Limited current interruption — Mating-type multi-pole splicing wire connectors are marked "Limited Number of Current Interrupting Operations,"

Multi-pole Splicing Wire Connectors (ZMNA)—Continued

or the equivalent, to identify that the device has been investigated for a maximum of 10 make-and-break current operations.

Installation instructions — Multi-pole splicing wire connectors are marked "To be sold only with installation instructions."

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic standard used to investigate products in this category is ANSI/UL 2459, "Insulated Multi-Pole Splicing Wire Connectors."

UL MARK

The Listing Mark of UL on the smallest unit container in which the product is packaged, with or without the UL symbol on the product, is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Multi-Pole Splicing Wire Connector" or "Luminaire Disconnect," or other appropriate product name as shown in the individual Listings.

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

WIRE-CONNECTOR ADAPTERS (ZMOW)

USE AND INSTALLATION

This category covers wire-connector adapters intended to be installed on the end of a conductor prior to its insertion and connection to certified wire connectors, or to connectors within certified equipment. Wire-connector adapters are used to transition between an aluminum conductor and another wire connector or piece of equipment rated for copper conductors only. Wire-connector adapters are also used to transition between a stranded conductor (copper or aluminum) to the solid pin on the adapter, essentially converting a stranded conductor to a solid conductor.

Wire-connector adapters may be uninsulated, supplied with integral insulation, or have separable insulation in the form of insulating caps or covers.

Wire-connector adapters are intended for use in installations covered by ANSI/NFPA 70, "National Electrical Code," and intended to be installed using the prescribed manufacturer's installation instructions and specified crimp tool.

PRODUCT MARKINGS AND RATINGS

Wire size — Wire-connector adapters are rated for 30 AWG or larger copper conductors and/or 12 AWG or larger aluminum conductors. The wire size is marked on the adapter, or on or within the unit container.

Single conductors — Wire-connector adapters accommodate a single conductor, unless otherwise noted in the installation instructions.

Wire stranding — Wire-connector adapters are for stranded wire only.

Stranded conductor Class — Wire-connector adapters are intended for use on the following strand configurations:

- Aluminum - Class B concentric, compressed, and unidirectional lay compact

- Copper - Class B concentric or compressed, and Class C concentric

Wire-connector adapters additionally rated for use with compact copper conductors are additionally marked "For compact-stranded copper conductors" or equivalent on the wire-connector adapter, or on or within the unit container.

Wire-connector adapters additionally rated for use with other Class conductors, such as Class M, are marked with the additional class designation and number of strands.

Strip length — Some wire-connector adapters or their unit containers are marked with a strip length for the conductor before assembly to the wire-connector adapter.

Conductor material — Wire-connector adapters or the unit containers are marked with the type of conductor material(s) as follows:

Marking (or equivalent)	For Use With
"CU"	Copper wire only
"AL"	Aluminum wire only
"AL-CU" or "CU-AL"	Copper or aluminum

Ampacity level rating:

- A. **Equipment use** — Equipment wiring requirements may restrict the sizing, ampacity and temperature ratings of connected conductors. Equipment requirements may limit 90°C or higher-rated conductors to 60 or 75°C ampacity in accordance with Electrical Equipment for Use in Ordinary Locations (AALZ).
- B. **General use** — Wire-connector adapters rated 75°C are intended for

Wire-connector Adapters (ZMOW)—Continued

use at ampacities not greater than those for 75°C-rated conductors, and wire-connector adapters rated 90°C are for use at ampacities not greater than those for 90°C-rated conductors. Wire-connector adapters may be marked with “75C” or “90C” to represent these levels. Alternatively, these rating levels may be represented by a 7 or 9 associated with the marking “CU,” “AL” or “AL-CU,” e.g., “AL9,” “AL9CU,” “AL7CU,” “CU7,” “CU9.” Wire-connector adapters not marked with an ampacity number 7 or 9 have an assumed level per the following table. Use of higher-temperature-rated conductors is not prohibited, provided the ampacity levels continue to be based on the 75 or 90°C ratings.

Wire-connector adapters are rated and marked as follows:

Type of Wire-connector Adapter	Rated For	Wire Range	Temp Marking	Rating
Copper body	CU only	All	Need not be marked	90
Aluminum body	CU only	All	75 or 90	As marked@
Aluminum body	AL or AL-CU	All	75 or 90	As marked@

@ Wire-connector adapters rated for 6 AWG or smaller conductors may have the markings on the adapter, the unit container, or on an information sheet packed in the unit container.

Insulation temperature rating (maximum operating temperature) — Insulated wire-connector adapters, insulating caps and insulating covers have an insulation temperature rating marked on the device or the unit container. This rating does not exceed the 75 or 90°C temperature rating of the wire-connector adapter.

Voltage rating — Uninsulated wire-connector adapters are rated for general use in circuits up through 2000 V. Uninsulated wire-connector adapters may be used in circuits over 2000 V up through 35,000 V where the effects of corona have been investigated in the end-use application. Uninsulated wire-connector adapters are not marked with a voltage rating.

Insulated wire-connector adapters, insulating caps and insulating covers have voltage ratings for which they have been found acceptable. The voltage rating is marked on the device or the unit container and may be stated as “300 volts maximum” or “600 volts maximum,” or equivalent wording.

Flammability rating — Insulated wire-connector adapters and insulating caps and covers may be additionally marked with a flammability rating of V-0, V-1, V-2, VTM-0, VTM-1, or VTM-2.

Insulating caps and covers — Wire-connector adapters or the unit container are marked with the catalog number of the insulating caps and covers for which they are intended.

INSTALLATION INSTRUCTIONS

Use of specific tools — A specific tool and die used to assemble a wire-connector adapter to a conductor is identified on the wire-connector adapter, or on or within the unit container of the wire-connector adapter. The identification consists of a catalog or type designation, color-coding, die index number, or equivalent means. Color-coding of the crimp barrel is common.

Multiple crimping operations — The number of crimps necessary to make a connection using the specific tool is identified on the wire-connector adapter, or on or within the unit container of the wire-connector adapter. Location and number of crimping points is commonly located on the crimp barrel of the wire-connector adapter.

Conductor strip length — Wire-connector adapters requiring a specific strip length have this information identified on the wire-connector adapter, on or within the unit container of the wire-connector adapter, on an insulating cover, or on the tool or tool-carrying case. Strip-length marking is optional for some constructions.

Preliminary preparation of conductor — Some wire-connector adapters supply instructions for the preliminary preparation of conductors, such as use of conductor termination compound (antioxidant compound), on or within the unit container.

Conductor termination compound — Some wire-connector adapters are shipped pre-filled with conductor termination compound (antioxidant compound). For non-pre-filled wire-connector adapters, conductor termination compound may be used if recommended by the wire-connector adapter manufacturer as preliminary preparation of the conductor. Wire brushing of the conductor may also be performed if recommended. Also see Conductor Termination Compounds (DVYW).

RELATED PRODUCTS

See Wire Connectors and Soldering Lugs (ZMVV) for additional information on wire connectors used in conjunction with the termination of wire-connector adapters.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic standard used to investigate products in this category is ANSI/UL 486A-486B, “Wire Connectors.”

Wire-connector Adapters (ZMOW)—Continued

UL MARK

The Listing Mark of UL on the product is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word “LISTED,” a control number, and the product name “Wire Connector Adapter.”

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

WIRE CONNECTORS AND SOLDERING LUGS (ZMVV)

USE

This category covers single-polarity wire connectors for use with all alloys of copper, aluminum, or copper-clad aluminum conductors, or all three, for the purpose of providing contact between current-carrying parts. Wire connectors may be uninsulated, supplied with integral insulation, or separable insulation in the form of insulating caps or covers.

Terminal connectors establish a connection between one or more conductors to a terminal plate or stud, or to any similar device by means of mechanical pressure. They are fixed in position.

Splicing wire connectors establish a connection between two or more conductors by means of mechanical pressure and are not intended to be permanently mounted. They are floating, such as a twist-on connector in an outlet box.

Insulating caps or covers are for general use when installed on specific connectors. Information covering use of the caps or cover on specific connectors appears on the unit containers in which the caps or covers are packaged.

Soldering lugs are terminal connectors designed for attachment to a conductor by means of solder (nonpressure).

Reusability — Wire connectors have not been investigated for reusability. Reusability should be determined by the installer and the Authority Having Jurisdiction.

Direct burial — Wire connectors have not been investigated for direct burial. See **RELATED PRODUCTS**.

Use in service equipment — Where wire connectors are used as a part of service equipment, dead-front switchboards, panelboards, meter sockets, enclosed switches, circuit breakers, etc., reference should be made to the General Information for those categories concerning the use of the wire connectors. When wire connectors suitable for use with aluminum or copper-clad aluminum conductors are employed in such equipment, the suitability for wiring with aluminum or copper-clad aluminum conductors of such equipment will be indicated by a marking on the equipment and is independent of any marking on the wire connector.

INSTALLATION

Wire connectors are intended for use in installations covered by ANSI/NFPA 70, “National Electrical Code” (NEC), and should be installed using the prescribed manufacturer’s installation instructions.

Stacking of connectors (multiple connectors assembled using a single bolt, nut and washers) may be permitted where mechanical interference is reduced or eliminated with the use of offset tangs, stacking adapters, and the like. The surface contact area of the mounting tang should make complete contact with the mounting surface or the previously stacked connector tang.

PRODUCT MARKINGS AND RATINGS

Wire size and wire combinations — Wire connectors are rated for 30 AWG or larger copper conductors and/or 12 AWG or larger aluminum or copper-clad aluminum conductors. The wire size, wire range or wire combinations are marked on the connector, or on or within the unit container. Wire connectors additionally investigated for metric-size conductors are marked with the metric wire sizes expressed in mm².

Multiple conductors — Connectors generally accommodate a single conductor under a clamping mechanism unless otherwise identified, such as with the number of conductors located parenthetically in front of the wire size or range. Some connectors may have a single-conductor wire range as well as a second multiple-conductor wire range. Some connectors, such as twist-on connectors, will have multiple conductors expressed in a list of wire combinations.

Parallel conductors — Connectors intended for paralleling of conductors are intended to be used in accordance with Clause 310.4 of the NEC. Parallel connectors may have multiple-conductor clamping mechanisms, each accepting a single conductor or a singular clamping mechanism accepting multiple conductors.

Wire stranding — Unless clearly marked “Solid,” “SOL,” “Stranded” or “STR” for a given wire size, wire range or wire combination, conductors

Wire Connectors and Soldering Lugs (ZMVV)—Continued

in the range 30-10 AWG are both solid and stranded, and 8 AWG and larger are for stranded wire only. Connectors additionally rated for metric conductor sizes may be marked with the letter “r” for rigid solid and rigid stranded conductors, or the letter “f” for flexible conductors.

Stranded conductor Class — Connectors rated for use with stranded conductors are for the following strand configurations:

- Aluminum – Class B concentric, compressed or compact, and SIW (single input wire)
- Copper-clad aluminum – Class B concentric or compressed, and Class C concentric
- Copper – Class B concentric or compressed, and Class C concentric

Wire connectors additionally rated for use with compact copper conductors are additionally marked “For compact-stranded copper conductors” or equivalent on the connector, or on or within the unit container.

Wire connectors additionally rated for use with other Class conductors, such as Class M, are marked with the additional class designation and number of strands.

Strip length — Some connectors or their unit containers are marked with a strip length for the conductor before assembly to the wire connector.

Conductor material — Wire connectors or the unit containers are marked with the type of conductor material(s) as follows:

Marking (or equivalent)	For Use With
“CU”	Copper wire only
“AL”	Aluminum wire only
“AL-CU” or “CU-AL”	Copper to copper, aluminum to aluminum, copper to aluminum but not intermixed or in direct physical contact, copper-clad aluminum to copper-clad aluminum, copper to copper-clad aluminum, aluminum to copper-clad aluminum but not intermixed or in direct physical contact
“AL-CU (intermixed – dry locations)”	Copper to copper, aluminum to aluminum, copper to aluminum intermixed and in direct physical contact, copper-clad aluminum to copper-clad aluminum, copper to copper-clad aluminum, aluminum to copper-clad aluminum and in direct physical contact

Except as otherwise noted on or in the shipping carton, aluminum conductors are not intended to be used in direct physical contact with copper and copper-clad aluminum conductors in the same connector. A wire connector for securing an aluminum wire in combination with a copper or copper-clad aluminum conductor, where physical contact occurs between the wires of different metals, is limited to dry locations only and is marked “AL-CU (intermixed – dry locations).”

Ampacity level rating:

- A. **Equipment use** — Equipment wiring requirements may restrict the sizing, ampacity and temperature ratings of connected conductors. Equipment requirements may limit 90°C or higher-rated conductors to 60 or 75°C ampacity in accordance with Electrical Equipment for Use in Ordinary Locations (AALZ).
- B. **General use** — Connectors rated 75°C are intended for use at ampacities not greater than those for 75°C-rated conductors, and connectors rated 90°C are for use at ampacities not greater than those for 90°C-rated conductors. Connectors may be marked with “75C” or “90C” to represent these levels. Alternatively, these rating levels may be represented by a 7 or 9 associated with the marking “CU,” “AL” or “AL-CU,” e.g., “AL9,” “AL9CU,” “AL7CU,” “CU7,” “CU9.” Connectors not marked with an ampacity number 7 or 9 have an assumed level per the following table. Use of higher-temperature-rated conductors is not prohibited, provided the ampacity levels continue to be based on the 75 or 90°C ratings.

Connectors are rated and marked as follows:

Type of Connector	Rated For	Wire Range	Temp Marking	Rating
Terminal (CU body)	CU only	All	Not marked	90
Terminal (AL body)	CU only	All	75 or 90	As marked@
Terminal	AL or AL-CU	All	75 or 90	As marked@
Splicing wire	CU only	30-6	Not marked	90
Splicing wire (CU body)	CU only	4 and larger	Not marked	90
Splicing wire (AL body)	CU only	4 and larger	75 or 90	As marked
Splicing wire	AL or AL-CU	30-6	Not marked	75
Splicing wire	AL or AL-CU	4 and larger	75 or 90	As marked

Wire Connectors and Soldering Lugs (ZMVV)—Continued

@ Terminal connectors rated for 6 AWG or smaller conductors may have the markings on the connector, the unit container, or on an information sheet packed in the unit container.

Insulation temperature rating (maximum operating temperature) — Insulated connectors, insulating caps and insulating covers have an insulation temperature rating marked on the device or the unit container. Insulated connectors, insulating caps and insulating covers that have an insulation temperature greater than the connector ampacity level rating are marked “Temperature Rating of Insulating Material ___°C.”

Voltage rating — Uninsulated wire connectors are rated for general use in circuits up through 2000 V. Uninsulated wire connectors may be used in circuits over 2000 V up through 35,000 V where the effects of corona have been investigated in the end-use application. Uninsulated wire connectors are not marked with a voltage rating.

Insulated wire connectors, insulating caps and insulating covers have voltage ratings for which they have been found acceptable. The voltage rating is marked on the device or the unit container and may be stated as “300 volts maximum,” “600 volts maximum,” or “600 volts maximum building wire, 1000 volts maximum, in signs or luminaires,” or equivalent wording.

Flammability rating — Insulated connectors and insulating caps and covers may be additionally marked with a flammability rating of V-2 or VTM-2 or better.

Assigned torque rating — A connector or its unit container may be marked with an assigned torque value for which the connector was investigated.

INSTALLATION INSTRUCTIONS

Use of specific tools — A specific tool and die used to assemble a wire connector to a conductor is identified on the connector, or on or within the unit container of the connector. The identification consists of a catalog or type designation, color-coding, die index number, or equivalent means. Color-coding of the crimp barrel is common.

Multiple crimping operations — The number of crimps necessary to make a connection using the specific tool is identified on the connector, or on or within the unit container of the connector. Location and number of crimping points is commonly located on the crimp barrel of the connector.

Conductor strip length — Wire connectors requiring a specific strip length have this information identified on the connector, on or within the unit container of the connector, on an insulating cover, or on the tool or tool-carrying case. Strip-length marking is optional for some constructions.

Preliminary preparation of conductor — Some wire connectors supply instructions for the preliminary preparation of conductors, such as use of conductor termination compound (antioxidant compound) or pre-twisting of conductors, on or within the unit container.

Pre-twisting — Some connectors may specify that conductors are to be pre-twisted before assembly onto the connector.

Conductor termination compound — Some connectors are shipped pre-filled with conductor termination compound (antioxidant compound). For non-pre-filled connectors, conductor termination compound may be used if recommended by the connector manufacturer as preliminary preparation of the conductor. Wire brushing of the conductor may also be performed if recommended. Also see Conductor Termination Compounds (DVYW).

RELATED PRODUCTS

Sealed wire-connector systems intended for direct burial, below-grade use, or similar damp or wet locations are covered under Sealed Wire-connector Systems (ZMWQ).

Wire-connector adapters installed on the end of a conductor prior to their subsequent connection to certified wire connectors or to connectors used in certified equipment are covered under Wire-connector Adapters (ZMOW).

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic standards used to investigate products in this category are ANSI/UL 486A-486B, “Wire Connectors,” and ANSI/UL 486C, “Splicing Wire Connectors.”

UL MARK

The Listing Mark of UL on the smallest unit container in which the product is packaged, with or without the UL symbol on the product, is the only method provided by UL to identify these products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word “LISTED,” a control number, and one of the following product names: “Wire Connector,” “Soldering Lug,” “Terminal Connector,” “Splicing Wire Connector,” or other appropriate product name as shown in the individual Listings.

