"(I) Foyers. Foyers that are not part of a hallway under 210.52(H) and have an area that is greater than 60 ft2 shall have a receptacle(s) located in each wall space as defined in 210.52 (A)(2)(1)."
Substantiation: There are many configurations for a home when it comes to the area just inside the house at the main entry door. The new provision for receptacles in Foyers might be simple to understand is the foyer was enclosed by four walls. In most designs, the floor area just inside the main entry door is either a part of a hallway or is an extension of a room. In other words, the main entry door is on one exterior wall, with no more than one wall directly adjacent to the door. In those cases where a door opens directly into an area are the end of a hallway with openings into a room on each side of this are, then possibly it could be considered a "foyer". But without a clear definition of a "foyer" as it relates to a residential dwelling, there will still be problems with discerning what exactly is a foyer. As an inspector I never ran into a situation where the wall space adjacent to an exterior door was not either part of an adjacent room, or part of a hallway.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 2-114.
Number Eligible to Vote: 12

2-120 Log #2803 NEC-P02 **Final Action: Accept**
(210.52(A)(2)(1))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-228
Recommendation: Revise text to read as follows:
(2) Wall Space. As used in this section, a wall space shall include the following:
(1) Any space 600 mm (2 ft) or more in width (including space measured around corners) and unbroken along the floor line by doorways and similar openings, fireplaces, and fixed cabinets ~~and similar openings~~.
Substantiation: As noted in NAHB's Affirmative Comment on this proposed change, without this added text the "unbroken floor line" would include the floor line in front of the kitchen cabinets.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-121 Log #2233 NEC-P02 **Final Action: Reject**
(210.52(A)(2)(3))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Comment on Proposal No: 2-235
Recommendation: Revise text to read as follows:
The space ~~afforded~~ occupied by fixed room dividers...".
Substantiation: Use of the word "afforded" is simply wrong! Pick up any dictionary, and you will find any definition of "afforded" that fits into the intended meaning of this article. That word has no meaning, and thus the sentence has no meaning. The essence of this proposal was not so much about railings, as the CMP appears to have surmised. That was a minor element. The essence is that the word "afforded" needs to be replaced.
Panel Meeting Action: Reject
Panel Statement: The submitter's change would literally state that the space in question is the space occupied by the fixed room divider itself.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-122 Log #1223 NEC-P02 **Final Action: Reject**
(210.52(A)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-238
Recommendation: This Proposal should be accepted to add new text to the requirement in Section 210.52(A)(3).
Substantiation: The substantiation for this proposal provides clear safety rationale for this requirement. The panel members appear to be laboring over issues of placement of such a floor receptacle for most practical access. This is not the role of the Code-Making Panel, but rather, a matter for designers, and may change over time with lifestyle preferences. In its statement, the Panel insinuates that placement of a receptacle under furnishings is an inherent hazard. Floor mounted receptacles are not prohibited by the Code in residential construction and are increasingly preferred even in rooms much smaller than is recommended in this proposal. There is little if any Code restriction for their placement respective of typical floor plans, furniture arrangement or traffic patterns. The Panel should refocus on the safety hazard that has been clearly and authoritatively substantiated and also recognize that the minimum size of the room in the proposal is quite large.
Panel Meeting Action: Reject
Panel Statement: A floor mounted receptacle installed at least six 6 ft. from the wall would not necessarily be appropriate for all room layouts.
In addition, the submitter has not provided any evidence that any safety issues have been experienced.
The panel suggests that the submitter provide, during the next code cycle, specific information that problems related to safety exist.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
LAROCCA, R.: In large rooms such as "great rooms" that have become increasingly popular, the only requirement is for receptacles to be installed along the wall space. If receptacles are not included in the open floor space, extension cords will be used to provide power to lamps and other appliances used in the open central area of the room. Cords used in such a manner will be run under carpets and rugs and may be damaged creating a potential fire or shock hazard, or create a tripping hazard if left exposed. Requiring one or more floor receptacles in large rooms would help prevent these potentially hazardous conditions.
PAULEY, J.: NEMA continues to support the concept that the addition of a floor outlet in these larger rooms will decrease the need to apply extension cords to accommodate furniture layout that is often not next to the walls due to the size of the room.
WEBER, R.: The proposal should have been accepted. With today's large homes, room size allows for furniture placement away from walls and receptacles. Home owners must resort to using extension cords which create trip hazards or placing them under rugs creating fire hazards.

2-123 Log #2804 NEC-P02 **Final Action: Accept**
(210.52(A)(3))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-237
Recommendation: Continue to Reject Proposal 2-237.
Substantiation: NO documentation was ever provided to show the current provisions of the NEC are a cause of a real fire or other life/fire-safety problem that would be solved if the floor boxes were mandated. The proposed requirement is nothing more than mandating a "convenience outlet that in fact may never be used. The installation and locations of floor boxes in commercial occupancies should be determined by the architect based on the needs of the building occupant.
Panel Meeting Action: Accept
Panel Statement: The original proposal deals with office buildings and hotels/motels, however, the proposal is made to the section of the Code that applies to dwelling units.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Comment on Proposal No: 2-238
Recommendation: Continue to Reject Proposal 2-238.
Substantiation: NO documentation was ever provided to show the current provisions of the NEC are a cause of a real fire or other life/fire-safety problem that would be solved if the floor boxes were mandated. The proposed requirement is nothing more than mandating a "convenience outlet that in fact may never be used. The installation and locations of floor boxes not adjacent to a fixed room diver, etc., in any occupancy, especially residential, should be determined by the architect based on the needs of the occupants.

2-125 Log #1958 NEC-P02 **Final Action: Reject**
(210.52(A)(4))

Submitter: Terrence V. Wendt, Electric Company of Omaha
Comment on Proposal No: 2-228
Recommendation: Revise text to read as follows:
Receptacles installed for countertop surfaces and desktop surface) ~~as specified in 210.52(C)~~ shall not be considered as the receptacles required by 210.52(A).
Substantiation: The concept should be expanded to cover more than just kitchen counters, the same hazards exist for wet bar countertops, desktops, etc. Although receptacles are not required, they are usually installed. By specifically singling out one type of countertop, you open the door for receptacles on other countertops or desktops to cover wallspace, causing the use of extension cords hanging off them or on the floor to cover wallspace and creating choking and fire hazards.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter that the conditions requiring receptacles for countertops are the same for desktops.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-126 Log #485 NEC-P02 **Final Action: Accept in Principle**
(210.52(C))

Submitter: Ronald E. Hackett, Village of Buffalo Grove
Comment on Proposal No: 2-241
Recommendation: Revise text to read as follows:
(C) Countertops. In kitchens, pantries, breakfast rooms, dining rooms, and similar areas of dwelling units, receptacle outlets for countertop spaces shall be installed in accordance with 210.52(C)(1) through (C)(5).
~~If a range, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop and the width of the countertop behind the range, counter-mounted cooking unit, or sink is less than 300 mm (12 in.), the range, counter-mounted cooking unit, sink is considered to divide the countertop space into two separate countertop spaces as defined in 210.52(C)(4). Each separate countertop space shall comply with the applicable requirements in 210.52(C).~~
(1) Wall Countertop Spaces. A receptacle outlet shall be installed at each wall countertop space that is 300 mm (12 in.) or wider. Receptacle outlets shall be installed so that no point along the wall line is more than 600 mm (24 in.) measured horizontally from a receptacle outlet in that space.
Exception: Keep as is. No changes required.
(2) Island countertop Spaces. At least one receptacle shall be installed at each island countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater.
If a range or sink is installed in the island countertop space. The range or sink is considered to divide the countertop space into two separate countertop spaces as defined in 210.52(C)(4). Each separate countertop space shall require at least one receptacle outlet for that countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater.
(3) Peninsular Countertop Spaces. At least one receptacle shall be installed at each peninsular countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. A peninsular countertop is measured form the connecting edge.
If a range or sink is installed in the peninsular countertop space. The range or sink is considered to divide the countertop space into two separate countertop spaces as defined in 210.52(C)(4). Each separate countertop space shall require at least one receptacle outlet for that countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater.
(4) Separate Spaces. Keep as is. No changes necessary.
(5) Receptacle Outlet Locations. Keep as is. No changes necessary.
Substantiation: Although the above comment is only a slight revision, it will provide additional clarity. The revised layout is more logical and easier to understand when applying 210.52(C). With the above revision, requirements for countertop spaces are more user friendly. Removing the second paragraph of 210.52(C) and relocating revised text under their proper heading, helps alleviate one from jumping back and forth from place to place. Also, unnecessary redundancy is removed. Separate space requirements are now all located in 210.52(C)(4), where they belong.
The second paragraph of 210.21(C) indicates a measurement of 300 mm (12 in.). This 300 mm (12 in.) or less measurement has no merit by itself. It makes no sense, is confusing, and is not practical for a countertop space with no wall space. 210.21(C) is where one would go to find the requirement for an island with no wall space, but has a range or sink installed. For example, an island has no wall space but has a range or sink. There is no logical reason to base whether you have separate spaces where the width behind the range or sink is less than 12 in. What if this dimension behind a range was 30 in.? It would be safe to conclude that this countertop space would be larger for this island, but 210.52(C) indicates that we do not create separate spaces.
The criteria for what constitutes separate spaces on an island with no wall space should be whether a 24 in. by 12 in. space is created. This would be consistent with code language already found in the NEC. It should not be based on whether the width behind the range or sink is 12 in. or less. What difference does the width behind a sink or range (on an island with NO WALL space) make when determining the receptacle outlet requirements? Currently, in this application, the code is not necessarily concerned with the space behind the ranges or sinks when determining if a receptacle outlet is required. However, we should be focused and concerned with the countertop space that is created to the right and left of the range or sink. If this is not true, then separate spaces is not relevant and 210.52(C)(1) and 210.52(C)(2) should only apply. In short, only one receptacle outlet is required. Period!
210.52(C) is confusing. See IAEI News Article for July-August 2009. Dwelling units. What is being taught is not necessarily consistent with the National Electrical Code. I know that code users understand the content from the IAEA News Article, but they have a hard time understanding 210.52(C) as written in the NEC. The IAEI Article is reasonable, clear, and precise. After reading the article, you have a clear understanding for countertop requirements.
If the intent of 210.52(C) is what is explained in the IAEI Article, then the code needs to be revised for clarity. With the new innovative kitchen designs and layouts, the "first generation" islands were basic and simple. These small rectangular islands are a thing of the past. The code is remiss if we don't have clear and precise code language when dealing with fancy, ornate and expensive kitchen islands and peninsulas.
With that said, is the code clear on the application for an island that has wall space directly behind a range or sink? Yes, where an island or peninsular has wall space behind a range or sink, 210.52(C)(1) and 210(C)(1) exception applies. Figure 210.52(C)(1) works because it defines the wall space behind a range or sink. The figure is located in 210.52(C)(1), wall countertop space. The wall space makes all the difference in the world. This revision removes confusion and intends to simplify the requirements.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel agrees with the submitter that relocating the text specified in 210.52 would improve clarity and has done so with the panel action on Proposal 2-242.
See the panel action and statement on Proposal 2-242.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-127 Log #2504 NEC-P02 **Final Action: Reject**
(210.52(C)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-246
Recommendation: Accept the proposal.
Substantiation: The panel statement is incorrect. The maximum uncovered distance on a conventional counter is about 5 ft (2 ft plus the counter depth plus a potential return of less than 1 foot), and this space is no more usable than a similar space in the middle of a wall for which no additional receptacle placement need be considered.
Panel Meeting Action: Reject
Panel Statement: The panel intends that this space be included in the wall line measurement. Exempting the space could result in receptacles being spaced 6 ft. apart where the counter continues along the wall line.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-128 Log #1957 NEC-P02 **Final Action: Accept in Part**
(210.52(C)(3) Exception)

Submitter: Terrence V. Wendt, Electric Company of Omaha
Comment on Proposal No: 2-251
Recommendation: Revise text to read as follows:
~~Exception: A receptacle in a small countertop space shall be permitted to serve as the receptacle peninsular countertop space where the spaces are continguous and the receptacle is located within 1.8 m (6 ft) at the outside edge of the peninsula.~~
FPN: A surface at countertop height out of similar or like material with no base cabinets underneath, capable of having chairs or stools underneath it, should not be counted as kitchen countertop space.
Substantiation: If the submitter's problem is with having inspectors consider tabletop style extension as countertops, the a fine print note should be adequate to make clear the intention of the code. The exception, as written, would be a step backwards in providing adequate outlets on peninsulars and to reducing hazards from extension cord usage.
Panel Meeting Action: Accept in Part
The panel Accepts the deletion of the Exception, and Rejects that addition of the Fine Print Note.
Panel Statement: The submitter's recommended FPN is inappropriate since it contains an interpretation and, in addition, the panel does not agree that this is not countertop space.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

BROWN, L.: This same Technical Committee put this Exception into the NEC during the ROP phase with the statement, "The panel has accepted the submitter's recommendation but added additional words to make it clear that the 6-ft measurement is from the end of the peninsula itself." This clarification provided that the receptacle did not need to be located at the far end of a peninsula, when the receptacle is only required to serve the peninsula from some point.

2-129 Log #2505 NEC-P02 **Final Action: Reject**
(210.52(C)(3) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-251
Recommendation: Continue to accept the proposal in the form modified by the panel.
Substantiation: This comment is intended to respond to the comments in the voting. Peninsular counters are routinely used as permanently installed kitchen tables, which may or may not have cabinets below them, and for which a receptacle placement at the outer end becomes not something a "dwelling unit owner needs" but rather something the dwelling unit owner will ferociously resist. The most protracted issues that I ever had to confront in my many prior years as an inspector, and I had to do so repeatedly, all had to do with disputed receptacle placements on kitchen peninsulas and islands. The disputes were never with the installing electrical contractors, only the owners. One owner battled unsuccessfully for over a year (with his certificate of occupancy duly held up for the entire time) to get an exemption from a receptacle placement in a kitchen island. This proposal is a reasonable compromise that has been frequently applied in the field, sometimes through the use of the creative interpretation described in the substantiation.
Panel Meeting Action: Reject
Panel Statement: After additional consideration, the panel concluded that the peninsular countertop should be supplied by a receptacle located in that space.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: Please see NAHB's Vote and Ballot Comment on Public Comment 2-128.
Comment on Affirmative:
WEBER, R.: The panel should continue to reject this comment. This would allow for a 4 foot peninsula to be installed without a receptacle to serve countertop appliances. It may not be practical or even possible for a wall mounted countertop receptacle to serve a peninsula. With the product standard for appliances reducing the cord length to 18 inches an appliance may not be able to reach a wall mounted receptacle outlet from the peninsula. This creates a safety hazard as homeowners may resort to using extension cords to supply those appliances.

2-130 Log #2512 NEC-P02 **Final Action: Accept**
(210.52(C)(3) Exception (New))

Submitter: Donald M. King, Rep. IBEW
Comment on Proposal No: 2-251
Recommendation: Delete Exception as follows:
~~Exception: A receptacle in a wall countertop space shall be permitted to serve as the receptacle for a peninsular countertop space where the spaces are contiguous and the receptacle is located within 1.8 m (6 ft) of the outside end of the peninsula.~~
Substantiation: The submitter did not present adequate substantiation to support his recommendation to eliminate the requirement for a minimum of one receptacle to serve peninsular countertop spaces. The present Code text clearly defines the minimum receptacle requirements for these spaces and there has not been sufficient substantiation presented to diminish those requirements. Also, consideration needs to be given to the fact that the receptacle installed at the wall countertop space in the submitter's substantiation is intended to serve the countertop space for that area to meet the requirements 210.52(C)(1) and should not be utilized to serve additional countertop space regardless of whether or not that countertop space is contiguous.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BROWN, L.: This is a reasonable Exception.
Comment on Affirmative:
WEBER, R.: See my Explanation of Affirmative Vote on Comment 2-129.

2-131 Log #1827 NEC-P02 **Final Action: Accept**
(210.52(C)(4))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 2-242
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(4) Separate Spaces. Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate countertop spaces in applying the requirements of 210.52(C)(1). If a range, counter-mounted cooking unit, or sink is installed in an island or peninsular countertop and the depth ~~width~~ of the countertop behind the range, counter-mounted cooking unit, or sink is less than 300 mm (12 in.), the range, counter-mounted cooking unit, or sink is considered to divide the countertop space into two separate countertop spaces ~~as defined in 210.52(C)(4)~~. Each separate countertop space shall comply with the applicable requirements in 210.52(C).
Substantiation: The issue is not the width of the countertop space behind a range, counter-mounted cooking unit or sink but the depth of the space in determining if the range, counter-mounted cooking unit or sink. For example, if the peninsular or island countertop depth is 24 inches (a common depth), and the depth of the countertop remaining behind the counter-mounted cooking unit is less than 12 inches, the counter-mounted cooking unit has divided the countertop into two spaces and a receptacle outlet is required for each space. If the counter space behind the counter-mounted cooking unit is 12 inches or more, the peninsula or island counter space has not been divided by the counter-mounted cooking unit and one receptacle is required.
The phrase "as defined in 210.52(C)(4)" is not needed as the phrase is located in 210.52(C)(4).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-132 Log #1226 NEC-P02 **Final Action: Accept in Principle**
(210.52(C)(5))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-253
Recommendation: This proposal should be accepted with the following change:
Receptacle outlets shall be located in, on, or above, but not more than 500 mm (20 in.) above the countertop. Receptacle outlets located in countertops shall be listed for the application. Receptacle outlets rendered not readily accessible by appliances fastened in place, appliance garages, sinks, or rangetops as covered in 210.52(1), Exception, or appliances occupying dedicated space shall not be considered as these required outlets.
Substantiation: This proposal would permit innovative receptacle constructions and housing designs that could be safely used in a countertop. The additional language in this comment requires outlets to be specifically listed for use in this application.
The Panel Action retains the present design prescriptions that have restricted innovation that might eliminate the continued permission afforded by the "Exception to (5)". This exception is a compromise to the safety intent of the requirement in 210.52(C)(5). The Panel statement that "The present text permits "tombstone style" receptacles to be used", and that "The receptacle would still be 'above' the countertop", is an example of how closed-minded the interpretation of the requirement is. One example of an existing technology used in floor applications is provided. This technology, if adapted for a countertop, could provide safe and aesthetically pleasing access to a receptacle from the top of the counter but below the countertop surface ("in the counter"). Such a design also meets the existing requirement that a receptacle cannot be mounted face-up. In floor applications, these listed products are subjected to scrub water exclusion tests, which demonstrates that protection from spills such as can occur in a countertop application, is feasible.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
"Receptacle outlets shall be located on, or above, but not more than 500 mm (20 in.) above the countertop. Receptacle outlet assemblies listed for the application shall be permitted to be installed in countertops."
Add an Information Note to read as follows:
"Information Note: See section 406.4(E) for requirements for installation of receptacles in countertops."
Panel Statement: The panel has revised the recommended text to clarify that installations in countertops are required to be listed receptacle assemblies.
The panel has added an Informational Note to address the requirements of 406.4(E) regarding the installation of receptacles installed in countertops in the face-up position.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-133 Log #1419 NEC-P02 **Final Action: Reject**
(210.52(C)(5))

Submitter: John E. Staires, City of Tulsa, Oklahoma
Comment on Proposal No: 2-256
Recommendation: Revise text as follows:
~~Exception to (5): To comply with the conditions specified in (1) or (2), receptacle outlets shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop. Receptacles mounted below a countertop in accordance with this exception shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support base.~~
~~(1) Construction for the physically impaired~~
~~(2) On island and peninsula countertops where the countertop is flat across its entire surface (no backsplashes, dividers, etc.) and there are no means to mount a receptacle within 500 mm (20 in.) above the countertop, such as an overhead cabinet.~~
Exception to (5): To accommodate construction for the physically impaired, receptacles shall be permitted to be mounted not more than 300 mm (12 in.) below the countertop. Receptacles mounted below a conountertop in accordance witht his exception shall not be located where the countertop extends more than 150 mm (6 in.) beyond its support base.
Substantiation: In rejecting Proposal 2-256, the panel statement on Proposal 2-249 was referenced. To quote the last sentence of the Panel Statement on Proposal 2-249, "Deleting the section entirely would leave substantial areas of modern kitchens without any receptacles". Proposal 2-256 would not reduce the number of receptacles required in modern kitchens, but would only affect the placement of required countertop receptacles. By permitting receptacles to be placed below the countertop in accordance with the existing wording of 210.52(C)(5), occupants, and particularly children, are subjected to the hazard posed by small appliances energized by receptacles below the countertop. Children are injured every year by pulling appliances off of countertops by the cord.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposed revised text removes language that permits the installation of receptacles below countertop surfaces which is one intent of this section.
The panel recognizes that not all countertop designs will allow for receptacles to be installed above the countertop and has permitted limited installation below the countertop surface to ensure that receptacles can be installed to serve those countertop spaces.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
BROWN, L.: It is also important to realize that persons with certain disabilities need the receptacles to be located below the countertop.

2-134 Log #2506 NEC-P02 **Final Action: Accept**
(210.52(C)(5))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-255
Recommendation: Continue to reject the proposal.
Substantiation: The panel statement is exactly correct. The approach in the NEC provides a reasonable balance for surfaces that are frequently permanently installed kitchen tables, and for which owners will actively resist, to the point of filing legislation in their state legislatures, tombstone outlets or other placements above extremely expensive countertop surfaces. The passion with which many of our citizens approach the construction detail on these surfaces simply has to be experienced to be fully appreciated.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-135 Log #1224 NEC-P02 **Final Action: Accept in Principle**
(210.52(D))

TCC Action: The Technical Correlating Committee revises the Informational Note as follows to provide the proper section reference:
"Informational Note: See 406.5(E) for requirements for installation of receptacles in countertops."
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-258
Recommendation: Continue to accept proposal 2-258 in principle but revise 210.52(D) as follows:
(D) Bathrooms. In dwelling units, at least one receptacle outlet shall be installed in bathrooms within 900 mm (3 ft) of the outside edge of each basin. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop, located on or in the countertop, or installed on the side or face of the basin cabinet not more than 300 mm (12 in.) below the countertop.
Substantiation: Also see comment on proposal 2-253. The Panel Action only addresses part of the original proposal and retains some design prescription. Similar to the present text in 210.52(C)(5), the proposed text would restrict innovation that would improve safety. Small bathroom appliances such as hot curling irons and high wattage blow dryers are accessible to small children when plugged into receptacles "installed on the side or face of the basin cabinet". Providing more options for mounting required receptacles from the counter surface will help address this safety issue. The Panel Action to not include the above recommended text and its statement reference to "tombstone" style receptacles is design limiting. One example of an existing technology used in floor applications is provided. This technology, if adapted for a bathroom countertop, could provide safe and aesthetically pleasing access to a receptacle from the top of the counter but below the countertop surface ("in the counter"). Such a design also meets the existing requirement that a receptacle cannot be mounted face-up. In floor applications, these listed products are subjected to scrub water exclusion tests which demonstrates that protection from spills and splashing water such as can occur in bathroom countertop applications, is feasible.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
"(D) Bathrooms. In dwelling units, at least one receptacle outlet shall be installed in bathrooms within 900 mm (3 ft) of the outside edge of each basin. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop, located on the countertop, or installed on the side or face of the basin cabinet not more than 300 mm (12 in.) below the countertop. Receptacle outlet assemblies listed for the application shall be permitted to be installed in the countertop.
Informational Note: See section 406.4(E) for requirements for installation of receptacles in countertops."
Panel Statement: The panel has revised the recommended text to clarify that installations in countertops are required to be listed receptacle assemblies.
In addition, the panel has added an Informational Note to address the requirements of 406.4(E) regarding the installation of receptacles.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-136 Log #2088 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: Joseph A. Ross, Ross Electrical Assessments
Comment on Proposal No: 2-261
Recommendation: Accept this proposal.
Substantiation: I am aware that it was "an outdoor receptacle located over a brick walkway" that prompted a change for the 2008 NEC. It's reassuring to note that the panel statement clearly permits an outdoor receptacle to be located above concrete, brick, hot top, and mulch; now, take one small step for mankind and permit the outdoor receptacle to be located above a wooden deck that is assessable from grade. This existing text of the 2008 NEC; to be a violation or not to be a violation is based on the length of a person's arm??
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms that the outdoor receptacle must be accessible while standing at grade level. The requirement to be accessible while standing at grade level was to address situations where the receptacles would be located well above grade, such as located over a garage, and a cord would be required to be run from the second level down the stairs for utilization equipment at grade.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
WEBER, R.: Dwellings built on sloped elevations requiring stairs to access the dwelling become subjective with respect to receptacles installed outdoors. The term "while standing" at grade clarifies the specific location of the receptacle.

2-137 Log #2302 NEC-P02 **Final Action: Reject**
(210.52(E))

Submitter: Raymond J. Millet, Jr., Commack, NY
Comment on Proposal No: 2-261
Recommendation: The proposal should be Accepted in Part. Accept the changes in (1) and (2). Paragraph (3), which restates the 2008 NEC provisions, need not be considered here because it may be changed by other CMP 2 activity and it was not the intended focus of the proposal.
Substantiation: The "most effective use of the required receptacle" is where it will be the most routinely used. No other definition would seem to make sense, and CMP 2 has not provided any substantiation for anything to the contrary. The proposal recognizes a receptacle on a readily accessible low deck, which is the most likely point of use. The statement that "additional receptacles that are installed for a porch or deck are permitted to be installed" is both true and beside the point. In fact, the current NEC requires receptacle placements in most of these locations; the more appropriate action would be to accept this comment and then note that additional receptacles can always be installed

where accessible while standing at grade, if so desired. CMP 2 should also reconsider the substantiation presented in Proposal 2-260, which provides many other practical objections to the present wording.

This comment was endorsed by a unanimous vote at the Eastern Section business meeting on October 7, 2009.

Panel Meeting Action: Reject

(210.52(E)(3) and Exception to (3))

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-265
Recommendation: Accept Proposal 2-265.
Substantiation: This proposal submitted by the IAEI provides better wording on the intent of this provision and it's Exception. This guidance is needed as, if there is no minimum dimension for a balcony, the opening area and guardrail afforded for a door in an exterior wall, installed for aesthetics or ventilation, would now be considered a "balcony". These include the safety guardrail at second floor double doors that are used for natural ventilation. This arrangement consists of a simple guardrail that may extend a few inches out from the face of the building. There is no usable, occupiable, or habitable space, it is just a guardrail. In addition, a simple architectural balcony that extends a foot or so out in front of these doors. There is hardly any area for more than one person to stand, let alone participate in any activity except looking. The Exception was included in the 2008 NEC as it provided the means to define the usable area of a deck or balcony.
Panel Meeting Action: Reject
Panel Statement: The panel has maintained their position that there should not be a minimum square footage for a balcony, deck, or porch to require a receptacle. As such, there is no need to revise the previous Exception into the main paragraph.

See the panel action and statement on Comment 2-141.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

BROWN, L.: This type of change should be modified during the adoption process to match Exception #3 of the 2008 NEC. As noted in NAHB's ballot comment on Proposal 2-265, As pointed out during the development of this new provision last cycle, if there is no minimum dimension for a balcony, the opening area and guardrail afforded for a door in an exterior wall, installed for aesthetics or ventilation, would now be considered a "balcony".

It is truly unfortunate that most of the member of Panel 2 are not that familiar with the many types of architectural projections that will now be labeled as a balcony. These include the safety guardrail at second floor double doors that are used for natural ventilation. This arrangement consists of a simple guardrail that may extend a few inches out from the face of the building. There is no usable, occupiable, or habitable space, it is just a guardrail. In addition, a simple architectural balcony that extends a foot or so out in front of these doors. There is hardly any area for more than one person to stand, let alone participate in any activity except looking. The Exception was included in the 2008 NEC as it provided the means to define the usable area of a deck or balcony. Without this exception the manufacture's have gotten another mandate into the NEC to require more of their products without providing substantiation that a problematic fire or life-safety situation exists.

WILKINSON, R.: Should have been an accept as it would have established a minimum size balcony.

2-141 Log #2807 NEC-P02 **Final Action: Reject**
(210.52(E)(3) Exception)

Submitter: Lawrence Brown, National Association of Home Builders (NAHB)
Comment on Proposal No: 2-266
Recommendation: Reject Proposal 2-266.
Substantiation: As pointed out during the development of this new provision last cycle, if there is no minimum dimension for a balcony, the opening area and guardrail afforded for a door in an exterior wall, installed for aesthetics or ventilation, would now be considered a "balcony". It is truly unfortunate that most of the members of Panel 2 are not that familiar with the many types of architectural projections that will now be labeled as a balcony. Without this exception the manufacture's have gotten another mandate into the NEC to require more of their products without providing substantiation that a problematic fire or life-safety situation exists.

WILKINSON, R.: Should be a reject as a guard rail in front of a window could be considered a balcony under current provisions.

2-142 Log #1206 NEC-P02 **Final Action: Reject**
(210.52(G))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 2-269
Recommendation: This Proposal should have been Accepted or Accepted in Principle. The proposal should be revised to read as follows:
In 210.52(G)(1), add an additional sentence to read: "Where a garage accommodates more than two vehicles, there shall be at least one receptacle per wall with the exception of the wall with installed garage doors."
Substantiation: One receptacle per garage is not enough. Many of these receptacles are inaccessible when a car is parked in the garage. Usually, extension cords are needed to access the receptacle when power tools, vacuum cleaners or other electrical equipment is used. These extension cords can be driven over by cars, cause a tripping hazard or can lie across puddles on the floor causing a possible shock hazard to the home owner. The proposed language only adds two receptacles to the garage when the garage can handle two or more cars.
Panel Meeting Action: Reject
Panel Statement: There is no evidence that additional receptacles in a garage will reduce the use of extension cords.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This comment should have been accepted in principal. See my Explanation of Negative Vote for Comment 2-143.

2-143 Log #718 NEC-P02 **Final Action: Reject**
(210.52(G)(1))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 2-269
Recommendation: The Proposal should be Accepted in Principle. The added sentence should read: "Where the garage is larger than 53 m2 (575 ft2), an additional receptacle shall be provided for each additional 23 m2 (250 ft2)."
Substantiation: This proposed revised wording addresses the Panel's Statement that the Proposal was based on the number of vehicles and there was no definition of a "vehicle space".
The revised text defines the area involved, not the number of vehicles or vehicle spaces. The internal size of a two-car garage is approximately 25 ft x 23 ft (575 ft2). Each additional 250 ft2 (20 ft x 12.5 ft) would accommodate an additional vehicle or provide storage or work space. Many people without basements have a workshop with power tools in the garage. When the single receptacle is not near the workshop area, they have to use an extension cord with a power strip and frequently leave the cord plugged in and laying on the floor; not a good safety practice.
If there was a room in a house larger than 25 ft x 23 ft (575 ft2), would the panel consider a single receptacle to be adequate? I do not think that it is necessary to have receptacles every 12 ft in a garage but it appears to be logical and reasonable to have more than one receptacle in very large garages.
As I stated in the Proposal, the use of very long extension cords can be a serious safety hazard.
Panel Meeting Action: Reject
Panel Statement: There is no justification to require receptacles based on the size of the garage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This comment should have been accepted. I disagree with the Panel statement that "There is no justification to require receptacles based on the size of the garage." The justification as indicated in the submitter's substantiation is to prevent the use of extension cords in multiple vehicle garages. The safety benefits of minimum receptacle spacing requirements is well documented and should apply for garages.

2-144 Log #2183 NEC-P02 **Final Action: Reject**
(210.52(G)(1))

Submitter: Michael McGlone, Strafford, NH
Comment on Proposal No: 2-269
Recommendation: Accept the proposal.
Substantiation: The added sentence addresses a common problem and promotes safety.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-142.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This comment should be accepted. See my Explanation of Negative Vote on Comment 2-143.

2-145 Log #1035 NEC-P02 **Final Action: Reject**
(210.52(H))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 2-272
Recommendation: The Proposal should be Accepted.
Substantiation: Lack of receptacles in hallways wider than 4 1/2 ft can create a safety hazard as explained in the Proposal. The revision would only apply when the hallway is wide enough to accommodate a piece of furniture in addition to the walkway.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any substantiation to justify the change.
In addition, the panel does not agree that having a 4.5 ft wide hallway creates an area that requires receptacle spacing by 210.52.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: This comment should have been accepted. As was pointed out by the submitter of this comment where portions of hallways are wider than 4.5 feet there is a need for minimum receptacle outlet requirements to prevent the use of extension cords that would otherwise be used to supply lamps and other electrical equipment in these areas.

2-146 Log #1207 NEC-P02 **Final Action: Reject**
(210.52(H))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 2-272
Recommendation: This proposal should have been Accepted.
Substantiation: The submitter is correct in his substantiation. 4.5 feet wide hallways are small rooms where furniture and lighting are commonly used. A single receptacle is inadequate to supply the electrical needs for these hallways. Extension cords are commonly used to supply the lighting. These extension cords have been installed under the carpet or rugs to reach the opposite wall. Extension cords under the carpet or rugs create a fire hazard.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-145.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KING, D.: See my Explanation of Negative Vote for Comment 2-145.
Comment on Affirmative:
WEBER, R.: This panelist disagrees that 4.5 feet wide hallways create small rooms. A hallway 15 feet long and 4.5 feet wide creates an area 67.5 square feet. The model residential building code requires a room to have an area at least 70 square feet and to be at least 7 feet in any horizontal dimension.

2-147 Log #573 NEC-P02 **Final Action: Reject**
(210.55)

Submitter: Matthew Smith, Little Diversified Architectural Consulting
Comment on Proposal No: 2-276
Recommendation: The new section 210.55 requires a listed floor box be placed in all meeting rooms. While these may be required for large meeting rooms to prevent tripping, in small rooms only capable of hosting 4 or 5 people the wall is typically convenient to the table and power strips and extension cords are not required.
Proposed:
210.55 Meeting Rooms. In meeting rooms greater than or equal to100sq. ft. located in office buildings and hotels/motels, a receptacle outlet in a listed floor box shall be installed in the center of each room. For a dividable meeting room a single receptacle outlet in a listed floor box shall be installed in the center of each partitioned area.
Substantiation: Owners and architects generally prefer multiple small meeting rooms to be used for small group meetings. Requiring floorboxes for each of these rooms increases cost to the owner without increasing safety or affecting the number of powerstrips as described in the original substantiation.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation to require a floor box in a 100 sq. ft. meeting room.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
WEBER, R.: This comment should have been accepted in principle. The need for a floor receptacle in meeting rooms is obvious. Cords are constantly being run across walkways and relocatable power strips are being daisy chained together to meet the power requirements for meetings and other functions. The area should be increased to 625 square feet to address these larger types of meeting rooms. The placement of the floor outlet should be a design issue and left up to the designer or installer. Wherever a single floor outlet is placed in a meeting room it will not be able to effectively serve all requirements and needs, but in many instances it will be able to reduce the reliance on extension cords thereby reducing trip hazards and increasing overall safety.

2-148 Log #1258 NEC-P02 **Final Action: Accept**
(210.55)

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 2-276
Recommendation: This proposal should have been rejected.
Substantiation: While it may be reasonable to require a receptacle outlet somewhere in a meeting room, the requirement for one in the center of the floor area does nothing to improve safety. In fact, in many rooms, a receptacle in the center of the room will be less safe, particularly where the seating in the room is set up classroom-style, with group tables, or in a circular or U-shaped configuration. Since meeting rooms may be configured in many different ways for different meetings, very often a floor box in the center of the room will be in the middle of an egress pathway. This proposal only requires a listed floor box, and not any particular design, so a cord plugged into such a box where the receptacle is approximately flush with the floor surface will mean a cord and plug will probably extend vertically from the box in the middle of the floor and will create a worse tripping hazard than a cord laying flat on the floor. (Or will the next step be to require all extension cords to have angle plugs? - which would then not work in recessed floor boxes.)

The second sentence of the proposal requires a floor box in the center of each partitioned area. In large ballrooms that can be divided in many different ways using different arrangements of partitions, there may be many "centers," and the floor boxes will be scattered about in such a way that in some configurations none will be located in a safe or convenient location even though many are available. The substantiation mentions the use of daisy-chained extension cords and implies that this proposal would somehow alleviate that problem, but it would only change the point of origin. Laptop computers and projection equipment are also mentioned, but a floor box in the center of a room, particularly a large room, would be unlikely to be near the point where a projector must be located, and laptop computers could be anywhere.

This proposal would reliably solve the stated problem in only one case: where the room is used for a large conference table that is located in the center of the room, so that cords originate under the table. No doubt it would also be of benefit to the manufacturers of floor boxes. This is a design issue that can only be resolved by design, and even then a designer cannot anticipate every possible use or arrangement of "meeting rooms" which are also commonly used for dances, receptions, banquets, and other gatherings that are not at all like the common business meeting or seminar. In fact, a designer may not even be able to identify which side of a room will be the front. The author of this comment has spent thousands of hours in meeting rooms in countless configurations, and those with floor boxes in the wrong places like this proposal would require are often less safe than the rooms with cords extending from the walls and temporarily taped flat to the floors. (Not that standard practice is actually good practice.) Since the NEC is explicitly not a design document, the proposal is inappropriate and should have been rejected.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:
KING, D.: The addition of receptacles in meeting rooms will reduce the use of extension cords in those spaces. The increased use of laptop computers and projection equipment in these type of meeting rooms has led to multiple plug strips and cords being used on a regular basis to power that equipment.

LAROCCA, R.: In meeting rooms such as found in office buildings, hotels, and motels it has become common practice to run multiple extension cords from the receptacle outlets in the perimeter of the room to the center of the room to accommodate the wide spread use of projectors, PCs, and other information technology equipment. Cords used in such a manner are run under carpets and rugs or are taped to the floor. The cords used in this way may run hotter due to restricted air flow, may be damaged creating a potential fire or shock hazard, or may result in a tripping hazard if left exposed and loose. Requiring a listed floor box and receptacle in these rooms would help prevent these potentially hazardous conditions.

PAULEY, J.: NEMA continues to support the need for additional outlets in meeting rooms. At every business meeting in these rooms, the evidence of additional outlets is shown through the extensive use of extension cords and the misuse of temporary power taps.

WEBER, R.: See my Explanation of Negative Vote on Comment 2-147.

2-150 Log #2244 NEC-P02 **Final Action: Accept**
(210.55 (New))

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 2-276
Recommendation: Proposal 2-276 should be rejected.
Substantiation: In accordance with 90.1(B), the NEC contains rules that are considered minimally necessary for safety, and compliance with those rules should result in an installation that is essentially free from hazard but not necessarily efficient, or in this case, convenient and adequate for good service. In addition, 90.1(B) goes on to state that the NEC is not intended as a design specification. From an electrical inspector's prospective, this proposed change is very ambiguous and would be very problematic to enforce. Also, the use, or misuse, of listed cord sets or listed relocatable power taps (i.e. power strips) is regulated by the fire code, not the NEC. The concern for safety is warranted, but revising the NEC in this manner is not appropriate.
Panel Meeting Action: Accept

2-151 Log #2508 NEC-P02 **Final Action: Reject**
(210.55 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-276
Recommendation: Accept the proposal in principle. In each of the two locations in the proposal, change "receptacle outlet in a listed floor box" to "receptacle outlet in the floor". In the second sentence, delete the word "single."
Substantiation: Outlets are not located in boxes; boxes that provide "the point on the wiring system at which current is taken to supply utilization equipment" are the outlets. In addition, 314.27(C) specifically requires that boxes be specifically listed for floor applications where floor receptacles are to be used. CMP 9 has jurisdiction over the standards of product acceptance for boxes used for this purpose, not CMP 2. The wording of this comment is editorially correct. In addition, there should be no distinction between the character of the receptacle outlet in each location. Some floor receptacles are configured as duplex receptacles and some as single receptacles; no substantiation was presented to justify limiting the device chosen in a partitioned meeting room to a single receptacle, while imposing no such limitation on an unpartitioned space. If "single" is intended to require a receptacle in each of the partitioned spaces, the phrasing at the end of the proposal ("center of each partitioned area") is clear and definitely accomplishes this purpose.
Panel Meeting Action: Reject
Panel Statement: After consideration of all the comments, the panel has reversed its decision to require a receptacle floor outlet in meeting rooms. As such, the change recommended by the submitter is unnecessary.

(210.55)

Submitter: Tom Baker, Puget Sound Electrical Training
Comment on Proposal No: 2-276
Recommendation: Delete the proposed new language
Substantiation: The assumption is that this receptacle will be used with a digital projector and laptop, or similar. Based on giving hundreds of presentations in varied locations, there is no assurance that a floor receptacle in the center of the room will be in the correct location for use in a presentation. The distance from the projector to the screen is dependent on the lens of the projector, screen size and size of the room. My projector has a wide throw lens and will fill a 7ft x 7ft screen at 12 feet, others will need to be much further away.
In large conference rooms the center of the room would be too far from the front to use without an extension cord.
The easy and safe solution is an extension cord from a wall receptacle and use "Gaffers Tape" to secure the cord to the floor.
A better proposal would be to require receptacles on the perimeter walls for use with an extension cord. These receptacles could be used for other purposes, such as food warmers, whereas the floor receptacle is limited to use for presentations.

(210.60(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-278
Recommendation: The proposal should be rejected.
Substantiation: The additional sentence and its supporting substantiation describe receptacles that are not receptacle outlets and therefore do not comply with 210.52(A). A receptacle in a portable luminaire, or in cord-and-plug connected (an assumption based never having seen hotel furnishings connected with flexible conduit), movable furniture or in an appliance, is not a receptacle outlet because the equipment in which it is installed is not part of the wiring system. This comment assumes that this equipment is cord-and-plug connected based on the substantiation and based on the submitter's observations over the years. The objectives of the proposal were addressed several cycles ago when the readily accessible rule was added to 210.60(B). It may be that the proposal submitter's hotel room described in the substantiation was wired prior to that change (1996 NEC), or possibly an inspection was missed, but this proposal misapplies rules for permanent wiring and is unnecessary.

Submitter: Greg Chontow, Hopatcong, NJ
Comment on Proposal No: 2-284
Recommendation: A wall switch shall control at least one lighting outlet at every entry to every habitable room and bathroom.
Substantiation: It is my intent to insure the safety of the occupants. The present wording does not take into consideration multiple entrances to a room, allowing the occupant to enter in the dark, creating a tripping hazard. This wording was first introduced in the 1975 NEC, understanding the effects of a room without a switch controlled lighting outlet. As dwellings get larger, it is more common for rooms with multiple entrances. CMP2 feels this is a design consideration, however, I believe this is a safety issue as there is a great possibility of a trip and fall. The CDC's National Center for Injury Prevention and Control lists nonfatal unintentional falls at #1 with 29.1% of the U.S. population affected. Greater illumination can decrease these numbers.

Comment on Proposal No: 2-287
Recommendation: The Proposal should be Accepted in Principle and Proposal 2-284 should be Accepted.
Substantiation: Where there are multiple entries to a room, there should be a wall switch for the lighting outlet at each entry to prevent occupants having to walk across the room in the dark, creating a safety hazard for the occupant, particularly for elderly people. It is a safety issue rather than a convenience design consideration. The Panel should not ignore safety considerations. A lawyer could very easily use the Proposal and the Panel Statement in support of a law suit.
Proposal 2-284 specifies a lighting outlet while Proposal 2-287 only requires a wall switch.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-157.

(210.70(A)(1))

Submitter: Marcus K. Everngam, Town of Madbury, NH
Comment on Proposal No: 2-288
Recommendation: The following is the text from the original proposal:
Submitter: Joel Green, Evergreen, CO
Recommendation: Revise text to read as follows:
(A)(1) Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom. At least one point of control shall be at the **usual point of entry** to the room.
Substantiation: Currently, there is no requirement for the control to be located near entry or exit locations. Entering into a dark room and being required to cross the room to turn on the lights may cause tripping.
Panel Meeting Action: Reject
Panel Statement: The term **"usual point of entry"** is vague and difficult to determine. There are instances where a switch may be located outside of that room.
Substantiation: The panel's statement that "The term **"usual point of entry"** is vague and difficult to determine." should give rise to the need for either carefully defining the term, or eliminating its use from the code. A clearly better solution is to require a control at **"all points of entry."** A good example is a basement which is accessible from internal stairs and a bulkhead: How does an inspector determine what the usual point of entry is? In the summer the bulkhead might be most frequently used and in the winter the bulkhead might never be used. The safest, most reliable and most convenient solution would be to have a control at both entrances. It is better for builders, installers and inspectors if there is a clear standard which does not require interpretation by anyone.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 2-157.

ARTICLE 215 — FEEDERS

2-162 Log #2375 NEC-P02 **Final Action: Reject**
(215.2)

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 2-300
Recommendation: The new text of proposal 2-300 is recommended.
Substantiation: The panel is requested to review their panel statement on this proposal and the subsequent panel action with consideration to the following:
Section 220.87 says "The calculation of a feeder or service load for existing installations shall be permitted to use actual maximum demand to determine existing load under all of the following conditions:" This statement says that the actual maximum demand becomes the existing load. Condition (2) does not state that 125% of the measured load becomes the existing load, it states that 125% of the load has to be less than the feeder rating. The panel statement: "The 125% factor in 220.87 is intended to be a safety factor to increase the load." is not in agreement with the present text of the code. Please clarify the panel statement (or clarify the code?)
Additional points offered for the panel's consideration:
1. If a load is being added to an existing feeder then the *conditions* of 220.87 (2) and (3) can be clearly evaluated and apply within the purveyance of Article 220, as nothing is being done to change a feeder size. However, if a new feeder is replacing an existing feeder, and the new feeder serves existing and new loads, then the conditions of (2) and (3) are no longer *conditional*, they instead need to become part of the criteria for sizing a new feeder, and belong in Article 215. However according to Article 215, a "load" has to be continuous or non continuous, and an existing load that is based on a 15 minute demand window, it is neither. Therefore there is a need to clarify the NEC, and proposal 2-300 is a means to accomplish this.
2. Proposal 2-300 retains what I, the submitter, think is the intent of the present code language: When sizing a feeder based on a load determined by 220.87 (1), a safety margin is needed to determine the feeder size. The 25% is a clear safety margin, and accomplishes a combination of allowing for an unforeseen load and derating for some portion of the measured load having the potential to be continuous. The part of this proposal that becomes "new code" is the addition of the Exception for 100% rated devices serving existing loads, with the safety margin being reduced to 10%. The 25% safety margin includes a consideration for an aspect of continuous load that would not be necessary for 100% rated devices.
3. I think the code should not be interpreted as the panel has done in their statement. If the "load" becomes a 125% of the measured demand load, it would have implications on the sizing of other electrical equipment besides feeders, such as transformers and generators that are rated for continuous operation at 100% of their nameplate, and can be "loaded" accordingly. In reality the measured demand load can be substantially less than the load calculated in accordance with other provisions of Article 220, and Section 220.87 permits effective utilization of an electrical system that has a history of low utilization. This is particularly valuable with transformers, which perform most efficiently when operated in the upper range of their loading capability. Requiring a 25% increase in "load' assessment and resulting lower loading of transformers would be contrary to the goals of the federal government's energy saving goals, including the energy star program.
Also consider a large emergency power plant with four (or more) paralleled generators serving a combination of loads. Often these power plants are constructed to accommodate growth, and the loading calculations utilize Section 220.87. If the 25% margin is applied to the load, it is conceivable that the fourth generator could never be utilized.
Panel Meeting Action: Reject
Panel Statement: Section 220.87 is intended to allow additional loads to be added to an existing service or feeder if the service or feeder system is adequate according to 220.87. Load calculations belong in Article 220, not in Article 215.

Moving the material to Article 215 would treat the 125 percent as a conductor sizing factor only.

2-167 Log #1583 NEC-P02 **Final Action: Accept**
(215.10 Exception No. 3 (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 2-309
Recommendation: Continue to reject this proposal.
Substantiation: This proposal should continue to be rejected, not only for the reasons given in the panel statement, but because it jeopardizes life-safety. The reasons for requiring ground-fault protection of equipment in certain applications are well documented. The damage than can result from a ground fault on such a system may render a substantial portion of the system inoperative, resulting in a lengthy outage potentially worse than that envisioned by the submitter, or worse yet start a life threatening fire. Further, restraint of the GFPE may increase the downstream arc flash hazard for maintenance workers.

The late J.R. Dunki-Jacobs, a recognized authority on ground-fault protection, stated in his book *Industrial Power System Grounding Design Handbook* (pages 186, 189) that, "If an arcing line-to ground fault is initiated in a solidly grounded system on one of three bare buses in a metal enclosure, the hot ionized gases that are developed by the fault can be expected to cause escalation to an arcing multi-phase fault within 1 or 2 cycles (0.0167 to 0.033 sec) of time." He went on to state, "Escalating arcing-ground faults have shown themselves to be extremely devastating…" and "Unquestionably then, engineering attention to their immediate suppression must be proactive and immediate, rather than reactive. Not only for reason of minimizing the released arc energy to maximize personnel safety, but also to avert arcing-fault escalation." The suggestion that an audible and visual signal device would be of any value is ludicrous.

System reliability and blackout prevention can be achieved by proper system design, equipment selection and coordination. The GFPE restraint called for in this proposal is unnecessary and a potential threat to life-safety.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-168 Log #2227 NEC-P02 **Final Action: Reject**
(215.10 Exception No. 3 (New))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association
Comment on Proposal No: 2-309
Recommendation: Modify the proposed text to read:
Exception No 3: Normal Source ground fault protection on the line side of a transfer switch supplying emergency and legally required standby systems shall be permitted to be restrained for ground faults on the loadside of the transfer switch, provided that audible and visual signal devices indicate whenever a ground fault relay has been restrained, and instructions on the course of action to be taken in the event of an indicated ground fault are located at or near the sensor location.
Substantiation: The CMP 2 Panel Statement to the original proposal was right on target. It pointed out that the provisions for health care are covered in 517.17, so this comment has removed all reference to health care systems. The Panel Statement also mentions that the process to achieve selective coordination is a design issue. And again, CMP 2 was correct. With that in mind, designers want to be able to utilize ground fault protection for the normal source, and at the same time, provide selective coordination for emergency and legally required standby devices and all overcurrent devices on their line side. This can easily be accomplished by allowing the normal side ground fault protection to be restrained for all ground faults on the load side of the transfer switch. It provides an allowance, similar to that found in 700.26 and 701.17, which permits ground fault protection to be totally omitted on the alternate source side of emergency and legally required standby systems. This comment will provide that added ability, without endangering any equipment protection on the normal source side of the transfer switch. The requirement for indication is included to correlate with the requirement found in 700.7(D).
Panel Meeting Action: Reject
Panel Statement: The purpose of having ground fault protection of equipment is to avoid major damage to the equipment from arcing ground faults. Allowing the devices to be restrained works against that goal.

The selectivity of the ground fault systems can be accomplished by applying multiple levels of ground-fault devices and appropriately coordinating those devices.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 220 — BRANCH-CIRCUIT, FEEDER, AND SERVICE CALCULATIONS

2-169 Log #2510 NEC-P02 **Final Action: Accept**
(220.5(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-317
Recommendation: The proposal should be accepted.
Substantiation: The panel statement is not responsive. Of course the NEC permits what the proposal suggests; it is what the NEC has said for twenty five years, since the 1984 NEC. Surprisingly, it did not always do so, although this is the usual approach for rounding. From the 1940 NEC (when first addressed) through the 1965 NEC, the Code allowed calculations to be truncated, with any decimal fractions dropped. From the 1968 through the 1981 editions, the Code, erroneously, allowed an exact decimal fraction of 0.5 to be dropped. These inconsistencies perhaps explain the numerous questions in the field, which have resulted in the many proposals over the years. This cycle is no exception, with one proposal originating within the panel. CMP 2 should take this opportunity to further clarify what, admittedly, this submitter thought was always clear.

The substantiation for the 1984 correction (Proposal 2-181 from none other than Mike Holt) stated, correctly, that "recognized mathematical processes round off decimals at 0.5 and larger to the next higher number." CMP 11 added the following statement on a related proposal (11-83) of the same authorship: "Round-off instructions as indicated by the submitter are built into calculators and computer software. Such standardized instructions are in the interest of safety and should be recognized in the NEC." Both panels then rejected adverse comments (2-236 and 11-49) stating that an ASTM document required 0.5 fractions to be rounded to the nearest whole even number, which could be either greater or lesser than the amount. That seems to have settled the technical question as a matter of the written record, but we are evidently left with an abundance of field inconsistencies with respect to how rounding should be done.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-170 Log #1591 NEC-P02 **Final Action: Reject**
(220.12)

Submitter: Jim Pauley, Schneider Electric
Comment on Proposal No: 2-320
Recommendation: Reconsider and accept the proposal.
Substantiation: We need to bridge the large gap between the NEC and the energy codes. I agree with Mr. Orlowski's comment that we should not sacrifice safety for non-safety related requirements. However, this proposal is written to protect the safety needed and to begin to bridge the gap with the energy codes. It only allows the lower VA values from the energy code to be used where the code is adopted by the local authority. As such, the point made in the panel statement about energy codes not being uniformly adopted is rendered moot. If the locality has not adopted an energy code, then the NEC values prevail.

Relative to the safety related aspects of the load calculations. The proposal requires that a power monitoring system be installed and designed with alarm levels related to the expected lighting loads. This provides a system of continual feedback to the building owner regarding the expected lighting load. The proposal further restricts the use of the demand factors in 220.42. As a result, the electrical safety aspects are not compromised.

The need for providing a way to bridge this gap is getting more and more significant. We require a lighting load calculation of 3.5VA/sq ft for office buildings. ASHRAE 90.1-2007 limits the lighting load to 1VA/sq ft for the general interior space of office buildings.

Accepting Proposal 2-320 will provide a safe path forward to allow the energy saving designs to capture additional savings in material and resources within the electrical infrastructure itself and provide appropriate safeguards to ensure that the limits are maintained.
Panel Meeting Action: Reject
Panel Statement: The energy codes are not uniformly applied throughout the country, therefore, no specific load requirements are possible based on these codes. The NEC specifies the minimum load requirements based on electrical safety.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

PAULEY, J.: The comment should have been accepted. NEMA supports efforts to better coordinate the NEC with other codes such as the energy codes. Given the importance of energy efficiency and the safeguards built into the original proposal, this would have been a reasonable way to provide some level or coordination with the energy codes. The panel statement was addressed in the recommended wording and in the comment substantiation.

2-171 Log #39 NEC-P02 **Final Action: Accept**
(220.14)

Submitter: Code-Making Panel 18,
Comment on Proposal No: 2-324
Recommendation: Panel 18 members agree and endorse Panel 2's action to reject the proposal and note that UL STP did not elect to include thermal receptacle requirements in the standard.
Substantiation: Panel 18 offers the following substantiation for this comment: No specific detail was provided with respect to where this proposed text is to appear in Article 406. Code-Making Panel 18 suggests that it should have been added as 406.2 (new). Code-Making Panel 18 is also aware of a CSDS proposal to revise the ANSI/UL 498 Standard for Attachment Plugs and Receptacles, to include thermal sensing technology, which did not achieve consensus.

This Comment was developed by a CMP-18 Task Group and balloted through the entire panel with the following ballot results:

13 Eligible to vote
9 Affirmative (Alternate T.K. McGowan voted for Principal M.S. O'Boyle)
3 Ballots Not Returned (S.A. Larson, J.F. Pierce, and S.K. Todd)
1 Abstention (Alternate R.D. Gottwald voted for Principal M.J. Kochan)

Mr. Gottwald's reason for abstaining is as follows: "I do not have the knowledge to address this subject appropriately."

Comment on Proposal No: 2-237
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

2-175 Log #1440 NEC-P02 **Final Action: Reject**
(220.51)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 2-337
Recommendation: Accept the proposal with the following revisions:

Fixed electric space heating loads shall be calculated at not less than 100 percent of the total load. The ampacity of service, feeder, and branch circuit conductors supplying fixed electric space heating loads shall not be less than 125 percent of such loads, plus not less than other loads supplied. In no case, shall a feeder or service load current rating be less than the largest branch circuit supplied. Where conductors supply a fixed electric space heating load(s), and in addition a motor load, the ampacity of the conductors shall be not less than 125 percent of the heating load(s) or the largest motor load, whichever is larger, plus all other load(s).

Exception: Where reduced heating of the conductors result from units operating on duty-cycle, intermittently, or from all units not operating simultaneously, the authority having jurisdiction may grant permission for feeders and service conductors to have an ampacity less than specified in this section, if the conductors have an ampacity not less than the load(s) so determined.
Substantiation: Example (D)(3) in Annex (D) indicates overcurrent protection not less than 125 percent for continuous loads which require a conductor ampacity or 125 percent. Feeder and service conductors supplying continuous loads can overheat overcurrent device terminals the same as a branch circuit. The 125 percent provision applied only to the larger of the heating load or largest motor, whichever is greater, should be permitted to avoid a required 125 percent factor to both, which is excessive, and allows for temporary overload (usually 125 percent) and the heating effects at terminals. If this comment is rejected, the example referred to in the Annex should be changed to prevent confusion.
Panel Meeting Action: Reject
Panel Statement: The submitter's concern is already handled by the rule in 424.3(B) for branch circuits. The rules in 210.19(A) and 215.2 already take into account the need for sizing for continuous loads. Placing those rules in Article 220 is improper, since that article deals with load calculations.

The panel notes that the submitter's substantiation pointing to Example (D)(3) has nothing to do with 220.51 and fixed electric space heating.
Number Eligible to Vote: 12

Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

2-182 Log #2752 NEC-P02 **Final Action: Accept**
(220.84(A)(3))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 2-358
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-183 Log #2380 NEC-P02 **Final Action: Reject**
(220.86 Exception and Table 220.86)

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 2-364
Recommendation: Accept in Principle proposal 2-364 with the following modification to the existing text.

Exception: If the school facility will be similar in occupancy classification, electrical system design, and facility management, to the type of school facility already under management, a 3-year baseline of historical demand data shall be permitted to be used as the calculated feeder or service load by a registered professional engineer.

This meets the criterion asserted in the committee's rejection of the original proposal. For the convenience of the committee, the Panel Statement is reproduced below:

Panel Statement: "There is no clear definition on how "similar" the installation would need to be in order for the demand data to be accurately applied in a new installation."

Substantiation: Sometimes it looks like our national fire safety objectives are at odds with national energy conservation goals. Electric space heating and air-conditioning underlie a broadening discussion about the demand increments in this Table. A registered professional engineer ought to be able to verify occupancy equivalency with an architect and be able to apply judgment in the use of energy consumption data now available from advanced metering technologies.

The scenario this proposal addresses can be described as follows:

School District Alpha built Elementary School Beta ten years ago and wants to build another Elementary School Gamma from the same set of plans prepared by A-E consultant Delta. (Many A-E's have prototype school buildings with, say, 1200A services calculated using NEC Chapter 2 methods) We want Delta's registered professional engineer to be able to size the service to Gamma according to 3-years of data from School District Alpha and Elementary School Beta energy reports. This happens frequently in an $100 Billion industry.

I have discussed this issue with energy experts and electrical designers who serve our industry and no one has any memory of a school transformer ever being overloaded. Quite the opposite; the utilities come along and slash the transformer size -- implied from the service conductor sizing of Table 220.86 -- sometimes by 50% in order to run the transformer closer to its nameplate capacity. Utilities are under pressure to expand this practice. I see this personally in the attachments to utility load letters that I have to fill out for a new service. These standard forms now look more like Schedules A through D of IRS Form 1040 in terms of me needing to identify just about every lamp and receptacle and fractional-hp motor in order for the service planner to justify the selection of the service transformer.

I see three parallel universes in full motion: public utility commissions (aligned with best safety practice asserted in the NESC), state bureaus of construction codes (aligned with the NEC and local variants of ICC building codes), and the energy commissions (aligned with DOE documents and ASHRAE 90.1). More overlap of the goals of these agencies needs to occur within the next NEC cycle or two. Perhaps innovations in material sciences in the near future will yield branch circuit wiring that it increases fire safety in disruptive ways; we have seen recently transformer manufacturers working with the DOE to get their efficiency numbers up. For the moment, acceptance of this proposal will continue the technical narrative of adaption of the NEC.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide data to support this change. As with past work on various calculations, it is necessary for the panel to see examples, along with specific data of how the criteria would be applied.

Similar schools may not have the same electrical load. Utilizing examples with specific data would allow a determination of parameters common to similar schools.

ARTICLE 225 — OUTSIDE BRANCH CIRCUITS AND FEEDERS

4-6 Log #70 NEC-P04 **Final Action: Accept**
(225.2)

TCC Action: The Technical Correlating Committee correlated the actions of Code-Making Panel 4 and made NEC Style Manual corrections.

The Technical Correlating Committee directs that the revised text will now read as follows:

"225.2 Definition.

Delete the definition of Electric Supply Station.

Substation. An enclosed assemblage of equipment, (e.g., switches, circuitbreakers, buses, and transformers) under the control of qualified persons,through which electric energy is passed for the purpose of switching or modifying its characteristics.

225.3 Other Articles.

Editorially relocate 225.2 to 225.3 to create a new 225.2.

225.8 Calculation of Loads 600 Volts, Nominal, or Less.

Editorially relocate 225.3 to 225.8 to create a new 225.2.

III. Over 600 Volts

225.50 Sizing of Conductors. The sizing of conductors over 600 volts shall be in accordance with 210.19(B) for branch circuits and 215.2(B) for feeders.

225.51 Isolating Switches. Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute a building disconnecting means, an isolating switch with visible break contacts and meeting the requirements of 230.204(B), (C), and (D) shall be installed on the supply side of the disconnecting means and all associated equipment.

Exception: The isolating switch shall not be required where the disconnecting means is mounted on removable truck panels or metal-enclosed switchgear units that cannot be opened unless the circuit is disconnected and that, when removed from the normal operating position, automatically disconnect the circuit breaker or switch from all energized parts.

225.52 Disconnecting Means

(A) Location. A building or structure disconnecting means shall be located in accordance with 225.32, or it shall be electrically operated by a similarly located remote control device.

(B) Type. Each building or structure disconnect shall simultaneously disconnect all ungrounded supply conductors it controls and shall have a fault-closing rating not less than the maximum available short-circuit current available at its supply terminals.

Exception: Where the individual disconnecting means consist of fused cutouts, the simultaneous disconnection of all ungrounded supply conductors shall not be required provided that there is a means to disconnect the load before opening the cutouts. A permanent legible sign shall be installed adjacent to the fused cutouts indicating the above requirement.

Where fused switches or separately mounted fuses are installed, the fuse characteristics shall be permitted to contribute to the fault closing rating of the disconnecting means.

(C) Locking

Disconnecting means shall be capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed.

Exception: Where an individual disconnecting means consist of fused cutouts, a suitable enclosure, capable of being locked and sized to contain all cutout fuse holders shall be installed at a convenient location to the fused cutouts.

(D) Indicating

Disconnecting means shall clearly indicate whether they are in the open "off" or closed "on" position.

(E) Uniform Position

Where disconnecting means handles are operated vertically the "up" position of the handle shall be the "on" position.

Exception: A switching device having more than one "on" position, such as a double throw switch, shall not be required to comply with this requirement.

(F) Identification. Where a building or structure has any combination of feeders, branch circuits, or services passing through it or supplying it, a permanent plaque or directory shall be installed at each feeder and branch circuit disconnect location denoting all other services, feeders, , or branch circuits supplying that building or structure or passing through that building or structure and the area served by each.

225.56 Inspections and Tests

(A) Pre-Energization and Operating Tests. The complete electrical system shall be performance tested when first installed on site. Each protective, switching, and control circuit shall be adjusted in accordance with recommendations of the protective device study and tested by actual operation using current injection or equivalent methods as necessary to ensure that each and every such circuit operates correctly to the satisfaction of the authority having jurisdiction.

(1) Instrument Transformers. All instrument transformers shall be tested to verify correct polarity and burden.

(2) Protective Relays. Each protective relay shall be demonstrated to operate by injecting current (and/or voltage) at the associated instrument transformer output terminal and observing that the associated switching and signaling functions occur correctly and in proper time and sequence to accomplish the protective function intended.

(3) Switching Circuits. Each switching circuit shall be observed to operate the associated equipment being switched.

(4) Control and Signal Circuits. Each control or signal circuit shall be observed to perform it's proper control function or produce a correct signal output.

(5) Metering Circuits. All metering circuits shall be verified to operate correctly from potential and current sources similarly to protective relay circuits.

(6) Acceptance Tests. Complete acceptance tests shall be performed after the station installation is completed, on all assemblies, equipment, conductors, control and protective systems as applicable to verify the integrity of all the systems.

(7) Relays and Metering Utilizing Phase Differences. All relays and metering which use phase differences for operation shall be verified by measuring phase angles at the relay under actual load conditions after operation commences.

(B) Test Report. A test report covering the results of the tests required in 225.56(A) shall be delivered to the authority having jurisdiction prior to energization.

Informational Note For acceptance specifications refer to NETA ATS-2007 Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems published by the InterNational Electrical Testing Association .

225.60 Clearances over Roadways, Walkways, Rail, Water, and Open Land.

(A) 22 kV, Nominal, to Ground or Less. The clearances over roadways, walkways, rail, water, and open land for conductors and live parts up to 22 kV, nominal, to ground or less shall be not less than the values shown in Table 225.60.

Table 225.60 Clearances over Roadways, Walkways, Rail, Water, and Open Land

*****Insert Table Here (not shown)*****

(B) Over 22 kV Nominal to Ground. Clearances for the categories shown in Table 225.60 shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

(C) Special Cases. For special cases, such as where crossings will be made over lakes, rivers, or areas using large vehicles such as mining operations, specific designs shall be engineered considering the special circumstances and shall be approved by the authority having jurisdiction.

Informational Note : For additional information, see ANSI C2-2007, National Electrical Safety Code.

225.61 Clearances over Buildings and Other Structures.

(A) 22 kV Nominal to Ground or Less. The clearances over buildings and other structures for conductors and live parts up to 22 kV, nominal, to ground or less shall be not less than the values shown in Table 225.61.

Table 225.61 Clearances over Buildings and Other Structures

*****Insert Table 225.61 Here (not shown)*****

(B) Over 22 kV Nominal to Ground. Clearances for the categories shown in Table 225.61 shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

Informational Note: For additional information, see ANSI C2-2007, National Electrical Safety Code.

225.70 Substations

(A) Warning Signs.

(1) General. A permanent, legible warning notice carrying the wording "DANGER — HIGH VOLTAGE" shall be placed in a conspicuous position in the following areas:

(a) At all entrances to electrical equipment vaults, electrical equipment rooms, areas, or enclosures; and

(b) At points of access to conductors on all high voltage conduit systems and cable systems; and

(c) On all cable trays containing high-voltage conductors with the

maximum spacing of warning notices not to exceed 3 m (10 ft.)

(2) Isolating Equipment. Permanent legible signs shall be installed at isolating equipment warning against operating it while carrying current, unless the equipment is interlocked so that it cannot be operated under load.

(3) Fuse Locations. Suitable warning signs shall be erected in a conspicuous place adjacent to fuses, warning operators not to replace fuses while the circuit is energized.

(4) Backfeed. The following steps shall be taken where the possibility of backfeed exists:

(a) Each group-operated isolating switch or disconnecting means shall bear a warning notice to the effect that contacts on either side of the device may be energized; and

(b) A permanent, legible, single-line diagram of the station switching arrangement, clearly identifying each point of connection to the high-voltage section, shall be provided in a conspicuous location within sight of each point of connection.

(5) Metal Enclosed and Metal Clad Switchgear. Where metal enclosed switchgear is installed the following steps shall be taken:

(a) A permanent, legible, single-line diagram of the switchgear shall be provided in a readily visible location within sight of the switchgear and this diagram shall clearly identify interlocks, isolation means, and all possible sources of voltage to the installation under normal or emergency conditions, including all equipment contained in each cubicle, and the marking on the switchgear shall cross-reference the diagram.

Exception to (a): Where the equipment consists solely of a single cubicle or metal-enclosed unit substation containing only one set of high-voltage switching devices, diagrams shall not be required.

(b) Permanent, legible signs shall be installed on panels or doors that give access to live parts over 600 volts, nominal, carrying the wording "DANGER — HIGH VOLTAGE" to warn of the danger of opening while energized.

(c) Where the panel gives access to parts that can only be de-energized and visibly isolated by the serving utility, the warning shall add that access is limited to the serving utility or following an authorization of the serving utility."

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-21
Recommendation: It was the action of the Technical Correlating Committee that further consideration be given to the comment expressed in the voting.

The text must comply with the NEC Style Manual.

The proposed text includes definitions in 225.2 that are not used in Article 225 or in the NEC. All text must be written in accordance with 90.5(A) in mandatory language.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

See panel action taken on Comment 4-8.

In addition, change the text in Proposal 4-21 to read as follows as follows:

(2) Protective Relays. Each protective relay ~~will~~ shall be demonstrated to operate by injecting current (and/or voltage) at the associated instrument transformer output terminal and observing that the associated switching and signaling functions occur correctly and in proper time and sequence to accomplish the protective function intended.

(3) Switching Circuits. Each switching circuit will shall be observed to operate the associated equipment being switched.

(4) Control and Signal Circuits. Each control or signal circuit ~~will~~ shall be observed to perform it's proper control function or produce a correct signal output.

(5) Metering Circuits. All metering circuits ~~will~~ shall be verified to operate correctly from potential and current sources similarly to protective relay circuits.

(7) Relays and Metering Utilizing Phase Differences. All relays and metering which use phase differences for operation shall be verified by measuring phase angles at the relay under actual load conditions after operation commences.~~, which may be at a later date than Pre-energization tests.~~

Panel Statement: See the panel action on comment 4-8.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

MCDANIEL, R.: EEI Negative Ballot Statement:

See my explanation of negative ballot on Comments 4-7 and 4-9. In addition, the Panel's changes on Comment 4-6 for items (2) Protective Relays; (3) Switching Circuits; (4) Control and Signal Circuits; (5) Metering Circuits; and (7) Relays and Metering Utilizing Phase Differences read as performance type requirements that would appear more appropriate in a work practice standard such as NFPA 70B.

4-7 Log #1388 NEC-P04 **Final Action: Reject**
(225.2)

TCC Action: The Technical Correlating Committee will establish a Task Group to provide additional definitions and requirements related to indoor and outdoor electrical substations for the 2014 NEC Code cycle.

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 4-21
Recommendation: Please reconsider and reject this proposal.
Substantiation: The proposal provides benefits for the inclusion of medium and high voltage substation and premises wiring installation requirements in the NEC. However, bringing NESC requirements into the NEC without the context of NESC basic provisions that are considered necessary for the safety of qualified personnel and the public under the specified conditions will result in an incomplete or unsafe installation.

We recommend and it may be more appropriate to create a task force to consider these items in a general area such as Article 110. For example, requirements for an electric substation apply to both outdoor and indoor applications and do not fall under the scope of Article 225. These requirements should be considered in a more general area.

We recommend a new article be written for Chapter 1 (possibly Article 120, entitled "Requirements for Electrical Installations over 600 Volts") that incorporates these concepts and integrates existing NEC text.

Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action on Proposal 4-21, as modified by the actions taken on Comments 4-6 and 4-8.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

MCDANIEL, R.: EEI Negative Ballot Statement:

The proposal provides benefits for the inclusion of medium and high voltage substation and premises wiring installation requirements in the NEC. However, bringing NESC requirements into the NEC without the context of NESC basic provisions that are considered necessary for the safety of qualified personnel and the public under the specified conditions will result in an incomplete or unsafe installation.

We recommend and it may be more appropriate to create a task force to consider these items in a general area such as Article 110. For example, requirements for an electric substation apply to both outdoor and indoor applications and do not fall under the scope of Article 225. These requirements should be considered in a more general area.

We recommend a new article be written for Chapter 1 (possibly Article 120, entitled "Requirements for Electrical Installations over 600 Volts") that incorporates these concepts and integrates existing NEC text.

Comment on Affirmative:

ROGERS, J.: The submitter raises a good discussion point as to whether or not these requirements should be limited to Article 225 and that should be reviewed in the future. The inclusion of requirements such as these is necessary as these installations exist on property beyond the service point and thus are not covered by the NESC and the current NEC does not contain sufficient requirements for installations such as these. Further discussion and more clarifying language will be needed in the next NEC cycle.

4-8 Log #1974 NEC-P04 **Final Action: Accept**
(225.2)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Comment on Proposal No: 4-21
Recommendation: Delete proposed definitions for electric supply station and generating station.
Substantiation: The terms "electric supply station" and "generating station" relate to installations not covered by the NEC pursuant to 90.2(B)(5). In addition, these terms and installation types do not appear in the 2008 NEC. These installations are covered by the National Electrical Safety Code (NESC). For further information regarding this comment, please refer to the article on "Connecting Premises Wiring to Supply Lines" published by the International Association of Electrical Inspectors in their September/October 2009 magazine (http://www.iaei.org/magazine/?p=4329#more-4329) on page 93.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: The submitter is correct in requesting the removal of these definitions at this time. These definitions and the installations they define will need to be reviewed in the next NEC cycle as there are installations on private property and on the customer side of the service point that meet these definitions in principle and yet they are not covered in the NEC.

4-9 Log #2255 NEC-P04 **Final Action: Reject**
(225.2)

TCC Action: The Technical Correlating Committee will establish a Task Group to provide additional definitions and requirements related to indoor and outdoor electrical substations for the 2014 NEC Code cycle.
Submitter: Roger D. McDaniel, Georgia Power Company / Rep. Edition Electric Institute
Comment on Proposal No: 4-21
Recommendation: This proposal should be rejected. Delete all wording of proposal 4-21.
Substantiation: This proposal should be rejected.

The proposal provides benefits for the inclusion of medium and high voltage substation and premises wiring installation requirements in the NEC. However, bringing NESC requirements into the NEC without the context of NESC basic provisions that are considered necessary for the safety of qualified personnel and the public under the specified conditions will result in an incomplete or unsafe installation.

We recommend and it may be more appropriate to create a task force to consider these items in a general area such as Article 110. For example, requirements for an electric substation apply to both outdoor and indoor applications and do not fall under the scope of Article 225. 4-10 Log #2511 NEC-P04 **Final Action: Accept in Principle**
(225.2, 225.3, and 225, Part III)

TCC Action: The Technical Correlating Committee will establish a Task Group to provide additional definitions and requirements related to indoor and outdoor electrical substations for the 2014 NEC Code cycle.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-21
Recommendation: Accept the proposal as modified by CMP 4 in principle and in part. Make the following modifications to the ROP action:

I. Reject the definitions proposed for 225.2.

II. Add the words "600 Volts Nominal, or Less" to the title of Part II (to read "More Than One Building or Other Structure, 600 Volts Nominal, or Less.")

III. In 225.52(A), add the phrase "or it shall be operable by mechanical linkage from a readily accessible location" at the end.

IV. In 225.52(B) Exception, revise the second sentence to read as follows: "A permanent and legible sign shall be installed immediately adjacent to the fused cutouts worded "DISCONNECT LOAD BEFORE OPENING CUTOUTS".

V. In 225.52(C), revise the rule to read as follows: "The disconnecting means shall be capable of being locked in the open position." Revise the exception to read as follows: "Where the disconnecting means consist of individual fused cutouts, a suitable enclosure, capable of being locked and sized to contain all cutout fuseholders shall be installed. It shall be at a location that is accessible to personnel during or immediately after the process of operating the cutouts."

VI. In 225.52(E) Exception, revise to read as follows: "Vertically operated disconnecting means having multiple sources of supply shall be permitted to be in the closed ("on") position with the handle in either the up or down position."

VII. In 225.52(F), Add commas around the clause "or passing through that building or structure".

VIII. Reject 225.56 and 225.70, or, if the sections are retained and this portion of this comment is rejected, then make additional changes as set forth in parts IX through XX of this comment.

IX. In 225.56(A), revise the first sentence to read as follows: "The complete electrical system design, including settings for protective, switching, and control circuits, shall be prepared in advance and made available on request to the authority having jurisdiction." In the second sentence, change "recommendations of the protective device study" to "the system design".

X. In 225.56(A)(2), change "will" to "shall" and change "(and/or voltage)" to "(or voltage or both current and voltage as necessary)".

XI. In 225.56(A)(3), change "will" to "shall".

XII. In 225.56(A)(4), change "will" to "shall" and correct the spelling if "its" (changed from "it's").

XIII. In 225.56(A)(5), change "will" to "shall" and change "similarly to" to "in a similar manner as".

XIV. In 225.56(A)(7), change "which" to "that" and convert the final wording ("after operation commences, which may be at a later date than Pre-energization tests") into a sentence as follows: "The verification shall be performed during an approved time period after operation commences".

XV. In 225.56(B) (FPN) [Informational Note], change the opening wording to read: "For an example of acceptance specifications …".

XVI. In 225.70(A)(1) and 225.70(A)(5)(b), add "KEEP OUT" to the required warning labels.

XVII. In 225.70(A)(1)(a) through (c), convert the letters (a), (b), and (c) to (1), (2), and (3) respectively.

XVIII. In 225.70(A)(3), Revise the text to read as follows: "A permanent and legible sign shall be installed immediately adjacent to the fuseholders worded "DISCONNECT CIRCUIT BEFORE REPLACING FUSES."

XIX. In 225.70(A)(4), revise the provision to read as follows: (4) Backfeed. Installations where the possibility of backfeed exists shall comply with (a) and (b).

(a) A permanent sign shall be installed on the switch enclosure or immediately adjacent to open switches with the following words or equivalent: "WARNING — CONTACTS ON EITHER SIDE OF THIS DEVICE MAY BE ENERGIZED BY BACKFEED."

(b) A permanent and legible single-line diagram of the station switching arrangement, clearly identifying each point of connection to the high-voltage section, shall be provided where is it is within view and not more than 1.8 m (6 ft) of each point of connection.

XX. In 225.70(A)(5)(c), change "the panel gives access" to "a panel or door gives access".
Substantiation: I. The first two definitions ("Electric Supply Station" and "Generating Station") are not used in the NEC. CMP 4, by rejecting the portion of Proposal 4-18 that used the term "Electric Supply Station", will not be inserting even this term into the 2011 NEC. The final definition ("substation") defines a species of equipment and belongs in Chapter 4 (Article 490), or in Article 100 (still under the jurisdiction of CMP 9) due to the use of the term in multiple articles.

II. Because Part III will now have the entirety of requirements for these over 600 volt applications, Part II must be clarified as not applying to over 600 volt installations unless a specific cross reference is made, as in 225.52(A).

III. This wording provides correlation with the CMP 4 action on Proposal 4-169 covering 230.205(A). There is no reason to treat the applications differently.

IV. The use of the words "above" or "below" in reference to the location of text in the NEC is not permitted by the NEC Style Manual, at 3.3.4. In addition, this signage requirement will benefit from clear prescriptive language, as suggested in this comment.

V. The opening portion of this part of the comment is a companion action to one by this submitter that correctly words and relocates the content of Proposal 1-63 which describes the attributes of a lock-open disconnecting means for the purpose of code enforcement. Since that comment will not be on CMP 4's agenda, the action text (to be located in the general part of Article 110 and therefore applicable to all voltages) is reproduced here: "Where a disconnecting means with provisions for being locked in the open position is required by a provision in the NEC, unless otherwise modified by that provision, the disconnecting function shall be accomplished by either a keyed or combination lockout device in which the provision for applying the lockout device remains in place on the disconnecting means and the disconnecting means remains operable until the lockout device is applied."

CMP 9 has already accepted language in Article 490 that presumes this concept is defined in Chapter One and need not be repeated in dozens of locations throughout the NEC. Companion proposals are being submitted in all instances where contrary action occurred during the ROP stage, providing a vehicle for this economy of wording. By this comment the TCC is encouraged to ensure that this concept is applied in a consistent manner.

The second part of this item addresses the fuseholder storage enclosure. It breaks the requirement into two sentences for readability and uses more prescriptive language than "convenient" for the purpose of making the rule more consistently applied and enforceable.

VI. This wording avoids the phrase "need not" because it is not a permissible form in an exception by the NEC Style Manual, at 3.1.4.1. The wording "the handle in either the up or down position" occurs in the parallel requirement in 404.7 Exception No. 1.

VII. The commas emphasize that the mere fact of passing through is enough to generate a label, and make the sentence more readable. They also clarify that the wording "and the area served by each" applies to both circumstances.

VIII. As covered in the comment in the voting, the scope of these two proposed sections encompasses many applications that appear to be beyond the scope of Article 225, specifically substations in general. These sections should be reported as "hold" since they involve topics that cannot be addressed in this cycle because they involve equipment that is covered in Article 490. If these sections are held as suggested, the TCC can reassign them to CMP 9 for action in the 2014 NEC cycle.

IX. The ROP wording refers to a "protective device study" which is not defined or described in any provision of the original proposal. This wording attempts a slightly more flexible approach that is intuitively obvious, and also ensures that the AHJ has the opportunity to review the design. The term "system design" is more familiar and the wording specifically captures "protective, switching, and control circuits" as being included in such a design.

X. This is a mandatory rule and the NEC Style Manual, at 3.1.1, requires "shall" in such cases. The second change removes the term "and/or", which is a term to be avoided as covered in Annex B of the NEC Style Manual.

XI. This is a mandatory rule and the NEC Style Manual, at 3.1.1, requires "shall" in such cases.

XII. This is a mandatory rule and the NEC Style Manual, at 3.1.1, requires "shall" in such cases. The spelling change applies because it denotes the possessive and not a two-word contraction.

XIII. This is a mandatory rule and the NEC Style Manual, at 3.1.1, requires "shall" in such cases. The other wording change is grammatical; in this context the word is used in the sense of "in a similar manner to" and not as an adverb, which would modify the verb "operate" and miss the "potential and current sources". The proposed wording in this comment clearly describes the intent.

XIV. The change from "which" to "that" is grammatical because it does not open a subordinate clause. The second part of this item eliminates the improper use of the word "may" (See the NEC Style Manual at 3.1.2) and gives the AHJ the authority to supervise the amount of time that may elapse before the testing is completed. The sentence in this comment is more clearly written because the tests are not to be done prior to the installation being put into service, and therefore both the impermissible word "may" and its permissible substitute "shall be permitted to be" are both incorrect.

XV. As worded, this note is, in effect, an incorporation of the requirements of another, non-NFPA standard into the NEC. This is not permitted because the other standard may change in an unpredictable way outside the control of NFPA. Instead the non-mandatory "an example of" is used for these purposes, as required in the NEC Style Manual at 3.1.3. See, for example, the many references to UL standards in the power-limited cabling articles [such as the note following 725.179(D) and many other locations]. In all instances, the reference is to an example or method, with the door left open to other options. Of course, the named method, as a practical matter, will be the one routinely used.

XVI. It has been established over the course of extensive litigation that waning signs must include a command so the viewer knows what he or she is supposed to do or not do. This is the reason that all such warnings throughout the NEC were converted in the 1990s to add a command in the wording. See, for example, 110.34(C).

XVII. This is a list, and the NEC Style Manual, at 2.1.5.1, requires the use of numbers for such items "in any subdivision level."

XVIII. This wording is prescriptive and less ambiguous than that accepted in the ROP.

XIX. The NEC is an installation code, not a work practice, and its provisions should stipulate installation requirements rather than a work sequence. The format in this comment [e.g. "shall comply with (a) and (b)"] is more consistent with NEC practice for that reason. The warning in (a) is prescriptive, definitive, and familiar, being based on 404.6(C) Exception. Responding to a comment in the voting, this subject is covered for 600-volt and below applications, in Article 404. The positioning rule in (b) is also less ambiguous, and avoids a misuse of the defined terminology "within sight" because a warning label 50 ft away is unlikely to accomplish its intended purpose.

XX. The circumstance described in 225.70(A)(5)(b), and which could involve the utility access problem, applies equally to a panel or to a door, and the language should apply to both.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel reaffirms its action on Proposal 4-21 as modified by the actions and statements on Comments 4-6 and 4-8 that address the submitter's concerns.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-11 Log #71 NEC-P04 **Final Action: Accept**
(225.21)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-33

Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal with respect to "agreeing" with the submitter, yet providing no specific reason for the panel action.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel continues to Reject Proposal 4-33, and modifies its panel statement on Proposal 4-33 to read as follows:

The present NEC text for this section refers the reader to 230.51, that provides specific conductor support details for cables other than service and individual open conductors. The requirements in Articles 225 and 230 are in addition to those found in Chapter 3.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

4-12 Log #2395 NEC-P04 **Final Action: Accept**
(225.27 (New))

Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 4-35

Recommendation: Revise accepted text to read as follows:

225.X. Raceway Seal. Where a ~~feeder~~ raceway enters a building or structure from an underground distribution system, it shall be sealed in accordance with 300.5(G). Spare or unused raceways shall also be sealed. Sealants shall be identified for use with the cable insulation, shield, or other components.

Substantiation: While I agree with the submitter and thepanel, the need for raceway seal is not dependent on the type circuit installed; service, feeder, branch circuit, or spare. The size of the circuit and associated raceway, nor the need to minimize the entrance of moisture into enclosures is not limited by the type circuit installed.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

SIGMUND, J.: I am voting against this comment. There should be an exception for industrial locations, where conditions of maintenance and supervision would insure that incursions from foreign objects through underground conduits to energized switchgear would not occur.

4-13 Log #1787 NEC-P04 **Final Action: Reject**
(225.27 Exception (New))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 4-35

Recommendation: Add Exception as follows:

Exception: In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel will be installing and maintaining the underground feeders, a seal will not be required on all underground conduits.

Substantiation: Unintended entry of foreign objects or cables through underground ducts are much less likely in an industrial establishment where the maintenance and supervision requires strict permitting and control of construction work.

Panel Meeting Action: Reject

Panel Statement: The comment attempts to introduce new language. The submitter is incorrect in his assumption that raceways are less subject to incursion by foreign elements because they are located in industrial locations.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

SIGMUND, J.: I am voting against this comment. There should be an exception for industrial locations, where conditions of maintenance and supervision would insure that incursions from foreign objects through underground conduits to energized switchgear would not occur.

4-14 Log #1041 NEC-P04 **Final Action: Accept**
(225.30 (New))

TCC Action: The Technical Correlating Committee editorially revised the text of the last sentence of the comment recommendation to conform with the text of Proposal 4-37 to read as follows:

"Where a branch circuit or feeder originates in these additional buildings or other structures, only one feeder or branch circuit shall be permitted to supply power back to the original building or structure, unless permitted in 225.30(A) through (E)."

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 4-37
Recommendation: Revise text to read as follows:

Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit unless permitted in 225.30(A) through (E). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit. Where a branch circuit or feeder originated in these additional buildings or other structures only one feeder or branch circuit shall be permitted to supply power back to the original building or structure unless permitted in 225.30(A) through (E).
Substantiation: The panel deleted existing code text for the multiwire branch circuit being considered as a single circuit without substantiation. This provision is important to users and inspectors to ensure uniform enforcement and clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-15 Log #2100 NEC-P04 **Final Action: Reject**
(225.32)

Submitter: Larry LeVoir, City of Irvine
Comment on Proposal No: 4-41
Recommendation: Accept the proposal.
Substantiation: I understand that CMP 4 has had to tackle this problem. It appeared at one point a consesus had been reached, but the proposal was dropped for the 2002 NEC. It seems as though CMP 13 was able to reach a consensus on this issue as it applies to feeders from generators. Please reference 700.12(B)(6), 701.11(B)(5), and 702.11. With these code sections one could install a feeder overcurrent device on the outside of the first building 40 feet and visible from the second building and a generator 40 feet from the same second building. The feeder conductors from the feeder overcurrent device on the outside of the first building would require a disconnecting means in accordance with section 225.32 where the conductors enter the second building but feeder conductors from the generator would not as long as they are installed per sections 700.12(B)(6), 701.11(B)(5), and 702.11 whichever is applicable. There is no difference I am aware of in these feeder conductors (aside from the source), but yet we have different rules for the same types of conductors. While an argument could made regarding the Emergency or Legally Required Systems as being "special", one could not make that argument for the Optional Standby Conductors. At the very least this should be forwarded to the TCC as a conflict in the code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any additional technical rationale for compromising the basic safety requirement for a disconnect at each building where feeders either supply or travel through the building.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-16 Log #334 NEC-P04 **Final Action: Accept**
(225.33(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-43
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-17 Log #1828 NEC-P04 **Final Action: Hold**
(225.36)

TCC Action: The panel action on this comment has resulted in technical revisions without the benefit of public review.

The Technical Correlating Committee directs that this comment, and the referenced Proposal, be reported as "Hold" in accordance with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 4-49
Recommendation: Accept the Proposal.
Substantiation: The proposal should be accepted as it corrects a serious flaw in this section. The allowance of using a set of 3-way or 4-way switches as a building disconnecting means violates the very core purpose of a disconnecting means. The person who may be working on the system at the building or structure served should be able to operate the disconnecting means at the building or structure and, after testing for absence of voltage, work on the electrical system in confidence. The worker should not have to be concerned that another person could restore power from another location to the equipment being worked upon.

Try as I have, it is difficult to understand the Panel's Statement in rejecting the proposal. The Panel states, "The reference to 3-way and 4-way switches should be retained." The Panel does not state why? It is illogical to retain the permission to use 3-way and 4-way switches as the disconnecting means. This sentence is not responsive to the proposal or the substantiation.

The Panel should explore the training apprentice electricians receive on disconnecting equipment before working on previously energized conductors and equipment. It is safe to say none of the training would teach it is okay to rely on 3 or 4-way switches for disconnecting means.

The Panel statement, "These may be snap switches but the disconnecting functionality of these devices is quite different and could be interpreted as not being acceptable as a disconnect for a building." The disconnecting functionality is quite different from what? The Panel continues "…and could be interpreted as not being acceptable as a disconnect for a building." I agree with this statement. If the Panel makes that conclusion, why wasn't the Proposal accepted. Sorry, the Panel Statement makes little sense.

Finally, the Panel states, "In this proposal the submitter has made an effort to mark the additional wording and the deleted wording but there is wording in the proposal that is not identified as new or changed that is not in the code." I have carefully compared the submitted text with that in the 2008 NEC and can't find a discrepancy. I do apologize, however, if I inadvertently missed some words.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 4-18.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-18 Log #2544 NEC-P04 **Final Action: Hold**
(225.36)

TCC Action: The panel action on this comment has resulted in technical revisions without the benefit of public review.

The Technical Correlating Committee directs that this comment, and the referenced Proposal, be reported as "Hold" in accordance with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-46
Recommendation: Accept the proposal in principle. Revise both the existing text and the exception in 225.36 as follows:
225.36 ~~Suitable for Service Equipment~~ Type. The disconnecting means specified in 225.31 shall be comprised of a circuit breaker, molded case switch, general use switch, or a snap switch. Where applied in accordance with 250.32(B) Exception, the disconnecting means shall be suitable for use as service equipment.
Exception: For garages and outbuildings on residential property, a ~~snap switch or a~~ set of 3-way or 4-way snap switches shall be permitted as the disconnecting means.
Substantiation: Although it is true that the SUSE requirement also involves greater spacings, these are only justified in instances where there is a true service exposure, with no overcurrent protection ahead of the equipment. The principal wiring difference is that identified in the proposal, namely, that a regrounding provision must be incorporated. This, in turn, is only a factor in the 250.32(B) Exception applications.

Since this proposal was offered, this submitter has been challenged to show, in terms of technical merit as opposed to code language, as to why a snap switch could not be used at a commercial occupancy. I can think of no good reason whatsoever, and this comment modifies the original proposal accordingly. All the requirements in 225.38 will be met by a snap switch with the requisite poles.

The panel statement, that the original proposal did not comply with 4.3.3 of the Regulations, is incorrect. The proposal suggested that the section should be "revised to read as follows." Therefore, the wording to be changed was precisely described (namely, the entirety of 225.36) and the new wording was precisely indicated (namely the statement of how the section wording should read). This proposal fully meets the provisions of 4.3.3(c) of the Regulations.

Although the standard proposal form suggests a preference for legislative formatting, it is only a preference ("should be in legislative format") and is not enforceable, although for the convenience of CMP 4, this comment does use legislative formatting. The Regulations do not require legislative formatting, and it is a serious violation of the Regulations for a Technical Committee to refuse to entertain a proposal simply because it did not employ legislative formatting. Untold thousands of proposals and comments have been acted on according to their merits by NEC code making panels over the decades, including within the current cycle, which did not use this formatting. The submitter recognizes that in this case CMP 4 did the right thing in providing an appropriate technical response allowing the rebuttal offered in this comment. However, the statement is still troublesome.

Panel Meeting Action: Accept in Part

Revise text to read as follows:

Type. The disconnecting means specified in 225.31 shall be comprised of a circuit breaker, molded case switch, general use switch, a snap switch, or other approved means. Where applied in accordance with 250.32(B) Exception, the disconnecting means shall be suitable for use as service equipment.

~~Exception: For garages and outbuildings on residential property, a snap switch or a set of 3-way or 4-way snap switches...".~~

Panel Statement: The panel Accepts the main text as submitted.

The panel Rejects the Exception allowing three way and four way switches for use as a building disconnecting means.

The panel added "other approved means" to recognize that the items listed are not an all inclusive list of available types of disconnects.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

YOUNG, J.: First there are a number of problems with the Panel Action and Statement on this Comment. The Panel Action should have been reported as Accept in Principle in Part. This is confirmed in the Panel Action and the Panel Statement which indicates that the main text is accepted as submitted but in fact the main text is modified from what was submitted.

The Panel Statement indicates the exception is rejected as though it was being proposed but the exception is in the present Code and the Comment was only to revise the exception. The CMP rejected the proposed change but went further and deleted the exception completely which was not what was proposed and no substantiation is provided.