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss,

Wire Connectors and Soldering Lugs (ZMVV)—Continued

expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

SEALED WIRE-CONNECTOR SYSTEMS (ZMWQ)

USE AND INSTALLATION

This category covers sealed wire-connector systems intended for wet or damp locations and other installations, such as direct burial, below grade, or above grade where protected from direct exposure to sunlight. These systems may also be used indoors or in dry locations.

Sealed wire-connector systems are intended for use in installations covered by ANSI/NFPA 70, "National Electrical Code."

Sealed wire-connector systems have not been investigated for direct exposure to sunlight. Additional performance considerations to show equivalency to the connected conductors should be considered for UV exposure.

This category covers a complete system or insulating caps, covers, resins, tubing and tapes that are part of the system for use with specific wire connectors where the seal is made at the conductor. Pressure wire connectors may or may not be provided with the system.

CONDUCTOR TYPES

Sealed wire-connector systems are intended for use with Types USE, RHW, XHHW, RW90 EP, RW90 XLPE or TWU, 30 AWG through 2000 kcmil copper or aluminum conductors with currents not exceeding the ampacity of insulated conductors rated either 75 or 90°C and intended for use at 600 V or less.

When so marked, sealed wire-connector systems may also be intended for use with conductors of single- or multiple-conductor underground feeder cable (Type UF), golf course sprinkler cable, underground low-energy cable, irrigation cable, or other cable with insulation acceptable for direct burial, below grade use, or wet locations.

PRODUCT MARKINGS AND RATINGS

Sealed wire-connector systems are marked with the following:

1. catalog number
2. wire range or wire combinations
3. voltage rating
4. operating temperature rating
5. the statement "For Use in Wet or Damp Locations"
6. special conductor types, if applicable

Sealed wire-connector systems are marked with the following:

1. all required wire-connector markings and assembly information (see ZMVV)
 2. complete assembly instructions for the sealed wire-connector system
- Sealed wire-connector systems not provided with a wire connector in the same unit container include a statement that the sealed wire-connector system is intended to be used only with certified wire connectors and are marked with one or more of the following:
1. the catalog number of the specific wire connector intended to be used
 2. the physical dimensions of a specific wire connector intended to be used, or
 3. the minimum and maximum envelope dimensions of any wire connector intended to be used

Some sealed wire-connector systems may additionally be marked "Direct Burial," "Raintight," "Watertight" or "Submersible," as applicable.

All markings are located on:

1. all parts that comprise the system,
2. the packaging carton,
3. the unit container, or
4. the information sheet provided in each unit container.

RELATED PRODUCTS

See Wire Connectors and Soldering Lugs (ZMVV) for additional information on wire connectors used within a sealed wire-connector system.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic standard used to investigate products in this category is ANSI/UL 486D, "Sealed Wire Connector Systems."

UL MARK

The Listing Mark of UL on the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Sealed Wire Connector System."

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for

Sealed Wire-connector Systems (ZMWQ)—Continued

any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

WIRE CONNECTORS AND SOLDERING LUGS CLASSIFIED IN ACCORDANCE WITH IEC PUBLICATIONS (ZNKD)

USE

This category covers connecting devices used as separate entities for the connection of two or more electrical copper conductors, rigid (solid and stranded) or flexible, having a cross-sectional area of 0.2 mm² up to and including 35 mm² and equivalent AWG conductors with a rated voltage not exceeding 1 000 Vac up to and including 1000 Hz and 1500 V dc where electrical energy is used for household and similar purposes.

These products may also be provided with the Listing Mark for Wire Connectors and Soldering Lugs (ZMVV).

These products are intended for distribution and use in areas of the world where international standards are in effect.

REQUIREMENTS

The basic standard used to investigate products in this category is IEC 60998-1 (2002), "Connecting Devices for Low-Voltage Circuits for Household and Similar Purposes – Part 1: General Requirements," in addition to one of the following:

IEC 60998-2-1 (2002), "Connecting Devices for Low-Voltage Circuits for Household and Similar Purposes – Part 2-1: Particular Requirements for Connecting Devices as Separate Entities with Screw-Type Clamping Units"

IEC 60998-2-2 (2002), "Connecting Devices for Low-Voltage Circuits for Household and Similar Purposes – Part 2-2: Particular Requirements for Connecting Devices as Separate Entities with Screwless-Type Clamping Units"

IEC 60998-2-3 (2002), "Connecting Devices for Low-Voltage Circuits for Household and Similar Purposes – Part 2-3: Particular Requirements for Connecting Devices as Separate Entities with Insulation-Piercing Clamping Units"

IEC 60998-2-4 (2004), "Connecting Devices for Low-Voltage Circuits for Household and Similar Purposes – Part 2-4: Particular Requirements for Twist-On Connecting Devices"

UL MARK

The Classification Mark of UL on the product or on the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Classification and Follow-Up Service. The Classification Mark for these products includes the UL symbol, the word "CLASSIFIED" above the UL symbol (as illustrated in the Introduction of this Directory), and the following additional information:

* CONNECTING DEVICE
IN ACCORDANCE WITH IEC 60998-1 AND IEC 60998-2.**
Control No.

* SCREW-TYPE, SCREWLESS, INSULATION-PIERCING OR TWIST-ON

** 1, 2, 3 or 4

For those products which are also Listed, the Classification Mark includes the appropriate Listing Mark and the statement, "ALSO CLASSIFIED BY UNDERWRITERS LABORATORIES INC. IN ACCORDANCE WITH IEC 60998-1 AND IEC 60998-2.**"

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

WIRE, HEAT RESISTANT, FOR OVENS (ZNA)

USE

This category covers single- and multiple-conductor wire intended for use in dry locations in infrared ovens and similar other high-temperature applications. The wire is rated 300 or 600 V, and 105, 150, 200, 250, 350 or 450°C.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic requirements used to investigate products in this category are contained in UL Subject 2563, "Outline of Investigation for Heat Resistant Wire."

UL MARK

The Listing Mark of UL on the attached tag, the reel, or the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Heat-resistant Wire."

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

WIRED CABINETS (ZNXR)**USE AND INSTALLATION**

This category covers wired cabinets, such as illuminated and nonilluminated jewelry, display and showcases.

Wired cabinets may be permanently connected or cord-and-plug connected. Cord-and-plug-connected wired cabinets are limited to groups of not more than six sections coupled together by flexible cord and locking connectors, with one of the wired-cabinet sections connected by a flexible cord and plug cap rated 15 or 20 A to a permanently installed receptacle in the building structure.

Permanently wired cabinets may be provided with convenience outlets for connection of equipment, such as POS (point-of-sale) equipment. Cord-and-plug-connected wired cabinets may have receptacles installed for connection of factory-installed equipment, such as luminaires. These receptacles are not intended for powering additional equipment and are occupied by factory-installed equipment.

Wired cabinets may be divided into sections when of such size that shipment as one cabinet is impractical. Each major subassembly bears a "Wired Cabinet Section" Certification Mark. Each group of wired-cabinet sections are provided with installation instructions describing or illustrating the proper assembly and electrical connection of the sections when applicable.

These products are intended to be installed in accordance with ANSI/NFPA 70, "National Electrical Code."

RELATED PRODUCTS

Other commercial display cabinets are covered under Commercial Displays (IYMX).

Cabinets provided with or designed for use with refrigeration equipment are covered under Commercial Refrigerators and Freezers (SGKW).

Nonilluminated advertising displays are covered under Advertising Displays, Nonilluminated (AAVU).

Custom-built commercial products, such as ticket machines, electronic point-of-sale products, Internet communication stands, and the like are covered under Custom-built Kiosks (EMHH).

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic standard used to investigate products in this category is UL 65, "Wired Cabinets."

UL MARK

The Listing Mark of UL on the product is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Wired Cabinet" or "Wired Cabinet Section ___ of ___" (the first blank identifies the number of the section, and the second blank identifies the total number of sections that constitute the complete wired cabinet).

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

POSITIONING DEVICES (ZODZ)**GENERAL**

This category covers cable ties, cable-tie mounts, and similar types of related hardware for field installation in accordance with ANSI/NFPA 70, "National Electrical Code" (NEC).

The investigation of cable ties to ANSI/UL 62275, "Cable Management Systems - Cable Ties for Electrical Installations," generally includes flammability, installation, minimum and maximum operating temperature, minimum installation temperature, and mechanical property considerations. In addition, cable ties may also be investigated for smoke and heat generation, corrosion resistance, and weatherability characteristics as appropriate for the product.

The investigation of fixing devices (cable-tie mounts) to ANSI/UL 62275 generally includes flammability, minimum and maximum operating temperature, and mechanical property considerations. In addition, fixing devices may also be investigated for smoke and heat generation, corrosion resistance, and weatherability characteristics as appropriate for the product.

The investigation of devices to ANSI/UL 1565, "Positioning Devices," generally includes flammability, maximum operating temperature, and mechanical property considerations. In addition, such devices may also be investigated for smoke and heat generation, corrosion resistance, and weatherability characteristics as appropriate for the product.

RATINGS**Type Designations for Products Investigated to ANSI/UL 62275**

Type 2 — A Type 2 product retains 100% of its declared loop tensile strength (cable ties) or declared mechanical strength (fixing devices) after test conditions. The declared maximum operating temperature for products designated and marked as "Type 2" is based solely on performance criteria in ANSI/UL 62275. The polymeric material comprising the product has not been separately investigated for long-term thermal properties according to ANSI/UL 746B, "Polymeric Materials - Long Term Property Evaluations."

Type 21 — A Type 21 product retains 100% of its declared loop tensile strength (cable ties) or declared mechanical strength (fixing devices) after test conditions. The declared maximum operating temperature for products designated and marked as "Type 21" is limited to the Relative Thermal Index - Strength (RTI - Strength) at 1.5 mm (0.06 in.) thickness for the polymeric material that comprises the product. The RTI - Strength for the material is determined by separate investigation for long-term thermal properties according to ANSI/UL 746B, and the declared maximum operating temperature of the product is based on the performance criteria in ANSI/UL 62275.

Type 2S and Type 21S — Type 2S and Type 21S products meet the same requirements as Type 2 and Type 21 products, respectively, but have been additionally investigated for use as primary support for a flexible conduit, flexible tubing, or cable in accordance with the NEC. Such products may also be marked "Support" in lieu of the "S" designation.

Products investigated to ANSI/UL 1565

Load Rating — When a load rating is declared, the device retains the declared mechanical strength following test conditions.

Temperature Rating — The temperature rating of the device is limited to the RTI - Strength at 1.5 mm (0.06 in.) thickness for the polymeric material that comprises the product. The RTI - Strength for the material is determined by separate investigation for long-term thermal properties according to ANSI/UL 746B, and the declared maximum operating temperature of the product is based on the performance criteria in ANSI/UL 1565.

Limited Support — Products marked "Limited Support" are able to provide support for nonflexible conduit or tubing up to the maximum load rating marked on the device. The devices are not intended to provide primary support for nonflexible conduit or tubing at the maximum spacing intervals specified in the NEC.

MARKINGS

For cable ties investigated to ANSI/UL 62275, the product, the smallest unit container in which the product is packaged, or the installation instructions provided with the product are marked with the manufacturer's identifier (company name or registered trademark), catalog or model number, the product's maximum and minimum operating temperature, minimum installation temperature if below 0°C, minimum and maximum bundle diameter, loop tensile strength, and type designation in accordance with ANSI/UL 62275.

For separately supplied fixing devices investigated to ANSI/UL 62275, the product, the smallest unit container in which the product is packaged, or the installation instructions provided with the product are marked with the manufacturer's identifier (company name or registered trademark), catalog or model number, the product's maximum and minimum operating temperature, declared mechanical strength, and type designation in accordance with ANSI/UL 62275.

Fixing devices or cable ties having integral fixing devices investigated to ANSI/UL 62275 that are dependent on specific maximum and minimum mounting-hole size, panel thickness, mounting orientation, or other variables critical to proper installation include this information in their marking on the product, smallest unit container in which the product is packaged, or installation instructions provided with the product.

For devices investigated to ANSI/UL 1565, the product or the smallest unit container in which the product is packaged is marked with the product's maximum load and thermal ratings, together with the manufacturer's identifier (company name or registered trademark) and catalog or model number.

POSITIONING DEVICES (ZODZ)

Products covered under this category have not been investigated for outdoor use unless marked "Resistant to Ultraviolet Light," "For Use Outdoors," "For Use Outdoors or Indoors," or similar wording, in which case they have been found acceptable for both indoor and outdoor use.

All metallic products are suitable for use in air-handling areas and may be marked "Suitable for use in air handling spaces in accordance with Sec 300.22(B), (C) and (D) of the National Electrical Code," "AH-1," or equivalent wording, as appropriate. Such products comply with the requirements in ANSI/UL 2043, "Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces."

All nonmetallic and composite products that have been investigated to determine their suitability for use in air-handling areas may be marked "Suitable for use in air handling spaces in accordance with Sec 300.22(C) and (D) of the National Electrical Code," "AH-2," or equivalent wording, as appropriate. Such products comply with the requirements in ANSI/UL 2043.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic standard used to investigate products in this category is ANSI/UL 1565, "Positioning Devices," or ANSI/UL 62275, "Cable Management Systems - Cable Ties for Electrical Installations."

UL MARK

The Listing Mark of UL on the product, or on the smallest unit container in which the product is packaged with or without the UL symbol on the product, is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Positioning Device" or "Cable Tie," or other appropriate product name as shown in the individual Listings.

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

WIRE-PULLING COMPOUNDS (ZOKZ)

USE

This category covers wire-pulling compounds intended for use as lubricants in installing electrical wire and cable in conduit and other raceway. These compounds have been investigated to determine their compatibility with conductor insulation and coverings.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic requirements used to investigate products in this category are contained in UL Subject 267, "Outline of Investigation for Wire-Pulling Compounds."

UL MARK

The Listing Mark of UL on the product is the only method provided by UL to identify products manufactured under its Listing and Follow-Up

WIRE-PULLING COMPOUNDS (ZOKZ)

Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Wire Pulling Compound."

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

WIREWAY, AUXILIARY GUTTERS AND ASSOCIATED FITTINGS (ZOYX)

USE AND INSTALLATION

This category covers metallic and nonmetallic wireway, auxiliary gutters, and associated fittings for installation in accordance with Articles 366, 376, 378 and 645 of ANSI/NFPA 70, "National Electrical Code" (NEC).

Metallic wireway installed in accordance with the product markings and manufacturer's instructions is suitable for use as equipment grounding conductors, and is certified for grounding.

PRODUCT MARKINGS

Products investigated to determine that they are rain tight are marked "Raintight."

Nonmetallic products investigated to determine their suitability for exposure to sunlight are marked "Sunlight Resistant."

Nonmetallic products investigated to determine their suitability for use in an air-handling space in a location subject to Article 645 of the NEC are so rated.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (AALZ).

REQUIREMENTS

The basic standard used to investigate metallic products in this category is ANSI/UL 870, "Wireways, Auxiliary Gutters and Associated Fittings."

The basic standards used to investigate nonmetallic products in this category are ANSI/UL 870 and ANSI/UL 5A, "Nonmetallic Surface Raceways and Fittings."

UL MARK

The Listing Mark of UL on the product is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and one of the following product names as appropriate: "Wireway or Auxiliary Gutter," "Wireway," "Auxiliary Gutter," "Wireway or Auxiliary Gutter Fittings," "Wireway Fittings" or "Auxiliary Gutter Fittings."

UL, in performing its functions in accordance with its objectives, does not assume or undertake to discharge any responsibility of the manufacturer or any other party. UL shall not incur any obligation or liability for any loss, expense or damages, including incidental or consequential damages, arising out of or in connection with the use, interpretation of, or reliance upon this Guide Information.

Index of UL Product Categories Correlated to the 2011 NEC®

The Index of UL Product Categories Correlated to the 2011 NEC is intended to act merely as a tool for the User to identify potential UL Product Category Codes and their location in this publication. Locating the Product Category Code on the pages indicated will provide the User with the UL Guide Information for the applicable Category Code. This Correlation Index may not be a comprehensive list. There may be other UL Product Categories for which Listed products are covered that may be applicable to the Code Section. The User should independently confirm the applicability of the Product Category to the Code Section and verify that no other UL Product Categories apply to the installation. The installation of products for the Categories identified in this index are subject to the approval by the Authority Having Jurisdiction (AHJ).

Index of UL Product Categories Correlated to the 2008 NEC®

The Index of UL Product Categories Correlated to the 2008 NEC is intended to act merely as a tool for the User to identify potential UL Product Category Codes and their location in this publication. Locating the Product Category Code on the pages indicated will provide the User with the UL Guide Information for the applicable Category Code. This Correlation Index may not be a comprehensive list. There may be other UL Product Categories for which Listed products are covered that may be applicable to the Code Section. The User should independently confirm the applicability of the Product Category to the Code Section and verify that no other UL Product Categories apply to the installation. The installation of products for the Categories identified in this index are subject to the approval by the Authority Having Jurisdiction (AHJ).

Other UL Services

In addition to its Listing, Classification and Component Recognition Services, UL can provide manufacturers with a variety of related assessment, inspection and facility registration services.

Specialized Services

UL has specialized services and staff to assist customers and others with various product certification and information needs.

Local Engineering Services

UL's Local Engineering Services (LES) offices give customers access to UL engineers in their own local areas. In key centers around the U.S., UL operates LES offices that offer fast and convenient service. Customers can use these offices as quick sources of information or to receive on-site product investigations, Field Engineering Services or other engineering evaluations locally.

Fact-Finding Investigations

In the interest of public safety, UL conducts Fact-Finding Investigations on an individual contract basis for manufacturers, trade associations, government agencies and others. Fact-Finding Investigations provide information or data that the sponsor can use, in seeking support for a proposed amendment to a nationally recognized installation code. These investigations result in a Fact-Finding Report. Contact UL's Customer Experience Center at cec.us@us.ul.com or 1.877.UL.HELPS (1.877.854.3577) for referral to the appropriate engineering staff.

Research Services

UL also serves the interests of the public by conducting research investigations -- both for its own use and use by others -- on products or materials to help identify safety concerns and to assist in the development of appropriate safety requirements. This research is particularly useful when new technologies emerge or new safety concerns are explored. UL's research expertise and facilities are available to manufacturers, trade associations, government and other groups. Contact UL's Customer Experience Center at cec.us@us.ul.com or 1.877.UL.HELPS (1.877.854.3577) for referral to the appropriate engineering staff.

Verification Services — Commercial Inspection, Testing and Auditing

UL Verification Services offers expertise in commercial testing, inspection and auditing that is recognized and respected around the world. Currently, UL Verification Services provides support to the appliance, high-tech, lighting, and retail industries through our global footprint, technical expertise, commitment to quality and unmatched customer service. Our full range of technical services support manufacturing business operations from initial design through prototyping and into final production and enhance retail or go-to-market supply chain quality management operations. For more information, Contact UL's Customer Experience Center at cec.us@us.ul.com or 1.877.UL.HELPS (1.877.854.3577) or e-mail cits@us.ul.com.

UL Information Services

UL's Technical Information Services

Manufacturers, AHJs and other groups look to UL as a uniquely broad and accessible source of technical information in areas such as product testing and certification, domestic and international standards, international compliance requirements, and quality system registration. UL provides a variety of technical information services.

Online Certifications Directory

UL's Online Certifications Directory of UL certified products can be accessed at www.ul.com/database.

UL White Book and Product Directory CDs

UL's White Book and CD and the Product Directory CDs below are published annually. Order by visiting <http://ul.com/global/eng/pages/offerings/perspectives/regulator/electrical/publications/>.

Following is a list of the Product Directory CDs currently available from UL and the distribution months.

<u>Annual Product Directory CDs</u>	<u>Month Distributed</u>
Building Materials, Fire Protection Equipment, Roofing Materials & Systems and Fire Resistance CD	March
Guide Information for Electrical Equipment - the White Book (Print or CD)	April
Guide Information for Canadian Certified Equipment - the Canadian White Book	June
Heating, Cooling, Ventilating & Cooking Equipment, Food Safety Equipment, Plumbing & Associated Products and Flammable & Combustible Liquids & Gases Equipment CD	October

UL's Website

Visit www.ul.com for information on UL's products and services. Topics include:

- UL Marks
- UL product testing and certification, facility registration, and related services
- Seminars
- Technical information resources, such as Standards (including access to the Standards Electronic Bulletin Board System) and UL's Online Certifications Directory
- UL news and activities, including the latest news releases
- Information for AHJs, consumers and retailers
- UL Standards CSDS
- UL Marking Guides

UL Standards Development Process – Potential Roles for AHJs

Background

UL provides global conformity assessment programs and services. In addition to being the leader in product safety certification and conformity assessment services, UL is a world leader in standards development. Through more than a century of involvement in the standards and conformity assessment community, UL is recognized for its unrivaled technical expertise in the areas in which it develops standards. UL's Standards for Safety are used to investigate and certify products and systems. These standards are used by manufacturers to help design products and systems to meet the requirements for certification, by AHJs who reference the standards for products and systems used in their jurisdictions, by code development organizations that adopt and reference UL Standards for Safety, and by certification organizations that apply UL requirements for product evaluations.

Content/Scope of a UL Standard for Safety

UL Standards are typically identified as Standards for Safety and cover reasonably foreseeable risks associated with a product. Limitations applicable to the products covered by the standard are delineated in the Scope.

UL Standards are intended to:

- Identify the requirements used for the investigation of products and provide consistency in the application of these requirements.
- Provide guidance for the development of products by manufacturers.
- Provide requirements compatible with nationally recognized installation codes so that AHJs may judge their acceptability under installation codes. In addition, UL Standards may also be used by AHJs as a basis for judging material or equipment outside the scope of the document by reason of size, rating, one of a kind, or the like.

UL Standards are developed under a procedure that provides for participation, review, and comment from groups representing a broad range of interests including industry, government, insurance groups, consumers, other interested parties, and the general public. This procedure takes into consideration the needs and opinions of a wide variety of interests concerned with the subject matter of the standard.

The factors that impact UL's decision to develop a new standard or maintain existing standards include:

- Request for UL product certification in a new area;
- Request by an AHJ, government agency or consumer organization in which a new need is identified;
- Change in nationally recognized codes;
- Reports from the field pertaining to products currently in use;
- New technology not contemplated in current requirements; or
- Harmonization with regional or international standards.

Generally, UL standards are additionally recognized as American National Standards (ANSI).

Authorities Having Jurisdiction (AHJs) and Consumer Involvement

To promote a balance of input to its standards development process, UL has intensive recruitment and outreach programs to encourage AHJs and consumers to participate on Standards Technical Panels (STP). UL offers process training and funding for attendance at STP meetings. Contact the STP Project Manager (available at <http://ulstandardsinfolnet.ul.com>) for more information in advance of a meeting.

Essential Elements of the STP Process for Consensus Standards

The UL standards development process for consensus standards is based on the essential elements of ANSI's standards development criteria. The process incorporates the following concepts:

Continuous maintenance and open participation

UL is continually open to input from the various users of UL Standards and other interested groups addressing particular issues. Input is provided by industry, consumer groups, insurance representatives, and government agencies, as well as by AHJs, trade associations, and advisory groups.

UL encourages interested parties to actively participate in UL's standards development process by becoming a member of a specific STP. UL strives to achieve balance among the interest categories on the STPs. All participation takes place electronically through the UL Collaborative Standards Development System (CSDS).

STP meetings are held when the STP Chair decides that there is a need to convene the consensus body either because there are proposals to discuss or comments to resolve. Meetings can also be considered if requested by STP members. STP meetings that result from proposals or are otherwise convened by UL are open. All STP meetings are posted on the UL CSDS.

In addition, UL solicits comments from UL's Standards subscribers and public review participants.

Anyone materially affected by a UL Standard is encouraged to submit proposals. The on-line Proposal Request Form is used to formally submit proposals for UL Standards using UL CSDS. In addition to providing rationale for the proposal, the proposed wording for the requirement is to be shown in legislative format.

Consensus body review and ballot

Proposals to develop or revise a standard are balloted to the STP, the consensus body. Proposals must reach consensus before UL publishes the requirements. Consensus is achieved when more than 50 percent of the STP returns a ballot and approval is granted by two-thirds of those voting minus abstentions, negatives without comment, and negatives based on material not covered by the ballot.

UL Standards and proposed revisions are balloted for a minimum of 30 days.

Public review

UL provides public notice of, and the opportunity to comment on, all proposals. UL notifies the public of its intent to develop a new standard, revise a standard, or publish approved requirements through notices in *ANSI Standards Action*.

Public review periods are typically 45 days and are done in parallel with the consensus body review and ballot phase.

Comment resolution and circulation of substantive changes

All comments received on proposals are given due consideration. Comments received during the consensus process can be handled one of four ways: (1) a response drafted by UL, (2) a response drafted based on discussions by the STP at a comment resolution meeting, (3) a response drafted by a task group, or (4) a response drafted by the original submitter of the proposal.

The disposition of comments is shared with participants, and substantive revisions to proposals resulting from the comments, along with continuing objections, are circulated to the STP and subscribers to give STP members the opportunity to change their vote. All comments are made available via UL CSDS.

A two-week circulation is provided for comments with no substantive changes. A four-week circulation is provided for comments that result in proposal revision.

Consensus is verified during this phase.

The submitter of a proposal that lacks consensus may withdraw the proposal at any time in the process. When a proposal is withdrawn, the STP will be notified, and the reason for withdrawal will be provided, when appropriate.

Opportunity for appeal

STP members and other participants with continuing objections have the right to appeal the STP approval of proposals prior to UL publishing the revisions.

Continuing objectors may appeal the decision of the STP on the basis of a procedural complaint. Technical decisions approved by the STP are not grounds for appeal and will not be heard.

All valid appeals will be heard through a standing Appeals Panel. Details on the process are available at <http://ulstandardsinfonet.ul.com>.

Publication of approved material

UL notifies STP members and provides public notice when proposals have completed the consensus process.

UL undergoes regular and extensive audits and has been awarded the right to be an ANSI Audited Designator. As such, UL does not need to submit its standards to the ANSI Board of Standards Review for approval; UL can self-declare and move approved materials directly to publication.

Roles of STP Members

There are no membership dues associated with STPs, and anyone interested in membership is encouraged to complete an STP application (refer to www.ulstandardsinfonet.ul.com or the STP application included on the Electrical Toolkit). The STP Chair appoints members to the STP based on completed applications and criteria outlined in UL's Approved Regulations Governing ANSI/UL Standards Technical Panels (<http://ulstandardsinfonet.ul.com/stp/regulations.html>). The role of an STP member is to fully participate in the consensus process by commenting and voting on proposals, helping to resolve comments, and submitting new proposals. Continued membership is contingent on active participation; however, meeting attendance is optional. STP members may also participate on task groups.

UL CSDS Participation

The UL CSDS affords subscribers to UL's Standards Service participation in the standards development process via on-line access to the latest proposals under consideration. This includes all stages of the proposal review and comment resolution process, as well as STP meeting reports, which include a summary of the discussions that took place at the STP meeting.

STP members have a complementary subscription to UL's Standards Service for the standards covered by the STP. STP members have an additional level of access to: any documents for preliminary review to obtain initial input on a concept, with or without specific proposals; agendas for STP meetings, which provide a description of the meeting topics, with rationale and impact statements for specific proposals, when appropriate; and a ballot feature, when appropriate, for specific proposals to issue or revise a UL Standard.

There is no paper distribution involved in UL's standards development process. All participation is through CSDS so participants must have access to a computer, e-mail, and the Internet.

UL Standards Publications

Standards for Safety Catalog – UL's Standards for Safety Catalog is available online at <http://ulstandardsinfonet.ul.com/catalog/stdscatframe.html>

To Order Standards Services

To order UL Standards, Standards Subscription Services and other Standards publications from the U.S. or Canada, call toll-free 1.888.UL.33503 or 1.888.853.3503. Callers from other countries can dial Int+415.352.2168. Or fax at 888.853.3512. For more information on ordering UL Standards, visit <http://ulstandardsinfonet.ul.com>.

UL StandardsInfoNet

UL StandardsInfoNet – the Internet website for information on UL Standards activities.

UL StandardsInfoNet provides access to UL's current Standards for Safety Catalog and Product Index.

UL StandardsInfoNet provides up-to-date information pertaining to UL's various Standards activities, such as information about new editions, revisions, proposed Standards, Bulletins, and Outlines of Investigation; a list of UL Standards approved by ANSI and the DoD; UL/CSA and UL/IEC harmonized Standards; the scope of each Standard and Outline of Investigation; meeting announcements, and the like.

UL StandardsInfoNet can be accessed at no cost by setting your browser's URL to:
<http://ulstandardsinfonet.ul.com>.

Regulatory Services Staff

To contact UL Regulatory Services staff members, call 1.800.595.9844 or e-mail ulregulatoryservices@us.ul.com or visit www.ul.com/codeauthorities. For more detailed contact information including contact names, phone, fax and e-mail addresses, visit the code authorities-website at <http://www.ul.com/global/eng/pages/offerings/perspectives/regulator/contacts/>.

Appendix A

UL Marking Guides and Application Guides

UL has developed these marking guides to assist AHJs and installers in understanding the meaning and location of markings on various UL Listed products. These products are intended to be installed in accordance with the NEC® and their UL Listing.

UL has developed these application guides to assist code and inspection authorities, electric utilities, contractors, installers, users, system designers, and other interested parties in understanding the basic components of alternative energy systems and lightning protection systems and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation.

The following UL Marking Guides and Application Guides are included in this appendix:

1. Dead-front Switchboards
2. Electrical Heating and Cooling Equipment
3. Luminaires
4. Molded Case Circuit Breakers
5. Panelboards
6. Swimming Pool Equipment, Spas, Fountains and Hydromassage Bathtubs
7. Wire & Cable
8. Alternative Energy Equipment and Systems Application Guide
9. Lightning Protection Application Guide
10. Green Construction Application Guide

The UL Guide Information for product categories referenced in the above marking guides is included within the UL White Book.

Marking and Application Guide

DEAD-FRONT SWITCHBOARDS

Dead-Front Switchboards
Marking and Application Guide

JANUARY 2013

PREFACE

UL developed the Dead-Front Switchboard Marking Guide for electrical inspectors, electric utilities, contractors, installers, users, designers, and other interested parties to aid in understanding deadfront switchboards and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation of switchboards used in ordinary locations, rated 600 volts or less. These switchboards are intended to be installed in accordance with the *National Electrical Code*® (*NEC*®) and their listing. These markings are required by UL 891, and are part of the listing.

The Table of Contents lists the main headings and their page numbers. The Index gives an alphabetical list of specific items and the section numbers where information about them can be found. Marking guides are available for Panelboards and Molded Case Circuit Breakers at www.ul.com/markingguides or in Appendix A of the UL White Book.

Complete information regarding the provision of markings and instructions for these switchboards is contained in the Standard for Switchboards, UL 891. References to the *National Electrical Code*® (*NEC*®) are to the 2011 edition.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web Site at <http://www.ul.com/codeauthorities>.

Your comments or suggestions are welcome and appreciated. They should be sent to:

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers in determining the suitability of deadfront switchboards in a particular installation and use, and to address concerns related to fire, shock, and mechanical hazards.

Products are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Additional information on marking requirements can be found in the guide information for Dead-Front Switchboards (WEVZ), which is located in the UL White Book and online at www.ul.com/database.

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

The numbering for code sections used in this document may change as the specific code is updated.

Additional information can be found at www.ul.com.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of power distribution equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified.”

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on power distribution equipment. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL's *safety* requirements. These requirements are primarily based on UL's own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word "Listed," the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word "Classified," a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

FIELD EVALUATIONS

You may encounter situations in which you are unable to determine if a product has been listed by a third-party organization. Or in other situations you might encounter a product bearing a listing label that may have been modified in the field, and now you question whether or not the product still complies with the applicable standard. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors, and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL's Web site at www.ul.com/field.

1. GENERAL INFORMATION

UL lists manufacturers of dead-front switchboards under the category of “Dead-Front Switchboards” (WEVZ) in the UL Online Certification Directory at www.ul.com/database.

This Directory also contains names of manufacturers who are authorized to label equipment similar in appearance to dead-front switchboards under the following categories:

Circuit Breaker and Metal-Clad Switchgear — over 600 volts (DLAH)

Switchgear Assemblies, Metal Enclosed, Low-Voltage Power Circuit Breaker Type (WUTZ)

The evidence of Listing is the UL Listing Mark on the product. The Listing Mark for switchboards includes the name and/or symbol of UL, together with the word “Listed,” a control number and one of the following product names as appropriate: “Dead-Front Switchboard Section,” “Switchboard Interior,” or “Switchboard Enclosure.”

The Listing Mark for Dead-Front Switchboard Sections contains the marking “_____ of _____,” in which the first space is marked with a number indicating the position that the section occupies in the series of sections which constitute the switchboard, and the second space is marked with the total number of sections (both Listed and non-Listed) in the switchboard. A single section switchboard is marked 1 of 1. The section on the left side when facing the front of the switchboard is marked as position one of the series.

A switchboard section mounted on top of one or more sections is marked “_____ T” where the blank is filled with the number of the initial section covered. A switchboard enclosure (pull section) may be included in the numbering sequence if it is located at either end of the switchboard. The pull section is included in the numbering sequence if located between switchboard sections.

A switchboard section omitting one side is marked to indicate the catalog number of a separate side panel that should be ordered, or the catalog numbers of stock sections to which it is intended to be connected.

The Listing Mark is applicable only to the section so marked; it does not cover other sections included in the complete switchboard. A switchboard may be shipped from the factory incorporating both Listed and non-Listed sections. The non-Listed sections have not been evaluated by UL.

The basic Standard used to investigate products in this category is the Standard for Switchboards, UL 891.

Switchboard markings may be molded, die-stamped, paint stenciled, stamped, etched metal that is permanently secured, or on a label secured by adhesive. Some markings may be located on a wiring diagram in a pocket on the switchboard.

2. GLOSSARY

ACCESSIBLE, FRONT - An enclosure in which incoming and outgoing field termination points are accessible from the front. Other connections shall be permitted to be rear or side accessible. If necessary, a limited number of devices shall be permitted to be removed to achieve this accessibility.

ACCESSIBLE, REAR - An enclosure in which all incoming and outgoing field termination points are accessible from the rear. Other connections shall be permitted to be front or side accessible. If necessary, a limited number of barriers or covers shall be permitted to be removed to achieve this accessibility.