Second and more important is that the CMP made significant changes in the requirements that are unsubstantiated and incorrect.

· 225.36 is the requirement that the building disconnect be suitable for use as service equipment. With the change in the title and the revised wording there is no longer a requirement for the building disconnecting means to be suitable for use as service equipment except in those cases where it is connected in accordance with 250.32(B) Exception.

· If not connected in accordance with 250.32(B) it is not required to be suitable for use as service equipment. A conditional reference to 250.32(B) Exception is not correct.

· Equipment is suitable for use as service equipment based on its design, construction, listing and application. It does not become suitable only by how it is applied as the new wording indicates.

· The existing exception to 225.36 is only for garages and outbuildings on residential property. With the deletion of the exception and the inclusion of snap switches as well as general use switches in the main text a snap switch or a general use switch can be used in any application as the disconnect for any building.

· Snap switches and general use switches do not have short circuit current ratings nor are these devices normally used with a fuse so they also do not provide overcurrent protection.

· Snap switches and general use switches are not used as the disconnect in service equipment and are actually component type devices for mounting in boxes. As such they are not even close to meeting the requirements of service equipment.

· A list of devices that are acceptable as the disconnect was added. This is only a list of the disconnect function and as such misses all the requirements associated with service equipment.

· While the list does include "other approved means" the list does not include some items such as a bolted pressure switch or an enclosed or dead front switch - UL 98 device - that is covered in Article 408. Possibly these would fall in "other approved means" but how is it determined what is approved? It would appear from the list that fuses would never be used as part of the building disconnect.

Last the Panel action on this Comment does not agree with the Panel action on Comment 4-20.

Comment on Affirmative:

DEATON, R.: **Affirmative Statement on Comment 4-18**

The 2008 NEC text of 225.36 reads as follows:

225.36 Suitable for Service Equipment.

The disconnecting means specified in 225.31 shall be suitable for use as service equipment.

Exception: For garages and outbuildings on residential property, a snap switch or a set of 3-way or 4-way snap switches shall be permitted as the disconnecting means.

The ROP shows that proposals 4-46 and 4-47, dealing with the main text, and 4-48 and 4-49, dealing with the exception, were all rejected. The general idea behind those proposals are as follows:

4-46 would have required the disconnect to be a circuit breaker, molded case switch, or general use switch, and would have required that the disconnect be suitable for use as service equipment if the installation were made in accordance to 250.32(B), which applies where there is a separate ground at the remote building or structure. Rejection was based on clarity issues and content not conforming to section 4.3.3.

4-47 would have inserted a fine print note with a reference to UL 869 A (Reference Standard for Service Equipment). Rejection was based on the fact that the equipment suitable for use as service equipment is marked as such.

4-48 and 4-49 would have removed 3-way and 4-way switches from the permitted disconnecting means. 4-48 had an additional requirement that the snap switch have a current rating at least that of the circuit conductors. Rejection was based on the fact that the panel wanted to retain the exception as is.

Three public comments on 225.36 were received (4-17, 4-18, 4-19). The panel action centered on 4-17 and resulted in 225.36 reading as follows (the exception is no longer present):

Type. The disconnecting means specified in 225.31 shall be comprised of a circuit breaker, molded case switch, general use switch, a snap switch, or other approved means. Where applied in accordance with 250.32(B), the disconnecting means shall be suitable for use as service equipment.

The net result in 225.36 is that the suitable for use as service equipment exception has been extended from garages and outbuildings on a residential premises to any installation where there is not a ground at the remote building or structure.

Also relevant to this issue is section 225.38. From the 2008 NEC:

225.38 Disconnect Construction.

Disconnecting means shall meet the requirements of 225.38(A) through (D).

Exception: For garages and outbuildings on residential property, snap switches or sets of 3-way or 4-way snap switches shall be permitted as the disconnecting means.

The ROP shows only one proposal, 4-51, to the above text. This proposal would have deleted the 3-way and 4-way switches from the exception. The panel rejected the proposal, desiring to retain the exception as is.

Only one public comment, 4-20, was received, which called upon the panel to accept proposal 4-51. The panel was favorably impressed by the added substantiation, reversed its stance in the ROP and accepted comment 4-20. The net result is that 225.38 will not read as follows (strikethrough text is being deleted):

225.38 Disconnect Construction.

Disconnecting means shall meet the requirements of 225.38(A) through (D).

Exception: For garages and outbuildings on residential property, snap switches ~~or sets of 3-way or 4-way snap switches~~ shall be permitted as the disconnecting means.

Two logical conflicts result from these actions:

1) Given a residential premises with garage or outbuilding not having a grounding electrode, 225.36 would allow a circuit breaker, molded case switch, general use switch, snap switch, or other approved disconnecting means, all of which need not be suitable for use as service equipment. However, 225.38 would allow only the choice of a snap switch among those items.

2) Given a non-residential premises where there is a garage or outbuilding with no grounding electrode, 225.36 would allow a circuit breaker, molded case switch, general use switch, snap switch, or other approved disconnecting means, all of which need not be suitable for use as service equipment. However, 225.38 would require that the disconnect be suitable for use as service equipment.

This comment is being offered to point out the logical conflict, realizing that resolution may not be practical until the next code cycle. This comment is being submitted under the direction of IEEE-SA Standards Coordinating Committee 18.

4-19 Log #1437 NEC-P04 **Final Action: Hold**
(225.36 Exception)

TCC Action: The panel action on this comment has resulted in technical revisions without the benefit of public review.
The Technical Correlating Committee directs that this comment, and the referenced Proposal, be reported as "Hold" in accordance with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.
Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-48
Recommendation: Accept the proposal with the following revision:
For detached garages and outbuildings on dwelling premises, a snap switch shall be permitted as the structure disconnecting means. Where the structure disconnecting means is a 3-way or 4-way snap switch, an additional disconnecting means complying with 225.31 and 225.32 shall be provided as the garage or outbuilding.
Substantiation: A 3-way or 4-way snap switch does not comply with 225.31 and 225.32 and doesn't indicate or have a marked on and off position, therefore, for a circuit not actually supplying load, one may not know if the circuit is energized or not which could be hazardous to a homeowner who is not a qualified person. This provision is less strict for dwelling premises than for premises that have qualified persons.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 4-17.
Number Eligible to Vote: 10

(225.38)

TCC Action: The panel action on this comment has resulted in technical revisions without the benefit of public review.
The Technical Correlating Committee directs that this comment, and the referenced Proposal, be reported as "Hold" in accordance with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 4-51
Recommendation: Accept the Proposal.
Substantiation: The proposal should be accepted as it corrects a serious flaw in this section. The allowance of using a set of 3-way or 4-way switches as a building disconnecting means violates the very core purpose of a disconnecting means. The person who may be working on the system at the building or structure served should be able to operate the disconnecting means at the building or structure and, after testing for absence of voltage, work on the electrical system in confidence. The worker should not have to be concerned that another person could restore power from another location to the equipment being worked upon.
Try as I have, it is difficult to understand the Panel's Statement in rejecting the proposal. The Panel states, "The reference to 3-way and 4-way switches should be retained." The Panel does not state why? It is illogical to retain the permission to use 3-way and 4-way switches as the disconnecting means. This sentence is not responsive to the proposal or the substantiation.
The Panel should explore the training apprentice electricians receive on disconnecting equipment before working on previously energized conductors and equipment. It is safe to say none of the training would teach it is okay to rely on 3 or 4-way switches for disconnecting means.
The Panel statement, "These may be snap switches but the disconnecting functionality of these devices is quite different and could be interpreted as not being acceptable as a disconnect for a building." The disconnecting functionality is quite different from what? The Panel continues "…and could be interpreted as not being acceptable as a disconnect for a building." I agree with this statement. If the Panel makes that conclusion, why wasn't the Proposal accepted. Sorry, the Panel Statement makes little sense.
Finally, the Panel states, "In this proposal the submitter has made an effort to mark the additional wording and the deleted wording but there is wording in the proposal that is not identified as new or changed that is not in the code." I have carefully compared the submitted text with that in the 2008 NEC and can't find a discrepancy. I do apologize, however, if I inadvertently missed some words.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-21 Log #1709 NEC-P04 **Final Action: Reject**
(225.39(A), (B), and (D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-52
Recommendation: Accept the proposed revised as follows:
(A) One Circuit Installation. For installations consisting of a single branch circuit the branch circuit, feeder, and service disconnecting means shall have a rating not less than 15-amperes.
(B) Two Circuit Installation. For installations consisting of two 2-wire branch circuits, a 2-wire feeder and service disconnecting means shall have a rating not less than 30-amperes. For installations consisting of two multiwire branch circuits or two 3-phase branch circuits, the feeder and service disconnecting means shall have a rating not less than 30-amperes. (D) No change.
Substantiation: In (A), the disconnecting means at the building served may be a circuit breaker or fused switch which makes the single circuit supply conductors a feeder.
In (B), the 30 ampere minimum rating should only apply if the feeder is two-wire, since a 3-wire 15-ampere feeder can supply two 2-wire branch circuits. Provisions should be specified where the installation consists of two multiwire circuits or two 3- phase circuits.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any sound technical rationale for the recommended change. Service disconnects are not covered in Article 225.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-22 Log #335 NEC-P04 **Final Action: Accept**
(225.60(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-54
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept

ARTICLE 230 — SERVICES

4-24 Log #2545 NEC-P04 **Final Action: Accept in Principle**
(230.6)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-64
Recommendation: Accept the proposal in principle and in part. Continue to reject item (5). Accept item (6) [which will become (5)] reworded as follows:
(5) Where installed within rigid metal conduit (Type RMC) or intermediate metal conduit (Type IMC) used to accommodate the clearance requirements in 230.24 and routed directly through an eave but not a wall of a building.
Substantiation: At the most recent IAEI Section Meeting, considerable discussion took place around whether service conductors travelling within an outer building wall had actually entered the building. The consensus was that as soon as the outer membrane had been penetrated, the conductors had entered the building. This submitter fully endorses this conclusion, but it makes service masts of the sort described in the proposal substantiation problematic. Do they penetrate the outer building membrane? Of course they do. Does anyone in their right mind want to disallow such masts? Probably not, but the panel statement that the application is "clearly outside the building" is incorrect in this instance.
This proposal addresses the question, but limits the application to heavy wall steel raceways. Remember that masts are not necessarily steel pipe; a heavy timber with cable on it is a mast within the provisions of 230.28. This section clearly indicates this by addressing raceway masts as simply one possibility in the second sentence. Heavy wall conduit masts have been used for this purpose for generations without objections. The proposal further qualifies the acceptable use to a direct pass-through. The submitter was once presented, as an inspector, with a conduit run that went up the outside of a building, then horizontally through an eave cavity some ten feet, and then up to its eventual weatherhead.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read as follows:
(5) Where installed in overhead service masts on the outside surface of the building traveling through the eave of that building to meet the requirements of 230.24.
Panel Statement: The addition of item six in Proposal 4-46, renumbered as item 5, will clarify what the is allowed.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
ROGERS, J.: This change is not really necessary and the Panel should retain the rejection and rationale used in the ROP stage. In addition the change made by the Panel at the ROC meeting creates a greater enforcement problem.
Comment on Affirmative:
STAFFORD, T.: It appears that the panel statement is incorrect and incomplete as noted on the ballot document.

4-25 Log #1884 NEC-P04 **Final Action: Reject**
(230.6(5) (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facilities Professionals
Comment on Proposal No: 4-65
Recommendation: Accept the proposal *In Principle in Part* with the following addition to the original 2008 text of Section 230.6(2):
(5) Where conductors are installed in rigid metal conduit that is supported within an enclosure having a three hour (minimum) fire smoke rating and a device providing short circuit protection is present at the supply end of the service conductors.
Substantiation: The addition of this exception, admittedly difficult because it is extends the already difficult concept of a service conductor being "outside the building", has the practical effect of reducing construction costs for service entrance raceway without increasing risk. Where some installations are supplied by a serving utility that offers the Owner additional service cable short circuit protection, those installations should be permitted relaxation of the concrete encasement requirement. The combination of the less expensive architectural construction and the utility-supplied short circuit protection, should accomplish safety objectives.
Panel Meeting Action: Reject
Panel Statement: Service-entrance conductors are subject to high arc flash energies that may burn through metallic conduit and blow through architectural treatments that provide 3 hour fire rating (typically 2 layers of dry wall). The masonry requirement has effectively protected buildings from service-entrance conductor failures and the resulting generation of heat and gas. The masonry requirement should remain.
The concrete or brick is to provide physical protection. Designs should consider service-entrance disconnects and overcurrent devices to be located as close as practical to the entry of the service conductors into the building. Feeders extending up into the building will have disconnecting means and overcurrent protection under the control of the premises owner.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-26 Log #1708 NEC-P04 **Final Action: Reject**
(230.7)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-66
Recommendation: Accept revised as follows: Circuit conductors other than service conductors shall not be installed in the same raceway, cable, conduit body, or auxiliary gutter.
FPN: See 300.3(2) for service conductors operating at over 600 volts.
Substantiation: Auxiliary gutters are not specifically included in 230.43 which begs the question; can they enclose service conductors? Reference to 300.3(2) should be noted to avoid possible conflict.
Panel Meeting Action: Reject
Panel Statement: Auxiliary gutters are recognized as an acceptable wiring method in 230.43. Redefining acceptable wiring methods in this section is redundant.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-27 Log #2546 NEC-P04 **Final Action: Accept**
(230.7)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-66
Recommendation: Continue to reject the proposal.
Substantiation: Auxiliary gutters are not raceways. CMP 4 should refer to the CMP8 panel statement on this topic on Proposal 8-10. CMP 4 may be interested in some historical information on this topic. The clear implication presented by the choice of wiring methods listed in the current raceway definition in Article 100 is that raceways are for extended lengths of run, and that more limited enclosed channels such as those within equipment are not to be so classified. This interpretation has been thoroughly tested. If any such enclosed channel were classified as a raceway, then surely an auxiliary gutter would be so classified. In the 1993 NEC cycle CMP 8 initially accepted a proposal to place "auxiliary gutters" into the list, and then unanimously reversed course in the face of negative comments from this comment submitter, NEMA, and others. The issues of auxiliary gutters and panelboard gutter spaces is particularly pressing because 230.7 forbids the sharing of raceways between service conductors and other conductors. If such enclosures are deemed to be raceways, then much service wiring as we know it could be construed as contrary to the NEC.
The issue of medium voltage and 600 volt or lower conductors in the same service raceway is virtually never attempted and need not be covered here. If necessary, 300.3(C)(2) adequately covers the question.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-28 Log #72 NEC-P04 **Final Action: Accept**
(230.24)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-76
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal since the text does not comply with the NEC Style Manual requiring mandatory text and including the subject of the rules being referenced.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel revises the text of Proposal 4-76 to read as follows:
(E) Clearance from Communication Wires and Cables. Clearance from communication wires and cables shall be in accordance with 800.44(A)(4).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
ROGERS, J.: This comment and the referenced proposal should both have been rejected. The clearance requirement is already defined in Article 800 and if every requirement like this is cross-referenced the NEC will be larger than a major city telephone directory. The most common problem relative to this that is found in the field is that of telecommunications cables being attached to service masts which is already not allowed in section 230.28.

4-29 Log #2316 NEC-P04 **Final Action: Accept in Principle**
(230.24(E))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 4-76
Recommendation: Change this proposal form (E) to a new informational note.
Substantiation: Rules that tell the Code user to "see" something are hardly enforceable. While this proposal has merit, it would be better as an informational note.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Comment 4-28.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
ROGERS, J.: This comment should have been rejected for the same reasons outlined in my comment on comment 4-28. This submitter was correct, however, in recommending that if this language were to appear in the NEC at least limit it to an informational note and not a mandatory code requirement.

4-30 Log #2547 NEC-P04 **Final Action: Hold**
(230.30)

TCC Action: The Technical Correlating Committee directs that the panel action on Comment 4-30 and Proposal 4-93 be reported as "Hold " consistent with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.
The text added by the panel, "listed direct burial cable", permits any listed direct burial cable to be installed for use as underground service cables and is inconsistent with the requirements of Chapter 3 (e.g., UF cable as covered in 340.12(1)).
The Technical Correlating Committee action to "Hold" will permit the panel to resolve correlation issues during the 2014 NEC revision cycle.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-93
Recommendation: Accept the proposal as modified by CMP 4 in principle. Make the following two changes:
1. Change item (7) to read (7) Listed Type USE underground service entrance cable.
2. Add a new item (8) to read (8) Type IGS cable.
Substantiation: These changes are necessary for correlation within Chapter Three. As worded in the Final Action on Proposal 4-93, Type UF cable could be used for this purpose, even though it does not appear for comparable service entrance uses in 230.43 and it is prohibited for such use in 340.12(1). This wording limits the underground cable selection accordingly. The second item correlates with 326.10(1) and 230.43(2); there clearly is no good reason to disallow this wiring method, uncommon though it may be, from one of its customary uses.
Panel Meeting Action: Accept in Principle
The panel Accepts in Principle the text of Proposal 4-93 as modified by Code-Making Panel 4 to read as follows:
1. (8) Listed direct burial cable.
Panel Statement: The addition of item (8) with the panel's revised wording is more appropriate.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: This comment is fine as amended except the word "cable" should be changed to "cable(s)."
ZGONENA, T.: This panel action did not address the submitters concern regarding potential misuse of UF cable and conductors in service entrance applications. Neither ballot options will correct the problem with this revision.
The TCC can correct this issue without changing the intent of the panel or submitter by adding the following text to the new (7) and (8):
(7) Listed direct burial cable permitted to be used as service conductors in Chapter 3.
(8) Listed direct burial conductor permitted to be used as service conductors in Chapter 3.

4-31 Log #2446 NEC-P04 **Final Action: Hold**
(230.30(B))

TCC Action: The Technical Correlating Committee directs that the panel action on Comment 4-30 and Proposal 4-93 be reported as "Hold " consistent with Section 4.4.6.2.2 of the NFPA Regulations Governing Committee Projects.
The text added by the panel, "listed direct burial cable", permits any listed direct burial cable to be installed for use as underground service cables and is inconsistent with the requirements of Chapter 3 (e.g., UF cable as covered in 340.12(1)).
The Technical Correlating Committee action to "Hold" will permit the panel to resolve correlation issues during the 2014 NEC revision cycle.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 4-93
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(B) Wiring Methods. Underground service conductors shall be installed in accordance with the applicable requirements of this code covering the type of wiring method used and shall be limited to the following methods:
(1) Type RMC conduit
(2) Type IMC conduit
(3) Type NUCC conduit
(4) Type HDPE conduit
(5) Type PVC conduit
(6) Type RTRC conduit
(7) Listed direct-burial conductors.
(8) Type MC cable that is identified for direct burial.
Substantiation: Type MC cable is available with an impervious jacket that is listed, labeled and marked as being suitable for direct burial. This cable that is so identified is suitable for use for underground service conductors and must be added to the list of acceptable wiring methods included in new 230.30(B).
Section 230.43 recognizes Type MC cable for use as a wiring method for services. This same "Use Permitted" is stated in 330.10(A)(1).
Though stated in the negative tense rather than the positive, 330.12(2)(a) states that Type MC cables are is not permitted for direct burial or concrete encasement unless identified for direct burial. So, if Type MC cable *is* identified for direct burial, it should be included in the list of acceptable wiring methods in 230.30.
The UL White book in the product category for Type MC Cable, "METAL-CLAD CABLE (PJAZ)" states, "Cable suitable for use in cable trays, direct sunlight or direct burial application is so marked. Cable marked for direct burial is also considered acceptable for encasement in concrete."
Please include Type MC cable that is identified for direct burial in the list of acceptable wiring methods in new Section 230.30(B).
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 4-30.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ZGONENA, T.: See comment on 4-30.

4-32 Log #2548 NEC-P04 **Final Action: Accept**
(230.40 Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-101
Recommendation: Accept the proposal in principle, reworded to reflect the terminology changes around service drops and laterals, and to reflect the scope of 230.2(E), as follows (legislative text used in reference to the original proposal submittal):
Add the following wording to the end of the existing exception: "If the number of service disconnect locations for any given classification of service does not exceed six, the requirements of 230.2(E) shall apply at each location. If the number of service disconnect locations exceeds six for any given supply classification, all service disconnect locations for all supply characteristics, together with any branch circuit or feeder supply sources if applicable, shall be clearly described using suitable graphics or text or both on one or more plaque(s) located in an approved, readily accessible location(s) on the building or structure served and as near as practicable to the point(s) of attachment or entry(ies) for each service drop or service lateral, and for each set of overhead or underground service conductors ~~service drop or lateral~~.

Substantiation: The submitter appreciates the concerns expressed in the panel statement and offers this comment to address the issues raised. It is true that there may be a feeder or branch circuit sources and they need to be addressed, and this comment includes them in the required information. However, it seems excessive to require placarding at every branch-circuit or feeder entry when the usual emergency application will involve an attempt by emergency service personnel to first disconnect service sources; in such cases the plaques required by this proposal and comment will clearly indicate the additional source locations and allow for additional disconnection as necessary.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-33 Log #2245 NEC-P04 **Final Action: Accept**
(230.40 Exception No. 3)

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 4-102
Recommendation: Continue to accept the submitter's proposal with the following revision: A single-family dwelling unit and ~~a separate structure(s)~~ its accessory structures shall be permitted to have one set of service-entrance conductors run to each from a single service drop or lateral.
Substantiation: This is a companion comment to companion Proposal 1-104. Previously, for a single-family dwelling premises, it has been interpreted that only one additional accessory structure could be supplied with a separate set of service-entrance conductors supplied from the same service drop or service lateral. It's very common for there to be two or more accessory structures on a single-family dwelling premises, especially in suburban, exurban or rural areas. This welcomed change will add clarity to the NEC and conformity with installation practices that have already been widely accepted by numerous electrical authorities having jurisdiction.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
ROGERS, J.: I recognize the necessity to potentially serve more than one separate structure on the same property and that why the proposal as referenced was accepted. The submitter has not presented any rationale for changing the language from separate structure(s) to accessory structure(s).

4-34 Log #2246 NEC-P04 **Final Action: Reject**
(230.40 Exception No. 3)

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 4-104
Recommendation: This proposal should have been accepted. In lieu of accepting Proposal 4-104, revise the 2008 NEC as follows: A single-family dwelling unit and a separate structure shall be permitted to have one set of service-entrance conductors run to each from a single service drop or lateral. The sets of service-entrance conductors shall originate at a common location on one of the buildings.
Substantiation: This is a companion comment to companion Proposal 1-102. Previously, for a single-family dwelling premises, it has been interpreted that only one additional accessory structure could be supplied with a separate set of service-entrance conductors supplied from the same service drop or service lateral, regardless if the sets of service-entrance conductors originate from a common location on one of the buildings, or on a yard pole a few feet away from the buildings served. It's very common for there to be two or more accessory structures on a single-family dwelling premises, especially in suburban, exurban and rural areas.

When 230.40 Exception No. 3 first appeared in the 1996 NEC, the book published by the International Association of Electrical Inspectors and titled "IAEI Analysis of 1996 National Electrical Code" had the following commentary in pertinent part: "…This new exception will allow one set of service-entrance conductors to be run from a 'common location' (emphasis added) on one building, such as a wireway or meter-socket enclosure(s) to the other structure. As indicated, the service drop or lateral is permitted to be run to either building…These service conductors must remain outside the structure… The service disconnecting means for each set of service-entrance conductors must be located to comply with Section 230-70(a)…It is not intended that the disconnecting means for both buildings be located at a common location on one of the building. The substantiation for the change covers the case where an existing service in a dwelling is not adequate for an additional load to be added for a remote building like a garage or workshop…".

NEC 240.40 Exception No. 3 and its limitation of extending service-entrance conductors to one additional building from a single service drop or lateral is reasonable and understandable from a safety perspective if the sets of service-entrance conductors originate from a common location on one of the buildings, such as what is described in the book entitled "IAEI Analysis of 1996 National Electrical Code".

However, if it is not the intent in 230.40 Exception No. 3 that the sets of service-entrance conductors originate at a common location on one of the buildings, then 230.40 Exception No. 3 is not necessary. Depending on the location of the service point on the property, or the location of common premises service equipment on a center yard pole, pedestal, or equipment pad, or the specific configuration of the installation, existing rules in Article 230 and Article 225 would be used for supplying electricity to more than one building on a multi-building premises, be it residential or otherwise.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented proper technical substantiation for this language, and, in addition, is adding new language that has not had public review.

The fact that the Exception allows multiple sets of service entrance conductors supplied by one service drop or lateral by default requires this connection to originate in one location.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-35 Log #2549 NEC-P04 **Final Action: Accept**
(230.40 Exception No. 4)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-105
Recommendation: Accept the proposal in principle. Change "multiple occupancy structures" to "multiple occupancy buildings."
Substantiation: The definition of "building" in Article 100 as slated to be revised in this code cycle fairly clearly indicates that any structure likely to be the subject of 210.25 is a building. This term is more properly descriptive and therefore more user friendly. The proposal submitter and CMP 4 are both correct that this exception needs to reflect the changes in 210.25 that now make it applicable to commercial occupancies.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-36 Log #73 NEC-P04 **Final Action: Accept**
(230.44)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-112
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 4-113.

See the Technical Correlating Committee action on Proposal 4-113.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The ROP draft correctly locates the text as intended by the panel, and is shown below:

"230.44 Cable Trays. Cable tray systems shall be permitted to support service-entrance conductors. Cable trays used to support service-entrance conductors shall contain only service-entrance conductors and shall be limited to the following methods:

(1) Service-entrance cables
(2) Type MC cable
(3) Mineral-insulated, metal-sheathed cable
(4) Type IGS cable
(5) Single Thermoplastic-Insulated Conductors 1/0 and larger with CT rating [ROP 4-113]

Such cable trays shall be identified with permanently affixed labels with the wording "Service-Entrance Conductors."

The labels shall be located so as to be visible after installation and placed so that the service-entrance conductors may be readily traced through the entire length of the cable tray. [ROP 4-112]

Exception: Conductors, other than service-entrance conductors, shall be permitted to be installed in a cable tray with service-entrance conductors, provided a solid fixed barrier of a material compatible with the cable tray is installed to separate the service-entrance conductors from other conductors installed in the cable tray." [ROP 4-112]
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: There was no technical rationale for limiting the conductors utilized to those of the thermoplastic type. If a manufacturer produces conductors that meet the listing requirements required for CT rating those conductors should also be allowed.

4-37 Log #74 NEC-P04 **Final Action: Accept**
(230.44)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 4-113
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal with respect to both the placement of the added text and the accepted text of the second sentence.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the panel action on Comment 4-36.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-38 Log #655 NEC-P04 **Final Action: Reject**
(230.44)

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 4-113
Recommendation: Reject this proposal and revise text to read as follows:
Cable tray systems shall be permitted to support service-entrance conductors per 392.3. Cable trays used to support service-entrance conductors shall contain only service-entrance conductors.
Substantiation: There is no substantiation for limiting SE conductors to these four methods. The cable tray is a support system and 392.3(A) and (B) permit all wiring methods plus single conductors under specific conditions. Therefore, the SE conductors could be safely installed in conduit which is supported by the cable tray as well as other methods. The present language is sufficient as the SE conductors can be used safely per 392.3(A) and (B). If this committee feels a reference to 392.3 is necessary, then add it, but do not limit to the four methods in the proposal.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any technical data to support expanding service conductors beyond the wiring methods defined in this section. The panel acknowledges that cable trays, as defined in Article 392, can be utilized for the installation of raceways; however, the panel remains firm that this application would be for conductors other than service conductors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-39 Log #2550 NEC-P04 **Final Action: Accept in Part**
(230.44)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-113
Recommendation: Accept the proposal in principle. Clarify that the added text is “and shall be limited to the following methods:” together with the list of wiring methods (no second sentence being added), to address the issue raised by the TCC. Correct the syntax of the list by using parallel wording as follows:
(1) Type SE cable
(2) Type MC cable
(3) Type MI cable
(4) Type IGS cable
(5) Single conductors if permitted by 392.10(B)
Substantiation: This list only slightly differs from the parallel language requirement of 3.3.5 in the NEC Style Manual and fully complies with the remainder of that section. The reference in Article 392 reflects the CMP 8 reorganization of Proposal 8-235a; the current reference would be to 392.3(B). This reference fully addresses the sizing limitations as well as the surface marking requirements. In addition, it captures the critical industrial occupancy limitation and also the rung spacing limitations for smaller cables, neither of which were addressed in the original proposal.
Panel Meeting Action: Accept in Part
The panel Accepts all of the recommended text changes, and Rejects item (5) that shall remain as written in Proposal 4-113.
Panel Statement: The panel reaffirms the text used in item 5 of Proposal 4-113 as it provides the specific definition of the conductors allowed.
392.10(B) is too narrow in that it limits the use to industrial establishments.
In addition, see the panel action on Comment 4-36.
Number Eligible to Vote: 10

Comment on Proposal No: 4-120
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal and identify the specific lack of conformance with 4.3.3(b) of the NFPA Regulations Governing Committee Projects.
This appears to be an NEC Style Manual issue concerning “possibly unenforceable and vague” terms.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel revises the panel statement on Proposal 4-120 to read as follows:
“The proposal does not meet the requirements of 4.3.3(c) of the NFPA Regulations Governing Committee Projects.”
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: The submitter has presented language that is vague and unenforceable as addressed in section 3.2.1 of the NEC Style Manual. The use of the words “if practicable” are definitely vague and unenforceable. In addition the submitter is attempting to extend a service raceway requirement to enclosures and other equipment with no documented technical rationale.

4-41 Log #1712 NEC-P04 **Final Action: Reject**
(230.53)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-120
Recommendation: Delete, or accept the proposal revised as follows: Where exposed to the weather, raceways meter assemblies, fittings, and enclosures shall be approved for use in wet locations. If practical, raceways shall be arranged to drain.
Substantiation: 110.3 (A)(1), 110.8, 110.26 (F)(2) and other provisions re; wet locations apply. Auxillary gutters are not listed as a raceway in Article 100 but are included in 230.43. Since most electrical equipment in wet locations is listed, the protocols for listing will cover provisions for draining, if necessary. Many service mast installations, in California, for example rise from the service equipment either exposed or within a wall; should the raceway drain into the service equipment?
Panel Meeting Action: Reject
Panel Statement: This section is intended to apply to raceways as stated.
The submitter is attempting to extend the requirement to enclosures as well. The panel reaffirms that all raceways exposed to the environment must be arranged to drain.
In addition, the submitter has suggested multiple options which does not conform to NFPA Regulations Governing Committee Projects regarding the form for comment submission.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-42 Log #1711 NEC-P04 **Final Action: Accept**
(230.66)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-126
Recommendation: Accept the proposal.
Substantiation: Any unlisted equipment can be marked as suitable for service equipment. This is not an assurance that it is suitable. Snap switches are required to be listed; why not service equipment?
Panel Meeting Action: Accept
Panel Statement: The panel reaffirms its action and statement on Proposal 4-126.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-43 Log #2525 NEC-P04 **Final Action: Accept**
(230.66)

Submitter: Timothy P. Zgonena, Underwriters Laboratories Inc.
Comment on Proposal No: 4-126
Recommendation: Propose to accept the original proposal.
Substantiation: Comment on panel action for Proposal 4-126:

The panel action to Reject this proposal was not appropriate, and the panel statement does not justify a rejection of the proposal. Adding the words "listed and" does not make the marking any more specific than the existing requirement, and does not change the meaning of the remaining portion of the sentence. Adding the words "listed and" would only require that the service equipment must be listed, it does not affect the marking of the equipment. It does not specify that the equipment marking specifically state "suitable only for use as service equipment", nor does it require the equipment marking to specifically state "suitable for use as service equipment". Equipment with EITHER of these markings is indeed marked to identify it as being suitable for use as service equipment. Requiring the service equipment to be listed and marked to identify it as being suitable for service equipment will help to ensure that the equipment is actually designed for use as service equipment, and has been determined by an independent agency to comply with the appropriate requirements for service equipment.

If the panel still considers the proposed wording to be confusing, it is suggested that the wording be revised as follows:

230.66 Marking. Service equipment rated at 600 V or less shall be marked to identify it as being suitable for use as service equipment. All service equipment shall be Listed. Individual meter socket enclosures shall not be considered service equipment.

This would clearly not change the existing marking requirement, but would require all service equipment to be Listed.

Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-44 Log #1710 NEC-P04 **Final Action: Reject**
(230.70(C))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 4-135
Recommendation: Delete this section.
Substantiation: "Prevailing" is defined as "having superior force or influence"; "generally current"; which does not appear to be as appropriate as "wet", "hazardous locations"; and other conditions covered elsewhere in the NEC. Articles 500 through 517 already apply. See 4.1 of the NEC Style Manual.
Panel Meeting Action: Reject
Panel Statement: The submitter is requesting the deletion of a section, and this request has not had any public review.

The panel reaffirms that this section is necessary and the submitter has not presented any technical substantiation to support its removal.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

(230.71(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-136
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

Panel Meeting Action: Accept

(230.71(A))

Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 4-148
Recommendation: Accept this proposal in principle by revising the proposal.
Add new text to read as follows:
230.71(A) (Second Paragraph): For the purpose of this section, disconnecting means installed as part of listed equipment and used solely for the following shall not be considered a service disconnecting means:
(1) Power monitoring equipment
(2) Surge-protective device(s)
(3) Control circuit of the ground-fault protective system
(4) Power-operable service disconnecting means
(5) Communications equipment under the exclusive control of a utility
Substantiation: This comment is being made in conjunction with my comment on proposal number 4-148 to add new text to paragraph 230.82. If the proposal to add the new text to 230.82 is accepted, then a new item needs to be added to paragraph 230.71(A) to exclude disconnecting means installed as part of this listed equipment.
Panel Meeting Action: Reject
Panel Statement: The panel is unclear as to what the submitter is attempting to achieve since the proposed text relates to a different section of the code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: I voted with the Panel on this comment and the referenced proposal due to the fact that these technologies are currently being developed and the NEC cannot be utilized as a constraint on new technologies. However, I remain deeply concerned relative to the listing, installation and maintenance of these devices as no definitive technical information was placed before the Panel for their review. These devices clearly represent one of those questionable areas of what rules apply, NESC or NEC and who inspects the installation. The Panel made an appropriate move to limit the allowance to being under the control of the serving electric utility but that still leaves many questions especially when considering how these requirements will be very different in different areas of the country.

4-47 Log #2101 NEC-P04 **Final Action: Reject**
(230.71(A)(4))

Submitter: Larry LeVoir, City of Irvine
Comment on Proposal No: 4-137
Recommendation: Accept the proposal.
Substantiation: I understand that CMP 4 has had to tackle this problem. It appeared at one point a consesus had been reached, but the proposal was dropped for the 2002 NEC. It seems as though CMP 13 was able to reach a consensus on this issue as it applies to feeders from generators. Please reference 700.12(B)(6), 701.11(B)(5), and 702.11. With these code sections one could install a service disconnect outside of the building 40 feet away and visible from the building and a generator 40 feet from the same building. The feeder conductors from the service disconnect outside the building would require a disconnecting means in accordance with section 225.32 where the conductors enter the building but feeder conductors from the generator would not as long as they are installed per sections 700.12(B)(6), 701.11(B)(5), and 702.11 whichever is applicable. There is no difference I am aware of in these feeder conductors (aside from the source), but yet we have different rules for the same types of conductors. While an argument could made regarding the Emergency or Legally Required Systems as being "special", one could not make that argument for the Optional Standby Conductors. At the very least this should be forwarded to the TCC as a conflict in the code.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any additional technical rationale for compromising the basic safety requirement for a disconnect at each building where service conductors enter the building.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-48 Log #2527 NEC-P04 **Final Action: Accept in Principle**
(230.72(A) Exception (New))

Submitter: Timothy P. Zgonena, Underwriters Laboratories Inc.
Comment on Proposal No: 4-140
Recommendation: Propose to accept the original proposal from the submitter.
Substantiation: The panel action to reject this proposal was not appropriate. The proposal should be accepted. Although 230.2(E) does provide identification requirements when there is more than one service, it does NOT require the identification of the location of each service disconnecting means when only one service is provided. 230.2(E) only requires identification of other services, branch circuits, or feeders that supply the building or structure. If there is only one service, but multiple service disconnects for that service, it is not required to identify the location of each service disconnect. Presumably, this is because the disconnects are all grouped together in accordance with 230.72. However, the exception to 230.72 allows the water pump disconnecting means to be located remotely. Since this could be one of the six disconnects allowed, and is therefore associated with just one service, 230.2(E) is not applicable, and therefore the submitter's concerns are NOT addressed in 230.2(E).
Panel Meeting Action: Accept in Principle
Panel Statement: The panel supports the concept, however, recognizes that an additional provision is needed.
See the panel action on Comment 4-49.
Number Eligible to Vote: 10

4-49 Log #2551 NEC-P04 **Final Action: Accept**
(230.72(A) Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-140
Recommendation: Accept the proposal in principle. Do not create an additional exception. Add the following text to the existing exception: "If remotely installed in accordance with this exception, a plaque shall be posted at the location of the remaining grouped disconnects denoting its location."
Substantiation: It is simpler to retain a single exception with the new rule folded in. The requirement only applies when the exception is operational, so it is less confusing to group the text together. The comments in the voting, establishing the need for this provision, are entirely correct.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-50 Log #601 NEC-P04 **Final Action: Accept in Principle**
(230.77)

Submitter: Richard R. Verrier, City of Biddeford
Comment on Proposal No: 4-145
Recommendation: Revise text to read as follows:
The service disconnecting means shall plainly indicate whether it is in the ~~open~~ off or ~~closed~~ on position.
Substantiation: The confusion describing the position indicator is contrary to other professions, i.e., you open a faucet to allow water flow and close it to shut it off. (open door close door)!!!
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
The service disconnecting means shall plainly indicate whether it is in the open (off) or closed (on) position.
Panel Statement: The panel accepts the submitter's concept and adds the word "(off)" after the word "open" and the word "(on)" after the word "closed" for clarification.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-51 Log #2148 NEC-P04 **Final Action: Accept in Principle**
(230.82)

Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 4-148
Recommendation: Accept this proposal in principle by revising the original proposal.
Add new text to read as follows:
(9) Connections used only to supply listed communications equipment under the exclusive control of a utility, if suitable overcurrent protection and disconnecting means are provided. A disconnecting means is not required if the supply is installed as part of a meter socket or meter socket extender such that access can only be gained with the meter removed and power is disconnected upon removal of the meter.
Substantiation: The intent of the original proposal is valid and necessary to accommodate new equipment and installations associated with Smart Grid applications and life-line (i.e. emergency calling) communications equipment powered at the premises. The proposed rewording more clearly defines the equipment and intended installation and use. Companion comments to add new text to paragraphs 230.71(A) addressing disconnecting means and 230.94 addressing overcurrent protection completes the proposal.
● The substantiation provided with the original proposal is valid but did not go into enough detail on the installation and performance requirements for modern systems, or on the safety of the equipment, for the panel to make an informed decision.
The following are among the requirements needed for the safe operation and installation of the new generation of metering and communications equipment.
● Providing reliable power and continued operation of the communications equipment should an event such as a fire cause the main service breaker to open. With modern broadband systems serving as an information pipeline handling large amounts of data as well as traditional voice services, this equipment is increasingly responsible for things like alarm services, medical and emergency monitoring systems in addition to the traditional life-line "911" call.
● Accommodating wireless communications or wire line communications from the power service monitoring equipment to the responsible utility without the risk of interference from premises based equipment or building construction.
● Ability of the utility to monitor power and control usage via the communications equipment including a complete power disconnect at the premises. Power can be controlled during emergencies, peak load demand times, service discontinuation, and the like.
● The ability to turn power back on at a premises where power has been disconnected via a communications link powered prior to the main disconnect. This can also be used to turn on power for a new customer without having to roll a truck.
● Access for installation and repair is required by the utility or utilities without having to enter the premises
● Installation of the utility provided equipment without imposing on the premises wiring system
● Powering of utility installed communications and monitoring equipment so that it is not charged to the customer
The new proposal includes a listing requirement to ensure critical safety items are addressed. These include but are not limited to current and withstand ratings, ability to safely clear faults in the connected equipment, accessibility, servicing issues, disconnects, grounding, isolation of connected circuits, resistance to environmental conditions and the like.
In the proposed rewording I use "connections" instead of "taps" based on the panel action on Proposal 4-152.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(9) Connections used only to supply listed communications equipment under the exclusive control of the serving electric utility, if suitable overcurrent protection and disconnecting means are provided. For installations of equipment by the serving electric utility, a disconnecting means is not required if the supply is installed as part of a meter socket such that access can only be gained with the meter removed.
Panel Statement: The revised wording more clearly reflects the intent of the panel, and provides further clarity and enhances usability and enforceability.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
ROGERS, J.: I voted with the Panel on this comment and the referenced proposal due to the fact that these technologies are currently being developed and the NEC cannot be utilized as a constraint on new technologies. However, I remain deeply concerned relative to the listing, installation and maintenance of these devices as no definitive technical information was placed before the Panel for their review. These devices clearly represent one of those questionable areas of what rules apply, NESC or NEC and who inspects the installation. The Panel made an appropriate move to limit the allowance to being under the control of the serving electric utility but that still leaves many questions especially when considering how these requirements will be very different in different areas of the country.

4-52 Log #2552 NEC-P04 **Final Action: Reject**
(230.82)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-149
Recommendation: Accept the proposal in principle. Do not rewrite 230.82. Revise 230.82(3) in the 2008 NEC as follows:

(3) Meter disconnect switches nominally rated not in excess of 600 volts that have a short-circuit current rating equal to or greater than the available short-circuit current, provided all metal housings and service enclosures are grounded in accordance with Part VII and bonded in accordance with Part V of Article 250. A meter disconnect switch shall be capable of interrupting the load served. A meter disconnect shall be legibly field marked on its exterior in a manner suitable for the environment substantially as follows:

METER DISCONNECT
NOT SERVICE EQUIPMENT

Substantiation: This comment is intended as a limited compromise that will achieve the principal goal of the many attempts to address this topic over the past few code cycles, namely, to avoid field confusion over the location of the service disconnect. Since these switches are fully rated for the application, they can easily cause confusion, particularly in cases where the serving utility has not locked them in the closed position (the usual orientation) with their own locking equipment. The orderly application of many NEC rules depend on agreement over the exact location of the service equipment, and any lack of clarity in this area is a serious concern.

Note that this section has moved beyond a simple list of items, although it is still formatted and numbered as a list. The content of the various enumerated items are not remotely parallel in format, with some items still list items and with many others containing various rules. It is apparent that the entire section flagrantly violates the NEC Style Manual requirements for lists, as covered at 3.3.5. This submitter intends the submission of a purely editorial proposal for the 2014 NEC cycle that will reformat this section as a combination of list items and rules, without making any substantive technical changes to the content.

Panel Meeting Action: Reject
Panel Statement: The panel does not agree that the additional marking that is being recommended is necessary.

The service disconnect is required to be marked as such in 230.70(B).

The meter disconnect is installed for use by utility companies when servicing the metering equipment and is readily definable as a disconnect ahead of the disconnect that is marked “Service Disconnect”.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: The word “Taps” is the correct word, in that it requires applying the requirements for tap conductors in this situation. Changing “taps” to connections would allow the connection of conductors which do not meet the requirements of taps. The Action should be to reject the original proposal.

4-54 Log #2529 NEC-P04 **Final Action: Reject**
(230.90(A) Exception No. 2)

Submitter: Timothy P. Zgonena, Underwriters Laboratories Inc.
Comment on Proposal No: 4-158
Recommendation: Propose to accept the original proposal.
Substantiation: Comment on panel action for Proposal 4-158:

The panel action to reject this proposal was not appropriate. The proposal should be accepted. As the submitter noted, 240.21(B) specifically prohibits the application of 240.4(B) to protection for a feeder tap. If it is unacceptable for a feeder tap, certainly it should also be unacceptable to apply this rule to protection for an ungrounded service conductor.

Panel Meeting Action: Reject
Panel Statement: The connections on the line side of the service disconnect to supply the equipment listed in 230.82 are considered extensions of the service conductors, and are not required to follow the “Feeder Tap” rules in 240.21(B) and 240.21(C).

The conductors supplying this equipment must be sized to be protected by the overcurrent device at the load end of these connections.

Number Eligible to Vote: 10

4-56 Log #2149 NEC-P04 **Final Action: Reject**
(230.94 Exception No. 7 (New))

Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 4-148
Recommendation: Accept this proposal in principle by revising the proposal.

Add new text to read as follows:

Exception No. 7: Circuits used only to supply listed communications equipment or under the exclusive control of a utility shall be permitted to be connected on the supply side of the service overcurrent device where separately provided with overcurrent protection suitable for the supply.

Substantiation: This comment is being made in conjunction with my comment on proposal number 4-148 to add new text to paragraph 230.82. If the proposal to add the new text to 230.82 is accepted, then a new exception needs to be added to paragraph 230.94 to accommodate the installation of the circuits on the supply side of the main service overcurrent device.

Panel Meeting Action: Reject
Panel Statement: The panel is unclear as to what the submitter is attempting to achieve since the proposed text relates to a different section of the code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-57 Log #2229 NEC-P04 **Final Action: Reject**
(230.95 Exception No. 2 (New))

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association
Comment on Proposal No: 4-165
Recommendation: Modify the proposed text to read:

Exception No 2: Normal Source ground fault protection on the line side of a transfer switch supplying emergency and legally required standby systems shall be permitted to be restrained for ground faults on the loadside of the transfer switch, provided that audible and visual signal devices indicate whenever a ground fault relay has been restrained, and instructions on the course of action to be taken in the event of an indicated ground fault are located at or near the sensor location.

Substantiation: Designers need to be able to utilize ground fault protection for the normal source, and at the same time, provide selective coordination for emergency and legally required standby devices and all overcurrent devices on their line side. This can best be accomplished by allowing the normal side ground fault protection to be restrained for ground faults on the load side of the transfer switch (on the emergency and legally required standby system side). While 700.26 and 701.17 permit ground fault protection to be totally omitted on the alternate source side of emergency and legally required standby systems, this comment simply allows the ground fault protection on the normal source side to be restrained for ground faults on the load side of the transfer switch, on the emergency and legally required standby side. This comment will provide the ability to utilize ground fault protection on the normal source side, and selectively coordinate emergency and legally required standby devices with all upstream devices, without endangering any equipment protection on the normal source side of the transfer switch. The requirement for indication is included to correlate with the requirement found in 700.7(D).

Panel Meeting Action: Reject
Panel Statement: This is a coordination issue and can be handled without revising the NEC.

The requirement should be dealt with in Articles 517, 700, 701, and 708.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

4-58 Log #2533 NEC-P04 **Final Action: Reject**
(230.95(C))

Submitter: Ron Widup, Shermco Inustries, Inc. / Rep. InterNational Electrical Testing Association (NETA)
Comment on Proposal No: 4-167
Recommendation: The panel should accept in principle, rather than reject, the original proposal.
Substantiation: Based on the panel statement I believe the following substantiation and explanation will correct and amend the original proposal to its proper form.

(C) Performance Testing. The ground-fault protection system shall be performance tested when first installed on
site. The test shall be conducted by primary current injection in accordance with instructions that shall be provided with the equipment and shall by conducted by primary current injection. A written record of this test shall be made and shall be available to the authority having jurisdiction.

Original Panel Statement:

It is not always possible to do primary current injection on an installation.
We believe the panel statement "It is not always possible to do primary current injection on an installation" is incorrect. The proper operation of a ground fault protection system can always be field-tested via primary current injection. We perform these particular tests by primary current injection every day in installations all across the country, many times bases on requirements set forth by the AHJ. When required by the AHJ, there has not been an exception allowed because "we could not do it". And to reiterate, the test is neither complicated nor onerous to the installer and/or owner.

Original Panel Statement:

The additional words could be in conflict with the words in the beginning of the same sentence that instruct to follow the instructions with the equipment.

The panel statement indicated the additional words "could be in conflict with the words in the beginning of the same sentence that instruct to follow the instructions with the equipment". Based on the concern of the committee and their corresponding panel statement, the proposed revised text in this comment clarifies the issue brought forth by the committee. So that the potential conflict in wording is eliminated and in order to further clarify the words, the order has been reversed as shown above.

Original Panel Statement:

Mandating a particular method to conduct performance tests is not within the scope of the NEC.
This is not mandating a particular method, rather it is clarifying a critical performance criteria to ensure the proper operation of a ground fault protection system. We are putting forth a proposal and comment related to a technical clarification for proper performance testing of ground fault protection systems, not what particular method is to be used. The technical clarification/error is that the intent of the code [performance testing] is not met if you do not perform by primary current injection.
This is arguably one the most important sections of the Code when it comes to protecting equipment, minimizing damage, and preventing fires. We have case after case where equipment and/or installation issues existed, yet were found and corrected due to field-testing by primary current injection. To not require performance testing by primary current injection would put >1000 amp 600-volt services at risk.
Panel Meeting Action: Reject
Panel Statement: Testing is to conform with instructions provided by the equipment manufacturer. Mandating a particular method to conduct performance tests is not within the scope of the NEC.

The requirement in the code is to test the system, not individual components.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:

ROGERS, J.: I voted with the Panel on this comment and the referenced proposal but in my opinion this discussion warrants further review. As and AHJ I have always been concerned with test methods in the field for GFPE devices especially when dealing with multiple levels of selectivity and GFPE requirements such as may be encountered in a health care facility. The submitters presented a good demonstration of why they believe the test methods they are recommending should be required. However, some of the Panel members both from manufacturing and utilities had sound technical reasoning for not mandating this test method. I would recommend that the submitters return in the next cycle and ask the Panel Chair if he would consider a task group to research all of the technical pros and cons for further review by the Panel.

4-59 Log #2540 NEC-P04 **Final Action: Reject**
(230.95(C))

Submitter: Roderic Hageman, PRIT Service, Inc.
Comment on Proposal No: 4-166
Recommendation: Add new text to read as follows:

(C) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. The test shall be conducted in accordance with instructions that shall be provided with the equipment. A written record of this test shall be made and shall be available to the authority having jurisdiction.

FPN No. 1: Ground-fault protection that functions to open the service disconnect affords no protection from faults on the line side of the protective element. It serves only to limit damage to conductors and equipment on the load side in the event of an arcing ground fault on the load side of the protective element.

FPN No. 2: This added protective equipment at the service equipment may make it necessary to review the overall wiring system for proper selective overcurrent protection coordination. Additional installations of ground-fault protective equipment may be needed on feeders and branch circuits where maximum continuity of electric service is necessary.

FPN No. 3: Where ground-fault protection is provided for the service disconnect and interconnection is made with another supply system by a transfer device, means or devices may be needed to ensure proper ground-fault sensing by the ground-fault protection equipment.

FPN No. 4: See 517.17(A) for information on where an additional step of ground-fault protection is required for hospitals and other buildings with critical areas or life support equipment.

FPN No. 5: Instructions provided by the manufacturer for acceptance testing generally greatly exceed the brief instructions posted near the ground fault protection equipment that are to be used in periodic verification. Acceptance testing generally includes instructions on checking for unwanted ground connections on the load side of the ground fault sensor, verification of correct neutral sensor polarity in four-wire systems, and extensive tests to confirm correct operation of ground fault systems for switchgear with multiple sources.
Substantiation: My original proposal, 4-166, changed wording in the body of 230.95 (C) recommending the addition of several specific test procedures. These procedures, if performed properly will uncover many errors that remain in ground fault systems because they cannot be found by simply pushing a test pushbutton. In the CMP-4 Panel Statement my proposal was rejected with three reasons given. I am responding to those three reasons below and changing my request as shown in the comment above.
Reason 1: It is not always possible to do primary current injection on an installation.
Response: Having tested these systems for much of my 35 year career, I can say that I have never encountered a ground fault system that I could not test by primary current injection. I am willing, and I believe able, to describe to CMP-4 how it can be done to any real system that the Panel can describe**.**

Reason 2: The additional words could be in conflict with the words in the beginning of the same sentence that instruct to follow the instructions with the equipment.

Response: I apologize for not considering fully how my additional text would affect the previous text. I can see that rearranging and further modification may have eliminated that issue. However, rather than pursuing that path, I am suggesting that CMP-4 add still another fine print note that will help AHJs seek out the full manufacturer's performance testing instructions, rather than accepting a pushbutton test that does not adequately test the system.

Reason 3: Mandating a particular method to conduct performance tests is not within the scope of the NEC.

Response: Article 230.95(C) is unusual as evidenced by the existing four fine print notes. Rather than attempt to find other examples of code that mandate specific performance tests, I am requesting an additional fine print note as described in my response to Reason 2.

I have supplied a file that is readily available on the Internet (Note: the file was not received by NFPA). It is General Electric's GEI-48907, "Ground Fault Protection Systems Performance Testing". This is an excellent example of one manufacturer's full instructions on how to acceptance test various types of ground fault protection schemes. There is much literature available that supports the position of full testing of these schemes. I encourage CMP-4 to find a way to ensure that this testing gets accomplished. Perhaps my suggested fine print note is a start.
Panel Meeting Action: Reject
Panel Statement: The comment introduces new text that, if accepted, will not have had an opportunity for public review.

As a FPN, it does not provide any new information or clarity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

Comment on Affirmative:

ROGERS, J.: I voted with the Panel on this comment and the referenced proposal but in my opinion this discussion warrants further review. As and AHJ I have always been concerned with test methods in the field for GFPE devices especially when dealing with multiple levels of selectivity and GFPE requirements such as may be encountered in a health care facility. The submitters presented a good demonstration of why they believe the test methods they are recommending should be required. However, some of the Panel members both from manufacturing and utilities had sound technical reasoning for not mandating this test method. I would recommend that the submitters return in the next cycle and ask the Panel Chair if he would consider a task group to research all of the technical pros and cons for further review by the Panel.

4-60 Log #1788 NEC-P04 **Final Action: Reject**
(230.205(A))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 4-169
Recommendation: Add Exception as follows:

Exception: In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified personnel will be installing and maintaining the pole top switch, a mechanical linkage or electronic mechanism will not be required.

Substantiation: Pole top switches operated by hot sticks are very common in industrial establishments, with no evidence presented that these type of installations are a safety hazard. In industrial establishments, persons knowledgeable about the operation and limitations of pole top switches will be the ones operating the switch. Operation by hot stick is very reliable, which cannot be said for all mechanical linkages or electronic mechanisms. They may introduce a safety hazard by not working when it is necessary to disconnect a pole top switch. The use of mechanical linkages may also cause a problem in an untrained operator trying to operate a non load break pole top switch with this mechanism.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any documented technical rationale for not requiring this enhanced safety device on these installations. There is no rationale to requiring pole top access and hot sticks to open a service disconnecting means.

This is also in conflict with 230.205(B).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

SIGMUND, J.: Pole top switches operated by hot sticks are very common in industrial establishments, with no evidence presented that these type of installations are a safety hazard. 4-61 Log #2553 NEC-P04 **Final Action: Accept**
(230.205(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-169
Recommendation: Continue to accept the proposal.
Substantiation: This comment is to respond to the comment in the voting. The requirement should apply regardless of the degree of training of the on-site electrical staff. Arranging for elaborate means of access to a service disconnect in an emergency, such as a bucket truck and hot sticks, inherently involves unacceptable time delays. The mechanical linkage or remote control actuation options are sufficiently flexible to allow for ready operation without excessive expenditures. Remember that for the 42 years prior to the 2008 NEC, the only placement rule was 230.70(B), which includes a ready access provision with no relief.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1

Ballot Results: Affirmative: 12

10-7 Log #1048 NEC-P10 **Final Action: Accept**
(240.4, FPN)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 10-13
Recommendation: Accept this proposal to add the following new FPN:

FPN: See ICEA P32-382 for information on allowable short-circuit currents for insulated copper and aluminum conductors.
Substantiation: Accept this proposal. The very essence of overcurrent protection invoices the concept of overload, short-circuit, and ground-fault protection. Merely matching a load calculation to a given wire size in an ampacity table is not acceptable without the consideration of possible fault conditions. I have found that most people are unaware that this information is available.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

COOK, D.: The ROP panel action for this item was reject with a panel statement that indicated the submitter had not provided substantiation the tables of Article 310 are inadequate. A review of submitted comment 10-7 reveals no substantiation that the tables are inadequate. Based on ROC panel discussion, I am convinced the ICEA information could possibly provide helpful information to some specific applications, but I'm not convinced the FPN is needed with the general requirements in 240.4. I believe it likely that the users with those special applications are currently aware and using the ICEA information. I can see unnecessary questions raised over designs and installations where conductors are sized based on the requirements in Article 310 and protected based on the requirements in Article 240. If the tables in 310 were inadequate, I would prefer to support enforceable revisions to those tables rather than an unenforceable FPN in 240.4.

HIDAKA, J.: Present product requirements take into account protection of the conductor under short circuit conditions. The submitter has not provided substantiation that the tables of Section 310 are inadequate.

MANCHE, A.: The code panel rejected the original proposal noting the submitter had not provided any substantiation that the tables of Section 310 are inadequate. This comment provides no further substantiation that this FPN should be added to the NEC. The addition of this fine print note will add confusion to the code.

CMP-10 is retracing the exact same tracks taken during the 1987 and 1993 NEC cycle. A review of a few of the points considered during those cycles will establish why these tables should not have been accepted with absolutely no substantiation before CMP-10 in 2009:

1) CMP-10 Panel Statement from Proposal 10-13 in the 1992 TCR with reference to the ICEA documents states "The assumption clearly stated in the documents limit the range of applicability of the documents such that to attempt to use them for all of the protective situations encountered in the code would be a misapplication of the documents."

2) The same discussion also took place in CMP-5 and 6. NEMA's comment 5-103 in the 1992 TCD, addressing the use of the ICEA tables: "In the 1987 Code cycle the ICEA indicated this publications was not suitable for code reference." NEMA was not alone with regard to referencing this issue brought by the ICEA.

The ICEA tables addressed a static electrical system, not a dynamic system as is the case when an overcurrent device is actively protecting the system. It should be noted that conductors do not have withstand ratings. It is a mistake to equate static damage equations (ICEA document) with a withstand rating. Upon the initiation of a fault, an overcurrent protective device will begin to open changing the short circuit current in the conductor. The ICEA formulas or tables do not take that into account, however it is addressed in the UL product standards when a circuit breaker is Listed and the conductors are reviewed for damage during testing. A current limiting fuse or circuit breaker is another example of a dynamic (changing current) protection condition that is not considered by the ICEA formulas and therefore provides false information to the user of the NEC. This comment should be rejected.

10-8 Log #1586 NEC-P10 **Final Action: Reject**
(240.4, FPN)

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 10-13
Recommendation: Continue to reject this proposal.
Substantiation: This proposal should continue to be rejected for the reasons stated in the panel statement, plus two additional reasons. First, the ICEA conductor damage tables referenced in the proposed FPN are based on an initial conductor temperature of 75°C. It is illogical to assume that all the conductors operate at such an elevated temperature. As a matter of fact, in its discussion of the insulation damage formula, the IEEE Green Book (IEEE Std 142-1991, pg. 116) cautions that the initial operating temperature factor in the equation is, "often taken as the conductor maximum operating temperature rating rather than the actual operating temperature. This is a conservative approach but may result in conductor oversizing by one trade size."

This proposal is similar in nature to 2-193. In that submitter's substantiation, he claimed that in some of the testing he had done in homes he had found that the let-through I^2t of 15 amp circuit breakers was as high as 88,804, exceeding the ICEA limit for #14 copper wire. But actual laboratory testing has confirmed that #14 copper wire at room temperature can withstand as much as 250,000 I^2t without insulation damage. Residential type circuit breakers typically let through a small fraction of that amount with a full 10,000 amps of available short circuit current. The let-through in actual applications where the available short circuit current will be considerably lower will likewise be much less than this.

Second, the UL 489 circuit breaker standard requires testing with four feet of wire to insure, among other considerations, that the wire is adequately protected under short circuit conditions. While the UL 248 series of fuse standards does not require similar testing with wire, the short circuit tests in the UL 98 switch standard does, thus insuring that fuses also adequately protect wire under short circuit conditions.

The problem alleged by the submitter is purely theoretical. There is no "real" problem with the listed overcurrent protective devices on the market today, therefore, this proposal is unnecessary.
Panel Meeting Action: Reject
Panel Statement: See Panel Action on Comment 10-7.
To address the submitter's concern that the ICEA tables are limited to a starting temperature of 75°C, the formulas in ICEA P32-382 take into account the initial operating temperature of choice, not only the elevated 75°C starting temperature as incorrectly stated in the Comment.

10-10 Log #2400 NEC-P10 **Final Action: Reject**
(240.7 (New))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 10-24
Recommendation: Add new text to read as follows:
240.7 Equipment Approval. The equipment required or permitted by this Article, after December 31, 2016, shall be acceptable only if listed or field evaluated by a qualified testing laboratory or inspection agency concerned with product evaluation.
Substantiation: Realizing overcurrent devices cannot be evaluated by normal inspection staff in the field, knowing the significance of the overcurrent protective device to the safety of any electrical installation, understanding the cost of listing would never be recovered for some number of unusual overcurrent protective devices, and realizing that time would be required to get through the listing process, this comment attempts to combine several of the proposals from the ROP into a possible solution for approval of overcurrent protective devices. Numerous organizations represented on this committee took public positions opposing self certification. Those positions seem to indicate support of product certification. Based on that support, this comment is offered as an alternative to proposals submitted earlier.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 5
Explanation of Negative:

BORTHICK, M.: My vote on the panel action for this comment is negative. This action relies upon field evaluations to be made by third party entities that have not had the opportunity to comment on the feasibility of the alternatives to listing as stated in the added language contained in the comment.

DARLING, D.: Much of the overcurrent protective devices for medium voltage installations are designed, manufactured, and tested as per applicable ANSI/IEEE C37 series standards. They are part of an engineered system designed for safety, operability and maintainability. As part of the system they may be modified by the manufacturer for proper application. No substantiation has been provided to limit the use of unlisted devices.

ELDRIDGE, C.: There is generally no problem with listed products until 600 volts is exceeded. There are no listed cutouts and most other medium voltage equipment. Even with the long lead time for this to take effect, the end of 2016, there is not likely to be listed equipment for medium voltage equipment.

FREDERICKS, C.: I'm voting against the panel action to accept
The intention may be good, but this requirement is impractical. There is quite a bit of equipment that is covered by this article, including specialized equipment and high voltage equipment, that is not available with a listing, and it would not be practical to make all of it available with a listing.
Field acceptance testing can be very valuable, including for listed equipment, but there is a big difference between the tests and inspections that are done for a field acceptance test vs. those that are associated with a listing.

MANCHE, A.: NEMA agrees with the submitter that a listed product provides further means of ensuring the product complies with the UL product safety standard, however, there has been no substantiation presented that requiring all overcurrent devices be Listed or field evaluated will enhance safety. It should also be noted that if accepted, this language places product Listing and field evaluation on par as being equivalent in terms of requiring acceptance by the authority having jurisdiction. In order to obtain a Listing, destructive testing is necessary to ensure compliance with the safety standard. Field evaluation is not defined within the NEC and therefore becomes a very subjective evaluation that now must be accepted since it is specifically stated in permissive language. Product Listing would no longer be the preferred method for determining compliance by the AHJ.

Comment on Affirmative:

COOK, D.: Based on the public positions of organizations and individual companies represented on CMP-10, we support this comment in our written ballot to acknowledge and require the proven US Electrical Safety System. We also encourage our partners that have risen in support of this time tested "System", as evidenced by their public positions in OSHA's request for information related to proposals allowing Suppliers Declaration of Conformity as an equivalent basis for equipment approval, to continue to support third party certification as a basis for equipment approval.

10-11 Log #2230 NEC-P10 **Final Action: Reject**
(240.13)

Submitter: Malcolm Allison, Ferraz Shawmut / Rep. National Electric Fuse Association
Comment on Proposal No: 10-28
Recommendation: Change the proposed text as shown below and insert as the final paragraph of 240.13
Normal Source ground fault protection on the line side of a transfer switch supplying emergency and legally required standby systems shall be permitted to be restrained for ground faults on the loadside of the transfer switch, provided that audible and visual signal devices indicate whenever a ground fault relay has been restrained, and instructions on the course of action to be taken in the event of an indicated ground fault are located at or near the sensor location.
Substantiation: Designers need to be able to utilize ground fault protection for the normal source, and at the same time, provide selective coordination for emergency and legally required standby devices and all overcurrent devices on their line side. This can easily be accomplished by allowing the normal side ground fault protection to be restrained for ground faults on the load side of the transfer switch (on the emergency and legally required standby system side). While 700.26 and 701.17 permit ground fault protection to be totally omitted on the alternate source side of emergency and legally required standby systems, this comment simply allows the ground fault protection on the normal source side to be restrained for ground faults on the load side of the transfer switch, on the emergency and legally required standby side. This comment will provide the ability to utilize ground fault protection on the normal source side, and selectively coordinate emergency and legally required standby devices with all upstream devices, without endangering any equipment protection on the normal source side of the transfer switch. The requirement for indication is included to correlate with the requirement found in 700.7(D).
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on proposal on 10-28.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-12 Log #1571 NEC-P10 **Final Action: Accept**
(240.13 Exception (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 10-28
Recommendation: Continue to reject this proposal.
Substantiation: This proposal should continue to be rejected, not only for the reasons given in the panel statement, but because it jeopardizes life-safety. The reasons for requiring ground-fault protection of equipment in certain applications are well documented. The damage than can result from a ground fault on such a system may render a substantial portion of the system inoperative, resulting in a lengthy outage potentially worse than that envisioned by the submitter, or worse yet start a life threatening fire. Further, restraint of the GFPE may increase the downstream arc flash hazard for maintenance workers.

The late J.R. Dunki-Jacobs, a recognized authority on ground-fault protection, stated in his book *Industrial Power System Grounding Design Handbook* (pages 186, 189) that, "If an arcing line-to ground fault is initiated in a solidly grounded system on one of three bare buses in a metal enclosure, the hot ionized gases that are developed by the fault can be expected to cause escalation to an arcing multi-phase fault within 1 or 2 cycles (0.0167 to 0.033 sec) of time." He went on to state, "Escalating arcing-ground faults have shown themselves to be extremely devastating…" and "Unquestionably then, engineering attention to their immediate suppression must be proactive and immediate, rather than reactive. Not only for reason of minimizing the released arc energy to maximize personnel safety, but also to avert arcing-fault escalation." The suggestion that an audible and visual signal device would be of any value is ludicrous.

System reliability and blackout prevention can be achieved by proper system design, equipment selection and coordination. The GFPE restraint called for in this proposal is unnecessary and a potential threat to life-safety.

10-16 Log #1761 NEC-P10 **Final Action: Hold**
(240.21(B)(1))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 10-46
Recommendation: Accept this proposal in principle as follows:
240.21(B)(1)(1)(b) should be revised as follows:
"b. Not less than the rating of the switchboard, panelboard, disconnecting means, or control device supplied by the tap conductors or not less than the rating of the overcurrent-protective device at the termination of the tap conductors.
Substantiation: The submitter is correct, the use of the word "device" in 240.21(B)(1)(1)(b) is incorrect. The word "device" is defined in Article 100 as follows:
"**Device.** A unit of an electrical system that carries or controls electric energy as its principal function."

During the discussion on this proposal, it was clear that the panel intends for these "tap conductors" to be provided with overload protection. As presently written, the text permits termination in a device as defined above. The intent of the panel is not met in the present text of this section. The submitter is correct the existing text is confusing and should be clarified.

The present text of 240.21(B)(1)(2) includes more prescriptive text and limits termination of these "tap conductors" to "switchboard, panelboard, disconnecting means, or control devices." The same level of clarity is necessary in 240.21(B)(1)(1)(b). The panel statement refers to the present permission of this section. The submitter seeks only to clarify what is permitted. Clarification is needed.

Panel Meeting Action: Hold

Panel Statement: The panel is only holding the comment. The panel acknowledges that the word "device" leads to ambiguity when it is compared against its definition in Article 100. It is the consensus of the panel that the appropriate resolution for this comment, as well as comments 10-17 and 10-18, would introduce new material that has not been the subject of public review. The panel agreed to form a task group to address this issue during the 2014 revision cycle.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-17 Log #1830 NEC-P10 **Final Action: Hold**
(240.21(B)(1))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 10-46

Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:

(1) Taps Not over 3 m (10 ft) Long. If the length of the tap conductors does not exceed 3 m (10 ft) and the tap conductors comply with all of the following:

(1) The ampacity of the tap conductors is

a. Not less than the combined calculated loads on the circuits supplied by the tap conductors, and

b. Not less than the rating of the switchboard or other equipment providing overload protection ~~device~~ supplied by the tap conductors, or

c. not less than the rating of the overcurrent protective device at the termination of the tap conductors.

(2) The tap conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.

(3) Except at the point of connection to the feeder, the tap conductors are enclosed in a raceway, which shall extend from the tap to the enclosure of an enclosed switchboard, panelboard, or control devices, or to the back of an open switchboard.

(4) For field installations, if the tap conductors leave the enclosure or vault in which the tap is made, the ampacity of the tap conductors is not less than one-tenth of the rating of the overcurrent device protecting the feeder conductors.

Substantiation: The conditions under which 10-ft tap conductors are permitted to be installed without overcurrent protection appropriate to the ampacity of the tapped conductors where the conductors originate needs to be clarified. The present word "device" must be replaced with more descriptive terms since the definition of "device in Article 100 is, "A unit of an electrical system that carries or controls electric energy as its principal function." Though not intended by 240.24(B)(1)(1)b, the broad definition of device includes wire and other conductors such as busway.

Article 408 permits switchboards to be used without overcurrent protection on their supply side. The phrase "Other equipment providing overload protection" in the Comment might include "A combination of a current transformer and overcurrent relay shall be considered equivalent to an overcurrent trip unit" as stated in 240.15(A).

Panelboards are required to have overcurrent protection on their supply side in 408.36 as are motor control centers in 430.94 and industrial control panels in 409.21. So, it does not appear this equipment can be used for termination of tap conductors unless the conductors terminate in overcurrent protection as provided in 240.21(B)(1)(1)b.

It is recommended that the list below 240.21(B)(1)(1) include a (c) to separate the items in the list.

Panel Meeting Action: Hold

Panel Statement: See panel action and statement on Comment 10-16.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-18 Log #2865 NEC-P10 **Final Action: Hold**
(240.21(B)(1))

Submitter: Don Ganiere, Ottawa, IL

Comment on Proposal No: 10-46

Recommendation: Accept in principle and revise as shown below:

240.21(B)(1)(1)(b) should be revised as follows:

"b. Not less than the rating of the ~~device~~ switchboard, panelboard, disconnecting means, or controller supplied by the tap conductors or not less than the rating of the overcurrent-protective device at the termination of the tap conductors.

Substantiation: The submitter is correct that the use of the word device in the existing text is not correct. The word is much too broad in scope to be used in this code section. Looking at the definition of device in Article 100, we see that it can mean just about anything. The code rule needs to tell the code user exactly what the tap conductor is permitted to be terminated on. The proposed wording of the submitter was a good start, but it needs to be expanded upon a bit. The panel statement says that the removal of the word device and its replacement with specific equipment that the tap conductor can be terminated on narrows the use of the section beyond what the current rule say is correct, however this "narrowing" is exactly what this section needs. This change will give the section some much needed clarity.

Panel Meeting Action: Hold

Panel Statement: See panel action and statement on Comment 10-16.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-19 Log #1762 NEC-P10 **Final Action: Hold**
(240.21(C)(2))

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 10-52

Recommendation: This proposal should be accepted in principle by retaining the part accepted in the ROP and by revising 240.21(C)(2) as follows:

240.21(C)(2)(1)(b) should be revised as follows:

"b. Not less than the rating of the switchboard, panelboard, disconnecting means, or control device supplied by the secondary conductors or not less than the rating of the overcurrent-protective device at the termination of the secondary conductors."

Substantiation: The submitter is correct, the use of the word "device" in 240.21(C)(2)(1)(b) is incorrect. The word "device" is defined in Article 100 as follows:

"**Device.** A unit of an electrical system that carries or controls electric energy as its principal function."

During the discussion on this proposal, it was clear that the panel intends for these "tap conductors" to be provided with overload protection. As presently written, the text permits termination in a device as defined above. The intent of the panel is not met in the present text of this section. The submitter is correct the existing text is confusing and should be clarified.

The present text of 240.21(C)(2)(2) includes more prescriptive text and limits termination of these "tap conductors" to "switchboard, panelboard, disconnecting means, or control devices." The same level of clarity is necessary in 240.21(C)(2)(1)(b). The panel statement refers to the present permission of this section. The submitter seeks only to clarify what is permitted. Clarification is needed.

Panel Meeting Action: Hold

Panel Statement: The panel is only holding the comment. The panel acknowledges that the word "device" leads to ambiguity when it is compared against its definition in Article 100. It is the consensus of the panel that the appropriate resolution for this comment, as well as comments 10-20 and 10-21, would introduce new material that has not been the subject of public review. The panel agreed to form a task group to address this issue during the 2014 revision cycle.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-20 Log #1831 NEC-P10 **Final Action: Hold**
(240.21(C)(2))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 10-52

Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:

(2) Transformer Secondary Conductors Not over 3 m (10 ft) Long. If the length of secondary conductor does not exceed 3 m (10 ft) and complies with all of the following:

(1) The ampacity of the secondary conductors is

a. Not less than the combined calculated loads on the circuits supplied by the secondary conductors, and b. Not less than the rating of the switchboard or other equipment providing overload protection ~~device~~ supplied by the secondary conductors, or

c. not less than the rating of the overcurrent-protective device at the termination of the secondary conductors

(2) The secondary conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.

(3) The secondary conductors are enclosed in a raceway, which shall extend from the transformer to the enclosure of an enclosed switchboard, panelboard, or control devices or to the back of an open switchboard.

(4) For field installations where the secondary conductors leave the enclosure or vault in which the supply connection is made, the rating of the overcurrent device protecting the primary of the transformer, multiplied by the primary to secondary transformer voltage ratio, shall not exceed 10 times the ampacity of the secondary conductor.

Retain the informational Note.

Substantiation: The conditions under which 10-ft transformer secondary conductors are permitted to be installed without overcurrent protection appropriate to the ampacity of the secondary conductors where the conductors originate needs to be clarified. The present word "device" must be replaced with more descriptive terms since the definition of "device in Article 100 is, "A unit of an electrical system that carries or controls electric energy as its principal function." Though not intended by 240.24(C)(2)(1)b, the broad definition of device includes wire and other conductors such as busway.

Article 408 permits switchboards to be used without overcurrent protection on their supply side. The phrase "Other equipment providing overload protection" in the Comment might include "A combination of a current transformer and overcurrent relay shall be considered equivalent to an overcurrent trip unit" as stated in 240.15(A).

Panelboards are required to have overcurrent protection on their supply side in 408.36 as are motor control centers in 430.94 and industrial control panels in 409.21. So, it does not appear this equipment can be used for termination of tap conductors unless the conductors terminate in overcurrent protection as provided in 240.21(C)(2)(1)b.

It is recommended that the list below 240.21(C)(2)(1) include a (c) to separate the items in the list.

10-21 Log #2867 NEC-P10 **Final Action: Hold**
(240.21(C)(2))

Submitter: Don Ganiere, Ottawa, IL
Comment on Proposal No: 10-52
Recommendation: This proposal should be accepted in principle by retaining the part accepted in the ROP and by revising 240.21(C)(2) as follows:
240.21(C)(2)(1)(b) should be revised as follows:
"b. Not less than the rating of the ~~device~~ switchboard, panelboard, disconnecting means, or controller supplied by the secondary conductors or not less than the rating of the overcurrent-protective device at the termination of the secondary conductors."
Substantiation: The submitter is correct that the use of the word device is not suitable for this section as a "device" can be almost anything per its Article 100 definition. The section needs clarification and the replacement of the word device with a specific list of equipment that a tap conductor is permitted to be terminated on would provide the clarity that this section requires.
Panel Meeting Action: Hold
Panel Statement: See panel action and statement on comment 10-19.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-22 Log #2554 NEC-P10 **Final Action: Reject**
(240.21(C)(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 10-53
Recommendation: The proposal should be accepted.
Substantiation: The panel statement is correct that the revised wording precludes other equipment than switchboards. The substantiation was clear on this point. This rule is routinely being applied improperly because past practice allowed for other arrangements. The procedure entered the NEC as 240.21 Exception No. 11 in the 1987 NEC, long before the prohibition on tapping a tap entered the NEC (1999 edition) and even longer before the individual protection rule applied to all panelboards (2008 NEC). At this time the switchboard is the only permissible application. The mention of "switchgear" in the panel statement is incorrect because this term applies to over 600 volt equipment and has no relevance to this section.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on proposal 10-53. In addition, the term "switchgear" is not restricted to greater than 600 volts.

(240.21(D))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 10-54
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-24 Log #1704 NEC-P10 **Final Action: Reject**
(240.21(D) and (E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 10-55
Recommendation: Delete (D) and (E).
Substantiation: "Permitted" does not constitute a requirement per 90.5(B) and is not enforceable. Section 230.91 relates to location, not specific conductor protection. 230.90 requires service conductor overload protection, not overcurrent protection. Service conductors do not have overcurrent protection. 368.17 already applies and is mandatory. Feeder taps are covered by 240.21(B).
Panel Meeting Action: Reject
Panel Statement: The general requirement in 240.21 states that "overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply." Deleting 240.21 (D) and (E) would create a conflict with 230.91 and 368.17 by eliminating permission for the overcurrent protection to be located other than where the conductors receive their supply
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

13-1 Log #78 NEC-P13 **Final Action: Accept**
(240.21(G))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 10-57
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 13 for action in Article 445.

This action will be considered by the Code-Making Panel 13 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The Panel accepts the direction of the NEC Technical Correlating Committee to act on Proposal 10-57 and rejects Proposal 10-57.
Panel Statement: No technical substantiation was provided in the proposal to permit conductors to be sized at 100 percent of the rating of the overcurrent protective device where the conductors will be terminated. These unprotected conductors may have to carry the full value of the generator rating until protective relays or other overload sensing devices shut the generator down. At the very least, these unprotected conductors could incur insulation damage during high values of fault current on the line side of the overcurrent protective device. See the panel action on Comment 13-13.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

10-25 Log #2102 NEC-P10 **Final Action: Reject**
(240.24(F))

Submitter: Larry LeVoir, City of Irvine
Comment on Proposal No: 10-68
Recommendation: Accept the proposal.
Substantiation: While my premise regarding modern building codes overlapping could be construed as applying code wide in the NEC, I am referring to a specific case here. This also has nothing to do with maintaing the integrity of fire resistive construction. The IBC Building Codes used by much of the nation do not permit the installation of equipment foreign to the stairwell in the stairwell. Yet the NEC allows it under the right conditions. This is a conflict that could lead installers down the wrong path of installation. In single family construction this practice could be permitted by the bldg code and possibly in some office occupancies.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action and statement on proposal 10-68. Furthermore, this section of the NEC does not specifically address stairwells, it ensures equipment with overcurrent protection devices is not located over steps.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-26 Log #2555 NEC-P10 **Final Action: Reject**
(240.24(F))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 10-67
Recommendation: Accept the proposal in principle. Add the following sentence to the end of the present rule: "Where located above a landing, the landing shall have a width and depth below the overcurrent devices in accordance with 110.26(A)(2) and 110.26(A)(1) respectively."
Substantiation: The submitter appreciates the information conveyed in the panel statement, and agrees that 110.26(A)(2) is the most relevant dimension. In addition, workers should not be in danger of falling if they step backwards while working. However, there are no requirements in the NEC that addresses the width and depth of a landing used as workspace, and not all landings meet these minimum workspace requirements. We can all readily agree that an inadequately sized landing is an unsafe workspace for this equipment.
Panel Meeting Action: Reject
Panel Statement: Working space is already addressed in 110.26 and applies in general to all electrical installations. Although the committee agreed that a landing with 110.26 working space could be an acceptable location, it is not the intent of the committee to define the location further without additional substantiation that supports such clarification is necessary.
Number Eligible to Vote: 12

10-26a Log #CC1000 NEC-P10 **Final Action: Reject**
(240.35)

TCC Action: Based on the panel action of Code-Making Panel 1 to "Accept" Comment 1-115, the Technical Correlating Committee directs that Comment 10-26a be reported as "Reject".
See the panel action on Comment 1-115 which accepted the necessary text in 110.24.
Submitter: Code-Making Panel 10,
Comment on Proposal No: 10-72
Recommendation: Revise text to read as follows:
240.35 Available Fault Current.
(A) Marking. Service equipment in other than dwelling units shall be legibly marked in the field with the maximum available fault current. The field marking(s) shall include the date the fault current calculation was performed and be of sufficient durability to withstand the environment involved.
(B) Modifications. When modifications to the electrical installation occur, that affect the maximum available fault current at the service, the maximum available fault current shall be verified or recalculated as necessary to ensure the service equipment interrupting ratings are sufficient for the maximum available fault current at the line terminals of the equipment. The required field marking(s) in (A) above shall be adjusted to reflect the new level of maximum available fault current.
Exception: The field marking requirements in (A) and (B) shall not be required in industrial installations where conditions of maintenance and supervision ensure that only qualified persons service the equipment.
Substantiation: The panel agrees with the text and the recommended placement of the requirement as developed by the task group as seen in Comment 1-115 and accepted by CMP 1 at the ROC meeting.
Panel Meeting Action: Accept
Panel Statement: The panel recognizes that the comment was accepted by CMP 1 at the ROC meeting. However, if it failed the CMP 1 letter ballot, CMP 10 places the same text in 240.35.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ELDRIDGE, C.: This proposal should be rejected based on the following rationale.
1. Some utilities publish tables of available fault current at the secondary terminals of the lowest impedance transformers they provide based on an infinite supply bus of radial distribution systems. These are usually for service voltages below 600 volts. For example, see GB7-060 in our Electric Service and Meter Manual http://apps.iplpower.com/goldbook/GB7%20Drawings.pdf. Higher voltage services, i.e. greater than 1000 volts are engineered where the utility would provide available characteristics at the time of design/installation from the supply at the service point. These two provisions can change, as the utility system is dynamic. Those described for under 600 volts have just been changed in my Company to reflect the new efficiency standards of distribution transformers.
2. With the advent of Smart Grid systems, the available fault current can change very quickly. Posting of the maximum available fault current supports the mistaken belief that that is the worst case. While it is for equipment ratings, it is not for arc hazard analysis. It can be likely that posted values on the equipment would be used for arc hazard energy calculations rather than equipment upgrades. It is better for a customer to be talking with the utility when upgrades are planned rather than assuming the posted values on the equipment can be used.
3. A customer is responsible to consult with their serving utility when working on their service connection that includes the premises service equipment. There are just too many variables that can change when making fault current calculations.
4. For equipment ratings, the maximum available fault current at any location would need to be considered and include motor and parallel generator contributions from the connections to premises wiring on the load side of the service point. This is something the premises owner will need to calculate based on their connected equipment.
5. Field marking equipment whether at the service equipment or elsewhere in the premises wiring would need to consider points 1 and 4 above.
6. Since NEC sections 90.8, 110.9, and 110.10 apply whether it is a new installation or altering of premises wiring, it should be sufficient for enforcement and examination under 90.4 and 90.7 to ensure equipment meets the capability of the maximum available fault current at any location within. Dated field marking is not necessary in this regard and its information could be misapplied in the future if values are not verified or used for other purposes than the intent of the equipment's withstand rating. Although the concept of the proposal is plausible, it appears this field marking requirement is a design and/or work practice issue that is not covered by the NEC (see 90.1(C) and 90.2(A)).

10-27 Log #606 NEC-P10 **Final Action: Reject**
(240.35)

Submitter: Donald R. Cook, Pelham, AL
Comment on Proposal No: 10-72
Recommendation: The task Group identified in the following substantiation recommends rejection of Proposal 10-72 to achieve correlation with Proposal 1-183.
Substantiation: Proposals 1-183 and 10-72 propose an available short circuit current marking requirement for electrical equipment. Both were Accepted in Principle by CMP-1 and CMP-10, respectively. The Technical Correlating Committee directed a Task Group be formed to determine if comments could be submitted to correlate the two actions. The Task Group was made up of the following members: Neil LaBrake, Michael Anthony, Mike Johnston, Vince Saporita, Alan Manche, Carl Fredericks, Jim Dollard, Gil Moniz, and Donny Cook. The task group compared the two Panel Actions and developed Public Comments for each action. The task group recommends the marking requirement be located in 110.24 rather than 240.35 based on short circuit current requirements that currently exist in 110.9 and 110.10 and marking requirements that currently exist in 110.22. Based on that consensus, the Task Group recommends Proposal 10-72 not be accepted for a new 240.35. See companion comment for Proposal 1-183 (copy provided).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel continues to support the concept in proposal 10-72 as modified by comment 1-115. See panel action and statement on 10-26a.

(240.35 (New))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Comment on Proposal No: 10-72
Recommendation: Reject this proposal and delete suggested text.
Substantiation: This proposal should be rejected based on the following rationale.
1. Some utilities publish tables of available fault current at the secondary terminals of the lowest impedance transformers they provide based on an infinite supply bus of radial distribution systems. These are usually for service voltages below 600 volts. For example, see Section 9.3 of our Company's ESB 750 (http://www.nationalgridus.com/electricalspecifications). Higher voltage services, i.e. greater than 1000 volts are engineered where the utility would provide available characteristics at the time of design/installation from the supply at the service point. These two provisions can change, as the utility system is dynamic. Those described for under 600 volts are now being changed in our Company to reflect the new efficiency standards of distribution transformers.
2. With the advent of Smart Grid systems, the available fault current can change very quickly. Posting of the maximum available fault current supports the mistaken belief that that is the worst case. While it is for equipment ratings, it is not for arc hazard analysis. It can be likely that posted values on the equipment would be used for arc hazard energy calculations rather than equipment upgrades. It is better for a customer to be talking with the utility when upgrades are planned rather than assuming the posted values on the equipment can be used.

3. A customer is responsible to consult with their serving utility when working on their service connection that includes the premises service equipment. There are just too many variables that can change when making fault current calculations.

4. For equipment ratings, the maximum available fault current at any location would need to be considered and include motor and parallel generator contributions from the connections to premises wiring on the load side of the service point. This is something the premises owner will need to calculate based on their connected equipment.

5. Field marking equipment whether at the service equipment or elsewhere in the premises wiring would need to consider points 1 and 4 above.

6. Since NEC sections 90.8, 110.9, and 110.10 apply whether it is a new installation or altering of premises wiring, it should be sufficient for enforcement and examination under 90.4 and 90.7 to ensure equipment meets the capability of the maximum available fault current at any location within. Dated field marking is not necessary in this regard and its information could be misapplied in the future if values are not verified or used for other purposes than the intent of the equipment's withstand rating.

Although the concept of the proposal is plausible, it appears this field marking requirement is a design and/or work practice issue that is not covered by the NEC (see 90.1(C) and 90.2(A)).

Panel Meeting Action: Reject

Panel Statement: The marking requirement is not included for the purpose of an arc flash hazard analysis. This marking is for equipment only.

The panel continues to support the concept in proposal 10-72 as modified by comment 1-115. See panel action, substantiation and statement on comment 10-26a.

10-29 Log #1492a NEC-P10 **Final Action: Reject**
(240.35)

Submitter: Timothy M. Croushore, Allegheny Power

Comment on Proposal No: 10-72

Recommendation: Please reconsider these two proposals and reject them.

Substantiation: I would like to commend both CMP-1 and CMP-10 for trying to resolve this issue. We agree that the issue of incident energy poses a potential hazard for electrical workers working on exposed and energized electrical components of electrical equipment. However, marking of the equipment will not resolve this issue. This is because the electrical supply system is a dynamic electrical system and source fault current will not be a constant. With the pressure on the electric utility to have dynamically reconfigurable supply systems through "smart-grid" technologies, the dynamics of the electrical supply system and the resultant changes in source fault current will be occurring. Rather than a marking, which will be wrong and will lead the qualified person into a false situation, we recommend the electrical industry develop a dynamic fault current and incident energy measuring device.

This device could be portable or permanently wired and work very similarly to a SureTest branch circuit analyzer (example Model 61-165). It can measure available short circuit current on a branch circuit without tripping a circuit breaker or operating a fuse. Rather than relying on a "marking" on the equipment, a device such as this one at the service will tell the actual available short circuit current available. Knowing the actual short circuit current available will provide the qualified electrical person the correct information about the potential hazard the individual situation poses.

A companion comment has been sent to Code-Making Panel 1 regarding the rejection of Comment 1-183 to section 110.24.

Panel Meeting Action: Reject

Panel Statement: The marking requirement is not included for the purpose of an arc flash hazard analysis. This marking is for equipment only.

The panel continues to support the concept in proposal 10-72 as modified by comment 1-115. See panel action, substantiation and statement on comment 10-26a.

10-30 Log #1797 NEC-P10 **Final Action: Reject**
(240.35 (New))

Submitter: Michael P. Walls, American Chemistry Council

Comment on Proposal No: 10-72

Recommendation: If the new text from Proposal 10-72 is retained in Article 240, revise the Exception at the end of the text accepted by the panel to read as follows:

Exception: ~~In installations with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment, m~~Marking on the enclosure is not required if documentation of 240.35(1) and (2) is available upon request to the authority having jurisdiction.

Substantiation: ACC agrees with the Explanation of Negative provided by Mr. Fredericks. Available documentation containing the required information, but not marked on the equipment, should be accepted to meet the intent of this requirement for all facilities.

Written safety procedures are certainly valuable, but whether or not they exist for an installation is not necessarily related to whether or not separate short circuit documentation can be as effective, or more effective, than a label on the equipment.

Panel Meeting Action: Reject

Panel Statement: The Comment provides no substantiation to justify the reduced safety that would result by allowing installations without written safety procedures and qualified personnel to utilize the exception. The panel continues to support the concept in proposal 10-72 as modified by comment 1-115. See panel action, substantiation and statement on comment 10-26a.

ELDRIDGE, C.: See my comment on 10-26a.

10-32 Log #2267 NEC-P10 **Final Action: Accept in Principle in Part**
(240.35 (New))

Submitter: Michael J. Farrell, III, Lucas County Building Regulations

Comment on Proposal No: 10-72

Recommendation: Continue to accept the proposal as modified by the panel's "Accept in Principle in Part".

Substantiation: (1) The concept for the original proposal is critical to assure that equipment interrupting and short-circuit current ratings are adequate, as was evidenced by acceptance of similar proposals by both CMP-1 and CMP-10.

(2) A Task Group, consisting of CMP-1 and CMP-10 members, met at the direction of the TCC. It decided to correlate the requirements between the panels and place the requirements in Article 110.

(3) The proposal, as modified by CMP-10, should continue to be accepted by CMP-10, just in case CMP-1 does not continue to pass a similar proposal.

(4) If Panel 10 passes this comment and if CMP-1 continues to accept their original proposal (or passes the comment developed by the task group), the TCC is requested take action to nullify the action taken on this comment by CMP-10.

(5) Passage of this comment will assure that this much needed requirement will be found somewhere in the NEC, either in Article 110 or in Article 240. The TCC is requested to assure that it is not in both.

Panel Meeting Action: Accept in Principle in Part

The panel rejects the submitters recommendation to continue to accept in principal in part proposal 10-72.

Panel Statement: The panel continues to support the concept in proposal 10-72 as modified by comment 1-115. See panel action, substantiation and statement on comment 10-26a. The panel concludes that it has met the goals of the submitters substantiation.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 10-72
Recommendation: The proposal should be rejected.
Substantiation: This wording is unenforceable because the labeling that it will require may or may not become obsolete after it is applied, through no fault of any party to the process. The most frequent source of increased available fault currents is utility activities on their networks. If the day after the final inspection the utility upgrades its transformers and primary distribution outside the facility, the labeling will be obsolete from that day forward.

In this case, the obsolescence of the labeling creates a direct hazard, because those servicing the equipment will tend to believe the label; they will have entered a fool's paradise. There does not appear to be any way to make this proposal practicable, unfortunately. There is no substitute for contemporaneous application of 110.9 and 110.10, which in turn requires communication with the utility.
Panel Meeting Action: Reject
Panel Statement: The panel continues to support the concept in proposal 10-72 as modified by comment 1-115. See panel action, substantiation and statement on comment 10-26a.
Number Eligible to Vote: 12

10-34 Log #2886 NEC-P10 **Final Action: Reject**
(240.35 (New))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Comment on Proposal No: 10-72
Recommendation: PLEASE REJECT THIS PROPOSAL.
Substantiation: I KNOW MR. FARRELL PERSONALLY AND WHILE I APPLAUD HIS EFFORTS OTHERS WHO FOLLOW US WILL USE THIS AS THE INFORMATION THEY NEED FOR ARC FLASH PROTECTION. THAT CAN BE A DEADLY MISTAKE, AND IT MIGHT EVEN BE SUCH THAT NO ONE IN THE BUILDING IS INVOLVED. IF THE UTILTY OVERBUILDS THE PRIMARY DISTRIBUTION SYSTEM, OR CHANGES THE TRANSFORMER, OR THE SERVICE DROP CONDUCTORS GET CHANGED DURING REPAIRS AFTER A STORM, ANY OF THESE CAN AFFECT THE AVAILABLE FAULT CURRENT. IN TURN, A LOWER FAULT CURRENT CAN ACTUALLY INCREASE THE ARC FLASH HAZARD DUE TO THE LONGER CLEARING TIME ON THE UPSTREAM DEVICE. PLUS, I BELIEVE THIS WOULD BE WAY TOO COSTLY TO IMPLEMENT, ESPECIALLY ON A SIMPLE ADDED CIRCUIT OR MINOR MODIFICATION TO THE WIRING SYSTEM. PLUS, WHETHER WE LIKE IT OR NOT.
Panel Meeting Action: Reject
Panel Statement: The panel continues to support the concept in proposal 10-72 as modified by comment 1-115. See panel action, substantiation and statement on comment 10-26a.