AMPACITY - The current in amperes a conductor can carry continuously under the conditions of use without exceeding its temperature rating.

BARRIER - A partition for the insulation or isolation of electric circuits or electric arcs.

BONDING - The permanent joining of metallic parts to form an electrically conductive low impedance path that will assure electrical continuity and the capacity to conduct safely any current likely to be imposed.

BUS - A conductor, or group of conductors, that serves as a common connection for two or more circuits.

BUS, BRANCH — A bus that originates at a section bus and terminates in one or more overcurrent devices.

BUS, GROUND – A bus to which the equipment grounding conductors from individual pieces of equipment are connected and which, in turn, is connected to the grounding electrode conductor at one point. It provides a continuous ground in multiple equipment sections through which it passes. See Figure 2.1.

BUS, NEUTRAL – A bus having the appropriate number of terminals to provide for the connection of the neutral line and load conductors. See Figure 2.1.

BUS, SECTION — That portion of the bus structure that serves one or more overcurrent devices in the switchboard section and comprises that part of the bus between the supply bus and branch bus. See Figure 2.1.

BUS, SPLICE — A bus that electrically connects switchboard sections. See Figure 2.1.

BUS, SUPPLY — A bus that is intended primarily for conducting electric power from the source to the main section of a switchboard. See Figure 2.1.

BUS, THROUGH — A bus that extends through a switchboard section. It is sometimes called a horizontal, cross or main bus. See Figure 2.1.

CIRCUIT BREAKER - A device designed to open and close a circuit by non-automatic means, and to open the circuit automatically on a predetermined overcurrent, without injury to itself when properly applied within its rating.

CIRCUIT BREAKER, MOLDED CASE - A circuit breaker which is assembled as an integral unit in a supporting and enclosing housing of insulating material.

CONTINUOUS CURRENT - The amount of current a conductor, a device or a piece of equipment can carry continuously for an indefinite period of time without exceeding its allowable temperature rise.

CURRENT RATING - The designated maximum direct or alternating current in rms amperes at rated frequency that a device can carry continuously under specified conditions.

DEAD-FRONT SWITCHBOARD - A switchboard which has no exposed live parts on the front.

DEVICE - A component of an electrical system that is intended to carry or control, but not utilize, electrical energy.

DISCONNECTING MEANS – A device, or a group of devices, or other means by which the conductors of a circuit can be disconnected from their source of supply.

DOUBLE-ENDED SWITCHBOARD (Multiple Source) — A switchboard construction that provides for the connection of two supply sources, such as a utility service and an on-site generator. See Figures 2.2 and 2.3 for typical examples.

FUSE - A protective device which opens by the melting of a current-sensitive element during specified overcurrent conditions.

FUSIBLE SWITCH - A switch in which one or more poles have a fuse in series in a composite unit.

I^2t (AMPERE SQUARED SECONDS) - An expression related to the circuit energy as a result of current flow. The “ I^2 ” stands for the square of the effective (rms) let-through current and the “ t ” stands for the time of current flow in seconds. “ I^2t ” is a common expression for the circuit energy between the initiation of the fault current and the clearing of the circuit.

INTERLOCK - An electrical or mechanical component actuated by the operation of a device or other means, with which it is directly associated to govern succeeding operations of the same or allied devices.

INTERRUPTING RATING – The highest current at rated voltage that a device is intended to interrupt under standard test conditions.

MAIN DEVICE – A single device that disconnects all ungrounded conductors, other than control power conductors when used, from the supply bus. See Figure 2.1.

MAIN SECTION(S) – A portion of a switchboard where the main or service disconnect device(s) is located. The section shall also be permitted to contain utility meters or other instruments. Incoming line conductors may be terminated in this section. See figure 2.1.

NEUTRAL – Neutral refers to a conductor (when one exists) of a polyphase circuit or single-phase, 3-wire circuit which is intended to have a voltage such that the voltage differences between it and each of the other conductors are approximately equal in magnitude and are equally spaced in phase, such as:

- a) the center point of a wire connected system,
- b) the midpoint of a 3-wire, single phase system,
- c) the midpoint of one side of a delta connected system.

RATING - A designated limit of operating characteristics based on definite conditions.

RATING PLUG – A self-contained portion of a circuit breaker that is interchangeable and replaceable in a circuit breaker trip unit by the user. It sets the Rated Current (In) of the circuit breaker.

SERVICE EQUIPMENT – The necessary equipment, usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors to a building or other structure, or an otherwise defined area, and intended to constitute the main control and means of cutoff of the supply.

SHORT-CIRCUIT CURRENT RATING – The maximum RMS available current to which a device can be connected. The rating is expressed in amperes and volts.

SWITCH - A device, manually operated, unless otherwise designated, for opening and closing or for changing the connection of a circuit.

SWITCHBOARD — A large single panel, structural frame or assembly of panels or structural frames on which may be mounted, on the face or back or both: switches, overcurrent, and other protective devices, buses, and instruments.

Note: Switchboards may be accessible from the rear as well as from the front and are not intended to be installed in cabinets.

SWITCHBOARD ENCLOSURE — An enclosure that encloses one or more switchboard sections or switchboard interiors, or provides auxiliary wiring space for an adjacent switchboard section.

SWITCHBOARD INTERIOR — The interior part of a switchboard intended to be installed in a switchboard enclosure to become the equivalent of a switchboard section.

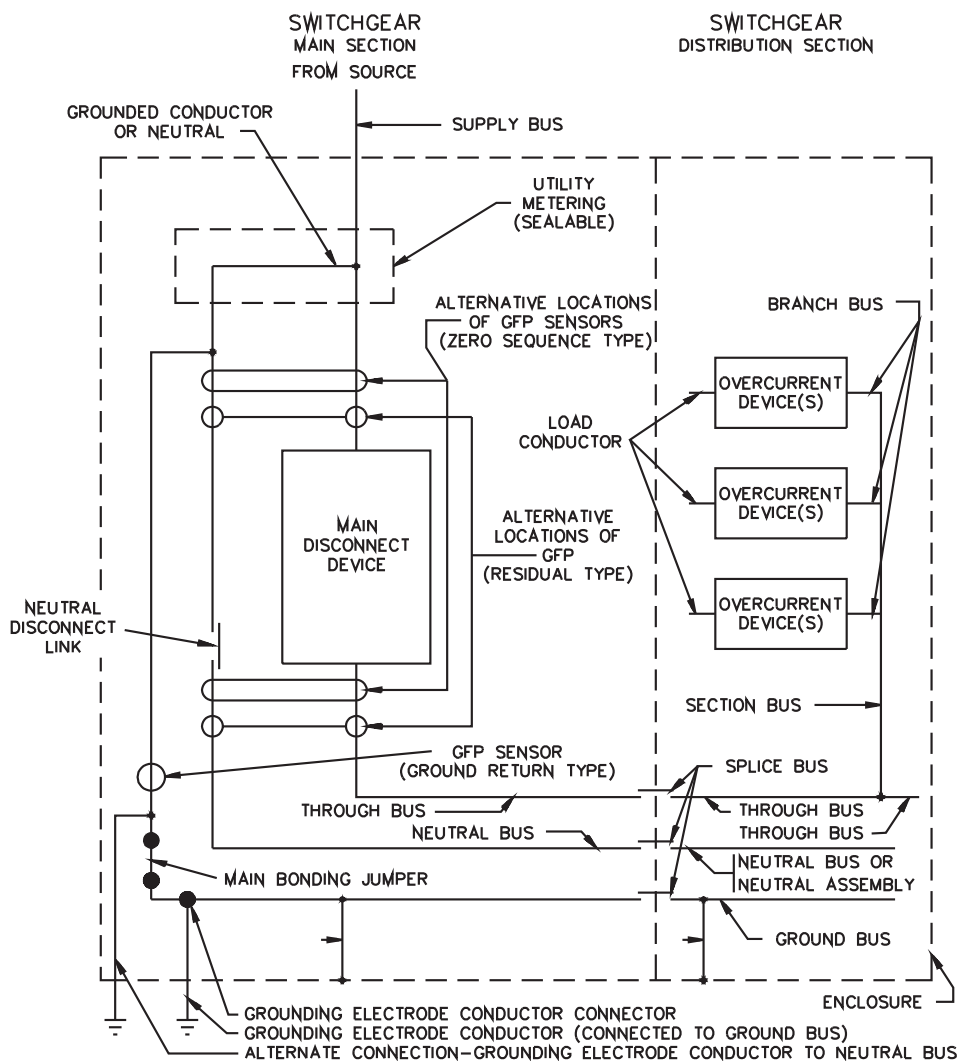

SWITCHBOARD SECTION — That portion of a switchboard that is prevented by the structural framework from being physically separated into smaller units.

Note: Framework that is welded or joined with steel rivets over 1/4 inch (6.4 mm) in diameter is considered to constitute a single section. However, framework that is joined with one-way (tamper-proof) bolts is not considered to constitute a single section. An assembly consisting of an enclosure and terminal blocks or bus bars is considered to be a switchboard section.

SYMMETRICAL CURRENT - Alternating current having no offset or transient component and, therefore, having a wave form essentially symmetrical about the zero axis. Symmetrical current is expressed in terms of rms A.

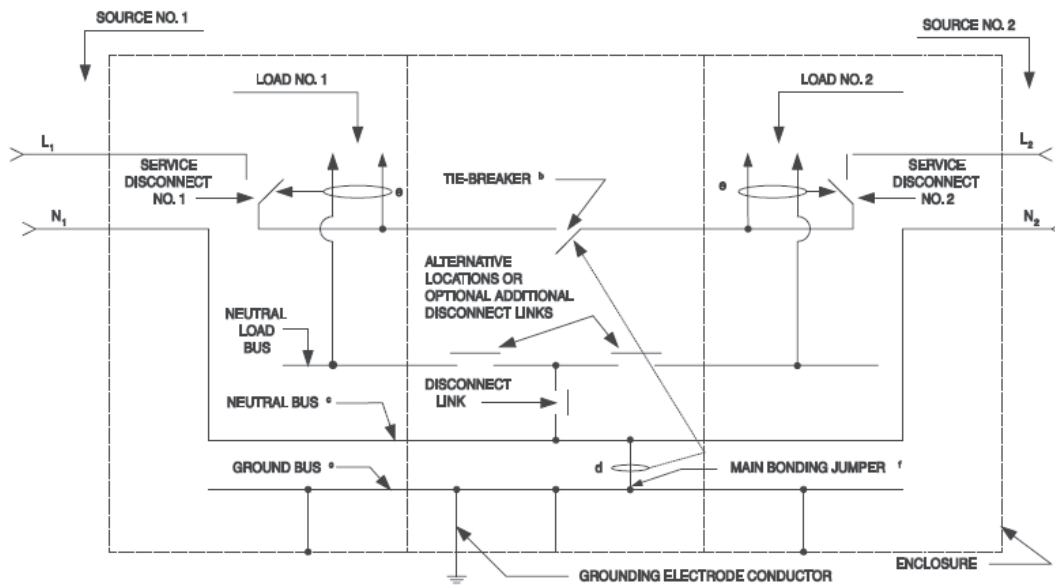

TAP – A terminal or provision for a terminal intended for field wiring that is located on the supply side of the service disconnecting means, for uses permitted by the installation rules of the country of installation.

^a Other variations are possible.

^b Tie-breaker disconnect (not a circuit breaker marked “Line” and “Load,” nor a fused switch).

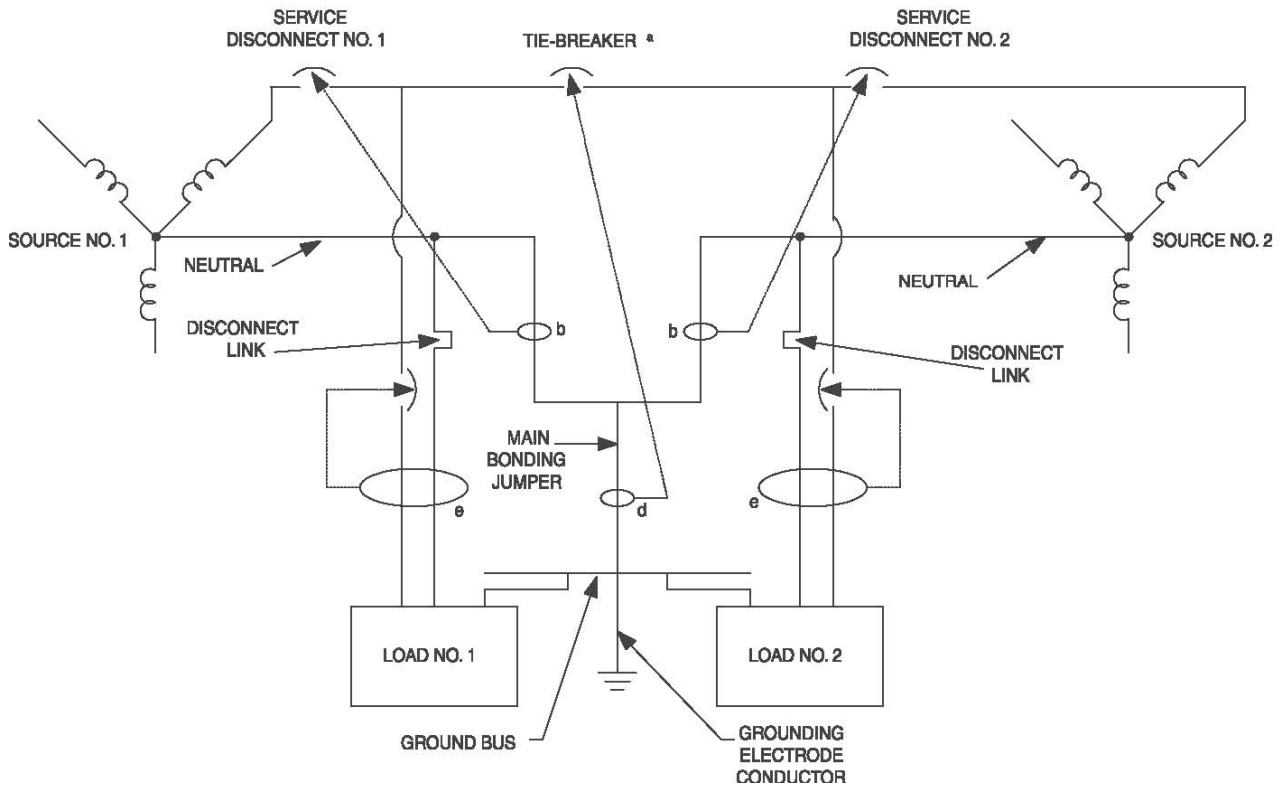

^c The neutral bus and ground bus may be combined if ground-return type ground-fault protection is not used and the sections are marked “Suitable only for use as service equipment.”

^d Ground-return type ground-fault protection sensor.

^e Zero sequence or residual type ground-fault protection sensor.

^f Size of main binding jumper based on largest service disconnect.

FIGURE 2.3
TYPICAL DOUBLE-ENDED SWITCHBOARD

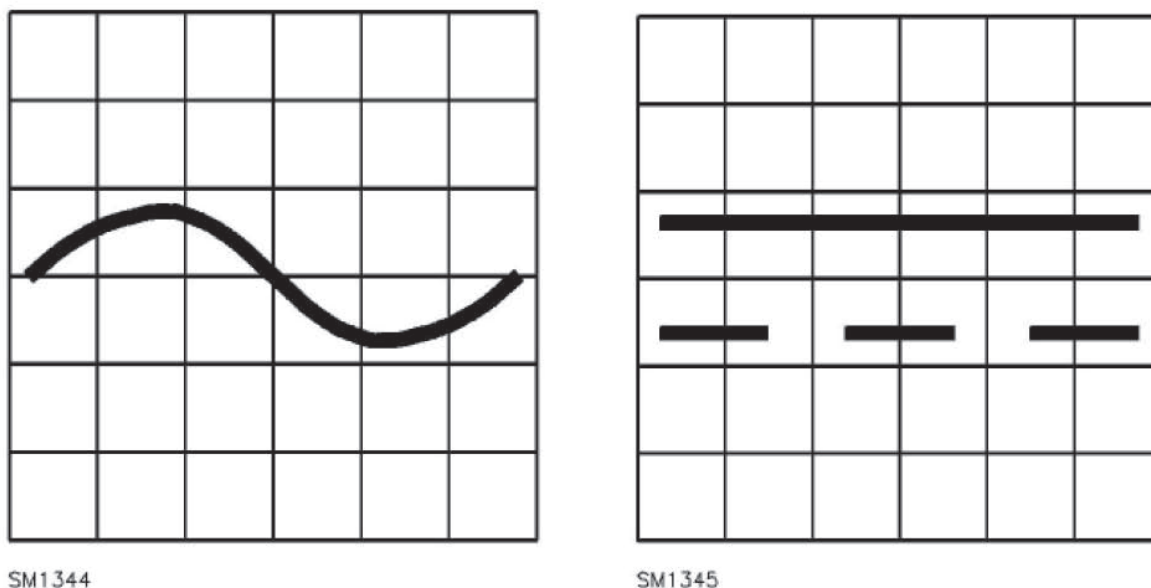

- ^a Tie-breaker disconnect (not a circuit breaker marked “Line” and “Load,” nor a fused switch).
- ^b Additional ground-return type ground-fault protection sensors are utility interlocked with the sensor described in note d so as to function only when a fault current is also sensed by the sensor described in note d.
- ^c Size of main bonding jumper based on largest service disconnect.
- ^d Ground-return type ground-fault protection sensor.
- ^e Zero sequence or residual type ground-fault protection sensor.