10-35 Log #1420 NEC-P10 **Final Action: Reject**
(240.76 (New))

Submitter: Thomas F. Mueller, Southern Company Services
Comment on Proposal No: 10-82
Recommendation: This paragraph/proposal should be completely rewritten as follows and the fine print note deleted:

240.87 Non-Instantaneous Trip. When design and construction of a facility involves non-instantaneous trip style breakers, a fault current study shall be completed and made available to the authority having jurisdiction that details the design enhancements included which can be used to limit arc flash energy in the event energized work must be performed anywhere on the system.
Substantiation: The problem of assessing available arc flash energy cannot be simplified by the addition of maintenance switches or zone selective interlocking. In other words, it is ludicrous to assume that energized work can be undertaken while wearing rubber gloves, a cotton shirt and jeans, as long as the maintenance switch is thrown. There are many options available to limit arc flash energy. The proposal as currently accepted will tend to limit those options to the three listed and compliance will provide the appearance of safety in design while not actually mandating a system that can be worked safely. When an electrical system is large enough to require the use of short time breakers, it is also capable of delivering deadly arc flash blasts. Such systems are complicated and beyond the scope of cookbook design. Perhaps coordination can be adjusted such that available arc flash energy is reduced. Perhaps upstream or downstream relaying can be installed specifically to limit arc flash energy when energized work is to be done. These are but two options that provide meaningful protection from hazardous arc flash blasts, but are not on the proposed list.

And even if there are only instantaneous trip breakers involved in a complex system, an arc flash study should still be completed. An arc flash by its very nature has some amount of resistance to current flow. The reduced current flow while high enough to cause great damage, may not be high enough for an instantaneous trip of a thermal magnetic or electronic circuit breaker. An arc flash study would determine that the instantaneous trip setting of such breakers would need to be lowered in order for energized work to proceed.

The company I work for has designed, built, and operated many, many industrial style plants where the electrical design includes short-time delay breakers. Our company has an exemplary safety record so we are well aware of the arc flash hazards that are present when and if work involves energized electrical equipment. We have used all of the protection options listed in the proposal but not necessarily for arc flash mitigation. We have a robust arc flash protection program in place that involves both system design and an informed work force. That design has been effective but in almost all cases, did not include protection mandated by Proposal 10-82 as accepted. Without change, the proposal as accepted will require the addition of expensive components to the electrical system under the guise of safety, while not addressing the problem. That is, can a piece of equipment be worked on safely while energized, and if so, what precautions should be taken to limit the arc flash energy and what PPE should that employee be wearing?
Panel Meeting Action: Reject
Panel Statement: The proposed new requirement does not require the use of power circuit breakers without an instantaneous, but rather will require the use of one of the three list items (or approved equivalent means) whenever a power circuit breaker without an instantaneous trip is used. The new requirement does not encourage energized electrical work, but rather provides reduced energies if an arc-flash should occur during required work on energized equipment. A fault current study is always required in order to determine equipment interrupting ratings and short-circuit current ratings, to meet 110.9 and 110.10 respectively. See panel action on Comment 10-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ELDRIDGE, C.: See my comment on 10-38.
FREDERICKS, C.: I'm voting against this panel action to reject.

The submitter here made several excellent points including reference to experience that will be typical of Supervised Industrial Installations, that I don't believe the Panel statement well addressed. The intent should be to protect the worker and to allow knowledgeable parties latitude as to how that will be accomplished. Please see also my voting explanations on comments 10-44 and 10-38.

10-36 Log #1611 NEC-P10 **Final Action: Hold**
(240.87 (New))

Submitter: Christopher G. Walker, Eaton Corp.
Comment on Proposal No: 10-82
Recommendation: Modify the Panel's accepted text to read as follows:

240.87 ~~Non-instantaneous Trip~~ Arc Energy Reduction: Where a circuit breaker ~~without an instantaneous trip~~ rated for, or can be adjusted to, 1,000 Amperes or more is utilized, one of the following or approved equivalent means shall be provided:

(1) Zone-selective interlocking
(2) Differential relaying
(3) Energy-reducing maintenance switching with a local status indicator

FPN: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to operate faster while the worker is working within an arc flash boundary as defined in NFPA 70E, and then to set the circuit breaker back to normal setting after the potentially hazardous work is complete.
Substantiation: The Panel Action recognizes the importance of having electrical circuits open without delay in order to minimize arc flash hazards. This comment is focused on requiring the use of either currently available or future devices, technologies or design approaches that may be incorporated to further minimize arc flash hazards, regardless of the circuit breaker's Instantaneous or Short-Delay capabilities. The Panel's action focuses on only Non-Instantaneous circuit breakers may exclude certain circuit breakers that have an instantaneous trip, yet may have a higher amount of let-through energy. This comment also addresses Mr. Cook's Comment on the Affirmative: *"As an enforcement representative I have some concern about the difficulty of identifying non-instantaneous trip circuit breakers in the field."* These devices and technologies would be used to further enhance existing design and operational safety options such as the use of PPE and other arc resistant equipment per NFPA 70E. This comment is focused on requiring the use of these devices and technologies of circuit breakers rated for, or can be adjusted to, 1,000 Amperes or more. This aligns with the rating established for Ground-Fault Protection of Equipment per NEC 230.95.

Panel Meeting Action: Hold
Panel Statement: The panel does not accept the proposed new title or the inclusion of all circuit breakers rated for or adjustable to 1,000 amperes or more. The proposed revision was not suggested or addressed in the proposal stage. In accordance with the Regulations Governing Committee Projects 4.4.6.2.2, this comment is held for process in the next cycle where it will receive the necessary public review.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-37 Log #1880 NEC-P10 **Final Action: Reject**
(240.87 (New))

Submitter: Jason D'Antona, Partners HealthCare System Inc.
Comment on Proposal No: 10-82
Recommendation: Delete 240.87 in its entirety.
Substantiation: Mandated inclusion of these prescribed methods to reduce arc-flash hazards, poses a serious conflict with the requirements of Articles 620.62 (selective coordination of elevator driving machines), 695.3(C)(3) (selective coordination of fire pump over current protection devices), 700.27(selective coordination of Emergency Systems), 701.18 (selective coordination of Legally Required Stand-By Systems) and 708.54 (selective coordination of Critical Operations Power Systems). If implemented, the allowed use of energy-reducing maintenance switches will allow over-current protection devices (OCPD) to remain in an uncoordinated state while the switch is activated. Allowing this uncoordinated state on systems defined in Articles 620.62, 695.3(C)(3), 700.27, 701.18 and 708.54 leaves those electrical systems vulnerable to extended electrical outages-thus exposing building occupants to hazards.

In cases where instantaneous trip functions are not used on feeder circuit breakers in order to achieve selective coordination, zone selective interlock and bus-differential relaying may not be possible or practical, especially if down stream devices are located in remote locations.
Panel Meeting Action: Reject
Panel Statement: The proposed new requirement does not require that power circuit breakers without instantaneous trip be used, but that when they are utilized, one of the three arc-flash energy reducing methods (or approved equivalent means) also be utilized. These methods do not interfere with selective coordination of critical systems, but rather support the ability of the systems to selectively coordinate. See panel action on Comment 10-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ELDRIDGE, C.: See my comment on 10-38.
FREDERICKS, C.: I'm voting against this panel action to reject.
Please see my voting explanations on comments 10-35, 10-44 and 10-38.

10-38 Log #1911 NEC-P10 **Final Action: Reject**
(240.87 (New))

Submitter: Ed Larsen, Square D Company/Schneider Electric
Comment on Proposal No: 10-82
Recommendation: Reject this proposal.
Substantiation: This proposal is a significant departure from the purpose of the NEC. The panel appears to be attempting to write a system design requirement that purports to accomplish some level of improved worker safety. However, it should be fully recognized that this is outside the purpose of the NEC. As stated in NEC 90.1, the purpose of the NEC is "practical safeguarding of persons and property from hazards arising from the use of electricity". A circuit breaker with a non-instantaneous function can be fully and safely utilized within the electrical system. In other words, the installation of a non-instantaneous trip circuit breaker does the job of protecting persons and property from hazards arising from the use of electricity. There is absolutely no basis to limit the use of the product as related to the electrical system installation requirements. The use of a non-instantaneous trip circuit breaker may result in low energy levels or in high energy levels depending on the system parameters. In either case, there are worker procedures and practices contained in NFPA 70E and OSHA requirements to handle the level of incident energy. Article 240 covers overcurrent protection requirements – not worker safety or incident energy.

Furthermore, this proposal will place an unnecessary burden on facility owners, operators and maintainers and should be rejected for a number of additional reasons.

1. Many companies strictly prohibit working on energized equipment, making this requirement totally unnecessary for them.

2. Others require their electrical maintenance workers to wear a minimum level of PPE. If the equipment will have an HRC equal to or lower than that, providing a means to reduce the hazard still further should not be required for them.

3. Many power systems are now being designed from the start with a low incident energy level by reducing the size of transformers or other design techniques that do not require the introduction of add-on systems like energy reducing maintenance switches or ZSI.

4. This proposal says nothing about reducing the Hazard Risk Category in fusible systems. It is a well documented fact that the use of Class L fuses can result in significantly higher incident energy levels that do equivalently sized circuit breakers, even without employing energy reducing maintenance switches or ZSI. The panel action requires a higher level of performance for systems protected by circuit breakers as compared to systems protected by fuses without any data or performance documentation to support such a difference.

5. This proposal does not address the need to provide multiple levels of energy reduction so as to minimize the impairment of selective coordination in the system.

6. The use of energy reducing maintenance switches can lead to the need for confusing labeling and operating instructions, thereby increasing the possibility that a worker will be inadequately protected when they think the equipment they are about to work on has been placed into a "safer" mode, but actually hasn't.

Panel Meeting Action: Reject
Panel Statement: The intent of this new requirement is to provide a reduced clearing time when and where justified energized work may be necessarily performed on equipment supplied by circuit breakers without an instantaneous trip capability. This requirement is indeed within the scope of the NEC as it is practical to provide a means to reduce the clearing time of circuit breakers without an instantaneous trip setting when and where justified energized work may be necessarily performed on equipment supplied by circuit breakers without an instantaneous trip capability.
This requirement does not limit in any manner the use of a circuit breaker without an instantaneous trip capability. Article 240 addresses overcurrent protection and is the appropriate location for a general requirement of this type. This requirement does not place a burden on any facility owner. Even companies that may prohibit energized work as a basic principle will be required to troubleshoot problems which will include voltage testing which is an energized task. Providing a means to reduce the clearing time when where justified energized work may be necessarily performed on equipment supplied by circuit breakers without an instantaneous trip capability is prudent and well within the scope of the NEC. This requirement does not impair in any way a selectively coordinated system. When an electrical worker enters equipment that is energized, regardless of whether it is selectively coordinated or not, the reliability of the system has been compromised. The use of energy reduction maintenance switches as well as all other methods will reduce the clearing time in the event of a fault.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ELDRIDGE, C.: When reducing the energy based on calculations to show the energy is reduced to an acceptable level, use of this switch for instantaneous tripping can create several problems:

1) The altered design to reduce the energy can compromise the effectiveness of the normal day-to-day protection scheme. It is undesirable to reduce the effectiveness of the system's protection if the instantaneous really is not part of the scheme, which could end up with tripping of other devices that could have unintended consequences.

2) The operating personnel using this proposed solution could greatly impact the devices that the switch is protecting if it was inadvertently left on, this condition would not allow the system to operate properly.

This is a work practice issue that is not covered by the NEC. The proposal will create a generic cookbook method of providing protection for workers without doing the proper analysis of the system to determine the proper PPE. Unknowingly, a false sense of security can be in place and possibly could result in an injury or fatality of a worker.

FREDERICKS, C.: I'm voting against this panel action to reject.

The panel statement either did not address or did not well address several good points that were made by the submitter. Re: the submitter's points:

1. Some companies do in fact prohibit all energized work on certain types of equipment, in addition to strongly restricting energized work on all equipment. Yes, voltage testing to confirm de-energization is still required, but with appropriate equipment, procedures and training, this is and should be recognized as a low-risk activity.

2. Adequate PPE has an excellent operational record of preventing arc flash injuries, and a requirement particularly at low voltage to reduce potential incident energies further below the ratings of the PPE does not seem valuable. I have never seen a documented case below 1000 volts where a worker that was protected by adequate PPE received any direct injuries from an arc flash, and I would be interested to hear if anyone could document such an incident.

3. As commented by the submitter, there are design options and in some cases the inherent nature of a system will be such that the addition of quick-trip maintenance switches or ZSI adds no additional safety benefit.

4. The submitter is correct that the proposal is unbalanced in not requiring similar measures for fusible systems protected by Class L fuses that will not be current-limiting for arcing currents, or for systems protected by breakers with an instantaneous trip that will not be activated by an arcing fault current.

5. The panel statement was correct that coordination with downstream devices is less relevant if a fault occurs within equipment, but potential loss of coordination by improper setting of a maintenance switch can still be a significant issue.

6. I agree with the thought that provision of quick-trip maintenance switches can result in a false sense of security that could lead a less-knowledgeable worker to take local action and make spot decisions to do energized work, based on a belief that they are protected by these devices. There could also be a false sense of security from assuming that all equipment on site has provisions that would now be required by code. There is not a substitute for adequate training, procedures, and PPE.

See also my voting explanation on comment 10-44.

10-39 Log #2011 NEC-P10 **Final Action: Reject**
(240.87 (New))

Submitter: Dennis M. Darling, Stantec
Comment on Proposal No: 10-82
Recommendation: Reject the proposal.
Substantiation: Primary direction of NFPA 70E is to De-Energize electrical equipment for worker safety. The proposed features will reduce but will not eliminate the electric hazards which can only be eliminated by removing all energy sources.

If any work needs to be performed on energized equipment a hazard risk analysis must be conducted justifying why the system can not be de-energized. A similar requirement for first de-energizing electrical equipment unless it is infeasible to do so exists in OSHA subpart S.

The IEEE/NFPA Arc-Flash Collaborative Research and Testing Project is presently working on quantifying the general arc-flash hazard. Until results of the results of the research and testing by the collaborative committee are complete both groups have agreed to not introduce codes or standards that may not be consistent with the findings of this investigation.

Other technologies exist to limit arc-flash incident energy.

This is a design issue and depends on safety and operational considerations.

The code should not provide a disincentive to the development of new technologies by providing a limited list of acceptable technologies and approaches.

Panel Meeting Action: Reject
Panel Statement: CMP 10 solidly supports the concept of de-energizing equipment whenever possible/feasible, according to principles in OSHA and NFPA 70E. However, as both OSHA and NFPA 70E detail, there are cases where energized work is justified. Under these cases, the requirements offered by this new Section will increase worker safety. This new requirement in no way encourages work on energized equipment. It does increase safety when energized work is required.

See the panel action and statement on comment 10-38.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

ELDRIDGE, C.: See my comment on 10-38.

FREDERICKS, C.: I'm voting against this panel action to reject.

Please see my voting explanations on comments 10-35, 10-44 and 10-38.

10-40 Log #2384 NEC-P10 **Final Action: Reject**
(240.87 (New))

Submitter: Michael A. Anthony, University of Michigan
Comment on Proposal No: 10-82
Recommendation: Accept the Proposal in Principle, but with the addition of another conditional phrase, as follows:

240.87 Non-instantaneous Trip. Where a circuit breaker without an instantaneous trip is utilized, **and where there are written, administrative procedures that permit working on energized equipment,** one of the following or approved equivalent means shall be provided:

(1) Zone-selective interlocking
(2) Differential relaying
(3) Energy-reducing maintenance switching with a local status indicator

Substantiation: Safety proposals of this nature have been conceptually cleared with our industry electrical professionals but some concern remains:

A- Does this proposal discourage de-energization of equipment; especially in motor control centers, where a fair amount of live work is undertaken? We want to *en*courage de-energization of equipment. This concern is captured in Mr. Darling's statement. We would like to work a little harder getting equipment simply turned off and a work a little slower on backing ourselves into specific equipment classes or technologies (though technological solutions are an important part of our work).

B - Does this proposal render some overcurrent protective schemes unspecifiable - especially those that do not have electronic trip units? Is ZSI available in, say, a substation main breaker with only Long-Short and Ground Fault protection? If it costs significantly more to add ZSI to the main breaker (which may or may not have adjacent breakers with which to communicate anyway) then we want to have the option of telling the Owner that the cost of not paying for ZSI is that the substation must be de-energized during servicing. Twenty-five years down the road, we want inspectors to be recognize no-time-delay schemes. We want our designers to have choices that span the entire safety-versus-economy continuum. If any of those breakers have their instantaneous functions effectively disabled, then the switchgear must be de-energized in order for work to proceed.

I think the industry under-estimates the degree to which Owners and occupants are willing to accommodate short 1-4 hour power outages so that electricians may work on equipment safely. We should start building enough redundancy into our building premises power systems so that electricians only need to work on de-energized equipment.

Panel Meeting Action: Reject
Panel Statement: As written, the comment would limit the new requirement to facilities that have written, administrative procedures that permit working on energized equipment. No substantiation is provided to reduce this safety requirement for facilities that do not have written administrative procedures.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-41 Log #2399 NEC-P10 **Final Action: Accept in Principle**
(240.87 (New))

TCC Action: The Technical Correlating Committee understands that the panel action on Comment 10-43 modifies the panel action on the Informational Note in Comment 10-41.
Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 10-82
Recommendation: Revise text from the Panel Action to read as follows:
240.87 Non-instantaneous Trip. Where a power circuit breaker is utilized without an instantaneous trip, or the instantaneous trip can be turned off, one of the following or approved equivalent means shall be provided:

(A) Zone-selective interlocking
(B) Differential relaying
(C) Energy-reducing maintenance switching with local status indicator

Where power circuit breakers are utilized, documentation shall be available to those authorized to design, install, inspect, or operate the device notifying field personnel the breaker does not or may not include an instantaneous trip function.

FPN: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to instantaneous while the worker is working within an arc-flash boundary as defined in NFPA 70E, and then to set the trip unit back to a normal setting after the potentially hazardous work is complete.

Substantiation: As stated in my comment on affirmative ballot during the ROP, I am supportive of proposed actions to protect installers that are required in some situations to perform work on energized equipment. Identifying the devices that are available and of concern has been difficult. While many breakers include an "Off" position for the instantaneous setting, they also include positions where the instantaneous protection is on. Those devices are not WITHOUT an instantaneous trip. That will make the enforcement of the requirement problematic. Revisions in the proposed text attempt to address the concerns raised by Mr. Cook and Mr. Ockuly in the affirmative ballots.
Panel Meeting Action: Accept in Principle

Revise text to read as follows:

240.87 Non-instantaneous Trip. Where a circuit breaker is utilized without an instantaneous trip, documentation shall be available to those authorized to design, install, operate or inspect the installation as to the location of the circuit breaker(s).

Where a circuit breaker is utilized without an instantaneous trip one of the following or approved equivalent means shall be provided:

(A) Zone-selective interlocking
(B) Differential relaying
(C) Energy-reducing maintenance switching with local status indicator

FPN: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to instantaneous to reduce the clearing time while the worker is working within an arc-flash boundary as defined in NFPA 70E, and then to set the trip unit back to a normal setting after the potentially hazardous work is complete.

Panel Statement: The panel has revised the proposed text for clarity. The panel deleted the text "instantaneous trip can be turned off" because the requirement addresses circuit breakers utilized without an instantaneous trip.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

DARLING, D.: Primary direction of NFPA 70E is to De-Energize electrical equipment for worker safety. The proposed features will reduce but will not eliminate the electric hazards which can only be eliminated by removing all energy sources. If any work needs to be performed on energized equipment a hazard risk analysis must be conducted justifying why the system can not be de-energized. A similar requirement for first de-energizing electrical equipment unless it is infeasible to do so exists in OSHA subpart S. Research and testing of the IEEE/NFPA Collaborative Effort on the Arc-Flash Hazard issue is presently working on quantifying the general arc-flash hazard. Other technologies exist to limit arc-flash incident energy. This is a design issue and depends on safety and operational considerations. The code should not provide a disincentive to the development of new technologies by providing a limited list of acceptable technologies and approaches.

ELDRIDGE, C.: See my comment on 10-38.

10-43 Log #1768 NEC-P10 **Final Action: Accept**
(240.87, FPN (New))

Submitter: Chad Kennedy, Schneider Electric/Square D
Comment on Proposal No: 10-82
Recommendation: Revise text as follows:
FPN: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to ~~instantaneous~~ no intentional delay while the worker is working within an arcflash boundary as defined in NFPA 70E, and then to set the trip unit back to a normal setting after the potentially hazardous work is complete.
Substantiation: Although this proposed language change will have limited value to new installations since current production circuit breakers have an instantaneous function included, the FPN is inaccurate in that in advising that a maintenance switch turns on a instantaneous function, it actually would more accurately move the breaker to a "no intentional delay" mode.
Panel Meeting Action: Accept
Panel Statement: The statement in the substantiation that all "current production circuit breakers have an instantaneous function" applies only to molded case circuit breakers, not to power circuit breakers.
The panel understands that the FPN as written in the panel action on comment 10-41 is modified by this action.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ELDRIDGE, C.: See my comment on 10-38.
FREDERICKS, C.: I'm voting against this panel action to accept.
Please see my voting explanations on comments 10-35, 10-44 and 10-38.

10-44 Log #1798 NEC-P10 **Final Action: Reject**
(240.87, FPN 2 (New))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 10-82
Recommendation: Add an additional FPN at the end of the text approved by the panel to read as follows:
FPN 2: Approved equivalent means may consist of one or more of the following: current limitation, available fault current reduction, arc resistant equipment, application of procedures that ensure PPE is rated to meet the available arc flash hazard energy, and procedures that ensure de-energized maintenance.
Substantiation: ACC agrees with the Explanation of Negative Vote provided by Mr. Fredericks. The proposed addition is in accordance with that Explanation of Negative Vote; equally-safe design and operational options should not be restricted. This is a technically-challenging addition to the code, so it is all the more important to ensure that Code users are fully aware of the panel's intent.
Panel Meeting Action: Reject
Panel Statement: The methods proposed in the comment do not address the accepted requirement in comment 10-41.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ELDRIDGE, C.: See my comment on 10-38.
FREDERICKS, C.: I'm voting against this panel action to reject.
This new requirement in 240.87 is well-intentioned and seeks to make a code requirement of practices that are usually valuable and usually a practical cost to apply. However, the new requirement is disproportionate in the equipment addressed and too prescriptive and too restrictive in the new requirements it adds.
Necessary guidance towards flexibility in the application of this new requirement, as proposed by this comment, here is specifically rejected by the panel, I believe without reasonable cause.
The panel statement claims that the alternate methods proposed in the comment do not address the accepted requirement, but they specifically do. Each of the alternate methods listed has a proven operational record in reducing arc flash hazards and injuries. For example, adequate PPE has a long and successful operational history in preventing arc flash injuries, particularly at the lower voltages addressed by this new requirement. It is important to understand that even with adoption of this new requirement, adequate PPE and in some cases a full flash suit, will still be required.

10-46 Log #1654 NEC-P10 **Final Action: Reject**
(240.91 (New))

Submitter: John W. Young, Siemens Industry
Comment on Proposal No: 10-83
Recommendation: Reject the Proposal.
Substantiation: Protection of the conductor is a standards issue. The standard requires that the circuit breaker be evaluated with rated wire and compliance is demonstrated by test. Putting a statement in the Code that smaller wire can be used does not mean that the wire is protected. The substantiation states that the conductors are protected against overloads by load calculations and monitoring. Protection is provided by the circuit breaker. If protection could be provided by load calculations there would be no need to have the circuit breaker (or fuse).
The substantiation also states that protection is provided by monitoring but there is no requirement for monitoring in the proposal.
The substantiation notes that short circuit protection is accomplished by a short circuit study but a short circuit study does not prove that the conductor is protected. This is demonstrated by test as required by the Standard.
Panel Meeting Action: Reject

10-47 Log #1769 NEC-P10 **Final Action: Reject**
(240.91 (New))

Submitter: Chad Kennedy, Schneider Electric/Square D
Comment on Proposal No: 10-83
Recommendation: This proposal should be rejected.
Substantiation: It is important to recognize that the panel has written a rule that tells the users of the NEC to misapply listed electrical products. Not a shred of evidence has been presented to the panel that shows that the products in question can be applied safely in the manner outlined in the code text. It is the responsibility of the submitter to produce credible and substantial evidence to show that the products can be safely used in the manner proposed. Under almost all other circumstances code panels have required fact finding reports, studies, etc. from third parties to show that a particular application can be safe. This proposal seeks to push the thermal performance of equipment well beyond any thermal values evaluated as part of the listing of the equipment.
The panel needs to give serious reconsideration to this proposal and consider the following:
What do we know:
1) No data has been provided by the submitter to support this relaxation of the conductor ampacity rules.
2) Thermal operating temperatures of the equipment will increase – this is simple physics – if you decrease the ability of the conductor to sink away heat by making the conductor smaller, the temperature within the equipment will increase.
3) An increase in thermal operating temperatures will impact equipment resulting in reduction in its life cycle and possible premature failure or equipment operation issues.

4) If conductor size is reduced, thermal operating temperatures will increase, in most cases, beyond those permitted by the standard resulting in negative performance concerns (we know this through limited testing that we have performed).

5) The thermal coordination of materials and components within the equipment is lost

6) At least a 10% rise in heat rise temperatures on components has been seen in the lab in non comprehensive testing

What is unknown, due to no data being provided by the submitter:

1) The higher temperature impact on the performance and useful life of insulation systems, device lubricants, springs, bus and cable terminations, enclosure gasket material, and plating as well as components used in the equipment.

2) If the equipment can operate safely at higher temperatures than permitted by UL why has the UL standard not been revised to reflect those higher permitted operating temperatures?

Further review of industry inspection and maintenance standards such as NEMA PB1.1, PB2.1, AB4, and BU1.1 demonstrate the importance of equipment temperature restrictions within the design and product standard ratings. For this proposal, compliance with the original design and appropriate industry product standard is no longer assured. The code panel must reject this proposal until a fact finding study, which would provide data, can demonstrate that the numerous known issues and unknown impact have been reviewed and addressed.

How can the code panel adopt a provision that in plain and simple terms applies the product in a manner not intended by the manufacturer or the product standard?

Panel Meeting Action: Reject

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

MANCHE, A.: See the NEMA voting comment on Comment 10-49.

10-48 Log #1922 NEC-P10 **Final Action: Reject**
(240.91 (New))

Submitter: Travis Lindsey, Travis Lindsey Consulting Services

Comment on Proposal No: 10-83

Recommendation: This proposal should be rejected.

Substantiation: The committee has not considered all of the variables associated with the temperature performance of conductors. the insulation performance of conductors and the
intricate relationship of conductor temperature to the equipment temperature limitations and ultimately system wide safety and performance.

Recent research shows that the effect of temperature on conductors is a much closer relationship than previously expected. In research of elevated ambient temperatures above rooftops by TLCS laboratory. a number of situations were tested. Many samples and experiments resulted in temperature rises exceeding the
allowable in NEC 310.16 for the associated conductors. The thermal performance of equipment attached to conductors increased by this change is not likely to be
suitable for the resulting temperature increases. The conductor and conductor insulation are likely to be impacted dramatically by the increase in temperature. The committee should not accept a significant change without substantial background investigation including literature research, fact finding, laboratory and field
testing. Even if this code panel determines the conductor can be appropriately protected with the proposed reduction in conductor ampacity. this long standing rule
must not be changed without an effort to coordinate with code panels 6, 7. 9 and others. The lack of coordination will create a situation where conductor ampacities
are increased without proper consensus of the technical committees charges with ensuring the proper use of conductors and equipment.

Panel Meeting Action: Reject

MANCHE, A.: See the NEMA voting comment on Comment 10-49.

10-49 Log #2010 NEC-P10 **Final Action: Accept in Principle**
(240.91 (New))

Submitter: Dennis M. Darling, Stantec

Comment on Proposal No: 10-83

Recommendation: 240.91 Protection of Conductors. Conductors shall be protected in accordance with 240.91(A) or (B).

(A) General. Conductors shall be protected in accordance with 240.4.

(B) Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than 95% of the rating of the overcurrent device defined in 240.6, where the conductor is protected within recognized time vs. current limits for ~~all~~ short circuit currents ~~of up to 1000 seconds duration~~.

Substantiation: The proposed action should have been Accept in Part:

The phrase "*all*" and "*up to 1,000 seconds duration*" should be deleted.

No published data is currently available to warrant the 1,000 second duration for cable damage curves.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

240.91 Protection of Conductors. Conductors shall be protected in accordance with 240.91(A) or (B).

(A) General. Conductors shall be protected in accordance with 240.4.

(B) Devices Rated over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than 95% of the rating of the overcurrent device defined in 240.6 where:

1) the conductors are ~~is~~ protected within recognized time vs. current limits for ~~all~~ short circuit currents ~~of up to 1000 seconds duration~~. and
2) where all equipment in which the conductors terminate is listed and marked for the application.

Panel Statement: The panel added the equipment listing requirement to address the concerns in the balloting of proposal 10-83 as well as those expressed in other comments.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

DARLING, D.: The following phrase was added by CMP-10, "where all equipment in which the conductors terminate is listed and marked for the application." **This is new material and has not had public review.**

MANCHE, A.: It is noted that the code panel has recognized the unresolved concerns voiced in the number of negative comments with regard to reducing conductors in equipment by attempting to put language in the NEC that would require the equipment to be evaluated through Listing and Marking the equipment for such application. Unfortunately there has been not data presented to the code panel that supports this application. NEMA has historically taken positions against the introduction of a product application where product standards requirements are voided. An example of the introduction of a product for use in an unintended application was found in 250.122 for a number of cycles where ground fault protection of equipment would permit the equipment grounding conductor to be reduced in size. An application that was granted by CMP-5 which required the ground fault protection to be "listed for the purpose." It was introduced into the 1999 NEC and removed in the 2008 NEC because no product standard was ever drafted or developed.

No data has been presented that supports a safe application of product beyond its UL Listing today. The code panel is attempting to support an application that has no documented safety record.

Comment on Affirmative:

DOLLARD, JR., J.: We are voting affirmative on the panel action to Accept in Principle Comment 10-49. Our comments are as follows:

In the Explanation of Negative Vote by Mr. D. Darling, it is stated that the panel action to include the phrase "where all equipment in which the conductors terminate is listed and marked for the application" constitutes new material and has not received public review.
This is incorrect.

The submitter of Comment 10-49 sought to modify the panel action to Accept Proposal
10-83. It is imperative to review Proposal 10-83 in the ROP.

See page 234 of the ROP. In the second and third paragraphs of the Explanation of Negative Vote on Proposal 10-83 by Mr. A. Manche, there is significant comment on the need for overcurrent devices used in this manner to be listed for the application.

The panel action to include this text is in direct response to the concerns expressed by Mr. A. Manche in the ROP.

There is no conflict, this is not new material. This concept had adequate public review in the ROP.

10-50 Log #2557 NEC-P10 **Final Action: Reject**
(240.91)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 10-83
Recommendation: The proposal should be rejected.
Substantiation: Why 95%, and not 94% or 96%? Is it just a coincidence that 95% of 400 amperes is 380 amperes, the 75° temperature column ampacity for 500 kcmil copper conductors? Have we seen this before? This is just another attempt to substitute 500 kcmil conductors in applications that would normally require 600 kcmil conductors. There has been no technical substantiation to support the impact of the change on the performance of the equipment to which the smaller sized conductors will be connected, either in terms of the termination performance or of the equipment itself. Remember, manufacturers have historically been secure in basing their equipment designs around UL and NEC temperature limitations at terminations. The wire and the equipment are evaluated as a system, and often the wires are a heat sink for the equipment. A 20% additional cross-sectional area for a connected conductor (500 kcmil vs. 600 kcmil) can obviously make a significant difference in how the equipment dissipates internal heat. If the proposal is accepted, UL will presumably be forced, quite correctly, to initiate a file review protocol for large equipment, resulting in substantial upheaval in equipment designs that will end up as a lose-lose proposition for both users and manufacturers alike.

It can be conceded that this proposal does address the performance of the conductors over the length of the run. However, every wire has both a middle and two ends. Any proposed approach to this subject must address both aspects; preferably on separate pieces of paper to there is no confusion between these differing problems. When we require separate conductor derating calculations for mutual conductor heating [310.15(B)(2)(a)] and for termination limitations [110.14(C)], and then selecting for the worst case, we are applying this principle. The substantiation for this proposal omits any mention of the latter, and as such must not be accepted.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on comment 10-49.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1

MANCHE, A.: See the NEMA voting comment on Comment 10-49.

10-51 Log #2739 NEC-P10 **Final Action: Reject**
(240.91 (New))

Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 10-83
Recommendation: Delete new language in 240.91.
Substantiation: There has been no substantiation that the reduced conductor size is adequate for the anticipated installations. While it is unlikely that reducing the conductor size will damage the conductors, it is unclear what the impact on connection longevity and equipment reliability will be.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on comment 10-49.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MANCHE, A.: See the NEMA voting comment on Comment 10-49.

10-52 Log #1312 NEC-P10 **Final Action: Reject**
(Table 240.92(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 10-84
Recommendation: The Proposal should be Accepted.
Substantiation: The Panel Statement chose the 3 rd definition in the dictionary and ignored the first two definitions of formula.

A formula can be an expression of a chemical composition or even a baby's formula and usually does not include an "=" sign. The Webster's Collegiate Dictionary, Eleventh Edition, first definition for equation is "the act or process of equating". An equation indicates that the variable on the left of the "=" sign equals the combination of variables on the right side of the "=" sign as stated in 2a of the definition of equation: "formal statement of the equality or equivalence of mathematical or logical expressions".
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms their rejection of this proposal. The proposed revisions do not add clarity or improve usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 250 — GROUNDING

5-35 Log #2084 NEC-P05 **Final Action: Reject**
(250, Part II)

Submitter: Jim Davis, Electrical Education Services, LLC
Comment on Proposal No: 5-81
Recommendation: Change the current heading for Part II of Article 250 to include the words "and System Bonding" as follows:
II. System Grounding and System Bonding.
Substantiation: The code panel is respectfully requested to reconsider the submitter's substantiation provided with the original proposal along with the explanation of negative provided by Mr. Brett, Jr. in the ROP for the 2011 NEC. By accepting this proposal, code users are presented with the clear distinction between "system" bonding (which is critical to overcurrent device operation) and all other bonding, which is critical to providing an effective path back to the system bonding connection. This would improve code clarity and actually agree with the current layout of the code text.
Panel Meeting Action: Reject
Panel Statement: See the panel statement for Proposal 5-81. Article 250 Part II is about grounding of electrical systems. Sometimes that is achieved via a main or system bonding conductor and therefore those requirements are properly located in Part II. Bonding in general was purposefully separated into Part V in the 1999 NEC process to assist users in understanding the difference in "grounding" and in "bonding". The diagram in 250.1 provides guidance that elements of bonding apply into multiple parts of Article 250, yet the parts do not have to each have the title changed to reflect that relationship.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-36 Log #79 NEC-P05 **Final Action: Accept**
(Figure 250.1, Title of Part X, 250.180, 250.182 250.188)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 5-51a
Recommendation: The Technical Correlating Committee directs the panel to clarify the panel action on this proposal with respect to retaining the term "high-voltage" in the first sentence of the revised 250.188(A) and anywhere else in this Article.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel recognizes that the text is correct in the ROP draft. The term "high-voltage" was deleted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-37 Log #579 NEC-P05 **Final Action: Accept in Principle**
(250.2)

Submitter: Charles R. Miller, Lebanon, TN
Comment on Proposal No: 5-52
Recommendation: Move existing definition of "System Bonding Jumper" from Article 250 to Article 100.
Substantiation: This term is used in more than one article. Besides Article 250, System Bonding Jumper is in 708.20(C) Exception.
Panel Meeting Action: Accept in Principle
Revise ROP draft text to read as follows:

Bonding Jumper, System. The connection between the grounded circuit conductor and the supply-side bonding jumper, or the equipment grounding conductor, or both, at a separately derived system.
Panel Statement: The panel accepts the definition as stated and relocates the definition to Article 100.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-38 Log #2558 NEC-P05 **Final Action: Accept**
(250.2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-55
Recommendation: Continue to reject the proposal.
Substantiation: The term is used throughout the NEC and does belong in Article 100. It would be an entirely appropriate addition to that article. An electrical component is "likely to become energized" if the failure of a single insulating element, such as the insulation on an ungrounded conductor, could result in the component becoming energized. This definition should be resubmitted in the 2014 NEC cycle to CMP 1 for action in Article 100.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-39 Log #1491 NEC-P05 **Final Action: Accept**
(250.2.Ground Fault)

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Please reconsider this proposal. Please revise the definition of ground fault in 250.2 to read as follows:
Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.
Substantiation: I would like to commend CMP-5 and the TCC for trying to resolve this issue. It turns out to be a rather complicated issue to resolve. If possible and not technically incorrect, this definition for "ground fault" should probably be moved from 250.2 to Article 100 definitions. Once in Article 100, it can be properly used in the other places in the Code that discuss the term "ground fault".

Please allow me to make the following points with regard to the grounded conductor and the definition of the term "ground fault".

1. The definition of ground fault should be acceptable to conductors of both service supplied and separately derived electrical systems.
2. The grounded conductor is by definition a normally current carrying conductor. Therefore, the definition as proposed by the TCC's suggested wording in the response to CMP-5's panel action will not be appropriate.
3. In a service supplied electrical system, the grounded conductor, the equipment grounding conductors, the grounding electrode conductors and the metallic enclosures are connected together at the main disconnecting means. This connection at the main disconnecting means is not a ground fault.
4. Further, either the proper (250.32 (B) Exception) or errant re-grounding of the grounded conductor somewhere on the circuit other than the main disconnecting means is also not a ground fault.
5. At the main disconnecting means of a service supplied electrical system, if an ungrounded conductor comes in "accidental" contact with a wire connected to the grounded bus, it is a ground fault no matter if the insulation on the wire is bare, or colored/marked white or green.
6. Last point. Please think about fault current in terms of the source of the current. All fault current starts at one terminal of the source and returns to another terminal of the same source. The ac source could be either a transformer, generator or power electronic inverter/converter. It doesn't matter who owns the ac electrical source such as electric utility or building/facility owner. If the fault current only involves the phase or line terminals/conductors (ungrounded terminals/conductors) it is a short circuit. However, if the fault current involves any path back to the grounded neutral point or intentionally grounded terminal of a corner grounded delta source, it should be called a ground fault.

I know from the panel statement on proposal 5-54 that the panel wishes to call an unintentional connection with high fault current between an ungrounded conductor and a grounded conductor a "short circuit". However, in reality, it is actually not a short circuit when referenced back to the ac source. So, while not completely correct either, lets use the above definition in this comment because it is, at least, not incorrect.
Panel Meeting Action: Accept
Panel Statement: The recommendation in the comment does not revise the text of the 2008 NEC. Note that the definition of "ground fault" was moved to Article 100 by CMP 5's action on Proposal 5-10. CMP 5 does not necessarily agree with the substantiation for this comment.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:

MOHLA, D.: The proposed wording is identical to the present wording in the 2008 NEC. The Proposal
5-54 definition included the neutral conductor which is a grounded conductor and not included in the present definition. A fault from a neutral to a ground can result in damage to property and personnel if not detected and cleared.

5-40 Log #2282 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Adam Baker, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Revise as follows:
Ground Fault: An unintentional, electrically conducting connection between an undergrounded conductor of an electrical circuit and ~~the normally non-current carrying conductors,~~ (earth), metallic enclosures, metallic raceways, (and) metallic equipment (that are sufficiently grounded and provide a well conductive path to the ground).
Substantiation: I believe that the current definition of ground fault is misleading. The connection between an ungrounded conductor of an electrical circuit and the normally non current carrying conductor should fall under the definition of short circuit. The current carrying conductor and non-current carrying conductor are part of a circuit. Therefore, if the non current carrying conductor were to come in contact with the current carrying conductor of the same circuit or if the non current carrying conductor and the current carrying conductor of another circuit where to come into contact then the circuit(s) would short out.

However, if the current carrying conductor of a circuit were to come in contact with a conductive object (metal pole, metallic enclosure) and that object was well grounded, then the current would now have a direct path to the ground. In return, this would cause a ground fault on the electrical circuit.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-41 Log #2283 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Jennifer Robinson, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Revise to read as follows:
Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.
Substantiation: I agree with the definition provided in Proposal 5-57. The wording, "normally non-current-carrying conductor" found in the current NEC definition can be unclear. A "grounded conductor" can also be a normally current-carrying conductor making the statement in the original definition of a ground fault provided in the 2008 NEC incorrect. The definition only refers to "ungrounded" conductors making contact with "normally non-current-carrying" conductors, which doesn't necessarily include "ungrounded" conductors that make contact with "grounded" conductors that can be "normally current-carrying" conductors. The definition proposed in Proposal 5-57 just clearly states "grounded conductor or normally non-current-carrying conductors…" eliminating any confusion concerning which conductors are in question.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-42 Log #2284 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Brandon W. Gibellino, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: I agree with the recommendation of Mr. Timothy M. Croushore, Allegheny Power/Rep. Edition Electric Light and Power Group. Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.
Substantiation: It is more effective to clearly specify that the line component of a line-to-ground fault is "an ungrounded conductor" rather than "a normally current carrying conductor"; and the ground component of a line-to-ground fault can be "a grounded conductor" as well as "normally non-current-carrying conductors". This eliminates any confusion when considering the neutral wire, which can provide a return path for current or which can also be tied to ground. The recommendation above clearly states the definition of a line-to-ground fault.

Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-43 Log #2285 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Andrew Bilitski, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: I strongly concur with the proposed recommendation and its substantiation that discusses Soares' two distinctions between a short circuit and a ground fault, but it is important to modify or add to these terms for today's current practices and the ever-changing future.
Substantiation: Due to the current scenarios used in modern day facilities and equipment, a new distinct term should be developed to describe an intentional inappropriate fault that behaves in the same fashion as a ground fault. The term "fault" carries the connotation of "undesired" with it, and in many situations current on a normally non-current-carrying line is preferred. A new term should clarify this discrepancy.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.

5-46 Log #2288 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Raymond Arnold, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: I propose that the definition be revised as follows:
"Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and a grounded conductor ~~normally non-current-carrying conductors~~, metallic enclosures, metallic raceways, metallic equipment, or earth."
Substantiation: A fault between an ungrounded conductor to any other conductor, non-current-carrying or otherwise, may not provide a path to ground. Should an ungrounded current-carrying conductor come in contact electrically with another ungrounded conductor, this may qualify as a fault; however, it may not provide a path to ground. Furthermore, the current definition provides that a ground fault is an electrical connection between an ungrounded conductor and earth, but not that a connection between a grounded conductor and an ungrounded conductor. Depending on the resistance of the grounded conductor, the loss may be negligible, and, thereby, provide a solid ground.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.

Ballot Results: Affirmative: 16

5-47 Log #2289 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Bridget Meadows, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: I agree with the proposed definition provided by Mr. Croushore.
Substantiation: It is agreed that the unintended, electrically conducting connection of the ungrounded conductor to ground is a ground fault. However, the unintentional, electrically conducting connection of the ungrounded conductor to the grounded conductor is also a ground fault; electrical current is still flowing from the ungrounded conductor through an unintended, direct connection to ground. This can be seen through symmetrical component study. In symmetrical components, a single line to ground and a line to line to ground connection are both considered ground faults. As seen in Figure A,That I have provided electrically, the only difference between Fault A and Fault B would be the impedance of the grounded conductor; in both causes, an unintended electrical connection has been made from the ungrounded conductor to ground.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.

5-48 Log #2290 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Morgan Cooper, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Revise to read as follows:
Ground Fault. An unintentional, electrically conducting connection between a normally current carrying conductor of an electrical circuit, and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment (or any other objects with a conductive path to) earth.
Substantiation: In the report on proposals A2010 Comment No. 5-54 Log #56 NEC-P05, the proposed definition of ground fault was rejected because the panel states that proposed definition is a short-circuit, not a ground-fault. To my knowledge, there is currently no definition for short circuits in the NEC. As in the recommendation submitted by Timothy M. Croushore, I agree with the proposed definition for a short circuit as "an unintentional, electrically conducting connection between two or three ungrounded conductors of an electrical circuit". If this is not the proper definition of a short circuit, then a more accurate description should be added to the NEC. I believe a ground fault is a connection between an electrically carrying conductor and any object with a relationship or link to ground. A ground fault can include many different sources such as a structure, vegetation, the neutral conductor, and others. This is why I added the comment "(or any other objects with a conductive path to) earth."
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-49 Log #2291 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Pedram Vaziri, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Change the definition to read as follows:
Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the ground conductor, metallic enclosures, metallic raceways, metallic equipment or earth.
Substantiation: A grounded conductor is a return path of the electricity to its original source. The phrase "the normally non-current-carrying conductor" should not be interchanged with grounded conductor. Otherwise, one interpretation of the definition can count the connection between neutral and earth as a ground fault; earth does not carry current, but a neutral conductor does.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-50 Log #2292 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Logan Hughes, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Revise to read as follows:
An unintentional electrically conducting connection between ~~an ungrounded or grounded~~ a normally current carrying conductor of an electrical circuit, and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.
Substantiation: I agree with the definition above. Specifying that the conductor is current carrying. A normal current carrying conductor is usually ungrounded, but they also consider it to be grounded or neutral.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-51 Log #2293 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Nathan J. Bard, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: I agree with Proposal 5-57's definition for Ground Fault.
Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.
Substantiation: The definition of Ground Fault as it currently reads is misleading since the neutral of a circuit can be a normally current carrying conductor. This implies that a connection between the neutral of a circuit and a normally non-current-carrying conductor, metallic enclosure, metallic raceway, metallic equipment or earth would be considered a Ground Fault. Using the Symmetrical Component method for calculating fault currents, we see that a connection between the neutral and any grounded component would only change the zero sequence impedance slightly since the neutral can already be grounded and this would not cause a higher level of current to flow during operation, although there could be current flow in normally non-current conducting equipment.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-52 Log #2294 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Michael Kalata, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Revise to read as follows:
Ground Fault. An unintentional, electrically conducting connection between an ungrounded normally current carrying conductor of an electrical circuit, and the normally non-current-carrying conductor, grounded neutral conductor, metallic enclosures, metallic raceways, metallic equipment, or earth.
Substantiation: This definition adds the case of a phase to neutral connection, which normally is a current-carrying conductor, but can cause a ground fault if connected with another normally current carrying conductor.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-54 Log #2297 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Mark Zucca, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Revise to read as follows:
Ground Faul. : An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the grounded conductor or normally non-current carrying conductors, metallic enclosures, metallic raceways, metallic equipment or earth.
Substantiation: The issue is with the use of the term "a normally current carrying conductor" is Proposal 5-57, since a grounded conductor or neutral conductor is also a "normally current carrying conductor", a connection between this grounded conductor and the equipment-grounding conductor path would be considered a ground fault according to Proposal 5-57, while this is a grounding error, this term "ground fault" is not the correct term for this occurrence.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-55 Log #2298 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: David Purkey, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Revise to read as follows:
Ground Fault. The accidental or unintentional electrically conducting connection between an ungrounded normally current carrying conductor of an electrical circuit and the grounded conductor and/or related grounded appurtenances, (enclosures, metallic equipment, etc.), normally non current carrying.
Substantiation: Generally, I agree with Mr.Croushore, suggest revised wordage to clarify conditions for a ground fault. 110.10 specifies phase to phase as well as phase to ground faults in the definition of a "fault." The use of the word "accidental" further emphasizes this condition not to be in the design criteria, while the addition of "current carrying" distinguishes further that the conductor is typically energized and this condition is an occurrence between an energized conductor and a ground conductor appurtenances only.

Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-56 Log #2301 NEC-P05 **Final Action: Reject**
(250.2.Ground Fault)

Submitter: Bryan Selestak, Allegheny Power
Comment on Proposal No: 5-54
Recommendation: Accept in Principle the proposal. Change the definition to read as follows:
Ground Fault. An ~~unintentional~~ unwarranted, electrically conducting connection between an ungrounded conductor of an electrical circuit and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.
Substantiation: The word "unintentional" in the original definition applies the possibility of intent. In reality, no one "intends" to cause a ground fault. The word "unwarranted" implies that the ground fault was a complete accident and no intent was involved.
Panel Meeting Action: Reject
Panel Statement: The definition of "ground fault" as it appears in the 2008 Edition of the NEC is appropriate for the application of the requirements of the NEC. See panel actions and statements on Proposal 5-10 and Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-57 Log #1051 NEC-P05 **Final Action: Reject**
(250.6(A), FPN (New))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 5-63
Recommendation: Accept this proposal to add text as follows:
Capcitive charging current normally present in equipment grounding conductors is not the objectionable current addressed in this section.
Substantiation: Most people are unaware that some current is normally present in equipment grounding conductors due to capacitive coupling between these conductors and adjacent conductors that are carrying current. This is a normal and not objectionable condition.
Panel Meeting Action: Reject
Panel Statement: There is no evidence indicating that the lack of this note has caused any problems with the use of this section. There may be cases where the level of capacitive charging current imposed on equipment grounding conductors, metallic raceways or enclosure could be objectionable for proper operations.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-58 Log #479 NEC-P05 **Final Action: Reject**
(250.8(A)(5) and (6))

Submitter: Thomas Lawshe, Bagby & Russell Electric Co., Inc. / Rep. IBEW Local 505, Mobile, AL
Comment on Proposal No: 5-73
Recommendation: Revise text to read as follows:
250.8(A)(5) Machine screw–type fasteners that ~~engage not less than two threads or~~ are secured with a nut. ~~(6) Thread–forming machine screws that engage not less than two threads in the enclosure.~~
Substantiation: Reference: NEC Article 422 Appliances.
In addition, over the past 10 years in the electrical industry with the introduction of non-linear loads, vibration and noise currents, is a problem with grounds becoming "loose." Manufacturers today are making appliances with extremely thin metal causing thread-forming machine screws to "loosen" due to vibration and "noise currents."
Panel Meeting Action: Reject
Panel Statement: The substantiation is based on manufacturers that used very thin sheet metal. The engagement of two full threads would require a sufficient sheet metal thickness, or a punch to provide adequate thread engagement to mitigate the problems observed. A 32 thread per inch would require 1/16" sheet metal which approximately is 16 gage galvanized or 15 gage mild steel sheet metal. The UL standards have used the two full thread engagement criteria in a number of standards without reported incidents. There was no technical substantiation for imposing a requirement to always use a nut without regard to metal thickness.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-59 Log #80 NEC-P05 **Final Action: Accept**
(250.20(D))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 5-83
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 5-101 that has deleted 250.20(D).
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Section 250.20(D) in the 2008 NEC is deleted by the action on Proposal 5-101. The opening paragraph of 250.20 in the 2011 NEC ROP Draft appears to be correct.

(250.24(C))

TCC Notes: The Technical Correlating Committee directs that the text of 250.24(C) be revised to read as follows:
"Where an ac system operating at less than 1000 volts...".
In addition, the Technical Correlating Committee directs that the Exception to 250.24(C) be revised to read as follows:
"Where two or more service disconnecting means...".
The remainder of Proposal 5-95 remains unchanged.
In this instance, the Technical Correlating Committee determined that the revised wording is more appropriate.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-95
Recommendation: Accept the proposal in part. Do not change "where" to "if" in the three places indicated in the proposal.
Substantiation: This comment is intended as a vehicle to raise a generic objection to the plethora of accepted ROP actions on the part of CMP 5 throughout its articles that replace "where" with "if." The changes were substantiated on the basis of the content of Section 3.3.4 in the NEC Style Manual, which states: "*Where* (in the sense of *when* or *if*) — Use *when* or *if* instead." I believe that this provision is being misinterpreted by the proposal submitter and CMP 5.

The word "if" is a generic conjunction that in usual code applications means "in the event that." In this sense, virtually any usage of "where" can be replaced by "if", as is equally the case of "when". The reason that these other words, particularly "where" have been generally applied throughout the NEC is that they more precisely define the event. The word "where" has been (and continues to be) used because it is limited to being a condition of place, and "when" has been (and continues to be) used in instances describing a condition of time.

The NEC is an installation document, and most of its provisions provide direction regarding installation practice in concrete locations, that being the nature of the trade. The subject of this proposal leads off with "Where an ac system operating at less than 1000 volts …" Although it is not grammatically incorrect to begin the sentence with "if", the word "where" is preferred because this rule describes a condition of place. Over the past decade, the word "where" has become the usual term for such usage throughout the NEC.

If this is to now change, it should be only following express direction from the TCC, preferably through a clarification in the NEC Style Manual. Literally thousands of changes will be required throughout the NEC to accomplish this change. As of now, we will have a few articles using an inconsistent style, which is to be avoided. This comment is directed to the TCC, and requests formal direction with respect to the usage of the word "where" and how Section 3.3.4 of the NEC Style Manual is to be applied going forward. If CMP 5 is indeed misapplying 3.3.4, then the CMP 5 actions (and many based on similar proposals from the same proposal submitter in other articles as well) should be set aside.
Panel Meeting Action: Reject
Panel Statement: The panel actions are in compliance with the Section 3.3.4 of the NEC Style Manual, Word Clarity. That section contains the following requirement, "Words and terms used in the NEC shall be specific and clear in meaning, and shall avoid jargon, trade terminology, industry-specific terms, or colloquial language that is difficult to understand. NEC language shall be brief, clear, and emphatic. The following are examples of old-fashioned expressions and word uses that shall not be permitted: Where (in the sense of when or if) — Use when or if instead." The Style Manual goes on to indicate in Annex B Standard Terms, "if (indicates condition - can usually be used instead of provided, provided that, or where)" and "where (location or situation)."

Ballot Results: Affirmative: 16

5-69 Log #1836 NEC-P05 **Final Action: Accept in Principle**
(250.30)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-102
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
250.30 Grounding Separately Derived Alternating-Current Systems. In addition to complying with 250.30(A) for grounded systems or as provided in 250.30(B) for ungrounded systems, separately derived systems shall comply with 250.20, 250.21, 250.22, ~~250.24(A)(2)~~ and 250.26.
Substantiation: The reference to 250.24(A)(2) is not needed as the requirements for establishing an earth connection at the source of an outdoor separately derived system has been included in 250.30(C).
Panel Meeting Action: Accept in Principle
Revise Section 250.30 in the ROP draft to read as follows:

250.30 Grounding Separately Derived Alternating-Current Systems. In addition to complying with 250.30(A) for grounded systems or as provided in 250.30(B) for ungrounded systems, separately derived systems shall comply with 250.20, 250.21, 250.22, and 250.26.

Informational Note No. 1: An alternate ac power source such as an on-site generator is not a separately derived system if the grounded conductor is solidly interconnected to a service-supplied system grounded conductor. An example of such situations is where alternate source transfer equipment does not include a switching action in the grounded conductor and allows it to remain solidly connected to the service-supplied grounded conductor when the alternate source is operational and supplying the load served.
Informational Note No. 2: See 445.13 for the minimum size of conductors that carry fault current.

(A) Grounded Systems. A separately derived ac system that is grounded shall comply with 250.30(A)(1) through (A)(8). Except as otherwise permitted in this article, a grounded conductor shall not be connected to normally non–current-carrying metal parts of equipment, to equipment grounding conductors, or be reconnected to ground on the load side of the system bonding jumper.
Informational Note: See 250.32 for connections at separate buildings or structures, and 250.142 for use of the grounded circuit conductor for grounding equipment.
Exception: Impedance grounded neutral system grounding connections shall be made as specified in 250.36 or 250.186, as applicable.
(1) System Bonding Jumper. An unspliced system bonding jumper shall comply with 250.28(A) through (D). This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices, in accordance with (a) or (b). The system bonding jumper shall remain within the enclosure where it originates. If the source is located outside the building or structure supplied, a system bonding jumper shall be installed at the grounding electrode connection in compliance with (C).
Exception No. 1: For systems installed in accordance with 450.6, a single system bonding jumper connection to the tie point of the grounded circuit conductors from each power source shall be permitted.
Exception No. 2: A system bonding jumper at both the source and the first disconnecting means shall be permitted if doing so does not establish a parallel path for the grounded conductor. If a grounded conductor is used in this manner, it shall not be smaller than the size specified for the system bonding jumper but shall not be required to be larger than the ungrounded conductor(s). For the purposes of this exception, connection through the earth shall not be considered as providing a parallel path.
Exception No. 3: The size of the system bonding jumper for a system that supplies a Class 1, Class 2, or Class 3 circuit, and is derived from a transformer rated not more than 1000 volt-amperes, shall not be smaller than the derived ungrounded conductors and shall not be smaller than 14 AWG copper or 12 AWG aluminum.
(a) *Installed at the Source.* The system bonding jumper shall connect the grounded conductor to the supply-side bonding jumper and the normally non–current-carrying metal enclosure.
(b) *Installed at the First Disconnecting Means.* The system bonding jumper shall connect the grounded conductor to the supply-side bonding jumper, the disconnecting means enclosure, and the equipment grounding conductor(s).

(2) Supply-Side Bonding Jumper. If the source of a separately derived system and the first disconnecting means are located in separate enclosures, a supply-side bonding jumper shall be installed with the circuit conductors from the source enclosure to the first disconnecting means. A supply-side bonding jumper shall not be required to be larger than the derived ungrounded conductors. The supply-side bonding jumper shall be permitted to be of nonflexible metal raceway type or of the wire or bus type as follows:
(a) A supply-side bonding jumper of the wire type shall comply with 250.102(C), based on the size of the derived ungrounded conductors.
(b) A supply-side bonding jumper of the bus type shall have a cross-sectional area not smaller than a supply-side bonding jumper of the wire type as determined in 250.102(C).

(3) Grounded Conductor. If a grounded conductor is installed and the system bonding jumper connection is not located at the source, 250.30(A)(3)(a) through (A)(3)(d) shall apply.
(a) *Sizing for a Single Raceway.* The grounded conductor shall not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest derived ungrounded conductor(s). In addition, for sets of derived ungrounded conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 12-1/2 percent of the circular mil area of the largest set of derived ungrounded conductors.
(b) *Parallel Conductors in Two or More Raceways.* If the ungrounded conductors are installed in parallel in two or more raceways, the grounded conductor shall also be installed in parallel. The size of the grounded conductor in each raceway shall be based on the total circular mil area of the parallel derived ungrounded conductors in the raceway as indicated in (a) but not smaller than 1/0 AWG.
Informational Note: See 310.10(H) for grounded conductors connected in parallel.
(c) *Delta Connected System.* The grounded conductor of a 3-phase, 3-wire delta system shall have an ampacity not less than that of the ungrounded conductors.
(d) *Impedance Grounded System.* The grounded conductor of an impedance grounded neutral system shall be installed in accordance with 250.36 or 250.186 as applicable.
(4) Grounding Electrode. The grounding electrode shall be as near as practicable to and preferably in the same area as the grounding electrode conductor connection to the system. The grounding electrode shall be the nearest one of the following:
(1) Metal water pipe grounding electrode as specified in 250.52(A)(1)
(2) Structural metal grounding electrode as specified in 250.52(A)(2)
Exception No. 1: Any of the other electrodes identified in 250.52(A) shall be used if the electrodes specified by 250.30(A)(4) are not available.
Exception No. 2 to (1) and (2): If a separately derived system originates in listed equipment suitable for use as service equipment, the grounding electrode used for the service or feeder equipment shall be permitted as the grounding electrode for the separately derived system.
Informational Note No. 1: See 250.104(D) for bonding requirements for interior metal water piping in the area served by separately derived systems.
Informational Note No. 2: See 250.50 and 250.58 for requirements for bonding all electrodes together if located at the same building or structure.

(5) Grounding Electrode Conductor, Single Separately Derived System. A grounding electrode conductor for a single separately derived system shall be sized in accordance with 250.66 for the derived ungrounded conductors. It shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in 250.30(A)(4). This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected.
Exception No. 1: If the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.
Exception No. 2: If a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. If the equipment grounding bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.
Exception No. 3: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A)(1), Exception No. 3, and the transformer frame or enclosure is grounded by one of the means specified in 250.134.
(6) Grounding Electrode Conductor, Multiple Separately Derived Systems. A common grounding electrode conductor for multiple separately derived systems shall be permitted. If installed, the common grounding electrode conductor shall be used to connect the grounded conductor of the separately derived systems to the grounding electrode as specified in 250.30(A)(4). A grounding electrode conductor tap shall then be installed from each separately derived system to the common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor. This connection shall be made at the same point on the separately derived system where the system bonding jumper is connected.
Exception No. 1: If the system bonding jumper specified in 250.30(A)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor tap to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.
Exception No. 2: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the system grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 250.30(A)(1), Exception No. 3 and the transformer frame or enclosure is grounded by one of the means specified in 250.134.

(a) *Common Grounding Electrode Conductor.* The common grounding electrode conductor shall be permitted to be one of the following:
(1) A conductor of the wire-type shall not be smaller than 3/0 AWG copper or 250 kcmil aluminum.
(2) The metal frame of the building or structure that complies with 250.52(A)
(2) or is connected to the grounding electrode system by a conductor not smaller than 3/0 AWG copper or 250 kcmil aluminum.
(b) *Tap Conductor Size.* Each tap conductor shall be sized in accordance with 250.66 based on the derived ungrounded conductors of the separately derived system it serves.
Exception: If a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. If the equipment ground bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.
(c) *Connections.* All tap connections to the common grounding electrode conductor shall be made at an accessible location by one of the following methods:
(1) A connector listed as grounding and bonding equipment.
(2) Listed connections to aluminum or copper busbars not smaller than 6 mm × 50 mm (1/4 in. × 2 in.). If aluminum busbars are used, the installation shall comply with 250.64(A).
(3) The exothermic welding process.
Tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.
(7) Installation. The installation of all grounding electrode conductors shall comply with 250.64(A), (B), (C), and (E).
(8) Bonding. Structural steel and metal piping shall be connected to the grounded conductor of a separately derived system in accordance with 250.104(D).
(B) Ungrounded Systems. The equipment of an ungrounded separately derivedsystem shall be grounded and bonded as specified in 250.30(B)(1) through (B)(3).
(1) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with 250.66 for the largest derived ungrounded conductor(s) or set of derived ungrounded conductors, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in 250.30(A)(5) or (6), as applicable. This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means. If the source is located outside the building or structure supplied, a grounding electrode connection shall be made in compliance with (C).
(2) Grounding Electrode. Except as permitted by 250.34 for portable and vehicle-mounted generators, the grounding electrode shall comply with 250.30(A)(4).
(3) Bonding Path and Conductor. A supply-side bonding jumper shall be installed from the source of a separately derived system to the first disconnecting means in compliance with 250.30(A)(2).
(C) Outdoors Source. If the source of the separately derived system is located outside the building or structure supplied, a grounding electrode connection shall be made at the source location to one or more grounding electrodes in compliance with 250.50. In addition, the installation shall comply with 250.30(A) for grounded systems or with 250.30(B) for ungrounded systems.
Exception: The grounding electrode conductor connection for impedance grounded neutral systems shall comply with 250.36 or 250.186, as applicable.
Panel Statement: The panel made editorial and organizational changes to improve clarity and that meet the submitter's intent. The action on this comment incorporates recommendations or concepts from the following comments: 5-69, 5-70, 5-71, 5-72, 5-73, 5-76, 5-79, 5-80, 5-81, 5-82, 5-83, 5-84, 5-85, and 5-87.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
WILLIAMS, D.: The rewrite of section 250.30 is a huge improvement and is in part from a great proposal to organize how we deal with separately derived systems. There was also an extensive amount of work by a CMP-5 Task Group that spent a lot of time prior to the NEC ROP Meetings and work that occurred during the meeting by the Task Group and by the full code panel. This change reflects how we design, install, and inspect separately derived systems.

5-70 Log #2092 NEC-P05 **Final Action: Accept in Principle**
(250.30)

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 5-102
Recommendation: Continue to Accept this proposal.
Substantiation: The changes made in this section is mainly used to reorganize Section 250.30. The reorganization helps installers and inspectors setting up the requirements in an order that they are used in the field.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-71 Log #2560 NEC-P05 **Final Action: Accept in Principle**
(250.30)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-102
Recommendation: Accept the proposal in principle, making three changes as follows:
I. In 250.30(A)(3)(c) change "service" to "system" in both the title and the rule.
II. In 250.30(A)(4) Informational Notes Nos. 1 and 2, change "bonding requirements of" and "requirements of bonding" to "bonding requirements for" and "requirements for bonding" respectively.
III. In 250.30(B)(3), change "A bonding jumper or conductor …" to "A supply-side bonding jumper …"
Substantiation: I. This application is within Section 250.30 covering separately derived systems and cannot be addressing services.
II. A requirement of bonding would be some requirement that is imposed by the act of (possessive) bonding. These requirements are imposed by the NEC for safety, and are therefore requirements for bonding. This comment corrects this usage in both places.
III. The conductor cited in this provision meets all the characteristics described in the new definition of supply-side bonding jumpers, and this terminology should be used here. Failing to make this change will create confusion as code users will think there is a difference when none is intended.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-72 Log #439 NEC-P05 **Final Action: Accept in Principle in Part**
(250.30(A)(1))

Submitter: J. Kevin Vogel, Crescent Electrical Supply
Comment on Proposal No: 5-102
Recommendation: Revise text to read as follows:
(1) System Bonding Jumper. An unspliced system bonding jumper shall be sized and installed~~. It shall be sized~~ in compliance with 250.28(A) through (D). "~~This connection~~ Attachment shall be made at any single point on the separately derived system from...".
Substantiation: 1. The proposed text removes ambiguity and makes it clear that all requirements contained in 250.28(A) through (D), not merely those having to do with "sizing" the SSBJ, need to be adhered to.
2. "Attachment" [see 250.28(C)] is more accurate than "This connection".
Panel Meeting Action: Accept in Principle in Part
The recommendation for the first sentence is accepted in principle. The recommendation for the second sentence is not accepted as it would not add clarity.
Panel Statement: See panel action on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-73 Log #1833 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(1))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-102
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(1) System Bonding Jumper. An unspliced system bonding jumper shall be installed~~. It shall be sized~~ in compliance with 250.28(A) through (D). This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices, in accordance with (a) or (b). The system bonding jumper shall remain within the enclosure where it originates. If the source is located outside the building or structure supplied, a system bonding jumper shall be installed at the grounding electrode connection in compliance with (C).

The 3 exceptions and 250.30(A)(1)(a) are unchanged by this Comment.
(b) *Installed at the First Disconnecting Means.* The system bonding jumper shall connect the grounded conductor to the supply-side bonding jumper, the disconnecting means enclosure, and the equipment grounding conductor(s). ~~The system bonding jumper shall remain within the enclosure where it originates.~~
Substantiation: Changes to the opening paragraph are to simplify the two sentences and to recognize that 250.28 contains requirements on the material, construction, attachment as well as the size of the system bonding jumper. All of these requirements are applicable to system bonding jumpers as the bold faced title of 250.28 identifies.
The last sentence of 250.30(A)(1)(b) is proposed to be located in the opening paragraph as the requirement relates to installations where the system bonding jumper is located at the source as well as at the first disconnecting means.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-74 Log #649 NEC-P05 **Final Action: Reject**
(250.30(A)(1)(a))

Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 5-102
Recommendation: Revise text to read as follows:
The system bonding jumper shall connect the grounded conductor to the ~~supply~~ derived side bonding jumper and the normally non current carrying metal enclosure.
Substantiation: This is a companion comment to 250.30(A)(2). This comment should be accepted only if the comment to 250.30(A)(2) is accepted.
Panel Meeting Action: Reject
Panel Statement: The suggested revision to the title "Supply Side Bonding Jumper" in Comment 5-77 was not accepted so this comment, as directed by the substantiation, is also rejected.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-75 Log #650 NEC-P05 **Final Action: Reject**
(250.30(A)(1)(b))

Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 5-102
Recommendation: Revise text to read as follows:
The system bonding jumper shall connect the grounded conductor to the ~~supply~~ derived side bonding jumper, the disconnecting means enclosure, and the equipment grounding conductor(s). The system bonding jumper shall remain within the enclosure where it originates.
Substantiation: This is a companion comment to 250.30(A)(2). It should only be accepted if the comment to 250.30(A)(2) is accepted.
Panel Meeting Action: Reject
Panel Statement: The suggested revision to the title "Supply Side Bonding Jumper" in Comment 5-77 was not accepted so this comment, as directed by the substantiation, is also rejected.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-76 Log #476 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(2))

Submitter: J. Kevin Vogel, Crescent Electrical Supply
Comment on Proposal No: 5-102
Recommendation: Revise text to read as follows:
(2) Supply Side Bonding Jumper. If the source of a separately derived system and the first disconnecting means are located in separate enclosures, ~~a~~ an SSBJ ~~or conductor~~ shall be installed with the circuit conductors from the source enclosure to the first disconnecting means. The ~~bonding jumper~~ SSBJ shall be of the wire, bus, or nonflexible metal raceway type. If ~~a~~ the SSBJ is of the wire type ~~is installed~~, it shall be sized and installed in accordance with 250.102(C), ~~based on the size of the derived phase conductors~~. If a bus is installed as the SSBJ, it shall have a circular mil area not less than the bonding jumper of the wire type as determined in 250.102(C). ~~This conductor~~ The SSBJ shall not be required to be larger than the derived circuit conductors. [ROP 5-102].
Substantiation: 1. Consistent use of the acronym "SSBJ" improves usability and clarifies the intent of the rules presented here.
2. The unedited text only requires the SSBJ to be "sized" per 250.102(C), but does not require the "installation", i.e., of parallel SSBJ's, also to comply. The proposed revisions attempt to correct that oversight.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts the concepts contained in the recommendation but makes minor editorial revisions for clarity or consistency. See the panel action on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-77 Log #651 NEC-P05 **Final Action: Reject**
(250.30(A)(2))

Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 5-102
Recommendation: Revise text to read as follows:
~~Supply~~ Derived Side Bonding Jumper. If the source of a separately derived system and the first disconnecting means are located in separate enclosures, a ~~SSBJ~~ DSBJ or conductor shall be installed with the circuit conductors from the source enclosure to the first disconnecting means. The bonding jumper shall be of the wire, bus, or nonflexible metal raceway type. If a ~~SSBJ~~ DSBJ of the wire type is installed it shall be sized in accordance with 250.102(C), based on the size of the derived conductors. If a bus is installed as the ~~SSBJ~~ DSBJ, it shall...(the rest of the section is to remain.)
Substantiation: The title and subsequent abbreviations should be changed to eliminate confusion in the case of transformer and battery type separately derived systems. The primary side of a transformer or the circuit feeding the charging unit of a battery could be viewed as the supply side of these two items. In the case of a generator separately derived system the use of derived side bonding jumper would still be accurate. If this comment is accepted, the companion comments on 250.30(A)(1)(a) and (b) should also be accepted to provide uniformity. In general, I applaud the reorganization of 250.30. It flows better and will hopefully be more user friendly.
Panel Meeting Action: Reject
Panel Statement: The proposed change is not acceptable as the supply side bonding jumper is used at a service as well as at separately derived systems.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-78 Log #1834 NEC-P05 **Final Action: Reject**
(250.30(A)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-102
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(3) Grounded Conductor. If a grounded conductor is installed and the system bonding jumper connection is not located at the source, the grounded conductor shall be in compliance with 250.24(C) (1) through (C)(4). ~~250.30(A)(3)(a) through (A)(3)(d) shall apply.~~
~~(a) *Sizing for a Single Raceway.* The grounded conductor shall not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest ungrounded service-entrance phase conductor(s). In addition, for sets of ungrounded conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 121/2 percent of the circular mil area of the largest set of ungrounded conductors.~~
~~(b) *Parallel Conductors in Two or More Raceways.* If the ungrounded conductors are installed in parallel in two or more raceways, the grounded conductor shall also be installed in parallel. The size of the grounded conductor in each raceway shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway as indicated in (a) but not smaller than 1/0 AWG.~~
~~Informational Note: See 310.10(H) for grounded conductors connected in parallel.~~
~~(c) *Delta Connected Service.* The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.~~
~~(d) *Impedance Grounded System.* The grounded conductor of an impedance grounded neutral system shall be installed in accordance with 250.36 or 250.186.~~
Substantiation: The issue of concern with this section is that the grounded conductor if installed so it will be called upon to carry fault current back to the source, is large enough to safely carry the current that can be supplied by the system. This is the same issue and concern addressed for service-supplied systems in 250.24(C)(1) through (C)(4) Those sections have been revised for the 2011 NEC and there does not seem to be an advantage to repeating all the information in this section.
Panel Meeting Action: Reject
Panel Statement: Though similar to the sizing rules in 250.24(C) in concept, the panel prefers to keep the requirements for sizing the grounded conductor in 250.30(A) for completeness.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-79 Log #477 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(3)(a))

Submitter: J. Kevin Vogel, Crescent Electrical Supply
Comment on Proposal No: 5-102
Recommendation: Revise text to read as follows:
(a) Sizing for a Single Raceway. The grounded conductor shall not be smaller than the required grounding electrode conductor specified in Table 250.66, but shall not be required to be larger than the largest ungrounded ~~service entrance~~ phase conductor(s). In addition, for sets of ungrounded conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 12 1/2 percent of the circular mil area of the largest set of ungrounded conductors. [ROP 5-102]
Substantiation: The words "service entrance" are not appropriate since we are dealing with the conductors for separately derived systems.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-80 Log #652 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(3)(a))

Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 5-102
Recommendation: Revise text to read as follows:
...larger than the largest ungrounded ~~service-entrance~~ derived phase conductor(s). (The remainder of the section should stay as is.)
Substantiation: The title of 250.30 is Grounding Separately Derived Alternating-Current Systems. In article 100, "Service" is defined as being supplied by a utility. Separately derived systems are defined as having no direct electrical connection to the service supplied by the utility. Neither version of the definition of service entrance conductors applies to separately derived systems.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-81 Log #1260 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(3)(a))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 5-102
Recommendation: Continue to accept the proposal. Revise the text in 250.30(A)(3)(a) as follows:
(a) *Sizing for a Single Raceway*. The grounded conductor shall not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest ungrounded derived ~~service entrance~~ phase conductor(s). In addition, for sets of ungrounded conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 12 1/2 percent of the circular mil area of the largest set of ungrounded derived phase conductors.
Substantiation: 250.30(A) covers grounding requirements for separately derived systems. The reference to "service-entrance conductors" is not technically accurate. For consistency, the correct term should be derived phase conductors.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-82 Log #1066 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(3)(c) (New))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 5-102
Recommendation: Revise the heading and text of 250.30(A)(3)(c) as accepted to eliminate the incorrect term "service" from this section. The revised text would be: "(c) Delta Connected ~~Service~~ System. The grounded conductor of a 3-phase, 3-wire delta ~~service~~ system shall have an ampacity not less than the ungrounded conductors."
Substantiation: This is an obvious misuse of the defined term "service." The section is about separately derived systems, not services.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-83 Log #1261 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(3)(c))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 5-102
Recommendation: Continue to accept the proposal.
Revise 250.30(A)(3)(c) as follows:
(c) *Delta Connected System ~~Service~~*. The grounded conductor of a 3-phase, 3-wire delta-connected separately derived system ~~service~~ shall have an ampacity not less than that of the ungrounded conductors.
Substantiation: 250.30(A) covers grounding of separately derived systems. This revision to Proposal 5-102 replaces the term "service" with the term "system" and the term "delta-connected separately derived system" to maintain consistency and accuracy within this section.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-84 Log #2342 NEC-P05 **Final Action: Accept in Principle**
(250.30(A)(3)(c))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-102
Recommendation: Revise 250.30(A)(3)(c) as follows:
(c) *Delta Connected System ~~Service~~*. The grounded conductor of a 3-phase, 3-wire delta ~~service~~ system shall have an ampacity not less than that of the ungrounded conductors.
Substantiation: Because this rule is in 250.30, it is referring to separately derived systems, not services.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-85 Log #1826 NEC-P05 **Final Action: Accept in Principle**
(250.30(B)(1))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-102
Recommendation: Revise the text of the 2001 NEC ROP Draft as follows:
(1) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with 250.66 for the largest derived ungrounded conductor(s) or set of ungrounded conductors ~~phase conductors~~, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in 250.30(A)(5) ~~250.30(B)(5)~~ or (6), as applicable. This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means. If the source is located outside the building or structure supplied, a grounding electrode connection shall be made in compliance with (C).
Substantiation: It appears the reference to 250.30(B)(5) or (6) is incorrect as these sections do not exist. It seems the correct reference should be to 250.30(A)(5) or (6) in the ROP Draft where the installation of a grounding electrode conductor for separately derived systems is covered.
CMP-5 has revised the term "phase conductor" to "ungrounded conductor" to be more descriptive. The addition of the phrase "ungrounded conductor(s) or set of ungrounded conductors" is intended to be editorial to clarify the application of the rule to installations with a single or parallel set of ungrounded conductors.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-86 Log #1056 NEC-P05 **Final Action: Reject**
(250.30(C) Exception)

Submitter: David Bredhold, Eaton Corporation
Comment on Proposal No: 5-102
Recommendation: Delete text as follows:
~~*Exception: The grounding electrode conductor connection shall not be made at the outdoor source for high-impedance grounded neutral systems. The system shall meet the requirements of 250.36.*~~
Substantiation: The exception could prove tenable if all secondary conductors from a transformer supplying only one building. The connection to the grounding electrode conductor could be made inside the building, even though the transformer and impedance are located some distance remote from the building.

In a campus system, however, where a transformer's secondary conductors supply more than one building (ref. 240.21(C)(4), termination of the ground-side of the impedance at a single building would prove impossible, the only possible termination point could be at the transformer where the impedance is located.
Panel Meeting Action: Reject
Panel Statement: The panel concludes the exception provides valuable information but revises it in Comment 5-69.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-87 Log #1835 NEC-P05 **Final Action: Accept in Principle**
(250.30(C) Exception)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-102
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
Exception: The grounding electrode conductor connection for an ~~shall not be made at the~~ outdoor source for high-impedance grounded neutral systems. ~~The system~~ shall comply with ~~meet the requirements of~~ 250.36.
Substantiation: The source of high-impedance grounded neutral systems is often located in a unit substation that is outside a building or structure. The consulting engineer needs the flexibility and option to locate the impedance device at the unit substation and also have the grounding electrode connection at that location.
The text of the revised exception is intended to offer suitable options to the design engineer or installer.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-69. The panel concludes this action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-88 Log #2693 NEC-P05 **Final Action: Reject**
(250.32(A) Exception)

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 5-124
Recommendation: The proposal should be accepted.
Substantiation: In the panel statement, CMP 5 challenges the assertion in the proposal substantiation that what is requested in the proposal was a former requirement of this part of the Code. The relevant text in the 1993 NEC is 250-24(a) Exception No. 2. The second sentence of this exception reads as follows: "Where there are no existing electrodes, a grounding electrode meeting the requirements of Part H shall be installed *where the building or structure supplies more than one branch circuit* [emphasis supplied]. In the 1996 edition, this was changed, courtesy of the Dan Leaf proposal #5-37 to read, "*where the building or structure is supplied by more than one branch circuit"* [emphasis supplied]. The result changed the point of supply criterion from the second building to the first building, and therefore changed the supply characteristic from a feeder to multiple branch circuits. The change was not substantiated by either the proposal submitter or the panel, and we still live with this concept today.
The wording of the proposal returns to the original concept. It is quite true that more than one branch circuit could arrive at an outbuilding, but they would be no larger individually than a single branch circuit could be under the present wording. The more important point is that a feeder will arrive at an enclosure where completely appropriate terminations are available to connect the (usually) 6 AWG or larger grounding electrode conductors that will be required to comply with these rules.
Panel Meeting Action: Reject
Panel Statement: The text in the 1993 NEC 250-24(a) Exception No. 2, referred to in the substantiation, is an exception to a rule that no longer exists in the NEC. The relevant text in the 1993 NEC is 250-24(a) Exception No. 1, which supports the action and statement on Proposal 5-124.
Number Eligible to Vote: 16

5-89 Log #82 NEC-P05 **Final Action: Accept**
(250.32(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 5-126
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal in accordance with 3.2.3 of the NEC Style Manual related to the use of acronyms.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel has considered the use of the term and the acronym and determined that the term "Supply-Side Bonding Jumper" is to be used without the acronym (SSBJ) at each location where the term is used.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-90 Log #2093 NEC-P05 **Final Action: Reject**
(250.32(B))

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 5-127
Recommendation: This proposal should be accepted.
Substantiation: The exception was put into the code for the initial cycle to inform users of the change and that existing installations are allowed to remain. There is no need to have this exception to continue in the code for the 2011 code cycle. All installations that fall under this exception were approved at that time and the current code would not require them to make a change.
Panel Meeting Action: Reject
Panel Statement: In many situations a branch circuit is added to an existing installation that was made using the grounded conductor as a fault current path for a building being supplied. This exception makes it clear that the installation can remain and be used or even an additional circuit installed without changing the feeder, similar to what is permitted for ranges and dryers in 250.140 and 250.142.
See panel action on Comment 5-91.

Ballot Results: Affirmative: 16

5-91 Log #1837 NEC-P05 **Final Action: Accept**
(250.32(B)(1) Exception)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-127
Recommendation: Revise text of the 2011 NEC ROP Draft as follows:
Exception: For installations made in compliance with previous editions of this Code that permitted such connection, ~~existing premises wiring systems only~~, the grounded conductor run with the supply to the building or structure shall be permitted to serve as the ground-fault return path ~~be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded~~ if all the requirements of (1), (2), and (3) continue to be ~~are~~ met:
The remainder of the Exception is unchanged by this Comment.
Substantiation: These changes are recommended to improve the application of the exception to only installations that were previously made in full compliance with the requirements in previous editions of the Code that permitted the grounded conductor (often a neutral) to be re-grounded at a building or structure and serve as the ground-fault return path. Installations made in compliance with more recent editions of the NEC are required have the neutral isolated from the equipment grounding means at the building or structure supplied by a feeder.
Since these are existing installations, the language on what the grounded conductor is connected to is no longer needed. Those rules were provided in the text that applied when the installation was made.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-92 Log #481 NEC-P05 **Final Action: Reject**
(250.32(B)(2)(a) and (b))

Submitter: J. Kevin Vogel, Crescent Electrical Supply
Comment on Proposal No: 5-126
Recommendation: Revise text to read as follows:
(a) Having Overcurrent Protection. If overcurrent protection is provided where the conductors originate, the installation shall comply with (B)(1)~~.~~ and 250.30.
(b) Without Overcurrent Protection. If overcurrent protection is not provided where the conductors originate, the installation shall comply with 250.30~~(A)~~...".
Substantiation: 250.30 Grounding Separately Derived Alternating-Current Systems, if accepted, will require: "In addition to complying with 250.30(A) for grounded systems or as provided in 250.30(B) for ungrounded systems, separately derived systems shall comply with 250.20, 250.21, 250.22, 250.24(A)(2) and 250.26". It is important that 250.32(B)(2)(a) and (b) both be subjected to all of the installation requirements contained in 250.30, especially those of 250.24(A)(2) regarding the connection of the grounded conductor of an outdoor transformer to a grounding electrode "either at the transformer or elsewhere outside the building."
Panel Meeting Action: Reject

Panel Statement: Section 250.32 deals with the equipment grounding conductor installation with feeder or branch circuits serving outbuildings or structures. If served by a separately derived system, the requirements of 250.30 still apply and do not need to be cross referenced again.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-93 Log #2561 NEC-P05 **Final Action: Accept in Principle**
(250.32(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-129
Recommendation: Accept the proposal as modified in principle. Add the following sentence as a second paragraph:

"If overcurrent protection is not provided where the conductors originate, the installation shall comply with 250.30(B), and if installed, the supply side bonding jumper shall be connected to the building or structure disconnecting means and to the grounding electrode(s). If overcurrent protection is not provided where the conductors originate, a supply-side bonding jumper shall be installed in accordance with 250.30(B)(3)."
Substantiation: This provision needs comparable language for ungrounded systems as CMP 5 inserted into the final version of Proposal 5-126. Note that the reference to the supply-side bonding jumper correlates with this submitter's comment on Proposal 5-102.
Panel Meeting Action: Accept in Principle
Revise the text of 250.32(C) from the 2011 NEC Draft to read as follows:

(C) Ungrounded Systems.

(1) Supplied by a Feeder or Branch Circuit. An equipment grounding conductor as described in 250.118 shall be installed with the supply conductors and be connected to the building or structure disconnecting means and to the grounding electrode(s). The grounding electrode(s) shall also be connected to the building or structure disconnecting means.
(2) Supplied by a Separately Derived System.
(a) Having Overcurrent Protection. If overcurrent protection is provided where the conductors originate, the installation shall comply with (C)(1).
(b) Without Overcurrent Protection. If overcurrent protection is not provided where the conductors originate, the installation shall comply with 250.30(B). If installed, the supply-side bonding jumper shall be connected to the building or structure disconnecting means and to the grounding electrode(s)."
Panel Statement: The revised text brings these requirements into parallel with the like requirements for grounded systems in 250.32(B) where supplied by a separately derived system outside the building or structure. The panel concludes the revisions meet the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-94 Log #14 NEC-P05 **Final Action: Reject**
(250.34)

Submitter: Rick Wittmer, WEXECC
Comment on Proposal No: 5-130
Recommendation: My proposed change is to require all vehicle mounted generators have a retractable cord reel mounted on the vehicle with the green wires attached to the reel, with sufficient cord of proper size to reach earth where a "TEE" ground rod be inserted into the earth and the cord with a clamp attached to it.

Unless I'm reading the code wrong, this code change should be retroactive to all generators mounted on vehicles. This is an accident waiting to happen. Please respond if I'm missing some part of the code that would make this a safe condition not to ground the truck chassis (generator housing) to earth.
Substantiation: I have been an electrical engineer in a power plant for 34 years, now retired. I have also been a volunteer fire fighter for 40 years. Recently, we purchased a new pumper with a 15 KW generator 110/220 volt. Over the years, the generators have increased in size and power output. These generators are large enough to power a home. When we took delivery of the truck the vendor representative stated a ground reel for the generator was an option, and not mandatory. I reviewed the requirements for grounding on page 70-103, section 250.34, Portable and Vehicle-Mounted Generators of the 2008 code book. There is no requirement for grounding the generator to earth ground only to the truck frame. We have 100 ft AWG #10 cord reels which can extend into a burning structure. These reels carry 220v/120v power for fans and portable lights. My safety concern is with a 20 or 30 amp breaker and a fireighter standing in water holding onto a portable light, could be electrocuted if the equipment were to ground out. Since the code requires the ground wire (green) be bonded to the truck frame. The truck frame is isolated from earth ground. I considered a GFIC breaker, but in the fire service conditions this would not be practical. We would be tripping breakers constantly.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided proposed text for this comment including the wording to be added, revised (and how revised), or deleted in accordance with 4.4.5(c) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-95 Log #1838 NEC-P05 **Final Action: Accept in Principle**
(250.35)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-134
Recommendation: Revise the existing text of the 2008 NEC as follows:
250.35 Permanently Installed Generators.
A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).
(A) Separately Derived System. If ~~Where~~ the generator is installed as a separately derived system, the requirements in 250.30 shall apply.
(B) Nonseparately Derived System. If ~~Where~~ the generator is ~~not~~ installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a SSBJ ~~an equipment bonding jumper~~ shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar or bus of the ~~enclosure of supplied~~ disconnecting mean(s) ~~in accordance with (B)(1) or (B)(2).~~ It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator
~~(1) Supply Side of Generator Overcurrent Device. The equipment bonding jumper on the supply side of each generator overcurrent device shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.~~
~~(2) Load Side of Generator Overcurrent Device. The equipment grounding conductor on the load side of each generator overcurrent device shall be sized in accordance with 250.102(D) based on the rating of the overcurrent device supplied.~~
Substantiation: The recommendation was to Accept Proposal 5-134 in Principle with the following action. This was accepted by CMP-5 at the Panel meeting in Hilton Head, SC on January 12-16, 2009. For some reason, this action was reported as "Reject" in the Report on Proposals. The changes to 250.35 as shown above was accepted by CMP-5 yet the revision does not appear in the 2011 NEC ROP Draft.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Comment intends to use the word "if" where appropriate.
Panel Meeting Action: Accept in Principle
Revise the existing text of the 2008 NEC to read as follows:
250.35 Permanently Installed Generators.
A conductor that provides an effective ground-fault current path shall be installed with the supply conductors from a permanently installed generator(s) to the first disconnecting mean(s) in accordance with (A) or (B).
(A) Separately Derived System. If the generator is installed as a separately derived system, the requirements in 250.30 shall apply.
(B) Nonseparately Derived System. If the generator is installed as a nonseparately derived system, and overcurrent protection is not integral with the generator assembly, a supply-side bonding jumper shall be installed between the generator equipment grounding terminal and the equipment grounding terminal, bar, or bus of the disconnecting mean(s). It shall be sized in accordance with 250.102(C) based on the size of the conductors supplied by the generator.
Panel Statement: The panel has considered the use of the term and the acronym and determined that the term "Supply-Side Bonding Jumper" is to be used without the acronym (SSBJ) at each location where the term is used.

It was the further action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise 250.36 to read as follows:

250.36 High-Impedance Grounded Neutral Systems.

High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 480 volts to 1000 volts if all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only qualified persons service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served. High-impedance grounded neutral systems shall comply with the provisions of 250.36(A) through (G).

(A) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral point. If a neutral point is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral point derived from a grounding transformer.

(B) Grounded System Conductor. The grounded system conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated. The grounded system conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance but in no case shall the grounded system conductor be smaller than 8 AWG copper or 6 AWG aluminum or copper-clad aluminum.

(C) System Grounding Connection. The system shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems."

(D) Neutral Point to Grounding Impedance Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway from the ungrounded conductors. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(E) Equipment Bonding Jumper. The equipment bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(F) Grounding Electrode Conductor Location. The grounding electrode conductor shall be connected at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(G) Equipment Bonding Jumper Size. The equipment bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) If the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66, based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) If the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).

Panel Statement: The revised text was accepted by the panel and as stated in several negative votes was not processed into the ROP. The panel concludes that the work of the TG making the proposal was correct. The panel also concludes the reject of Proposal 5-135 was also correct and the technical substantiation in support of that reject was correct.

The panel corrects the previous use of the term "equipment bonding jumper" as the bonding jumper does not complete the equipment grounding conductor path as defined in Article 100. Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if.

Ballot Results: Affirmative: 16

5-98 Log #1078 NEC-P05 **Final Action: Reject**
(250.50)

Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 5-137
Recommendation: Revise the text of 250.50, as indicated:

All grounding electrodes as described in 250.52(A)(1) through (A)~~(7)~~(8) that are present at each building or structure served shall be bonded together to form the grounding electrode system. Where none of these grounding electrodes exist, one or more of the grounding electrodes specified in 250.52(A)(4) through (A)~~(8)~~(9) shall be installed and used.
Substantiation: This proposal should be reconsidered. I have submitted comments on Proposals 5-142 Log #2567, and 5-143 Log #2570. It is not the intent of the submitter to group acceptable electrodes by trade. The reality that compelled the original proposal is that inspectors are requiring electricians to install the 20 ft of No. 4 copper when construction does not dictate the installation of No 4 Re-Rebar. The argument most often given, is "The #4 Cu is listed in 250.52(A)(3) so it must be installed". In contrast there is nothing in 250.52(A)(1) or (2) which would provoke such a response if a metal water pipe or building steel were not present. My original thought was if the 20 ft of No. 4 Cu. was located to the list of installed electrodes Items 4-7 (see Proposals 5-137 Log #2569, 5-142 Log #2567, and 5-143 Log #2570), then hopefully local authorities would not be so insistent on installing 20 ft of No. 4 copper. If the panel continues to reject these proposals then I would suggest a FPN indicating that the No. 4 Cu is not mandated in the absence of reinforcement steel in the foundations or footings.
Panel Meeting Action: Reject
Panel Statement: The requirement for establishing a grounding electrode system is in 250.50, including using all the electrodes that are present. Section 250.52 the qualifications for electrodes that are permitted to be used. If a concrete encased electrode doesn't exist, either rebar or wire, - they are not present and it is not required to install one. At least one of the electrodes in 250.52 shall be used.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-99 Log #686 NEC-P05 **Final Action: Reject**
(250.50, FPN (New))

Submitter: Paul Guidry, Fluor Enterprises, Inc.
Comment on Proposal No: 5-140
Recommendation: Add FPN to read:
FPN: Bonding of dissimilar metals will result in corrosion of one of the metals. Cathodic protection systems may need to be installed to mitigate the corrosion.
Substantiation: The panel statement was given as follows:
"The corrosion concern between concrete encased rebar and copper wire has been specifically addressed in the Institute of Electrical and Electronic Engineers standard 142, IEEE Recommended Practice for Grounding of Industrial and Commercial Power Systems (Green Book). It clearly mentions " It should be noted that steel rebar, when encased in concrete, has approximately the same potential as copper and thus will not corrode." Industry has been using concrete encased reinforcing bar grounding systems with and without connecting to the copper wires without any reported concerns."

The information in Std. 142 is correct as long as copper isn't connected to steel. I am currently on the IEEE Green Book Working Committee for the revision of Std. 142 and this information is being corrected.

Unfortunately, I do not have actual pieces of corroded rebar to show the panel. When concrete fails, it is usually blamed on "bad concrete", not realizing that the problems may have been caused by current flowing between different metals. But, I do have empirical data which I intend to demonstrate for the panel which proves that the connection of copper and steel creates a battery (or a corrosion cell).

Being employed by a large engineering firm, I have ready access to corrosion engineer's technical advice. Most people using the Code do not have this benefit. It can be argued that the Code isn't an instruction manual and that people using the Code should be aware of the cathodic current flowing and resulting corrosion. I agree that the Code is not an instruction manual. It is a highly technical document that shouldn't be used by untrained persons. However, most electrical engineers, designers, electricians and inspectors are not trained in cathodic protection principles and techniques. When following Code requirements, if there is a potential problem, I believe it is the ethical thing to do to at least add a FPN alerting users to the fact that there may be an issue. This is done throughout the Code today, much like the FPNs for voltage drop, conduit expansion, etc.
Panel Meeting Action: Reject
Panel Statement: The technical substantiation does not support the need for an Informational Note. Steel encased in concrete is at the same potential as copper.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-100 Log #1839 NEC-P05 **Final Action: Reject**
(250.52(A))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-144
Recommendation: Revise the existing text of the 2008 NEC by inserting an opening paragraph as follows:
250.52 Grounding Electrodes.
(A) General. Only the portion of grounding electrode(s) installed below the soil frost level shall be considered in determining compliance with (B)(1) through (B)(8) and the installation requirements of 250.53.
Renumber existing 250.52(A) to (B) and existing (B) to (C).
Substantiation: Several authoritative sources show the conductivity of the earth is reduced sharply if the earth is frozen. See Table 2-10 of the *Military Handbook, Grounding, Bonding, and Shielding for Electronic Equipments and Facilities Volume II of 2 Volumes Applications.* (Copy attached) This standard gives the resistance of sandy loam having 15.2 percent moisture. A direct, nearly lineal and opposite relationship exists. As the temperature decreases, the resistance of the earth increases. The changes are most significant as the temperature falls below freezing.
Additional documentation, though not so specific as that found in the Military Handbook, is found in the British Standard, Code of practice for Earthing. The fourth paragraph of section 8.1 gives guidance on installation of earthing electrodes below the frost level and recommends that portions of the earth electrode within 3 ft of the surface be disregarded.
Frozen earth severely reduces the opportunity of the grounding electrode to make a connection to the earth.
Building codes typically require that footings for building foundations be installed below the frost line to avoid structural damage from earth movement. As a result, grounding electrodes that are installed at or below the excavation level will automatically comply with the proposed rule. Underground metal water pipes are typically required to be buried below the frost level for obvious reasons.
This clarification needs to be added to the Code since CMP-5 made a change to 250.52(A)(4) for the 2008 NEC that permits concrete-encased electrodes to be installed vertically. Only the portion of the grounding electrode that is below the frost level should be considered when determining whether a qualifying grounding electrode is present.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There was no evidence provided that indicates that the existing methods have created a problem or have adversely affected the safety of the system.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRENDER, D.: Earth conductivity is reduced sharply if the earth is frozen. Frozen earth severely reduces the ability of an electrode to make contact with the earth. Only that portion of an electrode below the frost line should be considered when determining whether an electrode is effective.

5-101 Log #1371 NEC-P05 **Final Action: Reject**
(250.52(A)(1) Exception)

Submitter: Charles M. Trout, Maron Electric Company
Comment on Proposal No: 5-148
Recommendation: Delete 250.52(A)(1) Exception in its' entirety.
Substantiation: The panel statement refers to a condition of distance for the use of this exception, a condition which is not a part of the exception. The panel statement does not justify this exception with technical substantiation regarding permitting a lesser degree of safety because of an undefined distance and the lack of prescriptive requirements to enable the AHJ to enforce the requirement.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no evidence of a problem or for it providing a lesser degree of safety. In some situations, such as for large buildings, connecting to the water pipe and using it as an extension to the electrode can result in a lower impedance path. A facility that has a process to ensure the water pipe continuity is not interrupted can use the exception. The AHJ can verify that such a process or method exists.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

(250.52(A)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-158
Recommendation: Revise the existing text of the 2008 NEC as follows:
(3) Concrete-Encased Electrode. A conductive element ~~An electrode~~ encased by at least 50 mm (2 in.) of concrete, ~~located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth,~~ consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars for use as a concrete-encased electrode shall be in one continuous 6.0-m (20-ft) length or, if in multiple pieces of reinforcing bars, shall ~~permitted to~~ be connected ~~bonded~~ together by the usual steel tie wires, exothermic welding, welding, or other effective means to create one or more 6.0-m (20-ft) length(s). If ~~Where~~ multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.
(**a) Location.** Metallic components shall be located horizontally within that portion of a concrete foundation or footing that is in direct contact with the earth or within vertical foundations or structural components or members that are in direct contact with the earth.
Substantiation: A new subsection is proposed to cover the location requirements of concrete-encased electrodes. This will make the requirements more user-friendly. Changes are proposed to add requirements on how to create the minimum 20-ft length of concrete-encased electrode. CMP-5 accepted adding connection of hold-down bolts for structural steel grounding electrodes as "welding, exothermic welding, the usual steel tie wires.." so those three methods are recognized here.
CMP-5 added the permission to use concrete-encased electrodes in a "vertical" orientation in the 2008 NEC but now needs to "fill in the blanks" on how this style of electrode is to be installed or recognized. Some members of CMP-5 have stated it is their opinion the vertical grounding electrode must be in one 20-ft length. Others have opined that 4, 5-ft lengths should suffice. This proposal intends to require not less than one 20-ft length as that is the documentation that accompanied the original proposal to add the "Ufer ground" to Article 250 (so far as I can determine). Four, 5-ft lengths may perform adequately but documentation to support that premise has not been supplied to CMP-5. A concrete-encased grounding electrode installed in a vertical orientation needs to have direct earth contact to ensure the concrete-encased grounding electrode will maintain essential moisture level so as to remain conducive.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle

Revise the existing text of the 2008 NEC to read as follows:

250.52(A)(3) Concrete Encased Electrode. At least 6.0 m (20 ft) of either (1) or (2):

(1) One or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (1/2 in.) in diameter, installed in one continuous 6.0-m (20-ft) length, or if in multiple pieces connected together by the usual steel tie wires, exothermic welding, welding, or other effective means to create a 6.0-m (20-ft) or greater length; or

(2) Bare copper conductor not smaller than 4 AWG

Metallic components shall be encased by at least 50 mm (2 in.) of concrete and shall be located horizontally within that portion of a concrete foundation or footing that is in direct contact with the earth or within vertical foundations or structural components or members that are in direct contact with the earth. If multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.

Informational Note. Concrete installed with insulation, vapor barriers, films or similar items separating the concrete from the earth is not considered to be in "direct contact" with the earth.

Panel Statement: The panel made editorial and organizational changes to improve clarity.

An Informational note was added to provide clarification on direct contact with the earth.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-104 Log #1841 NEC-P05 **Final Action: Accept in Principle**
(250.52(A)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-158
Recommendation: Revise the existing text of the 2008 NEC as follows:
(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm (2 in.) of concrete, ~~located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth,~~ consisting of at least 6.0 m (20 ft) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm (½ in.) in diameter, or consisting of at least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG. Reinforcing bars shall be ~~permitted to~~ be connected ~~bonded~~ together by the usual steel tie wires, welding, or other effective means. If ~~Where~~ multiple concrete-encased electrodes are present at a building or structure, it shall be permissible to bond only one into the grounding electrode system.
(a) Location. Metallic components of the electrode shall be located horizontally near the bottom and within that portion of a concrete foundation or footing that is in direct contact with the earth or within vertical foundations or structural components or members that are in direct contact with the earth.
Substantiation: The Panel action and statement in rejecting the Proposal are not responsive to the proposal or substantiation. The Panel Statement is inconsistent with the text it accepted in Proposal 5-150 where the Panel crafted the language, "The hold-down bolts shall be connected to the concrete-encased electrode by welding, exothermic welding, the usual tie wires, or other approved means." The Panel states in its statement on Proposal 5-150 that proposed text and substantiation for Proposals 5-149, 150, 151 and 152 are included in its action on Proposal 5-150. A review of those proposals does not indicate any language about connection by welding or exothermic welding. Why is the language acceptable in Proposal 5-150 without substantiation and yet was rejected in Proposal 5-158?

It is not uncommon for reinforcing steel to be welded. The American Welding Society produces *D1.4:2005, Structural Welding Code - Reinforcing Steel*. Section 1.4 of the standard reads as follows:

"1.4 Welding Processes

1.4.1 Welding shall be performed with shielded metal arc welding (SMAW), gas metal arc welding (GMAW), or flux cored arc welding (FCAW).
1.4.2 Other welding processes may be used when approved by the Engineer, provided that any special qualification test requirements not covered here are met to ensure that welds satisfactory for the intended application will be obtained."

A new subsection is proposed to cover the location requirements of concrete-encased electrodes. This will make the requirements more user-friendly.

CMP-5 added the permission to use concrete-encased electrodes in a "vertical" orientation but now needs to "fill in the blanks" on how this style of electrode is to be installed or recognized. Some members of CMP-5 have stated it is their opinion the vertical grounding electrode must be in one 20-ft length. Others have opined that 4, 5-ft lengths should suffice. This proposal intends to require not less than one 20-ft length as that is the documentation that accompanied the original proposal to add the "Ufer ground" to Article 250 (so far as I can determine). Four, 5-ft lengths may perform adequately but documentation to support that premise has not been supplied to CMP-5. A concrete-encased grounding electrode installed in a vertical orientation needs to have direct earth contact to ensure the concrete-encased grounding electrode will maintain essential moisture level so as to remain conducive.

Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.

Ballot Results: Affirmative: 16

5-105 Log #2562 NEC-P05 **Final Action: Reject**
(250.52(A)(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-164
Recommendation: Accept the proposal.
Substantiation: The proposal only allows what the panel statement said, in effect, was acceptable. It allows multiple pieces of steel that are bonded together. The only difference is that the bonding is not accomplished by a steel-to-steel bond, but through bonds to the grounding electrode conductor. It is hard to imagine that the grounding impedance of four steel reinforcing rods connected in a common location using the usual tie wires would be less than the same four rods in separate locations all bonded together with copper. In fact, the latter scenario would presumably be lower in impedance because each rod would access differing sections of earth, and therefore receive the benefits of paralleled electrodes.
Panel Meeting Action: Reject
Panel Statement: No test data has been provided to support the recommendation of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-106 Log #1988 NEC-P05 **Final Action: Reject**
(250.52(A)(4))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 5-165
Recommendation: This proposal should be accepted
Substantiation: The only technical substantiation that is required to support this proposal is logic. It should be very clear that a 20' radial will provide a better grounding electrode than that same 20' of copper run around the structure would be. With the 20' run around a structure there will be overlapping spheres of influence that will reduce the effectiveness of the grounding electrode, just like the case where ground rods are installed too close to each other. If a grounding electrode must encircle the structure to be a functional grounding electrode, the why are ground rods, metal underground water pipes or building steel suitable for use as grounding electrodes?
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its view that the technical substantiation submitted is insufficient to justify a change. There was no empirical test data or field evidence provided to indicate a radial performs as well as a ring.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-107 Log #2396 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 5-166
Recommendation: The submitter's request that CMP-5 reconsider action on the Proposal 5-166 and accept as submitted.
Substantiation: As stated in the substantiation submitted with the proposal, enforcement has no means to evaluate an unlisted ground rod installed on a job site. Listing of the rods would require the rod to be evaluated prior to installation and permit the listing mark to be used as confirmation the NEC requirements have been met.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-108.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

BRENDER, D.: Panel should have accepted this Comment. The substantiation is persuasive and for the most part, seems to have been ignored by the Panel in its statement.

5-108 Log #2872 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: Gary Jones, Ft. Worth, TX
Comment on Proposal No: 5-166
Recommendation: The original proposal should be accepted and the panel may consider the ideal of the proposed language as follows:
Revise 250.52(A)(5) to read as follows:
(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 2.44 m (8 ft) in length and shall consist of the following materials.
(a) Pipe Electrodes. ~~Grounding~~ electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.
(b) Rod Electrodes.Rod type electrodes shall comply with the following:
(1) Shall be constructed of solid copper, steel or ~~Grounding electrodes of~~ stainless steel
(2) Where of steel, rods shall be coated by ~~and~~ copper or zinc ~~steel~~
(3) Shall be listed as grounding and bonding equipment ~~at least 15.87 mm (5/8 in.) in diameter, unless listed and not less than 12.70 mm (½ in.) in diameter.~~
Substantiation: After many discussions with inspectors both locally and throughout the country, we have concerns about being unable to determine if the ground rod installed meets the requirements of the NEC.

The proposed modified wording would provide further reassurance of appropriately constructed ground rods and proper coatings while still meet the intent of proposal 5-166 plus it removes the minimum size requirement. This will allow the listing process and product standard to determine what is adequate. Additionally, by having a listing mark it would help us (the AHJ) to make sure the ground rod meets valid standards. With the idea that listings requirements exist, the NEC does not need to establish minimum manufacturing requirements.

Concerning the panel statement, "the NEC cannot control the manufacture of non-compliant products". The National Electrical directs that compliant products are used by requiring them to be listed. This includes many listing provisions found in the NEC, particularly grounding and bonding as found in NEC section 250.8(A), all to guarantee that conforming equipment and components may be acceptable to the AHJ.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation provided that indicates that unlisted rods are not suitable.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRENDER, D.: Panel should have accepted this Comment. The substantiation is persuasive and for the most part, seems to have been ignored by the Panel in its statement.

5-109 Log #2889 NEC-P05 **Final Action: Reject**
(250.52(A)(5))

Submitter: Chuck Mello, Underwriters Laboratories
Comment on Proposal No: 5-166
Recommendation: Revise text as follows:

The panel should reconsider and accept the concept of the proposed language as follows:

Revise 250.52(A)(5) to read as follows:

(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 2.44 m (8 ft) in length and shall consist of the following materials.

(a) Pipe Electrodes. ~~Grounding~~ electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size ¾) and, where of steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Rod Electrodes.Rod type electrodes shall comply with the following:
(1) Shall be constructed of solid copper, steel or ~~Grounding electrodes of~~ stainless steel
(2) Where of steel, rods shall have a coating of ~~and~~ copper or zinc ~~steel~~
(3) Shall be listed as grounding and bonding equipment ~~at least 15.87 mm (5/8 in.) in diameter, unless listed and not less than 12.70 mm (½ in.) in diameter.~~
Substantiation: The revised language incorporates the provisions of Proposal 5-168 and the two negative ballots that were provided on that proposal to eliminate the minimum size and let that be covered by the present Listing process and product standard. The premise that where listings requirements exist, the NEC does not need to establish minimum manufacturing requirements is correct.

The basic issue for inspectors is very clearly brought out by one of the major manufacturers of ground rods in a recent broadcast statement:

"Ground Rod Markings. A fully marked ground rod gives you inspectability and traceability. An unmarked, no-name ground rod gives you liability. It's your choice. Choosing expediency or a few pennies cost difference over safety is potentially very dangerous for electrical inspectors, wholesalers, contractors and their customers."

When ground rods are installed and there is no indication of compliance with the UL standard for grounding and bonding equipment, the suitability of the rod cannot be readily determined by the inspector. The length, the core material used, the coating thickness are all in question no matter what the diameter.

The panel statement is incorrect in stating, "the NEC cannot control the manufacture of non-compliant products". The NEC can very much control that compliant products are used by requiring them to be listed, as evidenced by the numerous listing requirements placed in the NEC for conduit, wire, conduit fittings, specific grounding and bonding connectors, signs, and luminaires, etc., all to ensure that compliant products are provided, and can be readily inspected by the AHJ, for the installation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-108.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRENDER, D.: Panel should have accepted this Comment. The substantiation is persuasive and for the most part, seems to have been ignored by the Panel in its statement.

5-110 Log #1230 NEC-P05 **Final Action: Accept**
(250.52(A)(5)(b))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 5-168
Recommendation: Grounding electrodes of stainless steel and copper or zinc coated steel shall be at least 15.87 mm (5/8 in.) in diameter, unless listed ~~and not less than 12.70 mm (1/2 in.) in diameter.~~
Substantiation: This proposal should have been accepted. The UL467 Standard requires the minimum size of a listed rod to be the identical size as presently described in the NEC, 12.7 mm (1/2 in.). The NEC is intended to be an installation code and not a product design standard. Change the wording to a very simple statement.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRENDER, D.: The Panel should have rejected this Comment. The NEC appropriately contains many, many construction requirements. The present UL Product Safety Standard contains identical requirements to that of the NEC for the minimum diameter of ground rods. Nothing is to be gained by removing the minimum diameter.

5-111 Log #1080 NEC-P05 **Final Action: Reject**
(250.52(A)(8) (New))

Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 5-143
Recommendation: Add a new subsection number (8) to section 250.52(A) to read as follows and renumber existing subsections (8) as (9).

(8) Other Concrete Encased Electrodes. At least 6.0 m (20 ft) of bare copper conductor not smaller than 4 AWG, encased by at least 50 mm (2 in.) of concrete, located horizontally near the bottom or vertically, and within that portion of a concrete foundation or footing that is in direct contact with the earth.

Substantiation: This proposal should be reconsidered as Accept in Principal. It is not the intent of the submitter to group acceptable electrodes by trade. The reality that compelled the original proposal is that inspectors are requiring electricians to install the 20 ft of No. 4 copper when construction does not dictate the installation of No. 4 Re-Rebar. "The #4 Cu is listed in 250.52(A)(3) so it must be installed" this is the argument that is most often given. In contrast, there is nothing in 250.52(A)(1) or (2) which would provoke such a response if a metal water pipe or building steel were not present. My original thought was if the 20 ft of No. 4 Cu. was located to the list of installed electrodes Items 4-7 (see Proposals 5-137 Log #2569, 5-142 Log #2567, and 5-143 Log #2570), then, hopefully, local authorities would not be so insistent on installing 20 ft of No. 4 copper. If the panel continues to reject these proposals then I would suggest a FPN indicating that the No. 4 Cu. is not mandated in the absence of reinforcement steel in the foundations or footings.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-98.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-112 Log #496 NEC-P05 **Final Action: Accept**
(250.53(A)(2))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 5-169a
Recommendation: Continue to accept the proposal and add the word "single" in list item (2) as follows:
(2) Supplemental Electrode Required. A single rod, pipe or plate electrode shall be supplemented by an additional electrode of a type specified in 250.52(A)(2) through (A)(8).
Remainder as suggested in Proposal 5-169a.
Substantiation: The driving text in former 250.56 included the word "single." This word was lost in the proposal stage of the process. The new requirement to install a supplemental electrode is driven by the choice to install one rod, pipe, or plate electrode.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-113 Log #2232 NEC-P05 **Final Action: Reject**
(250.53(A)(2))

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Comment on Proposal No: 5-169a
Recommendation: Revise text to read as follows:
"Supplemental Electrode Required: A rod, pipe or plate electrode shall not by itself comprise an entire grounding electrode system, but rather shall be supplemented..."
Substantiation: The CMP is incorrectly interpreting its own words, in believing that the wording of this proposal does not presently require a rod to be supplemented, even if the rod is but one electrode in a system comprising many other types of electrodes. The wording, both as originally written in 250.56 and as proposed in 250.53, says that if there is a rod, then it gets supplemented. It says nothing about checking for the presence of other types of electrodes before deciding that a supplemental electrode is required.
Panel Meeting Action: Reject
Panel Statement: A single rod, pipe, or plate can be the entire "grounding electrode system" in cases where it meets the Code requirements in the exception to 250.53(A)(2). If a rod is connected to another electrode as defined in 250.52(A)(2) to (8), then no additional electrode is required either for the 2008 NEC in 250.56 or the proposed 2011 NEC.
See panel action and statement Comment 5-112.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-114 Log #2531 NEC-P05 **Final Action: Reject**
(250.53(A)(2))

Submitter: George M. Stolz, II, Western Sky Electric, LLC
Comment on Proposal No: 5-176a
Recommendation: The panel should reconsider and accept the proposal. Delete proposed 250.53(A)(2) and exception 2, and delete the existing 250.56.
Substantiation: There was no technical substantiation in the panel's comment to support how a second ground rod improves an electrical grounding system. Moving the text around the code does not distract this section's legion of critics from the fact that 30 ohms of resistance to earth is likely better than two paths of 3,000,000 ohms. If you move it around, we'll simply see you next cycle. The proposed changes make absolutely no difference in the interpretation or application of the text, add no additional safety to the NEC, and nothing substantive has been changed. I salute the panel's tenacity in their defense of this relic, hopefully in time it will fade along with the bygone 3-ohm water pipe requirement. I'm younger than most of you, chances are I'll outlive you, and perhaps the next generation will be able to demonstrate an enhanced ability to add.
Panel Meeting Action: Reject
Panel Statement: It is standard practice in some areas to install two ground rods because other types of electrodes are not present, instead of testing the resistance of a single rod. Depending on geographical location and conditions, installing more than two ground rods will not achieve a resistance of 25 ohms. In other locations a single rod can achieve a resistance of much less than 25 ohms.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-115 Log #1842 NEC-P05 **Final Action: Accept in Principle**
(250.53(A)(3))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-169a
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
Informational Note: ~~The paralleling efficiency of rods longer than 2.5 m (8 ft) is improved by spacing greater than 1.8 m (6 ft).~~ The paralleling efficiency of rods is increased by spacing adjacent rods by a distance equal to twice the length of a single rod. If the rods are not of the same length, the spacing of the paralleled rods is best determined by spacing not less than twice the length of the longer rod.
Substantiation: Note the Substantiation for Proposal 5-177. It states "The sphere of influence or relative earth cylinder or earth shell of a single rod is determined by the driven depth of the rod. No other rod should occupy this shell. Therefore, where it is possible to provide this spacing, the overall resistance to ground of the paralleled rods would be approximately half that of a single rod. I have seen certain local authorities require a 6-foot spacing between rods and this is certainly a misinterpretation of this concept."
The submitter of the proposal is correct. Manufacturers of listed ground rods recommend the rods be spaced not less than twice the length of the rod. This issue then becomes one of compliance with 110.3(B). The Informational Note brings valuable attention to this listing requirement.
This spacing to avoid overlapping "sphere-of-influence" by adjacent ground rods is also described in instructional manuals from manufacturers of earth-resistance testers.
Panel Meeting Action: Accept in Principle
Revise the recommended informational note text as follows:
Informational Note: The paralleling efficiency of rods is increased by spacing them twice the length of the longest rod.
Panel Statement: The proposed revised language is more concise and meets the submitter's intent.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 5-123. The panel action text includes both Proposal 5-194 and Proposal 5-195 combined.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-123 Log #1844 NEC-P05 **Final Action: Accept**
(250.64(B))

TCC Action: The Technical Correlating Committee directs that in the text of 250.64(B) the word "if" be changed to the word "where".
In this instance, the Technical Correlating Committee had determined that the revised wording is more appropriate.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-194
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(B) Securing and Protection Against Physical Damage. If ~~Where~~ exposed, a grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. Grounding electrode conductors shall be permitted to be installed on or through framing members. A 4 AWG or larger copper or aluminum grounding electrode conductor shall be protected if ~~where~~ exposed to physical damage. A 6 AWG grounding electrode conductor that is free from exposure to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection if ~~where~~ it is securely fastened to the construction; otherwise, it shall be protected in rigid metal conduit (RMC), intermediate metal conduit (IMC), rigid polyvinyl chloride conduit (PVC), reinforced thermosetting resin conduit (RTRC), electrical metallic tubing (EMT), or cable armor. Grounding electrode conductors smaller than 6 AWG shall be protected in RMC ~~rigid metal conduit~~, IMC ~~intermediate metal conduit~~, PVC ~~rigid polyvinyl chloride conduit (PVC)~~, RTRC ~~reinforced thermosetting resin conduit (RTRC)~~, EMT ~~electrical metallic tubing~~, or cable armor.
Substantiation: Please see the substantiation for Proposal 5-194. It appears, based upon CMP-5's statement on Proposal 5-195, that the Panel intended to incorporate the proposed changes in Proposal 5-194 into its action on Proposal 5-195. For some reason, it does not appear that happened.
This Comment incorporates the accepted language in the 2011 NEC ROP Draft so the work of CMP-5 on this section is preserved and to bring the use of acronyms into compliance with the NEC Style Manual.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Comment intends to use the word "if" where appropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-124 Log #1451 NEC-P05 **Final Action: Reject**
(250.64(E))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-197
Recommendation: Accept the proposal.
Substantiation: Raceways are not always used primarily for the purpose of protection, but as a support or a route for installation of conductors. Raceway conductor fill requirements do not specify that an equipment grounding conductor or bonding conductor is not be counted. Heating is not a factor where such conductors are the only ones installed, but they are not prohibited from installation with other conductors, where those other conductors can be affected. Installation with other conductors affects the area fill requirements for those conductors. Table 1 in Chapter 9 has a fill percentage for one conductor whether or not a circuit conductor. Proposed "provisions" include fishing of raceways and support of conduit bodies, which are not "requirements".
Panel Meeting Action: Reject
Panel Statement: If a grounding electrode conductor or grounding electrode bonding conductor were installed with circuit conductors, the raceway article requirements would already be in place when considering the overall circuit conductor conduit fill. The revised text does not add clarity. No additional technical substantiation was provided to delete the word "requirements" and add the terms "applicable provisions" as indicated in the panel statement for Proposal 5-197. Each raceway article, typically in the.22 section, references Chapter 9, Table 1 for raceway fill. Heat is not the only reason for limiting raceway fill, see 300.17.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-125 Log #1616 NEC-P05 **Final Action: Reject**
(250.64(E), FPN)

Submitter: Peter D. Noval, Jr., Philadelphia, PA
Comment on Proposal No: 5-200
Recommendation: Add new text to read as follows:
Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to the ground clamp or fitting. Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous metal raceways, boxes, and enclosures between the cabinets or equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.
FPN: NFPA 780-2008, Standard for the Installation of Lightning Protection Systems makes no distinction between ferrous and nonferrous and requires all metal conduit containing grounding electrode conductors to be bonded in the manner described by 250.64(E) for ferrous conduit.
Substantiation: The addition of the fine print note points out that the requirements for bonding grounding electrode conductor enclosures for lightning protection systems differ from those for other types of installations. Hopefully, this clarification will assist designers, installers and inspectors alike by eliminating the potential for confusion.
Panel Meeting Action: Reject
Panel Statement: The NEC is not the installation code for lightning protection systems. If these requirements are considered necessary, the proper installation code is NFPA 780.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-126 Log #338 NEC-P05 **Final Action: Accept**
(250.64(F)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-202
Recommendation: The proposal should be accepted in principle. Revise the ends text to read: "… bonding jumpers that are installed in accordance with 250.53(C).
Substantiation: This proposal removes the slang construction that substitutes "per" for "in accordance with" and is correct and enhances clarity. It is therefore to be distinguished from those proposals that would remove a perfectly concise and correct use of the word as a proposition meaning "for each". Comments have been submitted on all such proposals accordingly. The final sentence does, however, need the additional words "that are installed" in order for the rule to make sense grammatically. The NEC is an installation code and inanimate objects cannot comply with a rule requiring a certain installation protocol unless they have been so installed. The wording presented in this comment is more readable.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-127 Log #1221 NEC-P05 **Final Action: Reject**
(250.64(G))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 5-204
Recommendation: New text to read as follows:
Grounding electrode conductors shall be run as short and straight as practicable in order to limit conductor inpedance.
Substantiation: This revised statement is brief and to the point. The length of this conductor and the method of installation is very important and cannot be overlooked.
Panel Meeting Action: Reject
Panel Statement: The phrase "as short and straight as practicable" is subjective and difficult to enforce. The amount of acceptable conductor impedance is also left open to interpretation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-128 Log #1052 NEC-P05 **Final Action: Reject**
(250.66(B))

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 5-210
Recommendation: Accept this proposal to add text as follows:
Where the grounding electrode conductor is connected to a concrete encased electrode as permitted in 250.52(A)(3), that portion of the conductor that is the sole connection to the grounding electrode shall not be required to be larger than 4 AWG copper wire. This conductor shall be extended from this connection to an additional electrode(s) to protect the concrete from damage associated with ground-seeking current.
FPN: See IEEE F77-115-9.
Substantiation: It has been known for quite some time (at least 1960) that concrete footings can be damaged by ground-seeking current which causes the rapid expansion of the absorbed moisture in the concrete. Some code enforcing authorities are requiring the use of this type of electrode without the knowledge of potential damage.
Panel Meeting Action: Reject
Panel Statement: No documented evidence or direct technical substantiation has been provided to support adding the proposed requirement or the informational note.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-129 Log #2343 NEC-P05 **Final Action: Reject**
(250.68(C))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-212
Recommendation: Reject this proposal.
Substantiation: While this proposal does seem to address a real world concern, it also creates as many concerns as it solves. For example, with this new rule, no longer can an installer use the concrete encased electrode (CEE) as a GEC. It is quite common to connect from the service equipment to the CEE, then from the CEE to the underground water pipe. This is a very common practice, especially in wood framed structures. This change also eliminates connecting the GEC to a ground rod, then connecting a bonding jumper from the rod to another rod, as this proposed text states that only the water pipe or structural metal can have bonding jumpers.
Perhaps instead of rejecting the proposal, the CMP could include a "where used, bonding jumpers to water pipes or structural metal shall comply with the following…" type of statement. As currently accepted, however, room for confusion certainly exists.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-131. The panel action on Comment 5-131 resolved the issues with the submitter. Section 250.64(F) provides other locations for grounding electrode conductor and bonding jumper terminations. Section 250.50 requires all electrodes present to be bonded together.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-130 Log #2563 NEC-P05 **Final Action: Accept in Principle**
(250.68(C) (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-212
Recommendation: Accept the proposal in principle. In item (2)(a), change "reinforcing bars" to "conductive elements".
Substantiation: Concrete-encased electrodes are permitted to use bare copper wire as their conductive element, as well as steel reinforcing bars. The panel action, apparently inadvertently and certainly without substantiation does not accommodate an electrode made with bare copper wire.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-131.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-131 Log #1845 NEC-P05 **Final Action: Accept in Principle**
(250.68(C)(2) and 250.64(C))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-212
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
The opening paragraph of 250.68(C) and (C)(1) are not addressed by this Comment.
250.68(c)(2) The structural frame of a building that qualifies as a grounding electrode in accordance with 250.52(A)(2) and can be shown to provide a continuous path from the point of connection to the grounding electrode ~~as follows:~~.

~~a. By connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)~~
~~b. By bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.56~~
~~c. By other approved means of establishing a connection to earth~~
250.64(C) Continuous. Except as provided in 250.30(A)(5), (A)(6), 250.30(B)(1) and 250.68(C), grounding electrode conductor(s) shall be installed in one continuous length without a splice or joint. If required, splices or connections shall be made ~~except~~ as permitted in (1) through (4) ~~and (2)~~:
(1) Splicing of the wire-type grounding electrode conductor shall be permitted only by irreversible compression-type connectors listed as grounding and bonding equipment or by the exothermic welding process.
(2) Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor.
(3) Bolted, riveted, or welded connections of structural metal frames of buildings or structures
(4) Threaded, welded, brazed, soldered or bolted-flange connections of metal water piping
Substantiation: The purpose of this new 250.68(C) as stated in the new opening paragraph is to recognize the use of above-ground portions of metal water pipe and structural metal portions of a building as a grounding electrode conductor. As such, 250.68(C)(2) needs to be corrected to refer to the portion of structural metal that is recognized as a grounding electrode and not restate the conditions for determining the requirements for establishing the grounding electrode. In addition, the text on proving that the path from the connection of a wire-type grounding electrode conductor to structural metal that serves as a grounding electrode conductor may be obvious to some but ensuring the structural metal path is continuous is essential to its use as such.
It seems a coordinating change to 250.64(C) needs to be made so connections from a grounding electrode conductor through normal bolted, riveted or welded connections of structural steel and threaded, soldered, or bolted connections of metal water pipes are not considered a violation of the "without a splice" rules of that section. Separately derived systems commonly use continuous metal water piping systems and continuous structural steel as a grounding electrode conductor between the connection and the grounding electrode. Since these connection or splicing methods have been recognized by installers and inspectors for many years, it is hoped this information will not be considered a new concept for the NEC.
Panel Meeting Action: Accept in Principle
Revise 250.68(C) in ROP draft to read as follows:
"(C) Metallic Water Pipe and Structural Metal. Grounding electrode conductors and bonding jumpers shall be permitted to be connected at the following locations and be used to extend the connection to an electrode(s):
(1) Interior metal water piping located not more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted to be used as a conductor to interconnect electrodes that are part of the grounding electrode system.
Exception: In industrial, commercial, and institutional buildings or structures if conditions of maintenance and supervision ensure that only qualified persons service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a bonding conductor to interconnect electrodes that are part of the grounding electrode system, or as a grounding electrode conductor, provided that the entire length, other than short sections passing perpendicularly through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.
(2) The structural metal frame of a building that is directly connected to a grounding electrode as specified in 250.52(A)(2) or 250.68(C)(2)(a), (b) or (c) shall be permitted as a bonding conductor to interconnect electrodes that are part of the grounding electrode system, or as a grounding electrode conductor.
a. By connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode as provided in 250.52(A)(3) or ground ring as provided in 250.52(A)(4)
b. By bonding the structural metal frame to one or more of the grounding electrodes as defined in 250.52(A)(5) or (A)(7) that comply with 250.53(A)(2)
c. By other approved means of establishing a connection to earth"
Revise recommended text for 250.64(C) from this comment to read as follows:
"**250.64(C) Continuous.** Except as provided in 250.30(A)(5), (A)(6), 250.30(B)(1) and 250.68(C), grounding electrode conductor(s) shall be installed in one continuous length without a splice or joint. If necessary, splices or connections shall be made as permitted in (1) through (4):
(1) Splicing of the wire-type grounding electrode conductor shall be permitted only by irreversible compression-type connectors listed as grounding and bonding equipment or by the exothermic welding process.
(2) Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor.
(3) Bolted, riveted, or welded connections of structural metal frames of buildings or structures.
(4) Threaded, welded, brazed, soldered or bolted-flange connections of metal water piping."
Panel Statement: The revised text for 250.68(C) incorporates Comments 5-130 and 5-131 with editorial revisions made for clarity. The recommended text for 250.64(C) was accepted with changing the term "required" to necessary".

(250.94)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-227
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
250.94 Bonding for Other Systems. An intersystem bonding termination for connecting intersystem bonding and grounding electrode conductors required for other systems shall be provided external to enclosures at the service equipment or metering equipment enclosure and at the disconnecting means for any additional buildings or structures. The intersystem bonding termination shall comply with the following:
(1) Be accessible for connection and inspection. ~~The intersystem bonding termination~~
(2) Consist of a set of terminals or a bonding bar with ~~Have~~ the capacity for connection of not less than three intersystem bonding conductors. ~~The intersystem bonding termination device shall~~
(3) Not interfere with opening the enclosure for a service, building or structure disconnecting means, or metering equipment ~~enclosure~~.
~~The intersystem bonding termination shall be one of the following:~~
(4) ~~(1)~~ At the service equipment, be ~~set of terminals~~ securely mounted and electrically connected to ~~the~~ an enclosure for the ~~meter enclosure or~~ service equipment, to the electric utility meter, or to an exposed nonflexible metallic service raceway, ~~enclosure~~ or be mounted at one of these enclosures and be connected to the enclosure or to the grounding electrode conductor with a minimum 6 AWG copper conductor.
(5) At the disconnecting means for a building or structure, be securely mounted and electrically connected to the metallic enclosure for the building or structure disconnecting means, or be mounted at the disconnecting means and be connected to the metallic enclosure or to the grounding electrode conductor with a minimum 6 AWG copper conductor.
(6) The terminals or bonding bar shall be listed as grounding and bonding equipment.
~~(2) A bonding bar near the service equipment enclosure, meter enclosure, or raceway for service conductors. The bonding bar shall be connected with a minimum 6 AWG copper conductor to an equipment grounding conductor(s) in the service equipment enclosure, meter enclosure, or exposed nonflexible metallic raceway.~~
~~(3) A bonding bar near the grounding electrode conductor. The bonding bar shall be connected to the grounding electrode conductor with a minimum 6 AWG copper conductor.~~
Substantiation: This Comment is intended to be editorial in nature primarily to organize the requirements in list format. In addition, an effort is made to remove duplicate requirements in the subsections. An effort is also made to indicate the locations acceptable for the intersystem bonding termination at or near the service and at or near the building disconnecting means for buildings or structures supplied by a feeder.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
250.94 Bonding for Other Systems. An intersystem bonding termination for connecting intersystem bonding conductors required for other systems shall be provided external to enclosures at the service equipment or metering equipment enclosure and at the disconnecting means for any additional buildings or structures. The intersystem bonding termination shall comply with the following:
(1) Be accessible for connection and inspection.
(2) Consist of a set of terminals with the capacity for connection of not less than three intersystem bonding conductors.
(3) Not interfere with opening the enclosure for a service, building or structure disconnecting means, or metering equipment.

(4) At the service equipment, be securely mounted and electrically connected to an enclosure for the service equipment, to the meter enclosure, or to an exposed nonflexible metallic service raceway, or be mounted at one of these enclosures and be connected to the enclosure or to the grounding electrode conductor with a minimum 6 AWG copper conductor.

(5) At the disconnecting means for a building or structure, be securely mounted and electrically connected to the metallic enclosure for the building or structure disconnecting means, or be mounted at the disconnecting means and be connected to the metallic enclosure or to the grounding electrode conductor with a minimum 6 AWG copper conductor.

(6) The terminals shall be listed as grounding and bonding equipment.

Panel Statement: The panel accepts the organization provided in this comment but deletes the words, "and grounding electrode" in the first sentence of the opening paragraph so as to correct the purpose of the intersystem bonding termination. The term "bonding bar" was removed from two locations as it was not necessary. The action on this comment does not revise the existing exception or the existing Informational Notes which are to remain.

The panel understands the action taken on Comment 5-143 modifies the text of Informational Note 2.

Comment on Proposal No: 5-235

Recommendation: Accept the proposal with the following revisions:

For circuits over 250 volts, the electrical continuity of metal raceways and metal-covered cables that contain conductors other than service conductors shall be provided by one or more of the methods specified for services in 250.92(B), except for 250.92(B)(1).

Exception: Where there are no oversized, concentric, or eccentric knockouts used, or where a box or other enclosure with concentric or eccentric knockouts is listed to provide reliable bonding connections, the following methods shall be permitted:

(1) Couplings and connectors identified for the use.

(2) Two locknuts, one inside and one outside of boxes and other enclosures.

(3) Connectors for metal raceways and metal-covered cables, with shoulders that seat firmly against a metal box or enclosure with at least one locknut on the inside of the box or enclosure, or firmly threaded into a metal hub or hole of the box or enclosure.

(4) Fittings listed for the use.

Substantiation: Threadless couplings and connectors are used with RMC, IMC, and EMT. Enclosures other than cabinets should be included such as wireways and auxiliary gutters. Proposed (3) covers threadless connectors for raceways and cables.

Panel Meeting Action: Reject

Panel Statement: There are several text changes from the 2008 NEC 250.97 and even from Proposal 5-235, which is referenced to be used as the base, that have no technical substantiation. The threadless fittings cited are already permitted in the 2008 NEC 250.97 Exception (4).

(250.102(C))

TCC Action: The Technical Correlating Committee directs that in the text of 250.102(C) the word "if" be change to the word "where".
In this instance, the Technical Correlating Committee has determined that the revised wording is more appropriate.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-240
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
250.102 ~~Equipment~~ Bonding Conductors and Jumpers.
250.102(A) and (B) are not proposed to be changed by this Comment.
(C) Size— Supply Side Bonding Jumper (SSBJ) ~~on Supply Side of an Overcurrent Device~~.
(1) Size for Supply Conductors in Single Raceway or Cable. The SSBJ shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors ~~GEC~~. If the ungrounded supply conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the SSBJ shall have an area not less than 121/2 percent of the area of the largest set of ungrounded supply conductors.
(2) Size for Parallel Conductor Installations. If the ungrounded supply conductors are paralleled in two or more raceways or cables, and an individual SSBJ is used for bonding these raceways or cables, the size of the SSBJ for each raceway or cable shall be selected from Table 250.66 based on the size of the ungrounded supply conductors in each raceway or cable. A single SBBJ installed for bonding two or more raceways or cables shall be sized in accordance with (C)(1).
(3) Different Materials. If the ungrounded supply conductors and the SSBJ are of different materials (copper or aluminum), the minimum size of the SSBJ shall be based on the assumed use of ungrounded conductors of the same material as the SSBJ and with an ampacity equivalent to that of the installed ungrounded supply conductors.
~~If the ungrounded supply conductors are paralleled in two or more raceways or cables, the SSBJ, if routed with the raceways or cables, shall be installed in parallel. The size of the SSBJ for each raceway or cable shall be based on the size of the ungrounded supply conductors in each raceway or cable.~~
250.102(D) and (E) are not proposed to be changed by this Comment.
Substantiation: The title of 250.102 needs to be changed as shown to correlate with other changes made to the subsections in this section. The section now includes both supply-side bonding jumpers and equipment bonding jumpers.
It is intended that the use of acronyms in these sections complies with 3.2.3 of the NEC Style Manual.
It is noted the term "Supply Side Bonding Jumper" is defined in 250.2 of the 2011 NEC ROP Draft and thus can be used in this section as defined. As a result, it does not seem the term "on the Supply Side of an Overcurrent Device" is needed in the section title.
The organization of the section into subsections is intended to improve usability of the rules and to clearly identify the rules applicable to installing SBBJs for single and parallel conductor installations.
Adding the concept included in Proposal 5-242 of clearly stating the permission to use a single bonding jumper that is properly sized for bonding two or more raceways or cables is added to this Comment as it is concluded this will add clarity. Installing bonding jumpers in this manner also seems to be standard industry practice.
Panel Meeting Action: Accept in Principle
Revise the text of the 2011 NEC ROP Draft to read as follows:
250.102 Bonding Conductors and Jumpers."
Sections 250.102(A) and (B) are not changed by this Comment.
(C) Size- Supply-Side Bonding Jumper.
(1) Size for Supply Conductors in a Single Raceway or Cable. The supply-side bonding jumper shall not be smaller than the sizes shown in Table 250.66 for grounding electrode conductors. If the ungrounded supply conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the supply-side bonding jumper shall have an area not less than 121/2 percent of the area of the largest set of ungrounded supply conductors.
(2) Size for Parallel Conductor Installations. If the ungrounded supply conductors are paralleled in two or more raceways or cables, and an individual supply-side bonding jumper is used for bonding these raceways or cables, the size of the supply-side bonding jumper for each raceway or cable shall be selected from Table 250.66 based on the size of the ungrounded supply conductors in each raceway or cable. A single supply-side bonding jumper installed for bonding two or more raceways or cables shall be sized in accordance with (C)(1).
(3) Different Materials. If the ungrounded supply conductors and the supply-side bonding jumper are of different materials (copper or aluminum), the minimum size of the supply-side bonding jumper shall be based on the assumed use of ungrounded conductors of the same material as the supply-side bonding jumper and with an ampacity equivalent to that of the installed ungrounded supply conductors.
Sections 250.102(D) and (E) are not changed by this comment.
Panel Statement: The panel has considered the use of the term and the acronym and determined that the term "Supply-Side Bonding Jumper" is to be used without the acronym (SSBJ) at each location where the term is used.
Number Eligible to Vote: 16

(250.104(B))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 5-252
Recommendation: We support the panel's action of continuing to reject this proposal concerning the technical provisions.
Substantiation: Corrugated Stainless Steel Tubing (CSST) gas piping systems would be an added burden to the Authority Having Jurisdiction and by an electrician or electrical industry as their was in the past class action litigation taken against this product.
This is a fuel gas issue concerning "passive lightning protection" and not addressed by the National Electrical Code as stated in 90.1(A) "the use of electricity" and 90.2(A)(3) "and equipment that connect to the supply of electricity" and 250.104(B) "The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means."
The National Electrical Code would not prohibit this gas piping method from being bonded to the intersystem bonding required by section 250.94 CSST may need to have internal design changes or other incorporated engineering corrections when there is a national problem with lightning and not the use concerns with electricity and the scope of the National Electrical Code to correct this product dilemma.
Panel Meeting Action: Accept in Principle
Panel Statement: It is the panels understanding that this comment was intended to address Proposal 5-251 not Proposal 5-252. See panel action and statement on Comment 5-158. An informational note was added to address the issue.

(250.104(B))

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 5-251
Recommendation: Proposal 5-251 should be accepted.
Substantiation: CMP-5 rejected the submitter's proposal on the grounds that the proposed change may not solve the problems outlined in the proposal, that no test records were provided to substantiate the adequacy of the 6 AWG conductor, that the problems may be related to the product design, that the mitigation of the effects of lightning is a design option, that the proposed recommendation is not currently prohibited by the NEC and that it should be covered in the product standards, and that NFPA 54 contains the bonding requirements specific to the product in question and those requirements do not conflict with the NEC requirements.

Aside from all of the technical substantiation, or lack thereof, I would respectfully request CMP-5 to consider this dilemma: bonding of gas piping systems is generally considered electrical work, and if the NEC does not contain rules related specifically to bonding of gas piping systems, electrical inspectors will not have any authority outlined in NEC 90.4 to ensure that the gas piping systems are properly bonded. Another way of looking at this conundrum is as follows: the mechanical contractor chooses to install CSST gas piping; the manufacturer's installation instructions require the CSST to be bonded in accordance with NFPA 54 and the installation instructions; due to occupational and regulatory licensing, the mechanical contractor must secure the services of an electrical contractor to install the required bonding because it is classified as electrical work;
the electrical contractor does not have any correlated rules in the NEC, and must now familiarize himself with NFPA 54 and the installation instructions for the gas piping products that he did not install; the electrical contractor also must have his work inspected by the electrical inspector, yet the electrical inspector has the same predicament, whereby there are no rules in the NEC that correlate with NFPA 54; lacking any authority to inspect the bonding of the gas piping system, the electrical inspector will defer to the mechanical inspector because the rules are in NFPA 54, yet the mechanical inspector defers to the electrical inspector because bonding is electrical work. At the end of the day, the bonding may or may not be installed because it is too easy for the mechanical contractor to simply walk away while the mechanical inspector and electrical inspector continue the debate as to who has the proper authority or lack thereof.

I realize these strict boundaries related to trades, disciplines, occupational licensing, and inspection authority are not universal, but they are very real, and in those areas where the boundaries are established in state law or in local ordinances, accepting the submitter's proposal certainly does more good than harm, and it will allow the inspection community the opportunity to uniformly enforce the required rules and manufacturer's installation instructions in an effort to ensure fire and life safety for persons and property.
Panel Meeting Action: Reject
Panel Statement: The panel concluded to not include requirements but to add an informational note to address the issue. See panel action and statement on Comment 5-158.

(250.104(B))

Submitter: Robert Torbin, Cutting Edge Solutions, LLC
Comment on Proposal No: 5-251
Recommendation: Locate a second Informational Note at the end of Section 250.104(B) as follows:
Informational Note: Additional bonding requirements for corrugated stainless steel tubing (CSST) gas piping systems can be found in Section 7.13.2 of the National Fuel Gas Code/NFPA 54-2009.
Substantiation: NFPA has recently reconfirmed that the National Fuel Gas Code (NFPA-54) has primary jurisdiction for the requirements for bonding of corrugated stainless steel tubing (CSST) systems. Based on CMP#5 rejection of original Proposal 5-251, and in consideration of ongoing efforts by the NFPA Standards Council to coordinate the coverage for bonding of CSST within all NFPA codes/standards, the inclusion of an informational note (in lieu of the requirements in Proposal 5-251) would be sufficient to alert the code user that additional bonding requirements for gas piping can be found in Section 7.13.2 of NFPA-54. The CSST bonding requirements in NFPA-54 do not conflict with any requirements within Section 250.104(B) of the NEC as noted by CMP#5 in the Panel Statement. A test report on the effectiveness of bonding with a 6 AWG wire and the electrical properties of the CSST product is provided for further substantiation for the bonding requirement.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Locate a second Informational Note at the end of Section 250.104(B) to read as follows:
Informational Note: Additional information for gas piping systems can be found in Section 7.13 of the National Fuel Gas Code, NFPA 54-2009.
Panel Statement: Revisions to the recommended text were made to inform users that additional information for all gas piping is available in NFPA 54. The panel concludes that the submitters intent has been met.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

Comment on Affirmative:

BRENDER, D.: The Informational Note should have included revised as follows, "Informational Note: Additional information for bonding of gas piping systems can be found in Section 7.13 of the National Fuel Gas Code, NFPA 54-2009."

5-159 Log #1848 NEC-P05 **Final Action: Reject**
(250.104(B) and (C))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-252
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(B) Metal Gas Piping. Metal gas piping installed in or attached to a building or structure shall be bonded in accordance with (A)(1, (A)(2) and (A)(3). The bonding conductor or jumper shall be connected in an accessible location to a non-flexible and non-corrugated portion of the gas piping between the downstream side of the utility meter and the point of entrance into the building or structure.
(C) Other Metal Piping. If installed in or attached to a building or structure, a metal piping system(s)~~, including gas piping,~~ that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor if of sufficient size, or to one or more grounding electrodes used. The bonding conductor(s) or jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.

Informational Note: Bonding all piping and metal air ducts within the premises will provide additional safety.

Renumber existing 250.104(C) as (D) and 250.104(D) as (E).
Substantiation: This Comment intends to simplify the text from that in Proposal 5-252 in recognition that bonding of gas piping systems in buildings or structures should be treated identically to that for water piping as covered in 250.104(A).

Even though implementing lightning protection is not the primary purpose of the NEC, Article 250 does address bonding of lightning protection systems to the premises wiring system in 250.60 and 250.106. In fact, not bonding the systems together can create a serious overvoltage and side-flash hazard. Section 250.4(A)(1) and (B)(1) states that a connection to earth is needed to "… limit the voltage imposed by lightning …" It is hard to reconcile the 250.66 bonding conductor sizing for metal water piping with the 250.122 bonding conductor sizing for metal gas piping.

Many commercial and industrial occupancies contain as much or more metallic gas piping as metal water piping that is not being used as a grounding electrode. It is just as conductive and poses an identical risk of electric shock as metal water pipe.

Section 250.104(A)(1) requires the bonding of metal water piping with a conductor sized according to Table 250.66 even though the metal water piping is not a grounding electrode. It is inconsistent to not apply the same requirement to metal gas piping. This Comment should be accepted to be consistent with the Panel's action on Proposal 5-254 for bonding of structural metal that is not a grounding electrode.

The utility gas piping supply to a dwelling or small commercial building may be nonmetallic. This is similar to the water pipe supply to smaller buildings or structures. Yet, metal water piping in these buildings or structures is required to be bonded with a "full size" conductor even though not connected to a water pipe grounding electrode. Likewise, exposed metal structural frames that are not installed or connected as a grounding electrode or grounding electrode conductor are required to be bonded with a "full size" conductor. Gas piping presents an identical safety hazard and should be bonded in the same manner. Comparing the bonding rules in 250.104 we find:

Metallic Piping or Structure	Bonding with Table 250.66-sized conductor even though not a grounding electrode	Required to be "Likely to become energized" before the rule is triggered?	Poses shock or electrocution hazard if energized
Water Pipe 250.104(A)	Yes	No	Yes
Gas Piping 250.104(B)	No	Yes	Yes
Structural Metal 250.104(C)	Yes	Yes	Yes
Metal Water Piping Systems from Separately Derived Systems 250.104(C)(1)	Yes	No	Yes
Structural Metal in area of Separately Derived Systems 250.104(C)(2)	Yes	No	Yes

The bonding of the metal gas piping systems needs to be treated identically to the comprehensive rules for bonding water piping in 250.104(A). The rules there include buildings or structures supplied by a service or a feeder as well as multiple-occupancy buildings. Metal gas piping is installed identically to metal water piping systems in these buildings or structures. The gas piping system in many buildings often consists of hundreds of feet of metal piping. An equipment grounding conductor of a 12 AWG will not properly bond this system to safely de-energize the system in a ground fault or over-voltage condition. The gas piping includes additional hazards with the volatile mixture that could explode.

Other changes are intended to be editorial or for uniformity or consistency with similar requirements for bonding metal water piping or metal structural frames.
Panel Meeting Action: Reject
Panel Statement: The substantiation supports only using bonding conductors sized to Table 250.66 yet the reference to 250.104(A)(2) allows for the bonding conductor to be sized to Table 250.122. This is a conflict within the substantiation. No evidence of a problem with the present requirements was provided by the submitter. The panel concludes that the present requirements covering the bonding of gas piping system provide the practical safeguarding required.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

BRENDER, D.: The Panel's statement is not responsive to the substantiation. The focus of the proposal and comment is to address the need to bond metallic gas piping identical to the bonding requirements of metal water piping. The Panel should recognize this purpose as discussion was held on these issues at the Panel meeting. In fact, due to the expanded use of nonmetallic water piping systems, many buildings have more metal gas piping in or on the building or structure than metal water piping. The substantiation provides more than adequate logic to support the proposed change to this section. The Comment should have been accepted.

5-160 Log #2094 NEC-P05 **Final Action: Reject**
(250.104(B), (C), and (D))

Submitter: David A. Williams, Delta Township
Comment on Proposal No: 5-252
Recommendation: This proposal should be accepted.
Substantiation: The submitted has provided a valid substantiation why metal gas piping should be bonded to the same extent as metal water piping systems. There is even a greater hazard with metal gas piping if it becomes energized. By increasing the size of the metal gas piping bonding conductor this will help ensure safer installations. We are relying on the equipment grounding conductor for the circuit that could energize the piping system as a reliable bond. I have seen installations where the gas piping is not effectively connected to the equipment grounding conductor for the appliance. By accepting the proposal we will correct this type of hazards.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-159.
Number Eligible to Vote: 16

5-161 Log #34 NEC-P05 **Final Action: Reject**
(250.108)

Submitter: Joseph A. Hren, Uhrichsville, OH
Comment on Proposal No: 5-259
Recommendation: Delete text as follows:
~~**250.108 Use of Equipment Grounding Conductors.** An equipment grounding conductor shall not be used as a grounding electrode conductor.~~
Substantiation: The proposed section is in direct conflict with 250.54. Additionally, 250.130 permits an equipment grounding conductor (EGC) to be connected to a grounding electrode conductor (GEC), or in other words, a GEC is permitted to be used as an EGC. Electrical current is not discriminatory based on any assigned name. Furthermore, current code does not prohibit routing a GEC with service, feeder, or branch circuit conductors. Should a separate EGC also be required, both the GEC and the EGC are permitted to be bare conductors (250.62, 250.118), allowing both to contact each other. This is electrically illogical when one grounding conductor would suffice. There are also many, many instances where an EGC is unknowingly or inadvertently used as a GEC. One example is a feeder EGC between structures, each with an independent GES*. Under any situation where current must flow to grounding electrodes, this EGC will be used no differently than a GEC. Another example is metal conduit secured to structural metal, where the frame is an electrode.
*Grounding Electrode System.
Panel Meeting Action: Reject
Panel Statement: The proposed new requirement does not conflict with either 250.54 or 250.130. The fact that an equipment grounding conductor is permitted to be connected to a grounding electrode conductor, does not imply that one conductor is being used for both purposes.
Grounding electrode conductors and equipment grounding conductors are sized differently, and are installed under widely differing requirements.

Comment on Proposal No: 5-259
Recommendation: Continue to accept the proposal. Locate the text in Part VI of Article 250, as 250.121.
Substantiation: Although this location was given in the panel statement, the panel action did not stipulate an "Accept in Principle" with the revised location. The ROP Draft shows the location as 250.108. This comment provides the vehicle to correctly locate this material.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-164 Log #1849 NEC-P05 **Final Action: Accept in Principle**
(250.110)

TCC Action: The Technical Correlating Committee directs that the text of 250.110 be revised to read as follows:
"250.110 Equipment Fastened in Place (Fixed) or Connected by Permanent Wiring Methods. Exposed, normally non–current-carrying metal parts of fixed equipment supplied by or enclosing conductors or components that are likely to become energized shall be connected to an equipment grounding conductor under any of the following conditions:
(1) Where within 2.5 m (8 ft) vertically or 1.5 m (5 ft) horizontally of ground or grounded metal objects and subject to contact by persons
(2) Where located in a wet or damp location and not isolated
(3) Where in electrical contact with metal
(4) Where in a hazardous (classified) location as covered by Articles 500 through 517
(5) Where supplied by a wiring method that provides an equipment grounding conductor, except as permitted by 250.86, Exception No. 2, for short sections of metal enclosures
(6) Where equipment operates with any terminal at over 150 volts to ground
Exception No. 1: If exempted by special permission the metal frames of electrically heated appliances that have the frames permanently and effectively insulated from ground, shall not be required to be grounded.
Exception No. 2: Distribution apparatus, such as transformer and capacitor cases, mounted on wooden poles, at a height exceeding 2.5 m (8 ft) above ground or grade level shall not be required to be grounded.
Exception No. 3: Listed equipment protected by a system of double insulation, or its equivalent, shall not be required to be connected to the equipment grounding conductor. Where such a system is employed, the equipment shall be distinctively marked."
In this instance, the Technical Correlating Committee had determined that the revised wording is more appropriate.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-260
Recommendation: Revise the existing text of the 2008 NEC as follows:
250.110 Equipment Fastened in Place (Fixed) or Connected by Permanent Wiring Methods ~~(Fixed)~~.
Exposed, normally non–current-carrying metal parts of fixed equipment supplied by or enclosing conductors or components that are likely to become energized shall be connected to an ~~the~~ equipment grounding conductor under any of the following conditions:
(1) If ~~Where~~ within 2.5 m (8 ft) vertically or 1.5 m (5 ft) horizontally of ground or grounded metal objects and subject to contact by persons
(2) If ~~Where~~ located in a wet or damp location and not isolated
(3) If ~~Where~~ in electrical contact with metal
(4) If ~~Where~~ in a hazardous (classified) location as covered by Articles 500 through 517
(5) If ~~Where~~ supplied by a ~~metal-clad, metal-sheathed, metal-raceway, or other~~ wiring method that provides an equipment grounding conductor ~~ground~~, except as permitted by 250.86~~,~~ Exception No. 2~~;~~ for short sections of metal enclosures
(6) If ~~Where~~ equipment operates with any terminal at over 150 volts to ground
Exception No. 1: The metal frames ~~of electrically heated appliances, exempted by special permission, that have in which case the frames shall be~~ permanently and effectively insulated from ground, shall not be required to be grounded if exempted by special permission.
Exception No. 2: Distribution apparatus, such as transformer and capacitor cases, mounted on wooden poles, at a height exceeding 2.5 m (8 ft) above ground or grade level shall not be required to be grounded.
Exception No. 3: Listed equipment protected by a system of double insulation, ~~or its equivalent~~, shall not be required to be connected to the equipment grounding conductor. If ~~Where~~ such a system is employed, the equipment shall be distinctively marked.
Substantiation: The word "fixed" is proposed to be relocated in the bold-face title to more clearly describe the portion of the title it describes.
The word "normally" is proposed to be added to the beginning of the first sentence as the metallic parts of equipment governed by this section are not intended to carry current on a normal basis but only when a line-to-ground fault occurs.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This proposal intends to use the word "if" where appropriate.
Section 3.1.4.1 of the NEC Style Manual requires exceptions to be complete sentences. Changes are proposed to Exceptions No. 1 and 2 to bring these exceptions into compliance and to improve sentence structure.
For Exception No. 3, the words "*~~or its equivalent~~*" are proposed to be deleted as there does not seem to be an "equivalent" to a system of double insulation. The NEC does not regulate the design or function of double-insulation but relies on electrical product safety standards to determine suitability.
Other proposed changes are intended to be editorial in nature.
Panel Meeting Action: Accept in Principle
Retain recommended text as submitted except Exceptions No. 1 and No. 3 to read as follows:
Exception No. 1: If exempted by special permission the metal frames ~~of~~ electrically heated appliances, that have the frames ~~permanently~~ and effectively insulated from ground, shall not be required to be grounded.
Exception No. 3: Listed equipment protected by a system of double insulation, or its equivalent, shall not be required to be connected to the equipment grounding conductor. If such a system is employed, the equipment shall be distinctively marked.
Panel Statement: Revise the text in exception No. 1 to put the qualifier "If exempted by special permission" in front of the statement to provide greater clarity. Reject the deletion of the phrase "or its equivalent" in Exception No. 3 as there is no technical substantiation for its removal and its allowance under the purview of listed equipment allow future technology innovations that are determined to be equivalent to double insulation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-165 Log #2538 NEC-P05 **Final Action: Accept**
(250.112)

Submitter: Richard A. Janoski, Finleyville, PA
Comment on Proposal No: 5-262
Recommendation: Revise text to read as follows:
250.112 Fastened in Place or Connected by Permanent Wiring Methods (Fixed) - Specific. Except as permitted in 250.112 (F) and (I), exposed, non-current carrying metal parts of the kinds of equipment described in 250.112 (A) through (K) and non-current-carrying metal parts of equipment and enclosures described in 250.112 (L) and (M), shall be connected to an equipment grounding conductor regardless of voltage.
Substantiation: The phrase "shall be grounded regardless of voltage" is a statement the is "mandatory" and specifically requires that 250.112 (A) through (K) and (L) through (M) to be grounded regardless of voltage. This phrase is contradictory to it's proceeding subsections since 250.112 (F) and (I) contain voltage restrictions. To eliminate and confusion the new text in the opening paragraph should be added.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-166 Log #2566 NEC-P05 **Final Action: Accept in Principle**
(250.112)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-262
Recommendation: Accept the proposal in principle. Revise the rule in 250.112 as follows: ~~Except as permitted in 250.112(I),~~ Exposed, noncurrent-carrying metal parts of the kinds of equipment described in 250.112(A) through (K), and noncurrent-carrying metal parts of equipment and enclosures described in 250.112(L) and (M), shall be connected to the equipment grounding conductor unless otherwise permitted by particular provisions within or referenced by 250.112(A) through (M).
Substantiation: The submitter is correct that numerous locations in the list of equipment exempt equipment grounding connections. The recent exemption for 250.112(I) (which the proposal submitter erroneously failed to include in his recitation of the section text) is only one such location; paragraphs (A), (B), (C), (D), (F), and (J) also include instances where exemption is taken. For just one example, item (J) on luminaires cross references Part V of Article 410. This part includes 410.42(B) Exception No. 2 that allows for GFCI protection to be used in lieu of an equipment grounding connection in a particular case. For another example, 250.112(A) by itself waives the connection for certain dc switchboards, etc. The wording in this comment resolves the recurring correlation problem.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 5-165.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-167 Log #1850 NEC-P05 **Final Action: Accept in Part**
(250.114)

TCC Action: The Technical Correlating Committee directs that the word "if" be replaced with the word "where" in 250.114.
In this instance, the Technical Correlating Committee had determined that the revised wording is more appropriate.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-266
Recommendation: Revise the existing text of the 2008 NEC as follows:
250.114 Equipment Connected by Cord and Plug.
Under any of the conditions described in 250.114(1) through (4), exposed normally non–current-carrying metal parts of cord-and-plug-connected equipment ~~likely to become energized~~ shall be connected to the equipment grounding conductor.
Exception: Listed tools, listed appliances, and listed equipment covered in 250.114(2) through (4) shall not be required to be connected to an equipment grounding conductor if ~~where~~ protected by a system of double insulation ~~or its equivalent~~. Double insulated equipment shall be distinctively marked.
(1) In hazardous (classified) locations (see Articles 500 through 517)
(2) If ~~Where~~ operated at over 150 volts to ground
Exception No. 1: Motors, if ~~where~~ guarded and isolated from conductive material, shall not be required to be connected to an equipment grounding conductor.
Other portions of 250.114 are not intended to be changed by this Comment.
Substantiation: This Comment introduces "normally non-current-carrying metal parts" as similar language has been accepted for use in other sections of Article 250. The phrase "likely to become energized" does not seem to be needed here since the equipment that is cord-and-plug connected as covered by this section is connected to a source of electromotive force and thus is likely to become energized if there is a failure of insulation internally or externally. There does not seem to be an equivalent to a double insulation system.
The concept of "guarded" included in Exception No. 1 is not described in the exception yet has been in the NEC for many editions. If these motors that are operated at over 150 volts to ground are cord-and-plug connected and are permitted to be operated without an equipment grounding conductor, where is the ground-fault return path? It seems very important, from a safety standpoint, to require that this equipment is either supplied by an equipment grounding conductor or if an equipment grounding conductor is not supplied, that the motor is both guarded from contact by persons or animals such as in agricultural buildings as well as being isolated from conductive materials that could become a shock hazard if energized.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Comment intends to use the word "if" where appropriate.
Panel Meeting Action: Accept in Part
Retain recommended text as submitted except Exception and Exception No. 1 to read as follows:
Exception: Listed tools, listed appliances, and listed equipment covered in 250.114(2) through (4) shall not be required to be connected to an equipment grounding conductor if protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.
Exception No. 1: Motors, if guarded, shall not be required to be connected to an equipment grounding conductor.
Panel Statement: Reject the elimination of the phrase "or its equivalent" in the exception. With the qualification that these products have to be listed, there was no technical substantiation to delete this option and potentially stifle innovation of some future design that has an equivalency to double insulation. The added text "*and isolated from conductive material*" was also not accepted. The panel concludes the word guarded is sufficient.
Accept the remainder of the proposed changes.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-168 Log #1696 NEC-P05 **Final Action: Reject**
(250.114 Exception No. 1 for (2) and Exception)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-266
Recommendation: Accept revised as follows: Exception No. 1: Motors, where guarded and isolated from conductive material within the guarded area that extends outside the guarded areas shall not be required to be connected to an equipment grounding conductor.
Substantiation: The "point of danger" in the definition of guarded in Article 100 as applied to ungrounded motors is presumably contact with an energized motor frame. If the motor is in contact with ungrounded conductive material that extends outside the guarded area and the motor frame becomes energized, this condition can extend outside the guarded area.
Panel Meeting Action: Reject
Panel Statement: The revised text does not provide clarity and the definition of the "area" around the motor to be guarded is not provided. This then makes enforcement subjective and inconsistent. It is also unclear where the submitter intends this text to be inserted, in the exception or the exception to (2).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-169 Log #2341 NEC-P05 **Final Action: Accept in Principle**
(250.118(10)(a) and (b))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-269a
Recommendation: Replace "equipment grounding conductor" with "bare conductor" in two locations, as follows:
(10) Type MC cable where listed and identified for grounding in accordance with the following:
a. The combined metallic sheath and ~~equipment grounding~~ bare conductor of interlocked metal tape–type MC cable
b. The metallic sheath or the combined metallic sheath and ~~equipment grounding~~ bare conductors of the smooth or corrugated tube-type MC cable.
Substantiation: The bare conductor of type MC Cables is not an equipment grounding conductor—it is a component of the equipment grounding conductor (metal sheath plus bare conductor). By referring to these bare conductors as equipment grounding conductor, the role of the conductor is lost in the text.
Panel Meeting Action: Accept in Principle
Revise the text from 2008 NEC to read as follows:
(10) Type MC cable that provides an effective ground-fault current path in accordance with one or more of the following:
a. It contains an insulated or uninsulated equipment grounding conductor in compliance with 250.118(1)
b. The combined metallic sheath and uninsulated equipment grounding/bonding conductor of interlocked metal tape–type MC cable that is listed and identified as an equipment grounding conductor
c. The metallic sheath or the combined metallic sheath and equipment grounding conductors of the smooth or corrugated tube-type MC cable that is listed and identified as an equipment grounding conductor.

Panel Statement: The use of the term equipment grounding/bonding conductor is included to parallel with the UL product safety standard. The panel relocated the listing requirement for the cable types to those that are appropriate. This action meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
BRETT, JR., M.: I believe we acted inappropriately, the revision accepted is new material that has not had public review. The submitter only requested replacing "equipment grounding" with "bare" in two locations. The committee went far beyond that request by adding new language that has not had public review. As a committee member I did not have the opportunity to review this new wording for compliance with the testing laboratories listing criteria.

5-170 Log #1851 NEC-P05 **Final Action: Reject**
(250.118(5)(d))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-273
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
d. If used to connect equipment where flexibility is necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor of the wire type shall be installed through or with the flexible metal conduit.
Substantiation: In addition to reorganizing the sentence for improved syntax, the words "of the wire type" is added to the rule to clarify the type of equipment grounding conductor that is appropriate for supplementing the performance of flexible metal conduit as an equipment grounding conductor. This is necessary as flexible metal conduit is itself an equipment grounding conductor. The phrase "through or with the flexible metal conduit" is added to clarify the application of the rule.
Panel Meeting Action: Reject
Panel Statement: Reject the additional text for the wire type equipment grounding conductor and the statement about routing through or inside the metal conduit. These requirements are already clearly stated in 348.60 and this text is redundant.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

(250.118(6)(e))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-274
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
e. If used to connect equipment where flexibility is necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor of the wire type shall be installed through or with the liquidtight flexible metal conduit.
Substantiation: In addition to reorganizing the sentence for improved syntax, the words "of the wire type" is added to the rule to clarify the type of equipment grounding conductor that is appropriate for supplementing the performance of flexible metal conduit as an equipment grounding conductor. This is necessary as liquidtight flexible metal conduit is itself an equipment grounding conductor. The phrase "through or with the liquidtight flexible metal conduit" is added to clarify the application of the rule.
Panel Meeting Action: Reject
Panel Statement: Reject the additional text for the wire type equipment grounding conductor and the statement about routing through or inside the metal conduit. These requirements are already clearly stated in 350.60 and this text is redundant.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-172 Log #531 NEC-P05 **Final Action: Reject**
(250.119)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Communications Industry Solutions (ATIS)
Comment on Proposal No: 5-275
Recommendation: Reject the proposal.
Substantiation: The panel is writing requirements for communications circuits over which they do not have purview. The proposed requirements have no applicability unless specifically referenced in Chapter 8 (see 90.3).
Panel Meeting Action: Reject
Panel Statement: Types and sizes of equipment grounding conductors are specifically listed in 250.1 as requirements within the scope of Article 250. Communication cables are permitted in many applications throughout the NEC such as in Table 725.154(G).
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-173 Log #1663 NEC-P05 **Final Action: Reject**
(250.119)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-277
Recommendation: Delete the proposed wording and substitute:
Identification of Bonding Conductors and Equipment.
Grounding Conductors 6 AWG or Smaller. Unless otherwise provided in this Code, bonding conductors and equipment grounding conductors shall be permitted to be bare, insulated, or covered. Individually insulated or covered bonding conductors and equipment grounding conductors shall have a continuous outer covering that is green, green with one more continuous yellow stripes, or otherwise identified as permitted in this section. Conductors with insulation or individual covering that is green, green with one or more yellow stripes, or otherwise identified with green color shall not be used for ungrounded or grounded circuit conductors.
Exception: Power-limited Class 2 or Class 3 cables, power-limited fire alarm cables, communications cables, or network-powered broadband communications cables containing only circuits operating at less than 50 volts where connected to equipment not required to be grounded in accordance with 250.112(I) shall be permitted to use such identified conductors for other than bonding or equipment grounding conductors.
(A) Conductors Larger than 6 AWG. Bonding conductors and equipment grounding conductors larger than 6 AWG shall be permitted to be permanently identified at the time of installation at each end and at every point where the conductor is accessible.
Exception No. 1: Bonding conductors and equipment grounding conductors larger than 6 AWG shall not be required to be identified in conduit bodies that contain no splices or unused hubs.
Exception No. 2: Insulated or covered bonding conductors and equipment grounding conductors larger than 6 AWG installed as open individual conductors in overhead aerial spans, as open wiring on insulators, as concealed knob-and-tube wiring, or as permitted in the Exception for 590.4(C) shall be permitted to be identified only at each termination and splice point.
Exception No. 3: Insulated or covered bonding and equipment grounding conductors installed as single individual conductors in cable trays, wireways, or auxiliary gutters shall be permitted to be identified at each termination and splice point and at intervals acceptable to the authority having jurisdiction.
Exception No. 4: This provision does not apply to bonding conductors installed outside of a raceway, cable or enclosure.
Substantiation: Bonding conductors should be included; they are not always short and easily recognized. Where a conductor is installed in a nonmetallic raceway interposed between two metal raceways and connected to those metal raceways, it meets the definition of equipment bonding jumper. The proposal covers other types of installations not presently addressed. Yellow stripes should be specified continuous. The word "comply" implies (A)(1) and (A)(2) must be used for identification, not green insulation or covering.
"At every point where the conductor is accessible" requires continuous identification for open individual conductors in aerial spans or open wiring on insulators, in cable trays, wireways and auxiliary gutters, which doesn't correlate with green color or tape at terminations.
Panel Meeting Action: Reject
Panel Statement: The proposed text is not clear as to conductors larger than 6 AWG. The revised text is confusing and inconsistent.
The substantiation does not support the numerous revisions.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-174 Log #17 NEC-P05 **Final Action: Reject**
(250.119 Exception)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 5-275
Recommendation: Reject this proposal.
Substantiation: Section 90.3 Code Arrangement states that "Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8."
There are no correlating requirements in Articles 800 and 830 that limit communications cables and network-powered broadband communications cables to 50 volts. See Table 830.15 which sets the voltage limits for network-powered broadband circuits.
Having a requirement for communications cables in Article 250 without correlating requirements in Chapter 8 is bad code. This is an issue for the TCC.
The panel can correlate with 90.3 either by accepting the proposal without any voltage limitation on communications cables or rejecting the proposal in its entirety.
Panel Meeting Action: Reject
Panel Statement: Communication cables are permitted in many applications throughout the NEC such as in table 725.154(G). Types and sizes of equipment grounding conductors are specifically listed in 250.1 as requirements within the scope of article 250. The panel removed network-powered broadband communications cables from the exception. See panel action and statement on Comment 5-175.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-175 Log #1853 NEC-P05 **Final Action: Accept in Principle**
(250.119 Exception)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-275
Recommendation: Revise the text of the 2011 NEC ROP as follows:
Exception: Power-limited, Class 2 or Class 3 cables, power-limited fire alarm cables, communications cables, or network-powered broadband communications cables, containing only circuits operating at less than 50 volts that are supplied by a system that is where connected to equipment not required to be grounded in accordance with Part II or Part VIII of Article 250 250.112(I) shall be permitted to use a conductor with green insulation or green with one or more yellow stripes for other than equipment grounding purposes.
Substantiation: Changes are intended to be editorial rather than substantive. Setting off the opening qualifying phrases in commas makes the first part of the sentence read correctly. The phrase "that are supplied by a system that is not required to be grounded" rather than a reference to equipment seems to correct the reference. It is the system the equipment operates at that may or may not be required to be grounded rather than the equipment itself. The grounding of systems is shown in 250.112(I) to be Part II or Part VIII of Article 250. The direct reference to the system grounding requirements in this exception would save one "chase your tail" for the user of the Code.
Panel Meeting Action: Accept in Principle
Revise the Exception to read as follows:
Exception: Power-limited Class 2 or Class 3 cables, power-limited fire alarm cables, or communications cables, containing only circuits operating at less than 50 volts where connected to equipment not required to be grounded in accordance with 250.112(I) shall be permitted to use a conductor with green insulation or green with one or more yellow stripes for other than equipment grounding purposes.
Panel Statement: Network-powered broadband communications cables are only permitted in Chapter 8 and not used for the circuits described in 250.112(I). The intent of the exception is to allow specific wiring methods, connected to specific equipment, to be exempt from the rule in 250.119 as to the use of a conductor with green insulation. The exception lists the wiring methods. Section 250.112(I) addresses the equipment.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-176 Log #1854 NEC-P05 **Final Action: Accept**
(250.120(C))

TCC Action: The Technical Correlating Committee directs that the word "if" be replaced with the word "where" in 250.120(C).
In this instance, the Technical Correlating Committee had determined that the revised wording is more appropriate.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-279
Recommendation: Revise the existing text of the 2008 NEC as follows:
(C) Equipment Grounding Conductors Smaller Than 6 AWG. If not routed with circuit conductors as permitted in 250.130(C) and 250.134(B) Exception No. 2, equipment grounding conductors smaller than 6 AWG shall be protected from physical damage by an identified ~~a~~ raceway or cable armor unless installed within hollow spaces of the framing members of buildings or structures ~~except where run in hollow spaces of walls or partitions,~~ and if ~~where~~ not subject to physical damage~~, or where protected from physical damage~~.
Substantiation: The proposal should have been Accepted in Principle as the concepts contained therein would improve the application of the NEC. The substantiation provided with the Proposal is persuasive and articulates the need for the change in this section.
These changes are largely editorial and are intended to build upon the substantiation provided with the Proposal.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Comment intends to use the word "if" where appropriate.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
MOHLA, D.: Remove the word "identified" in front of the raceway
Neither the Proposal substantiation nor the Comment substantiation provided any indication that there were problems in the field that would be alleviated by identifying this raceway or cable armor. What is an identified raceway? By requiring "identification" without indicating by what means, the installer is left at the mercy of the electrical inspector who may want it painted green over its entire length. Article 200 covers identification of conductors but not of raceways or cable armor. This change adds cost without improving safety and should be rejected. Use of word " identified" is a new material that has not had any public review. This is not editorial change as indicated in the substantiation.
FPN under the definition of Identified clearly provides guidance on what is normally required by AHJ.
Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement.
FPN: Some examples of ways to determine suitability of equipment for a specific purpose, environment, or application include investigations by a qualified testing laboratory (listing and labeling), an inspection agency, or other organizations concerned with product evaluation.

5-177 Log #1916 NEC-P05 **Final Action: Reject**
(Table 250.122)

Submitter: Paul E. Guidry, Fluor Enterprises, Inc. / Rep. Associated Builders and Contractors
Comment on Proposal No: 5-281
Recommendation: Add Tables 250.122(A), (B), (C) and (D) as follows:

See Table 250.122(A) on page 155
See Table 250.122(B) on page 155
See Table 250.122(C) on page 156
See Table 250.122(D) on page 156

Substantiation: Substatiation: The panel was correct in pointing out that the submitted table was incomplete. Please reconsider the proposal based on the Tables 250.1 22(A), (B), (C), and (D) entitled "Exhibit 1, 2, 3, and 4". These tables are based upon Tables 7.1, 7.2 and 7.3 in UL 1277. "Smallest grounding conductor in cable containing 90°C (194°F) Circuit Conductors", "Smallest grounding conductor in cable containing 75°C (167°F).
Circuit Conductors" and "Smallest grounding conductor in cable containing 60°C (140°F) Circuit Conductors", and existing Table 250.122 respectively.
This proposal will add the ability to use equipment grounding conductors based on ungrounded conductor sizes available in multiconductor cable s in addition to basing the equipment grounding conductor (EGC) on an overcurrent protective device (OCPD) size as is currently the case. Currently, manufacturers of multiconductor cable assemblies install a standard size of EGC with a given size of ungrounded conductor. If the conductors are increased due to voltage drop (not because of an increase in the OCPD, you lose the curve that is built in to Table 250.122 for reducing the size of EGCs due to 250. 122(B).
For example, a 50A OCPD on a circuit requires a 8 AWG, type XHHW, CU ungrounded conductor. It is increase d to a 2 AWG due to voltage drop. Utilizing 250.122(B), the proportion is 2 AWG to 8 AWG = 66,360cm/16,510cm = 4.02. For a 50A OCPD according to existing Table 250.122. A 10AWG was originally able to be used for an EGC. So, multiply (10AWG) 10,380cm X 4.02 = 41,721cm. So, now the EGC would have to be a 4 AWG. This typically isn't a problem when installing raceways with single conductor wire. However, with multi-conductor cables, the standard EGC that is manufactured with a 2 AWG cable is a 6 AWG for 90°C insulation. This is a fairly typical problem in industrial plants today. The proportion calculation specified in 250.122 isn't being adhered to since it requires special cables to be ordered, or possibly the use of a four conductor cable with the EGC sized equivalent to the ungrounded conductors. When four insulated conductors are required plus the EGC, then special cable has to be ordered. This isn't a cost issue as much as it' s a waste of copper or aluminum. Table 250.122 as it stands today allows a reduction for the EGC. Utilizing the new tables would allow the reduction to be utilized in multiconductor cables.
This a companion comment to one submitted for 250.122(B), Proposal 5-292.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There was no substantiation provided to justify the reduction in size of the equipment grounding conductor in multiconductor cable that would assure the panel that an adequately low impedance fault path is achieved to comply with 110.10.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
MOHLA, D.: This comment and Proposal 5-281 have highlighted a concern that ground fault carrying conductors on the line and load side of the overcurrent device are required to be of different sizes even though they carry the same fault current. I have provided a sketch to illustrate the inequity without any technical basis.
Note: Supporting Material is available for review at NFPA Headquarters.

5-178 Log #1075 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Noel Williams, Herriman, UT
Comment on Proposal No: 5-287
Recommendation: This proposal should have been accepted.
Substantiation: The panel statement says the proposal would reduce the current sizing requirement. This is not true unless the current language is disregarded. The substantiation stated that a clarification was desired - essentially asking the panel to agree that "in no case" means exactly that. The panel chose to leave the "in no case" language intact and then said they didn't mean it as it applies to parallel circuits. "In no case" would mean, to most people, exactly what it says. If the panel intent is to say "in no case except parallel circuits" then the the language should say that. The Explanations of Negative should be more carefully considered, particularly that of Mr. Tremblador, Mr. Mohla, and Mr. Dobrowsky also point out the inconsistency between the requirements on the load side and those on the supply side. These are glaring inconsistencies, but I don't see current proposals to address them and past proposals that would have been rejected.
Panel Meeting Action: Reject
Panel Statement: The size of the circuit conductors supplying the equipment referred to in 250.122(A) is the equivalent area of the circuit conductors in parallel.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
MOHLA, D.: CMP 5 should reconsider the substantiation provided for rejection and accept the comment. The statement provided by the panel "The size of the circuit conductors supplying the equipment referred to in 250.122(A) is the equivalent area of the circuit conductors in parallel." Is not what the wording in 250.122 (A) states.
The submitter is correct that there is inconsistency in what is in the code and the way panel is reading it. Mr. Williams is pointing out how " in no case" is understood by most people. CMP should either change the wording as suggested by Mr. Williams or accept the rationale provided in Proposal 5-287. Will the same rationale advanced by CMP 5 for EGC sizes apply to Grounded conductors because same statement " but shall not be required to be larger than the phase conductors" appear in 250.30(A)(8) ?
Also, see my negative vote on Comment 5-179.
Comment on Affirmative:
BRENDER, D.: I believe the proposed additional text in the proposal and Comment 5-179 is not needed. The customary way to read and interpret the language in 250.122(A) General, "but in no case shall they (the EGC) be required to be larger than the circuit conductors" is, the general rule in (A) applies throughout 250.122 including parallel conductors in (F).
PORTER, C.: I agree with the original substantiation provided in proposal 5-287 and believe this comment should have been accepted. I agree with the comments provided by Mr. Dobrowsky, Mr. Mohla, and Mr. Temblador at the proposal stage.

5-179 Log #2734 NEC-P05 **Final Action: Reject**
(250.122(A))

Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 5-287
Recommendation: Revise as follows:
250.122 Size of Equipment Grounding Conductors.
(A) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250.122, but in no case shall they be required to be larger than the circuit conductors supplying the equipment, including in parallel circuits. Where a cable tray, a raceway, or a cable armor or sheath is used as the equipment grounding conductor, as provided in 250.118 and 250.134(A), it shall comply with 250.4(A)(5) or (B)(4).
Substantiation: As stated by CMP-5 member Mr. Mohla, "Sizing requirements for supply side grounded conductors and load side EGC should be same as they perform the same function during ground fault conditions." There has been no justification provided for sizing the EGC larger than the supply-side grounded conductors in parallel circuits, and the disparity between supply side and load side conductor sizing makes no sense electrically. While a larger EGC is beneficial where multiple circuits are included in one raceway (as required in 250.122(C)), it does not make sense where each parallel run is enclosed in its own raceway or cable.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms that the substantiation provided does not support reducing the present sizing requirement. The panel concludes that the rating of the overcurrent device is the determining factor for sizing all equipment grounding conductors, including those installed in parallel circuits. No additional technical substantiation was provided.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
MOHLA, D.: There is no technical basis for requiring basic rules not to apply to equipment grounding conductors when contained in multiple raceways.
The circuit conductors can share the normal and ground fault current on both line and load side of the overcurrent device. Grounded conductor can share the fault current on the line side of the overcurrent device. Grounded conductors are the fault current path on the line side of the overcurrent device. What is the technical justification for maintaining that ground fault current cannot be shared on the load side of the overcurrent device? Grounded conductor on the supply side of overcurrent
protective device performs the same function as EGC on the load side of the overcurrent protective device i.e. provides a path for ground fault currents.
Sizing requirements for supply side grounded conductors and load side EGC should be same as they perform the same function during ground fault conditions. Electrons do not discriminate whether they are on the line side or the load side of the overcurrent device and will equally divide between parallel conductors if they have been installed in compliance with 310.4(B) i.e same material, same length,same size in circular mill area and terminated in the same manner.
I have provided a sketch that uses same configuration used in submitter of comment 5-177. Ground fault current has been rounded up to show the current division,
Note the current division is same on both sides of the overcurrent device,Only the conductor sizes are required to be different on the load and line side even though the ground fault current is the same on both sides (42,000 A) and is shared equally between the six conductors on the line and load side (6000 A each).
Also note, that the purpose of ground fault current on the line side and load side is the same : to facilitate tripping of overcurrent device. In case of a transformer, line side of the overcurrent device is load side of the overcurrent device on the primary of the transformer.
Note: Supporting Material is available for review at NFPA Headquarters.
Comment on Affirmative:
BRENDER, D.: See my statement on Comment 5-178.
PORTER, C.: I agree with the original substantiation provided in proposal 5-287 and believe this comment should have been accepted. I agree with the comments provided by Mr. Dobrowsky, Mr. Mohla, and Mr. Temblador at the proposal stage.

5-180 Log #90 NEC-P05 **Final Action: Accept**
(250.122(B))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 5-290
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action to Reject this proposal while also providing revised text.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP 5 rejected this proposal as indicated by the panel statement. The text from the proposal was inadvertently copied to the panel action.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-181 Log #2235 NEC-P05 **Final Action: Hold**
(250.122(B))

TCC Action: The Technical Correlating Committee directs that the action on the comment be reported as "Hold" consistent with 3.3.1 of the NEC Style Manual in that it is not written in clear and concise language.
Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Comment on Proposal No: 5-290
Recommendation: Revise text to read as follows:
(B) Increased in Size: Where ungrounded conductors are increased in size from the minimum size that would have had sufficient ampacity, (BEFORE/ AFTER) any adjustment or correction factors are applied, grounding conductors...".
NOTE:The submitter advises that the panel will need to pick the word "before" or the word "after", in the comment below, whichever word describes your intent.
Substantiation: Something has to be added to this article, in order to declare the "starting point" from which conductor size is to be considered "increased". One cannot proportionally increase the size of the EGC, without knowing the ratio of the "size of the increased ungrounded" to the "size of ungrounded prior to the increase". What, then, is the "size of ungrounded prior to the increase?" If the starting point is Table 310.16, then say so. If we are supposed to begin with Table 310.16 and then apply adjustment and correction factors before we say we have the starting point, then say so.
Panel Meeting Action: Accept in Principle
Revise the text in 250.122(B) to read as follows:

(B) Increased in Size. If ungrounded conductors are increased in size from the minimum size that has sufficient ampacity for the intended installation before the ungrounded conductors are increased in size for any reason including but not limited to application of any adjustment or correction factors, equipment grounding conductors, if installed, shall be increased in size in proportion to the increase in circular mil area of the ungrounded conductors.
Panel Statement: The panel clarifies that the equipment grounding conductor is required to be increased in proportion to any increase of related ungrounded conductors above the minimum size required for the circuit before any increase in size is made to the ungrounded conductors for any reason.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-182 Log #2567 NEC-P05 **Final Action: Accept in Principle**
(250.122(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 5-290
Recommendation: Accept the proposal in principle, worded as indicated in the panel statement.
Substantiation: Unfortunately the wording in the panel statement was obviated due to the unfortunate action of reporting the proposal as "reject". Since the panel will revisit this issue due to the TCC action, the purpose of this comment is to commend CMP 5 for their presumed intent as reflected in the panel statement. This submitter's technical reasons for this recommendation are as presented in his Proposal 5-293.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-181.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-183 Log #2853 NEC-P05 **Final Action: Reject**
(250.122(B))

Submitter: Paul Guidry, Fluor Enterprises, Inc / Rep. Associated Builders and Contractors
Comment on Proposal No: 5-292
Recommendation: Revise 250.122(B). This is a companion proposal to one to revise Table 250.122 (proposal 5-281).

(B) Increased in Size. Where ungrounded conductors are increased in size, equipment grounding conductors, where installed, shall be increased in size proportionately according to the circular mil area of the ungrounded conductors, or where installed with multiconductor cables shall comply with Tables 250.122(A), (B) or (C).

Substantiation: 250.122(B) will need to be revised if my comment for proposal 5-281 is accepted.
Panel Meeting Action: Reject
Panel Statement: There was no substantiation provided to justify the reduction in size of the equipment grounding conductor in multiconductor cable that would assure the panel that an adequately low impedance fault path is achieved to comply with 110.10.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-184 Log #1855 NEC-P05 **Final Action: Accept in Principle**
(250.122(F))

TCC Action: See the Technical Correlating Committee Note on Comment 5-193.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-295
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(F) Conductors in Parallel. If ~~Where~~ conductors are installed ~~run~~ in parallel in multiple raceways or cables as permitted in 310.4 ~~310.10(H)~~, the equipment grounding conductors, if ~~where~~ used, shall be installed ~~run~~ in parallel in each raceway or cable. If ~~Where~~ conductors are installed ~~run~~ in parallel in the same raceway, cable, or cable tray as permitted in 310.10(H), a single equipment grounding conductor shall be permitted. Equipment grounding conductors installed in cable tray shall meet the minimum requirements of 392.10(B)(1)(c). Each equipment grounding conductor shall be sized in compliance with ~~on the basis of the ampere rating of the overcurrent device protecting the circuit conductors in the raceway, cable, or cable tray in accordance with Table~~ 250.122.
Substantiation: Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if." This Comment intends to use the word "if" where appropriate.

The word "installed" is preferred to "run" as it is more descriptive for use in the NEC which is an installation Code.

The changes proposed for the last paragraph correct the reference to all of 250.122 and not only to the Table. This is needed as circuit conductors may be increased in size in (B), be conductors for motors in (D), be in flexible cord (E), be for cable trays in (A) or (C), or be for feeder taps in (G). This change is intended to be editorial in nature and not introduce a new concept.
Panel Meeting Action: Accept in Principle

Correct the reference to 310.10(H) in the first sentence of the recommended text and do not accept the revision to 310.4. Accept the reminder of the recommended text.
Panel Statement: The reference was corrected to reflect the correct section in the ROP draft. The remainder of the recommended text remains unchanged.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:

BRETT, JR., M.: The committee accepted a major change without substantiation that will likely cause confusion and misapplications. This change was stated as an editorial change, but will likely cause confusion. By deleting the prescribed sizing requirements for equipment grounding conductors installed in parallel raceways and cables the installer may believe that the charging statement in section 250-122 applies to each parallel path and not the rule which requires the equipment grounding conductor never needs to be larger than the sum total of the circuit conductors paralleled. This Section 250.122(F) was written to clarify these exact requirements and the present language is much better and should be retained.
Comment on Affirmative:

WILLIAMS, D.: The panel concluded that when conductors are paralleled in multiple raceways that the equipment grounding conductor in each raceway is required to be sized per 250.122 for each equipment grounding conductor in each raceway. An example is a 3,000 amp feeder paralleled in 8 raceways using 500 kcmil conductors rated 380 amperes each. Using 250.122 based on the overcurrent device protecting the feeders, a 400 kcmil copper equipment grounding conductor would be required in each raceway. It appears that this is not enforced properly in many areas of the country. The change is editorial in nature and the last sentence was simplified. Hopefully this change will increase the understanding on how equipment grounding conductors are sized when installed in parallel.