3. ELECTRICAL RATINGS

General

The electrical rating includes voltage, current, frequency and short-circuit current ratings. An alternating current rating includes the number of phases, if other than single phase. Voltage ratings are followed by the symbol for alternating current and/or the symbol for direct current. See figure 3.1.

FIGURE 3.1
AC AND DC VOLTAGE SYMBOLS

A switchboard section or interior with provisions for connection to two or more supply sources is marked to indicate the current and voltage ratings for each supply source.

A switchboard section or interior with provision for connection to an external source of control circuit power, are marked to identify that purpose. The current and voltage ratings for the power source are marked or indicated on a wiring diagram.

Location

A switchboard section is marked with the electrical rating where it will be visible without removing any cover or trim.

A switchboard interior is marked with the electrical rating where it will be visible before or after a cover is installed.

A switchboard enclosure that is marked for use with a particular switchboard interior is marked with the electrical ratings of the switchboard interior, unless the switchboard interior rating will be visible, after installation, without removing any cover.

Voltage Rating

A switchboard section or interior is rated no more than 600 volts.

A switchboard section or interior may be marked with several alternative voltage ratings.

A switchboard section or interior that is designed for use on supply circuits involving two different voltages is marked with a combination voltage rating, e.g., 208Y/120, 480Y/277.

If a switchboard section or interior contains a transformer with a secondary circuit that leaves the section or interior, the transformer secondary voltage rating is marked.

Current Rating

Each switchboard section or interior is marked with the current rating of the supply bus and section bus; and, in addition, with the rating of the through or splice bus supplying the next section or interior, if the through or splice bus current rating is less than the current rating of the supply bus.

The adequacy of the supply, through, splice or section bus current rating with respect to the calculated load current (using the appropriate diversity factors in Article 220 of the *NEC*[®]) can only be determined at the time of final installation.

If the ampacities of the various phase bus bars, including the neutral bus bar, are not identical, the current rating markings of each bus bar and terminal are provided.

Short-Circuit Current Rating

Each switchboard section containing devices other than a transformer and associated wiring or interior is marked with the following information:

A. The words “Short-Circuit Current Rating” and the dc or rms symmetrical short-circuit current rating in amperes as noted in Table 3.1. If the switchboard section or interior contains meter mounting equipment other than that intended for use with current transformers, the phrase “Watt-hour meter not included in the short-circuit current rating” is also provided.

B. The maximum dc or rms voltage rating for each short-circuit current. (Since the ability of an overcurrent protection device to open on fault currents is affected by the voltage rating of the circuit, a switchboard may have several different short-circuit current ratings, each associated with a specific voltage rating.)

C. A statement that the short-circuit ratings are limited to the lowest short-circuit rating of (1) any switchboard section connected in series, (2) any installed circuit breaker or fused switch other than those located in a control circuit, (3) the short-circuit rating marked on the switchboard of any installed combination series-connected circuit breaker, or (4) any installed panelboard having a marked short-circuit rating.

D. A statement that additional or replacement devices –other than fuses – are to be of the same manufacturer, type designation, and equal or greater interrupting rating. This

may be accomplished by specific reference to the device if the interrupting rating of the device is not less than any marked short-circuit current rating of the switchboard. The ampere rating of the device is also included if the short-circuit rating varies with the ampere rating of the device. For a fuse, the class of fuses shall be specified.

E. If applicable, identification of the combination of the integral or remote main and branch circuit overcurrent devices that are required when applying the marked short-circuit current rating.

TABLE 3.1 RMS SYMMETRICAL OR DC SHORT-CIRCUIT CURRENT RATING

Amperes		
5,000	25,000	75,000
7,500	30,000	85,000
10,000	35,000	100,000
14,000	42,000	125,000
18,000	50,000	150,000
22,000	65,000	200,000

Figure 3.2 shows an example of a switchboard marking providing information for installation of circuit breakers having a lower interrupting rating than the short-circuit current rating of the switchboard. Circuit breakers are acceptable for use above their marked interrupting rating if used on the load side of a specific overcurrent device. (Blank spaces would be filled with appropriate information.)

FIGURE 3.2 SAMPLE SHORT-CIRCUIT CURRENT RATING

- A. “The short-circuit current rating of this switchboard is equal to the lowest interrupting rating of any installed circuit breaker or fused switch, but not more than _____ rms symmetrical amperes at _____ volts, 3-phase, or _____ rms symmetrical amperes at _____ volts, single phase”; and
- B. “The interrupting rating of a circuit breaker is 5,000 rms symmetrical amperes and for a fused switch is 10,000 rms symmetrical amperes”, or as marked on the device, except for the following series combination ratings:

Load Side				Line Side			Interrupting Rating		
Circuit Breakers				Circuit Breakers					
Mfr.	Type	Poles	Amp Rating	Mfg.	Type	Amp Rating	Symmet	Volts	Phases
							Amp rms	ac	

A load side circuit breaker may be a branch, sub-main, or an integral main used on the load side of a remote main. A line side circuit breaker or fused switch may be a sub-main, integral main, or a remote main. This series combination short-circuit current rating shall not exceed the interrupting rating of the line side circuit breaker or fused switch.

If the short-circuit current rating of a switchboard is dependent upon the use of a specific overcurrent device ahead of the switchboard, the switchboard is marked “When protected by _____ ampere maximum Class _____ fuse or _____ Type circuit breaker rated no more than _____ amperes, this switchboard is suitable for use on a circuit capable of delivering no more than _____ rms symmetrical amperes volts maximum.” The second blank space is filled with the fuse type designation (CC, G, J, L, RK1, RK5 or T). The third blank space is filled with the name of the circuit breaker manufacturer and the type designation.

The marking indicates only the type of overcurrent device(s) with which the switchboard has been tested.

4. PHASE IDENTIFICATION

Unless marked otherwise, the phase arrangement of the supply, through and section bus bars in a 3-phase switchboard, but not including the connections to meter sockets, is A, B, C from front to back, top to bottom, or left to right as viewed from the front of the switchboard section or interior.

5. SERVICE EQUIPMENT

Switchboards suitable for use as service equipment are provided with one of the following markings:

- A. “Suitable for use as service equipment” or
- B. “Suitable for use only as service equipment.”

Additional wording that places limitations on the use of the switchboard when used as service equipment may be added to either of the markings above for specific constructions. Typical wording that may be added is “... when no more than six main disconnecting means are provided.”

Unless otherwise indicated below, a switchboard that is marked for use as service equipment will contain from one to six service disconnecting means, service overcurrent protection, a neutral disconnecting link, a main bonding jumper and a grounding electrode conductor terminal.

The section or sections of a multi-section switchboard that contain the main bonding jumper, the grounding electrode conductor terminals and the neutral disconnecting means will be marked.

The main bonding jumper, the grounding electrode conductor terminal and the neutral disconnect link are identified by a marking or tag located on or adjacent to the part.

A switchboard marked per A or B above may also be used to provide the main control and means of cutoff for a separately derived system or a separate building.

Some ac rated switchboards incorporate neutrals that are factory bonded to the enclosure. Such switchboards are marked "Suitable only for use as service equipment."

If a switchboard section contains a service disconnect that serves as a main for a group of sections, the service overcurrent protection need not be provided if the section is marked "Suitable for use as service equipment for a second building if located on the load side of overcurrent protection not exceeding the switchboard supply current."

If a switchboard section or interior is marked "Suitable for use as service equipment" or "Suitable for use as service equipment when no more than six main disconnecting means are provided," the marking "Service disconnect" is provided in the form of pressure sensitive labels in an envelope or on a card with instructions to apply the labels near the disconnect handles if the equipment is used as service equipment. However, if the switchboard is intended for a particular installation in which it is known that it will be used as service equipment, the markings may be applied at the manufacturing location.

6. GROUND-FAULT PROTECTION

General

Switchboards provided with ground-fault protection are marked to indicate the circuit-main, feeder or branch-circuit that is so protected. If a marking on the ground-fault sensing or relaying equipment is not visible from the front of the switchboard with the cover removed, a separate marking, such as on the wiring diagram, is provided.

In a switchboard section or interior with ground-fault protection, the part of the neutral bus used for load terminations is marked with the following or equivalent statement: "Do not connect grounding conductors to these or any other neutral terminals; to do so will defeat ground-fault protection." This marking is placed on or adjacent to the neutral.

If components of a ground-fault protection system are located in two adjacent sections, a complete wiring diagram of both sections is secured to each of the sections.

If the control circuit for ground-fault protection is intended to be connected to an external source, the marking "External source connection for control circuit of ground-fault sensing and relaying equipment volts (ac or dc)" or equivalent is provided. If terminals for an external source for other types of control circuits are provided, they are similarly marked.

A switchboard section or interior (1) intended only for use as service equipment or (2) acceptable for use as service equipment and not provided with ground-fault protection is marked for a

specific use as follows:

- A. For a section or interior rated 3-phase and 4-wire: “Suitable only for use as service equipment when supplying a continuous industrial process” or “Suitable for use as service equipment only if supplying a continuous industrial process.”
- B. For a section or interior rated 3-phase and 3-wire, one of the markings specified in item A above plus the words “... or for systems where the neutral is not solidly grounded.”
- C. For supplying a fire pump or for an alternate source for legally required standby service. The above limitations noted in the preceding paragraph are based on *NEC*® Section 230.95, Exception, and Section 695.6(G).

Field Testing Information Sheets and Forms

To provide for system performance testing as required in the *NEC*® Section 230.95(C), each ground-fault relay and each apparatus incorporating a ground-fault relay or its functions that is intended for protection of a solidly grounded wye service rated more than 150 volts to ground but not exceeding 600 volts phase-to-phase is provided (1) with a test form and (2) with information sheets describing system testing instructions.

The test form includes spaces for the date the test was conducted and for the test results, and states that the form should be retained by those in charge of the building’s electrical installation in order to be available to the authority having jurisdiction.

The information sheet instructions include the following items and basically prescribe only that information necessary to perform the tests. The instructions are separate from more elaborate test details that the manufacturer may wish to provide. The instructions specify that:

- A. The interconnected system shall be investigated in accordance with the switchboard manufacturer’s detailed instructions, and that this investigation is to be undertaken by qualified personnel.
- B. The location of the sensors around the bus of the circuit to be protected shall be determined. This can be done visually, with knowledge of which bus is involved.
- C. The grounding points of the system shall be verified to determine that ground paths do not exist that would bypass the sensors. The use of high-voltage testers and resistance bridges may be suggested.
- D. The installed system is to be tested for correct response by the application of full-scale current into the equipment to duplicate a ground-fault condition, or by equivalent means such as by a simulated fault current generated by (1) a coil around the sensors or (2) a separate test winding in the sensors.
- E. The results of the test are to be recorded on the test form provided with the instructions.

7. TAPS

A tap, circuit, section or switchboard cannot be marked for emergency use. However, an automatic transfer switch may be marked for connection to an emergency source.

Some switchboards may have terminals or provisions for terminals, marked as taps, located on the supply side of the service disconnecting means. The suitability of these terminals as taps connected on the supply side of the service disconnect is intended to be determined in accordance with *NEC*® Sections 230.46, 230.82, 701.12(E) and 705.12.

Deadfront switchboards are not Listed to have their busbars tapped in the field unless there are existing holes in the busbars marked with the word “Tap” adjacent to the holes in the factory. Other holes in the busbar that are not marked with the word “Tap” are intended for the connection of overcurrent devices, other device’s as identified by the product markings and in the installation instructions, or other uses identified by the manufacturer. When the electrical equipment Listing does not include product markings or instructions for tapping busbars, this situation should be treated like any other field modification of Listed equipment.

Some Listed power equipment may have installation instructions with specific directions on tapping the busbars. If this is the case, this equipment can be field modified, following those manufacturer’s instructions, in accordance with the National Electrical Code® (NEC) Section 110.3(B). The UL White Book identifies the required markings for field-installed equipment that have been evaluated by UL. For additional information, please see the guide information for Dead-Front Switchboards (WEVZ).

Drilling or enlarging holes in busbars can increase the current density and reduce current carrying capacity. Some equipment is constructed with fully rated busbars, which have a typical current density of 1000 A per square inch of cross sectional area for copper and 750 A per square inch of cross sectional area for aluminum. However, some equipment use busbars at a higher current density and have temperature testing conducted to determine compliance with UL’s requirements.

Removing busbar material can result in higher operating temperatures, and additional holes can potentially weaken the busbar, which adversely affects the short circuit rating of the equipment required by NEC Section 110.10. Both sufficient wiring space and wire bending space need to be provided for the conductors and the wire connector at the tap connection. In measuring the wiring space, AHJs need to consider the possibility of the connectors rotating, which may result in reduction of the spacing between uninsulated live parts of opposite polarity and uninsulated live parts and ground.

Wire connectors (lugs) need to be Listed for the purpose and have the proper ratings for specific application, and the mounting hardware for wire connectors needs to be properly selected and attached with the correct torque. The potential reduction of required spacings from the wire connectors or fasteners to the enclosure or other busbars also needs to be evaluated. In completing the modification, all foreign material such as cutting oil, burrs and metal shavings needs to be removed from the equipment enclosure. Temporarily removed materials such as insulating barriers need to be returned to their original positions and secured. The above are just a few of the concerns and items that must be inspected, checked and reviewed where such modifications are made to this type equipment.

8. TERMINALS

Switchboard sections and interiors are for use only with copper conductors unless marked to indicate which terminals are suitable for use with aluminum conductors. Such a marking is independent of any marking on terminal connectors and is on a wiring diagram or other readily visible location.

A switchboard requiring access to field wiring terminals from the rear is marked on the front “Rear access required to make field connections.” The marking may be omitted if this statement is included in the conduit location instructions.

A wire terminal intended to secure more than one conductor in an opening is marked to indicate the number of conductors the terminal can accommodate. The marking is on the wire connector if visible, or in another visible location such as next to the terminal or on a wiring diagram.

If a pressure terminal connector provided in the switchboard section or interior for a field installed conductor requires the use of a special tool for securing the conductor, any necessary instructions for using the tool are provided. The instructions are located where readily visible, such as on the connector, on a wiring diagram, on a tag secured to the connector, or packaged with the terminal assembly kit.

If pressure terminal connectors are not provided on the equipment as shipped, the equipment is marked stating which pressure terminal connector or component terminal assemblies are for use with the equipment.

The terminal assembly packages have an identifying marking, wire size, and manufacturer’s name, trademark or other descriptive marking by which the organization responsible for the product may be identified. The marking also includes the required tightening torque unless the value of tightening torque is included along with the switchboard markings.

Tightening Torque

A switchboard section or interior is marked to indicate the specific tightening torque in pound inches or pound-feet for each pressure wire connector (except those requiring a special crimping tool) in the switchboard that is intended for field wiring. If different connectors are used for line, load, neutral or ground, the specific torques that are to be applied to each connector are clearly indicated. A calibrated torque wrench should be used to torque the wire connector to the specified value. Under-torquing or over-torquing may produce overheating and/or cause damage to the conductor. The torque marking may be provided in a written format or pictorially. See Table 8.1 for an example of a tightening torque marking.

The value of tightening torque for a field wiring terminal provided on a component such as a circuit breaker, switch or the like need not be marked on the switchboard section or interior.

A switchboard is marked in a location readily visible prior to being wired to indicate the required temperature rating of each field-installed conductor. This marking takes precedence over any device or component marking.

TABLE 8.1 EXAMPLE OF TIGHTENING TORQUE MARKING TIGHTENING TORQUE FOR WIRE CONNECTORS

Main Terminals		275 pound-inches (31.1 N • m)
Neutral Terminals	Main	275 pound-inches
	Large Branch	Torque screw to applicable value shown in Column B of the table for the conductor size installed.
	Small Branch	Torque screw to applicable value shown in Column A of the table for the conductor size installed.
Equipment Grounding Terminals	Large Hole	For three No. 10 AWG solid copper conductors, torque screw to 45 pound inches (5.1 N•m). For all other wire combinations, torque screw to value shown in Column B of the table for the conductor size installed.
	Small Hole	Torque screw to applicable value shown in Column A of the table for the conductor size installed.
Field-Installed Devices		Torque screw to value indicated on (or with) the device.

TIGHTENING TORQUE TABLE

Wire Size Installed in Connector		Tightening Torque			
		A		B	
AWG	(mm) ²	lb./in.	(N • m)	lb./in.	(N • m)
18–10	0.82–5.3	20	2.3	35	4.0
8	8.4	25	2.8	40	4.5
6–4	18.3–21.2	35	4.0	45	5.1
3	26.7	35	4.0	50	5.7
2	33.6	40	4.5	50	5.7
1–2/0	42.4–67.4	—	—	50	5.7

Conductor Temperature Ratings

A switchboard rated 110 amperes or less, or having any circuits for field wiring rated 110 amperes or less, is marked to indicate use of conductors sized for 60°C (140°F) ampacity for circuits rated 110 amperes or less, and conductors sized for 75°C (167°F) ampacity for circuits rated more than 110 amperes as specified in Table 310.15(B)(16) of the *National Electrical Code*®. The marking may specify conductors sized for 75°C ampacity for circuits rated 110 amperes or less if any circuit breaker involved is marked 75°C or 60/75°C.