5-185 Log #2771 NEC-P05 **Final Action: Accept**
(250.130(A))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 5-299
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-186 Log #2772 NEC-P05 **Final Action: Accept**
(250.130(C)(4))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 5-300
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-187 Log #1698 NEC-P05 **Final Action: Reject**
(250.132)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-301
Recommendation: Accept revised as follows: Isolated sections of metal raceways and metal-covered cables to be grounded shall be connected to an equipment grounding conductor or bonding conductor.
Substantiation: The provision should apply where grounding is done by choice. Direct connection to an equipment grounding conductor is not always necessary; an equipment bonding conductor can be provided in many cases to accomplish grounding.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation to remove the requirement and only leave the option provided. References to the requirements of 250.134 were deleted without technical substantiation.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-188 Log #1699 NEC-P05 **Final Action: Reject**
(250.146(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-305
Recommendation: Accept revised as follows: Where the box is surface mounted or extends outside the surface, or where a metal extension ring is secured to a flush box, direct metal-to-metal contact between the device yoke and the box or extension ring or a device that complies with 250.146(B) shall be permitted to ground the receptacle to the box.
Substantiation: The provision should include semi-recessed boxes and boxes provided with an extension ring, a common installation.
Panel Meeting Action: Reject
Panel Statement: A bonding jumper is required unless direct metal-to-metal contact is ensured such as for surface-mounted boxes. The proposed revision dilutes this provision.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-189 Log #1665 NEC-P05 **Final Action: Reject**
(250.148)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-307
Recommendation: Accept the proposal.
Substantiation: These provisions are covered by 250.86 and 314.40(D). The provision doesn't apply if conductors are not spliced or terminated within the box or on equipment, but 250.86 requires connecton to an equipment grounding conductor without conditions of splices or terminations of circuit conductors. 250.146 already applies.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement Proposal 5-307. No added information or technical substantiation was submitted.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-190 Log #1681 NEC-P05 **Final Action: Reject**
(250.162(A) Exception No. 2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-309
Recommendation: Accept the proposal.
Substantiation: Some rectifier derived circuits, unless separately derived, will be in effect be a ground system as indicated with the sketch, I have provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The present exception refers to 250.20 for systems required to be grounded and is not limited to separately derived systems as the proposal suggests.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-191 Log #1664 NEC-P05 **Final Action: Reject**
(250.166(A) and (B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 5-310
Recommendation: Accept the proposal with the following revisions:
(A)...the grounding electrode conductor shall have an ampacity not less than the neutral conductor and be not smaller than 8 AWG if copper or 6 AWG if aluminum or copper-clad aluminum.
(B)...the grounding electrode shall have an ampacity not less than the largest conductor supplied by the system and be not smaller than 8 AWG, if copper, or 6 AWG, if aluminum or copper-clad aluminum.
Substantiation: A copper and aluminum conductor of the same size do not have the same ampacity.
"Smaller" does not necessarily relate to ampacity.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation that supports adding an ampacity requirement for the grounding electrode conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-192 Log #495 NEC-P05 **Final Action: Accept in Principle**
(250.190)

Comment on Proposal No: 5-313
Recommendation: CMP-10 supports the CMP-5 action to Accept in Principle in Part Proposal 5-313.
Substantiation: The action taken by CMP-5 is correct based on the submitter's substantiation. While information for additional change may exist, it was not included with the proposal.
12 Eligible to vote
11 Affirmative (S.E. Townsend for D.M. Darling)
1 Negative (C. Fredericks)
The following Negative Comment on Vote was received:
C. Fredericks stated: Proposal 5-313 did not include substantiation to support the limits it proposed on grounding conductor size or cable shield dimensioning.
Medium and high voltage protection can be significantly different than low voltage protection, in that fast acting independent ground trips can be provided, that can safely protect smaller conductors than are required per Table 250.122, and in some cases a tape shield may be safely applied on a solidly grounded system without additional grounding conductors. See also Mr. Mohla's comments provided in the ROP.
Consequently, Panel 5 should have further modified 250.190(C)(2) and (C)(3)(a) from the language as accepted to the following:
(2) Shielded Cables. If the cable assembly is suitably rated for the ground fault current ~~and is of the concentric neutral type~~, the shield conductors shall be permitted as the equipment grounding conductor. ~~For solidly grounded systems, the cable copper screen or ribbon shield or combination of both shall not be used as an equipment grounding conductor.~~
(3) Sizing. Equipment grounding conductors shall be sized in accordance with (a) and (b) as follows:
(a) Equipment grounding conductors shall be sized in <u>either in accordance with recognized time-current limits or</u> accordance with Table 250.122 based on the current rating of the fuse or the overcurrent setting of the protective relay.
The following Affirmative Comment on Vote was received:
S.E. Townsend stated: "I concur with Mr. D. Mohla's Affirmative Comment on 250,190."
Panel Meeting Action: Accept in Principle
See panel action on Comment 5-193.
Panel Statement: See panel statement on Comment 5-193.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-193 Log #570 NEC-P05 **Final Action: Accept in Principle**
(250.190)

TCC Action: It was determined by the Technical Correlating Committee that Code-Making Panel 5 considered it unnecessary to "Reject" or "Hold" the comment, and incorporated the actions from Comments 5-192, 5-193, and 5-194 into the action taken on this comment.
Submitter: Code-Making Panel 6,
Comment on Proposal No: 5-313
Recommendation: If the panel considers it necessary, for the reasons indicated below, they could either "Reject" the original proposal, or "Hold" it for refined action and public review next cycle.
1. Include the technical reasons for these changes in the panel statement.
2. Include the technical reasoning for 250.122's "rating or setting of automatic overcurrent device" being inadequate.
3. Either reword the sections Title/Scope, or remove the reference to sizing a GEC.
4. The sizing requirements of 250.190(C)(3) appear to conflict with the permission of 250.190(C)(2), since (C) requires compliance with (1), (2), and (3).
5. (C)(3)(b) appears to be a redundant statement of the already required (C)(1).
6. Does any cable assembly have "a ground fault rating"?
7. Consider defining the terms "copper screen" and "ribbon shield".
Substantiation: We have to believe that there are unexplained good reasons for the panel's action, but shouldn't these technical reasons have been put into the public forum for review at the ROP stage? Why is the 2008 EGC sizing inadequate?
The substantiation does not present understood technical reasoning for 250.122's "rating or setting of automatic overcurrent device" (already required by 250.180) being a problem.
250.190 "Grounding of Equipment." addresses non-current carrying metal parts. What has it to do with a grounding electrode conductor, other than the GEC possibly being an acceptable place to connect the EGC? Isn't the sizing of any required GEC already addressed by 250.180 ("all applicable preceding"), 250.190 ("not smaller than"), and 250.66?

The sizing requirements of 250.190(C)(3) appear to conflict with the permission of 250.190(C)(2), since (C) requires compliance with (1), (2), and (3).
(C)(3)(b) appears to be a redundant statement of the already required (C)(1).

We do not know of a cable assembly that has a ground fault rating.

The UL standard 1072 "does not include requirements for cable with concentric neutral conductors." (Clause 1.4).

There is a Pity7 (cUL for MV) certification for a concentric neutral construction.

The terms "copper screen", and "ribbon shield" have no known Code definitions.

Panel member D. Mohla indicated in his affirmative comment on vote a need to edit the action's text.

We are reluctant to question a panel's action, but we have been directed to review it, and there are parts we do not understand.

We separately wish that the ROP for P-5-313-2011 had presented the revised Code text in full legislative format.

This comment was developed by a CMP-6 Task Group and balloted through the entire panel with the following ballot results:
11 Eligible to vote

7 Affirmative

4 Ballots Not Returned (S.B. Friedman, R.L. Huddleston, Jr., R. Hunter & J.M. Thompson)

The following Affirmative Comment on Vote was received:

L.B. McClung stated:

"I Agree with the affirmative vote by CMP-5, and also agree with comments by both Mr. Hammel, D. and Mr. Mohla, D.
For clarity - identify that metallic insulation shields can be tape/screen/drain wire or concentric neutral as well as point out that concentric neutral is a special grounding electrode conductor that also may serve as the electrical system neutral. Its main difference from drain wire construction is in size of the individual conductors that are wrapped concentrically or straight crinkled in parallel construction to the power conductor. Concentric neutral wires in combination should equal or exceed the cross section of the individual power conductor."

Panel Meeting Action: Accept in Principle
Revise Section 250.190(C)(2) and (3) to read as follows:

(2) Shielded Cables. The metallic insulation shield encircling the current carrying conductors shall be permitted to be used as an equipment grounding conductor, if it is rated for clearing time of ground fault current protective device operation without damaging the metallic shield. The metallic tape insulation shield and drain wire insulation shield shall not be used as an equipment grounding conductor for solidly grounded systems.
(3) Sizing. Equipment grounding conductors shall be sized in accordance with Table 250.122 based on the current rating of the fuse or the overcurrent setting of the protective relay.
Informational Note: The overcurrent rating for a circuit breaker is the combination of the current transformer ratio and the current pickup setting of the protective relay.

Panel Statement: Text has been revised to incorporate suggestions expressed by CMP 6 and CMP 10.

The 2008 NEC has no guidance given in Art. 250, Part X (systems over 1kV) on what the minimum equipment grounding conductor size is to be based on other than the automatic overcurrent device ahead of the equipment. 240.100(A) permits two types of protection. 1) Overcurrent Relays and Current Transformers. 2) Fuses. The addition of the new subsection (C) and the Informational Note should clarify that the size should be based upon the protective device whether it's a breaker, fuse or relay.

The revised wording removes a repeated rule. The revised wording reflects typical applications for the use of cable shielding. The panel does not accept the language "recognized time-current limits" because it is not suitable for mandatory text has cited in 4.2 of the NEC Style Manual.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-194 Log #1789 NEC-P05 **Final Action: Accept in Principle**
(250.190)

TCC Action: See the Technical Correlating Committee Note on Comment 5-193.
Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 5-313
Recommendation: Modify 250.190(C)(2) and (C)(3)(a) from the language as accepted to the following:

(2) Shielded Cables. If the cable assembly is suitably rated for the ground fault current ~~and is of the concentric neutral type,~~ the shield conductors shall be permitted as the equipment grounding conductor. ~~For solidly grounded systems, the cable copper screen or ribbon shield or combination of both shall not be used as an equipment grounding conductor.~~
(3) Sizing. Equipment grounding conductors shall be sized in accordance with (a) and (b) as follows:

(a) Equipment grounding conductors shall be sized in either in accordance with recognized time-current limits or accordance with Table 250.122 based on the current rating of the fuse or the overcurrent setting of the protective relay.

Substantiation: Proposal 5-313 did not include substantiation to support the limits it proposed on grounding conductor size or cable shield dimensioning. Consequently, these parts should have been modified by Panel 5 similar to the edits that are provided with this comment.

The limits proposed by Proposal 5-313 on grounding conductor sizing are the same as the existing NEC requirements for low voltage, but medium and high voltage protection can be significantly different than low voltage protection in that fast acting independent ground trips can be provided, that can safely protect smaller conductors than are required per Table 250.122.

The limits proposed by Proposal 5-313 on cable shielding do reflect typical applications, but there are cases where a tape shield may be safely applied on a solidly grounded system without additional grounding conductors.

See also Mr. Mohla's comments provided in the ROP.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-193.

ARTICLE 280 — SURGE ARRESTERS

5-195 Log #1231 NEC-P05 **Final Action: Accept**
(280.5)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 5-317
Recommendation: NEMA supports the panel action to accept proposals 5-317, 5-318 and 5-319.

~~280.5 Listing. A surge arrester shall be a listed device.~~

Substantiation: The 2008 NEC introduced a Listing requirement for surge arresters rated over 1000V for the first time in the history of the NEC. There was no substantiation presented that a safety issue exists with arresters rated over 1kV. The Listing requirement for surge protection was introduced into the NEC when Article 285 was introduced into the NEC to ensure the technology employed in a TVSS would protect safely.

The UL substantiation for adding 280.5 to the 2008 NEC refers strictly to low voltage arresters and UL1449. However section 280 is titled Surge Arresters Over 1kV. These arresters are not tested to UL1449 (as they note) and have very different application and test requirements. The only reference to high voltage arresters is that "The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over". Therefore Article 280.5 does not apply to low voltage surge protective devices or conflict with the requirement to list them. Therefore their argument provides no substantiation for listing surge arresters over 1kV.

Surge arresters rated above 1000V are governed by the ANSI/IEEE standard. More than 99% of arresters installed in the US are for use by the electric utilities. Electric utilities maintain their own approval process for manufacturers based on the ANSI/IEEE standard. UL does not have the capability to test surge arresters rated 1000V and above. To require listing by UL will be redundant testing for products that have already been certified independently for utility approval.

Installation of surge arresters is performed by installers trained and certified specifically for equipment 1000V and above. Of the arresters installed in non-utility plant, by virtue of the safety requirements for higher than 1kV, all of these arresters are installed in safe locations not accessible to the public. Safety requirements are described in the 2007 National Electrical Safety Code (NESC) and OSHA 1910.269.

The UL category has been in existence for years but there have been no market or safety issues that have led any surge arrester manufacturers to pursue such a listing. To date, there are no Listed surge arresters over 1000V. Currently there is no means to comply with the NEC requirement for Listed arrester over 1000V and there is no substantiation that would indicate a safety issue exists for arresters rated over 1000V. The Listing requirement for arrester has no basis for being in the NEC and should be deleted.

Response to Panel 5 circulation report comments and Panel 5 meeting discussion:

Comment - *"Just because there are no Listings is no reason to delete this requirement. This is a new requirement and has not been really implemented by enforcement to cause listings to happen."*
Response – As noted with the original submittal above, the reason to delete is not based on not having listings, rather the fact that there was "No substantiation presented" to add the listing requirement in the first place. The balance of the arguments support why there is no substantiation.

Comment - *" Without a Listed surge arrester there is no way for users that are not part of utilities to have assurance of its safety, proper operation, and compliance with the applicable safety standard(s)."*
Response – As noted in the proposal, surge arresters rated above 1kV are governed by the ANSI/IEEE standard. Electric Utilities maintain approvals based on the standard and all existing manufacturers comply. If in doubt, users can easily contact the local utility or the manufacturer for documentation of compliance.

Comment - *Contrary to what was presented, these surge arrestors at the 5 kV, 8 kV, 15 kV, 25 kV and higher voltage classes are being installed at other than the interface of the utility and the premises wiring. These products are being installed by regular electricians separately or being installed within medium voltage equipment being installed or maintained by electricians. There are numerous projects underway today with outdoor substations, padmounted transformers and medium voltage switchgear incorporating these type surge arresters.*

Response – It was noted during the presentation a small percentage (potentially less than one percent) of arresters rated above 1kV are in fact installed by non-utility installers, in non-utility installations. However, it was also presented that, per the 2007 National Electrical Safety Code (NESC) and OSHA 1910.269 code, equipment access be limited to and work on equipment over 1kV to be performed only by trained and qualified personnel.

NESC Section 11: "Rooms and spaces in which electric supply conductors or equipment are installed shall be so arranged with fences, screens, partitions, or walls to form an enclosure as to limit the likelihood of entrance of unauthorized persons or interference by them with equipment inside."

From NESC Section 42: "Employees whose duties require working on or in the vicinity of energized equipment or lines shall perform only those tasks for which they are trained, equipped, authorized."

From OSHA 1910.269: "This section covers the operation and maintenance of electric power generation, control, transformation, transmission, and distribution lines and equipment. These provisions apply to: Power generation, transmission, and distribution installations, including related equipment for the purpose of communication or metering, which are accessible only to qualified employees. Note: The types of installations covered by this paragraph include the generation, transmission, and distribution installations of electric utilities, as well as equivalent installations of industrial establishments. Training. Employees shall be trained in and familiar with the safety-related work practices, safety procedures, and other safety requirements in this section that pertain to their respective job assignments."

Comment - *Changes to the IEEE standard for surge arresters adopted since the completion of the 2008 NEC cycle, now requires short circuit testing and a short circuit rating. The present surge arrestors on the market likely are not tested for short circuit as yet and will not be unless there is a requirement to do so. The base technology of these surge arresters, is a MOV, which is the same technology as the under 1KV SPDs covered in UL 1149 and required by 285.5. The substantiation for the inclusion of listing for these in Article 285 was based on the same concerns for the reliability and performance under abnormal conditions and that a failure does not cause additional damage or hazards to the installation.*

Response – This statement is true as it relates to surge arresters below 1kV, it is false as it relates to surge arresters above 1kV. The short circuit tests, or sometimes referred to fault withstand or pressure relief tests, have been in the C62.11 standard since 1993. The pressure relief test for station class arresters goes back to at least the 1970s. All available products have been tested, as this is an absolute requirement for the market. There is no substantiation to require all designs to re-perform this specialized testing since all have already been qualified.

Comment at the CMP-5 panel discussion – Paraphrased -*"Tests for surge arresters rated below 1kV are the same as surge arresters above 1kV as they are both MOV arresters. Therefore arresters over 1kV can be tested as easily as low voltage arresters."*

Response – It is true that above 1kVarresters use MOV technology and most arresters below 1kV use MOV technology. Therefore there are similarities in some of the tests. However, due to the high voltage conditions, significantly higher surge exposure and outdoor installation properties, the tests requirements are significantly different and require significantly different laboratory capabilities. The test standard C62.11 for above 1kV arresters has 23 separate designs tests compared to only 8 design tests in the C62.62 standard for less than 1kV arresters. For the C62.11 test the voltage requirements include impulses greater than 750kV, 60 cycle voltages greater than 150kV, surge currents up to 100kA and short circuit currents up to 80kA at voltages up to 115kV. UL is not capable of performing these tests, and there are only a handful of laboratories in the world that can perform these tests, with most not able to perform the entire series of tests. Based on the range of applications, there are up to 10 different classes of arresters rated over 1kV, compared to only 4 classes of below 1kV arresters. In order to list all models of arresters, a manufacturer for above 1kV arresters could be required to perform over 130 separate tests, as compared to below 1kV up to only 28 separate tests. The testing burden for above 1kV arresters must be based on appropriate substantiation, not just a desire to have listed products.

Comment - *"Surge Arresters should remain listed and this proposal be rejected. As an electrician or an electrical inspector we often refer to the installation instructions that come with listed products for installing them properly. There is comfort in knowing that the product being installed has been evaluated by a National Recognized Testing Laboratory and tested to an appropriate listing standard. There are no surge arresters listed at this time, because they have not been submitted to a testing laboratory to be considered for meeting the standard criteria for surge arresters. Surge arresters are a product that electricians and inspectors are not very familiar with and the listing mark should be something they look for in choosing a product."*

Response – Substantiation is a requirement to make changes to the NEC and in particular, to add listing requirements. This was not done when section 280.5 was added. To date, the arguments for adding the listing requirement have not substantiated it. Surge arresters above 1kV are already required to meet the very stringent requirements of ANSI/IEEE C62.11. All manufacturers have available certified test reports they can provide to qualified electricians as they select and use surge arresters rated above 1kV.The UL substantiation for adding 280.5 to the 2008 NEC refers strictly to low voltage arresters and UL1449. However section 280 is titled Surge Arresters Over 1kV. These arresters are not tested to UL1449 (as they note) and have very different application and test requirements. The only reference to high voltage arresters is that "The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over". Therefore Article 280.5 does not apply to low voltage surge protective devices or conflict with the requirement to list them. Therefore their argument provides no substantiation for listing surge arresters over 1kV.

Surge arresters rated above 1000V are governed by the ANSI/IEEE standard. By far into the 95th plus percentile of arresters installed in the US are for use by the electric utilities. Electric utilities maintain their own approval process for manufacturers based on the ANSI/IEEE standard. UL does not have the capability to test surge arresters rated 1000V and above. To require listing by UL will be redundant testing for products that have already been certified independently for utility approval.

Installation of surge arresters is performed by installers trained and qualified specifically for equipment 1000V and above. Of the arresters installed in non-utility plant, by virtue of the safety requirements for higher than 1kV, all of these arresters are installed in safe locations not accessible to the public. Safety requirements are described in the 2007 National Electrical Safety Code (NESC) and OSHA 1910.269.

The UL category has been in existence for years but there have been no market or safety issues that have led any surge arrester manufacturers to pursue such a listing. To date, there are no Listed surge arresters over 1000V. Currently there is no means to comply with the NEC requirement for Listed arrester over 1000V and there is no substantiation that would indicate a safety issue exists for arresters rated over 1000V. The Listing requirement for arresters over 1000V has no basis for being in the NEC and should be deleted.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 14 Negative: 2

Explanation of Negative:

MELLO, C.: The substantiation for accepting the deletion of this requirement is based on enforcement of another Code, not typically adopted by local Authorities Having Jurisdictions, and on OSHA requirements that are enforced only by OSHA. The acceptance of this comment by the panel is basically substantiating that the Authorities Having Jurisdiction are enforcing the National Electrical Safety Code and that OSHA is enforcing the qualified worker provision of the OSHA regulations for all these installations, both which are false statements.

The MOV technology for the surge protection devices over 1 kV, and as covered in the scope of the ANSI/IEEE Standard C62.11, referenced in the Article, is the same technology employed in SPDs under 1000 Volts as covered in 285.5. The panel failed to address the technical issue on why the MOV technology for SPDs under 1000 Volts is required to be Listed, NEC 285.5, yet SPDs with the same MOV technology over 1000 Volts do not require Listing.

The substantiation that the local utility will provide a "certification" that a certain lightning arrester is "acceptable" or that an AHJ reviewing manufacturer's provided test data could determine acceptability are also false premises. Listing of products provides a foundation for installers, users, and inspectors of the acceptability of a device to perform the intended function in a safe manner and in the event of a failure to fail safely. As was presented, based on a visual inspection of a lighting arrester, how does the user or the inspector know it will perform safely when called upon to provide the intended safety function?

WILLIAMS, D.: The requirement for listing of surge arresters can protect designers, contractors, installers, and inspectors to ensure that the product has been evaluated by a third party Nationally Recognized Testing Laboratory. There are products we are finding that are coming from other countries that have been found to be less than what is required in the product standard. This can be a serious safety concern. The Listing requirement is vital to the electrical industry to ensure that electrical products that are being used are in compliance with the product standards. Surge arresters are no different. Authorities Having Jurisdiction, AHJ, depend on the product listing to assist them in their approval process. By these products not being listed could end up delaying approval on jobsites.

5-196 Log #1273 NEC-P05 **Final Action: Reject**
(280.5)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 5-316
Recommendation: The panel should reconsider and reject the proposal to eliminate the requirement for Listing.
Substantiation: This was a new requirement established in the 2008 NEC. That Code has been adopted in less than 50% of jurisdictions so enforcement, if any, has not had an opportunity to happen. There have been submittals to UL for this product and are being processed along with a number of submittals that resulted in changes to UL 1449 for less than 1000 Volts SPDs.

Article 285 requires SPDs under 1000 Volts to be listed, and the over 1KV surge arresters (SA) are of the same construction, so why are they excluded. They certainly pose at least the same or possibly a greater potential hazard due to the energy available if they fail.

We are dealing with SAs that are not utility owned or installed, but are located on the customers premises where the NEC prevails and public safety is a concern, just like an SPD under 1KV. There are numerous locations where these have been identified by AHJs, such as Amherst, MA; Shelby County, AL; Salt Lake City, UT; Los Angeles, CA; Longview, WA; and Colorado Springs, CO. These AHJs are unable to readily approve the installation because they have no basis to just accept the uncertified part. The identified units were found in padmounted switchgear, padmounted transformers, medium voltage motor control equipment, owner owned substations on outdoor power transformers, medium voltage generators and metal clad switchgear assemblies.

SAs are being manufactured all over the world and are now being imported into the USA. In order to level the playing field and ensure compliance with IEEEC62.11, 3rd party Certification would be beneficial in achieving this goal and mitigating a potential hazard and providing the AHJ a means to accept the product and approve the installation.

The excuse that there are no Listed SAs is a catch 22 situation and should not be used as justification for not requiring a Listed SA. This same excuse could be used for Signs, PV systems, and other products being installed. Users should demand compliance with IEEEC62.11 that has been verified by a qualified testing laboratory, to mitigate their liability and the AHJs should have a means of ensuring safety by a listing mark on the SA.
Panel Meeting Action: Reject
Panel Statement: The application of surge arrestors is an engineered solution on a situational basis. Listing is not required as these products can be purchased according to the engineered specifications. There was no field evidence presented to show that there is a problem with unlisted surge arresters.
Number Eligible to Vote: 16

MELLO, C.: See my explanation for negative vote Comment 5-195.

WILLIAMS, D.: The submitter has provided reasoning why surge arresters should be listed. Additionally, the requirement for listing of surge arresters can protect designers, contractors, installers, and inspectors to ensure that the

product has been evaluated by a third party Nationally Recognized Testing Laboratory. There are products we are finding that are coming from other countries that have been found to be less than what is required in the product standard. This can be a serious safety concern. The Listing requirement is vital to the electrical industry to ensure that electrical products that are being used are in compliance with the product standards. Surge arresters are no different. Authorities Having Jurisdiction, AHJ, depend on the product listing to assist them in their approval process. By these products not being listed could end up delaying approval on jobsites.

5-199 Log #1277 NEC-P05 **Final Action: Reject**
(280.5)

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Comment on Proposal No: 5-319
Recommendation: The panel should reconsider and reject the proposal to eliminate the requirement for Listing.
Substantiation: This was a new requirement established in the 2008 NEC. That Code has been adopted in less than 50% of jurisdictions so enforcement, if any has not had an opportunity to happen. There have been submittals to UL for this product and they are being processed along with a number of submittals that resulted in changes to UL 1449 for less than 1000 Volts SPDs.

Article 285 requires SPDs under 1000 Volts to be listed, and the other 1KV surge arresters (SA) are of the same construction, so why are they excluded. They certainly pose at least the same or possibly a greater potential hazard due to the energy available if they fail.

We are dealing with SAs that are not utility owned or installed, but are located on the customers premises where the NEC prevails and public safety is a concern, just like an SPD under 1KV. There are numerous locations where these have been identified by AHJs, such as Amherst, MA; Shelby County, AL; Salt Lake City, UT; Los Angeles, CA; Longview, WA; and Colorado Springs, CO. These AHJs are unable to readily approve the installation because they have no basis to just accept the uncertified part. The identified units were found in padmounted switchgear, padmounted transformers, medium voltage motor control equipment, owner owned substations on outdoor power transformers, medium voltage generators and metal clad switchgear assemblies.

SAs are being manufactured all over the world and are now being imported into the USA. In order to level the playing field and ensure compliance with IEEEC62.11, 3rd party Certification would be beneficial in achieving this goal and mitigating a potential hazard and providing the AHJ a means to accept the product and approve the installation.

The excuse that there are no Listed SAs is a catch 22 situation and should not be used as justification for not requiring a Listed SA. This same excuse could be used for Signs, PV systems, and other products being installed. Users should demand compliance with IEEEC62.11 that has been verified by a qualified testing laboratory, to mitigate their liability and the AHJs should have a means of ensuring safety by a listing mark on the SA.

5-200 Log #2398 NEC-P05 **Final Action: Reject**
(280.5)

Submitter: Donald R. Cook, Shelby County Development Services
Comment on Proposal No: 5-316
Recommendation: Submitter request CMP-5 reconsider action on Proposal 5-316 and reject as submitted.
Substantiation: Surge arresters are intended to serve a safety function. Installers and enforcement need some basis to determine if equipment is capable of serving that function. no field inspection or testing procedure exists to make that decision after the product is installed. While many utilities have company testing facilities and can rely on their own review of such products, few if any installation and enforcement organizations have access to their own test facilities. While premises wiring installations above 1000 volts are becoming more common each year, manufacturers must realize the approval of these products has to be based on independent third party certification (listing).
Panel Meeting Action: Reject

5-201 Log #2465 NEC-P05 **Final Action: Accept**
(280.5)

Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 5-316
Recommendation: Continue to accept this proposal.
Substantiation: There was no substantiation presented in the 2008 NEC that demonstrated a safety issue existed to require surge arrester listing on systems Over 1000V. Adding a listing requirement for equipment in the NEC is typically introduced when a significant safety issue must be addressed. Many products hold a listing requirement as the manufacturer understands it will assist the AHJ in determining the product has been built to its appropriate safety standard. Consider panelboards, switchboards, busway and many other products in the NEC that do not have a listing requirement. Placing a listing requirement in the NEC without substantive issues places the industry in a position to ask the AHJ for written permission to accept unlisted surge arrester since there are no products listed and it would take months for that listing process to be completed and make it to the field as has been demonstrated via the requirement that has been in place not for 2 years in some states and we still do not see listed arresters.

I agree with Mr. Williams that if the AHJ has concerns about the product safety, he can either ask for a listed product or a report from the (surge arrester) manufacturer that his product complies with the appropriate product standards. Square D does NOT manufacture surge arresters over 1000V. If there are safety issues being experienced in the field, then that data needs to be collected and provided to the code panel for further discussion that may then support such a requirement.
Panel Meeting Action: Accept

(280.21(1))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 5-320
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

ARTICLE 285 — TRANSIENT VOLTAGE SURGE SUPPRESSORS: TYSSs

5-203 Log #2873 NEC-P05 **Final Action: Reject**
(285.4)

Submitter: Tom Baker, Puget Sound Electrical Training
Comment on Proposal No: 5-321
Recommendation: Accept this proposal
Substantiation: Accept this proposal. New Article 694 Small Wind Electric Systems was accepted and will require SPDs [(694.4 (D)]. There are wind turbines installed in areas subject to lightning, just are there are dwelling units installed in areas subject to lighting. The rational for SPDs is valid for both locations.
If not, then the requirement in 694.4(D) should be deleted.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms that the installation of surge protection is a design issue. The reference to special equipment is inadequate substantiation to demonstrate a need for requiring surge protection in the type of occupancy listed in this proposal.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-204 Log #1856 NEC-P05 **Final Action: Accept**
(285.25)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 5-324
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
285.25 Type 3 SPDs. Type 3 SPDs (TVSSs) shall be permitted to be installed ~~anywhere~~ on the load side of branch-circuit overcurrent protection up to the equipment served. If included in the manufacturer's instructions, the Type 3 SPD connection shall be a minimum 10 m (30 ft) of conductor distance from the service or separately derived system disconnect ~~if the Type 3 SPD includes a cautionary marking, tag, or instruction statement pertaining to the 10-m (30-ft) distance~~.
Substantiation: It seems the word "anywhere" should be deleted as it seems it invites locations that may not be permitted by other sections of the NEC. SPDs are required to be listed by 285.5. As such, the listing agency will typically require and review installation instructions to be certain they comply with the safety standard. As a result, the installation details in this section seem more appropriate for the listing instructions.
Panel Meeting Action: Accept
Number Eligible to Vote: 16

Ballot Results: Affirmative: 12

3-4 Log #1821 NEC-P03 **Final Action: Reject**
(300.3(C)(2))

Submitter: Peter D. Noval, Jr., Philadelphia, PA
Comment on Proposal No: 3-15
Recommendation: This proposal should be accepted as follows:
(2) Over 600 Volts, Nominal. Conductors of circuits rated over 600 volts, nominal, shall not occupy the same equipment wiring enclosure, cable, cable tray or raceway with conductors of circuits rated 600 volts, nominal, or less unless otherwise permitted in (C)(2)(a) through (C)(2)(e).
(a) Secondary Wiring to electric-discharge lamps of 1000 volts or less, if insulated for the secondary voltage involved, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(b) Primary leads of electric-discharge lamp ballast's insulted for the primary voltage of the ballast, where contained within the individual wiring enclosure, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(c) Excitation, control, relay, and ammeter conductors used in connection with any individual motor or starter shall be permitted to occupy the same enclosures as the motor-circuit conductors.
(d) In motors, switchgear and control assemblies, and similar equipment, conductors of different voltage ratings shall be permitted.
(e) In manholes, if the conductors of each system are permanently and effectively separated from the conductors of the other systems and securely fastened to racks, insulators, or other approved supports, conductors or different voltage ratings shall be permitted.
(f) In cable trays, where installation is in accordance with 392.6(F). Conductors having nonshielded insulation and operating at different voltage levels shall not occupy the same enclosure, cable, cable tray, or raceway.
Exception: Conductors installed in cable tray and separated by a barrier in accordance with 392.6(F) shall be permitted to have nonshielded insulation where all conductors rated over 600 volts are operating at the same voltage level.
Substantiation: The panel statement and the comment on affirmative vote both refer to 392.6(G), with regard to conductors (rated less than 600 volts) being installed with those conductors rated over 600 volts in cable tray.
392.6(F), however does not appear to specifically address the shielding requirement for conductors rated over 600 volts installed in cable tray.
For example, conductors rated over 600 volts could be installed in cable tray with conductors rated 600 volts or less, with barrier between them in accordance with 392.6(F).
Within the section of cable tray containing conductors rated over 600 volts, there could be conductors operating at different voltage levels.
The proposed new text clarifies the intent of NEC 300.3(C)(2), with regard to shielding requirements for cable tray installations to help eliminate potential misinterpretations.
Panel Meeting Action: Reject
Panel Statement: Section 300.1(A) states that Article 300 applies, unless modified by other articles, and Section 392.6(F)(2) already requires a solid fixed barrier to separate cables rated at 600 volt or less from over 600 volt cables. The proposed exception in the Comment would permit unshielded cables rated over 600 volts without the limitations for shielding found in 310.6. Panel 6 would have to review and accept the proposed changes and the comment introduces specific text that has not had public review.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-5 Log #1667 NEC-P03 **Final Action: Reject**
(300.3(C)(2)(e))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-16
Recommendation: Accept the proposal with the following revisions:
In manhole and handhole enclosures, if the conductors of each system are permanently and effectively separated from the conductors of the other system(s). Where installed in a manhole, conductors shall be securely supported and fastened to racks, insulators or other approved supports. (remainder unchanged).
Substantiation: These provisions should include handhole enclosures defined in Article 100, not handholes covered in 410.30(B). Handhole enclosures are various sizes. 314.16 requires free space in junction boxes (handhole enclosures). Effective separation can be accomplished where system conductors are in a raceway and the handhole enclosure is provided to provide access to a junction or pull box or conduit body in the raceway.
Panel Meeting Action: Reject
Panel Statement: Providing permanent and effective separation of 600-volt or less from over 600-volt conductors within a handhole would be very difficult, if not impossible. The submitter has not provided additional technical substantiation and data showing handholes and the method of providing permanent and effective separation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

6-2 Log #93 NEC-P06 **Final Action: Accept**
(300.3(D) (New))

TCC Action: The Technical Correlating Committee directs that the Chair of Code-Making Panel 6 appoint a Task Group comprised of members from Code-Making Panels 6, 7, and 13 to correlate the requirements of fire-rated and non-fire-rated cables for the 2014 edition of the NEC.
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 3-17
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 6 for action in Article 310.
This action will be considered by Code-Making Panel 6 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC to review Proposal 3-17, and action was taken on Comment 6-15. The panel requests the TCC to redirect this issue to CMP 7 or CMP 13 for consideration.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

3-6 Log #1666 NEC-P03 **Final Action: Reject**
(300.4)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-19
Recommendation: Delete or accept the proposal.
Substantiation: Although "likely" is a term to be avoided, it is used numerous times in the NEC. "Adequately" is also a term to be avoided without specific conditions. If the requirements of 90.4, 90.7, 110.2, and 110.3 already apply and are sufficient, this section is superfluous.
Panel Meeting Action: Reject
Panel Statement: The panel rejected the addition of the term "likely" at the proposal stage and stands by it's decision and substantiation. Deleting the entire phrase would be counterproductive since the phrase is the basic rule and subsequent parts describe how to accomplish this basic rule.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-7 Log #1395 NEC-P03 **Final Action: Reject**
(300.4(A) Exception No. 1)

Submitter: Russell LeBlanc, The Peterson School
Comment on Proposal No: 3-22
Recommendation: The proposal should be accepted but modified as follows:
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, (~~rigid non-metallic conduit~~) Schedule 80 PVC, RTRC Type-XW, *or electrical metallic tubing.*
Substantiation: 300.4(A)(1), 300.4(A)(2), 300.4(D), and 300.4(F) all require steel plates for protection of the wiring methods. This is because these wiring methods may be exposed to physical damage from nails and screws and such. If this were not true, then a plate would not be required. It seems logical to me that if the wiring method is an area that is exposed to physical damage then we must use a plate for protection or a wiring method that is identified for use in that area. Not all "rigid nonmetallic conduits" are identified for this. See U.L. info. I realized that in all of my original proposals that I missed 300.4(F) Exception No. 1, but maybe that section can also be modified so that all of sections coordinate the same requirements.
The following info is from the 2008 U.L. White Book
REINFORCED THERMOSETTING RESIN CONDUIT (DZKT)
XW-type reinforced thermosetting resin conduit is Listed for aboveground use and is suitable for use wherever IPS, ID, RTRC 40 and RTRC 80 conduit may be used. The marking "AG, XW, RTRC" identifies conduit suitable for use **where exposed to physical damage** in accordance with the NEC.
RIGID NONMETALLIC SCHEDULE 40 AND SCHEDULE 80 PVC CONDUIT (DZYR)
Schedule 80 conduit has a reduced cross-sectional area available for wiring space and is suitable for use wherever Schedule 40 conduit may be used. The marking "Schedule 80 PVC" identifies conduit suitable for use **where exposed to physical damage** and for installation on poles in accordance with the NEC.
Panel Meeting Action: Reject
Panel Statement: Although the addition of RTRC Type XW is new material, there was still no technical substantiation provided to justify the change from rigid nonmetallic conduit to Schedule 80 PVC conduit. The purpose of the steel plates is to protect certain wiring methods from screws and nails so any change to this exception must provide substantiation that regular nonmetallic raceways must have nail plates.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-8 Log #2085 NEC-P03 **Final Action: Reject**
(300.4(A)(1), 300.4(A)(2), 300.4(D), and 300.4(F) Exception No. 1)

Submitter: Jim Davis, Electrical Education Services, LLC
Comment on Proposal No: 3-25
Recommendation: Revise as follows:
Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, ~~rigid nonmetallic conduit,~~ or electrical metallic tubing.
Substantiation: The substantiation for this proposed deletion cites multiple ACTUAL occurrences of penetrations of raceway and contained conductors, which are presumed by the submitter to be "technical" in nature. In any event, it is respectfully requested that the panel consider this matter once again in light of the fact that the current edition of the NEC does not include PVC or EMT in the exception to 300.4(E) which is an installation environment that could present less of a hazard to the wiring method than that presented by notches or holes in studs.
Panel Meeting Action: Reject
Panel Statement: The purpose of the steel plates are to protect certain wiring methods from screws and nails so any change to this exception must provide substantiation that nonmetallic raceways must have nail plates.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-9 Log #1670 NEC-P03 **Final Action: Reject**
(300.4(A)(2) Exception No. 1)

3-12 Log #507 NEC-P03 **Final Action: Reject**

(300.4(G) (New))

Submitter: Richard E. Loyd, Sun Lakes, AZ

Comment on Proposal No: 3-41

Recommendation: Reconsider in CMP-3 and Accept Proposal 3-41.

Please consider this comment on its safety merits regardless of the panel it is assigned to.

Substantiation: Although the Technical Correlating Committee assigned this issue to CMP-9, I believe they did so incorrectly. 300.4 is "the protection of conductors". This is the issue we are concerned with and that exists in the field. CMP-9 failed to address the substantiation and safety aspects in the proposals and comments related. More importantly, it is a safety issue that can be avoided during the installation process by protecting these conductors that are typically exposed to physical damage during the construction of a building or structure. This damage often goes undetected during construction and failure occurs later when the building is occupied. By placing protection over the conductors and components until trim-out and wall finishes are completed, will minimize failure which may be in the form of a fire or shock to occupants.

Panel Meeting Action: Reject

Panel Statement: The NEC Technical Correlating Committee established a task group, between the 2008 NEC and the 2011 NEC code cycles, to study the issue of whether Code-Making Panel 1, Code-Making Panel 3, or Code-Making Panel 9 has jurisdiction over requirements for protective cover plates for boxes.

The task group determined that Code-Making Panel 9 would have jurisdiction over this issue since Code-Making Panel 9 specifically deals with conductors within the box, box and cover construction requirements, and common box as well as cover sizes. The NEC Technical Correlating Committee has assigned coverage of this issue to Panel 9 rather than Panel 3 so any action on this issue in Article 300 would be inappropriate.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

CASPARRO, P.: This comment should have been accepted. Although the TCC assigned this to CMP #9, 300.4 is the protection of conductors, which is the concern that the submitter has. There has been more than enough documentation presented to justify this code change.

3-13 Log #680 NEC-P03 **Final Action: Reject**

(300.4(G))

Submitter: Carlo Compagnone, Jr., Compa Covers, Inc.

Comment on Proposal No: 3-43

Recommendation: This proposal should be accepted.

Substantiation: As a Master electrician and having been involved in the electrical field for almost twenty (20) years, I am concerned about home-safety issues and the harm, liabilities and expenses inherent therein. In particular, many home fires arise from faulty premises wiring group equipment[1] resulting from damage to wiring within the electrical outlet box. For instance, according to statistics provided by the National Fire Protection Association ("NFPA"), in 2006, "an estimated 16,380 reported U.S. non-confined home structure fires involving premises wiring group equipment resulted in 145 civilian deaths [and] 458 civilian injuries...".

(Please see "Home Electrical Fires," John R. Hall, Jr., March 2009, National Fire Protection Association.)

According to the NFPA, "The two leading specific factors contributing to ignition were unclassified electrical failure or malfunction (33%) and unspecified short circuit arc (28%). These two leading factors lack details on the nature of the failure. **The leading factors contributing to ignition with details were short circuit arc from defective or worn insulation (12%), arc from faulty contact or broken conductor (6%),** short circuit arc from mechanical damage (4%), and equipment overloaded (3%)." (emphasis added) (See Id.)

The main purpose of the National Electrical Code ("NEC") is the safeguarding of persons and property, which in turn is a primary reason why the NFPA sponsors the code making process and publishes the NEC. According to the NFPA's March 2009 analysis on home electrical fires, "Two-fifths (38%) of the 2003-2006 reported non-confined home structure fires involving premises wiring group equipment involved unclassified or unknown-type wiring. Because such a large share of these fires and associated losses are unclassified or unknown-type, the numbers and percentages for every specific type of equipment are probably severely understated. Comparisons within a group are not a problem. **For example, note that the number of fires declines for wiring as one moves from inside the house along the wiring network toward the connections to the utility poles outside the house.**" (*emphasis added*) (Id.) According to this analysis, the majority of fires begin within the outlet box, which is the one area of premises wiring in which the NEC provides no specific guidelines. This is an issue that has been raised in at least the past two (2) Code cycles, and numerous proposals have been submitted in this cycle in an attempt to address the matter. Clearly, it is necessary for the NEC to provide a specific mandate to electricians, that when implemented, would serve as a safeguard against death, injury and the loss of property due to home electrical fires caused within the house along the wiring network.

Acceptance of Proposal 3-43 would be a definitive step towards this mandatory.

It is unclear why the NEC contains provisions for protecting the wiring at almost all points of vulnerability throughout the construction process, but excludes the wiring located within the electrical outlet box. In fact, the NEC's newest provision, Section 406.11, involves a requirement for tamper-resistant receptacles with a built-in shutter system at the outlet plug post-construction. While the NEC has added this provision, it blatantly fails to ensure the integrity of the wiring once it reaches the outlet box. What good is Section 406.11, if the wiring behind the receptacle is damaged? This is certainly a problem that must be addressed by the NEC with specificity which includes a mandator provision for protecting wiring within the electrical outlet box.

While there are broad provisions contained in the NEC for safeguarding all electrical equipment and connections from damage and contamination, these provisions are not specific enough. For instance, Section 110.12, which provides that the equipment must be installed in a "neat and workmanlike manner," and states that "there shall be no damaged parts that may adversely affect safe operation or mechanical strength of the equipment...". While it is a nice concept that electrical equipment be neat and workmanlike, this phrase is unenforceable, and ultimately meaningless. In addition, despite its use of the word "equipment," Section 110.12 is not broad enough to address the concerns raised in Proposal 3-43. Nowhere in Section 110.12 is there a reference to wiring or the protection of wiring within electrical outlet boxes during the construction phase. The section only refers to equipment, including, "busbars, wiring terminals, insulators, and other surfaces...". It is not enough to assume Section 110.12 requires the protection of wiring in electrical boxes, particularly given the alarming statistics provided by the NFPA.

The concept of providing specific solutions for the protection of wiring is not foreign to the NEC, which mandates prescriptive requirements upon all areas of the wiring, except for wiring within the electrical outlet box. For example, Article 300 provides for very detailed methods of safeguarding cables which

are subject to damage during the construction phase. Article 300.4 requires the installation of a nail plate where cable wiring is subject to nail or screw penetration. Article 300.4(B)(1) requires installation of bushings or grommets on all metal edges of punched out or factory-installed holes. If an electrician does not meet these Code requirements, wires are damaged and the inspection is deemed a failure.

Clearly, wiring is damaged during the construction process because wires sit exposed for months, while various tradesmen work, subjecting the wiring in the outlet boxes to damage from plaster, power routers, insulation and paint contamination. Drywall installers no longer cut box openings by marking the location and cutting away from the box. Conductors are damaged by pin routers, since the operator cannot see where the box is located and wires located near the edge of the box can be severely damaged. When spray foam is utilized and sprayed into a box, wiring inside the box may be corroded over time as a result of chemicals contained in the spray foam. When paint is sprayed, the paint covers the colored wiring, including the ground wiring, making it unclear which wire is which and requiring the electrician to make a cut into the paint-covered wire, potentially damaging it. Further, when the ground wiring is covered in paint, the grounding bond is lost, since the paint disrupts the copper wire. Faulty ground wires cause short circuits, sparks and arcs, all of which cause fire.

Since there is no mandate for protecting wiring within the electrical box, electricians may or may not chose to cover the boxes once they have completed their wiring. Given the NFPA's grim statistics, it does not appear that enough electricians are choosing to provide protection for the electrical outlet boxes during construction.

Wiring damaged during the construction process also poses a financial hardship upon electricians since they oftentimes have to remove numerous sheets of drywall to rewire to box if enough additional cable is not available outside the box. Much of the time, the electrician must scrape the spray foam out of the box, or try to remove the paint from covered wires. Wire left exposed, having been contaminated by paint, plaster, power routers or other materials, must be cleaned out or cut, and the requirements of Section 110.12 are not met, since the work is no longer "neat."

What is more, while the Code requires, in Section 300.14, that six (6) inches of "free-flowing" conductor be left in an electrical box, the Code provides no specific provisions requiring protection of this length of wiring. Unfortunately, when wiring is compromised during the construction process, it is nearly impossible for an electrician to comply with this provision of the Code, as they oftentimes must cut portions of the damaged six (6) inches out of the box.

Requiring a cover, which is reusable, is a simple and cost-effective manner of ensuring that wiring is protected once it reaches the electrical outlet box. In fact, it should cost less than $100 to cover electrical boxes in most new construction homes, and these covers will be re-useable, lessening the cost substantially. This is a small expense in comparison to an electrician returning to the construction site and fixing the damage which occurred while other tradesmen did their jobs. In addition, there would be no need for re-inspection, since covers would be placed in boxes upon completion of rough wiring. Thus, boxes would be covered at the time of rough inspection, similar to nail plates having to be on at the time of rough inspection, pursuant to provision 300.4. Given that the electrical boxes would be covered at the completion of rough wiring, the wiring inside the box would not get damaged during construction.

Moreover, and most importantly, Proposal 3-43 offers a specific solution to a significant issue at a minimal expense in comparison to death, injury and property damage. Simply stated, requiring covers in electrical boxes at the time of rough inspection ensures the integrity of the wiring, ensures uniformity in protection of the wiring within electrical boxes, and ensures safety within the premises and conformity and compliance with the provisions and purpose of the National Electrical Code.

I have also submitted this proposal to Code-Making Panel 9 for 314.17(E) or 314.26.

[1]As defined by the National Fire Protection Association, "premises wiring" refers to all installed wiring equipment between power source and outlet. "Premises wiring" includes all electrical distribution equipment except cords, plugs and light fixtures. (Please see "Home Electrical Fires," John R. Hall, Jr., March 2009, National Fire Protection Association.)

Explanation of Negative:

CASPARRO, P.: This comment should have been accepted. See 3-12.

3-14 Log #1090 NEC-P03 **Final Action: Accept in Principle**
(300.4(H))

Submitter: David H. Kendall, Thomas & Betts Corporation

Comment on Proposal No: 3-46

Recommendation: This proposal should have been Accepted.

Substantiation: Thomas & Betts, Cooper Couse Hinds and EGS Electrical (Appleton) offer LISTED Expansion/Deflection Fittings. UL has addressed their listing issues by publishing a Certification Requirement Decision (CRD) for standard UL514B, Conduit, Cable and Tubing Fittings (See Attached). This CRD includes specific performance requirements for the deflection characteristic of the expansion/deflection fittings.

Also attached is the Thomas & Betts instruction sheet and catalog cut for the T&B Listed Expansion/Deflection Fitting.

Proposal 3-46 identified a real safety issue that needs to be addressed by the Code. Raceways are damaged when improperly installed in structural construction joints leaving conductors or cables exposed. Structural construction joints will experience shear and lateral loads due to gravity, expansion and contraction and movement of the structure. The International Building Code, Section 1906, refers the user to the provisions of ACI 318 (American Concrete Institute). However, neither of these codes addresses the use of an expansion/deflection fitting or other approved means when electrical raceways cross the construction joint.

Section 300.7(B) addresses "thermal" expansion and contraction due to temperature. Section 300.7(B) does not address Structural Expansion Fittings found in buildings, bridges and other structures that are affected by other forces such as wind, loading and ground movement.

This new section will emphasize that a raceway can be damaged if improperly installed in a construction joint and will be a tool for the electrical inspector to ensure the proper installation of electrical raceways.

It is important to note that the proposal not only stated that listed expansion/deflection fittings were permitted to be used but the language in the new section allow for "other approved means".

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add new 300.4(H) to read as follows:

(H) Structural Joints. A listed expansion/deflection fitting or other approved means shall be used where a raceway crosses a structural joint intended for expansion, contraction or deflection, used in buildings, bridges, parking garages, or other structures.

Panel Statement: The changes in the suggested text were editorial in nature but necessary to ensure that the expansion and deflection fitting is installed at the point on the structure where the movement would occur in the raceway. Conduit and tubing were deleted since they are raceways.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-15 Log #1227 NEC-P03 **Final Action: Accept in Principle**
(300.4(H) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 3-46

Recommendation: This Proposal should be accepted to add a new section 300.4(H) Structural Construction Joints.

Substantiation: Several NEMA Members including Thomas & Betts, Cooper Couse Hinds and EGS Electrical (Appleton) offer LISTED Expansion/Deflection Fittings. UL has addressed their listing issues by publishing a Certification Requirement Decision (CRD) for standard UL514B, Conduit, Cable and Tubing Fittings (see attached). This CRD includes specific performance requirements for the deflection characteristic of the expansion/deflection fittings.

Proposal 3-46 identified a real safety issue that needs to be addressed by the Code. Raceways are damaged when improperly installed in structural construction joints leaving conductors or cables exposed. Structural construction joints will experience shear and lateral loads due to gravity, expansion and contraction and movement of the structure. The International Building Code, Section 1906, refers the user to the provisions of ACI 318 (American Concrete Institute). However, neither of these codes addresses the use of an expansion/deflection fitting or other approved means when electrical raceways cross the construction joint.

Section 300.7(B) addresses "thermal" expansion and contraction due to temperature. Section 300.7(B) does not address Structural Expansion Fittings found in buildings, bridges and other structures that are affected by other forces such as wind, loading and ground movement.

This new section will emphasize that a raceway can be damaged if improperly installed in a construction joint and will be a tool for the electrical inspector to ensure the proper installation of electrical raceways. Not only are there listed expansion/deflection fittings on the market but the language in the new section allow for "other approved means".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-16 Log #2879 NEC-P03 **Final Action: Reject**
(300.5(A))

Submitter: Paul J. Casparro, Scranton Electricians JATC
Comment on Proposal No: 3-50
Recommendation: This Proposal should have been accepted.
Direct-buried cables or conduit or other raceways shall be installed to meet the minimum cover requirements of Table 300.5 and have their location identified by a warning ribbon that is placed in the trench above the undergound installation.
Substantiation: Overcurrent protection is not the full proof answer for safety. Available fault currents are higher today than ever before because of the expanding equipment in facilities today. We can't assume the correct AIC ratings on fuses and circuit breakers is correct. The liability is too great to not provide warning ribbons in underground installations today.
Panel Meeting Action: Reject
Panel Statement: The panel understands that the intent of the submitter is to have a warning ribbon for direct-buried cables that do not have some form of protective covering such as concrete. However the addition of such a requirement would be impractical as it would not be inclusive for all installation practices such as directional boring.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
CASPARRO, P.: This comment should have been accepted. After a very lengthy Panel discussion, it was obvious that something has to be done, we just couldn't come to an agreement. The contractors on Panel #3 even agreed that this is becoming a major problem in our industry. Somehow we need to start fixing this problem.
WHISTLER, W.: There is a definite need to provide a warning ribbon to identify direct buried cables that are feeders or branch circuits as they are not typically identified by utility locating services and many of these circuits are installed on residential properties with an open trench not directional boring or vibratory plow. Without the warning ribbon there is a lack of indication to the homeowner that danger is just a shovel full away.
Comment on Affirmative:
STENE, S.: The submitter must provide technical substantiation to address the issues in the Panel Statement in the proposal. This issue has been discussed by the Panel for the past two Code cycles and none of the proposals or comments during these Code cycles have provided any data on the occurrence of accidents that would have been prevented if warning ribbon had been installed above all underground branch circuit and feeder installations. To warrant such a sweeping change in the installation of underground wiring, substantial data must be provided to warrant this change.

3-17 Log #574 NEC-P03 **Final Action: Accept**
(300.5(C))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 3-52
Recommendation: NEMA supports the panel action. MC Cable is suitable for direct burial and concrete encasement.
Substantiation: We support this panel action as a positive and logical improvement to the Code. MC Cable is available as a listed assembly suitable for direct burial and concrete encasement.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-18 Log #1669 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-55
Recommendation: Accept the proposal with the following revisions:
Direct-buried conductors, cables and raceways that are not encased in a minimum 50 mm (2 in.) cement concrete envelope or not installed under a minimum 102 mm (4 in.) cement concrete slab shall have their location indicated by a continuous warning ribbon identified for the purpose placed in the trench at least 300 mm (12 in.) above the conductors, cables, or raceways.
Exception No. 1: This provision shall not apply to:
(1) Rigid metallic conduit or intermediate metal conduit installed at a depth less than 450 mm (18 in.).
(2) Grounding electrode conductors or electrode bonding conductors.
(3) Conductors protected by ground-fault circuit interrupters.
(4) Conductors operating at less than 50 volts.
Substantiation: The panel comment that his provision does not apply to raceways is the reason for the proposal. Conductors other than service conductors can provide shock and explosion hazards, especially high MVA circuits such as on industrial premises. The purpose is presumably for safety, not to prevent interruption of power. Some conductors which do not present a safety hazard of shock or explosion should be exempted.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 3-16.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
STENE, S.: The purpose of 300.5(D) is to provide directly buried conductors and cables with protection and to have the directly buried service conductors and cables identified with a ribbon buried in the trench at least 12 inches above the cables. This entire subsection does not apply to raceways, only conductors and cables.

3-19 Log #2568 NEC-P03 **Final Action: Reject**
(300.5(D)(3))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-55
Recommendation: The proposal should be accepted in principle. In 300.5(D), delete the words "Direct-buried" from the beginning of the parent text in 300.5(D).
Substantiation: The rule requires service conductors buried at least 18 in. below grade to have their location identified with a warning ribbon in the trench. This presently applies to service conductors if not enclosed in a raceway, but as the original submitter of this concept (Proposal 4-89 and Comment 3-3 for the 1999 NEC cycle), it was always intended to apply whether or not a raceway protected the conductors, unless concrete encasement was applied to the raceway. The original submittal was in Article 230, where this sort of confusion could not have happened. In fact, it did apply generally in that code cycle because it was a simple paragraph in a section entitled "Protection from Damage." Direct buried conductors are not encased in concrete, and this rule makes no sense unless the direct-burial criterion is removed. The burial depth limitation of 18 inches was chosen by this submitter exactly because that is the minimum cover depth of rigid nonmetallic conduit used in service applications, and the intent was for this to apply to these raceways.
In the 2002 cycle, the section was editorially reorganized with numbered paragraphs under what became parent language in 300.5, using a direct-burial criterion. This introduced the inadvertent error that now remains and is just coming to light. In addition, Paragraph 300.5(D)(4) is also now in direct conflict with the parent language of 300.5(D), because it squarely addresses raceways where subject to physical damage. A review of each provision under 300.5(D) shows that none of those provisions depend on the words "direct-buried" in the parent text, and work well without them. This provision is routinely applied in accordance with the original intent and this inadvertent editorial mistake should be corrected.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement in Comment 3-16.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
STENE, S.: While the Panel agrees that there is an issue with 300.5(D)(4), none of the proposals in this section for the 2011 NEC dealt with removing the words "direct buried" from the parent text. This proposed deletion would totally change the installation requirements for direct buried cables and would constitute new material that has not had public review.

3-20 Log #2759 NEC-P03 **Final Action: Accept**
(300.5(D)(3))

Submitter: James J. Rogers, Bay State Inspectional Agency
Comment on Proposal No: 3-56
Recommendation: Continue to reject.
Substantiation: The task group agrees with the panel action on this proposal, in addition the concerns of the submitter were addressed by CMP 4 actions during actions on proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-21 Log #1490 NEC-P03 **Final Action: Reject**
(300.5(G) and 300.50(E))

Submitter: Timothy M. Croushore, Allegheny Power
Comment on Proposal No: 3-59
Recommendation: Please reconsider this proposal. Please revise 300.5 (G) to read identically as 300.50 (E) and remove the FPN after 300.5 (G)

300.5 (G) Raceway Seal. Where a raceway enters from an underground system, the end within the building shall be sealed with an identified compound so as to prevent the entrance of moisture or gases, or it shall be so arranged to prevent moisture from contacting live parts.

Substantiation: This comment requests a change in 300.5(G) to provide consistency of the requirements for the raceway seals in both 300.5(G) and 300.50(E) regardless of the voltage of the cable or conductor within the raceway.

If there is a need to have two different raceway seal requirements as currently required in the Code, could the technical committee (CMP-3) explain how the voltage of the cable or conductors necessitates this need?

If the 300.5(G) FPN is desired to be kept, does the "*Presence of hazardous gasses or vapors*" text of the FPN refer to a hazardous (classified), Class I location?
Panel Meeting Action: Reject
Panel Statement: This requirement would mandate the sealing of every raceway meeting these criteria, even in locations where this is not necessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

BURLISON, S.: I agree with the submitter and the intent of the comment. The submitter was not attempting to add or change the requirements only clarify the existing ones. The panel refused to acknowledge the sealing requirements in 300.5(G) and 300.50(E) are different for no apparent reason. If there are reasons for the different requirements, the panel failed to clarify the technical reasons for the difference in sealing requirements for conduits containing high and low voltage conductors.

3-22 Log #1984 NEC-P03 **Final Action: Accept in Principle**
(300.6(A))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 3-64
Recommendation: This proposal should be accepted.
Substantiation: I don't think I made my original proposal completely clear. When the electrician purchases a "factory made" elbow or a "factory cut" nipple, the threads of these items do not always have corrosion protection on the threads like the full lengths of made conduit do. Because these unprotected threads are not field cut the current code rule does not require the installer to apply a corrosion protection compound. These threads have the same corrosion issues as a field cut thread and need field applied protection. My proposal will require than any unprotected threads installed in areas where corrosion protection is required to have field applied corrosion protection.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:

(A) Ferrous Metal Equipment. Ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, nipples, fittings, supports, and support hardware shall be suitably protected against corrosion inside and outside (except threads at joints) by a coating of approved corrosion-resistant material. Where corrosion protection is necessary and ~~the conduit is threaded in the field~~, where threads do not have corrosion protection, the threads shall be coated with an approved electrically conductive, corrosion-resistant compound.

Panel Statement: The text was modified to more accurately meet the intent of the submitter.
Number Eligible to Vote: 14

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 3-65
Recommendation: Reject the proposal.
Substantiation: Cables have a 100 percent conductor fill which is a natural block for the transmission of condensation. No substantiation was provided to indicate that condensation inside a cable has been a problem. NEMA agrees with the negative comment submitted by Mr. Owen.
Panel Meeting Action: Reject
Panel Statement: See the recommendation and substantiation on Comment 3-24a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-24 Log #2124 NEC-P03 **Final Action: Hold**
(300.7 Exception)

Submitter: Patrick G. Salas, General Electric Company
Comment on Proposal No: 3-65
Recommendation: Add wording to end of 300.7:

Exception: Sealing is not required for busway.

Substantiation: The proposed change will make this requirement applicable to busway. The problems encountered with cable in conduit passing from one temperature to another have not been experienced in busway installations. This is largely due to the fact that while the housing of a conduit is generally intact over the course of its run, busway will have openings minimally at each joint which permit the egress of condensation.

Some busway designs, especially "sandwich style" busway, has very little internal airspace between the housing and the conductors or between the conductors themselves. Airflow through busway is very restrictive as a result.

The present design of busway joints may not lend themselves to the application of sealing meathods such as those used for cable in conduit installations. There is a concern it may not be possible to apply a sealant without the sealant coming in contact with bare conductor, and could compromise the insulation integrity. There has been no testing performed to assure the suitability commercially available sealants applied to internally seal busway and this could jeopardize UL listing of the busway.
Panel Meeting Action: Hold
Panel Statement: Adding an exception to exclude busways constitutes new material that has not had public review.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

STENE, S.: "Cable raceway" is not a wiring method found in Chapter 3. Rejecting the proposal does not fix the problem. The comma was inserted between "cable" and "raceway in the 2002 NEC but was subsequently left off in the 2005 and 2008 NEC and should have been corrected as errata.

3-24a Log #CC300 NEC-P03 **Final Action: Accept**
(300.7(A))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 3-65
Recommendation: Revise 300.7(A) to read as follows:

300.7 Raceways Exposed to Different Temperatures.

(A) Sealing. Where portions of a raceway or sleeve are known to be subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building, the raceway or sleeve shall be filled with an approved material to prevent the circulation of warm air to a colder section of the raceway or sleeve. An explosionproof seal shall not be required for this purpose.

Substantiation: "Cable raceway" is not a wiring method found in Chapter 3. Deleting the word "cable" fixes the problem that was editorially introduced during the comment stage in 2002 when the text was originally inserted into the NEC. The comma was subsequently left off in the 2005 and 2008 NEC and should have been corrected as errata. Also there was no technical substantiation that condensation in cables is a problem.

3-25 Log #339 NEC-P03 **Final Action: Accept**
(300.7(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-66
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

Submitter: T David Mills, T. David Mills Associates
Comment on Proposal No: 3-72
Recommendation: The Panel should accept this proposal.
Substantiation: The panel statement that this "information is valuable for the user of the code, and the user should not have to go back to an annex for this information" implies that the user in the field actually has access to the referenced testing standards. While this may be true for most FPN's, it does not apply in the case where the FPN only references another standard, which would require the acquisition of the referenced standard anyway. For a user to refer to an annex for testing information does not impede field installation practices. Annex I would only be used for referenced standards, not other FPN information.
The number of fine print notes (FPNs) solely to reference other documents has continued to grow significantly and many are repeated verbatim in several different sections of the Code. This undesirable and user unfriendly situation can be alleviated by forming an informative annex that can be referenced by multiple FPNs without repeating duplicate paragraphs of words.
Panel Meeting Action: Reject
Panel Statement: There has been no technical reason submitted for creating an additional annex for reference information other than Annex A. Putting this information into an annex in the back will tend to make the Code less user friendly and make it more difficult for the user to access the information in a timely fashion.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-28 Log #9 NEC-P03 **Final Action: Reject**
(300.17, FPN)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 3-84
Recommendation: Accept this proposal.
Substantiation: The panel statement about composite optical fiber cables containing current-carrying conductors is correct. However, the panel ignored 770.3(A) which states:
(A) Composite Cables. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed, and marked in accordance with the appropriate article for each type of electrical cable.
Referring to Article 770 can be confusing since 770.3(A) refers the user to the appropriate article for the electrical cable.
Panel Meeting Action: Reject
Panel Statement: The purpose of 300.17 and the Fine Print Note is to refer to requirements and information dealing with the number and size of conductors in a raceway. The reference to Article 770 is necessary since fiber optic cables can be installed with power, lighting, and control conductors and will affect the dissipation of heat and the ready installation or withdrawal of conductors without damaging any of the conductors.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-29 Log #1668 NEC-P03 **Final Action: Reject**
(300.20(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 3-88
Recommendation: Delete or revise the proposal:
Where conductors of alternating current circuits are installed in ferrous metal raceways or other enclosures, or contained in ferrous metal-covered cables, they shall be arranged and connected to avoid heating the surrounding ferrous metal by induction.
Substantiation: "Cables" is proposed since factory installed conductors in cables cannot prevent a violation of this section. For example, three Type MC cables with three 1/0 AWG conductors in each cable; the conductors in each cable can be paralleled for one phase, and each cable connected to a different phase. This is a violation of 300.3(B)(1), but this provision doesn't specifically prevent such an arrangement. Since 300.3 applies, this provision can be deleted. The panel example makes assumptions that do not always apply.
Panel Meeting Action: Reject
Panel Statement: Section 300.20(A) applies to conductors within a ferrous metal enclosure or ferrous metal raceway since the conductors can be field installed in these raceways and enclosures. Conductors cannot be field installed in ferrous AC or MC cables so grouping of conductors within the ferrous metal covered cable would not be possible.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-30 Log #2389 NEC-P03 **Final Action: Reject**
(300.20(B))

Submitter: James S. Conrad, Tyco Thermal Controls
Comment on Proposal No: 3-90
Recommendation: This proposal should be accepted: **300.20 Induced Currents in Ferrous Metal Enclosures or Ferrous Metal Raceways**
(B) Individual Conductors. Where a single conductor carrying alternating current, that exceeds 200 amps. per conductor, passes through metal with magnetic properties, the inductive effect shall be minimized by (1) cutting slots in the metal between the individual holes through which the individual conductors pass or (2) passing all the conductors in the circuit through an insulating wall sufficiently large for all of the conductors of the circuit.
Substantiation: Section 300.20 Induced Currents in Ferrous Metal Enclosures or Ferrous Metal Raceways (B) Individual Conductors.
A typical situation of single conductor cables entering a metal (ferrous) enclosure would be single conductor MI cables used to supply power for a fire pump (Article 695) or emergency feeders (Article 700). The reason for cutting slots in the enclosure or passing the cable through a non-ferrous plate is to minimize the heating effects on the piece of equipment the cables are entering, thereby preventing the temperature of the piece of equipment from exceeding its listed rating.
We have been involved in engineering and sales of MI cables systems for over 35 years and have closely monitored the installation of hundreds of these systems. The temperature rise for systems where sinble conductor mineral insulated (MI) cables carrying a current under 200 Amps has been insignificant and we have not seem any equipment failure.
I have provided a photograph showing the surface temperature of a 200 ampere 208V, 3-phase, 4-wire ferrous metal enclosure at the point where four MI cables enter the top of the enclosure. As you can see,the enclosure temperature is under 20°C (70°F).
Based on years of successful installation, the CEC allowance of cables up to 200 amp without concern of over heating, I am asking the panel to reconsider and accept this comment.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter still has not provided technical substantiation to justify setting a 200-ampere minimum current threshold as requested by the panel statement in the proposal. Providing a Fact Finding Study covering the various types of individual conductors with a thorough study of induced current would provide the technical substantiation for the acceptable level of induced current. A single photograph showing a single application is not sufficient technical substantiation to justify the suggested change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-31 Log #1396 NEC-P03 **Final Action: Reject**
(300.21)

Submitter: Russell LeBlanc, The Peterson School
Comment on Proposal No: 3-91
Recommendation: The proposal should be accepted in principal but modified as follows:

If a conduit or raceway of metric designator 53 (trade size 2 inch) or larger, penetrates a fire-resistance-rated wall, partition, floor, or ceiling, and that same conduit or raceway also enters an enclosure of the ventilated type, that conduit or raceway shall be sealed or plugged with an approved fire stopping material at the point of entrance to the enclosure to prevent fire, smoke, or other products of combustion from passing through the raceway or conduit into other areas of the building or structure.

Substantiation: I have modified the wording for clarity and so the application is more focused, and less of a "sweeping" change.

In my original proposal I provided a first hand eyewitness account of what happened.

This was NOT a second hand or third hand story. I saw it happen with my own eyes! I am not a novice. I have been in the trade for over 25 years. I have also been teaching electrician classes for over 10 years. I am OSHA certified. I am an instructor approved by the Mass. Dept. of Education, and The Board of Examiners of Electricians. I have authored several other code changes. I am a member of NFPA. No, I am not a Fire chief or fire science engineer, or some other Fire Dept. Official. But I know what I saw, and it just did NOT seem right to me. I am very concerned. The smoke simply should NOT have been able to spread through the building via the raceways. What more technical substantiation is needed than that?

Lets break it down to simple science and logic.

If I build a fire in a fireplace, the smoke will go up the chimney flue, if the flue damper is OPEN.

If I build a fire in a fireplace, the smoke will NOT go up the chimney flue, if the flue damper is CLOSED!

Try it!

Apply logic here.

If I am wrong then maybe we don't need to seal the raceway ends. But this "chimney effect" of the unsealed pipes has already happened once. I have seen it. If it happens again, the occupants may not be as lucky as the first time I saw this phenomenon happen.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter still has not provided any technical substantiation for the recommended additional text. The suggested text could apply to most switchboards, large panels, transformers, and other metal electrical equipment without proper substantiation of the location of the equipment and the possible air circulation into other areas of the building. The suggested text does not clarify the various building construction that might require the sealing of raceways, for example where a switchboard is installed in a concrete electrical room with 2 inch and larger raceways extending out of that room, the text would seem to require all 2 inch or larger raceways to be sealed even where installed under ground into other parts of the building.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-32 Log #1344 NEC-P03 **Final Action: Reject**
(300.22)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Comment on Proposal No: 3-94
Recommendation: 300.22 Wiring in Unexposed Spaces ~~Ducts Not for Air-Handling, Fabricated Ducts for Environmental Air, and Other Spaces or Environmental Air (Plenums)~~. The provisions of this section shall apply to the installation and uses of electrical wiring and equipment in the following spaces: (a) ducts used for dust, loose stock, or vapor removal; (b) ducts specifically fabricated for environmental air; (c) ~~and~~ other spaces used for environmental air (plenums) and (d) air-handling areas beneath raised floors for information technology equipment .

Exception. *The provisions of this section shall not apply to the installation and uses of electrical wiring or equipment in risers, cable trays, manholes, hoistways or any other unexposed spaces not specifically mentioned.*

(***Note: No changes proposed to the remainder of section 300.22.)***

Substantiation: This comment addresses two issues:

(1) it eliminates a laundry list in the section title, and

(2) it addresses all spaces covered by the section. The exception clarifies the application of this section for four specific applications (risers, cable trays, manholes and hoistways) that are covered in the articles which also address wiring in ducts and plenums.

Panel Meeting Action: Reject
Panel Statement: In the proposed title change, there isn't a definition provided for "unexposed spaces." Air-handling areas beneath raised floors for information technology equipment rooms are already covered in existing 300.22(D). The suggested exception seems to be addressing a wiring method covered in Article 392 that does not involve fabricated ducts or other spaces for environmental air (plenums), manholes that are not involved in fabricated air-handling ducts or other spaces used for environmental air (plenums) so the exception was not pertinent to the requirements in 300.22.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-33 Log #2569 NEC-P03 **Final Action: Reject**
(300.22)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-94
Recommendation: Accept the proposal as amended by CMP 3 in principle. In Informational Note No. 2, insert the following as a second sentence:

"The terminology includes, but is not limited to, ceiling cavity plenums and raised floor plenums as used in NFPA 90A."

Substantiation: CMP 3 and the proposal submitters are to be commended for handling a difficult assignment about as well as possible. The terms "ceiling cavity plenum" and "raised floor plenum" are widely used in the field, and according to the proposal substantiation, in the NFPA 90A document as well. The "ceiling cavity plenum" is about to enter Article 645 as well (Proposal 12-122). Therefore there will be no loss of accuracy in including a mention of these words. Adding these references, one after another as synonymous items, will provide a much better point of departure and basis for understanding for the generations of electricians who have been well trained to never use the unmodified word "plenum" to refer to a 300.22(C) space. I have found during extensive training events that if I use, for example, the words "ceiling cavity plenum" both the building officials and the electricians present immediately visualize the same location, whereas a reference to the unmodified word "plenum" leaves the different disciplines on different pages entirely. This is merely an informational note, and as such its wording should be such as to maximize its educational effect.
Panel Meeting Action: Reject
Panel Statement: The accepted text in FPN No. 2 in 300.22(C) in the proposal provides the informational material reference to NFPA 90A, Standard for the Installation of Air-Conditioning and Ventilating Systems, for plenum and other air handling spaces that are covered by "Other Spaces Used for Environmental Air (Plenums)" without starting a list or referencing specific sections within NFPA 90A Standard for the Installation of Air-Conditioning and Ventilating Systems. If the area is not specifically fabricated for air handling then the area is an "other space used for environmental air (plenum)".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-34 Log #483 NEC-P03 **Final Action: Reject**
(300.22, FPN)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 3-94
Recommendation: Accept proposal 3-94 in principle by adding an informational note immediately following 300.22(B) as shown below:
Informational Note: For information on fire protection of wiring installed in fabricated ducts and plenums see sections 4.3.4.1 (air ducts) and 4.3.11.3.3 (apparatus casings plenums) in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*
Substantiation: The table below shows how section 300.22 in the 2008 NEC tracks the latest (2009) edition of NFPA 90A.

2008 NEC Section	2009 NFPA 90A Section	NFPA 90A Terminology
300.22(B)	4.3.4	Air ducts
300.22(B)	4.3.11.3.3	Apparatus casing plenum
300.22(C)	4.3.11.2	Ceiling cavity plenum
300.22(C)	4.3.11.4	Air-handling unit room plenum
300.22(C)	4.3.11.5	Raised floor plenum

NFPA 90A-2009 has two sets of requirements for wiring in air handling spaces. It greatly restricts the wiring permitted in air ducts and apparatus casing plenums, permitting only limited lengths of cable that is associated with the function of the air handling system. On the other hand, NFPA 90A-2009 permits unlimited amounts of plenum cable in ceiling cavity plenums, raised floor plenums and air-handling unit room plenums.

A new informational note is recommended for 300.22(B) to inform the reader of the correlating sections of NFPA 90A.

Correlating NFPA 90A and NEC section 300.22(B) is a concept that has had public review. See proposals 3-93 and 3-94. Also see panel sixteen's actions on proposals 16-48 (770.113(B) FPN), 16-160 (800.113(B) FPN), 16-267 (820.113(B) FPN) and 16-331(830.113(B) FPN) which introduced a similar informational note (FPN).

Panel Meeting Action: Reject

Panel Statement: See the panel statement in Comment 3-33.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-35 Log #482 NEC-P03 **Final Action: Reject**

(300.22(B))

Submitter: Stanley Kaufman, CableSafe Inc.

Comment on Proposal No: 3-94

Recommendation: Accept proposal 3-94 in principle by leaving the text of 300.22(B), except for the title, unchanged from the text in the 2008 Code and changing the title from:

(B) Ducts or Plenums Used for Environmental Air. [Text in the 2008 NEC.]

Or

(B) Ducts Specifically Fabricated for Environmental Air. [CMP 3 action on proposal 3-94]

TO:

(B) Ducts or Plenums Specifically Fabricated for Environmental Air.

Substantiation: The panel action on section 300.22(B) eliminated fabricated plenums from the section and thereby reduced the correlation between 300.22 and NFPA 90A. This comment would restore fabricated plenums to 300.22(B) by reverting to the language in the current (2008) Code and only recommends an editorial change in the title of 300.22(B).

The table below shows how section 300.22 in the 2008 NEC tracks the latest (2009) edition of NFPA 90A.

2008 NEC Section	2009 NFPA 90A Section	NFPA 90A Terminology
300.22(B)	4.3.4	Air ducts
300.22(B)	4.3.11.3.3	Apparatus casing plenum
300.22(C)	4.3.11.2	Ceiling cavity plenum
300.22(C)	4.3.11.4	Air-handling unit room plenum
300.22(C)	4.3.11.5	Raised floor plenum

NFPA 90A-2009 has two sets of requirements for wiring in air handling spaces. It greatly restricts the wiring permitted in air ducts and apparatus casing plenums, permitting only limited lengths of cable that is associated with the function of the air handling system. On the other hand, NFPA 90A-2009 permits unlimited amounts of plenum cable in ceiling cavity plenums, raised floor plenums and air-handling unit room plenums.

The current requirements for wiring in fabricated ducts in section 300.22 correlates with the NFPA 90A requirements for air ducts. Likewise, the current requirements for wiring in fabricated plenums in section 300.22(B) correlates with the NFPA 90A requirements for wiring in apparatus casing plenums.

Acceptance of this comment will restore the correlation in the requirements for wiring in apparatus casing plenums, a type of fabricated plenum.

Panel Meeting Action: Reject

Panel Statement: The definition of "plenum," as found in NFPA 90A and Article 100 in the NEC, is not specific to fabricated or other spaces used for environmental air (plenum). A fabricated return air duct is very specific and obviously covered by 300.22(B). A fabricated return air duct can be connected through the building to an "other space used for environmental air (plenum)," such as the space above a drop ceiling or a raised floor. The intent of the proposal text is to provide the definite line of demarcation between a fabricated duct and all others that are not specifically fabricated for that use but are used for air handling.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-36 Log #484 NEC-P03 **Final Action: Reject**

(300.22(C), FPN)

Submitter: Stanley Kaufman, CableSafe Inc.

Comment on Proposal No: 3-94

Recommendation: Accept proposal 3-94 in principle by revising the Informational Notes to 300.22(C) as shown below:

Informational Note No. 1: The spaces over a hung ceiling and below a raised floor used for environmental air-handling purposes are ~~is an~~ examples of the types of other space to which this section applies.

~~Informational Note No. 2: The phrase "Other space used for environmental air (plenum) used in this section correlates with the use of the terms "plenum" in NFPA 90A, the Standard for the Installation of Air-Conditioning and Ventilating Systems, 2009, and other mechanical codes where the plenum is used for return air purposes, as well as some other air-handling spaces.~~

Informational Note No. 2: For information on fire protection of wiring installed in other spaces used for environmental air see sections 4.3.11.2 (ceiling cavity plenum), 4.3.11.4 (air-handling unit room plenum) and 4.3.11.5 (raised floor plenum) of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilation Systems.*

Substantiation: The table below shows how section 300.22 in the 2008 NEC tracks the latest (2009) edition of NFPA 90A.

2008 NEC Section	2009 NFPA 90A Section	NFPA 90A Terminology
300.22(B)	4.3.4	Air ducts
300.22(B)	4.3.11.3.3	Apparatus casing plenum
300.22(C)	4.3.11.2	Ceiling cavity plenum
300.22(C)	4.3.11.4	Air-handling unit room plenum
300.22(C)	4.3.11.5	Raised floor plenum

NFPA 90A-2009 has two sets of requirements for wiring in air handling spaces. It greatly restricts the wiring permitted in air ducts and apparatus casing plenums, permitting only limited lengths of cable that is associated with the function of the air handling system. On the other hand, NFPA 90A-2009 permits unlimited amounts of plenum cable in ceiling cavity plenums, raised floor plenums and air-handling unit room plenums.

The panel action on proposal 3-94 correlates with NFPA 90A-2009 for air ducts, ceiling cavity plenums and raised floor plenums, and omits apparatus casing plenums and air-handling unit room plenums. The purpose of this comment is to specifically mention raised floor plenums and air-handling unit room plenums in the informational notes to 300.22(C).

Correlating NFPA 90A and NEC section 300.22(C) is a concept that has had public review. See proposals 3-93 and 3-94. Also see panel sixteen's actions on proposals 16-48 (770.113(C) FPN), 16-160 (800.113(C) FPN), 16-267 (820.113(C) FPN) and 16-331(830.113(C) FPN) which introduced an informational note (FPN) similar to the recommended text for informational Note No. 2.

Panel Meeting Action: Reject

Panel Statement: See the panel statement in Comment 3-33.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

3-37 Log #1343 NEC-P03 **Final Action: Reject**

(300.22(C), FPN 2)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Comment on Proposal No: 3-94

Recommendation: FPN No. 2: The phrase "other spaces used for environmental air (plenums)" used in this section is intended to have the same meaning as ~~correlates with the use of~~ the term "plenums" used in NFPA 90A, the *Standard for the Installation of Air-Conditioning and Ventilating Systems*, 2009, and in other building or mechanical codes. It refers to plenums ~~where the plenum is~~ used for return air purposes, as well as to some other air-handling spaces.

(***Note: No changes proposed to the remainder of section 300.22).***

Substantiation: This comment resolves the problem of an FPN that addresses a term not used in the singular and points out also that the term "plenums" is used in building codes as well as in mechanical codes (both NFPA 5000 and IBC). Furthermore, the new last sentence includes some editorial clarification.

It is understood by the commenter that the Technical Correlating Committee changed the designation of "FPN" to "Informational Note".

Panel Meeting Action: Reject

Panel Statement: The definition of "plenum" is essentially the same in NFPA 90A and Article 100 of the NEC so the suggested changes to FPN No. 2 are unnecessary. See the panel statement in Comment 3-35.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

(300.22(C)(2))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 3-97
Recommendation: Revise text to read as follows:
(2) Cable Tray. The provisions of this section apply to the use of metallic cable tray systems in such spaces as a supporting method.
(a) Metal Cable Tray Systems. Metal cable tray systems shall be permitted to support the methods in 300.22(C)(1).
(b) Solid Bottom Metal Cable Tray. Solid bottom metal cable trays systems with solid metal covers shall be permitted where accessible to enclose wiring methods and cables in accordance with 392.3(A) and (B).
Renumber the remainder of the section accordingly.
Substantiation: This suggested language does not change the panel's intent and is consistent with 300.22(C)(1). The text is reworded to clarify that open cable tray shall only be permitted to support those methods permitted in 300.22(C)(1), and that solid bottom with solid covers can support any system allowed in Article 392.
Panel Meeting Action: Accept in Principle
Change the proposed text in the panel meeting action in the proposal and this comment as follows:
(2) Cable Tray Systems. The provisions in (a) or (b) apply to the use of metallic cable tray systems in other spaces used for environmental air (plenums), where accessible, as follows:
(a) Metal Cable Tray Systems. Metal cable tray systems shall be permitted to support the wiring methods in 300.22(C)(1).
(b) Solid Side and Bottom Metal Cable Tray Systems. Solid side and bottom metal cable tray systems with solid metal covers shall be permitted to enclose wiring methods and cables, not already covered in 300.22(C)(1), in accordance with 392.3(A) and (B).
Panel Statement: The changes to the comment are editorial in nature and provide more specific text to clarify the intent of cable tray installation in an "other space used for environmental air (plenum)."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-39 Log #1203 NEC-P03 **Final Action: Accept in Principle**
(300.22(C)(2))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 3-97
Recommendation: This Proposal should continue to be an Accept in Principle with the following revision to the Panel Action.
(2) Cable Tray in Other Spaces Used for Environmental Air (Plenums). The provisions of this section apply to the use of metallic cable tray systems in other spaces used for environmental air (plenums).
(a) Metal Cable Tray Systems. Metal cable tray systems shall be permitted in other spaces used for environmental air (plenums) to support wiring methods, cable and raceway types permitted in other spaces used for environmental air (plenums).
(b) Solid Bottom Metal Cable Tray. Solid bottom metal cable trays systems with solid metal covers shall be permitted where accessible to enclose other types of cables, conductors, and raceways not specifically permitted to be installed exposed in other spaces used for environmental air (plenums).
Substantiation: Nonmetallic Plenum Optical Fiber Raceways found in Articles 725, 770, 800 and 820 are permitted to be installed in Other Spaces Used for Environmental Air (Plenums). Raceways should be included along with the cable types permitted in other spaces used for environmental air (plenums).
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement in Comment 3-38 that accomplishes the submitter's purpose.

Ballot Results: Affirmative: 14

3-40 Log #2346 NEC-P03 **Final Action: Accept in Part**
(300.22(C)(2))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 3-97
Recommendation: Remove the double period at the end of the title, and include mandatory text in the requirement, as follows:
(2) Cable Tray in Other Spaces Used for Environmental Air (Plenums). The provisions of this section apply to the use of metallic cable tray systems in other spaces used for environmental air (plenums).
(a) *Metal Cable Tray Systems.* Only ~~M~~metal cable tray systems shall be permitted in other spaces used for environmental air (plenums) to support wiring methods and cable types permitted in other spaces used for environmental air (plenums).
(b) *Solid Bottom Metal Cable Tray.* Only ~~S~~solid bottom metal cable trays systems with solid metal covers shall be permitted where accessible to enclose other types of cables, conductors, and raceways not specifically permitted to be installed exposed in other spaces used for environmental air (plenums).
Substantiation: As currently accepted, the provisions for cable trays contain no mandatory text. By adding the word "only" in two locations, the permissive language becomes mandatory.
Editorially, there seems to be an extra period at the end of the title in the ROP draft.
Panel Meeting Action: Accept in Part
Accept the deletion of the double period and reject the remainder of the comment.
Panel Statement: Inserting the word "only" would only permit cable trays to support these wiring methods, whereas any of these wiring methods could be supported using the appropriate support methods in the.30 section of each Chapter 3 wiring method permitted in an "other space used for environmental air (plenum)."
Number Eligible to Vote: 14

(Table 300.50, Note 3)

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG - Association of Education Facility Executives
Comment on Proposal No: 3-103
Recommendation: Accept the proposal as written.
3. In industrial establishments, **or campus style facility complexes within a single, contiguous boundary under a single management**, where the conditions of maintenance and supervision ensure that qualified persons shall service the installation, the minimum cover requirements for other than rigid metal conduit, shall be permitted to be reduced 150 mm (6 in.) for each 50 mm (2 in.) of concrete or equivalent placed entirely within the trench over the underground installation.
Substantiation: The submitter has provided adequate substantiation to at least restore the expanded applicability criterion of Table 300.50 Note 3 back to where it was in the 2002 NEC code cycle when it was permitted as an exception. Somewhere in the mix of things (3-101 Log #7 NEC-P03 of the May 2004 ROP) the tradeoff of depth for concrete covering was dropped. It is hard to follow those arguments, counter-arguments, and unsubstantiated claims of lack of substantiation.
In any case, many APPA institutions have congested underground infrastructure (district heating piping tunnels, electric and telecommunication duct banks, water and sewer piping, etc.) where some flexibility in dimensional requirements ought to be permitted -- as it was before the 2005 NEC. It is common for underground duct construction to reveal unforeseen conditions which can be remedied by restoring Note 3, and expanding it to include the campus style facility arrangements. The exemption works for us because of the quality of the management and the standard of care and training common in high voltage workgroups in US colleges and universities, as the submitter asserts.
For the enlightenment of the panel, the NFPA 101 definition of "Industrial Occupancy" is reproduced as shown below:
3.3.178.8* Industrial Occupancy. An occupancy in which products are manufactured or in which processing, assembling, mixing, packaging, finishing, decorating, or repair operations are conducted.
A fair argument could be made that the word "industrial" is much less appropriate in Note 3 than campus style facility arrangements.
Panel Meeting Action: Reject
Panel Statement: The phrase "campus-style facility complexes" is vague and could be interpreted far beyond the submitter's example without proper technical substantiation. As far as the original proposal is concerned, the term "institutional" is vague and could be interpreted far beyond the submitter's example of a university. As the submitter pointed out, if the AHJ accepts a lesser burial depth for high voltage cables in occupancies other than an industrial location, where public access is usually limited, then the AHJ can use 90.4.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-43 Log #2570 NEC-P03 **Final Action: Reject**
(Table 300.50 Note 3)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 3-103
Recommendation: The proposal should be accepted.
Substantiation: If the note were written in such a way that the greater public access in and the somewhat less precise definition of institutional settings would make a significant difference, then the panel objection would be justified. However, the entirety of the note makes it clear that there must be qualified maintenance and supervision. Any inspectional authority applying this note is therefore required to make that assessment prior to allowing this use. Remember also, this only allows for medium voltage installations to use somewhat reduced burial depths in exchange for more robust underground concrete protection. No vagrant is going to be able to casually dig up one of these installations.

It is very poor code to send inspectors into 90.4 unless the circumstance is so unique that the NEC does not address the issue. These circumstances are anything but unique. And again, a review of NFPA records does not show a single public proposal to limit this provision over the 36 years that it had been in the NEC without any qualification whatsoever. The action in Massachusetts is not an application of 90.4; it is a formal amendment state-wide to the NEC arrived at through a public regulatory process that avoids any necessity for municipal inspectors to apply 90.4 to these installations.
Panel Meeting Action: Reject
Panel Statement: As far as the original proposal is concerned, the term "institutional" is vague and could be interpreted far beyond the submitter's example of a university. As the submitter pointed out, if the AHJ accepts a lesser burial depth for high voltage cables in occupancies other than an industrial location, where public access is usually limited, then the AHJ can use 90.4.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

3-44 Log #2140 NEC-P03 **Final Action: Hold**
(300.50(B))

Submitter: Thomas Guida, TJG Services, Inc. / Rep. Champion Fiberglass, Inc.
Comment on Proposal No: 3-106
Recommendation: Accept the Panel Action with the additional revision to 300.5(D)(4) as shown:

300.5(D)(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, RTRC-XW, Schedule 80 PVC conduit, or equivalent.
Substantiation: The revision to 300.5(D)(4) was intended in the text of the original proposal although not specifically mentioned in the proposal as noted in the Panel Statement.
Panel Meeting Action: Hold
Panel Statement: Hold the comment for the 2014 NEC since it is new material that has not had public review.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 310 — CONDUCTORS FOR GENERAL WIRING

6-3 Log #2353 NEC-P06 **Final Action: Accept in Principle**
(310)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 6-8
Recommendation: Please explain the panel action.
Substantiation: The panel action was to accept in principal, yet the panel statement doesn't address what parts of the proposal were accepted and which were not. The statement also refers to other proposals modifying "this section". Which section does the panel refer to?
Panel Meeting Action: Accept in Principle
Panel Statement: The panel agrees that the action on the proposal was to accept in principle to make it clear to NFPA staff and others that this was a non technical reorganization only, and not intended to negate any other acceptance action on other proposals. The word "Section" should have been "Article", meaning Article 310 which was the subject of the reorganization.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-4 Log #2571 NEC-P06 **Final Action: Accept in Principle in Part**
(310)

TCC Action: The Technical Correlating Committee directs that the text be revised as follows to comply with 2.2.2 and 2.4.1 of the NEC Style Manual:
"310.2. Definition.
Electrical Ducts. Electrical conduits, or other raceways round in cross section, that are suitable for use underground or embedded in concrete.
310.10. Uses Permitted. The conductors described in 310.100 shall be permitted for use in any of the wiring methods covered in Chapter 3 and as specified in their respective tables or as permitted elsewhere in this Code."
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-8
Recommendation: Accept the proposal in principle. Make the following changes:

I. In 310.2, the "Electrical Duct" definition, rewrite as a definition without mandatory text as follows: "As used in this Article 310, electrical ducts ~~shall include~~ are any of the electrical conduits recognized in Chapter 3 as suitable for use underground and other raceways round in cross section, if listed for underground use and where embedded in earth or concrete.

II. Revise 310.10 as follows: 310.10. Applications. The conductors described in 310. 100 are recognized for use in any of the wiring methods covered in Chapter 3 and as specified their respective tables or as permitted elsewhere in this Code. (Insert the informational note regarding thermoplastic insulation following this text, as in the proposal.)

Ill. Reconfigure the proposed 310.10(A) through 310.10(D) as 310.12, Location. (Then insert each lettered subsection as in the proposal, so the appearance is comparable the existing 310.8.)

IV. Reconfigure 310.10(E) as 310.14, Shielding.

V. Reconfigure 310.10(F) as 310.16, Direct-Burial Conductors. For correlation, change the 310.14 Exception No. 2 reference [310.10(E) Exception No. 2 in the proposal] to 310.16 Exception No. 2.

VI. Reconfigure 310.10(G) as 310.18, Corrosive Conditions. VII. Reconfigure 310.10(H) as 310.20, Conductors in Parallel. The numbered subdivisions (1) through
(5) revert to their lettered designations in the current Code (A) through (E). Delete 31 0.84(H) from the proposal

VlII. Reconfigure 310.106(C) as 310.22, Stranded Conductors, and 310.106(D) as 310.24, Insulated Conductors. IX. Insert a new "Part Ill, Ampacity Calculation and Allowances for Conductors Rated 0-2000 Volts", at the end of the paralleled conductor section.

X. Insert, as the first section in Part III, the following:
310.40. General. Ampacities for conductors shall be permitted to be determined by tables as provided in 310.50 or under engineering supervision as provided in 310.70. Any ampacity determination shall be subject to the requirements in 310.44.

Informational Note No. 1: Ampacities provided by this part do not take voltage drop into consideration. See 210.19(A), Informational Note No. 4, for branch circuits and 2IS.2(A), Informational Note No. 2, for feeders.

Informational Note No. 2: For allowable Ampacities of Type MTW wire, see Table 13.5.1 in NFPA 79-2007, Electrical Standard/or Industrial Machinery.

Informational Note No. 3: See 110.14(C) for conductor temperature limitations due to termination provisions.

XI. Reconfigure 310.80(8) and its exception as 310.42, Selection of Ampacity.

XII. Reconfigure 310.80(C) and its informational note as 310.44, Temperature Limitation of Conductors.

XIII. Reconfigure 310.82 as 310.50, Tables, modified to read as follows:

310.50. Tables. Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity Table 310.116 through Table 310.119, and Ampacity Table 310.120 and 310.121 as modified by 310.52 through 310.60. Revise the Informational Note references to read "Table 310.116 through Table 310.119."

ALTERNATIVE, Part 1: Retain the tables in this location by using the numbering protocol set by CMP 6 through their action on Proposal 6-52, so the tables become numbered "310.50(16)," "310.50(17)," etc.

XIV. Insert a new 310.52 using the text accepted as part of Proposal 6-53, with all appurtenant tables and notes.

XV. Reconfigure 310.84(A) through (C) including the table and all exceptions and informational notes as 310.54(A) through 310.54(C) with the same tables, exceptions and informational notes.

XVI. Reconfigure 310.84(D) as 310.56.

XVII. Reconfigure 310.84(E) with three numbered paragraphs as 310.58 with three lettered paragraphs. Convert the reference from 310.84(A) to 310.54(A) in two places.

XVIII. Reconfigure 310. 84(F) as 310.60. Convert the reference from 310.84(A) to 31 0.54(A).

XIX. Reconfigure 310.84(G) including its table as 310.62, with the internal table reference numbering changed accordingly.

XX. Reconfigure 310.86 as 314.70.

XXI. Insert a new Part IV as follows:

IV. Ampacities of Conductors Rated 2001 to 35,000 Volts

XXII. Insert, as the first section in Part IV, the following:

310.80. General. Ampacities for solid dielectric-insulated conductors rated 2001 to 35,000 volts shall be permitted to be determined by tables as provided in 310.90 or under engineering supervision as provided in 310.96.

Informational Note: See 110.40 for conductor temperature limitations due to termination provisions.

XXIII. Configure 310.60(B)(1) in the current NEC and its exception (part of 310.90 in the rewrite) as 310.82.

XXIV. Reconfigure 310.92 as 310.90, Tables, modified to read as follows:

310.90. Tables. Ampacities for conductors rated 2001 to 35,000 volts shall be as specified in the Ampacity Table 310.167 through Table 310.186, adjusted in accordance with 310.92(A) through (C). Where ambient temperatures differ from those shown in the tables, 310.92(D) shall apply. ALTERNATIVE, Part 2: Retain the tables in this location by using the numbering protocol set by CMP 6 through their action on Proposal 6-123, so the tables become numbered "310.90(67)," "310.90(68)," etc.

XXV. Reconfigure 310.94 as 310.92, changing all internal references accordingly.

XXVI. 310.96, as a coincidence, will remain 310.96 as in the proposal.

XXVII. Renumber Part III as Part V. Re-title and renumber the first section (310.104 in the proposal) as

310.100. Conductor Constructions.

XXVIII. Delete the note on thermoplastic insulation following this section.

XXIX. Renumber the construction tables as 310.100(A) through 310.100(E) For correlation, change the references to these tables in Section 6 from 310.104 to 310.100, and in 310.14 Exception No. 1(c) [310.10(E) Exception No. 1(c) in the proposal, erroneously stated as 310.106(D)] to 310.100(D). Also, renumber the reference in 310.20(E) [310.10(H)(5) in the proposal, erroneously pointing to 310.106 in the proposal] as 310.100. In addition, renumber the references in 310.44 Informational Note from 310.104(A) and 310.104(C) to 310.100(A) and 310.100(C) [in the proposal at 310.80(C) FPN].

XXX. Reconfigure 310.106(A) and (B), and the internal table accordingly, as 31 0.192(A) and (B).

XXXI. Delete 310.106(C) and (D).

XXXII. Reconfigure 310.110 as 310.104. In 310.1 04(C) change the reference to 310.1 06(B)(I).

XXXIII. Reconfigure 310.120 as 310.106. In 310.106(B)(2) Exception No. 3 and No. 4, change the reference to 310.106(A), and in 310.106(B)(4) change the reference to 310.106(A)(4).

XXXIV. Designate the ampacity tables that follow, as their own part, Part VI ("VI. Ampacity Tables").

XXV. Reconfigure Tables 310.82(A) through 310.82(F) as Tables 310.116 through 310.121 respectively.

XXVI. Reconfigure Tables 310.92(A) through 310.92(T) as Tables 310.167 through 310.186 respectively. To correlate, correct the table references in 310.92(A) [310.94(A) in the proposal] from 310.92(C), (D), (O), and (P) to 310.169, 310.170, 310.181, and 310.182 respectively.

ALTERNATIVE, Part 3: Retain the tables in their current relative location. Do not create this part. To correlate, correct the table references in 310.92(A) [310.94(A) in the proposal] from 310.92(C), (D), (O), and (P) to 310.90(69), 310.90(70), 310.90(81), and 310.90(82) respectively.

Substantiation: The fundamental problem with this reorganization is that it attempts to take an article that does not address any particular wiring method and force it into the standardized formats for wiring method articles. The NEC Style Manual does not require this and should not be used as justification for this proposal. The succeeding Articles 312 and 314 are also examples of articles that do not require this type of formatting, and there have never been any serious attempts to force them into the wiring methods straightjacket. Nevertheless, the reorganization is an excellent starting point, particularly in the creation of a construction part of the article. The other major benefit in the proposal is the elimination of excessively long citation strings that drill down to frequently referenced provisions. This submitter will be happy to see "310.15(B)(2)(a)" become a simple section and a lettered paragraph

There are significant problems, however, such as an excessively long and difficult "Uses Permitted" section, even though what follows are application rules and not permitted uses, no "Uses Not Permitted" section, a number gap from 10 to 80. In the proposal, this was presumably selected only because 80 is the usual wiring method ampacity section, and an article dealing with conductors has no need to cover supports and all the other provisions that wiring methods articles must address. The most important concern, however, is moving the ampacity tables in such a way that their location will be unfamiliar to all existing users. They have been in their current position since they moved out of Chapter 9 in the 1959 NEC. CMP 6 did a good job of protecting this concept in its actions outside this proposal on Proposals 6-52 and 6-123. This proposal presents two alternatives for the panel to consider, one that incorporates those actions and leaves the Tables in the same relative position and the other that creates a separate end part of the article similar to the table part (XIV) in Article 430. In both cases the use of creative numbering preserves user familiarity based on a half century of consistent usage.

This comment builds on the proposal in a constructive effort to overcome these deficiencies, and other actual NEC Style Manual deficiencies, as follows:

I. This change looks more like a definition instead of a group of rules. The listing specification could be relocated into a listing section within Part I if necessary. Note that if done, it should occupy Section 6 and so the proposal Section 6 would become a different number.

II. The revised title is based on the relevant part of the existing 310.13 title. "Uses Permitted" is appropriate for a wiring method article but not for this one. Section 310.100 is the new home [310.104 in the proposal] of this material.

III through VII. Since this material becomes full sections, titles are required. The deletion of 310.84(H) in the proposal is necessary because it erroneously duplicates the provisions of 310.20(D) here [in the proposal as 310.10(H)(4)].

VIII. This material involves field application provisions as well as construction provisions, and it seemed more user friendly to locate it with other field application rules. The title of the insulated conductor rule was modified to make sense in a stand-alone section instead of how it now appears in the NEC.

IX. Dividing this article into additional parts helps keep pertinent concepts well organized; this is the first example of an additional part.

X, XI, and XII. This is essentially 310.80(A) through (C) of the proposal. These topics are correctly ordered in the proposal because they are general ampacity rules that apply whether tables or Neher-McGrath calculations are used. The informational note on terminations is grouped with the others because it is not related to the ampacity transition rule.

XIII. The table numbering uses numbers that will be very friendly to the existing user base. Table 310.16 becomes Table 310.116, for example, and all other ampacity tables follow the same procedure.

XIV. This preserves the organizational sequence that follows from Proposal 6-53.

XV through XIX. These are the adjustment rules, formatted as full sections to avoid long citation strings. One of the strengths of the original proposal was to open the article up to this possibility, and these renumberings take the concept slightly further. Remember when we could cite the mutual conductor heating rule as "Note 8"? Now it would simply be 310.54(A) as opposed to the current 310.15(8)(2)(a).

XX. This is the Neher-Mcgrath rule, set off using the decade numbering principle.

XXI. This begins the medium-voltage provisions, set off as a separate part for organizational simplicity.

XXII. This the counterpart to Section 40 for 600 volts and below. The termination note is relocated to here because it is unrelated to the transition rule.

XXIII. The weak link and transition exception provisions now have their own section.

XXIV. This is 310.92 in the proposal with some editorial modification to avoid a virtual complete restatement of 310.92(0) [310.94(D) in the proposal] within a section that is only supposed to be pointing at the referenced provision. The cross reference in the informational note is coincidentally correct.

XXV. Simple renumbering to leave space from the Neher-McGrath calculation formula.

XXVI. As in the proposal.

XXVII. This is the construction part. Unlike the proposal, the first part of this (and other) parts in this comment begins with a decade number, as required in 2.4.2.1 of the NEC Style Manual.

XXVIII. This note has been retained in 310.10; it was duplicated here in the proposal.

XXIX. These tables contain extensive text and it seemed wise to follow the lead of the proposal and keep them with their implementation rules. However, there is room in Part VI (presumably as Tables 110 through 114 or as Tables 190 through 194; the part would need to be re-titled from "Ampacity Tables" to "Tables" if this happens) if CMP 6 wants to keep all tables in that part.

XXX and XXXI. This is 310.106 in the proposal; subsections (A) and (B) are retained and (C) is relocated to Part II, as noted earlier.

XXXII and XXXIII. These are the final section numbers, in logical order.

XXXIV, XXXV and XXXVI. The tables get their own part. This is an appropriate strategy where a number of tables end up by necessity occupying a block of code space. A good example of this principle at work in the current NEC is Part XIV of Article 430. The tables, as noted, are numbered to retain continuity of recognition for present code users.

Note: If the Alternative approach (parts 1, 2, and 3 as set forth in the action text of this comment) is followed by CMP 6, then these actions become moot, and the highest section number in Article 310 will be 310.106 in Part V of the article.

Panel Meeting Action: Accept in Principle in Part

The actions that follow apply to the 2011 ROP draft renumbering. Accept the proposal in principle in part. Revise the text as follows:

310.2. Electrical Ducts. As used in this Article 310, electrical ducts shall include are any of the electrical conduits recognized in Chapter 3 as suitable for use underground, and other raceways round in cross section, if listed for underground use and where embedded in earth or concrete.

310.10. Uses permitted Applications. The conductors described in 310. 100104 are recognized shall be permitted for use in any of the wiring methods covered in Chapter 3 and as specified in their respective tables or as permitted elsewhere in this Code. (Insert the informational note regarding thermoplastic insulation following this text, as in the proposal.)

The remaining portions of the comment, Parts III through XIII and the alternatives submitted are rejected.

Panel Statement: The panel accepts in principle Part I and Part II of the recommendations as revised text in the action. The panel agrees that the change of the definition from mandatory language is appropriate. The panel accepted the term "includes" vs. the proposed "are" and editorially adjusted the remaining text so as to not change the meaning of the definition, as publicly commented upon. In Part II, the panel understands that the conductors are described in Section 310.104. The panel accepted the heading change from "Uses Permitted" to "Applications" and agreed with the substantiation to do so. Finally, the panel changed the words "are recognized" to "shall be permitted".

The remaining portions of the comment, Parts III through XIII and the alternatives submitted were rejected because the panel agreed that the flow of the article was being sacrificed with no apparent gain.

The argument to readjust the numbering of the tables to be closer to the previous tables was not accepted, however a similar Comment 6-21 was accepted in principle and the submitter is referred to that action for further explanation.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-5 Log #1676 NEC-P06 **Final Action: Reject**
(310.3)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 6-13
Recommendation: Accept the proposal with the following revisions:

Where connected to equipment where conditions require flexibility of the wiring method after installation, circuit conductors and grounding and bonding conductors shall be a stranded type for that portion of the wiring method and installed in a manner to prevent strain on the terminations.

Substantiation: Where flexing is required after installation, conductors should be stranded and installed to prevent strain on terminations.
Panel Meeting Action: Reject
Panel Statement: The decision to use stranded conductors where flexibility of the wiring method is needed is a design issue. The Submitter has not identified recommended revisions to the original proposal. The comment does not clarify existing text or substantiate that there is a problem that needs to be addressed and contains unenforceable language. Additionally, the submitter has not provided technical data to substantiate that stranded conductors are required.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-6 Log #2572 NEC-P06 **Final Action: Accept**
(310.4(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-20
Recommendation: Accept the panel actions on this proposal in part. Do not change "Where" to "When" at the section beginning.
Substantiation: The panel was correct in rejecting the use of the word "if". The word "if" is a generic conjunction that in usual code applications means "in the event that." In this sense, virtually any usage of "where" can be replaced by "if", as is equally the case of "when". The reason that these other words, particularly "where" have been generally applied throughout the NEC is that they more precisely define the event. The word "where" has been (and continues to be) used because it is limited to being a condition of place, and "when" has been (and continues to be) used in instances describing a condition of time.

The NEC is an installation document, and most of its provisions provide direction regarding installation practice in concrete locations, that being the nature of the trade. The subject of this proposal leads off with "Where an ac system operating at less than 1000 volts …" Although it is not grammatically incorrect to begin the sentence with "if", the word "where" is preferred because this rule describes a condition of place. Over the past decade, the word "where" has become the usual term for such usage throughout the NEC.

In this instance, "where" is the appropriate word, because what is described is indeed a condition of place and not time.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-7 Log #95 NEC-P06 **Final Action: Accept**
(310.6)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 6-21b
Recommendation: The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with 3.1.3 of the NEC Style Manual related to Fine Print Notes.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise the first sentence as follows: "…to replace existing nonshielded conductors on existing equipment in industrial establishments…"

Delete the first sentence in the FPN. Revise the text in the second sentence from "may not meet" to "may not comply with".
Panel Statement: The phrase "on existing equipment" was relocated from the FPN to positive text in the first sentence.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

ZIMNOCH, J.: Cables rated above 2400 v are unsafe. The problem lies in the voltage present on the insulations surface, especially at the terminations.
Comment on Affirmative:

WALL, C.: I commend the panel for realizing the need for and permitting the use of non-shielded cables up to 5000 volts on existing equipment in industrial establishments.

6-8 Log #1389 NEC-P06 **Final Action: Reject**
(310.6)

Submitter: Timothy M. Croushore, Allegheny Power / Rep. Edison Electric Institute/Electric Light & Power NEC Task Force
Comment on Proposal No: 6-24
Recommendation: Please reconsider this proposal and accept it.
Substantiation: The current NEMA – MG-1 Motor Standard does not provide adequate space in medium voltage motor terminal enclosures to install terminations on shielded medium voltage cables and maintain minimum cable bending radius required by 300.34.

The negative ballots have also implied that non-shielded cables installed in metal raceways are unsafe. Non-shielded cables in metal raceways are safe; it is unsafe work practices that put personnel at risk.
Panel Meeting Action: Reject
Panel Statement: The referenced proposal was accepted in part during the 2011 ROP. The panel does not agree with the use of non-shielded conductors within metal raceways. The inconsistencies of conductors in conduit installations do not assure a lack of insulation damage and do not assure a concentric lay orientation of the cables. The panel has accepted the use of non-shielded cables for existing installations. Product standards can be changed to provide adequate space in medium voltage motor terminal enclosures.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:

THOMPSON, J.: UL is unaware of specific problems associated with the qualified use of 5KV cable. If data indicates otherwise, this data should be made available for review. 5KV was Listed in the past and is now Recognized (QACA2) and remains as a UL certified product. The proper supervision and installation by qualified persons is a requirement for all wiring.

WALL, C.: I commend the panel for permitting the use of non-shielded cables up to 5000 volts on existing equipment and permitting the use of non-shielded metal clad cables up to 5000 volts; however, there is still a need to allow the use of other non-shielded cables on new installations up to 5000 volts because NEMA has not revised the MG-1 standard to require larger terminal boxes on motors that will accommodate the longer terminations and allow installing the shielded cables without bending to a lesser radius than permitted by 300.34. Bending the cables to a smaller radius than stated in 300.34 will cause separation of the insulation shield and early failure of the cable.

ZIMNOCH, J.: See My Explanation of Negative on 6-7.

6-9 Log #1790 NEC-P06 **Final Action: Accept in Principle**
(310.6)

TCC Action: The Technical Correlating Committee directs that the text be revised to read as follows to comply with the NEC Style Manual:
"Non-shielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in Type MC cables...".
Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 6-24
Recommendation: Accept the proposal as accepted by the panel, and add the words or armor at the end of the sentence after the word "sheath".
Substantiation: Armored cable is what is being allowed by this proposal, so the final wording should include the word "armor" as allowed cable types.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Non-shielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in Type MC metal clad cables in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation. For other establishments, solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded.
Panel Statement: The panel chose the term "metal clad cable" as defined in the code in Section 330.2 and revised the text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
FRIEDMAN, S.: The panel has changed its position on use of armored non-shielded 5 kV cable without any additional information establishing why the panel position should be changed. The panel for two code cycles has agreed that 5 kV non-shielded armored or not armored cable is not safe and has now decided to change. Although conditions of installation was included, NEMA does not agree to modify position without better substantiation for doing so.
KENT, G.: For existing installations, the panel has addressed the original submitter's concerns. In new installations, the use of shielded cable should remain a requirement over 2.4KV for safer installations.
ZIMNOCH, J.: See My Explanation of Negative on 6-7.
Comment on Affirmative:
CLINE, S.: I believe that the technical information presented at the meeting stated that the construction of metal-clad cables reduced risk in two ways: 1) That the consistently symmetric concentric lay of the cables yielded a significantly balanced electrical field, and 2) that the metallic cladding then acted to protect against remaining hazards of normal operation or of damage to the cable. The reduction in risk was not perceived as perfect, and so the limitation to especially qualified installations was required as a balance.
HUNTER, R.: No evidence was produced to show that cables installed in metallic raceways is an unsafe condition. It appears to be an assumption by the panel.
WALL, C.: I commend the panel for recognizing the importance of permitting the use of non-shielded metal clad cables up to 5000 volts in qualified industrial establishments.

6-10 Log #2573 NEC-P06 **Final Action: Accept in Principle in Part**
(310.6)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-21b
Recommendation: I. Accept the proposal in principle. Revise item "(a)" to read "(a) The conditions of maintenance and supervision shall ensure …"
II. Convert the informational note to mandatory text, as follows: "(e) The equipment to which the existing nonshielded cable is connected shall not be relocated or replaced."
Substantiation: The first change makes the wording parallel with the other conditions, as required by 3.3.5 in the NEC Style Manual. The second change responds to the TCC note by making the note an actual rule, as apparently intended.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel rejects the recommendation in Part I of the comment. The removal of the word "where" is not needed and does not add clarity to the requirement.
The panel accepts the concept of changing part of the FPN to mandatory text, see action on Comment 6-7. In Part II of the recommendation leaving the second sentence as an Informational Note (FPN) allows the user and the AHJ to make a judgment regarding relocation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
ZIMNOCH, J.: See My Explanation of Negative on 6-7.

6-11 Log #448 NEC-P06 **Final Action: Reject**
(310.7 Exception No. 1)

TCC Actions: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 6-28
Recommendation: Add text to read as follows:
Continue to Accept in Principle the Proposal but list the text the Panel revised for Section 310.6 in Proposal 6-24. This text is included here for reference.
Non-shielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation and the cables have an overall metallic sheath. For other establishments, solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded.
Substantiation: The Proposal was Accepted In Principle but the text required was referred to Proposal 6-24. Proposal 6-24 was recorded as Reject by the TCC for failing to meet the required 2/3 affirmative vote required. The result is that although Proposal 6-28 passed by a 9-2 vote, the text was not included because the referenced Proposal (6-24) did not pass. This Comment is intended to allow the Panel to revisit both actions.
Panel Meeting Action: Accept in Principle
In Section 310.7 delete "Cables rated above 2000 volts shall be shielded".
Panel Statement: The basic rules of shielding are covered in Section 310.6. This action eliminates the conflict between 310.6 and 310.7.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:
CLINE, S.: All references are to the 2008 Code numbering:
I believe that Tim Wall has brought up important and valid points, although I might suggest detail differences. However, I do not believe that the rules would allow the changes to be made at this point. The Comment 6-11 deletion of the phrase should not cause an application problem since 310.6 also applies to direct-burial situations, however, I do believe that the deletion may be a style manual violation.
Perhaps the TCC can "Hold" this Comment due to the style manual violation. To not muddy the water, perhaps we should "Hold" this Comment ourselves, and not delete the phrase this cycle, then simplify the text, without changing the requirements, next cycle.
The 310.7 Exceptions apply to the shielding requirement which would only be in 310.6, but the Exceptions only apply to direct-burial situations.
I would: Add the words "For direct-burial installations " at the beginning of Exception #2, and move it to 310.6 to replace the current Exception #2.
310.7 Exception #1 presents more problems due to it currently only applying to 2001-2400 volts. While it belongs in 310.6, its placement and wording will be critical to not change installation requirements without substantiation.
The grounding paragraph could be deleted as it is covered in 310.6.
FRIEDMAN, S.: The panel should have voted to reject. The panel has changed its position on use of armored non-shielded 5 kV cable without any additional information establishing why the panel position should be changed. The panel for two code cycles has agreed that 5 kV non-shielded armored or not armored cable is not safe and has now decided to change. Although conditions of installation was included, NEMA does not agree to modify position without better substantiation for doing so. In addition, the sentence "Cables rated above 2000 volts shall be shielded" should not have been removed from section 310.7 because both exceptions in this section refer to that sentence.
KENT, G.: The text deletions proposed by the panel would create substantial conflict with 310.6 due to exceptions in 310.7. This comment should be held over for discussion and balloting in the next cycle.
ZIMNOCH, J.: See My Explanation of Negative on 6-7.
Comment on Affirmative:
WALL, C.: I agree with the resultant panel action; however, the exceptions 1 and 2 that remain are exceptions to the phrase deleted by the panel action. Since Article 310.6 addresses shielding requirements, I recommend that Exceptions 1 and 2 be moved to 310.6. Also, the paragraph between the two exceptions, requiring that the metallic shield be grounded, is a duplication of this requirement in 310.6 and should be deleted.

6-12 Log #2347 NEC-P06 **Final Action: Reject**
(310.10)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 6-8
Recommendation: Revise text to read as follows:
310.10 Uses Permitted. Only ~~T~~these conductors shall be permitted for use in any of the wiring methods recognized in Chapter 3 and as specified in their respective tables or as permitted elsewhere in this *Code*.
Informational Note: Unchanged.
Substantiation: By adding the word "only" this section becomes mandatory text, as opposed to the permissive text that the accepted text provides.
Panel Meeting Action: Reject
Panel Statement: The panel understands that the submitter's reference to 310.10 is from the ROP draft. The addition of the word "only" is too restrictive. Multiconductor cables containing conductors other than those included in Article 310 may be listed by a testing laboratory if they comply with the appropriate product standard.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
ZIMNOCH, J.: See My Explanation of Negative on 6-7.

6-13 Log #1791 NEC-P06 **Final Action: Accept**
(310.11(B)(2), FPN)

TCC Action: The Technical Correlating Committee directs that the final text in this section be revised to change the words "lead shielded" to the words "lead sheathed".
Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 6-35
Recommendation: Reject proposal and leave wording as is with and lead shielded cable as part of the text.
Substantiation: As pointed out in the proposals by Mr. Laidler and Mr. Zimnoch, lead-shielded cable is still used by some industrial customers and thus needs to be included in the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
CLINE, S.: For editorial confirmation: The term "-shielded" is incorrect, it should be "-sheathed" as it is now. The intent of the Panel is (as stated by the Submitter: "...leave wording as is...") to leave the wording as it is in the 2008 Code.
My thanks to Mr. Robert Huddleston for noting my error as Chair.
HUDDLESTON, JR., R.: There is incorrect wording on the comment - should read "lead sheathed cable" instead of "lead shielded cable" as the original proposal stated (Proposal 6-35). Correction needs to be made to ensure that "lead sheathed cable" is the wording used.

6-14 Log #740 NEC-P06 **Final Action: Accept**
(310.13)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 6-37
Recommendation: Continue to Accept the Proposal.
Substantiation: The Panel Action to Accept the Proposal is correct since Panel 5 Accepted Proposal 5-285 to relocate the text to 250.122(A).
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-15 Log #1286 NEC-P06 **Final Action: Reject**
(310.X)

Submitter: Thomas Guida, TJG Services, Inc.
Comment on Proposal No: 3-17
Recommendation: Recommendation: This proposal should be accepted in principal and placed in the appropriate position in Article 310.
Add new paragraph as follows:
310.XX Fire-Rated Cable and Conductors. Fire-rated cable and conductors used for survivability of critical circuits to ensure continued operation during a specified time under fire conditions shall be listed as part of an electrical circuit protective system. The installation of the electrical circuit protective system shall comply with any restrictions provided in the listing. Cables and conductors shall also be listed for use in accordance with the wiring methods described in this code.
FPN No. 1: One method of defining the fire rating of electrical circuit protective systems is by testing the system in accordance with UL 2196-2006, *Standard for Tests of Fire Resistive Cables*.
FPN No. 2: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Marking. In addition to the marking required in 310.11, cable and conductors shall be surface marked with the suffix –CIR (Circuit Integrity Rating), along with the circuit integrity duration in hours and system identifier.
Substantiation: There has been confusion between fire-rated and non-fire-rated conductors and cables used for general wiring. As an example, a specially constructed Type RHW conductor may be fire-rated as part of an electrical circuit protective system. The proposed standardized marking would distinguish these specially insulated conductors from those that meet only the standard requirements. There are particular installation requirements defined by the listing organization in order to maintain a fire rating. The need to comply with these requirements is not identified in the current code.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that adding a new section in Article 310 dealing with Fire rated cables and conductors is not appropriate. Article 310 deals with conductors and cables for general wiring and not conductors and cables for special applications. Type RHW conductors are already included in Table 310.104(A) when used for general wiring. Special characteristics of the conductor or cable can be addressed as an optional marking on the conductor as permitted in 310.120(D).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-20 Log #1047 NEC-P06 **Final Action: Reject**
(310.15(A)(2) Exception)

Submitter: Gregory P. Bierals, Samaritan's Purse World Medical Mission
Comment on Proposal No: 6-49
Recommendation: Accept this proposal to revise the exception to read as follows: Where different ampacities apply to adjacent portions of a circuit the higher ampacity shall be permitted to be used beyond the point of transition. A distance equal to 3.0 m (10 ft) or 10 percent of the circuit length figured at the higher ampacity, whichever is left.
Substantiation: The reference to the word "two", as is presently used, is irrelevant and unnecessary. The mere fact that there are differing ampacities is sufficient, without specifying their number.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that the text is clear as written and does not accept the deletion of the word "two".
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-21 Log #2352 NEC-P06 **Final Action: Accept in Principle**
(310.15(B) and Table 310.16 through Table 310.21)

TCC Action: The Technical Correlating Committee notes the request of Code-Making Panel 6 to provide an article cross-reference.
In Addition, the Technical Correlating Committee notes that NEC Handbook material is outside the scope of Code-Making Panel 6.
Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 6-52
Recommendation: Reject this proposal in its entirety.
Substantiation: The changes proposed in 6-52 do not add any value whatsoever to the Code.
While I applaud the efforts of the submitter and the panel, and feel the manual of style should typically be followed, I believe this to be an exception. Please consider the pros and cons of this change.
The pros:
It meets the style manual.
The cons:
Everyone has to relearn the table numbers, including the most commonly used table in the Code (310.16).
Manufacturers have to revise their labels, at their own expense (or that of the customer), in order to be accurate.
Code users have to familiarize themselves with the new numbering system.
Confusion will ensue between Code users that are used to the numbering system and those who are not.
Writers must revise their work to address the change.
Other sections of the Code have to be correlated.
This change seems to be "change for the sake of change", considering that it addresses no real safety concern.
Panel Meeting Action: Accept in Principle
The panel accepts the comment in principle and includes a parenthetical reference to the former table number adjacent to the new table number in the Table title for a 2 cycle period to assist in locating the new table. Such an example would be:
"Table 310.15(B)(16) (formerly Table 310.16)."
The panel further recommends to staff that a complete article cross reference between the old section numbers and the new section numbers be included in the Annex of both the handbook and the NEC 2011.
Panel Statement: The panel confirms that the reorganization is in the best interest of the article and remains consistent with NEC style manual recommendations.
While the panel agrees that there is a substantial transition period necessary as a result of the extensive rewrite, the panel has included a parenthetical reference to the former table number, adjacent to the new table number in the Table title, for a proposed 2 cycle period to assist in locating the new table. Such an example would be:
"Table 310.15(B)(16) (formerly Table 310.16)." This action will allow the user to readily confirm they are using the correct table and will assist in the transition.
The panel further recommends to staff that a complete article cross reference between the old section numbers and the new section numbers be included in the Annex of both the handbook and the NEC 2011 to assist users in finding the corresponding sections in Article 310.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
ZIMNOCH, J.: Changing the references to these tables would cause much confusion in the field.

6-22 Log #2348 NEC-P06 **Final Action: Accept**
(310.15(B)(2)(1))

TCC Action: In accordance with 4.3.4 of the NFPA Regulations Governing Committee Projects, the Technical Correlating Committee notes that proposals cannot be withdrawn after the proposal closing date.
The Technical Correlating Committee notes that Proposal 6-59 remains "Rejected".

Ballot Results: Affirmative: 11

6-24 Log #471 NEC-P06 **Final Action: Accept in Part**
(Table 310.15(B)(2)(a))

Submitter: Steven R. Terry, Electronic Theatre Controls Inc.
Comment on Proposal No: 6-57
Recommendation: 1. Revise Table Heading Column 1 of the proposal to: Number of Current-Carrying Conductors (See Note 1).
2. Continue to add Note below the table as per the proposal.
Substantiation: Whether or not the change of this table heading in 1993 from "Number of Conductors" to "Number of Current-Carrying Conductors" was accompanied by an associated Proposal or Panel Action does not alter the fact that the change made the table clearer! CMP 6 did us a favor in 1993 with this editorial change! Previous to this change, there was always confusion between the number of physical conductors, and those conductors that are to be used in this Ampacity Adjustment Factor calculation. This proposal further improves the situation by the addition of Note 1 to remind the reader how to arrive at

the number of current carrying conductors. However, the revision of the table heading is obfuscating and confusing, because it conflicts with the section title and requires the reader to follow Note 1 to determine that this particular "Number of Conductors" is not simply that, but rather a "special definition" arrived at by applying the recommendation of Note 1, not what the heading actually says.

This is very confusing, and the Code would be much better with the original column heading, but with the parenthetical reference to the new note.

Note: I have made an accompanying comment to Proposal 6-199 for Table B.310.11.

Panel Meeting Action: Accept in Part

The panel rejects part 1. With the mandatory note below the table, it is clear that all conductors, except in accordance with 310.15(B)(4) and (5), are to be included. The panel accepts Part 2 of the submitters comment.

Panel Statement: The panel supports removing the words "Current -Carrying" from the first Column Heading and adding the note at the bottom of the table which reads: "Number of Conductors is the total number of conductors in the raceway or cable adjusted in accordance with 310.15(B)(4) and (5)" does add clarity to this section. The previous Column Heading that contained the words "Current-Carrying" often caused confusion because grounded conductors and grounding and bonding conductors sometimes do carry current. The new note at the bottom of the table makes it clear that the user takes the total number of conductors in the cable or raceway and subtracts the neutral conductors not required to be counted under 310.15(B)(4) and the grounding or bonding conductors not required to be counted under 310.15(B)(5).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-25 Log #2349 NEC-P06 **Final Action: Reject**

(Table 310.15(B)(2)(a))

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 6-57

Recommendation: This proposal should be rejected altogether.

Substantiation: This proposed change does not solve any real problem. There is no history of widespread misunderstanding of this rule, so there should be no reason to change it. Furthermore, the number of conductors in the raceway is not the issue addressed by this subsection. The issue is the number of *current-carrying conductors*. Previous editions of the Code have addressed this quite clearly, so there is no reason to change it. Furthermore, the fact that the informational note is a necessary part of this proposal only proves that the change makes the Code *less clear,* not *more* clear.

Panel Meeting Action: Reject

Panel Statement: This is a change that will benefit the usability of the Code in the long term. See the panel action and statement on Comment 6-24.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-27 Log #2809 NEC-P06 **Final Action: Accept**

(310.15(B)(2)(a))

Submitter: Carl Timothy Wall, Alabama Power Company

Comment on Proposal No: 6-60

Recommendation: Revise text to read as follows:

(2) Adjustment Factors.

(a) More than Three Current-Carrying Conductors in a Raceway or *Cable*. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(2)(a). Each current carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

~~Exception No. 1:~~ Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the ~~derating~~ adjustment factors shown in Table 310.15(B)(2)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

Table 310.15(B)(2)(a) is unchanged

FPN No. 1: See Annex B, Table B.310.11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

FPN No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.

~~Exception No. 2:~~ (1) Where ~~For~~ conductors are installed in cable trays, the provisions of 392.11 shall apply.

~~Exception No. 3:~~ (2) ~~Derating~~ Adjustment factors shall not apply to conductors in ~~nipples~~ raceways having a length not exceeding 600 mm (24 in.).

~~Exception No. 4:~~ (3) ~~Derating~~ Adjustment factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3.05 m (10 ft) and if the number of conductors does not exceed four.

~~Exception No. 5:~~ (4) Adjustment factors shall not apply to Type AC cable or to Type MC cable ~~without an overall outer jacket~~ under the following conditions:

(a) The cables do not have an overall outer jacket.

~~(1)~~ (b) Each cable has not more than three current-carrying conductors.

~~(2)~~ (c) The conductors are 12 AWG copper.

~~(3)~~(d) Not more than 20 current-carrying conductors are bundled, stacked, or supported on "bridle rings."

~~A 60 percent adjustment factor shall be applied where the current carrying conductors in these cables that are stacked or bundled longer than 600 mm (24 in.) without maintaining spacing exceeds 20.~~

(5) An adjustment factor of 60 percent shall be applied to Type AC cable or Type MC cable under the following conditions:

(a) The cables do not have an overall outer jacket.

(b) The number of current carrying conductors exceeds 20.

(c) The cables are stacked or bundled longer that 600 mm (24 in) without spacing being maintained.

Substantiation: The inclusion of the sentence **"The following adjustments shall be permitted for the conductors and installation methods listed in (1) through (4):"** followed by four items that are either **"shall apply"** or **"shall not apply"** is confusing. Additionally, the fourth item, previously exception 4, is also confusing because it is not clear that the last part of this exception is not clearly identified as part of new item 4 and would be better separated and reworded as a new item 5. For consistency, it would be better to itemize the requirements for this new item 5.

This recommendation is not intended to change any of the present requirements but only to more clearly state the present requirements. Additionally, for clarity, the word changes made in proposal 6-62 and 6-63 are included in this recommendation.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-28 Log #99 NEC-P06 **Final Action: Accept**

(Table 310.15(B)(2)(c))

TCC Action: The Technical Correlating Committee directs that the title of Table 310.15(B)(3)(c) be changed to correlate with the action taken on Proposal 6-66 and this comment.

Submitter: Technical Correlating Committee on National Electrical Code®,

Comment on Proposal No: 6-68

Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered relative to the use of the terms "conduit" and "raceway" and correlated with the action taken on Proposal 6-66.

This action will be considered by the panel as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel's action on Proposal 6-68 should have been to accept in principle in part. While the panel did replace "conduits" with "circular raceways", the use of "raceway" alone would include types which were not part of the submitted technical substantiation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Panel Meeting Action: Accept
Panel Statement: The panel's action on Proposal 6-69 should have been to accept in principle in part. While the panel did replace "conduits" with "circular raceways", the use of "raceway" alone would include types which were not part of the submitted technical substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-30 Log #491 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 6-67
Recommendation: The panel should reconsider the negative voting and accept the proposal.
Substantiation: All substantiation for accepting the Table and text was performed by the proponent of this proposal.

The panel accepted the testing presented by Copper Development Association (CDA) performed by Mr. Lindsey at his home in Las Vegas, NV. Adding "cables" completes the concerns that were found in the testing. As stated in Proposal 6-67 the tests were performed on four products; PVC schedule 40 conduit, Rigid metal conduit, Electrical Metallic tubing and Type MC Cable. All of these exhibited similar temperature rise.

While the testing was done on only four products, it is apparent that the heat rise results would be similar in all types of conduit, tubing and cable types which can be located outside on rooftops in accordance with the NEC. Testing each type and size individually is neither necessary nor needed. The effects of the radiant heat from the sun coupled with the heat generated in the conductor from current flow is essentially the same regardless of the enclosure type.

If the committee continues to reject ROP 6-67, then they should delete the entire requirement from the code.
Panel Meeting Action: Reject
Panel Statement: The panel rejects use of the term "conduit" alone using "circular raceways" instead. The panel rejects the addition of cables due to insufficient data to support the change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1 Abstain: 1
Explanation of Negative:

ZIMNOCH, J.: Sufficient data was presented for metal-clad, Type MC cables, just as when data was presented for the conduits.
Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus on this issue.
Comment on Affirmative:

CLINE, S.: While there is certainly intuitive connection between MC and/or other cables and the conduit testing data, I have not seen data which would convince me in a scientific analysis. Yes, it's the same cable which, if in a conduit, would have the rules apply. Now it's directly in the sun - does that mean it gets as hot or hotter? Or does the airflow now available directly on the outer surface provide more cooling than the radiant heat applies? The physics of cable inside conduit is significantly different from exposed cable.

HUNTER, R.: The fact that this research was performed by a trade organization, with no evidence of insulation failure or verification by an independent third party throughout the entire process,makes this submitter's suggestion in his last sentence the appropriate action.

6-31 Log #568 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 6-67
Recommendation: Revise text to read as follows:

310.15(B)(2)(c) Conduits and MC Cables Exposed to Sunlight on Rooftops. Where conductors in conduits and MC cables are installed ~~or cables are installed in conduits~~ exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(2)(e) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and Table 310.18.
Substantiation: This proposal should have been accepted in principal. Type MC cable was thoroughly researched and substantiation for this was submitted. Panel 6 requested that the previous research for conduits be enhanced by additional research to allow for cables to be added to this section. MC cable constitutes over 95 percent of the market share for all cables installed above rooftops. The subject of this research was published in a peer reviewed IEEE paper and has had national attention. This research was established to provide specific conductor temperature data enabling the user of the code to apply long standing provisions in table 310.16 and others for proper temperature correction and adjustment.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel rejects use of the term "conduit" alone using "circular raceways" instead. The panel rejects the addition of type mc cable due to insufficient data to support the change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 6 Negative: 4 Abstain: 1
Explanation of Negative:

FRIEDMAN, S.: Although the panel has stated that sufficient data was not provided for inclusion of MC cable in section 310.15(B)(2)(c), testing was conducted by Copper Development Association and data was provided to the panel members. The data supported the fact that the heat rise in MC Cable on rooftop in direct sunlight was equivalent to that in circular raceways. There does not appear to be a reason for rejecting this comment based on "insufficient data". The data should have been accepted and the need to increase ambient temperature when installing MC cable on rooftops should be included in section 310.15(B)(2)(c).

KENT, G.: The submitter addressed the panel statement on "cables" and identified only "MC Cables" for which testing is submitted. No information was provided in the ROP to indicate added testing was needed for "MC Cables, actually, reading the panel statement, acceptance of the data is clear.

LAIDLER, W.: This comment should have been Accepted in Part. We agree with the panel's action to reject the term "conduit "and use "circular raceways" instead. We do not agree with the panel's action not to add type MC cable. The panel rejected the proposal to add the term "cables" based on the fact that the submitter only provided data based on research done on MC Cable. The submitter has provided all the substantiation that the panel asked for, including a third party review. Test results provided by the submitter have shown that conductors installed in circular raceways and MC Cable are subjected to a higher ambient temperature when installed in direct sunlight above rooftops.

ZIMNOCH, J.: This Comment should have been Accepted. On Proposal 6-67 the Panel Statement specifically stated "The term "cables" is too general for this requirement. The testing described in the substantiation was performed using MC cable only, and not other types of cable. Testing on MC cables is not representative of all cables. In order for the term "cables" to be added at this stage, testing would have to be completed on all types of cables. Otherwise, the proposal would need to be more specific." The Comment addresses the Panel Statement that the Proposal would need to be more specific and the Comment limits adding only Type MC to the rule for which the Panel admitted in Proposal 6-67 that the data submitted was for MC Cable only.

The Panel stated that sufficient data was not provided for inclusion of MC cable in section 310.15(B)(2)(c), even though testing was conducted by the Copper Development Association and the data was provided to the Panel members with Proposal 6-67. The data supported the fact that the heat rise in MC Cable on a rooftop in direct sunlight was equivalent to that in circular metal raceways. There does not appear to be a valid reason for rejecting this comment based on "insufficient data". The data should have been accepted and the need to increase the ambient temperature when installing MC cable on rooftops should be included in Section 310.15(B)(2)(c).
Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus on this issue.
Comment on Affirmative:

CLINE, S.: While there is certainly intuitive connection between MC and/or other cables and the conduit testing data, I have not seen data which would convince me in a scientific analysis. Yes, it's the same cable which, if in a conduit, would have the rules apply. Now it's directly in the sun - does that mean it gets as hot or hotter? Or does the airflow now available directly on the outer surface provide more cooling than the radiant heat applies? The physics of cable inside conduit is significantly different from exposed cable.

HUNTER, R.: There are different types of MC cables, which are unique in design, which were not tested. Also see my comments on 6-30.

THOMPSON, J.: Initial data suggests the need for a comprehensive research project to determine the affects of sunlight/rooftops on conduit, MC cable, and cable in general.

6-32 Log #687 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: David Brender, Copper Development Association, Inc.
Comment on Proposal No: 6-67
Recommendation: Section should read:

(c) Conduits and MC Cables exposed to Sunlight on Rooftops. Where conductors in conduits and MC cables are installed ~~or cables are installed in conduits~~ exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and 310.18.

Substantiation: This proposal should have been Accept in Principle. Type MC cable was extensively studied in response to a request from the Panel. Temperature data was submitted that showed MC cables exhibited similar temperature rise to cables in conduits. The research was published in a peer-reviewed IEEE Transaction Paper. It has received positive comments from inspectors and government officials for making temperature correction an enforceable part of the NEC. The Code already requires application of ambient temperature correction factors. This experiment determined the appropriate ambient temperatures to which the insulation is subjected. In the experiments in question, the conductors were not loaded (carrying current); the purpose of the research was to establish ambient temperatures only, for purposes of applying the correction factors in Tables 310.16 and 310.18.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The panel rejects use of the term "conduit" alone using "circular raceways" instead. The panel rejects the addition of type mc cable due to insufficient data to support the change.

6-34 Log #1232 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 6-67
Recommendation: Reject the Panel Action. Accept the proposal as submitted.
Substantiation: As indicated in the negative vote and comment submitted by NEMA's representative Sam Friedman, this proposal should have been accepted. The submitter of this proposal is the same person that submitted the 2008 proposal to require ambient temperature correction for conductors in *conduit*s on rooftops. The Panel accepted that proposal although not all conduits were tested. This cycle, the Panel rejected this proposal to include cables because not all cables were tested. The submitter's substantiation states that *"temperatures inside RNC raceways tend to be hotter than in EMT raceways and that black MC cables are comparable to RNC, except directly on the roof where the MC is hotter"*. These two contrary actions improperly impose different restrictions on different types of wiring methods, which according to the substantiation, are subject to the same need for ambient temperature correction.
Panel Meeting Action: Reject
Panel Statement: The panel rejects use of the term "conduit" alone using "circular raceways" instead. The panel rejects the addition of cables due to insufficient data to support the change.
Number Eligible to Vote: 11

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: William A. Wolfe, Steel Tube Institute of North America
Comment on Proposal No: 6-67
Recommendation: Accept the proposal and add "MC" in front of "Cables" so that the text reads:

Conduits and MC Cables Exposed to Sunlight on Rooftops. Where conductors in conduits or MC cables are installed exposed to direct sunlight on or above rooftops,...".

Substantiation: While we entirely agree with the negative comment of Mr. Friedman, we can support the negative comment of Mr. Zimnoch as an alternative. The panel rejected this proposal since not all cables were tested, although during the last NEC cycle, the Panel added "conduits" to the text even though all conduits were not tested. Since MC cables were tested and were found to "run hotter" than raceways that were tested, MC cables should be added to this requirement.
Panel Meeting Action: Reject
Panel Statement: The panel rejects use of the term "conduit" alone using "circular raceways" instead. The panel rejects the addition of cables including type mc cable due to insufficient data to support the change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 6 Negative: 4 Abstain: 1

6-36 Log #1671 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 6-66
Recommendation: Reject the proposal and substitute the following:

Raceways and Cables Exposed to Direct Sunlight on Roofs. Where cable wiring methods, raceways, and auxiliary gutters are installed on or directly above rooftops and exposed to direct sunlight, the adjustment factors shown in Table 310.15(B)(2)(c) shall be in addition to the adjustment factors in Table 310.15(B)(2)(a) and the outdoor temperature to determine the applicable ambient temperature for application of the correction factors for insulated conductors in Table 310.16 and Table 310.18.

Exception No. 1: Only the adjustment factors in Table 310.15(B)(2)(a) shall apply to conductors in an above-the-roof raceway mast.

Exception No. 2: Busway conductors.

Substantiation: Cable wiring method conductors are heated the same as conductors in raceways, perhaps more since there is less air circulation. Auxiliary gutters are noted since they are not listed in the definition of raceway. All applicable adjustment factors should be included in determining conductor ampacity. The adjustment factor for direct sunlight does not seem appropriate for raceway masts or busways.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the addition of cable and does not extrapolate the data to include other raceways or auxiliary gutters, as the data is insufficient to do so.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-37 Log #1792 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: Michael P. Walls, American Chemistry Council
Comment on Proposal No: 6-66
Recommendation: Reject the proposal and leave wording as is with Conduits instead of ~~Circular Raceways~~ at the start of the sentence.
Substantiation: Most in the electrical trade understand what "conduit" is. Using terminology that does not increase understanding is counter productive to the intention of the NEC. The concern of EMT not being officially conduit is totally unfounded—EMT is commonly referred to as "thin-wall conduit" and all appear to understand this. In the experience of ACC member companies, no electrician has ever asked a helper to hand him a "5 ft length of 1in. circular raceway!" A better option is to define EMT as "think-wall conduit" in Article 358.
Panel Meeting Action: Reject
Panel Statement: The Panel agrees that the term "circular raceway" is the appropriate term to use in this section. The submitter is correct that EMT is sometimes referred to as "thin wall conduit" but the NEC defines it as a "thin wall raceway of circular design".
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1 Abstain: 1
Explanation of Negative:

WALL, C.: I agree with the submitter that the term "conduits" is recognized and the term "circular raceways" is not. If the term conduit is not understood then it needs to be defined for clarity rather than introducing a less recognized term.

Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus on this issue.

6-38 Log #2576 NEC-P06 **Final Action: Accept**
(310.15(B)(2)(c))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-71
Recommendation: The proposal should have been fully rejected.
Substantiation: The use of the word "Where" in this case is the appropriate wording. The word "where" is limited to being a condition of place, and "when" is used in instances describing a condition of time. The NEC is a document governing electrical installations that will remain in place, and as such "where" is the usual term, and does apply in this instance.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-39 Log #2746 NEC-P06 **Final Action: Hold**
(310.15(B)(2)(c))

Submitter: Randal Hunter, City of Las Vegas
Comment on Proposal No: 6-70
Recommendation: Revise text to read as follows:

Conduits Exposed to Sunlight on Rooftops. Where conductors or cables are installed in conduits exposed to direct sunlight on or above rooftops, the ~~adjustments shown in Table 310.15(B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and Table 310.18~~ conductors shall be 90ºC and the wiring method shall be installed a minimum of 3½" above the rooftop.

Substantiation: The code as currently written is requiring our design professional and electricians to perform up to four different calculations in order to install any wiring method above a rooftop, and we also are referencing them to another standard(ASHRAE) which won't be available to the electricians, they barely have code books.

Table 310.16 is losing its validity when we continue to add more factoring issues that have to be taken into account. Another suggestion that has come up is to install the wiring methods thru the attic. This presents an even worse condition because we don't have free air in this environment and the starting temps in the attic are the maximum temps reached on the roof when installed less that 1" on the rooftop.

The data provided by CDA has shown that above 3 1/2" the temps reached are approximately 30ºF above the ambient temperature. If starting with a worst case of 120ºF that would lead us to a combined temp of 150ºF. This is well below the insulation rating of 194ºF of the conductors called out in the above revision. The conductors will only experience these elevated temperatures for a few hours a day a few days a year, and it is my understanding that commercially available conductors are rated to handle this type of condition without loss of life.

This is a compromise which should make it much easier on the contractors and inspectors in the field. The CDA testing which has been proceeding for the last few years has not had a witnessed failure of the insulation of the conductors. This fact, along with a lack of a valid third party certification of the testing methods, will just continue to lead to a foregone conclusion at every future code meeting due to a lack of information. By making the changes as outlined above, we are able to have a final, simple solution and further testing of other wiring methods and applications should not be required as we will have addressed the fact that temperature does increase on a rooftop and have a solution that allows us to make an installation which should not cause damage to the conductors based on the data provided by the CDA.

Panel Meeting Action: Hold

Panel Statement: The panel agrees to hold the comment based on Section 4.4.6.2.3 of the Regulations Governing Committee Projects. The basis for hold is the presentation of new material.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-40 Log #2808 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c))

Submitter: George A. Straniero, AFC Cable Systems, Inc.

Comment on Proposal No: 6-67

Recommendation: Accept the proposal in principle by revising the proposed text to be more specific:

(c) Conduits and MC Cables Exposed to Sunlight on Rooftops. Where conductors in conduits and MC cables are installed ~~or cables are installed in conduits~~ exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15 (B)(2)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.16 and 310.18.

Substantiation: The revised text offered by this comment is consistent with the direction suggested by the panel statement on proposal 6-67. The panel statement offered that the testing described in the substantiation was performed using MC cable only and that the proposal would need to be more specific. The revised wording of this comment provides more specific text that reflects the substantiation submitted with the proposal.

Panel Meeting Action: Reject

Panel Statement: The panel rejects use of the word "conduit" alone using "circular raceways" instead. The panel rejects the addition of type mc cable due to insufficient data to support the change.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 7 Negative: 3 Abstain: 1

Explanation of Negative:

FRIEDMAN, S.: Although the panel has stated that sufficient data was not provided for inclusion of MC cable in section 310.15(B)(2)(c), testing was conducted by Copper Development Association and data was provided to the panel members. The data supported the fact that the heat rise in MC Cable on rooftop in direct sunlight was equivalent to that in circular raceways. There does not appear to be a reason for rejecting this comment based on "insufficient data". The data should have been accepted and the need to increase ambient temperature when installing MC cable on rooftops should be included in section 310.15(B)(2)(c).

KENT, G.: This should have been Accept in Part and Principal. The panels change to 'circular raceways' should have been included, and "MC Cables" accepted. The submitter addressed the panel statement on "cables" and identified only "MC Cables" for which testing is submitted. No information was provided in the ROP to indicate added testing was needed for "MC Cables, actually, reading the panel statement, acceptance of the data is clear.

ZIMNOCH, J.: See Reason for Negative on Comment 6-31.

Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus on this issue.

Comment on Affirmative:

CLINE, S.: While there is certainly intuitive connection between MC and/ or other cables and the conduit testing data, I have not seen data which would convince me in a scientific analysis. Yes, it's the same cable which, if in a conduit, would have the rules apply. Now it's directly in the sun - does that mean it gets as hot or hotter? Or does the airflow now available directly on the outer surface provide more cooling than the radiant heat applies? The physics of cable inside conduit is significantly different from exposed cable.

THOMPSON, J.: Initial data suggests the need for a comprehensive research project to determine the affects of sunlight/rooftops on conduit, MC cable, and cable in general.

6-41 Log #1793 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c) and FPN, and Table 310.15(B)(2)(c) and FPN)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Michael P. Walls, American Chemistry Council

Comment on Proposal No: 6-70

Recommendation: The proposal should have been accepted as written, which would delete 310.15(B)(2)(c) and associated FPN and also delete Table 310.15(B)(2)(c) and FPN.

Substantiation: This requirement to temperature correct the ampacity of conductors on rooftops appears to have been submitted by a single testing agency. The panel should only accept testing that is independently verified.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide technical data sufficient to support the comments recommendation.

Technical substantiation was provided during the 2008 code cycle to support the ambient adjustment factors to conduit exposed on rooftops. This testing proved to the panel's satisfaction that the adjustments are required. The testing was based on the temperature readings, not on the location. The adjustment factors noted are based on raised ambient temperatures based on the tables. It is the elevated ambient temperature that affects the long-term aging of the conductor.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 7 Negative: 4

Explanation of Negative:

HUDDLESTON, JR., R.: I am voting to not support the Panel Action to reject this proposal, as I believe that field data does not support the inclusion of this ampacity deration for roof-top conductors. There have been no documented cases of conductor failures due to insulation damage on conductors installed on roof-tops, and there were many examples given of successful installations that had been in existence for many years without problems and without ampacity deration. The Panel should always take raw data and apply it properly to real world situations. Because there was no evidence of issues from the long-term use of conductors on roof-tops presented, the Panel should have rejected the data during the 2008 Code-making cycle.

HUNTER, R.: After years of data produced without verification by a third party organization during the entire project, this proposal and comment is the right thing to do.

MCCLUNG, L.: Code Panel 6 has now addressed the issue of solar radiation effects on the ampacity of wire in conduit (i.e. circular raceway) and Type MC Cable for rooftop applications since the 2005 cycle. The action of the Panel was to insert Table 310.15(B)(2)(c) "Ambient Temperature Adjustment for Conduits Exposed to Sunlight On or Above Rooftops" to address this issue. Over this period, the data submitted to the Panel to support this issue was developed from one site specific application where it was recognized that the intense sunlight had immediate effect on the temperature rise in the conduit and Type MC Cable. It should be noted that this testing was done on non-energized conductors in conduit and in Type MC Cable and that the data submitted did not address any long term aging effects. Yes, it gets hot inside the conduit or cable but to this point there has been no data presented showing any detrimental effects. Also, at no point during this period has the data submitted to the Panel been independently (i.e. third-party) verified.

To this point the Panel has excluded Type MC Cable from Table 310.15(B)(2)(c) as it recognized that there was insufficient data submitted for inclusion. The Panel should continue to do so.

For many years now, the electrical industry has safely used the allowable ampacity found in Table 310-16 including all adjustment factors, especially temperature, to size conductors in conduit and Type MC Cable for rooftop applications. Over this period, there has been no reported evidence of conductor or cable degradation due to the increased temperature rise inside the conduit or Type MC Cable. If there was a problem, you would think failure data would have been included in the many reports submitted to the Panel. Therefore, the present method of sizing conductors in conduit or Type MC Cable for rooftop applications using the time honored allowable ampacity values in Table 310-16 with appropriate adjustments is considered adequate.

Rather than relying on experimental data to size conductors in conduit and Type MC Cable for rooftop applications or using the time honored allowable ampacity values found in Table 310-16, the ampacity values can be calculated using the electrical/ thermal circuit found in the IEEE 835-1994(R2006) "*IEEE Standard Power Cable Ampacity Tables*" which includes the air space inside the conduit and cable. The ampacity values contained in this standard are based on the Neher-McGrath calculation method (which is recognized by the present code in Article 310-15) For conductors in horizontal conduit or cable in free air as would be found on rooftops, the ampacity calculation in this Standard includes the effect of sun (solar radiation) and wind. The following table contains some representative ampacity values from IEEE 835, Table 29 for three (3), 600V copper conductors in horizontal conduit in free air based on a conductor temperature of 90°C and an ambient temperature of 40°C. For comparison, the allowable ampacity values from Table 310-16, adjusted to a 40°C ambient, and adjusted per Table 310.15(B)(2)(c) at the 1/2 inch value above the roof have been included.

With such a wide variation in parameters and ampacity as shown in the above Table, the Panel should reconsider their position on this issue and render their judgment based on scientific methods versus experimental data from a single test site.

WALL, C.: There have not been documented real world failures. I would like to see peer review and documentation of real world failures that justify the use of the temperature adjustment factors for conductors in conduit on roof tops.

Comment on Affirmative:

CLINE, S.: I affirm the Action of the Panel during the 2008 cycle, which include specific majority rules regarding adoption. An opinion regarding the data is not valid. Please document a failure of the testing methods used.

6-42 Log #2735 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c) and FPN, and Table 310.15(B)(2)(c) and FPN)

Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 6-67
Recommendation: Delete 310.15(B)(2)(c) and FPN, and Table 310.15(B)(2)(c) and FPN.
Substantiation: The submitter's substantiation is valid. Unless evidence is submitted that conductor insulation is failing in rooftop applications, including this requirement is unjustified. The data submitted shows that it gets hot in a conduit on a rooftop, but does not show that there is a safety risk. No evidence of insulation degradation was included and no third-party data was included. A comparison of insulation types would also be necessary, as different insulation types have differing threshold failure temperatures, differing emergency overload characteristics, and differing chemical, physical and electrical performance in elevated temperatures.
For this proposal, the submitter wishes to include the general term "cables" when only a small sample of cables were tested. This term is too general, and once again there has been no evidence submitted that cables on rooftops are failing or present a safety risk due to elevated temperatures. Even for MC cables, the submitter has not shown any failures in rooftop applications. We have inspected cables that have been in service for decades on rooftops and found that the insulation was not compromised.
Panel Meeting Action: Reject
Panel Statement: The submitters recommendation does not correlate with Proposal 6-67.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-43 Log #2736 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c) and FPN, and Table 310.15(B)(2)(c) and FPN)

Comment on Proposal No: 6-70
Recommendation: Delete 310.15(B)(2)(c) and FPN, and Table 310.15(B)(2)(c) and FPN.
Substantiation: The submitter's substantiation is valid. Unless evidence is submitted that conductor insulation is failing in rooftop applications, including this requirement is unjustified. The data submitted shows that it gets hot in a conduit on a rooftop, but does not show that there is a safety risk. No evidence of insulation degradation was included and no third-party data was included. A comparison of insulation types would also be necessary, as different insulation types have differing threshold failure temperatures, differing emergency overload characteristics, and differing chemical, physical and electrical performance in elevated temperatures.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide technical data sufficient to support the comments recommendation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:

HUDDLESTON, JR., R.: See comment on 6-41.

HUNTER, R.: See Explanation of Negative on my comment 6-41.

MCCLUNG, L.: See my reason for negative ballot on Comment 6-41.

WALL, C.: The original data presented was not independently verified nor have failures been documented.

Comment on Affirmative:

CLINE, S.: Degradation of the insulating materials due to heat/temperature is the reason for de-rating conductor ampacity. This process in the Code has a very long history. Anecdotal statements regarding insulation damage are not sufficient - on the other side I have personally witnessed multiple rooftop conductor insulation failures. The assumption by evidence, is that insulations now in use, degrade with heat - at differing rates to be sure, but degrade over time. Derating is certainly meant to balance the relative risks of differing installations.

6-44 Log #2796 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c) and FPN, and Table 310.15(B)(2)(c) and FPN)

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Marty Brett, Steel Tube Institute of North America
Comment on Proposal No: 6-70
Recommendation: This proposal should be "accept".
Substantiation: We agree with the submitter's substantiation that there was no actual field data provided to indicate a problem, that the study was based on a limited range of conduits and conduit sizes with individual conductors, and that there was no independent verification of the study. The panel has rejected proposals to add "cables" to the ambient temperature correction requirements because only certain types of cables were tested. The panel should have rejected the 2008 proposal for conduits for the same reason: only certain conduits where tested. The appropriate action for this issue would be to reinstate the FPN that appeared in the 2005 NEC advising of a possible need for ambient temperature correction in these types of installations and to add "cables" to the FPN.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide technical data sufficient to support the comments recommendation.

Technical substantiation was provided during the 2008 code cycle to support the ambient adjustment factors to conduit exposed on rooftops. This testing proved to the panel's satisfaction that the adjustments are required. The testing was based on the temperature readings, not on the location. The adjustment factors noted are based on raised ambient temperatures based on the tables. It is the elevated ambient temperature that affects the long-term aging of the conductor.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 7 Negative: 4
Explanation of Negative:

HUDDLESTON, JR., R.: See comment on 6-41.

HUNTER, R.: This comment adds to the original proposal. Deleting this section would resolve the outstanding issues of no demonstrated insulation failures during testing and real world installations and the fact that this testing has been performed by a trade organization without independent third party verification and monitoring from the beginning of the project.

Additionally, TUV Rheinland visited the site for 2 days in November of 2009 and from this brief visit tried to validate the years of data produced, even though it was noted that there was "the absence of a Quality Manual and written test procedures".

This helps to confirm that this concept should only be an FPN, as noted by the submitter.

MCCLUNG, L.: See my reason for negative ballot on Comment 6-41.

WALL, C.: The original data presented was not independently verified nor have failures been documented.

Comment on Affirmative:

CLINE, S.: Degradation of the insulating materials due to heat/temperature is the reason for de-rating conductor ampacity. This process in the Code has a very long history. Anecdotal statements regarding insulation damage are not sufficient - on the other side I have personally witnessed multiple rooftop conductor insulation failures. The assumption by evidence, is that insulations now in use, degrade with heat - at differing rates to be sure, but degrade over time. Derating is certainly meant to balance the relative risks of differing installations.

6-47 Log #1959 NEC-P06 **Final Action: Reject**
(310.15(B)(2)(c) and Table 310.15(B)(2)(c))

Submitter: Joseph A. Ross, Ross Electrical Assessments
Comment on Proposal No: 6-66
Recommendation: Revise text to read as follows:

(c) Raceways and Cables Exposed to Sunlight on Rooftops. Where conductors ~~or cables~~ are installed in ~~conduits~~ raceways or cables exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(2)(c) shall be added...

Revise table as follows: Table 310.15(B)(2)(c) Ambient Temperature Adjustment for Raceways and Cables Exposed to Sunlight On or Above Rooftops
Substantiation: "Distance Above Roof to Bottom of Raceway or Cable."

This requirement was adequately covered in previous editions of the NEC in 310.10 and the Ampacity Tables Correction Factors, however the inclusion of 310.15(B)(2)(c) has served as a wake-up call to commence enforcement. The required ampacity adjustment applies to the circuit conductors regardless of whether they are enclosed in a conduit, tubing, or cable; hence the revision for the all inclusive "racways and cables."
Panel Meeting Action: Reject
Panel Statement: The panel rejects the addition of "cables" and does not extrapolate the data to include other raceways, as the data is insufficient to do so. Additionally, no data was provided by the submitter to support the change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

ZIMNOCH, J.: The Comment should have been Accepted in Principle by replacing "cables" with "Type MC Cables" in the title and the rule in 310.15(B)(2)(c) and in the title of Table 310.15(B)(2)(c). See Reason for Negative on Comment 6-33.
Comment on Affirmative:

LAIDLER, W.: We are voting along with the panel's action to reject this comment because sufficient substantiation has not been provided to warrant the inclusion of all types of raceways and cables at this time. We do agree with the submitter that 310.15(B)(2)(c) has served as a wake-call as far as enforcement of 310.10 goes and needs to be researched further to include other wiring methods that are installed above rooftops.

6-48 Log #2537 NEC-P06 **Final Action: Accept in Part**
(310.15(B)(2) Exception No. 4)

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 6-79
Recommendation: Revise text to read as follows:

Exception No. 4: Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit or rigid polyvinyl chloride ~~non-metallic~~ conduit (PVC), high density polyethylene conduit (HDPE) or reinforced thermosetting resin conduit (RTRC) having a length not exceeding 3.05M (10 ft) and if the number of conductors does not exceed four.
Substantiation: I would request that the panel reconsider their rejection of the original proposal 6-79 submitted. The changes proposed by the panel leave reference to "rigid" nonmetallic conduit, the only "rigid" nonmetallic conduit is PVC. This appears to be overly restrictive as HDPE or RTRC are not identified as a rigid nonmetallic conduit. Is it the intent of the panel to limit the use of this exception to PVC only? There is a RTRC raceway with identification as "XW," that is similar to schedule 80 PVC and has been accepted by some of the other code making panels and is listed as a raceway acceptable for use like PVC.

Additionally, the panel's statement "this section does not determine the type of conduits that are to be used," but within the current language rigid and intermediate metallic raceways are specifically allowed, the only metallic raceway types allowed. The CMP has the opportunity to determine the nonmetallic raceway types allowed to be installed where no derating for 4 or less current carrying conductors are used, whether it is PVC, HDPE, or RTRC. It is necessary to be specific to the nonmetallic raceway types or inconsistency and enforcement may be difficult. Without limitations any nonmetallic conduit could be installed and not have to apply any derating factors. Thank You!
Panel Meeting Action: Accept in Part

Revise text to read as follows:

Exception No. 4: Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit or rigid polyvinyl chloride ~~non-metallic~~ conduit (PVC) or reinforced thermosetting resin conduit (RTRC) having a length not exceeding 3.05M (10 ft), and if the number of conductors does not exceed four.
Panel Statement: The panel accepts the Submitter's recommendation to include Reinforced Thermosetting Resin Conduit (RTRC) and rejects including High Density Polyethylene Conduit (HDPE). High Density Polyethylene Conduit (HDPE) is not permitted to be used where exposed. Both RTRC and PVC conduits are defined as rigid nonmetallic conduits in their respective articles.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-49 Log #1678 NEC-P06 **Final Action: Reject**
(310.15(B)(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 6-81
Recommendation: Accept the proposal with the following revisions:

Where bare or covered circuit conductors are installed in a raceway, cable, or enclosure with insulated conductors, the temperature rating of the bare or covered conductors shall be considered equal to the lowest insulation temperature rating of the insulated conductors for the purpose of determining ampacity.
Substantiation: This provision should not apply where the conductors are part of open wiring on insulators, knob-and-tube wiring, open overhead aerial conductors, or direct-burial conductors. Circuit conductors should be specified as grounding and bonding conductors and usually don't have their ampacity determined, but are sized by other rules, other enclosures should be specified, since, for example, auxiliary gutters are not classified as a raceway per the definition in Article 100. This provision does not exclude open aerial conductors where a bare conductor may be installed with insulated conductors.
Panel Meeting Action: Reject

Panel Statement: The present rule covers all situations where bare or covered conductors are installed with insulated conductors. The comment attempts to detail specific applications by adding "raceways, cable, or enclosure" to the text. The panel prefers to leave this rule more generic as it is presently stated.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-50 Log #1858 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(c))

TCC Action: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 6-67
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:

(c) *Circular Raceways* *or Type MC Cables Exposed to Sunlight on Rooftops.* If ~~When~~ conductors or cables ~~are installed~~ in circular raceways or Type MC cables are installed exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(3)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.15(B)(2)(a) or Table 310.15(B)(2)(b).
Informational Note: One source for the average ambient temperatures in various locations is the ASHRAE Handbook — *Fundamentals*.

Table 310.15(B)(3)(c) Ambient Temperature Adjustment for Conduits or Cables Exposed to Sunlight On or Above Rooftops

	Temperature Adder	
Distance Above Roof to Bottom of Conduit or Cable	**°C**	**°F**
0 – 13 mm (1⁄2 in.)	33	60
Above 13 mm (1⁄2 in.) – 90 mm (3 1⁄2 in.)	22	40
Above 90 mm (3 1⁄2 in.) – 300 mm(12 in.)	17	30
Above 300 mm (12 in.) – 900 mm (36 in.)	14	25

Substantiation: This comment is intended to address the concerns of the Panel as included in the Panel Statement. The Panel is correct that the results of the testing as included in the substantiation for the proposal was for Type MC cables. The documentation proved conclusively that Type MC cables exposed to sunlight on rooftops experience nearly identical heat rise to conductors installed in circular raceways.

Extensive documentation on the heat rise experienced in the Type MC cables that were tested was submitted with the proposal. It is interesting to note the Panel apparently accepted the documentation (science) since no objection was raised in the Panel Statement.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts the part in (c)

Circular Raceways. The panel rejects the addition of type mc cable due to insufficient data to support the change. The panel rejects the change to the word "If".
Number Eligible to Vote: 11
Ballot Results: Affirmative: 6 Negative: 4 Abstain: 1
Explanation of Negative:

FRIEDMAN, S.: Although the panel has stated that sufficient data was not provided for inclusion of MC cable in section 310.15(B)(2)(c), testing was conducted by Copper Development Association and data was provided to the panel members. The data supported the fact that the heat rise in MC Cable on rooftop in direct sunlight was equivalent to that in circular raceways. There does not appear to be a reason for rejecting this comment based on "insufficient data". The data should have been accepted and the need to increase ambient temperature when installing MC cable on rooftops should be included in section 310.15(B)(2)(c).

KENT, G.: This should have been Accept in Part and Principal. The panel was correct to accept the change to 'circular raceways' and correct in rejecting 'if', but should have also accepted "and MC Cables". The submitter addressed the panel statement on "cables" and identified only "MC Cables" for which testing is submitted. No information was provided in the ROP to indicate added testing was needed for "MC Cables, actually, reading the panel statement, acceptance of the data is clear.

LAIDLER, W.: This comment should have been accepted. The submitter is correct in his substantiation when he states "Extensive documentation on the heat rise experienced in the Type MC cables that were tested was submitted with the proposal. It is interesting to note the Panel apparently accepted the documentation (science) since no objection was raised in the Panel Statement."

ZIMNOCH, J.: The Comment should have been Accepted in Principle by replacing "cables" with "Type MC Cables" in the title and the rule in 310.15(B)(2)(c) and in the title of Table 310.15(B)(2)(c). See Reason for Negative on Comment 6-33.
Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus on this issue.
Comment on Affirmative:

CLINE, S.: While we did agree with the use of the term "circular raceways" instead of "conduits", our position on the balance of the changes is as it was for other Proposal 6-67 Comments. While there is certainly intuitive connection between MC and/or other cables and the conduit testing data, I have not seen data which would convince me in a scientific analysis. Yes, it's the same cable which, if in a conduit, would have the rules apply. Now it's directly in the sun - does that mean it gets as hot or hotter? Or does the airflow now available directly on the outer surface provide more cooling than the radiant heat applies? The physics of cable inside conduit is significantly different from exposed cable.

HUNTER, R.: It is difficult to understand the panel statement, but the intention is to accept only the use of the words "circular raceways" as in other panel actions.

THOMPSON, J.: Initial data suggests the need for a comprehensive research project to determine the affects of sunlight/rooftops on conduit, MC cable, and cable in general.

(310.15(B)(6))

Submitter: Ron B. Chilton, Raleigh, NC
Comment on Proposal No: 6-87
Recommendation: This proposal should have been accepted.
Substantiation: There have been few sections of the National Electrical Code more misunderstood, confusing, and abused than Table 310.15(B)(6) of this Code. There was no exact formula leading to the diversity that has been considered for the last 50 years that led to allowing this Table to be used and, therefore, overload conductors greater than their known ampacities listed in Table 310.16, 30 years ago this Table may have seemed to work, it has outlived its usefulness. With the optional calculation for dwellings used in conjunction with the allowed ampacities of that Table, based on that theoretical diversity derived many years ago, we calculate circuits with the 3 watts per square foot rule, use 10,000 volt-amperes at 100 percent, then reduce the remaining total calculated figure by 60 percent. Then, we may supply that load with a service cable that could have an ampacity as much as 50 amps lower than what is permitted by Table 310.15(B)(6). We ultimately allow service and feeder conductors and equipment to be overloaded betting on diversity that may no longer exist due to the extended number of electrical appliance and household electronics now used daily in our homes. Homeowners never complain about too much service, too many receptacles, too much lighting, or too many circuit breakers yet in their new home when their lights dim due to the A/C compressor starting up they ask why the electrical code allows this to happen. The explanation that meeting the minimum requirements of the National Electrical Code is all that is required doesn't ease their concern. Many sections of the National Electrical Code have been changed when we realize we have allowed unfavorable conditions, for this reason and these issues we must progress with minimum standards for dwellings to meet what is actually demanded for our current situations.
Panel Meeting Action: Reject
Panel Statement: The panel rejects accepting Proposal 6-87 and the deletion of the subsection. No technical substantiation was provided to warrant the deletion, but the panel recognizes the concerns of the submitter. See panel action on Comment 6-55.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-55 Log #2261 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

TCC Action: The Technical Correlating Committee directs that Proposals 6-83a, 6-88, 6-90, 6-91, and 6-92 and Comment 6-55 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative on this comment.

After a review of all of the proposals and all of the associated comments on this particular issue, the Technical Correlating Committee has determined that neither correlation nor consensus were achieved as directed by the Technical Correlating Committee Notes on Proposals 6-83a and 6-85 and directs that the text of 310.15(B)(6) revert to the 2008 code language.

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 6-83a
Recommendation: The following uses the numbering from the ROP Draft with renumbered 2008 NEC 310.15(B)(6), as 310.15(B)(7).
(7) 120/240-Volt, Single-Phase Dwelling Services and Feeders.
The provisions of (a), (b), and (c) below shall be applicable for 120/240-volt, single-phase systems, for individual dwelling units of one-family, two-family, and multifamily dwellings.
(a) ~~For individual dwelling units of one family, two family, and multifamily dwellings, c~~Conductors, as listed in Table 310.15(B)(7), shall be permitted as ~~120/240-volt, single-phase~~ service-entrance conductors and service lateral conductors.
(b) Feeder conductors of a type listed in Table 310.15(B)(7), with an overcurrent rating matching the service rating, and installed in raceway or cable ~~for a dwelling unit~~, after adjustments and corrections, shall not be required to have an ampacity rating greater than the Table 310.15(B)(16) unadjusted 75degreeC allowable ampacity of the Table 310.15(B)(7) service conductors.
(c) The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.
In addition, delete the words "and Feeders" in the title of Table 310.15(B)(7), and delete the words (or Feeder" in the Table heading.
As the Section would read:
(7) 120/240-Volt, Single-Phase Dwelling Services and Feeders.
The provisions of(a), (b), and (c) below shall be applicable for 120/240-volt, single-phase systems, for individual dwelling units of one-family, two-family, and multifamily dwellings.
(a) Conductors, as listed in Table 310.15(B)(7), shall be permitted as service-entrance conductors and service-lateral conductors.
(b) Feeder conductors of a type listed in Table 310.15(B)(7), with an overcurrent rating matching the service rating, and installed in raceway or cable, after adjustments and corrections, shall not be required to have an ampacity rating greater than the Table 310.15(B)(16) unadjusted 75°C allowable ampacity of the Table 310.15(B)(7) service conductors.
(c) The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.
Substantiation: This Comment recognizes that it has never been the intention of the Panel to allow ignoring the rules of installation-condition-required adjustment (deration)—It is not expected to be allowed to supply a 200 amp feeder using 2/0 copper conductors in a conduit traveling across and close to the roof: then into a 45 degree C ambient, surrounded by insulation, and along with 12 other current-carrying conductors.
The original instance is in the 1975 NEC, as a Note 3 to the tables. All allowed types are 75 or 90 degree-C insulation types. The data of this Table was in text-sentence form as part of the "Notes to Tables 310-16 through 310-19" and has been expanded in scope (higher amperages and added types) since. The Panel's actual reasons could not be found, but the Note was certainly intended to recognize that the dwelling demand has a great diversity to it, and rarely, if ever, reaches a significant percentage of the overcurrent device's rating for any extended period of time, and that requiring the higher temperature insulations led to a practical installation. The accepted conductors have 75 degree-C ampacity ratings ranging from 83.75 to 92 percent of the Service Rating, with an average of about 87.5 percent.
Originally limited to three-wire service conductor runs only, the movement and modifications to the text, from an original Table Note - into its own Sub-section - and into a Table of its own, have created a condition where there appear to be ambiguous interpretations.
The purpose of this section is:
to apply only to the listed dwellings,
to apply only to 120/240-vo1t single-phase systems,
to apply to service-entrance or service-lateral conductors,
to apply to feeders with Service Rating-size-overcurrent-protection,
to require feeder conductors to be in raceway or cable,
to require the use of 75 or 90 degree-C minimum conductors,
to recognize that the 3-wires are: 2 ungrounded and 1 grounded (neutral),
to allow an equipment grounding conductor,
to allow reduction of the grounded conductor meeting other requirements.
It recognizes that there is no reason to require an adjusted-ampacity conductor for a feeder to have a higher amperage rating than the service conductor supplying it, since it can only carry the same or less current than the service conductors do. By clarifying that other adjustments still apply, the necessity to consider the feeder's status as a "main power feeder" is moot.
Proposal 2011-6-83a succeeded in:
defining the application to the listed dwellings,
defining the application to service conductors which must be 120/240-volt,
providing for requirement of the Table's conductor types for service conductors,
recognizing that the 3-wires are: 2 ungrounded and 1 grounded (neutral),
allowing an equipment grounding conductor to be installed,
allowing reduction of the grounded conductor meeting other requirements
Proposal 2011-6-83a failed to:
apply only to 120/240-volt single-phase feeders,
provide unambigouous limitation to feeders with Service Rating-size-overcurrent-protection,
provide for requirement of the Table's conductor types for feeders,
require feeder conductors to be in raceway or cable.
The Comment action on page 2 is intended to solve the deficiencies.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
The following uses the numbering from the ROP Draft with renumbered 2008 NEC 310.15(B)(6), as 310.15(B)(7).
(7) 120/240-Volt, Single-Phase Dwelling Services and Feeders
The provisions of (a), (b), and (c) below shall be applicable for 120/240-volt, single-phase systems, for individual dwelling units of one-family, two-family, and multifamily dwellings that supply a single service disconnect for each unit.
(a) Service Entrance and Underground Service Conductors. Conductors, as listed in Table 310.15(B)(7), shall be permitted as service-entrance conductors and underground service conductors.

(b) Feeder Conductors. Feeder conductors listed in table 310.15(B)(7) installed in conduit or as part of a listed cable assembly that do not require adjustments or corrections shall be determined using Table 310.15(B)(7). If adjustments or corrections are required, first determine the ampacity of the service conductors or laterals by utilizing Table 310.15(B)(16), using the 75 degrees C column values. After adjustments or corrections, the feeder conductors shall not be required to have an ampacity greater than the corrected value determined from the table.

(c) Grounded Conductor. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.

Panel Statement: The term service lateral was changed to underground service to agree with language by CMP 4. In the charging statement the panel clarified that the use of this method is intended for a single panel. The panel clarified in Section 310.15(B)(7)(b) the method to make adjustments in a step by step fashion.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 7 Negative: 4

Explanation of Negative:

FRIEDMAN, S.: The comment and the panel action should be rejected. The text created by the panel creates numerous issues and are outlined as follows:

1) The text in the main paragraph that states "shall be applicable" implies that the table must be used for the dwelling unit applications. In fact, the provision is an alternative to using the normal ampacity tables.

2) The provision applies to "multi family dwellings that supply a single service disconnect to each unit". This wording eliminates the application of the table in the most common multi-family applications where the entire dwelling unit is supplied by a feeder overcurrent device because the overall metering installation is protected by a single service disconnect.

3) The text, because of the removal of the wording associated with carrying the total load of the dwelling unit, can be applied to feeder conductors within a single dwelling unit that has multiple service disconnects supplying separate panelboards which is not intended by the original section.

4) The wording of item (b) in the panel action is very confusing and unclear as to what values are being adjusted or corrected. In addition, the final sentence of (b) implies that the values in the table are feeder ampacities, when in reality they are actually the rating of the service or feeder for the application and they do not represent the ampacity of the conductor size listed in the table.

HUNTER, R.: The language in (7)(b) leaves us in a situation of when and how to apply this. When the panel uses the word "if", it provides enforcement issues. Also, the multiple interpretations of diversity, as applied to this issue, proves that the material which was originally submitted in the 70's should be updated to better address today's construction practices.

Due to the confusion this new language will cause, we should revert to the 2008 NEC language for this cycle.

PICARD, P.: This language does not add clarity to application of this code provision. The language will create even more confusion. The Panel should have worked with the language in Comment 6-61. As noted in that Panel statement for Comment 6-61, the Panel action in Comment 6-55 may create anomalies in conductor sizing with no technical substantiation for the changes.

THOMPSON, J.: I agree with the position stated by members Mr. Friedman, Mr. Hunter and Mr. Picard. This language does not add clarity to the existing requirements in the 2008 Code. Consideration should be given to forming a Task Group to develop a proposal for the 2014 Code.

The current language in the 2008 Code should be retained.

Comment on Affirmative:

CLINE, S.: I was hesitant to comment on an item which I happened to submit, even though its only intent was editorial for clarification of existing 2008 requirements. I want to address the many good comments made during balloting.

Wording more clearly permissive than "shall be applicable" would be good, but "applicable" and "applied" are certainly different and there should be no question as to the non-mandatory nature of "shall be applicable." I do not know if the TCC or NFPA staff have the editorial latitude to make this "may be applied" or some less questionable wording.

I am unable to understand point 2 about the case where there is also a disconnect for the whole multi-meter setup. Where there is also a service disconnect for the individual unit, the Section may be applied.

It is true that this Section could be applied to multiple feeders, however, the sizing of every one of these feeders would have to be in accordance with the service rating/conductors. For example, a 200 amp rated service could indeed have two 200 amp feeders, each sized in accordance with the Table (possibly 2/0 copper); it could not have two 100 amp feeders sized by the Table.

It is correct that this whole Section applies only to the rating of the service; the whole purpose of the Section is not to change the ampacity of the conductors, but only to allow application of them under a circumstance normally requiring a conductor of higher ampacity.

If this Comment fails ballot resulting in a Reject of the Comment, I highly recommend to the TCC (if possible under its rules) that the Comment and the Proposal, be placed on Hold due to the failures of the Proposal's wording (see Comment 6-55 Substantiation).

HUDDLESTON, JR., R.: The Panel should be commended for its action on this comment.

6-56 Log #2350 NEC-P06 **Final Action: Reject**
(310.15(B)(6))

TCC Action: See the Technical Correlating Committee Note on Comment 6-55.

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 6-83a

Recommendation: This proposal should be rejected altogether.

Substantiation: While I applaud panel 6 for trying to fix this section, I don't believe this is the correct approach. A simpler fix would be to simply revert back to the 2005 text—text that everyone understood and text that had a long standing track record of safe installations. As currently proposed, there is much, much confusion as to what this section does and does not apply to.

A comment will also be made to proposal 6-88 to reiterate this concept.

Panel Meeting Action: Reject

(310.15(B)(6))

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 6-88

Recommendation: This proposal should have been accepted outright.

Substantiation: In Proposal 6-83a, the panel did an admirable thing in trying to fix this broken rule. In that proposal, Mr. Thompson recognizes that, while the intent of the panel was sound, the text didn't really work. A simple solution is to revert back to the well tested and well understood language of the 2005 text. There was no real substantiation justifying the change in the first place, so changing back to previous language seems to be a logical approach in fixing the problem pointed out in so many proposals this cycle.

Panel Meeting Action: Reject

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 6-83a

Recommendation: The proposal should be accepted in principle and in part. Accept the concept of reformatting the section into three parts. Reject the elimination of the text [shown in the proposal as the struck-through text in the parent language of (6)] that requires the conductors to see the entire load of the dwelling unit.

Substantiation: This change, apparently based on the reasoning in Proposal 6-88, is based on fallacious reasoning. Removing an air-conditioner from a load profile obviously reduces the load. It also increases the intensity of the load that remains on the feeder, and thereby works to undermine the validity of the ampacity values allowed in this section. The load that remains on those conductors will be the subject of a new load calculation reflecting the actual connected load that remains. This process of load shedding could continue until there was only a single load left, that might even run continuously. Under the panel action, these special ampacities will apply even to this single load, provided the installation is residential. The panel statement on Proposal 6-61 in the 2008 code cycle was completely correct, namely: "It is the panel's intent that this allowance apply only to conductors carrying 100% of the dwelling unit's diversified load."

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 6-55.

Number Eligible to Vote: 11

6-59 Log #2737 NEC-P06 **Final Action: Reject**
(310.15(B)(6)(b) and (c))

TCC Action: See the Technical Correlating Committee Note on Comment 6-55.
Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 6-83a
Recommendation: Revise the panel's recommendation and delete the feeder conductor language as follows:
~~(b) The fFeeder conductors to for a dwelling unit, after adjustments and corrections, shall not be required to have an allowable ampacity rating greater than the Table 310.15(B)(16) allowable ampacity of their the service-entrance conductors.~~
(~~e~~b) The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.
Substantiation: As the Chair pointed out in his comment, the language no longer has a direct connection for sizing feeders. If the panel deletes the language about feeder conductor sizing in this section, users of the Code could simply use the language in 215.2(A)(3) to determine feeder sizing for dwelling units.
Panel Meeting Action: Reject
Panel Statement: The panel modified the language upon which the comment was based and therefore rejected this comment. The panel recognizes the concerns of the submitter. See panel action on Comment 6-55.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
PICARD, P.: See comment on Comment 6-55.

6-60 Log #2234 NEC-P06 **Final Action: Reject**
(310.15(B)(6), FPN)

Submitter: Charles E. Beck, Affiliated Engineers NW, Inc.
Comment on Proposal No: 6-86
Recommendation: Add the following Fine Print Note at the bottom of Table 310.15(B)(6):
FPN: The "Service or Feeder Ratings" shown in the above table shall be permitted to be considered the ampacities of the associated conductors only for the specific conditions of use that are addressed in this article.
Substantiation: The "Panel Statement" describing the reason for rejecting this proposal describes the values in the table with the following words, "The conductor ampacities listed in 310.15(B)(6)...". But nothing in the table itself, and nothing in the text that refers to the table, includes the word "ampacities." All the table presently permits is certain conductors to be used for certain service or feeder ratings. That is not the same thing. If the CMP wishes to permit the table to be used as an ampacity table, then the fact should be stated in the table itself, or in the article that refers to the table.
Panel Meeting Action: Reject
Panel Statement: The Rule Governing Committee projects does not permit mandatory language in Informational Notes (FPN). See the panel action and statement on Comment 6-55.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

6-61 Log #1592 NEC-P06 **Final Action: Accept in Principle in Part**
(310.15(B)(7))

TCC Action: See the Technical Correlating Committee Note on Comment 6-55.
Submitter: Jim Pauley, Schneider Electric
Comment on Proposal No: 6-83a
Recommendation: Revise the proposed 310.15(B)(7) as follows:
(7) 120/240-Volt, Single-Phase Dwelling Services and Feeders
(a) For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(7), shall be permitted in the following ~~as~~ 120/240-volt, single-phase applications where the conductors carry the total load of the dwelling unit:
__1. service-entrance conductors
__~~2. and~~ service lateral conductors
__3. feeder conductors
__(b) Feeder conductors for ~~a~~ individual dwelling units shall not be required to be larger than the service entrance or service lateral conductors. Where the service entrance conductor or service lateral is copper and feeder conductor is aluminum, the feeder conductor shall be sized using Table 310.15(B)(7) based on the service rating for the copper service entrance or service lateral conductors. ~~after adjustments and corrections, shall not be required to have an ampacity rating greater than the Table 310.15(B)(16) allowable ampacity of the service conductors.~~
(c) The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.
Substantiation: The continual changes to this section are resulting in significant misunderstandings and resulting in major cost increases for the cables needed for dwelling units. The changes in this comment actually resolve two issues. First, it takes the basic rule back to what was originally intended when it went into the NEC. Second, it more generically addresses the issue of feeder conductors being larger than the service conductors.
Here is the specific substantiation:
Item (a) of the section is revised to put feeder conductors back into the language. It also splits the text up with a list to avoid misapplying the various limitations to different conductors. Note the addition of the language that regardless of whether it is a feeder, service entrance conductor or service lateral conductor – it must always carry the total load to the dwelling unit. This was the original substantiation for having the rule in the code in the first place. What was shown was that when you looked at the total loading of a dwelling unit (total was the only thing measured), you could safely use conductors sized as shown in the table. It was never substantiated to allow the use of the table when the total load was not being carried.
The panel's removal of feeder conductors creates significant issues in multi-family applications. The feeders do carry the total load to the individual dwelling unit and as such the table should apply. The panel has removed this application completely.
The ROP wording (and the 2008 NEC wording) actually permits the table to be used for service entrance conductors that do not carry the total load. This is a misapplication from the original intent. Why would I be able to use the table for service conductors from a meter socket to two separate 200A panels when neither of the panels carries the total load? The panel was correct in its effort in the 2008 NEC to put back in the total load to the dwelling unit wording, but they didn't apply the words to all of the applications as it should have been.
I understand the panel's intent to try to word item (b) to equate the allowable ampacities between the feeder and the installed service conductor. However, this will still create some fairly significant anomalies in the conductor sizing without substantiation. For example, take a single family dwelling service rated 200A. It has an outside main disconnect. Feeder conductors then continue inside to a 200A panel. Under the proposal wording, I could use a 4/0 Al SE cable for the service entrance conductors to the 200A disconnect. However, for a 200A SER feeder (assuming it goes through some type of thermal insulation) going into the dwelling I will need to install a 300 kcmil Al SER cable (195A at 60C). Is there any evidence that has been presented to the panel that would show conductors simply sized out of the table are problematic in these applications?
The proposed revision to (b) actually attempts to solve that problem by using the language from 215.2(A)(4) which states that a feeder conductor need not be larger than the service conductor. This takes the ampacity language out of play. Basically, if I have a 4/0 Al service entrance conductor, I am not required to install a 250kcmil Al or 300 kcmil Al feeder conductor for that dwelling unit. There is a rare instance where the sizing in this manner can result in an incorrect result. This is when the service entrance conductors are copper and the feeder is aluminum. The proposed wording takes this into account by requiring that the aluminum conductor be selected from Table 310.15(B)(7) based on the service rating for the copper service entrance conductor. So if I used a 2/0 copper service entrance conductor for a 200A dwelling unit service under 310.15(B)(7), the aluminum feeder to the dwelling unit would have to be at least 4/0 Al.
Here is a summary of the applications that would be permitted under the ROP wording and under this new proposed rewording:

Application (120/240V single phase dwelling)	2011 ROP Wording	This Comment wording
Service entrance conductors carrying total load	Table applies	Table applies
Service entrance conductors that do not carry the total load	Table applies	Table does not apply
Feeders that carry the total load	Table does not apply	Table applies
Feeders that do not carry the total load	Table does not apply	Table does not apply[1]

[1] However, the feeder would not have to be larger than the service conductor.

Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel accepts in principle part (a) of the submitters comment.

The panel rejects part (b), because the current NEC terminology "allowable ampacity" was intended to require "adjustments and corrections" where applicable. Deletion of this terminology is not substantiated.

The panel recognizes that the accepted action on Comment 6-55 may create "anomalies" in the conductor sizing. No evidence was presented to the panel that show conducers sized out of the table have presented problems.

Ballot Results: Affirmative: 11

6-63 Log #2331 NEC-P06 **Final Action: Reject**
(Table 310.16)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 6-99
Recommendation: Reject the proposed change.
Substantiation: I agree with Mr. Wall's comments on this matter. There have been no documented cases of the existing table being inadequate or unsafe. It is my opinion that the CMP should keep the track record of these values in mind before revising them. If the existing values are unsafe, where are the fires? The conductors that are being changed are the most commonly used conductor sizes in the country. If this was a real problem, it would have manifested itself long, long ago.
This proposal seems to fix a problem that doesn't exist. Perhaps a better solution would be to change the CEC instead of the NEC? It seems that if these values are in the CEC, the CEC is overly restrictive—the NEC is certainly not overly restrictive or we would be discussing electrical fires in the substantiation.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that the NEC/CEC ampacity harmonization task group performed adequate verification using IEEE 835-1994 IEEE standard power cable ampacity table to validate the ampacities shown in the original proposal.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-64 Log #2578 NEC-P06 **Final Action: Reject**
(Table 310.16)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-99
Recommendation: The proposal should be accepted in part. Reject the modifications to 14 and 12 AWG copper wires, and to the 12 AWG aluminum wires.
Substantiation: As noted in the comments in the voting, these modifications are based on calculations and not real-world experience. Although 240.4(D) makes the impact of these changes moot in many cases, motor circuits are not bound by these limitations, and the 110.14(C)(1)(a)(4) relief only applies at the motor and not to other locations in the circuit. Small motor circuits have used the table ampacities for decades in the context of devices not marked for higher temperature connections with no reported loss experience, and this change should be better substantiated before imposing a significant change on code users.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that the NEC/CEC ampacity harmonization task group performed adequate verification using IEEE 835-1994 IEEE standard power cable ampacity table to validate the ampacities shown in the original proposal.
Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-66 Log #1956 NEC-P06 **Final Action: Reject**
(Table 310.17)

Submitter: Charles M. Trout, Maron Electric Company
Comment on Proposal No: 6-112
Recommendation: Delete Table 310.17 in its entirety.
Substantiation: This proposal should be accepted. Section 110.14(C) requires that ALL equipment termination provisions shall be based on Table 310.16. The panel statement is incorrect in stating this does not apply to busbars or splicing devices. It applies to ALL equipment terminations.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms rejection of Proposal 6-112.

Derating calculations utilize Table 310.17 values, then are limited by termination maximums. Larger conductors based on termination requirements in 110.14(C) are permitted to be spliced to smaller conductors for long runs based on Table 310.17.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-67 Log #106 NEC-P06 **Final Action: Accept**
(Table 310.20)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 6-118
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal related to the word "allowable".

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel rejects the inclusion of the word "Allowable".
Panel Statement: The panel recognizes that the word "Allowable" was inadvertently added by the panel action on Proposal 6-118 without substantiation due to the word not being underlined in the original proposal. The panel action on Proposal 6-118 should have been Accept in Part rejecting the addition of the word "Allowable".
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-68 Log #1857 NEC-P06 **Final Action: Accept in Principle in Part**
(310.20(H))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 6-16
Recommendation: Revise the text of the 2011 NEC ROP Draft as follows:
(H) Conductors in Parallel.

(1) General. Aluminum, copper-clad aluminum, or copper conductors for each phase, polarity, neutral, or grounded circuit shall be permitted to be connected in parallel (electrically joined at both ends) only in sizes 1/0 AWG and larger ~~Aluminum, copper-clad aluminum, or copper conductors 1 AWG and smaller, comprising each phase, polarity, neutral, or grounded circuit conductor shall not be connected in parallel (electrically joined at both ends). Where conductors of size 1/0 and larger are installed in parallel they shall be~~ if installed in accordance with 310.10(H)(2) through 310.10(H)(6). **[ROP 6-16]**

Exception No. 1: Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, or for frequencies of 360 Hz and higher, provided all of the following apply:

(a) They are contained within the same raceway or cable.