If the circuit breaker is to be installed in the field, the switchboard marking indicates that the circuit breaker is to be marked either 60/75°C (140/167°F) or 75°C (167°F) if conductors sized for 75°C ampacity are to be used.

A marking is provided near a terminal, such as “Use AWG 90°C (194°F) copper wire,” to indicate that 90°C (194°F) copper wire is to be used. UL determines the size of the conductor on the basis of 75°C (167°F) ampacity.

9. BRACING

If bracing is required to prevent the conductors from pulling out of the wire terminals under fault conditions, a marking is provided indicating the type of bracing to be added to conductors routed through the switchboard between the point of entry or exit and the terminals. The marking is located adjacent to the terminals.

An example of a marking that satisfies this requirement is: “Wrap line cables together with minimal 3/8-inch nylon rope or rope having a minimum tensile strength of 2,000 pounds at (1) 6 inches and 12 inches from the line terminals with five wraps and (2) every additional 6 inches with five wraps or every 1 inch with one wrap.” The drawing in Figure 9.1 may also be provided.

FIGURE 9.1
SECUREMENT OF CABLE

10. SYSTEM COORDINATION

NEC® Section 240.12 concerns electrical system coordination. UL does not evaluate switchboards to determine compliance with the *NEC*® Section 240.12, since it is not possible to determine upstream and downstream system overcurrent devices that have been selected. It is the responsibility of the system design engineer to specify overcurrent devices for system

coordination.

11. VOLTAGE DROP

NEC® Sections 210.19(A)(1) and 215.2(A)(3) concern voltage drop. UL does not evaluate switchboards to determine compliance with voltage drop considerations. It is the responsibility of the design engineer to address any voltage drop considerations in a switchboard system, as needed.

12. CONDUIT ENTRY

Unless indicated otherwise (as noted below), UL evaluates switchboards to determine compliance for the clearance of conductors and conduit entering into the bottom of a switchboard, per *NEC*® Section 408.5. Acceptability of other conduit entry/exit points can only be determined at the time of final installation.

In order to correlate with *NEC*® Section 408.5, if the minimum distance between the bottom of the enclosure and any bus bars is less than:

- A. 8 inches for insulated bus bars, their supports and other obstructions, or
- B. 10 inches for uninsulated bus bars,

then instructions and drawings showing the intended conduit or raceway locations are (1) supplied with the switchboard section or enclosure or (2) contained in the manufacturer's catalog (identified by the catalog number or other designation that appears on the switchboard).

13. ENCLOSURE TYPES

A switchboard section or enclosure is provided with a marking that is visible after installation that indicates the enclosure type designation(s). This marking helps inspection authorities to judge whether an enclosure is suitable for a specific environment as mentioned in *NEC* Section 110.3(A)(1). Enclosure type designations are coordinated with requirements in *NEC* Section 110.28.

14. MULTIPLE SOURCES

A switchboard intended to be connected to multiple sources shall be marked to indicate that both ends of a disconnecting means may be energized. The marking shall be provided on all covers that give access to the disconnecting means.

15. BARRIERS

In a switchboard section or interior marked as being suitable for uses as service equipment, any uninsulated ungrounded bus bar or terminal on the line side of a service disconnect is isolated by a barrier so that with every service disconnect in the off position, no uninsulated live part is exposed to inadvertent contact while servicing any load terminal, including a neutral load terminal, a branch circuit equipment grounding terminal or the neutral disconnect link. The barrier may contain ventilating openings.

16. FIELD INSTALLATION OF DEVICES

The UL Mark applies to the switchboard as it is originally manufactured when shipped from the factory. Authorized use of the UL Mark is the manufacturer's declaration that the switchboard was originally manufactured in accordance with the applicable requirements. UL does not know what the effect of a modification may have on the safety of the switchboard or the continued validity of the UL certification mark unless the field modification(s) have been specifically investigated by UL. Unless UL investigates a modified switchboard, UL cannot indicate that the switchboard continues to meet UL's safety requirements.

The only exception for a field modification authorized by UL is when the switchboard has specific markings regarding field-installation of equipment. A switchboard enclosure or section intended to accommodate a field installed device is marked to indicate the manufacturer and the catalog number or equivalent of the device to be installed.

Additions to switchboards not marked for the field installation of such devices can be investigated under UL's Field Evaluation Service or Field Inspection Service.

Marking and Application Guide

ELECTRICAL HEATING AND COOLING EQUIPMENT

JANUARY 2013

Electrical Heating and Cooling
Equipment Marking and Application Guide

PREFACE

Because of changes in installation codes, the increasing complexity of the equipment involved, and other factors, more and more markings are being used on electrical heating and cooling equipment.

The markings described in UL 1995, the “*Standard of Safety for Heating and Cooling Equipment*”, and UL 1996, the “*Standard of Safety for Electric Duct Heaters*”, are required on the various types of electrical heating and cooling equipment for proper and safe installations. Markings that apply only to servicing and operating the equipment, or markings placed on the equipment by the manufacturer that are not required by UL, are not covered in the Guide.

The adequacy of the markings described is determined as part of the investigation of equipment bearing the UL Listing Mark.

UL has developed this guide for use by code and inspection authorities, contractors, installers, users, designers and other interested parties to aid in determining what markings are pertinent for safe and proper installation of electrical heating and cooling equipment, and to understand the significance of these markings in order to facilitate a reasonably safe and code-compliant installation.

UL Marking Guides are updated as necessary due to new product development, changes in the National Electrical Code®, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web Site at www.ul.com/codeauthorities.

The Table of Contents lists the main headings and their page numbers. The Index gives an alphabetical list of the specific items and the section(s) number where information can be found. All references to the National Electrical Code® have been updated to the 2011 edition.

Your comments or suggestions are welcome and appreciated. They should be sent to:

Appendix A – UL Heating and Cooling Equipment Product Categories 28

Appendix B – Heating and Cooling Equipment Codes and Standards 29

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers in determining the suitability of electric heating and cooling equipment in a particular installation and use, and to address concerns related to fire, shock, and mechanical hazards.

Products are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation. A list of heating and cooling equipment product categories evaluated by UL, along with the applicable standard(s), can be found in Appendix A.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product.

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

The numbering for code sections used in this document may change as the specific code is updated. A list of model codes and standards applicable for each product can be found in Appendix B.

Additional information can be found at www.ul.com.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of heating and cooling equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified.”

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on heating and cooling equipment. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL's *safety* requirements. These requirements are primarily based on UL's own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word "Listed," the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word "Classified," a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

UL Gas-Fired Mark

UL's Gas-Fired Mark is used exclusively on gas-fired appliances and equipment. The Gas-Fired Mark indicates a product's compliance to nationally recognized gas standards, including UL, ANSI Z21/Z83 Series and CSA/CGA standards. The UL Gas-Fired Mark signifies that a product has been evaluated to reasonably foreseeable hazards including both gas and electrical hazards. Gas-fired equipment evaluated to Canadian national standards is authorized to display the Canadian Gas-Fired Mark. For gas-fired equipment evaluated to both U.S. and Canadian standards, the combination U.S. and Canadian Gas-Fired Mark is authorized.

GAS-FIRED

UL Energy Mark

The UL Energy Mark appears on air conditioners and furnaces, and similar products evaluated to U.S. and Canadian energy efficiency standards. These products are already certified for safety by UL before earning the UL Energy Mark.

FIELD EVALUATIONS

You may encounter situations in which you are unable to determine if a product has been listed by a third-party organization. Or in other situations you might encounter a product bearing a listing label that may have been modified in the field, and now you question whether or not the product still complies with the applicable standard. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors, and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL's Web site at www.ul.com/field.

1. GENERAL INFORMATION

UL Standards for electrical heating and cooling equipment include requirements for the location, legibility and permanence of the markings described in this Guide. These requirements vary depending on the importance of the marking, environmental and use conditions, and a number of other factors. UL evaluates the reliability of an adhesive used to secure a marking. UL requires markings to be located where they will be visible after the equipment is installed; and affixed to a permanent unit part, or to a part that requires the use of a tool to remove and that must be in place for the unit to operate properly except for certain supplementary markings.

Normally, nameplate markings must be located where they can be read without using tools to partially disassemble the unit. Access to the nameplate of a unit designed for built-in installation may require removal of a panel or grill that gives access to the field wiring compartment.

2. LISTING MARKS

Section 110.3(A)(1) of the *National Electrical Code®(NEC®)* states that “suitability of equipment may be evidenced by listing or labeling.” Only units that bear a UL Listing Mark are UL Listed. For electrical heating and cooling equipment, the UL Mark that is required on the unit includes: the name and/or symbol of Underwriters Laboratories; the word “LISTED;” a UL control number; and the product or category name. Some Listed Heating and Cooling Equipment may contain a Listed Gas Heating Section. This will be identified on the unit by the UL *Gas-fired Listing* Mark that is provided either on the Listed heating and cooling equipment or on a Listed gas-fired heating section or portion of a Listed Unit.

3. COMPANY IDENTIFICATION

If there is a question on the design or construction of a unit, the identification of the organization responsible for the product is important. This is one of the basic markings required by *NEC®* Section 110.21.

UL requires that the responsible manufacturer or private labeler be identified on the unit nameplate by a company name, trade name or trademark. This company is also known as the “Listee” and is the name that appears in UL’s published Directories. UL provides an Index of Tradenames and Trademarks in the Online Certifications Directory at www.ul.com/database .

4. MODEL IDENTIFICATION

The nameplate of every unit bearing a UL Listing Mark is required to include a distinctive model identification. This may be a “Model No.,” “Type,” “Cat. No.,” “Part No.,” or similar identification,

and may consist of any combination of numbers and letters. The model designation is important when referencing the manufacturer's installation instructions or other published literature, and when contacting the manufacturer or UL with questions about the product. The model designation is also important for determining the acceptable use of "split-system" sections, or accessories (see "Split-Systems" and "Use of Accessories").

5. SPLIT-SYSTEMS

Many central cooling air conditioners and heat pumps are Listed as "split-systems." Such Listings are given to equipment for which two or more sections of the system have been evaluated together. Sections of systems are typically identified on the Listing Mark as "Section of Central Cooling Air Conditioner" or "Section of Heat Pump," but may be identified as another type of Listed product such as a "Fan Coil Unit" or an "Electrical Central Heating Furnace." These Listed combinations are identified in the UL *Electrical Appliance and Utilization Equipment Directory*. It is important to note that combinations of equipment not identified in UL's published Listings have not been evaluated by UL.

6. USE OF ACCESSORIES

UL evaluates accessories to determine their suitability for field installation and use with specific models of UL Listed equipment. Listed accessories bear a Listing Mark that includes the word "accessory" in the product or category name (see "Listing Marks"). The Listing Mark may indicate the specific equipment type with which the accessory is to be used (such as "Accessory for Heat Pump"). If the Listing Mark indicates "Air Conditioning Equipment Accessory," it is commonly designed for use on more than one type of heating or cooling equipment. In all cases, however, the accessory is Listed only for equipment marked (on wiring diagram, etc.) to indicate the permitted use of the specific accessory. Many Listed units are marked for use with more than one accessory. In some cases, the marking will indicate that if one accessory is used, another must be used in conjunction.

One common marking for accessories relates to the use of supplementary electric resistance heaters. Typically, such a marking will indicate the optional use of any one of a series of heater accessories. It will usually also specify some action to be taken by the installer to indicate which heater has been installed or that no heater has been installed. Failure of the installer to perform the specified action can be considered as noncompliance with *NEC*® Section 110.3(B). For example, the marking may state, "Any of the following heater accessories may be installed. Installer to check appropriate block" followed by a list of accessory model numbers and associated electrical ratings, including a line stating "none." To comply with *NEC*® Section 110.3(B), the installer must mark the appropriate block. The accuracy of this installer marking can be verified by examining the markings on the accessory.

For some accessory types, such as a compressor "hard start" kit, the intended mounting location within the unit may not be obvious. In such cases, the unit marking is required to indicate the intended mounting location.

A unit Listed for use with accessories requiring wiring connections to the unit will show these connections on an attached wiring diagram (see "Wiring Diagram").

7. EXTERNAL LOADS OR LINE VOLTAGE SWITCHING DEVICES

A unit that provides a means for connecting an external load, such as a cooling tower, an evaporator blower motor, or a blower motor that circulates air across duct heaters, is marked to specify the maximum rating of each such load. These markings may also specify the minimum wire sizes to be used. Minimum wire size markings are required when the load is a motor connected to a multimotor or combination load circuit and the wire size normally adequate for carrying the load current would not be protected properly by an overcurrent device for the circuit.

A unit with a means of connecting a switching device in other than a Class 2 control circuit is marked with the minimum required ratings for each such device.

These markings are located in the unit where field wiring is to be connected to the remote load or switching device, or on the wiring diagram attached to the unit (see “Wiring Diagram”).

8. SUPPLEMENTARY OVERCURRENT PROTECTION

NEC® Section 424.22(C) permits supplementary overcurrent protective devices required for subdivided loads of resistance type heating elements in electric space heating equipment to be supplied as a separate assembly by the heater manufacturer. All units that require this supplementary overcurrent protection, but do not have the protective devices factory installed, are marked to identify the separate assembly available from the unit manufacturer. This information is marked on or adjacent to the nameplate containing the electrical ratings of the heating elements. The assembly has a separate UL Listing, and the common identification on its Listing Mark is “Control Panel for Specific Electric Space Heating Equipment.”

Other specific Listed separate assemblies such as a panelboard, however, may be referenced by the marking on the heating unit. In any case, the proper use of the separate assembly identified on the unit will provide compliance with *NEC*® Sections 424.22(B) and (C).

9. ELECTRICAL RATING, GENERAL

The nameplate for each Listed unit includes the appropriate electrical ratings. These ratings identify the required characteristics of each electrical circuit to be connected to the unit and also the load characteristics that the unit will impose on each circuit.

For a unit with a single motor as its only energy consuming component, the motor nameplate may provide the required electrical ratings if all ratings on the motor nameplate apply to its use in the unit, and the motor nameplate is visible as installed. If motor ratings are shown on the unit nameplate, they take precedence over the ratings on the motor nameplate.

10. VOLTAGE RATING

All equipment requiring connection to an electrical supply source is required to include the voltage rating of each source on the unit nameplate. The rating includes the voltage as either a single nominal value such as “230 V” or as a voltage range such as “220—240V.” Standard voltage ranges are 110—120, 200—208, 220—240, 254—277, 440—480 and 550—600. Units marked with a single nominal value within one of these voltage ranges can be connected properly to any

voltage within the indicated range, but not to a different voltage. For example, a unit marked “230 volts” can be connected properly to a 240-volt supply source, but not to a 208-volt supply source.

Some equipment is marked for use on more than one voltage. Individual voltage ratings may be a single value or a range of values as indicated above, with each of the multiple ratings separated from the others by a slash (e.g., “208/240” or “220—240/440—480”) or by a separate line or column in a tabulation of ratings.

When inductive loads are involved, it is usually necessary to change some connections to make the equipment suitable for one of the voltage ratings. Instructions for these changes are usually indicated on the wiring diagram attached to the unit and typically involve at least a change in a control circuit transformer tap within the equipment.

If the inductive load is a motor, the instructions may appear on the motor itself, with a marking to indicate the voltage for which it is factory connected and how to reconnect it for another voltage.

Many motors and other components with dual voltage ratings, however, are used in equipment that is UL Listed for a single voltage only. When a unit is UL Listed for more than one voltage, this is indicated on the unit nameplate.

Some equipment showing two voltage ratings may be designated to have both voltages supplied from the same supply circuit. In such cases, the rating indicates the number of wires needed in the supply circuit (e.g., “120/240 V, 3W” or “120/240 V, 3ph, 4W”) or the number of wires will be indicated clearly on the wiring diagram attached to the unit.

Some equipment designed for connection to a 2-wire branch circuit nominally rated at 208 or 240 volts, may not be suitable for potentials exceeding 120 volts to ground. Such equipment is marked “Maximum Voltage to Ground 120” (or the equivalent) near the supply voltage rating.

11. FREQUENCY RATING

Some form of frequency rating is required with each marked voltage rating. This may be identified as “Cycles,” “Cycles per Second,” “Hertz” or an appropriate abbreviation. A unit or unit circuit for connection to direct current will be marked to indicate this suitability.

12. ELECTRICAL LOAD RATINGS

The unit nameplate indicates the electrical load on each supply circuit, other than a Class 2 control circuit, to which the unit is intended to be connected. These load ratings include any remote loads or accessories identified by markings on the unit (see “Remote Loads” and “Use of Accessories”). In general, the individual segments of this load rating are appropriately identified. Rather than individual ratings for each load segment, a single overall rating may be given:

- 1) When a unit does not include any motors rated at 1/8 horsepower or more; or
- 2) When a unit rated for single-phase alternating current includes a hermetic refrigerant motor-compressor and other loads, and its markings indicate a minimum circuit ampacity and maximum size of the overcurrent device of 15 amperes at 240 volts or less, or 20 amperes at 120 volts (see

“Minimum Circuit Ampacity” and “Branch-Circuit, Short-Circuit and Ground-Fault Protection”).

For some units intended to be connected to two or more supply circuits, it may be necessary to consult the unit wiring diagram to determine which loads are connected to each circuit (see “Wiring Diagram”).

The load rating may be expressed in watts or kilowatts for resistance loads such as electric heaters and motors rated less than 1/8 horsepower. All other load ratings are expressed in amperes.