(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.

(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 2: Under engineering supervision, 2 AWG and 1 AWG grounded neutral conductors shall be permitted to be installed ~~run~~ in parallel for existing installations. **[ROP 6-19]**

Informational Note to Exception No. 2: Exception No. 2 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

(2) Conductor Characteristics. The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, equipment grounding conductor, or equipment bonding jumper shall comply with all of the following: **[ROP 6-17]**

(1) Be the same length
(2) Consist of ~~Have~~ the same conductor material
(3) Be the same size in circular mil area
(4) Have the same insulation type
(5) Be terminated in the same manner

(3) Separate Cables or Raceways. If ~~When~~ run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors and shall have the same physical ~~electrical~~ characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor. **[ROP 6-20]**

(4) Ampacity Adjustment. Conductors installed in parallel shall comply with the provisions of 310.15(B)(3)(a).

(5) Equipment Grounding Conductors. If ~~Where~~ parallel equipment grounding conductors are used, they shall be sized in accordance with 250.122. Sectioned equipment grounding conductors smaller than 1/0 AWG shall be permitted in multiconductor cables in accordance with 310.104 provided the combined circular mil area of the sectioned equipment grounding conductors in each cable complies with 250.122.

(6) Equipment Bonding Jumpers. If ~~Where~~ parallel equipment bonding jumpers are installed in raceways, they shall be sized and installed in accordance with 250.102. **[ROP6-17]**

Substantiation: The Code Panel is to be applauded for its efforts to improve the clarity of the rules that apply to conductors installed in parallel. The suggestions included in this Comment are intended to assist the Panel in this quest.

The original language CMP-6 has used in (H)(1) for many editions of the Code is rearranged, hopefully, to improve clarity and avoid the multiple rules on sizes of conductors that are generally permitted to be installed in parallel.

In (H)(1) Exception No. 2, the word "run" is to be replaced with "installed" for clarity.

In (H)(2)(2) the words "consist of" are intended to replace "have" as perhaps conductors don't "have conductor material" they "consist of conductor material"!

I will take one more crack of the bat in trying to convince the Panel that "physical" is better than "electrical" in describing the characteristics of raceways or cables installed in parallel. Granted, "electrical characteristics" is technically correct. However, installers and inspectors have, for many years, clearly understood "physical characteristics" to mean the installation is not permitted to consist of one run of EMT and another of IMC or RMC. They are different physically which is easy to determine. With the change to "electrical characteristics," discussion and debate will occur over whether these three metal raceways have the same "electrical characteristics." Or, unfortunately, perhaps the discussion won't take place and people will assume the metal raceways are the same electrically. Add an aluminum conduit to the mix and the discussion can get more confusing. After all, the aluminum conduit is conductive so it must be the same as EMT, IMC and RMC. Right? It seems like a "fix" for something that wasn't broken!

The proposed change to (H)(5) is intended to be editorial and add clarity. This Comment intends to use the word "if" where appropriate. Note that:
the use of the word "when" is to relate to a condition of time;
the use of the word "where" denotes a location; and
the use of the word "if" requires a complying action.
Section 3.3.4 of the NEC Style Manual states that "where" should not be used to mean "when" or "if."

Panel Meeting Action: Accept in Principle in Part

The panel accepts in principle in part the recommendation.
The change in principle in 310.10 (H)(1) and 310.10(H)(3) the word "if" is revised to "where".

The panel rejects the changes to the word "if" in 310.10(H)(5) and 310.10(H)(6).

The panel rejects the change to the word "physical" in 310.10(H)(3).

The panel accepts all other changes.

Panel Statement: The panel accepts in principle in part the recommendation. The use of the term "where" is correct. The panel agrees that the term "electrical" is more technically correct for this requirement. The panel accepts the remaining changes as editorial without changing the intent of the section.
Number Eligible to Vote: 11

6-69 Log #340 NEC-P06 **Final Action: Accept**
(310.60(C)(2)(b))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-124
Recommendation: The proposal should be rejected.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.

Ballot Results: Affirmative: 12

9-5 Log #1299 NEC-P09 **Final Action: Reject**
(312.6 Exception)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 9-27
Recommendation: The Proposal should be Accepted in Principle and "…with provisions for one or two wires per terminal shall comply…" revised to read "…with provisions for one or two wires to be attached to each terminal shall comply…"
Substantiation: The Panel Statement made an excellent point that the number of wires that can be attached to a terminal is decided at the point of manufacture and not at installation. This revision will be more explicit that the number of wires to be attached to a terminal cannot exceed the manufacturer's design.

The proposed wording is more appropriate for a standard and is more explicit in describing the installation.

The Manual of Style for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).

Most of the Panels have accepted changes to replace "per" with more explicit language and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: The elimination of the word "per" in its long-standing use as a preposition makes the language of the NEC more stilted and less readable without adding clarity. CMP 9 reaffirms its action and statement on Proposal 9-27.

9-11 Log #2466 NEC-P09 **Final Action: Reject**
(312.8(3))

Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 9-34
Recommendation: Revise committee language in 310.8(3) to:

(3) A label shall be applied to the feed-through conductors that identifies them as feed-through conductors within the enclosure.
Substantiation: The committee offered no substantiation for requiring the equipment to be labeled. The committee labeling requirement goes too far to require each disconnect for the feed-through conductors be identified. Such a label requirement is not even required for the feeder serving the equipment itself. The label may not warrant a level of "warning" or even a level of "caution." Consider the parallel of opening a wireway and installing another conductor, are we concerned with the other conductors already contained within being energized? I agree that identification of the feed-through conductor is of value, but the present language proposed by the committee places in question why we required the insulation of taps in wireways and do we need to have extensive labels on them which would seem to be well outside the bounds of electrical industry practice today.
Panel Meeting Action: Reject
Panel Statement: CMP 9 disagrees that giving notice as to the location of the upstream disconnecting means is excessive in these cases. CMP 9 is now, in accordance with the terms of Proposal 9-142, requiring this sort of labeling on panelboards and switchboards. CMP 9 does not have jurisdiction over wireways, but there may be a qualitative difference between the relative number of terminations and splices in cabinets and cutout boxes as opposed to wireways. This would be a decision for CMP 8 to make in a subsequent code cycle. The concept of providing the warning label was accepted in principle by the panel action on Proposal 9-33.

Ballot Results: Affirmative: 12

9-12 Log #1236 NEC-P09 **Final Action: Accept**
(312.10(B) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-36
Recommendation: This Proposal should be rejected.
Substantiation: UL 50 already contains the proposed requirement for the enclosures covered in Article 312. UL 50 states, "An edge on an enclosure shall not be sufficiently sharp to constitute a risk of injury in normal maintenance or use." The proposed language is unenforceable and would lead to non-standard interpretation. The objective of this proposal is already covered in Section 110.3(A)(8) under "Examination" of equipment. It would be nearly impossible to address each and every of such "other factors" separately in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

BELISLE, R.: The panel should have rejected this comment. The proposed language is clear and under "section II. Construction Specifications", the requirement would apply to manufacturers in a production facility that is designed and constructed to build products to very tight specifications. This is clearly the appropriate location for such requirements. Additionally, the current standard does not apply to "areas subject to contact during installation."

FOGARTY, R.: See my Explanation of Negative Vote on Comment 9-15.

HARTWELL, F.: Refer to my explanation of negative vote on Comment 9-15.

9-13 Log #1608 NEC-P09 **Final Action: Accept**
(312.10(B) (New))

Submitter: Thomas A. Domitrovich, Eaton Corp.
Comment on Proposal No: 9-36
Recommendation: Reject this proposal
Substantiation: There are many hazards on the job site that could hurt an individual but not every hazard is that which should be addressed by the National Electrical Code. Safety of those who work with electrical products should be at the top of our list but there are other ways to help those who work with electrical products on issues such as this.

These requirements should be appropriately addressed in the product standards, not in an installation code.
Panel Meeting Action: Accept

9-14 Log #1652 NEC-P09 **Final Action: Accept**
(312.10(B))

Submitter: John W. Young, Siemens Industry
Comment on Proposal No: 9-36
Recommendation: Reject the Proposal.
Substantiation: The submitter describes this as a major problem but there is no substantiation and this does not agree with what UL or the manufacturers are seeing.

Mr. Osborne comments that UL encouraged the filing of file field reports of incidents so this could be investigated but that no field reports or complaints have been filed. Mr. Rupp comments that manufacturers are not receiving reports of incidents. If this is a major problem why aren't manufacturers or UL hearing about it.

This is a subject that is dealt with in the product standards and Mr. Osborne comments that an invitation had been extended to participate in the standards activities if there is a view that the standards need to be revised but again no one accepted the invitation to address this.

If there are isolated problems these need to be reported and investigated and dealt with. If something needs to be done it should be in the standards and not in the Code.
Panel Meeting Action: Accept

9-15 Log #1770 NEC-P09 **Final Action: Accept**
(312.10(B) (New))

Submitter: Chad Kennedy, Schneider Electric/Square D
Comment on Proposal No: 9-36
Recommendation: This proposal should be rejected.
Substantiation: CMP 9 has created a significant dilemma with this proposal. It raises more questions than it answers and, in fact, places the electrical inspector in an untenable position. Each of the following questions must be addressed before consideration this topic can be appropriately addressed

1. There has been no comprehensive data or statistics provided to demonstrate exactly what problem is being fixed. Scrapes, scratches and cuts occur for many reasons on a construction site. Even plastic edges can take the skin of a knuckle if hit at the right angle. Interestingly, most electrical contractors we talk to focus on luminaire housings as the most significant source of edges - not cabinets or cutout boxes.

2. There is a product standard that covers sharp edges. Is the alleged issue with products that meet the standard or with products that do not meet the standard? If it is with products that meet the standard, then we need to address the product standard directly. If it is with products that do not comply with the standard, then we need to step up enforcement of the standard. Again, with no data we can't develop an action plan.

3. We did a review of our internal processes and products and found compliance with the UL standard. If these same products are the ones in the field that someone says has a sharp edge, how is it expected to be resolved? Interestingly, UL has a significant field reports process that is used by inspectors and installers – we have not seen any reports through this system that would indicate that sharp edges on cabinets are an issue.

4. The panel has provided no performance criteria for a "sharp edge". This simply invites a wide variation in what is acceptable and what is not. If the inspector says that the edge is sharp, but the contractor says it isn't – who is correct (given the fact that the contractor was the one doing the "normal installation")?

5. The words "edges subject to hand contact during normal installation" are confusing. What would be an edge not subject to hand contact?

6. How does an inspector test for a "sharp edge" in the field? Subjective? Opinion? If the contractor was not "cut" during installation was the edge sharp?

7. Given that nobody has submitted a proposal to the product standard to modify the requirements, is the panel assuming too much about where the problem actually exists? Perhaps the issue is with unlisted or field fabricated equipment?

8. The proposal language attempts to provide design requirements by stating that the equipment must be "protected" or "de-burred and rounded". This list of compliance methods is extremely restrictive. Since the panel has no evidence of what products or parts of a product create the actual issue, how could it possibly consider methods of compliance?

This proposal cannot be enforced in the NEC. Concerns with sharp edges must continue to be addressed by performance based standards that can uniformly be applied to the products. If actual field issues exist, they need to be submitted to the certification agency so that appropriate action can be taken.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:

BELISLE, R.: See Ballot comment 9-12.

FOGARTY, R.: The panel should have rejected Comment 9-15, and thereby accepted Proposal 9-36, which sought to revise the Code to require metal enclosure products to be manufactured with exposed edges either protected or de-burred and rounded to minimize the risk of injury. This would have then resulted in corresponding revisions to the relevant product standards.

The panel's unanimous belief that unprotected burred and sharp edges do present a real safety concern to installers is clearly evident in its statement on Comment 9-19.

Absent a standard or Code revision, this ongoing concern will continue to exist because of the competitive need to make a product that just meets the current product standards. Obviously, no one wants to make an unsafe product. However, in the low bid world, the reward for being the first manufacturer to voluntarily exceed the current standard to make a safer product is the loss of market share to those who continue to meet it.

HARTWELL, F.: The existing product standard is insufficient, and this revision would lead to suitable refinements to that standard. By locating the rule in the construction part of the article, compliance with the requirement would be principally enforced by the testing laboratories, subject to field review in egregious cases under 110.3(A). This is as it should be. For example, no one expects inspectors to routinely run around with calipers and measure the thickness of steel outlet boxes to judge compliance with the 0.0625 in. dimension in 314.40(B). The comment requests clarification as to which edges are subject to hand contact during installation; one could ask any electrician but one example would be an enclosure with riveted ends. The edge at the enclosure opening would be subject to contact, but the others, being flush against other surfaces, would pose no hazard and would also meet the "protected" criterion.

This working electrician is not surprised by the lack of routine injury reports to manufacturers, because the workforce culture among electricians is not one where such complaints will be made. The prevailing ethic is to suck it up and move on. In addition, the funding for field personnel to participate in STPs is extremely problematic. It is certainly true that edges of fluorescent luminaires have become a very significant issue as the gauges of steel employed have decreased leaving cut edges inherently sharper, but CMP 9 does not have jurisdiction over Article 410.

Since the underlying proposal is now to be rejected, the manufacturers and the testing laboratories have opened a window to address these issues through modifications in the product standard and testing protocols. Fair enough. It should be duly noted that that window may begin to close after the first Friday in November, 2011, if no progress ensues. Refer to the last sentence of the panel statement on Comment 9-19.

9-16 Log #1929 NEC-P09 **Final Action: Accept**
(312.10(B) (New))

Submitter: Robert D. Osborne, Underwriters Laboratories Inc.
Comment on Proposal No: 9-36
Recommendation: The Panel should reject this proposal.
Substantiation: Panel members agree that the concern with sharp edges is one to be addressed by the product standards. Requirements exist in the Standards, and members of the panel were encouraged to participate in the Standards process if they believed requirements were in need of revision. As a result of discussions during the last Code cycle, all members were extended an invitation to join Standards Technical Panels, and encouraged to file field complaints so problems could be identified and addressed. No members choose to accept this invitation, and, no field reports related to this issue have been filed. Properly documented field complaints can be used to identify whether a problem is specific to an industry, a manufacturer, or a specific factory. Multiple field complaints for a specific category and/or specific issue can be used to identify a systemic problem and may used to develop proposals to a standard or revisions to a certification program.

What constitutes a sharp edge is subjective, and with any subjective requirement, the code user is placed at a disadvantage when applying the requirements. Additionally, the ability of the AHJ to decide on the approval of equipment is already provided in 90.4. Should inspectors conclude that sufficiently sharp edges exist on equipment, they can reject the installation citing 90.4.

It is suggested that panel members refocus their efforts and address this concern in the proper forum rather than introducing requirements that are misplaced.

9-19 Log #653 NEC-P09 **Final Action: Reject**
(312.12(B) (New))

TCC Action: The Technical Correlating Committee understands that Comment 9-19 is directed to Proposal 9-36 dealing with 312.10(B)(New) rather than 312.12(B)(New).
Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 9-36
Recommendation: This proposal should be accepted as is.
Substantiation: I realize that this new rule would be hard for the local AHJ to enforce, however, since the manufacturers and standards seem unwilling to address the problem, the NFPA can take the lead through this rule. I have over thirty years in the trade and have received stitches three times due to sharp edges. There have been numerous other times that I have had minor cuts that only required a band-aid. I presently work for a contractor that employs about 150 electricians. The company's safety director has told me that on average three employees a year get stitches due to sharp edges in equipment. He has no idea how many have received, but not reported, minor cuts that did not require professional medical attention. The de-burring of these edges could most safely be done in the manufacturing process. After all, in the field to de-burr one needs to expose themselves to edges that have not already been de-burred.
Panel Meeting Action: Reject
Panel Statement: CMP 9 understands the importance of worker safety during the installation of these products and has given this issue careful consideration. The proposed requirement is very subjective and would add a substantial burden to the installers and inspection communities. This subject is best handled through the cooperative efforts of installers, manufacturers and approval agencies. CMP 9 recognizes that the concern expressed in this comment and Proposal 9-36 is real and urges the industry stakeholders to proactively address this issue in the product standard development process.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
BELISLE, R.: The panel should have accepted this comment. The substantiation to reject is based on an assumed "burden" that would be placed on installers and inspectors? This makes no sense as the proposed requirement would be inserted in the NEC under section II. Construction Specifications. As stated and agreed to during the panel meeting, rarely does an inspector or installer verify that a box thickness is "not less than 1.35 mm (0.053 in.)" per NEC requirements, or that ample spacing of a door from live parts exist, etc.
Only in a clear case of poor construction or obvious reduced safety does the installer/inspector community have to address such a concern. These "II. Construction Specifications." apply to manufacturers in a production facility that is designed and constructed to build products to very tight specifications. This is clearly the appropriate location for such requirements.
The panel unanimously agreed that the concern for safety is real and that action needs to be taken. It is unclear why some members of the panel chose to defer the action to another process that is unfamiliar to most members, while action taken at the NEC level would have prompted action by manufacturers to act, rather than promote further study, discuss, and formulate future actions.
FOGARTY, R.: See my Explanation of Negative Vote on Comment 9-15.
HARTWELL, F.: Refer to my explanation of negative vote on Comment 9-15.

ARTICLE 314 — OUTLET, DEVICE, PULL, AND JUNCTION BOXES; CONDUIT BODIES; FITTINGS; AND MANHOLES

9-20 Log #2877 NEC-P09 **Final Action: Reject**
(314.15)

Submitter: Paul A. Keleher, Paul Keleher Electrical Services
Comment on Proposal No: 9-38
Recommendation: The submitter of the proposal intends to more adequately document the problem and resubmit in the next revision cycle.
Substantiation: None provided.
Panel Meeting Action: Reject
Panel Statement: The comment provides neither recommendation nor substantiation, and cannot be processed, as covered in Section 4.4.5(c) and (d) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-21 Log #354 NEC-P09 **Final Action: Accept**
(314.16(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-40
Recommendation: Continue to reject the proposal.
Substantiation: The CMP 9 actions on this topic are correct for all such proposals within its scope. It is interesting to note that there are some applications of the word "per" that are not really correct, or at least capable of improvement. One good example where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-22 Log #1302 NEC-P09 **Final Action: Reject**
(Table 314.16(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 9-40
Recommendation: The Proposal should be Accepted.
Substantiation: Acceptance of the Proposal will provide consistency with the subheading in the Table which stipulates "for Each" rather than "per".
The proposed wording is more appropriate for a standard and is more explicit in describing the installation.
The Manual of Style for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).
Most of the Panels have accepted changes to replace "per" with more explicit language and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 9-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-23 Log #1422 NEC-P09 **Final Action: Reject**
(314.16(B)(4) Exception)

Submitter: Mark Shapiro, Farmington Hills, MI
Comment on Proposal No: 9-47
Recommendation: Add an Exception to 314.16(B)(4):
Exception: Listed devices and equipment wider than a single 50 mm (2 in.) device box that are marked with the cubic in. volume that they occupy within device boxes shall have their volume deducted based on their markings.
Substantiation: Somehow, the substantiation to this proposal was not available to the panel at the January meeting. However, the proposal was printed in the ROP, so it has had public review and need not be rejected for consideration out of hand.

There are new lighting control products that require 4-gang device boxes. They sit, for the most part on the surface of the box, with a smaller portion protruding into it. One controller in particular protrudes into the box, for the most part, 0.36 inches - plus a smaller area that extends 0.5 inches into the box. The total area within the box for this device equals 8.8 cubic inches. The change to this subsection in the 2008 NEC requires a deduction of at least 16 cubic inches to account for the device, based on the use of 14 AWG conductors. Other products take up other volumes.

These devices do not seem to fit into the category that was intended when this change was made. But the change has a large impact on their use. The proposal requires that the devices and equipment be listed to make sure that a testing laboratory is involved in the process. It is not a necessary part of the proposal.
Panel Meeting Action: Reject
Panel Statement: The occluded volume is only part of the volume allowance consideration; the rules also take into account the necessary space for wire management. For example, a large industrial grade duplex receptacle wired on 12 AWG conductors might take up about 3.5 cu. in. and residential grade receptacles substantially less, but in any case less than the 4.5 cu. in. that would be required for the volume allowance. The smallest four-gang device box (1.5 in. deep) will have 30 cu. in. available, and more common similarly-ganged device boxes far more. CMP 9 regrets that the original proposal substantiation was lost so this response could not have been addressed in the comment period, but at this time it is unconvinced that there is an actual problem.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-24 Log #2579 NEC-P09 **Final Action: Accept**
(314.16(C)(2))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-48
Recommendation: Accept the proposal in principle. Reformat the new text as a stand-alone enumerated paragraph (3) as follows:

(3) Short-Radius Conduit Bodies. Conduit bodies such as capped elbows … (remainder as in the proposal)."
Substantiation: After further review, this subject matter, covering enclosures that are prohibited from containing splices, taps or devices, is not a good location for a second paragraph of a code rule that allows splices, taps, or devices in certain cases. A separate paragraph with its own title will be less confusing.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-25 Log #2532 NEC-P09 **Final Action: Reject**
(314.17(D) (New))

Submitter: Daniel J. Kissane, Pass & Seymour/Legrand
Comment on Proposal No: 9-51
Recommendation: The panel should accept the proposal as a new section 314.17(E) with the text of the original proposal revised as follows:

(D) Protection During Construction. Where outlet or device boxes are secured in place prior to the application of the surface finish and arranged for flush mounting in drywall, the open fronts shall be covered ~~to prevent conductor damage~~ during ~~the~~ surface application construction activities. ~~with protective plates identified for this purpose and marked "Not for Permanent Installation."~~
Substantiation: As a manufacturer of both flush device boxes and the wiring devices that are installed in the boxes, we are familiar with field reports of both damaged conductors and debris that is left in the box as a result of finishing operations. The devices installed in these boxes are not simply receptacles and mechanical switches, but also receptacle and switch snap in connectors and control and protective devices that are of electronic design, such as, GFCIs, TVSS, dimmers, and occupancy sensors. It is important to be certain that these products are not contaminated due to foreign materials in the enclosure.

The proposal has been revised to provide a less prescriptive requirement. The requirement now states that the open front shall be covered without specifying the specific means for meeting the requirement.
Panel Meeting Action: Reject
Panel Statement: CMP 9 agrees with the importance of keeping the foreign materials out of the boxes during the rough-in phase of construction process. The NEC deals adequately with this issue in 110.12(B). If it becomes necessary to cover the conductors, there are many acceptable methods to accomplish that task including commercial products for the purpose.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-26 Log #681 NEC-P09 **Final Action: Reject**
(314.17(E) or 314.26)

Submitter: Carlo Compagnone, Jr., Compa Covers, Inc.
Comment on Proposal No: 9-52
Recommendation: This proposal should be accepted.
Substantiation: As a Master electrician and having been involved in the electrical field for almost twenty (20) years, I am concerned about home-safety issues and the harm, liabilities and expenses inherent therein. In particular, many home fires arise from faulty premises wiring group equipment[1] resulting from damage to wiring within the electrical outlet box. For instance, according to statistics provided by the National Fire Protection Association ("NFPA"), in 2006, "an estimated 16,380 reported U.S. non-confined home structure fires involving premises wiring group equipment resulted in 145 civilian deaths [and] 458 civilian injuries...".

(Please see "Home Electrical Fires," John R. Hall, Jr., March 2009, National Fire Protection Association.)

According to the NFPA, "The two leading specific factors contributing to ignition were unclassified electrical failure or malfunction (33%) and unspecified short circuit arc (28%). These two leading factors lack details on the nature of the failure. **The leading factors contributing to ignition with details were short circuit arc from defective or worn insulation (12%), arc from faulty contact or broken conductor (6%),** short circuit arc from mechanical damage (4%), and equipment overloaded (3%)." (emphasis added) (See Id.)

The main purpose of the National Electrical Code ("NEC") is the safeguarding of persons and property, which in turn is a primary reason why the NFPA sponsors the code making process and publishes the NEC. According to the NFPA's March 2009 analysis on home electrical fires, "Two-fifths (38%) of the 2003-2006 reported non-confined home structure fires involving premises wiring group equipment involved unclassified or unknown-type wiring. Because such a large share of these fires and associated losses are unclassified or unknown-type, the numbers and percentages for every specific type of equipment are probably severely understated. Comparisons within a group are not a problem. **For example, note that the number of fires declines for wiring as one moves from inside the house along the wiring network toward the connections to the utility poles outside the house.**" (*emphasis added*) (Id.) According to this analysis, the majority of fires begin within the outlet box, which is the one area of premises wiring in which the NEC provides no specific guidelines. This is an issue that has been raised in at least the past two (2) Code cycles, and numerous proposals have been submitted in this cycle in an attempt to address the matter. Clearly, it is necessary for the NEC to provide a specific mandate to electricians, that when implemented, would serve as a safeguard against death, injury and the loss of property due to home electrical fires caused within the house along the wiring network.

Acceptance of Proposal 9-52 would be a definitive step towards this mandate.

It is unclear why the NEC contains provisions for protecting the wiring at almost all points of vulnerability throughout the construction process, but excludes the wiring located within the electrical outlet box. In fact, the NEC's newest provision, Section 406.11, involves a requirement for tamper-resistant receptacles with a built-in shutter system at the outlet plug post-construction. While the NEC has added this provision, it blatantly fails to ensure the integrity of the wiring once it reaches the outlet box. What good is Section 406.11, if the wiring behind the receptacle is damaged? This is certainly a problem that must be addressed by the NEC with specificity which includes a mandatory provision for protecting wiring within the electrical outlet box.

While there are broad provisions contained in the NEC for safeguarding all electrical equipment and connections from damage and contamination, these provisions are not specific enough. For instance, Section 110.12, which provides that the equipment must be installed in a "neat and workmanlike manner," and states that "there shall be no damaged parts that may adversely affect safe operation or mechanical strength of the equipment...". While it is a nice concept that electrical equipment be neat and workmanlike, this phrase is unenforceable, and ultimately meaningless. In addition, despite its use of the word "equipment," Section 110.12 is not broad enough to address the concerns raised in Proposal 9-52. Nowhere in Section 110.12 is there a reference to wiring or the protection of wiring within electrical outlet boxes during the construction phase. The section only refers to equipment, including, "busbars, wiring terminals, insulators, and other surfaces...". It is not enough to assume Section 110.12 requires the protection of wiring in electrical boxes, particularly given the alarming statistics provided by the NFPA.

The concept of providing specific solutions for the protection of wiring is not foreign to the NEC, which mandates prescriptive requirements upon all areas of the wiring, except for wiring within the electrical outlet box. For example, Article 300 provides for very detailed methods of safeguarding cables which are subject to damage during the construction phase. Article 300.4 requires the installation of a nail plate where cable wiring is subject to nail or screw penetration. Article 300.4(B)(1) requires installation of bushings or grommets on all metal edges of punched out or factory-installed holes. If an electrician does not meet these Code requirements, wires are damaged and the inspection is deemed a failure.

Clearly, wiring is damaged during the construction process because wires sit exposed for months, while various tradesmen work, subjecting the wiring in the outlet boxes to damage from plaster, power routers, insulation and paint contamination. Drywall installers no longer cut box openings by marking the location and cutting away from the box. Conductors are damaged by pin routers, since the operator cannot see where the box is located and wires located near the edge of the box can be severely damaged. When spray foam is utilized and sprayed into a box, wiring inside the box may be corroded over time as a result of chemicals contained in the spray foam. When paint is sprayed, the paint covers the colored wiring, including the ground wiring, making it unclear which wire is which and requiring the electrician to make a cut into the paint-covered wire, potentially damaging it. Further, when the ground wiring is covered in paint, the grounding bond is lost, since the paint disrupts the copper wire. Faulty ground wires cause short circuits, sparks and arcs, all of which cause fire.

Since there is no mandate for protecting wiring within the electrical box, electricians may or may not chose to cover the boxes once they have completed their wiring. Given the NFPA's grim statistics, it does not appear that enough electricians are choosing to provide protection for the electrical outlet boxes during construction.

Wiring damaged during the construction process also poses a financial hardship upon electricians since they oftentimes have to remove numerous sheets of drywall to rewire to box if enough additional cable is not available outside the box. Much of the time, the electrician must scrape the spray foam out of the box, or try to remove the paint from covered wires. Wire left exposed, having been contaminated by paint, plaster, power routers or other materials, must be cleaned out or cut, and the requirements of Section 110.12 are not met, since the work is no longer "neat."

What is more, while the Code requires, in Section 300.14, that six (6) inches of "free-flowing" conductor be left in an electrical box, the Code provides no specific provisions requiring protection of this length of wiring. Unfortunately, when wiring is compromised during the construction process, it is nearly impossible for an electrician to comply with this provision of the Code, as they oftentimes must cut portions of the damaged six (6) inches out of the box.

Requiring a cover, which is reusable, is a simple and cost-effective manner of ensuring that wiring is protected once it reaches the electrical outlet box. In fact, it should cost less than $100 to cover electrical boxes in most new construction homes, and these covers will be re-useable, lessening the cost substantially. This is a small expense in comparison to an electrician returning to the construction site and fixing the damage which occurred while other tradesmen did their jobs. In addition, there would be no need for re-inspection, since covers would be placed in boxes upon completion of rough wiring. Thus, boxes would be covered at the time of rough inspection, similar to nail plates having to be on at the time of rough inspection, pursuant to provision 300.4. Given that the electrical boxes would be covered at the completion of rough wiring, the wiring inside the box would not get damaged during construction.

Moreover, and most importantly, Proposal 9-52 offers a specific solution to a significant issue at a minimal expense in comparison to death, injury and property damage. Simply stated, requiring covers in electrical boxes at the time of rough inspection ensures the integrity of the wiring, ensures uniformity in protection of the wiring within electrical boxes, and ensures safety within the premises and conformity and compliance with the provisions and purpose of the National Electrical Code.

I have also submitted this proposal to Code-Making Panel 9 for 314.17(E) or 314.26.

[1]As defined by the National Fire Protection Association, "premises wiring" refers to all installed wiring equipment between power source and outlet. "Premises wiring" includes all electrical distribution equipment except cords, plugs and light fixtures. (Please see "Home Electrical Fires," John R. Hall, Jr., March 2009, National Fire Protection Association.)

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 9-25.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-27 Log #1672 NEC-P09 **Final Action: Reject**
(314.24)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-57
Recommendation: Accept the proposal with the following revisions:

Size of Boxes. Boxes shall comply with applicable provisions of 110.3(A) and 314.16, and have an internal depth, height, and width to allow conductors and equipment to be installed without damage.. The internal depth, width, and height shall include that provided by extension rings, plaster rings, raised covers, and listed box extenders, and comply with (C).

(A) Boxes Without Enclosed Devices or Equipment. No box shall have an internal depth less than 12.7 mm (1/2 in.).

(B) Boxes With Enclosed Devices. Boxes used to enclose devices shall have an internal depth not less than 23.8 mm (15/16 in.).

(C) Equipment and Condcutors.

(1) Boxes that enclose equipment shall have an internal depth, width, and height not less than the equipment plus 6 mm (1/4 in.).

(2) Boxes that enclose conductors larger than 4 AWG shall be approved.

FPN: See 314.28.

(3) Boxes that enclose conductors 8, 6, or 4 AWG shall have an internal depth not less than 52.4 mm (2 1/8 in.). Boxes that enclose conductors 12 or 10 AWG shall have an internal depth not less than 30.2 mm (1 3/16 in.).

(4) Boxes that enclose conductors 14 AWG and smaller shall have an internal depth not less than 23.8 mm (15/16 in.).

Exception: No change.

Substantiation: The first paragraph should apply to boxes whatever their particular use, and be noted to comply with 110.3(A) and 314.16. Height and width should be noted in the first paragraph. Proposed (C)(1) covers clearance whether or not there is a rearward projection.

Proposed (C)(2) provides for other applicable NEC provisions, such as 314.28 to apply.

Panel Meeting Action: Reject
Panel Statement: CMP 9 agrees that in determining the compliance with this section an enforcing authority would be evaluating the conditions set out in 110.3(A), but those provisions offer no greater prescriptive specificity than the current text. The width and height of boxes is not within the scope of this section. The remainder of this comment involves concepts that are fully addressed in the panel action on Proposal 9-56a and no substantiation was presented to show why the comment version is superior.

(314.27)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-75
Recommendation: The Technical Correlating Committee directs Code-Making Panel 9 to reconsider the proposal and act on its merits.

The Technical Correlating Committee directs that the Chairs of Code-Making Panels 9 and 18 establish a Task Group to review Proposals 9-75 and 18-130 with regard to application within their respective articles.

This action will be considered by Code-Making Panel 9 as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committee to reconsider the proposal and reaffirms its action to reject the proposal.

Panel Statement: Refer to the panel action and statement on Comment 9-31.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-29 Log #108 NEC-P09 **Final Action: Accept**
(314.27)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-77
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing more description of "designed for the purpose."

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

I. Revise the panel action on 314.27(A) from Proposal 9-77 to read:
(A) Boxes at Luminaire or Lampholder Outlets. Outlet boxes or fittings designed for the support of luminaires and lampholders, and installed as required by 314.23, shall be permitted to support a luminaire or lampholder.

(1) Wall Outlets. Boxes used at luminaire or lampholder outlets in a wall shall be marked on the interior of the box to indicate the maximum weight of the luminaire that is permitted to be supported by the box in the wall, if other than 23 kg (50 lb).

Exception: A wall-mounted luminaire or lampholder weighing not more than 3 kg (6 lb) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the luminaire or its supporting yoke, or the lampholder is secured to the box with no fewer than two No. 6 or larger screws.

(2) Ceiling Outlets. At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire or lampholder may be attached. Boxes shall be required to support a luminaire weighing a minimum of 23 kg (50 lb). A luminaire that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box unless the outlet box is listed and marked for the maximum weight to be supported.

II. Revise 314.27(E) [which is becoming 314.27(D)] by deleting the words "and (B)".
Panel Statement: The panel action addresses the recommendation from the Technical Correlating Committee by removing "designed for the purpose" from (A)(1). This concept is already addressed in the parent text of (A). The panel action also maintains the requirements for support of lampholders as covered in the 2008 edition. The modification to 314.27(E) (2008 edition) correlates with the restructuring of this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-30 Log #1680 NEC-P09 **Final Action: Hold**
(314.27)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-77
Recommendation: Accept the proposal with the following revision:

(A) Boxes and fittings identified for the support of luminaires, lampholders, cameras, television sets, electric signs, or other electrical equipment and installed in accordance with 314.23 shall be permitted to support such equipment.

(1) Boxes or Fittings Supported on Vertical Structures. Boxes or fittings supported on vertical structures shall be identified for the purpose and marked on the exterior of the box to indicate the maximum weight to be supported if greater than 23 kg (50 lbs).

Exception: Other boxes, with or without extension rings or plaster rings, and mounted on a vertical support member or surface and supporting equipment specified in (A) shall be permitted to support such equipment weighing not more than 3 kg (6 lbs) if the equipment is secured to the box, extension ring, or plaster ring by not less than two No. 6 or larger machine screws.
Substantiation: Lampholders, TV receivers and cameras, and other equipment should be noted. Support members may not always be a wall or ceiling. Support boxes may not always be an "outlet", e.g., an end-to-end row of fluorescent fixtures suspended by fixture stems from boxes where only one box is an "outlet."
Panel Meeting Action: Hold
This action is on Comment 9-30 only.
Panel Statement: This comment requests that vertical structures be considered in the same way as walls for the purposes of determining the support requirements for boxes used for luminaire support. CMP 9 is aware that there are many applications for which this is entirely legitimate. CMP 9 is also aware that mounting a luminaire to a wall on a recessed box, especially after the mounting screws are tightened, allows the wall to assist the box in the support of the luminaire. The current testing protocol involves a cantilever test that anticipates the presence of a wall surface, in part because this rule specifically covers wall (and ceiling) mounted luminaires. In addition, the current distinctions between wall and ceiling mounting positions for luminaires and the parameters for the exception governing small luminaires were based in part on whether the mounting screws were in shear or in tension.

CMP 9 has been unable to conclusively determine whether, or to what affect, the absence of a wall surface treatment should affect the support parameters for a luminaire mounted on a vertical structure, particularly for boxes that have wall ratings but that lack ceiling ratings. CMP 9 intends to study these applications, both for luminaires and for equipment, in order to write appropriate language for these applications in 314.27, but is unable to complete this work in the time frame available for processing comments in the 2011 NEC cycle.

Therefore, in accordance with 4.4.6.2.2(c) of the Regulations Governing Committee Projects, CMP 9 directs that this comment be reported as "Hold". This action is for Comment 9-30 only, and does not affect the further processing of Comments 9-29 and 9-32 or the underlying Proposal 9-77.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-31 Log #2515 NEC-P09 **Final Action: Reject**
(314.27(A))

Submitter: Patricia Barron, Safety Quick Light
Comment on Proposal No: 9-75
Recommendation: Revise text to read as follows:

314.27(A) At every outlet used exclusively for lighting, the box shall be ~~designed or~~ installed supplied with a receptacle, specifically designed for luminaires, allowing for mechanical support and providing electrical connection to the branch circuit so that a luminaire may be attached.
Substantiation: Statement of Problem - There are a significant number of electrocutions and accidents occurring during luminaire installations, which result in substantial numbers of **injuries and cases of death.**
Substantiation for Comment: The proposed Power Plug for luminaires is based on the same concept of a standard wall receptacle and plug. Replacing the existing mounting method for luminaires, with the power plug and the pre-installation of the receptacle method **will eliminates 100% of all shock hazard risks**, while installing Luminaires. Luminaires will be safely plugged in or out, to the ceiling or wall. (The power plug UL and CSA Certified, has passed a 200 pound load test and can be used for all luminaries up to 50 pounds).The plug **makes luminaire installations as safe as plugging in a table lamp to the wall**. Luminaries can be plugged or unplugged for bulb replacement, painting, or other, free of risk and **without touching any energized circuits**. An outlet box, without a fixture, but with the receptacle is completely enclosed and safe - exactly like a standard wall receptacle. **When using the proposed power plug and receptacle, all luminaire associated wiring risks are completely eliminated.**
For a video demonstration go to: www.safetypowerplug.com

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The principal impact of this product is on luminaire construction, governed by Article 410. The impact on boxes and their requirements in Article 314 is essentially nonexistent. The receptacle mounted on the box as covered in this application is a device mounted to a yoke and positioned in the box. As such, it is simply and completely covered within the provisions of 314.16(B)(4) for volume allowances, 314.25 for covers and canopies, and 314.27 for luminaire support. None of these provisions require any modifications to accommodate these products, which can be used under current requirements within the location, weight, and voltage limitations of the products, and the occupancy limitations described by the submitter at the ROC meeting. CMP 9 continues to conclude that the jurisdiction over this product belongs with CMP 18. As stated in the panel statement on Proposal 9-75, there is no provision in Article 314 that precludes the use of this device.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:

MCCULLOUGH, R.: The panel statement should also have included the fact that a task group comprised of members of Code-Making panels 9 and 18 determined that CMP -9 was correct in its determination during the ROP stage that CMP-18 should have jurisdiction over this subject matter.

(314.27(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-77
Recommendation: Change "designed for the purpose" to "designed for luminaire support" in paragraph (1).
Substantiation: This should address the TCC concerns. Note, however, that "designed for the purpose" in this context is quite clear, and unchanged from the existing text in the current NEC.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 9-29.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-33 Log #1212 NEC-P09 **Final Action: Accept in Principle**
(314.27(D))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 9-81
Recommendation: This Proposal should be accepted as revised for section 314.27(D) to require fan rated boxes in single or multi-family homes.
Where two or more separate switched, ungrounded conductors are provided to a ceiling mounted outlet box in the center of the ceiling, in single or multi-family dwellings, the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.
Substantiation: Panel 9 made the following statements for their rejection of proposal 9-81:

"The proposal does not take into consideration the physical location of a box where locating a ceiling-suspended (paddle) fan would be impractical." Response: The revised text addresses this issue by requiring fan rated boxes located in the center of the ceiling.

"There are numerous reasons to install multiple switched conductors to the outlet box location that would not involve the installation of a ceiling-suspended (paddle) fan." Response: This statement was addressed in the original proposal. It is acceptable for a chandelier and other "multiple reasons" to be supported by a box listed for ceiling fan support. Ceiling fan boxes are also required to be tested and listed for luminaire support per UL514A and UL514C. On the rare occasion that a multiple switched conductors to the outlet box would be utilized in a residential home, such as for a chandelier, a fan rated box would be acceptable for this application. All Fan Rated ceiling boxes are listed for both fan support and luminaire support. This additional feature enhances the safety of the installation with insignificant additional cost.

"There are also other acceptable methods of installing a ceiling-suspended (paddle) fan that does not utilize a fan brace box." Response: The panel's statement is correct and these methods are inspected per 314.27(D) during construction. However the homeowner does not know this when he/she decides to add a ceiling-suspended paddle fan. Such retrofit installations are seldom inspected.

Listed Fan Rated Outlet Boxes are approved for the sole support of ceiling-suspended (paddle) fan per 314.27(D) or a luminaire per 314.27(B). It is disturbing that Panel 9 continues to oppose this proposal, the focus of which is to protect homeowners from possible injury or property damage.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the action on Comment 9-34 that generally meets the submitter's intent.
CMP 9 disagrees that all ceiling outlet applications can be accomplished with boxes listed for fan support. For example, consider a large outlet box that includes extension boxes or plaster rings or both; such a combination will not be available as a listed box for fan support and yet with suitable framing the fan bracket can be secured directly to structure. The wording in Comment 9-34, which uses the key word "spare", correctly focuses on probable fraudulent intent. If an installer wishes to avoid the fan box requirement in particular instances, all that is necessary is to not run a spare conductor. The recommendation to apply this to only boxes located in the center of the room does not completely address the salient issue.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-34 Log #1237 NEC-P09 **Final Action: Accept**
(314.27(D))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-81
Recommendation: This proposal should be accepted in principle, with the following modified new second paragraph:

Where spare, separately switched, ungrounded conductors are provided to a ceiling mounted outlet box, in a location acceptable for a ceiling-suspended (paddle) fan in single or multi-family dwellings, the outlet box or outlet box system shall be listed for sole support of a ceiling-suspended (paddle) fan.
Substantiation: Many new homes are built with multiple wired switches that accommodate future installation of fans with luminaire kits. Since standard luminaire are installed in standard boxes, the homeowner, when replacing the luminaire with a fan, very likely will not know to replace the standard box with a ceiling box rated for support of a fan and luminaire kit.

The modified text in the new requirement addresses the concerns cited by the members of CMP-9. The addition of the term "spare" in the first sentence denotes that the circuit is not used in the current electrical system and leaves open the possibility of use for future paddle fan control. The second addition "in a location acceptable for a ceiling-suspended (paddle) fan" exempts the locations where ceiling-suspended (paddle) fans cannot be used.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 12

9-35 Log #355 NEC-P09 **Final Action: Accept**
(314.28(A)(2) Exception)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-84
Recommendation: Continue to reject the proposal.
Substantiation: The CMP 9 actions on this topic are correct for all such proposals within its scope. It is interesting to note that there are some applications of the word "per" that are not really correct, or at least capable of improvement. One good example where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-36 Log #1303 NEC-P09 **Final Action: Reject**
(314.28(A)(2) Exception)

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 9-84
Recommendation: The Proposal should be Accepted.
Substantiation: The proposed wording is more appropriate for a standard and is more explicit in describing the installation.

The Manual of Style for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).

Most of the Panels have accepted changes to replace "per" with more explicit language and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 9-5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-37 Log #109 NEC-P09 **Final Action: Accept**
(314.28(E))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 9-87
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal by providing a title for 314.28(E)(5).

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The panel accepts the direction of the Technical Correlating Committee and has taken a clarifying action in Comment 9-39.
Panel Statement: Refer to the panel action and statement on Comment 9-39.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-38 Log #1210 NEC-P09 **Final Action: Accept in Principle**
(314.28(E))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 9-87
Recommendation: This Proposal should have been Accepted in Principle with the following revision:

(E) Power Distribution Block. Power distribution blocks shall be permitted in pull and junction boxes over 1650 cm3 (100 in.3) in size for connections of conductors where installed in metal or nonmetallic boxes and the installation complies with (1) through (5).

Exception: Equipment grounding terminal bars shall be permitted in smaller enclosures.

(1) Installation. Power distribution blocks installed in metal or nonmetallic boxes shall be listed.

(2) Size. In addition to the overall size requirement in the first sentence of 314.28(A)(2), the power distribution block shall be installed in a metal or nonmetallic box with dimensions not smaller than specified in the installation instructions of the power distribution block.

(3) Wire Bending Space. Wire bending space at the terminals of power distribution blocks shall comply with 312.6.

(4) Live Parts. Power distribution blocks shall not have uninsulated live parts exposed within a metal or nonmetallic box, whether or not the box cover is installed.

(5) Through Conductors. Where the pull or junction boxes are used for conductors that do not terminate on the power distribution block(s), the through conductors shall be arranged so the power distribution block terminals are unobstructed following installation.

Substantiation: Nonmetallic boxes should be included in this new section since Power Distribution Blocks are commonly used in these boxes. Also a title was added to 314.28(E)(5) per the TCC instructions.
Panel Meeting Action: Accept in Principle

Delete the word "metal" in each of the four locations where "metal" was specified in the panel action on Proposal 9-87 to modify either "box" or "boxes".

Panel Statement: CMP 9 concludes that the unmodified term "boxes" is simpler and meets the submitter's concerns. The panel action on Comment 9-39 addresses the submitter's recommendation to add a title to 314.28(E)(5).

Ballot Results: Affirmative: 12

9-40 Log #1238 NEC-P09 **Final Action: Accept**
(314.40(D) (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-90
Recommendation: This Proposal should be rejected.
Substantiation: UL 50 already contains the proposed requirement for metal pull and junction boxes covered in Article 314. UL 50 states, "An edge on an enclosure shall not be sufficiently sharp to constitute a risk of injury in normal maintenance or use." The proposed language is unenforceable and would lead to non-standard interpretation. The objective of this proposal is already covered in Section 110.3(A)(8) under "Examination" of equipment. It would be nearly impossible to address each and every of such "other factors" separately in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:

BELISLE, R.: See Ballot comment 9-12.

FOGARTY, R.: See my Explanation of Negative Vote on Comment 9-15.

HARTWELL, F.: Refer to my explanation of negative vote on Comment 9-15.

SZENDRE, M.: There is problem with sharp edges, and until the manufacturers address the issue, this issue will continue to get pushed for adoption into the Code.

9-41 Log #1653 NEC-P09 **Final Action: Accept**
(314.40(D))

Submitter: John W. Young, Siemens Industry
Comment on Proposal No: 9-90
Recommendation: Reject the Proposal.
Substantiation: The submitter describes this as a major problem but there is no substantiation and this does not agree with what UL or the manufacturers are seeing.

Mr. Osborne comments that UL encouraged the filing of file field reports of incidents so this could be investigated but that no field reports or complaints have been filed. Mr. Rupp comments that manufacturers are not receiving reports of incidents. If this is a major problem why aren't manufacturers or UL hearing about it.

This is a subject that is dealt with in the product standards and Mr. Osborne comments that an invitation had been extended to participate in the standards activities if there is a view that the standards need to be revised but again no one accepted the invitation to address this.

If there are isolated problems these need to be reported and investigated and dealt with. If something needs to be done it should be in the standards and not in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:

BELISLE, R.: The panel should have rejected this comment. The panel unanimously agreed that the concern for safety is real and that action needs to be taken. It is unclear why some members of the panel chose to defer the action to another process that is unfamiliar to most members, while action taken at the NEC level would have prompted action by manufacturers to act, rather than promote further study, discuss, and formulate future actions.

FOGARTY, R.: See my Explanation of Negative Vote on Comment 9-15.

HARTWELL, F.: Refer to my explanation of negative vote on Comment 9-15.

SZENDRE, M.: There is problem with sharp edges, and until the manufacturers address the issue, this issue will continue to get pushed for adoption into the Code.

9-42 Log #1679 NEC-P09 **Final Action: Reject**
(314.40(D))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 9-89
Recommendation: Accept the proposal with the following revisions:

An approved means shall be provided in each metal box for the connection of an equipment grounding or bonding conductor. For wire-type conductors, the means shall be a tapped hole with at least two machine screw threads or a machine screw and nut used for no other purpose or a listed grounding clip.

Exception: A listed box with a self-tapping grounding screw shall be permitted.

Substantiation: Metal boxes with hubs or knockouts provide grounding means for metal raceways and cables. Where a wire type equipment grounding or bonding conductor is used, a tapped hole or nut and bolt connection can provide a grounding or bonding connection.
Panel Meeting Action: Reject
Panel Statement: The wording adds nothing to the Code. The approved means is covered in 110.2; the two-thread and the nut-and-bolt rules are in 250.8(A)(6); the ground clips are covered in 250.8(A)(8), and the dedicated purpose rule is in 250.148(C).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-43 Log #1930 NEC-P09 **Final Action: Accept**
(314.40(D) (New))

Submitter: Robert D. Osborne, Underwriters Laboratories Inc.
Comment on Proposal No: 9-90
Recommendation: The panel should reject this proposal.
Substantiation: Panel members agree that the concern with sharp edges is one to be addressed by the product standards. Requirements exist in the Standards, and members of the panel were encouraged to participate in the Standards process if they believed requirements were in need of revision. As a result of discussions during the last Code cycle, all members were extended an invitation to join Standards Technical Panels, and encouraged to file field complaints so problems could be identified and addressed. No members choose to accept this invitation, and, no field reports related to this issue have been filed. Properly documented field complaints can be used to identify whether a problem is specific to an industry, a manufacturer, or a specific factory. Multiple field complaints for a specific category and/or specific issue can be used to identify a systemic problem and may used to develop proposals to a standard or revisions to a certification program.

What constitutes a sharp edge is subjective, and with any subjective requirement, the code user is placed at a disadvantage when applying the requirements. Additionally, the ability of the AHJ to decide on the approval of equipment is already provided in 90.4. Should inspectors conclude that sufficiently sharp edges exist on equipment, they can reject the installation citing 90.4.

It is suggested that panel members refocus their efforts and address this concern in the proper forum rather than introducing requirements that are misplaced.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:

BELISLE, R.: The panel should have rejected this comment. The proposed language is clear and under "section II. Construction Specifications", the requirement would apply to manufacturers in a production facility that is designed and constructed to build products to very tight specifications. This is clearly the appropriate location for such requirements. Additionally, the current standard does not apply to "areas subject to contact during installation."

The substantiation to reject is based on an assumed "burden" that would be placed on installers and inspectors? This makes no sense as the proposed requirement would be inserted in the NEC under section II. Construction Specifications. As stated and agreed to during the panel meeting, rarely does an inspector or installer verify that a box thickness is "not less than 1.35 mm (0.053 in.)" per NEC requirements, or that ample spacing of a door from live parts exist, etc.

Only in a clear case of poor construction or obvious reduced safety does the installer/inspector community have to address such a concern. These "II. Construction Specifications." apply to manufacturers in a production facility that is designed and constructed to build products to very tight specifications. This is clearly the appropriate location for such requirements.

The panel unanimously agreed that the concern for safety is real and that action needs to be taken. It is unclear why some members of the panel chose to defer the action to another process that is unfamiliar to most members, while action taken at the NEC level would have prompted action by manufacturers to act, rather than promote further study, discuss, and formulate future actions.

FOGARTY, R.: See my Explanation of Negative Vote on Comment 9-15.

HARTWELL, F.: Refer to my explanation of negative vote on Comment 9-15.

SZENDRE, M.: There is problem with sharp edges, and until the manufacturers address the issue, this issue will continue to get pushed for adoption into the Code.

9-44 Log #450 NEC-P09 **Final Action: Accept**
(314.42)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 9-91
Recommendation: Continue to Reject this proposal.
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In the Panel Statement, CMP-9 noted that the "AHJ is qualified to determine the suitability of a bushing, and therefore 'approved' is the appropriate standard for product acceptance in this case." This response gets its authority from Section 3.1.2 of the NEC Style Manual regarding Permissive Rules where it expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 320 — ARMORED CABLE: TYPE AC

7-1 Log #1673 NEC-P07 **Final Action: Reject**
(320.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-5
Recommendation: Accept the proposal and delete the FPN.
Substantiation: 230.43 uses the term "limited" re: use and uses are covered by the listed wiring methods. If this is not an all inclusive list, how did the Authority Having Jurisdiction determine what other uses are acceptable? Any other use would be by special permission where the AHJ makes the determination.
Panel Meeting Action: Reject
Panel Statement: The submitter has not indicated how the term "only" will clarify the language presently in Section 320.10. The title of this section is "Uses Permitted" and the term "shall be permitted" is consistent with the language in Section 90.5(B). The use of the term "only" will give finality to the list of permitted uses for Type AC Cable. The FPN is meant to indicate that the list contained in "Uses Permitted" is not an all-inclusive list. The reference to Section 230.43 is irrelevant because that section is intended to be restrictive and provide strict, narrow guidance to which wiring methods are allowed for service conductors.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

FAHRENTHOLD, C.: During the 2005 ROP meetings, the "Uses Permitted" article was deleted from this article and items were added to the "Uses Not Permitted" to further clarify where this wiring method was not allowed. Due to a large objection by the industry, the "Uses Permitted" was added back in the 2005 ROC. The panel felt that there was no way to identify every acceptable use of this wiring method so the fine print note was added. To add the word "only" and delete the fine print note would go against the panel's intent in the 2005 ROC.

7-2 Log #917 NEC-P07 **Final Action: Reject**
(320.12(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-8
Recommendation: Accept the proposal with the following revisions:

Where likely to be exposed to physical damage.

Substantiation: See Explanation of Negative on Proposal 7-9, 320.12(1).
Panel Meeting Action: Reject
Panel Statement: Not one of the many proposals submitted brought a strong argument that the existing language is lacking. Section 3.2.1 of the NEC Style Manual is not precise in supporting the use of the word "likely"; in fact Table 3.2.1 lists the term "likely" as possibly unenforceable and vague. The existing language is time tested and the use of the word "likely" in this manner does not improve the usability of this section. Although the word "likely" may be used in other sections of the code, it does not improve usability of this requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-3 Log #935 NEC-P07 **Final Action: Reject**
(320.12(1) and (3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-10
Recommendation: Accept the phrase "likely to be".
Substantiation: See explanation of negative for Proposal 7-9 320.12(1)
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 7-2 for sub-part (1). In the case of 320.12 (3) see the panel action and statement to Proposal 7-10 log#1805 of 70A 2010-ROP. The Panel assumes that the comment applies to 320.12(1) and (4) since (3) was renumbered as (4) in Proposal 7-10.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-4 Log #2582 NEC-P07 **Final Action: Reject**
(320.17)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-12
Recommendation: Accept the panel action on the proposal in part; change the occurrences of the word "when" as added by CMP 7 to "where".
Substantiation: The word "if" is a generic conjunction that in usual code applications means "in the event that." In this sense, virtually any usage of "where" can be replaced by "if", as is equally the case of "when". The reason that these other words, particularly "where" have been generally applied throughout the NEC is that they more precisely define the event. The word "where" has been (and continues to be) used because it is limited to being a condition of place, and "when" has been (and continues to be) used in instances describing a condition of time.

The NEC is an installation document, and most of its provisions provide direction regarding installation practice in concrete locations, that being the nature of the trade. The subject of this proposal is no different. Although it is not grammatically incorrect to begin the sentence with "if", the word "where" is preferred because this rule describes a condition of place. Over the past decade, the word "where" has become the usual term for such usage throughout the NEC. As noted by the TCC, "when" is a condition of time, inappropriate for these installation requirements.
Panel Meeting Action: Reject
Panel Statement: The comment is moot to Proposal 7-12; the panel took no such action. See panel action and statement on Comment 7-5 and 7-6. The comment is not in compliance with the Rules Governing Committee Projects 4.4.6.2.1(a).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-5 Log #110 NEC-P07 **Final Action: Accept**
(320.23)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 7-13
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal concerning the use of the word "when" since the NEC Style Manual considers "when" as a condition of time.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The Panel Accepts the change from "When" back to "Where" in the first sentence in 320.23(A) and (B) and changes from "If" back to "Where" in the second sentence of 320.23(A). The remainder of the Panel Action on the Proposal is still Accepted in Principle in Part.
Panel Statement: See committee statement on Comment 7-6. The word "where" has been used because it is limited to being a condition of place, and "when" has been used in instances describing a condition of time.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-6 Log #1416 NEC-P07 **Final Action: Accept**
(320.23)

Submitter: Dennis A. Nielsen, Lawrence Berkeley National Laboratory / Rep. Institute of Electrical & Electronic Engineers, Inc.
Comment on Proposal No: 7-13
Recommendation: Revise text to read as follows:

320.23 In Accessible Attics.

Type AC cables in accessible attics or roof spaces shall be installed as specified in 320.23(A) and (B).

(A) Cables Run Across the Top of Floor Joists.

~~When~~ Where run across the top of floor joists, or within 2.1 m (7 ft) of floor or floor joists across the face of rafters or studding, the cable shall be protected by substantial guard strips that are at least as high as the cable.

~~If~~ Where this space is not accessible by permanent stairs or ladders, protection shall only be required within 1.8 m (6 It) of the nearest edge of the scuttle hole or attic entrance.

(B) Cable Installed Parallel to Framing Members.

~~When~~ Where the cable is installed parallel to the sides of rafters, studs, ceiling or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with 300.4(D).
Substantiation: The proposed changes of ''Where'' replaced with "When" or "If" does not increase safety. The present code uses "Where" to indicate location. The change to "If" and ''When'' sets text to be time dependent. ''Where'' subject to physical damage is used throughout the Code. This could be progressive to other parts of the code where "Where" is currently used. This change has potential to allow the opportunity for the user to be subjective in applying "If" and/or ''When'' the situation presents itself and not absolute in every location.
Panel Meeting Action: Accept
Panel Statement: The Panel also changed the word "If" back to "Where" since "where" is preferred because this rule describes a condition of place. The word "if" is a generic conjunction that means "in the event that." An inspector can only evaluate existing conditions and not speculate on what might occur in the future.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-7 Log #1468 NEC-P07 **Final Action: Reject**
(320.30)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-15
Recommendation: Accept the proposal with the following revisions:

Securing and Supporting.

(A) General. Type AC cable shall be secured to supports by staples, cable ties, straps, hangers, clamps, or other means identified for the use, and installed so as not to damage the cable.

Exception: That portion installed in raceways. Cables installed through metal framing members shall be permitted to be secured to such members by tie wires.

(B) Securing. Unless otherwise permitted, Type AC cable shall be secured to supports within 300 mm (12 in) of every termination and at intervals not exceeding 1.4 m (4 1/2 ft).

FPN: See 300.4

(C) Unsupported Cables. Type AC cables shall not be required to comply with 320.30(A) where that portion of the cable complies with any of the following:

(1) is fished between access points through concealed spaces in finished buildings or other structures and supporting is impractical.

(2) If not more than 600 mm (2 ft) in length at terminations where flexibility is necessary after installation.

(3) Is not more than 1.8 m (6 ft) in length from the last point of cable fastening and support to the point of connection to equipment within an accessible above ceiling space, or surface mounted on such ceiling. For the purpose of this section, Type AC cable connectors shall be permitted as the last point of support before the cable connection to equipment.
Substantiation: Securing and supporting are not necessarily the same; a cable laid on the floor is supported; securing should be to the required supports. Support through framing members is not prohibited by the NEC and is covered by the present first paragraph of (C), and (B) requires the cable to be secured.
Panel Meeting Action: Reject
Panel Statement: The proposed change to this section does not improve clarity or consistency. It is logical for the user to assume that Type AC cable installed in a raceway does not need to comply with the securing and supporting requirements of this article. The submitter has not presented technical substantiation indicating present industry practice regarding securing and supporting cables installed in raceways presents a history of failure. Securing and supporting requirements are not the same and they are addressed in Section 320.30 (B) and (C). The panel refers the submitter to the NEIS #120 for standardized cable installations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-8 Log #1467 NEC-P07 **Final Action: Reject**
(320.30(B) Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-17
Recommendation: Accept the proposal.
Substantiation: Correlation. Section 320.10(B) merely permits installation in cable trays but does not negate or modify 320.30(A).
Panel Meeting Action: Reject
Panel Statement: The panel does not agree that there is a need to correlate Section 320.10 "Uses Permitted", with 320.30 "Securing and Supporting". Cable Tray is a support system for various wiring methods contained within the NEC. The requirements of Article 392 stand alone and provide appropriate language for the use of such wiring methods within the tray.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-9 Log #2694 NEC-P07 **Final Action: Reject**
(320.80(A))

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 7-21
Recommendation: Accept the proposal.
Substantiation: This comment is offered for the sake of consistency with comparable material in 334.80. The same technical issues apply. With respect to the research that underlies the wording proposed for 334.80, and provided in a companion comment thereto, note that even wiring in a metal raceway was adversely affected by the embedment in foam thermal insulation, and therefore Type AC cable would easily be at risk.
Panel Meeting Action: Reject
Panel Statement: The panel has reviewed Proposal 4-97 from the A86 TCR which was referenced in Proposal 7-21. That material did not address the installation of Type AC Cable in or on thermal insulation. Section 320.80(A) requires conductors insulated for 90C. Derating from 90C is appropriate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 324 — FLAT CONDUCTOR CABLE: TYPE FCC

7-10 Log #1695 NEC-P07 **Final Action: Reject**
(324.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-26
Recommendation: Accept the proposal.
Substantiation: "Permitted" per 90.5(B) does not impose a requirement and, therefore, is not enforceable. If "uses permitted" is not a limitation and not intended to be an all-inclusive list it is superfluous and the "not permitted" uses can govern and the cable can be used for anything not covered by the "not permitted" provision. 322.10 and others use the term "only" for uses permitted. Why do those sections not permit other applications as long as the "not permitted use" is not violated?
Panel Meeting Action: Reject
Panel Statement: The list of uses permitted represents the most common uses; it is not an all-inclusive list as noted in the FPN at the end of the section. 324.12 defines the specific uses that are not permitted. The addition of the term "only" is used for those cable types that are only permitted in the specified applications and nowhere else.
The comparison to Article 322 Flat Cable Assemblies and that of Flat Conductor Cable is invalid. FC is specifically designed for field installation in surface metal raceway. Whereas FCC is a branch circuit wiring system for field-installation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 326 — INTEGRATED GAS SPACER CABLE: TYPE IGS

7-11 Log #1694 NEC-P07 **Final Action: Reject**
(326.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-28
Recommendation: Accept the proposal.
Substantiation: "Permitted" does not impose a requirement per 90.5(B) and is not enforceable. If "Uses permitted" is not a limitation and not all inclusive, it is superfluous and "not permitted" uses can govern.
Panel Meeting Action: Reject
Panel Statement: The submitter has not indicated how the term "only" will clarify the language. The title of this section is "Uses Permitted" and the term "shall be permitted " is consistent with the language in Section 90.5(B). Section 326.12 defines the specific uses that are not permitted. The addition of the term "only" is used for those cable types that are only permitted in the specified applications and nowhere else.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 1

7-12 Log #356 NEC-P07 **Final Action: Accept in Principle**
(326.112)

TCC Action: The Technical Correlating Committee notes that the action taken on this comment does not satisfy the recommendation of the submitter.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-31
Recommendation: The proposal should be rejected.
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.
Panel Meeting Action: Accept in Principle
Revise second sentence as follows:
The nominal gas pressure shall be 138 kPa gauge ~~(20 pounds per square inch gauge)~~ (20 lb/in.^{2} gauge).
Panel Statement: The revised text conforms to the NEC Style Manual Annex B for standard terms for Units of Measurement used in Code text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 328 — MEDIUM VOLTAGE CABLE: TYPE MC

7-13 Log #111 NEC-P07 **Final Action: Accept**
(328.10)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 7-33
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal relative to the text of the second sentences in both (3) and (6).
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text to read as follows:
328.10 Uses Permitted.
Type MV cable shall be permitted for use on power systems rated up to 35,000 volts nominal as follows:
(1) In wet or dry locations
(2) In raceways
(3) In cable trays, where identified for the use, in accordance with 392.3, 392.6(F), 392.8, and 392.12. Type MV cable that has an overall metallic sheath or armor, also complies with the requirements for Type MC cable, and is identified as "MV or MC" shall be permitted to be installed in cable trays in accordance with 392.3(B)(2).
(4) Direct buried in accordance with 300.50
(5) In messenger-supported wiring in accordance with Part II of Article 396
(6) As exposed runs in accordance with 300.37. Type MV cable that has an overall metallic sheath or armor, also complies with the requirements for Type MC cable, and is identified as "MV or MC" shall be permitted to be installed as exposed runs of metal-clad cable in accordance with 300.37.
FPN: The "Uses Permitted" is not an all-inclusive list.
Panel Statement: The panel clarified the TCC's request. See the revised text in the panel action.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 330 — METAL-CLAD CABLE: TYPE MC

7-14 Log #1760 NEC-P07 **Final Action: Accept in Principle**
(328.14 (New))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 7-36
Recommendation: Accept this proposal.
Substantiation: I agree with the negative comment as written by Mr. La Dart.

Mr. La Dart is correct. The installation and termination of type MV cable needs to be performed by qualified persons. Where this type of cable is not installed or terminated properly, hazards exist for the occupancy in which it is installed and for the men and women who will maintain or renovate theses systems.

The panel statement to reject reads as follows:

"Qualified person" is already defined in Article 100. Workmanship is a requirement of 110.12."

It should be noted that MV cable is not presently required to be installed by "qualified persons". Therefore the definition in Article 100 does not apply to the installation of type MV cable in any manner.

Furthermore the statement that workmanship is covered in 110.12 again has no bearing. 110.12 does not in any way address a requirement for qualified persons.

The panel statement to reject does not address the proposal.

Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 7-15.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-15 Log #1780 NEC-P07 **Final Action: Accept in Principle**
(328.14 (New))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 7-36
Recommendation: Accept the proposal in principle and revise as follows:

328.14 Installation, Type MV cable shall be installed, terminated and tested only by qualified persons.

Informational Note: IEEE 576-2000 Recommended Practice for Installation, Termination, and Testing of Insulated Power Cables as Used in Industrial and Commercial Applications includes installation information and testing criteria for MV cable.

Substantiation: I highly encourage CMP-7 to reconsider the merits of this proposal. The submitter has identified a need in the NEC for installation criteria for MV cables: it's missing. The panel statement does not provide a reason for rejecting the proposal. Article 328 falls short of including many of the requirements necessary for installing medium voltage cables such as radius of bends, termination methods, acceptance and performance testing criteria of the installation, and so forth. The NEC is an installation Code and defines the term "qualified person" which is definitely necessary for these types of installations. This is specialized work and requires significant training and knowledge. The panel statement only addresses that there is a defined term in article 100 and that workmanship is covered in 110.12. This comment attempts to preserve the points and concepts made by the submitter. The new informational note can be used to ensure that necessary installation criteria (missing in the NEC) from other applicable standards are included in the installation processes, including any applicable performance and acceptance testing to verify the integrity of the installed cables prior to energizing. The NEC should require more specific qualifications for special equipment and systems requiring highly trained and knowledgeable workers. This type of installation qualifies for that type of expertise. The proposed language actually reflects what is happening in the field (or should be) relative to installing these types of cables. The exact wording of the proposed text may need to be adjusted slightly.

Panel Meeting Action: Accept in Principle

Accept the proposal in principle and revise text as follows:

328.14 Installation, Type MV cable shall be installed, terminated and tested ~~only~~ by qualified persons.

Informational Note: IEEE 576-2000 Recommended Practice for Installation, Termination, and Testing of Insulated Power Cables as Used in Industrial and Commercial Applications includes installation information and testing criteria for MV cable.

Panel Statement: The panel agrees that MV cable should be installed by qualified persons, as should all electrical systems. Adding this requirement highlights the technical complexity of installing MV cable, and the Information Note provides direction to an appropriate standard. The panel agrees that the word only is not necessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

FAHRENTHOLD, C.: Qualified person is defined in article 100 so there is no need to add qualified person requirement to this article. There is also no documented problem with unqualified persons performing this work.

7-16 Log #1682 NEC-P07 **Final Action: Reject**
(330.4 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-38
Recommendation: Accept the proposal.
Substantiation: Type MC cables, 600 volts and over 600 volts rated should be listed. As are most other cables conductors, and equipment such as Class 2 and 3 transformers, snap switches, communication wires and grounding conductors of 820.100(A)(1).
Panel Meeting Action: Reject
Panel Statement: The panel rejects the comment because the submitter has not provided the technical substantiation to support the requirement for Type MC cable to be listed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

LA DART, S.: The panel should have accepted Proposal 7-38 and Comment 7-16. This is a safety issue. Products are required to be listed throughout the NEC. Product Standards are developed to provide for safer products to be used on electrical installations.

The "uses permitted" section of article 330 allows a multitude of uses for type MC cable, including "hazardous locations". It seems ironic that 330.40 would require MC cable "fittings" to be listed, and not have the same requirement for the cable.

MC cable is currently being manufactured as a "listed product", and we agree with the submitter of the Proposal -----That the code should require it to be installed as a "listed product".

7-17 Log #918 NEC-P07 **Final Action: Reject**
(330.30)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-47
Recommendation: Accept the proposal with the following revisions:

(A) General. Except as permitted in 330.30(B), Type MC cables not installed in a raceway or direct buried shall be secured to supports by staples, cable ties, tie wires, straps, hangers, clamps, or other approved means, installed so as not to damage the cable, at intervals not exceeding 1.8m (6 ft.) except as otherwise permitted in this section.

FPN: See 300.4 where cables are supported by openings in structural members. Cables containing four or less conductors not larger than 10 AWG shall be secured to supports within 300 mm (12 in.) of terminations except as permitted in 330.30(D).

(B) Unsupported Cables. Type MC cables shall not be required to comply with 330.30(A) for that portion that complies with the following:

(1) The cables is fished between access points through concealed spaces in finished buildings or other structures and supporting is not practical.

(2) Type MC cable containing four or less conductors not larger than 10 AWG and not more than 1.8 m (6 ft) in length from the last support shall not be required to be secured to support within 300 mm (12 in.) of termination at equipment within an accessible ceiling space or surface mounted on such ceiling. The last support for such installation shall be permitted to be a cable connector.

Substantiation: (A) should exclude cable installed in a raceway or direct buried. Cables supported by openings in metal framing members should be permitted to be fastened by tie wires (commonly accepted). A FPN reference to 300.4 is appropriate. Proposed (B)(2) specifies a particular cable since other MC cables already have a standard 6 ft requirement and present wording allows a cable fitting for such cables so installed. The provisions of (D)(2) should include equipment surface mounted to suspended ceilings.
Panel Meeting Action: Reject
Panel Statement: The proposed change to this section does not improve the clarity or consistency. It is logical for the user to assume that MC cable installed in a raceway or direct buried does not need to comply with the securing and supporting requirements of this Article. The submitter has not presented technical substantiation indicating present industry practice regarding securing and supporting direct buried cables or cables installed in raceways presents a history of failure. Securing and supporting requirements are not the same and they are addressed in Section 330.30 (B) and (C). The panel refers the submitter to the NEIS # 120 for standardized cable installations.

ARTICLE 332 — MINERAL-INSULATED, METAL-SHEATHED CABLE

7-20 Log #916 NEC-P07 **Final Action: Reject**
(332.4 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-58
Recommendation: Accept the proposal.
Substantiation: Practically all wiring methods and conductors are required to be listed (for safety and use). This article and Article 490 do not mention voltage rating; the voltage rating is covered in Table 310.13(A), but without listing the AHJ has to determine if the cable is so rated and be the sole enforcer of 310.11(B)(3). It is difficult to perceive why a 600 volt cable is not listed, when listing is required for other cables and 820.100(A)(1) requires listing for a grounding conductor.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the comment because the submitter has not provided the technical substantiation to support the change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
LA DART, S.: The panel should have accepted Proposal 7-58 and Comment 7-20. This is a safety issue. We agree with the submitter----"That practically all wiring methods and conductors are required to be listed (for safety and use)". Type MI cable should not be an exception. Type MI cable has numerous applications in the field, (including hazardous locations).
Product standards help to provide for safer electrical installations. This fact formulates the basis for the needed "technical substantiation" for accepting the proposal.

7-21 Log #936 NEC-P07 **Final Action: Reject**
(332.12(1))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-60
Recommendation: Accept the proposal with the following revisions:
In underground runs unless protected where likely to be subject to physical damage.
Substantiation: See explanation of negative for Proposal 7-9 320.12(1).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 7-2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-22 Log #937 NEC-P07 **Final Action: Reject**
(332.12(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-62
Recommendation: Accept the proposal.
Substantiation: See explanation of negative for Proposal 7-9 320.12(1).

7-23 Log #915 NEC-P07 **Final Action: Reject**
(332.30)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-64
Recommendation: Accept the proposal with the following revisions:
Except where direct buried, or encased in concrete, or installed in a raceway, Type MI cable shall be secured to supports by staples, cable ties, tie wires, straps, hangers, or other approved means, installed so as not to damage the cable, at intervals not to exceed 1.8 m (6 ft), except as otherwise permitted in this section.
FPN: See 300.4(B) Unsupported Cable. Cable shall not be required for that portion of cable fished between access points through concealed spaces in finished buildings or other structures and supporting is not practical.
Substantiation: Securing to supports should be exempted where cables are embedded in concrete, direct buried, or installed in raceways. Present (A) is superfluous as 300.4 and the first paragraph already apply. A vertical run through holes or notches is supported since it has to be attached to supports the same as a vertical run on the side of a stud.
Panel Meeting Action: Reject
Panel Statement: The proposed change to this section does not improve the clarity or consistency. It is logical for the user to assume that MI cable installed in raceway, direct buried, or encased in concrete does not need to comply with the securing and supporting requirements of this Article. The submitter has not presented technical substantiation indicating present industry practice regarding securing and supporting direct buried cables, cables installed in raceways, or encased in concrete presents a history of failure. Securing and supporting requirements are not the same and they are addressed in Section 332.30. The panel refers the submitter to the NEIS # 120 for standardized cable installations.
Number Eligible to Vote: 14

7-26 Log #1859 NEC-P07 **Final Action: Accept in Principle**
(334.10(1))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 7-77
Recommendation: Accept the proposal in principle and revise 334.10(1) to read as follows:
One- and two- family dwellings and their garage or storage buildings.
Substantiation: The term "Accessory Structure" used in the proposal is defined in the ICC Residential Code as "A structure not greater than 3,000 square feet (279 m2) in floor area, and not over two stories in height, the use of which is customarily accessory to and incidental to that of the dwelling(s) and which is located on the same lot". This term is much too broad and goes beyond garages and storage sheds that were requested in the substantiation for proposal 7-76 and 7-77.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
One- and two-family dwellings and their attached or detached garages, and their storage buildings.
Panel Statement: The panel recognizes that "Accessory Structures" is too broad in scope. The addition of "attached or detached garages, and storage buildings" should be permitted and addresses the submitter's concerns.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-27 Log #2249 NEC-P07 **Final Action: Accept in Principle**
(334.10(1))

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 7-77
Recommendation: Continue to accept Proposal 7-77.
Substantiation: Compared to my laundry list of words in Proposal 7-75 attempting to catch all types of accessory structures, Proposal 7-77 greatly simplifies and clearly articulates that accessory structures need to be initially included in the allowance offered by 334.10(1). Too many authorities having jurisdiction have mistakenly required that the installation of Type NM cable in accessory structures somehow constitutes a greater hazard than the dwelling structure itself, and that Type NM cable needs to be installed behind a rated thermal barrier material. If warranted, and due to special circumstances on a case-by-case basis, the authority having jurisdiction can always invoke rules in Article 90 and Article 110 if the accessory structure actually qualifies as an "Other structure" under 334.10(3). In the Explanation of Negative comment by panel member LaDart, I find it
interesting that some persons believe 334.10(1) is meant to protect the Type NM cable from the occupants of the structure; conversely, the purpose of the rated thermal barrier material is to protect the occupants and to buy some time to escape the structure should the wiring be the source of or contributory to fire or smoke.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 7-26.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-28 Log #2356 NEC-P07 **Final Action: Accept in Principle**
(334.10(1))

Submitter: Marcus R. Sampson, Lysistrata Electric
Comment on Proposal No: 7-77
Recommendation: Mr. Ladart's comment against the panel vote should be noted and the accepted change to this section revised.
Substantiation: Using "dwelling associated garage(s) and storage shed(s)" is a much better choice in this instance. Installers and inspectors need to apply different rules to those dwelling accessory structures that may be Article 501, 513, 547 or other special occupancy buidings.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 7-26.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-29 Log #2259 NEC-P07 **Final Action: Reject**
(334.10(2))

Submitter: William Benard, Gemini Electric Inc.
Comment on Proposal No: 7-77
Recommendation: Revise as follows:
334.10(2) Multifamily dwellings that consist solely of dwelling units, occupancies ancillary to the multifamily dwelling units and their accessory structures and permitted to be of Types III, IV, and V construction except as prohibited in 334.12.
Substantiation: The current definition of "dwelling multifamily" is a common definition used in several other NFPA documents and for consistency sake cannot be edited without affecting other NFPA codes. It appears that the original intention to limit the use of exposed type NM cable to structures that are one family, two family and mutifamily dwellings was with the intention to permit the unconcealed installation of type NM cable within structures that were "solely" one, two or three or more dwelling occupancies. Multiple occupancy structures containing uses, other than dwelling units, can also be comprised of three or more dwelling units; however, the definition of multifamily does not contain the specificity of the word "solely" as one and two family dwellings are described in Article 100. It becomes necessary to detail in 334.10(2) that the Type NM cable will be permitted exposed in multifamily buildings that consist solely of dwelling units. By definition, a multiple occupancy building with three or more dwelling units and mercantile or other occupancy uses is by definition a multi-family dwelling.
Adding the language "occupancies ancillary to the dwelling units and their accessory structures" permits structures with a make up of "solely dwelling units" to have occupancies or rooms intended only to support the existence and use of the dwelling units to be considered as part the building make-up. The inclusion of the language "and their accessory structures" also supports and extends the accepted Proposal 7-77, Section 334.10(1) to be reflected in 334.10(2).
Panel Meeting Action: Reject
Panel Statement: The definition of multifamily dwelling in Article 100 is clear and does not apply to mixed use structures. There is no need to adjust the language of Section 334.10(2). This is new material that has not had public review. The panel action is in accordance with Section 4.4.6.2.1(b) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 14

(334.12(B)(4))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-88
Recommendation: Accept the proposal with the following revisions:
...in wet or continuously damp locations.
Substantiation: 334.10(A)(1) permits nonmetallic sheathed cable in normally dry locations which doesn't exclude locations that may occasionally be damp or wet. Basement and crawl spaces may be occasionally damp.
Panel Meeting Action: Reject
Panel Statement: Types NM and NMS are only permitted in "normally dry" locations. See 334.12(B)(4), and the definition "Location Damp" in Article 100. The submitter has not presented technical documentation indicating that damp locations do not have a deteriorative effect on these cables. Only Type NMC is permitted in "dry, moist, damp, or corrosive locations". The argument that a location is only damp periodically or the area must be continuously damp in order to restrict a wiring method is false.

7-33 Log #114 NEC-P07 **Final Action: Accept**
(334.15(C))

TCC Action: The Technical Correlating Committee directs that the text be revised to read as follows:
"Where cable is run at angles with joists in unfinished basements and crawl spaces, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. Nonmetallic-sheathed cable installed on the wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing or shall be protected in accordance with 300.4. Conduit or tubing shall be provided with a suitable insulating bushing or adapter at the point where the cable enters the raceway. The sheath of the nonmetallic-sheathed cable shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (1⁄4 in.). The cable shall be secured within 300 mm (12 in.) of the point where the cable enters the conduit or tubing. Metal conduit, tubing, and metal outlet boxes shall be connected to an equipment grounding conductor complying with the provisions of 250.86 and 250.148."
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 7-99
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel action and statement on this proposal identifying the part of the proposal that was rejected.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Where cable is run at angles with joists in unfinished basements and crawl spaces, it shall be permissible to secure cables not smaller than two 6 AWG or three 8 AWG conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. Nonmetallic-sheathed cable installed on the wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing or shall be protected in accordance with 300.4. Conduit or tubing shall be provided with a suitable insulating bushing or adapter at the point the cable enters the raceway. The nonmetallic-sheathed cable sheath shall extend through the conduit or tubing and into the outlet or device box not less than 6 mm (1⁄4 in.). The cable shall be secured within 300 mm (12 in.) of the point where the cable enters the conduit or tubing. Metal conduit, tubing, and metal outlet boxes shall be connected to an equipment grounding conductor complying with the provisions of 250.86, and 250.148.
Panel Statement: The panel accepted the replacement of "NM" with "nonmetallic-sheathed" and rejected everything else for the reasons stated. The panel rejects the use of the term "shall" in place of "shall be permitted". There are other methods that may be employed to protect the cable. The use of a raceway is only one such method. The panel has chosen to edit the paragraph and reference Sections 250.148, and 250.86 to comply with section 4.1.2 of the NEC Style Manual. The panel rejects the exclusion of the exception to 250.86. Short sections of metal raceway or tubing are permitted to protect cables if so desired.
Number Eligible to Vote: 14

7-34 Log #1962 NEC-P07 **Final Action: Reject**
(334.15(C))

Submitter: Gerald H. Horn, Spencer Research & Development, dba/J-Horn Electric, Inc.
Comment on Proposal No: 7-98
Recommendation: Revise text to read as follows:
Smaller cables shall be run either through bored holes in joist or on a running board or through listed devices designed for the support of NM cable attached to the bottom of ceiling joist. These devices allow NM cable to be run at right angles to the joist and must be installed within 12 in. of the main center support beam.
Substantiation: The listed device would be less expensive for the installer, would put less stress on the cable sheath, and would not compromise the integrity of the wood joist by eliminating the bored holes.
I am submitting this 2011 Report on Comments form to clarify my original submission in the ROP stage. I have added a restriction on the placement of the listed device to satisfy concerns of Panel 7 members that the device could be a hindrance when finishing basement ceilings. Several electrical inspectors I have contact with also expressed the same concerns. The restriction on the placement of the device satisfied their concerns, and I have not had a single negative response with all the AHJs I have contacted with the change. With the problems facing the housing industry, any improvement to installation methods and cost would be helpful to the housing industry.
Underwriters Laboratories has listed the product for which I proposed a change in the wording of 334.15(C) for the 2011 Code.
UL listed the product subject to 334.15(C).
I have provided copies of correspondence from UL regarding the listing. In addition, I have provided some pictures of the listed product in an actual installation.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The substantiation provided with the comment did not address the concerns expressed by the Panel on Proposal 7-98 of the 70-A 2010 ROP.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-35 Log #1076 NEC-P07 **Final Action: Accept**
(334.15(C) Exception No. 1)

Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 7-97
Recommendation: Delete the New Exception which was added at the proposal meeting.
~~Exception No. 1: Where the height of a crawl space does not exceed 1.4 m (4 1/2 ft) it shall be permissible to secure NM cables, that run at angles with joist, to the bottom edge of joist. NM cables run within 2.1 m (7 ft) of crawl space access shall comply with 320.23.~~
Substantiation: The submitter did not present a clear argument that the current requirements for physically protecting cables smaller than 6/2 or 8/3 in these exposed areas was impossible nor a safety hazard to installers. The explanation presented was injury to electricians in these confined areas when boring holes through framing members. This proposal never addressed alternative methods to protect said exposed cables. There are several products available to the industry that would provide adequate protection to the wiring method and anyone entering these spaces for maintenance or storage. Furthermore, the panel action accepting a relaxation of the long-standing requirements to protect this wiring method in those areas that are 4-1/2 ft or smaller is excessive. If the occupants are going to utilize the first 7 ft of these areas what makes one think they will not penetrate the space to beyond? Most building codes require crawl spaces to have poured floors. This invites the use of these areas for a variety of applications (I see it daily). Most of the areas I observe usually contain equipment, which requires periodic maintenance and area lighting. The exception invites an installation standard that lacks foresight for the use of such areas exposing the installed cables and personnel that may enter these areas to hazard. Common ties that may occupy such areas include bikecycles (40 in.), lawn furniture (47 in.), desks (32 in.), ladders (24-30 in.). It is unreasonable to expect that a homeowner is going to ignore a dry area that presents such an ample opportunity to store seasonal items. I am convinced that the existing text is adequate needing no further manipulation by the panel. It is reasonable to consider that such installation can and will be evaluated at the time of

installation and the AHJ and installer will come to an agreement as to how best secure the installation and the building's occupants from harm.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
RAY, J.: This comment should have been rejected. This code section needs to provide some differentiation between an unfinished basement and a crawl space. The words "and crawl spaces" were added to the 2008 code with substantiation that the same dangers exist for crawl spaces and unfinished basements. In fact, unfinished basements and crawl spaces do not have the same dangers. Clearly a 24 inch crawl space and a 6 to 8 ft unfinished basement have unique and separate dangers. The substantiation further stated a need to give direction as to the requirements of a crawl space. The exception accepted in the proposal stage provided some direction for crawl spaces and accepting this comment reverses that action of the panel.

7-36 Log #1995 NEC-P07 **Final Action: Reject**
(334.15(C) Exception No. 1)

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Comment on Proposal No: 7-97
Recommendation: Add new text to read as follows:
Exception: Where the height of a crawl space does not exceed 1.4 m (4 1/2 ft) it shall be permissible to secure nonmetallic-sheathed cables, installed at angles to the joists, to the bottom edge of joists. Nonmetallic-sheathed cable installed within 2.1 m (7 ft) of crawl space access shall be protected by substantial guard strips that are at least as high as the cable.
Substantiation: I agree with the submitter I have lost my front teeth when I lost control of a right angle drill in a 36 in. crawl space.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the comment because the submitter has not provided technical data to support the change. The panel has reviewed the submitter's substantiation and worker safety is addressed by safe work practices.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1

8-6 Log #325 NEC-P08 **Final Action: Accept**
(334.30(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 7-106
Recommendation: It was the action of the Technical Correlating Committee that this proposal be referred to Code-Making Panel 8 for action in Article 342.
This action will be considered by Code-Making Panel 8 as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the TCC recommendation to consider and rejects the proposal. The Panel concludes this proposal was intended for 344.30(C).
An identical proposal 8-22 was submitted for 342.30(C) and was rejected by CMP-8 based on the panel action taken on Proposal 8-24a. Proposal 7-106 was incorrectly directed to CMP 7 and should continue to be rejected. There has never been any technical substantiation to support the proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

7-37 Log #2688 NEC-P07 **Final Action: Reject**
(334.80)

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 7-111
Recommendation: The proposal should be accepted.
Substantiation: The panel statement refers to research unavailable to the code making panel. The research is documented in the substantiation for Proposal 4-97 in the A86 TCR (the equivalent of today's ROP) for the 1987 NEC cycle, as plainly stated in the substantiation for this proposal. This proposal appears on page 125 of that document. The tests were conducted by Forensic Engineering, Inc. in Marietta, Georgia. We assume that this material is readily available to CMP 7 members, as we have discussed this topic at length with individual members, and we know that it is common knowledge. It is clear from the statements made in the voting that this topic has been reviewed. Surely this information informed the 60°C limitation imposed by CMP 7 on Type SE cable in the 2008 NEC cycle and partially maintained in this cycle (Proposal 7-133). For the benefit of panel members that may not have had access to the cited material, enough copies of the relevant page from the old TCR are being submitted with this comment.
The ampacity limitations for this wiring method are too severe for applications without thermal insulation embedment, and insufficiently severe for applications that are embedded within thermal insulation. The proposal seeks a technically appropriate balance, nothing more.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel has reviewed Proposal 4-97 from the A86 TCR, which was referenced in Proposal 7-111. That material did not address the installation of Type NM Cable in or on thermal insulation. Section 334.112 requires conductors insulated for 90C. Derating from 90C is appropriate. There is no other documentation or study available to this panel indicating the existing language contributes to failure.

(336.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 7-117
Recommendation: Accept the proposal.
Substantiation: This provision is not a requirement and therefore not enforceable. If "uses permitted" is not all inclusive, how are other not prohibited uses to be judged acceptable? 230.43 limits wiring methods and if that is the intent of this provision it should be clear.
Panel Meeting Action: Reject
Panel Statement: The panel understands that the submitter's comment refers to Proposal 7-116. The submitter has not indicated how the term "only" will clarify the language presently in Section 336.10. The title of this section is "Uses Permitted" and the term "shall be permitted" is consistent with the language in Section 90.5(B). The use of the term "only" will give finality to the list of permitted uses for Type TC Cable. The reference to Section 230.43 is irrelevant because that section is intended to be restrictive and provide strict, narrow guidance to which wiring methods are allowed for service conductors
Number Eligible to Vote: 14

7-40 Log #502 NEC-P07 **Final Action: Reject**
(336.10(7))

Submitter: Robert Alexander, P2S Engineering
Comment on Proposal No: 7-118
Recommendation: Accept the Proposal.
Substantiation: The cable is primarily designed to be installed in cable tray and as permitted in 336.10." The statement is, of course, true. SO WHAT? It's pure sophistry. In all the times this Proposal or ones similar have been made, the Panel HAS NEVER ONCE established a valid technical or safety (valid or not) issue that would reasonably prohibit the alternate use of TC-ER as proposed.
Forget the name - consider the construction. It isn't even a unique or novel concept. Type TC-ER is obviously superior to Type NM (in any form) yet is restricted from uses where Type NM would be readily permitted. Please spare the further sophistry that there are applications where neither would be permitted.
This commenter is aware that, while Type TC-ER "…complies with the crush and impact requirements of Type MC …," Type MC does, in fact, generally perform better under those qualification tests. If safety were a genuine concern, the appropriate response would be to raise the "pass/fail" qualification standard – not arbitrarily prohibit Type TC from a reasonable alternate application.
There is a reasonable safety concern that TC-ER may at some time in the future be proposed as a substitute for Type MC. That is when to reject it – but only if the application warrants a unique feature of Type MC.
Panel Meeting Action: Reject

Panel Statement: Type TC cable was introduced into the Code as a tray cable. As additional substantiation was provided it was permitted to be used as open wiring in limited lengths when it complied with the crush and impact requirements of Type MC Cable. It was never intended to be a universal wiring method outside of cable tray.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
RUNYON, G.: Mr. Alexander raises the same point that many have had for the past several code cycles. The panel continues to reject other uses of this cable without any technical or safety justification. The panel should have accepted Mr. Alexander's recommendation that the panel accept the proposal.
Comment on Affirmative:
FAHRENTHOLD, C.: During the code cycle for the 2002 code, the restriction for limiting the distance of 50 feet that the cable could be installed outside the cable tray between the cable tray and the utilization equipment was deleted in article 336.10 (6). The panel felt that the 50 foot restriction was too arbitrary. However, the panel has never intended for this cable to be installed outside the cable tray for unlimited lengths. In making this change, the panel was allowing the cable to leave the cable tray and be installed along a support structure to the utilization equipment so that either additional cable tray did not have to be installed or that the tray cable did not have to be transitioned to some other wiring method.

(336.100)

Submitter: Robert L. Seitz, Artech Engineering
Comment on Proposal No: 7-125
Recommendation: Add to end of paragraph:
A braided or basket weave metallic armor shall be permitted beneath the outer non metallic jacket
Substantiation: Reconsideration of proposal is requested. Apparently some words were deleted from the substantiation provided. There is a need for a cable construction of the type this change would permit. The: additional durability afforded by a braided metallic sheath or an nor along with the enhanced ability to provide for ground fault detection available because of such metallic layer in the TC construction would provide a very workable solution to many installation problems especially where more flexible connections are necessary. The argument was not intended to justify the new construction permitted for use in shipboard or offshore environments but was meant to encourage the allowance of a cable construction, that is common for offshore installation. for onshore industrial facilities covered by the National Electrical Code. The fact that such a construction is currently available in a cable type very similar to TC seemed a reasonable argument in favor of this metallic sheath, as it would be easy to implement in TC by cable manufacturers. It is presumed that such a cable would he qualified to be marked TC-ER if the requirements for TC-ER are met. This proposer agrees that there should be no confusion allowed between TC and MC cable. The braided or woven construction is so different from the metallic sheath described in 300.116, and could not be confused during installation. Where greater flexibility is required at motors driven by variable speed drives, the metallic sheathed TC cable would provide benefit just as an MC cable docs for such application, again with the greater and better flexibility.
Panel Meeting Action: Reject
Panel Statement: As stated in the Panel Statement on Proposal 7-125, the exclusion of a metallic sheath or armor on the cable was specifically intended to differentiate Type TC Cable from Type MC Cable. The use of metallic tapes or braids for shielding purposes is permitted under the current Code. Shipboard cables are excluded from the Code under 90.2(B)(1).

ARTICLE 338 — SERVICE-ENTRANCE CABLE: TYPES SE AND USE

7-44 Log #2001 NEC-P07 **Final Action: Reject**
(338.10(4)(a))

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety
Comment on Proposal No: 7-133
Recommendation: Revise text to read as follows:
(a) *Interior Installations.* In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334, excluding 334.80. Where installed in thermal insulation exceeding 3.0 meters (10 ft) the ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The 90°C (194°F) rating shall be permitted to be used for ampacity adjustment and correction purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor.
Substantiation: This will give the AHJ a measurement and the installer a definable limitation to the SE cable.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented technical documentation to support excluding the 60 degree ampacity limitation for cable installations which comprise of 10 ft or less of a cable run, in contact with thermal insulation.
The submitter has not presented technical documentation to support excluding the 60 degree ampacity limitation for cable installations which comprise of 10 ft or less in contact with thermal insulation. See the panel action and statement on Comment 7-48.