For hermetic refrigerant motor-compressors, the required individual segment rating is always given in rated-load amperes (RLA). Locked-rotor amperes (LRA) are also included but may be omitted for single-phase compressors with an RLA rating of 9 amperes or less at 115 volts, or 4.5 amperes or less at 230 volts.

Air conditioning liquid chillers with “star-delta” start centrifugal motor-compressors and not factory equipped with a controller or overload protection for that motor are marked with LRA ratings for both the star and delta connections (see “Remote Overload Protection for Motors”).

For all other motors, the required individual segment rating is expressed in amperes, full-load amperes, or an appropriate abbreviation. A locked-rotor current rating is not required.

A pilot duty (electromagnetic) load, or a resistance load of less than 1 ampere need not be identified separately on the unit nameplate. Also, a load such as a crankcase heater need not be identified separately if it is not energized concurrently with an identified larger load, such as a compressor motor. The unit nameplate ratings for motor loads may differ from the ratings on the motor nameplates. Unit nameplate ratings should be used for properly sizing the supply conductors, disconnect means, etc., since these ratings reflect the actual loads that will be imposed by operation of the motor in the unit.

Units with dual voltage ratings may also show dual-load ratings or a single-load rating representing the highest load imposed at either voltage. Dual-load ratings can be shown in tabular form or separated by a slash. For example, a motor rating of “120/240 V, 6.4/ 3.2 A” indicates the motor is rated 6.4 amperes at 120 volts and 3.2 amperes at 240 volts.

13. MOTOR HORSEPOWER RATINGS

In equipment where the selection of a properly rated remote controller or disconnect means is dependent on the horsepower rating of a motor, the horsepower rating is required to be included in the unit nameplate (see “Electrical Rating, General”). It is not necessary that a horsepower rating be included on the unit nameplate for a hermetic refrigerant motor-compressor.

If the nameplate is marked with the disconnect size the horsepower is not required to be marked for the other motors.

A fan or blower motor rated at less than 1/8 horsepower when its ampere or wattage rating is included on the unit nameplate

14. BRANCH-CIRCUIT SELECTION CURRENT

The nameplate on a unit that includes a hermetic refrigerant motor-compressor may show branch-circuit selection current for the motor-compressor in accordance with *NEC*® Section 440.4(C). This rating may be identified by a suitable abbreviation and will always be equal to or higher than the motor-compressor RLA rating marked on the unit nameplate. The branch-circuit selection current rating for the motor-compressor is to be used instead of the rated-load amperes in determining appropriate ratings for externally mounted controllers and disconnecting means, branch-circuit conductors, and short-circuit and ground-fault protective devices for these conductors. A branch-circuit selection current rating is always included on the unit nameplate if the motor-compressor's thermal protector or the protective system built into the unit permits a continuous current flow greater than 156 percent of the rated-load current for the motor-compressor, or the single overall ampere rating for the unit marked on the unit nameplate (see "Electrical Load Ratings").

15. SUPPLY WIRE SIZE

According to *NEC*® Section 424.3(B), the ampacity of branch-circuit conductors supplying fixed electric space heating equipment consisting of resistance elements with or without a motor shall be not less than 125 percent of the total load connected to the circuit. Units incorporating fixed electric space heating means on the same circuit with a motor usually show the minimum required ampacity for the conductors supplying that circuit (see "Minimum Circuit Ampacity"). If a circuit supplying fixed electric space heater does not include a motor, the unit marking needs not to show a minimum circuit ampacity. The above noted *NEC*® requirement ordinarily applies to the proper sizing of the supply conductors for such a circuit.

NEC® Sections 424.22(D) and (E) indicate exceptions to the requirement for sizing such conductors based on 125 percent of the load. Units with fixed electric space heating loads arranged in accordance with these exceptions are marked with a minimum conductor size for each such circuit involved. Such markings are located on or adjacent to the unit nameplate. For other markings that specify minimum conductor size, see "Temperature Ratings of Field Installed Wiring" and "External Loads for High Voltage Switching Devices."

16. MINIMUM CIRCUIT AMPACITY

In general, a unit designed to have more than one motor, or a motor with other loads, supplied from a single branch-circuit, must be marked to show the minimum required supply-circuit conductor ampacity for each circuit. There are two exceptions:

- 1) If the branch-circuit involved is to be rated 15 amperes, and the unit is marked "Use Only on a 15 Ampere Branch-Circuit;" and
- 2) If the unit is to be supplied through a remote control assembly specified on the unit nameplate, and the minimum ampacities are specified on that assembly.

These ampacity markings are in accordance with *NEC*® Section 430.7(D) and 440.4(B) and are computed in accordance with Section 430.24 and 440.33. Any remote loads identified by other markings on the equipment and supplied from the unit are included in these computations. The

marking is on or adjacent to the unit nameplate and is usually identified as “Minimum Circuit Ampacity” or its abbreviation.

17. BRANCH-CIRCUIT, SHORT-CIRCUIT AND GROUND-FAULT PROTECTION

Units required to be marked with a minimum circuit ampacity (see “Minimum Circuit Ampacity”) are also required to show the maximum ampere rating of the short-circuit and ground-fault protective device for each applicable circuit. These markings also conform with *NEC*® Section 430.7(D). They are computed in accordance with Section 430.53 and take into account any remote loads used in the ampacity calculations. The branch-circuit, short-circuit and ground-fault protection marking is included on the same label as the ampacity marking and is typically identified as “Maximum Fuse Amps,” “Maximum Fuse or HACR Type Circuit Breaker Amps,” “Maximum Fuse or Circuit Breakers Amps,” “Maximum Overcurrent Protection Amps” or their suitable abbreviations.

There are several other situations when the maximum ampere rating of the short-circuit and ground-fault protective device must be marked on the unit, even though a marking for minimum circuit ampacity may not be required. Typical examples are overcurrent protection devices for separate high voltage control circuits or transformers in the unit. These markings are identified in the same manner as described above, but can be located on an attached wiring diagram (see “Wiring Diagram”) or adjacent to the terminals or leads to which the supply circuit wires are to be connected, rather than on or adjacent to the unit nameplate.

The markings for short-circuit and ground-fault protection always include some indication of the type of protection device as well as the maximum current rating. This is significant since the various types of devices recognized by the *NEC*® to provide this protection do not necessarily provide the same level of protection for all units. Briefly, if the marking indicates:

- 1) Only “Fuse,” then only fuses are to be used;
- 2) “Circuit Breaker” and “Fuse,” then either fuses or circuit breakers
- 3) “Fuse or Circuit Breaker” or “Overcurrent Protection,” then fuses or any type of circuit breaker (including “HACR Type”) may be used.

In any case, the devices used should be covered by the *NEC*® to provide short-circuit and ground-fault protection.

The maximum rating and type of protective device specified in the marking described above are those considered in the evaluation of the unit for Listing, and are intended to apply to the protective devices installed on the line side of the supply circuit conductors, not to protective devices factory installed in the unit.

18. BRANCH-CIRCUIT RATING

NEC® Section 424.3(A) indicates that branch circuits supplying two or more outlets for fixed electric space heating equipment shall be rated 15, 20, 25 or 30 amperes. Although this is rarely applicable to the type of equipment covered in this Guide, some units rated 16 amperes or less may not be suitable for connection to 20- or 30-ampere branch-circuits. Such units show the

maximum rating of the branch-circuit to which they are to be connected. This marking will be on or adjacent to the unit nameplate, or near the area where supply wires are to be connected.

19. INTEGRAL OVERLOAD PROTECTION FOR MOTORS

Most electrical heating and cooling equipment includes appropriate overload protection for each motor in accordance with Part C of *NEC*® Article 430. In many cases, the unit or the individual motor is marked to indicate that this protection is provided. Even if there are no such markings, it can be assumed that adequate protection is provided for each motor unless the unit markings indicate the need for remote devices to provide such protection (see “Remote Overload Protection for Motors”).

A unit with a thermally protected hermetic refrigerant motor-compressor always includes a marking in accordance with *NEC*® Section 440.4(A) to indicate the type of thermal overload protection provided for each motor-compressor. A unit that uses thermal protection complying with *NEC*® Sections 440.52(A)(2) and (B)(2) is marked “Motor-Compressor Thermally Protected,” or an equivalent statement to reference the motor-compressor(s) involved, unless the motor-compressor itself is marked “Thermally Protected.” When protection is provided by an integral protective system in a unit, complying with *NEC*® Sections 440.52(A)(4) and (B)(4), the unit is marked “Motor-Compressor Thermally Protected System,” or an equivalent statement to reference the motor-compressor(s) involved.

A unit that includes a 3-phase motor and overload protection for that motor other than an overcurrent unit in each motor supply conductor will provide adequate primary single-phase failure protection when supplied by transformers connected wye-delta or delta-wye. Such a unit is marked to indicate that the motor is protected under primary single-phasing conditions.

20. REMOTE OVERLOAD PROTECTION FOR MOTORS

Some units evaluated to determine the adequacy of specific motor controllers (starters) to provide motor overload protection may be shipped from the factory without the controller installed. For these units, UL requires that the manufacturer provide the proper controller for remote mounting, and the unit must be marked to identify this controller. The marking includes the controller manufacturer’s name, the model designation and the rating of the overcurrent (heater) element to be used in the overload relay of the controller. This marking is located either where field wiring connections to the controller are to be made, or on the wiring diagram attached to the unit (see “Wiring Diagram”).

Some units that contain a continuous-duty single-speed blower motor rated over 1 horsepower as the only load on a supply circuit need not include overload protection for that motor when:

- 1) The motor is located where it will not be adversely affected by high ambient air temperatures during normal use of the unit; and,
- 2) Energization of any electric space heaters in the unit cannot occur without the blower operating.

These units are marked to indicate the need for providing a remote controller with overload protection devices rated or selected for compliance with the installation codes specified by the jurisdictional authority.

Most air conditioning liquid chillers that use a centrifugal motor-compressor are not factory equipped with a controller or overload protection for that motor. In this case, the unit nameplate will indicate that these components are not provided and designate the manufacturer's specifications for the components to be installed remotely. The specifications include the electrical rating of the required controller, the start sequencing, the overload protection trip current and the connections to the chiller electrical control system. If a current transformer is to be provided as part of the controller to provide a signal input circuit to the chiller control system, the specifications will also include requirements for the current transformer and any necessary shunting resistor.

21. CONNECTION TO NONMETALLIC ENCLOSED WIRING

Most UL Listed equipment is provided with knockouts or openings designed to accommodate properly sized conduit fittings for any of the appropriate types of wiring systems covered by the *NEC*®. Some units, however, are designed only for connection to a system other than metal-clad cable or conduit. These units are marked to indicate the appropriate type of system or systems to be used. This marking will be visible when power supply connections are being made.

22. EQUIPMENT GROUNDING CONNECTION

Except as indicated below, every unit is required to have a means for connecting the equipment grounding conductor for each circuit, other than a Class 2 control circuit, to which the unit is to be connected. If a wire binding screw is provided for this purpose, it will have a green colored head. A pigtail lead for this purpose will be green and may have yellow stripes. A pressure type wire connector will be marked "G," "Gr," "Ground," "Grounding," or the equivalent, on or near the connector, or will be identified on the unit wiring diagram. The grounding terminal may be

identified by the symbol "⊕".

A unit that requires connection to a circuit with power supply conductors larger than No. 2 AWG does not have to be provided with means for connecting an equipment grounding conductor for that circuit. Such a unit may be grounded by an appropriate metallic raceway, but it will be marked "If This Unit Is Supplied By A Wiring System That, In Accordance With The National Electrical Code, Requires The Installation Of An Equipment Grounding Conductor Or Conductors, A Terminal Or Terminals For Connection Thereof Must Be Installed," or an equivalent statement.

23. FACTORY-PROVIDED WIRE CONNECTORS

Some units have pigtail leads for connection to supply or control circuit wiring when the unit is installed. To help provide a reliable splice, these leads are ordinarily no more than two wire sizes smaller than the minimum size copper conductor required by the *NEC*® for the external circuit. When two or more pigtail leads are to be connected to the same external circuit conductor, each pigtail may be more than two wire sizes smaller, if a suitable reusable wire connector, such as a twist-on wire connector, is factory-provided on the pigtails. If so, the unit is marked to indicate that the provided connector is to be used for field wiring splice connection.

Some units equipped with pigtail leads for splice connections to an external line voltage circuit have reusable wire connectors on these leads that may not be suitable for splicing to properly sized external circuit wiring. These wire connectors may be used, for example, to insulate lead ends, not necessarily used in every installation. Such units are marked to indicate that these wire connectors are not for field wiring connections.

Either type of marking described above will be located in the field wiring area where plainly visible during installation and inspection.

24. COPPER OR ALUMINUM WIRING

Units provided with terminals for field-connected wiring are marked to indicate the use of copper conductors only or whether aluminum and/or copper clad aluminum conductors may also be used. This marking is independent of any marking on the terminals and visible during unit installation and inspection after unit installation. Such a marking is typically located on a surface adjacent to the terminals or included on the attached unit wiring diagram. The conductor material(s) specified by the marking applies to the wires connected to the unit itself. Other conductor materials, however, may be used elsewhere in the circuits supplying the unit, provided that proper consideration is given to ampacities, splicing methods, etc.

25. TEMPERATURE RATING OF FIELD INSTALLED WIRING

For some equipment, the testing and construction are based on the use of wiring with 75°C insulation. However, most equipment, where ampacities of 100 or less are involved, is marked for use with 75°C rated conductors at 75°C ampacities. The use of wiring with 75°C insulation is necessary when conductor ampacities higher than 100 are required. When the use of wiring with insulation rated higher than 75°C (or 75°C) is required because of terminal or wiring compartment temperatures, the equipment must be marked to specify the minimum temperature rating (90°C) and the minimum conductor size of the wires unless the conductor size is to be based on the 75°C wire ampacity. Such markings are located adjacent to the field-wiring connection point or on an attached wiring diagram and are visible while making the connections and after they have been made. Some equipment is marked to indicate an area for locating field wiring and splices to prevent excessive insulation temperatures.

26. WIRING DIAGRAM

Most units have an attached wiring diagram. Such a diagram is required on a UL Listed unit when the method of connection to the electrical supply is not obvious, or if it is necessary to electrically connect an accessory or other remote load to the unit. Also, such a diagram is always required on a duct heater and includes the proper external connections for interlocking with the blower motor to insure compliance with *NEC*® Section 424.63. Many of the other markings concerning proper field-wiring connections described elsewhere in this Guide may be included in this wiring diagram.

27. CONNECTION TO LOW VOLTAGE SUPPLY SOURCE

Some units require an external supply source for low -voltage control circuits. The required voltage rating of this source (typically 24 volts) will be identified on the unit wiring diagram (see “Wiring Diagram”) or by a marking adjacent to the terminals or leads to which the supply wires

are to be connected. The minimum necessary capacity rating of the supply transformer will also be included in this marking unless it is less than 5 volt amperes. If the supply is required to be a limited energy type because of wiring or loads within the unit, the marking will also indicate this (e.g., “Class 2,” etc.).

28. EXTERNAL DEVICES AND/OR WIRING IN LOW VOLTAGE CIRCUITS

Many units are intended for connecting external low-voltage control circuit switching devices and wiring. If the power supply for such a circuit is part of the unit and the unit is marked Class 2 the circuit is a Class 2 control circuit per *NEC*® Article 725 and may be wired accordingly. If external to the unit, the type of supply source will determine the external wiring and components to be used as explained in Section 27.

If the type of unit transformer, the function of the control circuit, or other items require that the circuit be treated as a Class 1 control circuit, the unit will be marked “Wire Per NEC Class 1” or the equivalent. This marking is located on the attached wiring diagram (see “Wiring Diagram”) or in the immediate vicinity of the terminals or leads provided for connection to the control circuit.

29. MULTIPLE CLASS 2 SUPPLIES

A unit with a built-in transformer that provides a Class 2 control circuit supply for connection to a heating/ cooling thermostat or an equivalent device will be marked to indicate that isolation shall be maintained between this circuit external to the unit and separate external Class 2 output circuits. This marking may be a part of the wiring diagram (see “Wiring Diagram”) that shows the proper wiring connections necessary to maintain this separation, or it may be a statement such as “Use Thermostat With Isolating Contacts To Prevent Interconnection Of Class 2 Outputs.” The statement may be located in the immediate area of the unit’s field-wiring Class 2 circuit connections, or on the unit wiring diagram.

A unit that contains two or more built-in transformers to supply separate external Class 2 control circuits is marked similarly to warn that separation must be maintained between these circuits external to the unit.

Failure to heed these markings can result in control circuits exceeding the limitations for Class 2 control circuits as defined in *NEC*® Article 725.

30. INSTALLATION CLEARANCES

Many types of units require clearances between the cabinet and attached duct work, and combustible materials. These clearances are required to be marked on the unit nameplate. The required clearances are given in inches.

Except units that show “Duct Heater” as the product identity with the Listing Mark, all equipment with electric resistance space heaters is marked with the required clearance even if the “clearance” is zero.

Duct heaters need to be marked only with required clearances that are greater than zero. All duct heaters rated 50 kilowatts or less, however, are required to be suitable for zero clearance

installations.

Designated clearances other than zero are based on tests with uninsulated sheet metal ducts attached. Under these conditions, temperatures not higher than established maximum values have been measured on a wooden test enclosure, representing combustible construction, with the specified clearance (air) from the unit and ducts. When clearances are required between an attached outlet duct and combustible materials, the marking usually specifies the length of duct beyond the plenum or unit cabinet from which clearances must be maintained. If no distance is specified, the clearances need not be maintained from the portions of duct that are more than 6 feet from the plenum.

31. STATIC PRESSURE

The external static pressure imposed by the duct system attached to a unit can affect the unit air flow adversely. UL tests equipment at a high enough static pressure to take into account the effect of typically connected duct work; the minimum test static required is based on the rated heating and/or cooling capacity of the equipment. Tests on larger equipment require higher static pressures to account for the anticipated use of longer, more complex duct systems. Some units are marked to indicate the static pressure at which they were tested.

32. REFRIGERANT TYPE

Units employing a compressor with or without a refrigerant coil indicate the refrigerant to be used for field charging and the refrigerant used for any factory charge (see “Refrigerant Amount”). This designation is a number in accordance with ASHRAE Standard 34, or UL 2182, the Standard for Refrigerants, and is either prefixed or suffixed by the word “Refrigerant” or prefixed by the letter “R” or the trade name of the refrigerant. The use of a refrigerant type other than one designated in the marking is not covered by the UL Listing of the unit, except as noted in the section “Refrigerant Retrofit.” Units without a compressor need not be marked with the refrigerant type.

33. REFRIGERANT AMOUNT

The nameplate on a unit containing a refrigerant compressor is marked with information concerning the amount of refrigerant. For a self-contained unit with the full amount of refrigerant needed for proper operation of the system, the marking will state the factory refrigerant charge weight.

A unit requiring field charging that is a section of a complete system Listed by UL (see “Split-Systems”), or one that contains a complete refrigerant system is marked to show the correct refrigerant charge weight or how to determine the correct charge. The marking to show how to determine the correct charge may refer to other markings on the unit or to the installation instructions. In either case, the nameplate always includes a blank for the installer to mark the total system charge weight.

UL Listed units that do not contain the complete refrigerant systems and are not a section of a complete system Listed by UL, merely include a blank on the nameplate for the installer to mark the total system charge weight.

33A. REFRIGERANT RETROFIT

The information marked on the equipment nameplate relative to refrigerant type and amount of refrigerant is critical when equipment is to be evaluated using the installation requirements of ASHRAE 15, “Safety Code for Mechanical Refrigeration.” In these cases, the information in the ASHRAE standard, such as refrigerating system classification, table of allowable refrigerants and amounts, and system application requirements, is used to make calculations that ensure that the refrigerant type and amount are suitable for the application, the size of the room, the type of occupancy, etc.

In view of the national and international environmental protocol restrictions on the use of ozone-depleting chemicals and the increasing availability of alternative refrigerants, situations will arise in the field for which the equipment’s original refrigerant is retrofitted with another type of refrigerant. The amount of the new refrigerant may also change from the amount of original refrigerant used.

In some cases, the alternative refrigerant being retrofitted will not be included in the ASHRAE 15 standard. For the interim period, until such time as the ASHRAE standard can be revised, information (such as allowable amounts per cu. ft. of space) has been included in the UL Listing Report covering the equipment. This information may be obtained from the equipment manufacturer.

34. REFRIGERANT PRESSURE

A unit with refrigerant-containing components is marked to indicate the pressure for which the refrigerant system or any of its components were factory tested for leakage. Separate test pressures may be marked for the discharge (high) and suction (low) sides of the system. The pressure is identified as “Design Pressure” and appears on the unit nameplate.

These pressure markings are of little concern to installers or inspectors when the unit involved is one of the following:

- 1) A unit that is marked to indicate that it is factory charged (see “Refrigerant Amount”);
- 2) A unit serving as a section of a UL Listed system (see “Split-Systems”) charged with the correct refrigerant type and amount (see “Refrigerant Type” and “Refrigerant Amount”); and,
- 3) A unit containing a complete refrigerant system charged with the correct refrigerant type and amount.

For these types of units, the factory test pressure is adequate for the factory charge or the designated field charge.

For other types of units, the adequacy of the factory test pressure may need to be determined by measurements on the installed system.

A unit requiring connection to a remote condenser that is not part of a UL Listed system is also marked to specify the minimum design pressure of the remote condenser. To comply with this specification, the “Design Pressure” marked on the condenser should be at least as high as the minimum design pressure specified, and the condenser should be the type specified.

35. HEATING AND COOLING COILS

Equipment intended to employ water or steam as a heat exchange medium for the conditioned air is required to be marked with the fluid type(s) for which it has been evaluated. If a coil is for hot (or both hot and cold) water, the marking indicates the maximum permissible inlet water temperature. If the coil is for steam, or for water at a temperature exceeding 200°F, the marking indicates the maximum permissible pressure. If the coil is for cooling only, this information is marked. Such markings are generally located in the area where piping connections are made to the unit.

36. SUITABLE FOR OUTDOOR USE

A unit evaluated for outdoor installation is identified by a marking “Outdoor Use” or equivalent statement on or near the nameplate. These units are investigated for adequate corrosion protection and the ability of the enclosure to prevent accumulation of water, which could result in risk of electric shock or fire. Some equipment such as a through-the-wall unit, is marked to indicate that only a portion of the unit may be mounted outdoors. Equipment that is UL Listed for outdoor use is identified either by an appropriate footnote or by the designation of the Listed equipment (i.e., outdoor section) in UL’s published Listings. A unit not marked as indicated above is UL Listed for indoor installation only.

37. MOUNTING POSITION

The intended mounting position of most units is obvious from their construction and/or position of their unit markings. For some equipment, particularly duct heaters, the mounting position is not obvious. Most duct heaters are suitable for mounting in either horizontal or vertical ducts. All duct heaters and some similar types of equipment are required to be marked with their acceptable mounting positions (e.g., “This Side Up In Horizontal Duct,” “This Side Up In Vertical Duct,” etc.). Other equipment, such as indoor air handlers, are often investigated and UL Listed for mounting in several positions (e.g., upflow, downflow, horizontal).

For some types of equipment, including all units incorporating electric resistance space heaters, it is particularly important that the unit be oriented properly, as to which side is up when mounted in the horizontal position.

Note that a unit suitable for mounting in any one of several positions sometimes may be properly installed with the markings located sideways or upside down. If there is any question concerning the mounting position of a UL Listed unit, and there are no markings on the unit to indicate that it may be mounted in this position, consult the manufacturer’s installation instructions. UL reviews the instructions packaged with the unit as part of its investigation.

38. AIR FLOW DIRECTION

For some duct heaters, proper operation of the temperature limiting devices is dependent on the direction of air flow across the heating elements. Such units are marked with an arrow and appropriate wording to indicate the proper direction of air flow.

39. AIR VELOCITY

Proper operation of electric resistance space heaters is dependent on the quantity of air moving past the elements. The adequacy of the air moving means is determined as part of the investigation of all central electric space heating equipment Listed with specific fans or blowers. This pertains to units with both heaters and blowers factory installed and to units marked to indicate the use of field-installed heater accessories (see “Use of Accessories”).

Multispeed Blower Motors

Some units designed for field-installed heaters use a multispeed blower motor, and it may be necessary to adjust the fan speed when certain heaters are installed. Such equipment is marked to indicate the need for this change, and details showing how to accomplish it are included in markings, usually on the wiring diagram.

Large Commercial/Industrial Equipment

Some very large commercial and industrial type equipment with fixed electric space heating use belt-driven, adjustable speed blowers. The manufacturer’s installation instructions include directions for setting the blower speed based on the external static pressure. UL verifies these instructions as part of its product investigations, and these instructions should be followed to assure adequate air flow.

Duct Heaters

One type of unit UL does not investigate for use with specific air moving equipment is a duct heater. *NEC*® Section 424.59 requires provision of uniform and adequate air flow over the face of the heating elements in a duct heater. Every duct heater is marked to indicate the minimum required air flow. This marking may include the specific minimum velocity, but in most cases, it will reference the installation instructions for details. The installation instructions typically include a chart or graph showing the minimum required air flow based on the heater kilowatt rating and the temperature of the air entering the heater. They also include directions for using the graph, and generally at least one example. The manufacturer’s instructions, packaged with the heater, are reviewed as part of the UL investigation. It is important that they be followed, as also indicated in *NEC*® Section 424.66.

Minimum air velocities for duct heaters are usually specified in feet per minute, but may be specified in cubic feet per minute, if the duct heaters are to be installed only in a duct of the same size as the heater. The installation instructions should be consulted for any restrictions in this regard.

NEC® Section 424.59 states that the airflow shall be uniform as well as adequate. Another factor that should not be overlooked is the fine print note in *NEC*® Section 424.59. Generally, an unobstructed straight run of duct at least 4 feet long on the inlet side of the heater is adequate to insure fairly uniform air flow across the duct area. Obstructions on the outlet side of the heater, however, can also affect uniformity of airflow. Published information for Duct Heaters (KOHZ) in the UL White Book offers some additional guidance.

40. INLET AIR TEMPERATURE

UL’s investigation of most equipment is based on the assumption that the air entering an indoor unit is at normal room temperature. UL tests are conducted with inlet air temperatures of 80°F.

Some indoor units are investigated and Listed for connection to duct systems where the air entering the unit is preheated by some other means. Since duct heaters are typically used in such installations, any unit identified as a “Duct Heater” as part of the Listing Mark is marked to indicate a maximum entering air temperature (see *NEC*® Section 424.60). For some duct heaters, this marking may reference the installation instructions that, as indicated elsewhere in this Guide, have been investigated as part of the Listing and should be consulted. Fan units may also be used in applications where the inlet air is preheated, and if tested to cover this application, will also be marked to indicate a maximum entering air temperature. If not so marked, a maximum entering air of 80°F is assumed. Use of equipment in systems that preheat inlet air to a temperature higher than its marked maximum inlet temperature, or 80°F if not marked, can result in overheating of wiring, electrical components and duct work.

41. DUCT CONNECTIONS

Units designed to be connected to a duct system for conditioned air are Listed for installation in accordance with the applicable portions of the National Fire Protection Association Standard for Installation of Air Conditioning and Ventilating Systems, NFPA 90A, and/or the Standard for Warm Air Heating and Air Conditioning Systems, NFPA 90B. Certain unit markings may limit the types of installations permitted by these Standards.

NFPA Standards 90A and 90B permit certain types of residential installations of nonheating equipment without a noncombustible duct or equivalent barrier beneath a bottom air discharge or return air opening in a unit. A unit that does not include a means of heating but requires such a barrier is marked “For Nonresidential Installation Only.”

A unit not investigated for connection to a duct system as defined in these Standards, may be marked “This Unit Is Intended Only For Free-Air Discharge Or For Connection To A Duct Supplying Only One Room.”

Certain types of equipment that cannot be properly installed with attached duct work in rooms having a ceiling height of 7-1/2 feet or less may be marked to indicate the minimum required ceiling height.

42. SHORT-CIRCUIT CURRENT RATING

NEC® Section 440.4(B), now requires that multimotor and combination-load equipment shall be provided with a visible nameplate marked with the short-circuit current rating, with the following exception:

Multimotor and combination-load equipment used in one and two family dwellings, cord and attachment plug connected equipment, or equipment supplied from a branch circuit protected at 60 amps or less shall not be required to be marked with a short-circuit current rating. All these types of markings described above are located on or adjacent to the unit nameplate.

43. CARBON DIOXIDE (R744) AS A REFRIGERANT

Equipment intended to utilize carbon dioxide (R744) in a secondary loop or a cascade system as a heat exchange medium for the conditioned air is required to be marked with the fluid type(s) for which it has been evaluated. If the equipment is for use with R744 (carbon dioxide) system components, the marking indicates the design pressure of the equipment is not less than the design pressure of the associated components.

If the equipment contains a pressure vessel within the R744 loop or system, but pressure relief and pressure-regulating relief valves are not provided as part of the equipment, a marking shall be located where visible to the installer indicating that pressure-relief or pressure-regulating relief valves are not installed on the equipment and that a sufficient number of valves having capacity deemed adequate shall be field-installed on the system.

Pressure-regulating relief valves shall be provided with the following or equivalent marking: "Do not defeat, cap, add piping to the outlet of the valve or attempt to change the relief setting."

44. MOTORS FOR USE WITH SOLID-STATE SPEED CONTROLS

Motors intended for use with remotely located solid-state speed controls for Heating & Cooling equipment is requires to be marked with the following statement, "SUITABLE FOR USE WITH ANY SOLID-STATE SPEED CONTROLS" or equivalent wording. If a speed control is specified by the manufacture, the marking is not required.

45. HEAT PUMP WATER HEATING EQUIPMENT

Heat pump water heating equipment that have a heat exchanger are required to be marked with following, If the heat exchanger is intended for connection to a potable water system, it shall be of double wall construction and the design shall incorporate either a vented interface or redundant construction to prevent the leakage of refrigerant into potable water, the equipment shall be marked with the following, or the equivalent: "CAUTION: DOUBLE WALL HEAT EXCHANGER, SUITABLE FOR POTABLE WATER CONNECTION". Heat exchangers may be of single wall construction provided they are not intended for connection to a potable water system, and shall be marked with the following, or the equivalent: "CAUTION: SINGLE WALL HEAT EXCHANGER, NOT SUITABLE FOR POTABLE WATER CONNECTION".

APPENDIX A

UL HEATING AND COOLING EQUIPMENT PRODUCT CATEGORIES

UL does list this type of equipment and continues to develop new product categories to address the safety issues associated with this type of equipment. Below is a list of product categories that UL currently lists to address these types of products. Each product category is tabulated with a UL Category Code. By clicking on the code, you will be linked to the UL Guide Information for the category and any Listings or Classifications under that Product Category in the UL Online Certifications Directory database at www.ul.com/database.

Category Code	Category Name	Standard Used
Electric Heating and Cooling Equipment		
KTFV	Absorption Air Conditioning Equipment	UL 1995, UL 795, UL 296, ANSI Z21.40.1
ACKZ	Air conditioners, packaged terminal	UL 484, ANSI Z21.86
ABFY	Air conditioning equipment accessories	UL 1995
KZZV	Central furnaces	ANSI Z21.47
KOHZ	Duct heaters	UL 1996
LZPG	Ductless heating and cooling equipment, large, open building	UL 1995
LZPU	Heater assemblies Classified for use on Specified Equipment	UL 1995
LZFE	Heating and Cooling Equipment	UL 1995
KMLW	Remote control panels for electric duct heaters	UL 1996
KKWS	Room Air Heaters, Fixed and Location Dedicated	UL 2021
ACVS	Special purpose air conditioners	UL 484
MJAT	Specialty heating and heating-cooling appliance accessories	UL 1995, UL 462, UL 207, UL 295, UL 795, UL 296
Gas-Fired Heating and Cooling Equipment		
LLRR	Commercial radiant heaters	ANSI Z83.19 or Z83.20
LKQA	Outdoor patio heaters	ANSI Z83.26
LTCT	Unit heaters	ANSI Z83.8
LPOL	Unvented room and log heaters	ANSI Z21.11.2
LPNH	Vented room heaters	ANSI Z21.86
LPPM	Vented fireplace heaters	ANSI Z21.88
Solid-Fuel-Fired Heating and Cooling Equipment		
LBHZ	Solid-fuel-fired central furnaces	UL 391
DGAW	Solid-fuel type room heaters	UL 1482
Oil-Fired Heating and Cooling Equipment		
LGJR	Floor furnaces	UL 729
LUDZ	Unit heaters	UL 731
Kerosene-Fired Heating and Cooling Equipment		
LQLT	Room heaters	UL 896
Combination-fired Heating Equipment		
LANT	Gas-Oil-Fired Central furnaces	ANSI Z21.47 and UL 727
LTQR	Gas-oil-fired unit heaters	ANSI Z83.8 and UL 731
LBEV	Solid-fuel Combination central furnaces	UL 391

APPENDIX B: HEATING AND COOLING EQUIPMENT CODES AND STANDARDS

Heating and cooling equipment must be installed in accordance with model codes and installation standards. These codes require these products to be listed and labeled in accordance with applicable product standards.

UL standards are typically identified as Standards for Safety and cover reasonably foreseeable risks associated with a product. Limitations applicable to the products covered by the standard are delineated in the Scope section of the standard. UL standards are intended to:

- Identify requirements for evaluation of products and provide consistency in the application of these requirements.
- Provide guidance for development of products by manufacturers.
- Provide requirements compatible with nationally recognized installation codes

An UL Outline of Investigation is a document that contains the construction, performance, and marking criteria used by UL to investigate a product when the product is not covered by the scope of an existing UL Standard for Safety. Outlines are not consensus documents and do not require review by an UL Standards Technical Panel (STP) or other external group.

ANSI Z21.11.2	Gas-Fired Room Heaters, Volume II, Unvented Room Heaters
ANSI Z21.47	Gas-Fired Central Furnaces
ANSI Z21.86	Vented Gas-Fired Space Heating Appliances
ANSI Z21.88	Vented Gas Fireplace Heaters
ANSI Z83.8	Gas Unit Heaters and Gas-Fired Duct Furnaces
ANSI Z83.19	Gas-Fired Low-Intensity Infrared Heaters
ANSI Z83.20	Gas-Fired High-Intensity Infrared Heaters
ANSI Z83.26	Gas-Fired Outdoor Infrared Patio Heaters
IFGC	International Fuel Gas Code
IMC	International Mechanical Code
NEC (NFPA 70)	National