7-48 Log #1824 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4))

TCC Action: The Technical Correlating Committee understands that the panel action on this comment is prefaced with the following text "In addition to the provisions of this article," at the beginning of the first sentence in 338.10(B)(4)(a) to correlate with existing text in 338.10(B)(4)(b).

Submitter: Richard W. Likes, L & F Electric
Comment on Proposal No: 7-133
Recommendation: Revise text to read as follows: "Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334, excluding 334.80."
Substantiation: There seems to be no information as to why the code was even changed in 2008 without any written proof that SE cable, which is marked to indicate XHHW conductors which are rated for both wet and dry locations. This is one difference from Romex wire. Romex does not say what conductors it contains. Still my question, has the NEC been wrong all these years?
Panel Meeting Action: Accept in Principle
Revise original panel action text on Proposal 7-133 as follows:
Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334, excluding 334.80. Where installed in thermal insulation, the ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The maximum conductor temperature rating shall be permitted to be used for ampacity adjustment and correction purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor.
Informational Note: For the installation of main power feeder conductors in dwelling units refer to 310.15(B)(7).
Panel Statement: The panel action text and statement to Proposal 7-133 was to accept the submitter's proposal in principle with the addition of panel generated language addressing the several concerns raised regarding the negative effect on such installations when the cable is embedded in thermal insulation. The panel added an informational note for clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
CYBULA, T.: No evidence was submitted to support the idea that a Type SE cable having either 75 or 90 C rated insulated conductors would behave differently than a Type NM with 90 C insulated conductors to warrant excluding the Type SE cable from the requirements of 334.80 when used as internal wiring.
STRANIERO, G.: The panel action should not have included the phrase" excluding 334.80". SE cable installed as a substitute for NM Cable should be subject to the installation requirements for NM. This provision is in place for Type UF where so installed, as referenced in 340.10(4), and should also apply to SE. The Ampacity adjustment rules in 334.80 including those on cables passing through bored holes without maintaining spacing and where installed in thermal insulation without maintaining spacing also apply to SE cable where installed as NM.
Comment on Affirmative:
DALY, J.: When Type SE Cable is used in interior installations, it should conform to the same installation requirements as Type NM cable including 334.80. 334.112 requires conductors in Type NM Cable to be rated at 90C (194F) but the allowable ampacity after adjustments and corrections cannot exceed the ampacity for 60C conductors. Conductors in Type SE Cable containing 90C rated conductors should be adjusted and corrected from the 90C ampacity column and Type SE Cable containing 75C conductors should be adjusted and corrected from the 75C ampacity column however, in either case, the adjusted ampacity cannot exceed that permitted in the 60C ampacity column.
The language proposed by the Panel falls short when SE cables are installed as branch circuits in that it does not require all of the ampacity adjustment and correction requirements found in 334.80.
SMITH, M.: We think there is a need to request a reseach project on the affects of conductors when installed in thermal insulation. CMP-7 will be makeing a formal request for a reseach grant to look into this and give the Panel a clear direction.

7-49 Log #2250 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4))

Submitter: John Williamson, Maple Grove, MN
Comment on Proposal No: 7-133
Recommendation: Proposal 7-133 should have been accepted.
Substantiation: Type SE cable is the preferred wiring method of choice among electrical contractors for individual dwelling unit feeders in multifamily buildings, where the 120/240-Volt single-phase feeder carries 100% of the dwelling unit's diversified load. However, the lack of coordination between 338.10(B)(4) and Table 310.15(B)(6) has paralyzed both electrical contractors and electrical inspectors; do we use the 60C rating as per 338.10(B)(4) or do we use Table 310.15(B)(6) for sizing the feeder? Contractors need a straight answer so they can properly bid, plan, and layout their electrical work. And it's more than a routine judgment call for the electrical inspector; the lack of correlation in the NEC forces the electrical inspector to make a very difficult decision – common sense leads one to believe that Table 310.15(B)(6) would result in a safe installation, yet the
typical inspector does not have all of the technical information that causes others to promote a 60C rating for Type SE cable that is used for interior wiring.

7-50 Log #2583 NEC-P07 **Final Action: Reject**
(338.10(B)(4))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-133
Recommendation: Reject the proposal.
Substantiation: Although the panel action is an improvement on the 2005 NEC language that was worded the same way as the proposal itself suggested for the 2011 edition, it still does not meet minimum safety requirements, in two areas. First, if the cable is being listed to 75°C, then the derating should be done from that temperature column. (This is not clear in the 2009 edition of the UL White Book, but the panel statement on this proposal seems definitive.)
The more interesting issue is the idea that although cable embedded in insulation must be taken as a 60°C conductor in this case, derating can still apply from a higher design temperature. As clearly shown in the NEMA/UL study used as substantiation for proposals on this topic in the 2008 NEC cycle, the ampacity of cable embedded in thermal insulation is far lower than its nominal value. The panel action recognizes that in part by the 60°C rule, but then, inconsistently, fails to apply the concept to derating. If the ampacity of a cable is based on the 60°C ampacity column, then derating must be applied from the same starting point. Doing anything else would be similar to pulling nine TW conductors into a raceway, explaining that in general the ampacity will be based on the 60°C ampacity column, but allowing the derating for mutual conductor heating to be based on the 90°C ampacity column. The cable would overheat just as surely as the embedded raceway in this example results in a base ampacity lower that the cable insulation would normally predict, and for multiple conductor heating the derating must also be taken from that lower value.

7-51 Log #2738 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4))

Submitter: Christel K. Hunter, Alcan Cable
Comment on Proposal No: 7-133
Recommendation: Add new text to the 2008 NEC language to read as follows, without the additional limitation added by the panel:
Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334, excluding 334.80.
Substantiation: Several submitters made the obvious and correct statement that there was no substantiation provided to the code panel justifying the change in the 2008 NEC to limit SE cable to 60 degrees C. Mr. Hinrichs comment that information was provided to CMP-7 during the 2008 cycle that SE cable is manufactured the same as NM cable indicates that the CMP was given inaccurate information. NM and SE cable are manufactured to different standards and generally use different insulation types and materials. Additionally, they are manufactured in different sizes and are rarely used for the same applications. It is obvious from the allowed uses that the cables are different, since SE is suitable for wet locations and service entrance, and NM is not allowed for those applications. One of the panel member comments indicated that this subject is a safety issue, yet there has been no showing that SE failed in the previous decades of use when sized using the 75C column. He also stated that the performance of the cable types will be the same when placed in thermal insulation, but no evidence of this was presented to the CMP. Another of the panel members indicated that the insulated conductors in SE cable are typically rated at 75C, and this is also incorrect. The conductors are rated at 90C, and the assembly is rated at 75C. It is obvious that the entire premise of the change to limit SE cable to 60C is based on incorrect information and assumptions. The Code should revert to the time-proven language in the 2005 NEC.

7-55 Log #1077 NEC-P07 **Final Action: Reject**
(338.10(B)(4)(a))

Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 7-133
Recommendation: Revise text to read as follows:
(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 334. ~~excluding 334.80. [ROP-7-133] Where installed in thermal insulation, the ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The 90°C (194°F) rating shall be permitted to be used for ampacity adjustment and correction purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor. [ROP 7-133]~~
Substantiation: The panel should reject this proposal and keep the language currently in the 2008 NEC, at least for one more cycle. If you consider the panel's action on Proposal 7-111 (334.80) which would have adopted similar permissive language for type NM Cable, the panel voted 14 Affirmative to reject. The submitters for Proposals 7-134, 135, and 136 have not presented clear evidence that Type SE Cable is profoundly different from that of Type NM cable. Clearly the panel had reservations concerning heat dissipation for Type SE when installed in thermal insulation, yielding the 75-degree limit, which was adopted. It would be helpful if the Code Panel had scientific evidence to support adoption or rejection of this language but in the absence of documentation the panel should reconsider its vote. It is important to consider that when type SE is installed as interior cable it is most likely used in Type 5 (wood frame) structures. When used in such structures it is predominately used as feeder (beyond the service entrance). Installers incorrectly apply the permissive ampacities listed in the current Table 310.15(B)(6). These (Feeder) cables do not offer the same load diversity that was considered when that table was developed. If such conditions are not detected, there is a probability that the cable will be over fused. Another point to consider concerns the installation of insulation, this occurs after the rough-in electrical inspection. In today's homes quite a bit of the interior vertical partitions are insulated for sound damping purposes. Additionally, many of the unfinished areas that are not temperature controlled have insulation installed per building codes. Inspectors will have a difficult time in determining which interior partitions or framing cavities will compel the 75-degree limitation on these cables. The acceptance of these proposals essentially establishes a hierarchy of installation requirements. Inspectors and installers will be at odds regarding installation requirements. This adopted language establishes two rules, one for Type NM, and one for Type SE. This will undoubtedly lead to enforcement problems. During the 2008 cycle, this panel determined a need to address both of these wiring methods with similar restrictive language. None of the adopted proposals have significantly indicated a need to back track on that decision.

8-8 Log #357 NEC-P08 **Final Action: Accept**
(342.28)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-16
Recommendation: The proposal should be rejected.
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.
The negative comment in the voting is correct. The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

8-10 Log #1989 NEC-P08 **Final Action: Reject**
(342.30(C))

Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 8-24a
Recommendation: This proposal should be modified and accepted in principle.
(C) Unsupported Raceways. Where oversized, concentric or eccentric knockouts are not encountered, Type IMC ~~shall be permitted to be unsupported where the raceway is not more than 450 mm (18 in.) and remains in unbroken lengths (without coupling)~~. nipples not more than 900 mm (3') shall be permitted to be support by the conduit terminations. Such raceways shall terminate in an outlet box, junction box, device box, cabinet, or other termination at each end of the raceway.
Substantiation: The change for the 2008 code was an attempt to make the code match real world and provide relief from a rule that requires support for all raceways, no matter how short they are. While it is rare for an inspector to red tag the installation of a short nipple for lack of a code required support it has happened. The easiest way to fix this is to permit the conduit termination to be used as the means of support as has been done in the field for years. This comment also applies to proposals 8-35, 8-78, 8-105, and 8-125.
Panel Meeting Action: Reject
Panel Statement: This comment does not address the concern for smaller raceways in exposed locations. These raceways may be susceptible to damage or movement where not securely fastened in place. Additionally, the raceway terminations are to terminate the raceway, not to provide support. The number of possible installation scenarios in which a given installation may or may not functionally benefit from being supported within 3' of the termination is infinite. However, a raceway that is supported within 3' of the termination has been demonstrated to provide effective support. Any decision to omit the support required by general rule within 3' of raceway terminations is a decision best made in the field by the AHJ based on the circumstances of the given installation.

Comment on Proposal No: 8-24a
Recommendation: Revise text to read as follows:
342.30(C) Unsupported Raceways. Type IMC shall be permitted to be installed unsupported where the raceway is not more than 900 mm (3 ft) in length and terminates in an outlet box, junction box, device box cabinet or other termination on either end.
Substantiation: I agree with the substantiation in Proposal 8-24a that historically many raceways have been installed between enclosures that are not more than three feet apart and there has been no significant number of failures reported. However, I would recommend accepting the proposal in principle and revising the existing text as I also agree with the original substantiation from the 2008 NEC cycle that the literal wording "within three feet" means that support is required. Revising the text as proposed in this comment will continue to resolve future issues of whether the raceway must be supported where it runs between enclosures that are not more than three feet apart, add clarity to the section, and address the submitter's concerns.

8-13 Log #2584 NEC-P08 **Final Action: Reject**
(344.6 Exception (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-26
Recommendation: The proposal should be accepted.
Substantiation: It would certainly be preferable if the listed product were routinely available, but that is certainly not the case as of this writing. That being the case, the NEC should recognize the reality and respond accordingly. It is poor code when one of its provisions routinely send inspectors into 90.4. That section should be reserved for truly unique problems that were unpredictable when that part of the code was being developed. The issue of unlisted brass conduit has been around for at least fifteen years. This new exception is very narrowly written and, should listed products become available, it can be withdrawn in a subsequent code cycle.
Panel Meeting Action: Reject
Panel Statement: The panel continues to reject this proposal and requires RMC, regardless of material, to be Listed. The Panel agrees with submitters statement pertaining to 90.4 and would not support the use of a non-listed plumbing product as a substitute for red brass RMC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-14 Log #358 NEC-P08 **Final Action: Accept**
(344.28)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-30
Recommendation: The proposal should be rejected.
Substantiation: The use of the word "per" in this context does not violate the NEC Style Manual, and the use of the slash mark within normal text that is not describing a formula of some sort is confusing. It would only be appropriate in a context such as where the other units are abbreviated, such as "VA/ft^2". This kind of change should not be made until a policy decision regarding style has been made. The TCC referred a similar proposed change (3-66, rejected by CMP 3) to the NFPA Glossary of Terms Advisory Committee for information.

The negative comment in the voting is correct. The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-15 Log #1470 NEC-P08 **Final Action: Reject**
(344.30(B)(4))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-33
Recommendation: Delete.
Substantiation: Runs through openings are not prohibited by the NEC and are assumed to be permitted by 300.4 if in accordance with that Section.

(A) and (B) provide requirements which do not exempt runs through openings or notches whether or not vertical, horizontal, or other angles.
Panel Meeting Action: Reject
Panel Statement: This section deals with horizontal raceway runs. Vertical runs must be supported and secured. The submitter's reference to 300.4 is not applicable as that section addresses protection of cables and raceways from physical damage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-16 Log #2105 NEC-P08 **Final Action: Reject**
(344.30(C))

Submitter: M. Shan Griffith, ELEKTEK, PLLC / Rep. Institute of Electrical and Electronic Engineers, Inc. (IEEE)
Comment on Proposal No: 8-35
Recommendation: Proposal 8-35 should have been rejected and the language retained as in the present NEC.
Substantiation: During the 2008 NEC cycle Panel 8 fully considered the need for adding the section which the submitter of Proposal 8-35 proposes to delete. The Panel determined that the present language was needed to clarify that short nipples do not require additional support and that this was not universally understood by AHJ's, especially in remote & rural areas. It is, therefore, not generally true that "This new NEC provision (in the 2008 NEC)… addressed a non-existent problem" as the submitter of Proposal 8-35 asserts.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-17 Log #2792 NEC-P08 **Final Action: Reject**
(344.30(C))

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 8-35
Recommendation: Revise text to read as follows:

344.30(C) Unsupported Raceways. Type RMC shall be permitted to be installed unsupported where the raceway is not more than 900 mm (3 ft) in length and terminates in an outlet box, junction box, device box cabinet or other termination on either end.
Substantiation: I agree with the substantiation in Propsoal 8-35 that historically many raceways have been installed between enclosures that are not more than three feet apart and there has been no significant number of failures reported. However, I would recommend accepting the proposal in principle and revising the existing text as I also agree with the original substantiation from the 2008 NEC cycle that the literal wording "within three feet" means that support is required. Revising the text as proposed in this comment will continue to resolve future issues of whether the raceway must be supported where it runs between enclosures that are not more than three feet apart, add clarity to the section, and address the submitter's concerns.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-18 Log #2106 NEC-P08 **Final Action: Reject**
(344.60)

Submitter: M. Shan Griffith, ELEKTEK, PLLC / Rep. Institute of Electrical and Electronic Engineers, Inc. (IEEE)
Comment on Proposal No: 8-39
Recommendation: Proposal 8-39 should have been accepted.
Substantiation: Industry experience indicates that, for several reasons including the one presented by the proposal submitter, metallic conduit systems do not always provide adequate equipment grounding. As a result, ANSI/IEEE Standard 142-2007 (the "Green Book"), section 2.2.3, recommends installation of a separate equipment grounding conductor (EGC) in conduit.

With regard to the Panel statement that RMC is tested and listed for grounding, there does not appear to any reference to a test method for establishing the adequacy of RMC as an equipment grounding conductor in the UL White Book either in the section on RMC or in the White Book NEC Correlation Index. Further, if there is such a UL test described elsewhere, the current level used and resulting voltage drop would both be of interest as factors in determining the suitability of RMC as an EGC for all installations.

Finally, if the proposed change is ultimately accepted it would have to be correlated with other sections of the NEC that presently recognize RMC as a grounding means. Similarly, Article 342 for IMC would require revision. (See also my Comments on Proposal 8-129).
Panel Meeting Action: Reject
Panel Statement: The submitter has not demonstrated evidence of any failure of this raceway type to perform reliably when installed as directed by the NEC. Furthermore this product is listed for grounding. Reference to damaged raceways possibly not performing the equipment grounding function of the raceway does not support the elimination of this type of raceway as an effective equipment grounding means. Any component of an electrical system that is damaged may not perform its intended function reliably and therefore should be effectively repaired or replaced.

Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 348 — FLEXIBLE METAL CONDUIT: TYPE FMC

8-19 Log #1469 NEC-P08 **Final Action: Reject**
(348.12(7))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-42
Recommendation: Accept the proposal with the following revisions: Where likely to be subject to physical damage.
Substantiation: See Explanation of Negative Vote on Proposal 7-9, 320.12(I).
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-7.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-20 Log #1209 NEC-P08 **Final Action: Hold**
(348.60)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 8-51
Recommendation: If the NEMA comments on proposals 8-51 and 8-65 should be accepted, Section 356.60 should be revised for harmonization of the sections. Revise 356.60 to read as follows:

356.60 Grounding and Bonding. ~~Where~~ If used to connect equipment where flexibility is ~~required~~, necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.

Substantiation: If the NEMA Comments are accepted for proposals 8-51 and 8-65 then Section 356.60 should be revised for harmonization of the sections.
Panel Meeting Action: Hold
Panel Statement: Comment 8-20 introduces new material to 356.60.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Griffith, M.
Explanation of Negative:

LOYD, R.: I see no value in holding this comment. It is not new material. The submitter indicates it is intended to apply to 356.60 and not 348.60. For consistency in the raceway articles, this should have been accepted. The vibration concept has been introduced for the last several cycles. Since it was accepted by CMP-5 and in all flexible raceway articles except 356, it should also be accepted here.

8-21 Log #1233 NEC-P08 **Final Action: Accept**
(348.60)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 8-51
Recommendation: The Panel should accept the proposal in principle with the following changes to the first sentence of 348.60:

"~~Where~~ If used to connect equipment where flexibility is ~~required~~ necessary to minimize the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed."

Substantiation: The revised text is the same text as accepted by Panel 5 in Proposal 5-273 for Section 250.118(5)(d). This comment should be accepted to reduce confusion between requirements in 348.60 and 250.118.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-22 Log #2107 NEC-P08 **Final Action: Accept in Principle**
(348.60)

Submitter: M. Shan Griffith, ELEKTEK, PLLC / Rep. Institute of Electrical and Electronic Engineers, Inc. (IEEE)
Comment on Proposal No: 8-51
Recommendation: Proposal 8-51 should have been accepted as submitted.
Substantiation: Acceptance of the proposed language in original Proposal 8-51 will better clarify the meaning of the "flexibility" that FMC is suitable to provide. And, while it is understood that the NEC is not a design guide, inclusion of the proposed language will also aid in facilitating responsible engineering designs seeking compliance with the intent of the NEC. Installation and definition of the equipment grounding conductor is covered under CMP-5 responsibility and acceptance of the proposed revision by CMP-8 should be correlated with CMP-5.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 8-21.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-23 Log #2585 NEC-P08 **Final Action: Accept in Principle**
(348.60)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-51
Recommendation: Accept the proposal in principle. Accept the entire text, except replace "required" with "necessary":
Substantiation: As the originator of the concept that the flexibility rule must be limited to applications where the flexing continues after the installation is complete, this submitter believes the proposal is squarely within the original concept and very helpful. Questions about vibration isolation crop up repeatedly, and this proposal provides excellent clarification. Furthermore, without this language, this section will again be at odds with 250.118(5)(d) because CMP 5 has accepted it under Proposal 5-273.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 8-21.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 350 — LIQUIDTIGHT FLEXIBLE METAL CONDUIT: TYPE LFMC

8-24 Log #582 NEC-P08 **Final Action: Accept**
(350.10(4))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 8-54
Recommendation: Continue to reject.
Substantiation: I agree with Mr. Dabe and Mr. Griffith's negative voting on Proposal 8-108. No substantiation was provided and more information is needed. Mr. Berman's comment points out that shipping and handling may be a problem, but states we should not worry about that, I disagree.

This is a flexible wiring method and not suitable for prewiring in unlimited lengths and sizes. There is no evidence that the product is presently tested with enclosed conductors. The weight could vary from a few pounds to hundreds of pounds which could only be moved with equipment. Moving is likely to damage the raceway and conductors which may not be detected by the installer.

300.18 requires the raceway to be installed prior to insertion of the conductors so that the conductors are protected from damage until installed in the raceway which is properly secured and supported with all boxes and fittings in place.
Panel Meeting Action: Accept
Panel Statement: Evidence of suitability for use in all product sizes and unlimited lengths has not been presented. The submitter's assertion that Mr. Berman's comment on shipping and handling is a problem is incorrect.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-25 Log #1489 NEC-P08 **Final Action: Reject**
(350.30)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-56
Recommendation: Accept the proposal with the following revisions:

"LFMC shall be securely fastened to supports by approved means within 300 mm (12 in) of each conduit termination and at intervals not to exceed 1.4 m (4 1/2 ft).

Exception No. 1, 2, 3 no change

Exception No. 4: Lengths not exceeding 1.8 m (6 ft) within an accessible above ceiling space from the last point where the surface mounted on such ceilings.

Exception No. 5: Where direct buried.

Exception No. 6: Where installed in cable trays except as specified in 392.8(B).

Substantiation: Fastening should be to the required supports, which does not exclude concrete walls, or other approved means. There is no reason not to include equipment surface mounted on such ceilings. Where direct buried or installed horizontally in cable trays fastening to support is not needed.

Panel Meeting Action: Reject
Panel Statement: Additional changes do not improve the usability of the NEC. "Securely Fastened" is not restricted to supports only. Securing to concrete walls, cable trays, and other approved means are acceptable whether it is fished, exposed, or concealed. Exception 4 applies to raceways within an accessible ceiling only. It is recognized that a degree of concealment is present and the luminaire would be installed in the ceiling grid. It does not permit supporting the raceway to the ceiling grid. Proposed Exception 5 is new material that is not needed since raceways that are direct buried are both secured and supported by the earth. Proposed Exception 6 is unacceptable since Section 392.6(J) requires raceways to be secured to the cable tray per the appropriate raceway article. Section 392.8(B) applies to cable only.

(350.30(B))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-62
Recommendation: Accept the proposal with the following revisions:
Article350 Liquidtight Flexible Metal Conduit. Type LFMC and Liquidtight Flexible Nonmetallic Conduit. Type LFNC
350.1 Scope. This article covers the use, installations, and construction specifications for liquidtight flexible metal conduit (LFMC) and liquidtight flexible nonmetallic conduit (LFNC) and their associated fittings.
350.2 Definitions. Liquidtight Flexible Metal Conduit (LFMC). A raceway of circular cross section with an outer liquidtight nonmetallic sunlight resistant jacket over a flexible metal core, with associated fittings.
Liquidtight Flexible Nonmetallic Conduit (LFNC). A raceway of circular cross section of various types as follows:
(1) A smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and covers, designated as Type LFNC-A.
(2) A smooth inner surface with integral reinforcement within the conduit wall, designated as Type LFNC-B that is a prewired manufactured assembly provided in continuous lengths in a coil or on a reel.
(3) A corrugated internal and external surface without integral reinforcement within the conduit wall, designated as Type LFNC-C, which is flame resistant.
FPN No. 1: FNMC is an alternate designation.
FPN No. 2: Extreme cold may cause some types of LFNM to become brittle and more susceptible to physical damage.
350.3 Listing. LFMC and LFNC and their associated fittings shall be listed.
II. Installation
350.4 Uses Permitted. Use of LFMC and LFNC shall be permitted in exposed or concealed locations only as follows:
(1) Where flexibility is required for installation, operation, or maintenance.
(2) For routing and protection of conductors and cable from liquids, vapors, or solids.
(3) LFNC shall only be permitted outdoors if listed and marked for such use.
350.5 Uses Not Permitted. LFMC and LFNC shall not be permitted as follows:
(1) Where likely to be subject to physical damage for which it is not designed and approved.
(2) Where ambient temperatures, conductor temperatures, or both are in excess of that for which the conduit is approved.
(3) Where conductors in LFNC operate at over 600 volts, nominal, except as permitted in 600.32(A).
(4) In any hazardous (classified) location, except as permitted elsewhere in this Code.
350.6 Size.
(A) Minimum LFMC and LFNC smaller than metric designation 16 (1/2) shall not be permitted.
Exception: Where in accordance 348.20.
(B) Maximum. LFMC and LFNC larger than metric designation 103 (trade size 4) shall not be permitted.
FPN: See 300.1(C) for the metric designers and trade sizes. These are for identification purposes only, and do not relate to actual dimensions.
350.7 Number of Conductors and Cables. The number of conductors and cables in LFMC and LFNC shall not exceed the percentage fill specified in Table 1, Chapter 9, and the Notes to Table 1.
Exception: For metric designator 12 (trade size 3/8 Table 348.22). "Fittings Outside Conduit" columns shall apply.
350.8 Bends, How Made. Bends in LFMC and LFNC shall be made so the conduit is not damaged and the internal cross section area is not effectively reduced. The radius of the curve to the center line of any bend shall be not less than in Table 2, Chapter 9, in the column "Other Bends".
350.9 Bends-.
Number in One Run. More than 360 degrees of bends, including offsets, kicks, and saddles, shall not be permitted in a run of LFMC or LFNC between conductor or cable pull points, including other raceways to which they are connected.
350.10 Trimming. All ends of LFMC and LFNC shall be trimmed to remove rough edges.
350.11 Securing and Supporting. LFMC and LFNC shall be securely fastened to supports by approved straps, staples, cable ties, hangers, or other approved means designed and installed so as not to damage the conduit, at intervals not to exceed 1.4 m (4-1/2 ft) and within 300 mm (12 in.) of the end of a run of conduit.
Exception: Fastening to support shall not be required as follows:
(1) For that portion of conduit that is fished between access points through concealed spaces in finished buildings or other structures and supporting is impractical.
(2) Where direct buried.
(3) Where encased in cement concrete.
(4) If not more than 600 mm (2 ft) in length at terminations where flexibility is necessary.
(5) If not more than 1.8 m (6 ft) in length from the last point where secured to the connection to a luminaire or other equipment within an accessible ceiling space or surface mounted on such ceiling.
(6) Type LFNC-B where installed in lengths not exceeding 1.8 m (6 ft).
350.12 Connectors. Angle connectors for LFMC and LFNC shall not be concealed.
III. Construction Specifications.
350.13 Marking. LFMC and LFNC shall comply with 110.21 and include a type designation in accordance with 350.2, and the trade size. Where suitable for outdoor use or direct burial, it shall be so marked. The type, size, and number of conductors in prewired manufactured assemblies (Type LFNC-B) shall be provided by a printed tag or label attached to the carton, coil,or reel. The enclosed conductors shall comply with 310.11(A) and (B). Delete present Articles 350 and 356.
Substantiation: The proposal is largely editorial to combine similar or identical provisions of two articles and reduce the bulk of the NEC. However, many of the proposed revisions are not presently covered, e.g., Article 356 has no support requirements for LFNC other than Type LFNC-B. Cables such as optical fiber, coaxial, and NM may not be deemed covered by "conductors." There are no provisions for fishing other than Type LFNC-B. The number of bends should include provision for other raceways directly connected to LFMC or LFNC without a junction box. The provision for number of conductors should include reference to Notes to Table 1, Chapter 9. I don't believe there are couplings specifically listed for use with LFMC; usually rigid metal conduit couplings are used. Bonding jumpers should be permitted. Installation of equipment grounding and bonding conductors is already covered in Article 250. The length restriction in 356.12(3) is negated by the condition of where a longer length is necessary or where it is secured, therefore, serves no useful purpose.
Panel Meeting Action: Reject
Panel Statement: CMP 8 accepted the Task Group Proposal to separate Article 351 for Liquidtight Flexible Metal Conduit and Liquidtight Flexible Nonmetallic Conduit into two separate Articles 350 and 356 for the 2002 NEC. The proposed language does not follow the agreed upon cable and raceway articles format. The submitter includes elements of various rejected proposals for which there is a lack of substantiation to support the changes submitted in the body of the comment.
Number Eligible to Vote: 12

Comment on Proposal No: 8-78
Recommendation: Proposal 8-78 should have been rejected and the language retained as in the present NEC.
Substantiation: During the 2008 NEC cycle Panel 8 fully considered the need for adding the section which the submitter of Proposal 8-78 proposes to delete. The Panel determined that the present language was needed to clarify that short nipples do not require additional support and that this was not universally understood by AHJ's, especially in remote & rural areas.

Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-36 Log #2793 NEC-P08 **Final Action: Reject**
(352.30(C))

Submitter: Mark R. Hilbert, Wolfeboro, NH
Comment on Proposal No: 8-78
Recommendation: Revise text to read as follows:
352.30(C) Unsupported Raceways. Type PVC conduit shall be permitted to be installed unsupported where the raceway is not more than 900 mm (3 feet) in length and terminates in an outlet box, junction box, device box cabinet or other termination on either end.
Substantiation: I agree with the substantiation in Proposal 8-78 that historically many raceways have been installed between enclosures that are not more than three feet apart and there has been no significant number of failures reported. However, I would recommend accepting the proposal in principle and revising the existing text as I also agree with the original substantiation from the 2008 NEC cycle that the literal wording "within three feet" means that support is required. Revising the text as proposed in this comment will continue to resolve future issues of whether the faceway must be supported where it runs between enclosures that are not more than three feet apart, add clarity to the section, and address the submitter's concerns.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-37 Log #1498 NEC-P08 **Final Action: Reject**
(352.48 and Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-83
Recommendation: Delete and substitute the following:
All unthreaded joints and connections of PVC conduit shall be made by means of an approved solvent.
Exception: The solvent shall not be required for the movable part of an expansion fitting.
Substantiation: "Approved" alone (acceptable to the Authority Having Jurisdiction) could be made by a slip-fit connection only which can permit separation due to expansion and not provide watertightness.
Panel Meeting Action: Reject
Panel Statement: The requirements of Section 110.3(B) mandate the use of suitable connection methods per the product listing.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-38 Log #1497 NEC-P08 **Final Action: Reject**
(352.60)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-84
Recommendation: Substitute the following:
Where equipment grounding or bonding is provided, a separate equipment grounding or bonding conductor shall be provided.
Substantiation: As written, this provision could require a 100 ft run of RMC with 2 ft of connected PVC conduit to contain an equipment grounding conductor the full length and possibly require an increase in raceway size. A bonding conductor in accordance with 250.102(E) should be permitted.
Panel Meeting Action: Reject
Panel Statement: The current language of this section adequately conveys the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 353 — HIGH DENSITY POLYETHYLENE CONDUIT: TYPE HDPE CONDUIT

8-39 Log #1496 NEC-P08 **Final Action: Reject**
(353.10)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-86
Recommendation: Accept the proposal.
Substantiation: Of course "shall be permitted" is an acceptable phrase, but that does not respond to the substantiation that it does not impose a requirement and is not enforceable, and does not prohibit any use that does not violate 353.12 or other NEC provision. Many NEC provisions specify "only".
Panel Meeting Action: Reject
Panel Statement: The language used in 353.10 is consistent with other raceway Articles. "Uses Permitted" is not an all inclusive list and is not intended to prohibit the use of HDPE Conduit.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 355 — REINFORCED THERMOSETTING RESIN CONDUIT: TYPE RTRC

8-40 Log #1478 NEC-P08 **Final Action: Reject**
(355.10(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-97
Recommendation: Accept the proposal with the following revisions:
"The use of RTRC shall only be permitted in accordance with 355.10(A) through (H).
Substantiation: "Shall be permitted" per 90.5(B) does not impose a requirement thus not enforceable. Other uses not prohibited by 355.12 can be employed. If this section is not a limitation it can be deleted and 355.12 can govern. Some sections use the word "only" with "permitted" or have conditions or specify "limited to" as in 230.43.
Panel Meeting Action: Reject
Panel Statement: The language used in 355.10 is consistent with other raceway Articles. "Uses Permitted" is not an all inclusive list and is not intended to prohibit the use of RTRC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-41 Log #2534 NEC-P08 **Final Action: Accept in Principle**
(355.10(F), FPN)

Submitter: James M. Imlah, City of Hillsboro
Comment on Proposal No: 8-98
Recommendation: Add new text to read as follows:
FPN: RTRC conduit, type XW, is identified for areas of physical damage.
Substantiation: The panel has accepted the proposal in principle for clarification of 255.10 (F). Actions from other code panels have accepted an "-XW" type RTRC for acceptance in areas subject to physical damage. As related to this and other panel actions this could be treated as a related proposal as permitted 4.4.6 from the regulations governing committees that states " A TC shall consider and act on all comments that are directly related to the substantive content of the Report on Proposals. Panel actions 3-106 [300.50 (B)], 4-115 [230.50 (b) (1)], and 7-94 [334.15 (B)] have accepted the reference for type -XW for areas subject to physical damage and providing adequate protection. As a similar action CMP 8 took for PVC, 352.10 (F) the addition of a FPN and the same action should be applied to RTRC-XW. This specific –XW reference is also found in the UL white book. Although the specific comment has not had public review the referenced other panel proposal actions were to accept in principle 3-106 and 4-115 and accepted for 7-94 and therefore have had some public review. There even appears to be questioning as shown in 19-153 (551.47 (P) (2) and 551.80 (B) as the panel statement was

"The addition of the references to RTRC as shown in the panel actions meets the submitter's intent. The addition of the "marked with the suffix –XW" is rejected because it is not included in Article 355, but the submitter's intent is addressed by the requirement "listed for exposure to physical damage." The addition of –XW would provide that RTRC will qualify for installations similar to other raceways "if identified for such use" and not "listed" as the panel action states.

Panel Meeting Action: Accept in Principle

Add an Information Note to state the following to 355.10(F):

Informational Note: RTRC, Type XW, is identified for areas of physical damage.

Panel Statement: The word "conduit" is already used in the acronym "RTRC" and is redundant. Also the panel recognizes that "FPN" is being replaced throughout the code with "Informational Note".

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

8-42 Log #1487 NEC-P08 **Final Action: Reject**
(355.22)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 8-102

Recommendation: Accept the proposal with the following revisions:

"The number of conductors, cables, and flexible cords or cables shall not exceed the raceway fill indicated in Table 1, Chapter 9 and the notes thereto.

Substantiation: This provision should include single and multiconductor cables and flexible cords or cables and the notes to the table which recognizes them since the outer jacket and fillers comprise a cross section larger than the contained conductors.

Panel Meeting Action: Reject

Panel Statement: Cables are permitted to be installed per the second sentence (right after the sentence with the proposed revision) of 355.22. Note 9 does reference flexible cord, but a proposal with the technical substantiation to support the addition of cords to 355.22 has not been submitted nor submitted to the other raceway articles. Flexible cords are not permitted to be installed in raceways "except as otherwise permitted in this code" per Section 400.8(6).

Number Eligible to Vote: 12

ARTICLE 356 — LIQUIDTIGHT FLEXIBLE NONMETALLIC CONDUIT: TYPE LFNC

8-45 Log #581 NEC-P08 **Final Action: Accept**
(356.10(6))

Submitter: Richard E. Loyd, Sun Lakes, AZ

Comment on Proposal No: 8-108

Recommendation: Reconsider and reject this proposal to be consistent with action taken on Proposal 8-54.

Substantiation: I agree with Mr. Dabe and Mr. Griffith's negative voting, no substantiation was provided and more information is needed and the action should be consistent with the action taken on Proposal 8-54. Mr. Berman's vote on Proposal 8-54 acknowledges shipping and handling may be a problem, but states we should not worry about that, I disagree.

This is a flexible wiring method and not suitable for prewiring in unlimited lengths and sizes. There is no evidence that the product is presently tested with enclosed conductors. The weight could vary from a few pounds to hundreds of pounds which could only be moved with equipment. Moving is likely to damage the raceway and conductors which may not be detected by the installer.

300.18 requires the raceway to be installed prior to insertion of the conductors so that the conductors are protected from damage until installed in the raceway which is properly secured and supported with all boxes and fittings in place.

Panel Meeting Action: Accept

Panel Statement: Evidence of suitability to expand product sizes with unlimited lengths has not been presented. The submitter's assertion that Mr. Berman's comment on shipping and handling is a problem is incorrect.

8-51 Log #2114 NEC-P08 **Final Action: Reject**
(358.60)

Submitter: M. Shan Griffith, ELEKTEK, PLLC / Rep. Institute of Electrical and Electronic Engineers, Inc. (IEEE)
Comment on Proposal No: 8-129
Recommendation: Proposal 8-129 should have been accepted.
Substantiation: Industry experience indicates that, for several reasons including the one presented by the proposal submitter, metallic conduit systems do not always provide adequate equipment grounding. As a result, ANSI/IEEE Standard 142-2007 (the "Green Book"), section 2.2.3, recommends installation of a separate equipment grounding conductor (EGC) in conduit.
With regard to the Panel statement that EMT is tested and listed for grounding, there does not appear to any reference to a test method for establishing the adequacy of EMT as an equipment grounding conductor in the UL White Book either in the section on EMT or in the White Book NEC Correlation Index. Further, if there is such a UL test described elsewhere, the current level used and resulting voltage drop would both be of interest as factors in determining the suitability of EMT as an EGC for all installations.
Finally, if the proposed change is ultimately accepted it would have to be correlated with other sections of the NEC that presently recognize EMT as a grounding means. Similarly, Article 342 for IMC would require revision. (See also my Comments on Proposal 8-39).
Panel Meeting Action: Reject
Panel Statement: The submitter has not demonstrated evidence of any failure of this raceway type to perform reliably when installed as directed by the NEC. Furthermore this product is listed for grounding. Reference to damaged raceways possibly not performing the equipment grounding function of the raceway does not support the elimination of this type of raceway as an effective equipment grounding means. Any component of an electrical system that is damaged may not perform its intended function reliably and therefore should be effectively repaired or replaced.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 360 — FLEXIBLE METALLIC TUBING: TYPE FMT

8-52 Log #449 NEC-P08 **Final Action: Accept in Principle**
(360.24(A))

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 8-135
Recommendation: The Proposal action should have been to Accept in Principle and changed to read as follows:
"Where FMT ~~may be~~ is infrequently flexed in service after installation,…".
Substantiation: This Proposal was one of several that were submitted regarding the use of the word "may" in the text of the NEC. The Submitter of the Proposal noted in several of the substantiations that Table 3.2.1 of the NEC Style Manual lists this word as one of several "Possibly Unenforceable and Vague Terms." In most Panel responses, the text of Section 3.2.1 was correctly referenced where it allows those terms where they have been "reviewed in context" and found to be clear.
However, Section 3.1.1 of the NEC Style Manual regarding Mandatory Rules expressly states that "The terms may or can shall not be used." Similarly, Section 3.1.2 of the NEC Style Manual regarding Permissive Rules also expressly states that "The term may shall only be used where it recognizes a discretionary judgment on the part of an authority having jurisdiction."
Since the use of the term may in this Section does not meet these either of these criteria, it should be changed.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(A) Infrequent Flexing Use. When FMT is infrequently flexed in service after installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 360.24(A).

Panel Statement: Additional wording was changed to comply with the style manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-53 Log #1484 NEC-P08 **Final Action: Accept in Principle**
(360.24(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-135
Recommendation: Accept the proposal or accept with "is" in place of "May be."
Substantiation: "May" is also a term to be avoided per the NEC Style Manual and shall only be used to recognize discretionary judgment by the AHJ. Does the NEC Style Manual apply to panels?
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 8-52.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 362 — ELECTRICAL NONMETALLIC TUBING: TYPE EMT

8-54 Log #1477 NEC-P08 **Final Action: Reject**
(362.60)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-148
Recommendation: Accept the proposal with the following revisions:
"Where equipment grounding is provided a separate wire type equipment grounding conductor or bonding conductor shall be installed.
Substantiation: A bonding conductor in accordance with 250.102(E) should be permitted. As written, a 100 ft run of RMC with 2 ft of connecting PVC conduit would require a wire type EGC for the entire length, and possibly require a larger raceway due to conductor fill. Where equipment grounding is not required but provided by choice the provision should apply. Reference to Article 250 is superfluous; all applicable provisions of that article already apply unless amended.
Panel Meeting Action: Reject
Panel Statement: The current language of this section adequately conveys the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 366 — AUXILIARY GUTTERS

8-55 Log #1475 NEC-P08 **Final Action: Reject**
(366.12(3))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-151
Recommendation: Accept the proposal.
Substantiation: There can be installations where the same auxiliary gutter supplements wiring space for equipment separated by a wall.
Panel Meeting Action: Reject
Panel Statement: The submitter's assertion of an auxiliary gutter supplementing wiring space for equipment separated by a wall is impractical. The function of an auxiliary gutter is to supplement equipment at a specific location not to pass through walls or ceilings.

Ballot Not Returned: 1 Griffith, M.

8-57 Log #2262 NEC-P08 **Final Action: Accept**
(366.22(A))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 8-155
Recommendation: Reject this Proposal.
Substantiation: This Proposal is part of a group: 6-59, 8-155, 8-194, and 8-204. There were unforeseen consequences to this which were not editorial in nature. No Substantiation was given for a technical change. All four need to be Rejected. Comments with the same text are submitted for the three Accepted Proposal.
Statement/Substantiation text:
The TCC has asked for correlative action between CMP-6 and CMP-8 regarding 2011 cycle Proposals 6-59, 8-155, 8-194, and 8-204, I have submitted this for that purpose.
If the Actions of8-155, 8-194, and 8-204 are allowed to stay as-is, then with the Rejection of 6-59, it appears that signaling and control conductors will have to be counted in the affected raceways as current-carrying; this is certainly an unintended consequence. The proposals turn out to not be the editorial change the submitter thought - they would have had significant impact. It is unfortunate that the submitter did not make the group of Proposals co-dependent, such that the Proposals would only take effect if they were all Accepted.
The reference phrase in the Proposals is: **Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.**
The following text ***in bold italics*** is from the 2011 cycle ROP for 6-59:
Panel Meeting Action: Reject
Panel Statement: While the reference phrase is contained in all of the sections referenced* (8-155, 8-194, and 8-204)*, the proposal would allow signaling and control cables to be loaded into circular raceways and in cables and not require adjustment. These conductors would take up space, reduce airflow, and reduce heat dissipation. The restrictive nature of circular raceways is different from auxiliary gutters, metallic, and non-metallic wireways. The proposed text should not apply as a general rule.
Number Eligible to Vote: 11
Ballot Results:Affirmative: 11
Proposal 2011-6-59 must be Rejected.
Panel Meeting Action: Accept
Revise 366.22(A) to read as follows:
366.22 Number of Conductors.
(A) Sheet Metal Auxiliary Gutters. The sum of the cross-sectional areas of all contained conductors at any cross section of a sheet metal auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter. The adjustment factors in 310.15(B)(3)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(5), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current carrying conductors.
Panel Statement: Reject Proposal 8-155 and reinstate the deleted language to 366.22(A).
The panel also updated the Section 310.15 references in this section.

(366.22(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-155
Recommendation: Reject the proposal.
Substantiation: The proposal is unnecessary and creates a direct conflict with 725.51(B), which adequately addresses the same topic in a more comprehensive and technically appropriate manner. The CMP 8 locations referenced in the substantiation differ, as appropriate based on the differing wiring methods involved, from the one-size-fits-all approach in this proposal. A companion comment is being drafted by this submitter to continue to oppose the change in the Article 310.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Comment 8-57.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.
Comment on Affirmative:

HUMPHREY, D.: The limitation of 40% fill applies to signaling and controller circuits as well as other conductors permitted to be installed in a common raceway. Conductors that are intended to carry no or negligible loads such as neutrals that carry only the unbalanced load, equipment grounding conductors etc. have historically not been counted as current carrying. The inclusion of signaling and motor control conductors used only for starting duty is a similar application that should not be counted as "current carrying" per 310.15(B).

8-60 Log #359 NEC-P08 **Final Action: Accept**
(366.58(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-162
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment, including CMP 9 which unanimously rejected the companion proposal (9-28) which would have changed the terminology in the column heading to agree with this text. The CMP 8 panel action correlates correctly with Article 312.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-61 Log #1295 NEC-P08 **Final Action: Reject**
(366.58(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 8-162
Recommendation: The Proposal should be Accepted in Principle and the phrase revised as follows: "…one wire <u>on a</u> ~~per~~ terminal in Table 312.6(A) shall apply."
Substantiation: The proposed wording is more appropriate for a standard and is more explicit in describing the installation.

The Manual of Style for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).

Most of the Panels have accepted changes to replace "per" with more explicit language and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: The NEC style manual does not restrict the use of the word "per" in this code section. The proposed change does not add clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 368 — BUSWAYS

8-62 Log #1474 NEC-P08 **Final Action: Reject**
(368.12(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-165
Recommendation: Accept the proposal with the following revisions: Busways shall not be installed where likely to be subject to corrosion or physical damage unless identified for such use.
Substantiation: Corrosive liquids and solids can also cause damage. If busways were required to be listed, I would have used that term. "Severe" is not NEC defined, is subjective, and most other sections regarding physical damage do not use the word, e.g., 110.12(B). Section 368.12(B) uses the word "identified."
Panel Meeting Action: Reject
Panel Statement: The language of the proposal would result in another level of subjective analysis that would not serve to clarify the proper application of this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-63 Log #1483 NEC-P08 **Final Action: Reject**
(368.13 (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-168
Recommendation: Accept the proposal.
Substantiation: It is difficult to rationalize why a lighting busway does not have to be listed when the luminaries supplied by it are required to be listed; or why a 4000 ampere busway does not have to be listed and the switches and circuit breakers supplied by it have to be listed.
Panel Meeting Action: Reject
Panel Statement: Per the 2002 and 2008 ROCs, CMP 8 continues to reaffirm its position that it is not the intent of the panel to require listing of all busways. The submitter has not provided evidence that a safety issue exists that would warrant this additional code requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Griffith, M.
Explanation of Negative:

WALBRECHT, G.: The Authority Having Jurisdiction does not have the means available to determine the safety of the design, manufacture, installation, and operation of a busway in accordance with the 110.3(A). Busways and their associated fittings, as with any wiring method, should be evaluated and listed by a nationally recognized third party certification organization. Field fabrication and modification of factory-produced components can also be hazardous and should be properly examined and evaluated by a nationally recognized testing organization.

8-64 Log #1479 NEC-P08 **Final Action: Reject**
(368.320(3)(5))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-170
Recommendation: Accept the proposal.
Substantiation: Frequency is not relative to a busway designed and installed for dc. Withstand voltage should also apply to other frequencies such as 50 or 400 hertz.
Panel Meeting Action: Reject
Panel Statement: The term "if for alternating current" does not improve the clarity or usability of the Code. The rated withstand voltage in 368.320(5) is a value determined through testing and does not indicate the operating frequency of the busway.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 370 — CABLEBUS

8-65 Log #745 NEC-P08 **Final Action: Accept**
(370.4(B))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 8-172
Recommendation: The Proposal should be Accepted in Principal and revise "Table 310.17 and Table 310.19" to read "Table 310.15(B)(17) and Table 310.15(B)(19)".
Substantiation: This will correlate with the Panel Action on Proposal 6-52.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-66 Log #746 NEC-P08 **Final Action: Accept**

Comment on Proposal No: 8-173
Recommendation: The Proposal should be Accepted in Principal and revise "Table 310.69 and Table 310.70" to read "Table 310.60(C)(69) and Table 310.60(C)(70)".
Substantiation: This will correlate with the Panel Action on Proposal 6-123.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 372 — CELLULAR CONCRETE FLOOR RACEWAYS

8-67 Log #1507 NEC-P08 **Final Action: Reject**
(372.2)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-176
Recommendation: Accept the proposal with the following revisions:
A transverse raceway providing access to predetermined cells of a precast concrete floor, thereby permitting installation of electrical conductors and optical fiber cables from a distribution center to the floor cells.
Substantiation: Raceways are clearly defined in Article 100. Non-conductive optical fiber cables should be included.
Panel Meeting Action: Reject
Panel Statement: It is not the intention of this definition to provide a list of all possible conductor types that may be installed. The definition is intended to provide the user with a general understanding of this raceway type. The installer should refer to Article 770 for installing fiber optical cables in any raceway.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-68 Log #120 NEC-P08 **Final Action: Accept**
(372.12)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 8-178
Recommendation: The Technical Correlating Committee directs that the panel clarify the panel actions on this proposal to comply with 3.1.3 of the NEC Style Manual regarding mandatory language in Fine Print Notes.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text to read as follows:
372.12 Splices and Taps.
Splices and taps shall be made only in header access units or junction boxes. A continuous unbroken conductor connecting the individual outlets is not a splice or tap.
Panel Statement: CMP 8 reconsidered Proposal 8-178 and modified the FPN and included it in the body of the text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-69 Log #2115 NEC-P08 **Final Action: Reject**
(372.17 (New))

Submitter: M. Shan Griffith, ELEKTEK, PLLC / Rep. Institute of Electrical and Electronic Engineers, Inc. (IEEE)
Comment on Proposal No: 8-179
Recommendation: Revise proposed Exception to read as follows:
Exception: Where multiple outlets on the same circuit are supplied by separate conductor sets it shall be permitted to count only one such set of current-carrying conductors for the purpose of ampacity adjustment.
Substantiation: To permit such a conductor count for purposes of determining circuit ampacity (adjustment factor) in a raceway is no different than where only current carrying conductors are permitted to be counted in other code sections. See, for example, 392.11(A)(1) & 392.11(B), both of which permit omission of non-load-carrying cable conductors for conductor count in tray and 310.15(B)(4) which permits omission of the non-load-carrying neutral conductor in the conductor count. Further, no additional conductor heating in the same raceway is introduced if the current associated with the circuit is instead assumed to be distributed across the separate conductor sets. In fact, the heating is less in this case since the heating varies as the current magnitude squared and the sum of the current in all sets is limited to the circuit rating. For example, if the total current on a 30 Ampere circuit was assumed to be equally divided between two conductor sets, the total heating would be one-fourth of that seen if the entire 30 Amperes was assumed to be carried by a single set (the set to be counted by this proposal). The adjustment factors of 310.15(B)(2) would still apply according to Panel's stated intent. Only the method of counting conductors would change to become consistent with that permitted elsewhere in the code to accurately recognize the actual current loading of conductors.
Panel Meeting Action: Reject
Panel Statement: There is no way to determine the load division. The adjustment factors of 310.15(B)(2) apply to this type of raceway as they do other raceway types.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 374 — CELLULAR METAL FLOOR RACEWAYS

8-71 Log #1494 NEC-P08 **Final Action: Reject**
(374.17)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-181
Recommendation: Accept the proposal in principle.
Substantiation: Refer to the Explanation of Negative Vote for Proposal 8-179, 372.17, Exception (new).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 8-74.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-72 Log #1960 NEC-P08 **Final Action: Reject**
(374.17)

Submitter: John J. Michlovic, H.H. Robertson Floor Systems
Comment on Proposal No: 8-183
Recommendation: Revise text to read as follows:
374.17 Ampacity of Conductors. The ampacity adjustment factors in 310.15(B)(2)(a) shall not apply to conductors installed in cellular metal floor raceways.
Substantiation: Ampacity adjustment Table 310.15(B)(2)(a) was devised for round conduit and other small raceways. It makes no allowance for large flat bottom raceways nor does it address the available area for wiring. Testing submitted proved the table too conservative for cells and trenches.
Panel Meeting Action: Reject
Panel Statement: CMP 8 continues to reject Proposal 8-183. The submitter has proposed that the ampacity adjustment factors in Table 310.15(B)(3) (Old Table 310.15(B)(2)) shall not apply to cellular metal floor raceways. CMP 8 has not been provided with a fact finding report using a variety of worst case scenarios sufficient to support this proposal. CMP 8 would expect to see test data without diversity for representative wire sizes permitted in Section 374.4, and conductor types within cellular metal floor raceway installations constructed in accordance with Section 374.5, which allows a maximum number of conductors up to 40 percent of the interior cross-sectional area of the cell or header. CMP 8 also recommends that any exception to Table 310.15(B)(3) should be made to CMP 6.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-73 Log #1961 NEC-P08 **Final Action: Reject**
(374.17)

Submitter: John J. Michlovic, H.H. Robertson Floor Systems
Comment on Proposal No: 8-184
Recommendation: Revise text to read as follows:
374.17 Ampacity of Conductors. The ampacity adjustment factors in 310.15(B)(2)(a) shall apply to conductors installed in cellular metal floor raceways only where the number of conductors in cells or header compartments exceeds 30.
Substantiation: Raceways in Articles 366, 376, 384 and 386 are permitted 30 conductors before ampacity adjustments are required. No testing was required for these raceways. Cells and headers in Article 374 are larger and concrete embedded. There is no valid reason to deny 30 conductor exemption to Article 374 raceways regardless of test results.
Panel Meeting Action: Reject
Panel Statement: The other raceways cited in the submitter's substantiation include additional restrictions regarding ampacity adjustment that were not included for cellular metal floor raceways. The other raceways are not installed in concrete.
Cellular floor metal raceways are similar to the raceway found in Article 390, not the raceways referenced in the submitter's comment. The submitter should provide a fact finding report for future consideration.
Number Eligible to Vote: 12

8-75 Log #774 NEC-P08 **Final Action: Reject**
(374.17 Exception (New))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-186
Recommendation: Delete present Articles 372 and 374 and accept proposal revision as follows:
Article 372.
Cellular Concrete and Metal Floor Raceways.
Scope.
This article covers the use and installation requirements for cellular concrete and metal floor raceways.
372.2 Definitions.
Cellular Concrete and Metal Floor Raceways. The hollow spaces of cellular concrete or metal floors with associated metal fittings designed and installed as enclosures for electrical conductors and other cables.
Cell. A single enclosed tubular sp, debris, or other matter. Ace in a precast cellular slab or a cellular metal floor member, the axis of the cell being parallel to the axis of the floor member.
Header. A transverse metal raceway designed and installed to provide access to selected cells.
372.3 Uses not permitted. Conductors and cables shall not be installed in cellular concrete or metal floor raceways as follows:
(1) Where likely to be subject to corrosion.
(2) In any hazardous (classified) location except as permitted by other articles of this Code.
(3) In commercial garages, other than for supplying ceiling outlets or fittings or extensions below the floor.
FPN: See 300.8 for installation of conductors and cables with other systems.
372.4 Header. The header shall be installed in a straight line at a right angle to the cell(s) and mechanically secured to the top of the raceway(s). The ends shall be enclosed by approved metal fittings and sealed to prevent entry of water, dirt, debris, or other matter. The header shall be mechanically and electrically continuous and connected to an equipment grounding conductor in accordance with applicable provisions of Article 250.
572.5 Connection to other equipment. Connections from cells to equipment shall be made with approved wiring methods.
372.6 Junction boxes. Junction boxes shall be metal, leveled to floor grade and sealed to prevent entry of water, dirt, debris, and other matter, mechanically secured to the raceway, and grounded as required.
572.7 Markers. A number of markers acceptable to the authority having jurisdiction shall be installed for the location of cells.
572.8 Inserts. Inserts shall be leveled and sealed to prevent the entry of water, dirt, debris, or other matter. Inserts shall be metal. Where grounding is provided, a wire type equipment grounding conductor shall connect outlet devices to an approved grounding connection in the header. Where cutting through the cell wall for inserts or other purposes, chips and debris shall be removed, and the cutting tool shall be designed and used to prevent damage to contained conductors and cables.
372.9 Size of conductors. No electrical conductors or cables larger than 1/0 AWG shall be installed in a cell except by special permission.
372.10 Maximum number of conductors. The combined cross-sectional area of conductors and cables shall not exceed 40 percent of the cross-sectional area of a cell or header. This provision shall include the cross-sectional area of optical fiber cables installed in accordance with 770.133.
372.11 Splices and taps. Splices and taps shall only be permitted in header access units and junction boxes. Loop wiring (continuous unbroken conductor connecting individual outlets shall not be considered to be a splice or tap).

372.12 Removed outlet devices. When an outlet or fitting is removed, the section of conductors or cable supplying the outlet or fitting, including equipment grounding conductors, shall be removed from the raceway.

372.13 Ampacity. The ampacity adjustment factors provided in 310.15(B)(2) shall apply.

372.14 Construction specifications.

General. Cellular concrete and metal floor raceways shall be constructed and installed to provide secure mechanical continuity of the complete system and reliable electrical continuity of metal floor systems. They shall provide a complete enclosure for conductors and cables. The interior surfaces shall be free of burrsand sharp edges or provided with approve means to protect conductors and cables from damage...

Substantiation: The proposal provides for one article to cover both types of cellular floors. “Cable” is specified to include coaxial cables which may be installed separately or in compliance with 770.133. There is no electrical safety reason to require removal of an outlet when use is discontinued; use may resume at any time and the provision is impossible to enforce. Acceptance will reduce the bulk of the NEC and simplify the use for code users.

Panel Meeting Action: Reject

Panel Statement: CMP 8 does not support combining Articles 372 and 374 into a single Article. The proposed language does not follow the agreed upon cable and raceway article format.

ARTICLE 376 — METAL WIREWAYS

8-77 Log #1482 NEC-P08 **Final Action: Reject**

(376.10)

Submitter: Dan Leaf, Seneca, SC

Comment on Proposal No: 8-188

Recommendation: Accept the proposal.

Substantiation: Since this section is not a requirement it is not necessary and users can be governed only by “uses not permitted.” Permitted uses should be restrictive; the AHJ should not have the responsibility to determine uses not specified. Some NEC sections use the word “only” with “permitted” e.g., 230.82, or have conditions or specify “limited to” (230.43).

Panel Meeting Action: Reject

Panel Statement: The language used in 376.10 is consistent with other raceway Articles. “Uses Permitted” is not an all inclusive list and is not intended to prohibit the use of Metal Wireways.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

8-78 Log #2263 NEC-P08 **Final Action: Accept**

(376.22(A))

Submitter: Scott Cline, Monterey Park, CA

Comment on Proposal No: 8-194

Recommendation: Reject this proposal.

Substantiation: This Proposal is part of a group: 6-59, 8-155, 8-194, and 8-204. There were unforeseen consequences to this which were not editorial in nature. No Substantiation was given for a technical change. All four need to be Rejected. Comments with the same text are submitted for the three Accepted Proposal.

Statement/Substantiation text:

The TCC has asked for correlative action between CMP-6 and CMP-8 regarding 2011 cycle Proposals 6-59, 8-155, 8-194, and 8-204, I have submitted this for that purpose.

If the Actions of8-155, 8-194, and 8-204 are allowed to stay as-is, then with the Rejection of 6-59, it appears that signaling and control conductors will have to be counted in the affected raceways as current-carrying; this is certainly an unintended consequence. The proposals turn out to not be the editorial change the submitter thought - they would have had significant impact. It is unfortunate that the submitter did not make the group of Proposals co-dependent, such that the Proposals would only take effect if they were all Accepted.

The reference phrase in the Proposals is: **Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.**

The following text ***in bold italics*** is from the 2011 cycle ROP for 6-59:

Panel Meeting Action: Reject

Panel Statement: While the reference phrase is contained in all of the sections referenced* (8-155, 8-194, and 8-204), ***the proposal would allow signaling and control cables to be loaded into circular raceways and in cables and not require adjustment. These conductors would take up space, reduce airflow, and reduce heat dissipation. The restrictive nature of circular raceways is different from auxiliary gutters, metallic, and non-metallic wireways. The proposed text should not apply as a general rule.***

Number Eligible to Vote: 11

Ballot Results:Affirmative: 11

Proposal 2011-6-59 must be Rejected.

Panel Meeting Action: Accept

Revise 376.22(B) to read as follows:

376.22 Number of Conductors.

(B) Adjustment Factors. The adjustment factors in 310.15(B)(3)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(5), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

Panel Statement: CMP 8 recognizes that the referenced section should be 376.22(B), not 376.22(A). Reject Proposal 8-194 and reinstate the deleted language.

The panel also updated the Section 310.15 references in this section.

(376.23(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-198
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment, including CMP 9 which unanimously rejected the companion proposal (9-28) which would have changed the terminology in the column heading to agree with this text. The CMP 8 panel action correlates correctly with Article 312.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-83 Log #1296 NEC-P08 **Final Action: Reject**
(376.23(A))

Submitter: James M. Daly, Upper Saddle River, NJ
Comment on Proposal No: 8-198
Recommendation: The Proposal should be Accepted in Principle and the phrase revised as follows: "…one wire on a ~~per~~ terminal in Table 312.6(A) shall apply."
Substantiation: The proposed wording is more appropriate for a standard and is more explicit in describing the installation.

The Manual of Style for NFPA Technical Committee Documents 3.2.1.2 states that "Spelling and definitions of general words and terms shall follow *Webster's Collegiate Dictionary*, 11th Edition." The dictionary defines "per" as through, by means of, for each, and according to. Its most common and natural nonbusiness uses always involve figures ($150 per performance, 32 miles per gallon, 55 miles per hour), or sports (averages 15 points per game).

Most of the Panels have accepted changes to replace "per" with more explicit language and it will provide more consistent terminology throughout the NEC.
Panel Meeting Action: Reject
Panel Statement: The NEC style manual does not restrict the use of the word "per" in this code section. The proposed change does not add clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-84 Log #1481 NEC-P08 **Final Action: Accept in Principle**
(376.100(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-200
Recommendation: Accept the proposal with the following revisions:

"Wireways shall be constructed and installed so that reliable and effective electrical and mechanical continuity of the complete system is assured."
Substantiation: 3.2.1 of the NEC Style Manual states "adequate" is a term, by itself, that shall not be used.
Panel Meeting Action: Accept in Principle

Revise text to read as follows:

376.100 Construction.

(A) Electrical and Mechanical Continuity. Wireways shall be constructed and installed so that electrical and mechanical continuity of the complete system is assured.
Panel Statement: The revised text addresses the submitter's concern with the compliance to the NEC style manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 378 — NONMETALLIC WIREWAYS

8-85 Log #122 NEC-P08 **Final Action: Accept**
(378.22)

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 8-204
Recommendation: It was the action of the Technical Correlating Committee that this proposal be reconsidered by the panel relative to the actions taken on Proposals 6-59, 8-155, 8-194 and 8-204.

The Technical Correlating Committee directs the Chairs of Code-Making Panels 6 and 8 to form a Task Group to correlate Proposals 6-59, 8-155, 8-194 and 8-204, and submit comments, if deemed appropriate.

This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 8-88.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

(378.22)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-204
Recommendation: Reject the proposal.
Substantiation: The proposal is unnecessary and creates a direct conflict with 725.51(B), which adequately addresses the same topic in a more comprehensive and technically appropriate manner. The CMP 8 locations referenced in the substantiation differ, as appropriate based on the differing wiring methods involved, from the one-size-fits-all approach in this proposal. A companion comment is being drafted by this submitter to continue to oppose the change in the Article 310.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 8-88.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-88 Log #2264 NEC-P08 **Final Action: Accept**
(378.22(A))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 8-204
Recommendation: Reject this proposal.
Substantiation: This Proposal is part of a group: 6-59, 8-155, 8-194, and 8-204. There were unforeseen consequences to this which were not editorial in nature. No Substantiation was given for a technical change. All four need to be Rejected. Comments with the same text are submitted for the three Accepted Proposal.

Statement/Substantiation text:

The TCC has asked for correlative action between CMP-6 and CMP-8 regarding 2011 cycle Proposals 6-59, 8-155, 8-194, and 8-204, I have submitted this for that purpose.

If the Actions of8-155, 8-194, and 8-204 are allowed to stay as-is, then with the Rejection of 6-59, it appears that signaling and control conductors will have to be counted in the affected raceways as current-carrying; this is certainly an unintended consequence. The proposals turn out to not be the editorial change the submitter thought - they would have had significant impact. It is unfortunate that the submitter did not make the group of Proposals co-dependent, such that the Proposals would only take effect if they were all Accepted.

The reference phrase in the Proposals is: **Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.** The following text ***in bold italics*** is from the 2011 cycle ROP for 6-59:
Panel Meeting Action: Reject

Panel Statement: While the reference phrase is contained in all of the sections referenced* (8-155, 8-194, and 8-204)*, the proposal would allow signaling and control cables to be loaded into circular raceways and in cables and not require adjustment. These conductors would take up space, reduce airflow, and reduce heat dissipation. The restrictive nature of circular raceways is different from auxiliary gutters, metallic, and non-metallic wireways. The proposed text should not apply as a general rule.

Number Eligible to Vote: 11

Ballot Results:Affirmative: 11

Proposal 2011-6-59 must be Rejected.
Panel Meeting Action: Accept

Revise 378.22 to read as follows:

378.22 Number of Conductors. The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic wireway shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic wireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

The adjustment factors specified in 310.15(B)(3)(a) shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified above.

Panel Statement: CMP 8 recognizes that the referenced section should be 378.22, not 378.22(A). Reject Proposal 8-204 and reinstate the deleted language to 378.22.
The panel also updated the Section 310.15 references in this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-89 Log #361 NEC-P08 **Final Action: Accept**
(378.23(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 8-206
Recommendation: Continue to reject the proposal.
Substantiation: The preposition "per" in the English language carries the precise meaning of "for each" in the context in which it is used. The use has been consistent for many centuries because it is carried over from Latin. It is not subject to misunderstanding, and there is no substantiation available that it is being misapplied in the field. The NEC Style Manual does not list this word in "Table 3.2.1, Possibly Unenforceable and Vague Terms." Section 3.3.4 of the same document requires that "NEC language shall be brief, clear, and emphatic." Its use in this section and in similar contexts elsewhere is just so. Its use is not proscribed by the NFPA Style Manual and even appears in that manual as an example of properly worded text. Refer to A.2.3.5.2, which cites the following example: "Where joist channels are wider than 0.6 m (2 ft), more than one discharge device shall be required per channel."

There are instances where there are better choices of wording, such as where it is used as a slang expression meaning "in accordance with" and the proposals to correct such instances are to be supported. In some instances where used in what is essentially a formula a slash can be substituted, and companion comments have been submitted to support such changes as well. However, in cases such as the subject of this proposal, the existing use is correct and should not be changed. A majority of the code-making panels have made a similar assessment, including CMP 9 which unanimously rejected the companion proposal (9-28) which would have changed the terminology in the column heading to agree with this text. The CMP 8 panel action correlates correctly with Article 312.
Panel Meeting Action: Accept

(378.60)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-207
Recommendation: Accept the proposal with the following revisions:

Where equipment is to be grounded or bonded, a separate equipment grounding or bonding conductor shall be installed in the nonmetallic wireway.
Substantiation: The provision should apply where grounding or bonding is required or by choice and include bonding conductors.
Panel Meeting Action: Reject
Panel Statement: CMP 8 continues to support the reject of Proposal 8-207. The proposed changes do not improve the clarity or content of the existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 380 — MULTIOUTLET ASSEMBLY

8-92 Log #123 NEC-P08 **Final Action: Accept in Principle**
(380)

TCC Action: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 8-208
Recommendation: It was the action of the Technical Correlating Committee that the definition of "multioutlet assembly" remains in Article 100 according to 2.2.2.1 of the NEC Style Manual.
This action will be considered by the panel as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Revise Article 380 to read as follows:
ARTICLE 380
Multioutlet Assembly
I. General
380.1 Scope. This article covers the use and installation requirements for multioutlet assemblies.
Informational Note: See the definition of multioutlet assembly in Article 100.
II. Installation
380.10 Uses Permitted. The use of a multioutlet assembly shall be permitted in dry locations.
380.12 Uses Not Permitted. A multioutlet assembly shall not be installed as follows:
(1) Where concealed, except that it shall be permissible to surround the back and sides of a metal multioutlet assembly by the building finish or recess a nonmetallic multioutlet assembly in a baseboard
(2) Where subject to severe physical damage
(3) Where the voltage is 300 volts or more between conductors unless the assembly is of metal having a thickness of not less than 1.02 mm (0.040 in.)
(4) Where subject to corrosive vapors
(5) In hoistways
(6) In any hazardous (classified) location, except as permitted by other articles in this Code
380.23 Insulated Conductors. For field assembled multioutlet assemblies, insulated conductors shall comply with 380.23(A) and (B).
(A) Deflected Insulated Conductors. Where insulated conductors are deflected within a multioutlet assembly, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the multioutlet assembly, or where the direction of the multioutlet assembly is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 312.6(A) shall apply.
(B) Multioutlet Assemblies Used as Pull Boxes. Where insulated conductors 4 AWG or larger are pulled through a multioutlet assembly, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required by 314.28(A)(1) for straight pulls and 314.28(A)(2) for angle pulls. When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.
380.76 Metal Multioutlet Assembly Through Dry Partitions.
It shall be permissible to extend a metal multioutlet assembly through (not run within) dry partitions if arrangements are made for removing the cap or cover on all exposed portions and no outlet is located within the partitions.
Panel Statement: A Multioutlet Assembly is a unique wiring method that serves code applications other than the raceway function. The inclusion of "Multioutlet Assembly" in Article 100 is accordingly entirely appropriate. See 2.2.2.1 of the NEC Style Manual.
The panel supports the inclusion of the definition of a multioutlet assembly in Article 100. The panel intends to keep the formatting of Article 380 intact as shown in the 2011 NEC draft. Adding the informational note directs the user to Article 100 for the definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-93 Log #2306 NEC-P08 **Final Action: Reject**
(380.2)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 8-208
Recommendation: Please correlate 8-208 and 18-7.
Substantiation: In the ROP draft, the definition is in both 100 and 380. While the style manual mandates that it be in Article 100, it is inconsistent with every other wiring method definition.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 8-92.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-94 Log #1505 NEC-P08 **Final Action: Reject**
(380.2(B)(2) and 380.2(B)(4))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-211
Recommendation: Accept the proposal with revised (4):
Where likely to be subject to corrosive conditions.
Substantiation: "Severe" is subjective and not NEC defined. Corrosive agents other than vapors should be included. "Likely" is a term used in many sections.
Panel Meeting Action: Reject
Panel Statement: CMP 8 continues to support the reject of Proposal 8-211. The proposed changes do not improve the clarity or content of the existing text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-95 Log #1235 NEC-P08 **Final Action: Reject**
(380.23)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 8-212
Recommendation: The panel should reject this proposal.
Substantiation: The proposal that was accepted by the panel imposes the wire bending requirements for products that are significantly different than multioutlet assemblies in both construction and installation. Multioutlet assemblies are typically lengths of channel with a removable cover. The wire bending requirements that were accepted are for cabinets, cutout boxes, junction and pull boxes, which have a design and function completely different than multioutlet assemblies. Applying these wiring bending requirements to multioutlet assemblies is not only inappropriate due to the differences in product functionality but would also have very little affect on the conductor overfill issue cited in the substantiation.
This proposal may be confusing surface raceway with multioutlet assemblies. The design and function of multioutlet assemblies make it unlikely that the conductor overfill condition described in the substantiation will occur. The multioutlet assemblies typically have conductors installed to feed the receptacles that are an integral part of the multioutlet assembly. Surface raceway is commonly used for the installation of conductors that feed the multioutlet assembly. Conductor fill in surface raceways is addressed by Articles 386 and 388.
There is no clear indication in the substantiation that overfill of conductors in multioutlet assemblies is occurring in field installations of multioutlet assemblies.
Panel Meeting Action: Reject
Panel Statement: Multioutlet assemblies may be "field assembled" and may contain conductors that pass through one section in order to supply another section of multioutlet assembly. Direction is appropriate especially to field installations with regard to wire bending space within the assembly. As stated in the ROP the panel wanted to differentiate between field assembled versus listed multioutlet assemblies.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Griffith, M.
Explanation of Negative:
WEST, R.: While it is clear that the new text applies only to field assembled (not listed) multioutlet assemblies, there is no clear indication in the substantiation of proposal 8-212 that overfill of conductors in multioutlet assemblies is occurring in field installations.

ARTICLE 382 — NONMETALLIC EXTENSIONS

7-57 Log #2815 NEC-P07 **Final Action: Hold**
(382.2, 382.10(C), 382.15(B), and 382.30(B))

Submitter: Richard Temblador, Southwire Company
Comment on Proposal No: 7-144
Recommendation: This proposal should be accepted as submitted.
Substantiation: A Fact-Finding Report has been completed based on the installation of Concealable Nonmetallic Extensions under flooring materials. The proposed expanded use of concealable nonmetallic extensions broadens its use to serve as a safe alternative to extension cords. Branch circuit wiring can be safely extended using concealable flat wire nonmetallic extension for power or lighting where needed, and as needed, to accommodate decorating schemes, placement of specific equipment or furniture to suit ever-changing lifestyles.
A copy of the fact-finding report in support of Proposal 7-144 has been provided.
Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Hold
Panel Statement: Currently this product is not listed. The information presented during the panel meeting did not specify when such listing could be expected. The panel has reviewed the fact finding material and recognizes that this document's data is primarily focused on the wiring methods performance regarding thermal readings while operated under flooring material. Absence of technical data indicating the ability of this product to perform when subjected to hazards such as crush, impact, and other flexing, abrasion and foreign object penetration when installed under a variety of flooring materials this CMP has determined it appropriate to put Proposal 7-144 on hold.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-58 Log #362 NEC-P07 **Final Action: Accept**
(382.15(B))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-149
Recommendation: Continue to accept the proposal.
Substantiation: This proposal removes the slang construction that substitutes "per" for "in accordance with" and is correct and enhances clarity. It is therefore to be distinguished from those proposals that would remove a perfectly concise and correct use of the word as a proposition meaning "for each". Comments have been submitted on all such proposals accordingly.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-59 Log #363 NEC-P07 **Final Action: Accept**
(382.104(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-151
Recommendation: Continue to accept the proposal.
Substantiation: This proposal removes the slang construction that substitutes "per" for "in accordance with" and is correct and enhances clarity. It is therefore to be distinguished from those proposals that would remove a perfectly concise and correct use of the word as a proposition meaning "for each". Comments have been submitted on all such proposals accordingly.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 388 — SURFACE NONMETALLIC RACEWAYS

8-96 Log #1502 NEC-P08 **Final Action: Reject**
(388.30)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-228
Recommendation: Accept the proposal with the following revisions:
Surface nonmetallic raceways shall be securely fastened to supports at intervals in accordance with the manufacturers' instructions.
Substantiation: "Supported" does not necessarily require fastening. Support means includes the concrete walls and other means noted in the panel statement. Raceways can be supported on any horizontal surface without any attachment.
Panel Meeting Action: Reject
Panel Statement: The current language of this section adequately conveys the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-97 Log #1504 NEC-P08 **Final Action: Reject**
(388.60)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-229
Recommendation: Accept the proposal with the following revisions:
Where equipment is to be grounded or bonded, a separate equipment grounding or bonding conductor shall be installed in the monmetallic conduit.
Substantiation: The provision should apply whether grounding or bonding is required or by choice. Bonding conductors should be included. "Separate" is superfluous; an EGC in the raceway is separate.
Panel Meeting Action: Reject
Panel Statement: The current language of this section adequately conveys the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

ARTICLE 390 — UNDERFLOOR RACEWAYS

8-98 Log #1501 NEC-P08 **Final Action: Reject**
(390.2(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-231
Recommendation: Accept the proposal.
Substantiation: This provision is not a requirement, which it appears intended to be.
Panel Meeting Action: Reject
Panel Statement: The proposed language does not reconcile with the intended permitted uses of this raceway type. There are different rules for installation depending on the occupancy type. The deletion of the limiting text would effectively expand the permitted use of the product into areas for which this products use may not have been evaluated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-99 Log #1503 NEC-P08 **Final Action: Reject**
(390.2(A))

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-231
Recommendation: Accept the proposal.
Substantiation: "Shall be permitted" does not impose a requirement per 90.5(B), and therefore, not enforceable. How is the Authority Having Jurisdiction to determine if a use not covered in (A) and not prohibited by (B), is suitable? Some sections use the word "only" with "permitted", e.g., 230.82, or have conditions or specify "limited to" as in 230.43.
Panel Meeting Action: Reject
Panel Statement: The language used in 390.2(A) is consistent with other raceway Articles. "Uses Permitted" is not an all inclusive list and is not intended to prohibit the use of Metal Wireways.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

8-100 Log #1500 NEC-P08 **Final Action: Reject**
(390.15)

Submitter: Dan Leaf, Seneca, SC
Comment on Proposal No: 8-233
Recommendation: Accept the proposal with the following revisions:
Electrical connections to underfloor raceways shall be made by fittings and wiring methods approved for the use.
Substantiation: Connections to underfloor raceways maybe to other than distribution centers and wall outlets. "Any" wiring method of Chapter 3 does not correlate with "not permitted" use and "only" permitted use of some wiring methods.
Panel Meeting Action: Reject
Panel Statement: The heading of the section is "Connections to Cabinets and Wall Outlets". The current language provides clear and concise direction to the user. The proposed change does not enhance clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Griffith, M.

Comment on Affirmative:

BLOM, J.: Because this Article re-write involves a relocation of material into new sub-dividing sections, future users of the 2011 NEC may have difficulty finding the desired material in the new sub-dividing section names. I recommend the NFPA staff add to the 2011 sub-dividing section cross-references from the former 2008 NEC sub-dividing section. CMP-6 has made a similar request for cross-references for relocated material within Article 310.

ARTICLE 392 — CABLE TRAYS

8-100a Log #CC800 NEC-P08 **Final Action: Accept**
(Article 392)

TCC Action: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the panel action.

Submitter: Code-Making Panel 8,
Comment on Proposal No:
Recommendation: Revise Article 392 to read as follows:

Article 392 Cable Tray

I. General

392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

Informational Note: For further information on cable trays, see ANSI/ NEMA–VE 1-2002, *Metal Cable Tray Systems*; NECA/NEMA 105-2007, *Standard for Installing Metal Cable Tray Systems*; and NEMA–FG 1-1998, *Nonmetallic Cable Tray Systems*.

392.2 Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

II. Installation

392.10 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.

(A) Wiring Methods. The wiring methods in Table 392.10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.10(A) Wiring Methods

Wiring	Method Article
Armored cable	320
CATV cables	820
Class 2 and Class 3 cables	725

Signaling raceway	725

(B) In Industrial Establishments. The wiring methods in Table 392.10(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.10(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

(1) Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).

(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).

(b) Welding cables shall comply with the provisions of Article 630, Part IV.

(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.

(2) Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(B)(1).

(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types and raceways as permitted by other articles in this *Code*.

(D) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

392.12 Uses Not Permitted. Cable tray systems shall not be used in hoistways or where subject to severe physical damage.

392.18 Cable Tray Installation

(A) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment.

(B) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(C) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(D) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.

(E) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.10(D).

(F) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(G) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.

(H) Marking. Cable trays containing conductors rated over 600 volts shall have a permanent, legible warning notice carrying the wording “DANGER-HIGH VOLTAGE-KEEP AWAY” placed in a readily visible position on all cable trays with spacing of warning notices not to exceed 3m (10 ft).

392.20 Cable and Conductor Installation

(A) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(B) Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1) The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(C) Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.10(H), the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(D) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.22 Number of Conductors or Cables.

(A) Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays. The number of multiconductor cables, rated 2000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays Containing Any Mixture of Cables. Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where the cable ampacity is determined according to 392.80 (A)(1)(c), the cable tray width shall not be less than the sum of the diameters of the cables and the sum of the required spacing widths between the cables.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(2) Ladder or Ventilated Trough Cable Trays Containing Multiconductor Control and/or Signal Cables Only. Where a ladder or ventilated trough cable tray having a usable inside depth of 150mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(3) Solid Bottom Cable Trays Containing Any Mixture of Cables. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(a) Where all of the cables are 4/0 AWG or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(b) Where all of the cables are smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 392.22(A) for the appropriate cable tray width.

(c) Where 4/0 AWG or larger cables are installed in the same cable tray with cables smaller than 4/0 AWG, the sum of the cross-sectional areas of all cables smaller than 4/0 AWG shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 392.22(A) for the appropriate cable tray width. The 4/0 AWG and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(4) Solid Bottom Cable Tray Containing Multiconductor Control and/or Signal Cables Only. Where a solid bottom cable tray having a usable inside depth of 150 mm (6 in.) or less contains multiconductor control and/or signal cables only, the sum of the cross sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm (6 in.) shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm (6 in.).

(5) Ventilated Channel Cable Trays Containing Mulitconductor Cables of Any Type. Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 392.22(A)(5).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 392.22(A)(5).

See Table 392.22(A) on Page 233

Table 392.22(A)(5) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Multiconductor Cables					
Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
75	3	1500	2.3	850	1.3
100	4	2900	4.5	1600	2.5
150	6	4500	7.0	2450	3.8

(6) Solid Channel Cable Trays Containing Multiconductor Cables of Any Type. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(a) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 392.22(A)(6).

(b) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 392.22(A)(6).

Table 392.22(A)(6) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray		Column 1 One Cable		Column 2 More Than One Cable	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
50	2	850	1.3	500	0.8
75	3	1300	2.0	700	1.1
100	4	2400	3.7	1400	2.1
150	6	3600	5.5	2100	3.2

(B) Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays. The number of singleconductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes apply to both aluminum and copper conductors.

(1) Ladder or Ventilated Trough Cable Trays. Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(a) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single-conductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(B)(1) for the appropriate cable tray width.

(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(B)(1) for the appropriate cable tray width.

(d) Where any of the single conductor cables are 1/0 through 4/0 AWG, the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

(2) Ventilated Channel Cable Trays. Where 50 mm (2 in.), 75 mm (3 in.), 100 mm (4 in.), or 150 mm (6 in.) wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

750	30.0	22,500	35.0	22,500 – (30 Sd)	35– (1.2 Sd)	17,700	27.5	17,700–(25 Sd)	27.5–Sd
900	36.0	27,000	42.0	27,000 – (30 Sd)	42– (1.2 Sd)	21,300	33.0	21,300–(25 Sd)	33.0–Sd

[a]The maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm2 for a 150-mm wide cable tray in Column 2 shall be 4500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

[b]The term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(C) Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.
The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

392.30 Securing and Supporting.

(A) Cable Trays. Cable trays shall be supported at intervals in accordance with the installation instructions.

(B) Cables and Conductors. Cables and conductors shall be secured to and supported by the cable tray system in accordance with (1), (2) and (3) as applicable:

(1) In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable runs.

(2) Supports shall be provided to prevent stress on cables where they enter raceways from cable tray systems.

Informational Note: Examples of non-power conductors include Nonconductive Optical Fiber Cables, Class 2 and Class 3 Remote Control Signaling and Power Limiting Circuits.

(B) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided all the following requirements are met:

(1) The cable tray sections and fittings are identified as an equipment grounding conductor.

(2) The minimum cross-sectional area of cable trays conform to the requirements in Table 392.60(A).

(3) All cable tray sections and fittings are legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(4) Cable tray sections, fittings, and connected raceways are bonded in accordance with 250.96, using bolted mechanical connectors or bonding jumpers sized and installed in accordance with 250.102.

Table 392.22(B)(1) Allowable Cable Fill Area for Single-Conductor Cables in Ladder, Ventilated Trough, or Wire Mesh Cable Trays for Cables Rated 2000 Volts or Less

Maximum Allowable Fill Area for Single-Conductor Cables in Ladder, Ventilated Trough, or Wire Mesh Cable Trays					
Inside Width of Cable Tray		Column 1 Applicable for 392.22(B)(1)(b) Only		Column 2[a] Applicable for 392.22(B)(1)(c) Only	
mm	in.	mm^2	$in.^2$	mm^2	$in.^2$
50	2	1,400	2.0	1,400 - (28 Sd)[b]	2.0 - (1.1 Sd)[b]
100	4	2,800	4.5	2,800 - (28 Sd)	4.5 - (1.1 Sd)
150	6	4,200	6.5	4,200 - (28 Sd)[b]	6.5 - (1.1 Sd)[b]
200	8	5,600	8.5	5,600 - (28 Sd)	8.5 - (1.1 Sd)
225	9	6,100	9.5	6,100 - (28 Sd)	9.5 - (1.1 Sd)
300	12	8,400	13.0	8,400 - (28 Sd)	13.0 - (1.1 Sd)
400	16	11,200	17.5	11,200 - (28 Sd)	17.5 - (1.1 Sd)
450	18	12,600	19.5	12,600 - (28 Sd)	19.5 - (1.1 Sd)
500	20	14,000	21.5	14,000 - (28 Sd)	21.5 - (1.1 Sd)
600	24	16,800	26.0	16,800 - (28 Sd)	26.0 - (1.1 Sd)
750	30	21,000	32.5	21,000 - (28 Sd)	32.5 - (1.1 Sd)
900	36	25,200	39.0	25,200 - (28 Sd)	39.0 - (1.1 Sd)

[a]The maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm^2, for a 150 mm wide cable tray in Column 2 shall be 4200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

[b]The term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm^2 (in inches, of all 1000 kcmil) and larger single-conductor cables in the same cable tray with smaller cables.

See Table 392.60(A) on Page 235

(3) The system shall provide for the support of cables and raceway wiring methods in accordance with their corresponding articles. Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between the cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8m (6 ft). The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

392.46 Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

392.56 Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible. Splices shall be permitted to project above the side rails where not subject to physical damage.

392.60 Grounding and Bonding.

(A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250. Metal cable trays containing only non-power conductors shall be electrically continuous through approved connections or the use of a bonding jumper not smaller than a 10 AWG.

(C) Transitions. Where metallic cable tray systems are mechanically discontinuous, as permitted in 392.18(A), a bonding jumper sized in accordance with 250.102 shall connect the two sections of the cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.

392.80 Ampacity of Conductors.

(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(1) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.15(B)(16) and Table 310.15(B)(18), subject to the provisions of (a), (b), (c), and 310.15(A)(2).

(a) The adjustment factors of 310.15(B)(3)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Adjustment factors shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.15(B)(16) and Table 310.15(B)(18) shall be permitted for multiconductor cables.

(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).

Informational Note: See Table B.310.15(B)(2)(3).

Table 392.60(A) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal[a]			
	Steel Cable trays		Aluminum Cable Trays	
	mm^2	$in.^2$	mm^2	$in.^2$
60	129	0.20	129	0.20
100	258	0.40	129	0.20
200	451.5	0.70	129	0.20
400	645	1.00	258	0.40
600	967.5	1.50[b]	258	0.40
1000	---	---	387	0.60
1200	---	---	645	1.00
1600	---	---	967.5	1.50
2000	---	---	1290	2.00[b]

[a]Total cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

[b]Steel cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 600 amperes. Aluminum cable trays shall not be used as equipment grounding conductors for circuits with ground-fault protection above 2000 amperes.

(2) Single-Conductors Cables. The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The adjustment factors of 310.15(B)(3)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19). Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19).

(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19). Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19).

(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.15(B)(17) and Table 310.15(B)(19).

Exception to (2)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).

(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).

Informational Note: See Table 310.15(B)(20).

(3) Combinations of Multiconductor and Single-Conductor Cables. Where a cable tray contains a combination of multiconductor and single-conductor cables, the allowable ampacities shall be as given in 392.17(A)(1) for multiconductor cables and 392.17(A)(2) for single-conductor cables, provided that the following conditions apply:

(1) The sum of the multiconductor cable fill area as a percentage of the allowable fill area for the tray calculated in accordance with 392.22(A), and the single-conductor cable fill area as a percentage of the allowable fill area for the tray calculated in accordance with 392.22(B), totals not more than 100 percent.

(2) Multiconductor cables are installed according to 392.22(A) and single-conductor cables are installed according to 392.22(B) and 392.20(C) and (D).

(B) Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 392.22(C) shall not exceed the requirements of this section.

(1) Multiconductor Cables (2001 Volts or Over). The allowable ampacity of multiconductor cables shall be as given in Table 310.60(C)(75) and Table 310.60(C)(76), subject to the following provisions:

(a) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 310.60(C)(75) and Table 310.60(C)(76) shall be permitted for multiconductor cables.

(b) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 310.60(C)(71) and Table 310.60(C)(72).

(2) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(a) The ampacities for 1/0 AWG and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.60(C)(69) and Table 310.60(C)(70). Where the cable trays are covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 310.60(C)(69) and Table 310.60(C)(70).

(b) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.60(C)(69) and Table 310.60(C)(70).

(c) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.60(C)(67) and Table 310.60(C)(68).

III. Construction Specifications

392.100 Construction.

(A) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

(B) Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

(C) Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 300.6.

(D) Side Rails. Cable trays shall have side rails or equivalent structural members.

(E) Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(F) Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material."

Substantiation: The following rewrite includes changes based on comments received for panel Proposal 8-235a or for proposals associated with Article 392. In addition, Section 392.60 was revised to add the word "only" for clarification and "listed" was changed to "approved" since listed connectors are not currently available. An Informational Note was added to 392.60 to show examples of non-powered conductors and to remove the "(communication, data, signal, etc.)" from the section. Titles have been revised for clarity as needed.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Griffith, M.

8-101 Log #1 NEC-P08 **Final Action: Accept in Principle in Part (392)**

Submitter: Joyce Evans Blom, Kelly Engineering Co. on assignment to Dow Chemical
Comment on Proposal No: 8-235a
Recommendation: ARTICLE 392
Cable Trays
I. General
392.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.
FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.
392.2 Definition.
Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.
II. Installation
392.10 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.
(A) Wiring Methods. The wiring methods in Table 392.10(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

Table 392.10(A)

Wiring Method	Article
Armored cable	320
CATV cables	820
CATV raceways	820
Class 2 and Class 3 cables	725
Communications cables	800
Communications raceways	800
Electrical metallic tubing	358
Electrical nonmetallic tubing	362
Fire alarm cables	760
Flexible metal conduit	348
Flexible metallic tubing	360
Instrumentation tray cable	727
Intermediate metal conduit	342
Liquidtight flexible metal conduit	350
Liquidtight flexible nonmetallic conduit	356
Metal-clad cable	330
Mineral-insulated, metal-sheathed cable	332
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	340
Network-powered broadband communications cables	830
Nonmetallic-sheathed cable	334
Non-power-limited fire alarm cable	760
Optical fiber cables	770
Optical fiber raceways	770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays	
Polyvinyl chloride PVC conduit	352
Power and control tray cable	336
Power-limited fire alarm cable	760
Power-limited tray cable	725
Rigid metal conduit	344
Rigid nonmetallic conduit	352
RTRC	355
Signaling raceway	725

(B) In Industrial Establishments. The wiring methods in Table 392.10(A) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles.
In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installed cable tray system, any of the cables in 392.10(B)(1) and (B)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.
(1) Single-conductor. Single-conductor cables shall be permitted to be installed in accordance with (B)(1)(a) through (B)(1)(c).
(a) Single-conductor cable shall be 1/0 AWG or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 1/0 AWG through 4/0 AWG single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 225 mm (9 in.).
(b) Welding cables shall comply with the provisions of Article 630, Part IV.
(c) Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 4 AWG or larger.
(2) Medium Voltage. Single and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 392.10(B)(1).
(C) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 501.10, 502.10, 503.10, 504.20, and 505.15.
(D) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 392.10, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.
392.12 Uses Not Permitted.
Cable tray systems shall not be used in hoistways or where subject to severe physical damage.
Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.
392.18 Cable Tray Installation
(A) **Complete System.** Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles. Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1.8 m (6 ft). ~~The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.~~
~~A bonding jumper sized in accordance with 250.102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with 250.96.~~
Cable tray systems used as equipment grounding conductors shall be bonded as required by 392.60 (B) to ensure electrical continuity.
(B) Cable Tray Support. Cable trays shall be supported at intervals in accordance with the installation instructions.
(C) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.
(D) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.
(E) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 300.21.
(F) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 392.18~~0~~(E~~H~~).
(G) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.
(H) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 314.1. ~~For~~ R~~r~~aceways terminating at the tray ~~a listed cable tray clamp or adapter~~ shall be ~~used to~~ securely fasten~~ed~~ ~~the raceway~~ to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article. For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article. For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 314.23.
392.19 Cable Installation.

(A) **Multiconductor Cables Rated 600 Volts.** Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(B) **Cables Rated Over 600 Volts.** Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1) The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(C) Connected in Parallel. Where single conductor cables comprising each phase, neutral, or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 310.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance. Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(D) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 1/0 through 4/0 AWG, all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

392.12 Uses Not Permitted.

~~Cable tray systems shall not be used in hoistways or where subject to severe physical damage.~~

~~Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 300.22, to support wiring methods recognized for use in such spaces.~~

~~**392.17 Ampacity of Conductors**~~

~~**(A) Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.**~~

~~(1) The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of 392.22(A) shall be as given in Table 310.16 and Table 310.18, subject to the provisions of (1), (2), (3), and 310.15(A)(2).~~

~~(a) The derating factors of 310.15(B)(2)(a) shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of currentcarrying conductors in the cable and not to the number of conductors in the cable tray.~~

~~(b) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 310.16 and Table 310.18 shall be permitted for multiconductor cables.~~

~~(c) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 310.15(C).~~

~~FPN: See Table B.310.3.~~

~~The allowable ampacity of single-conductor cables shall be as permitted by 310.15(A)(2). The derating factors of 310.15(B)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:~~

~~(a) Where installed according to the requirements of 392.22(B), the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Table 310.17 and Table 310.19.~~

~~(b) Where installed according to the requirements of 392.22(B), the ampacities for 1/0 AWG through 500 kcmil single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 310.17 and Table 310.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 1/0 AWG through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Table 310.17 and Table 310.19.~~

~~(c) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities in Table 310.17 and Table 310.19.~~

~~*Exception to (2)(c): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 310.15(C).*~~

~~(d) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 1/0 AWG and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310.15(B).~~

~~FPN: See Table 310.20.~~
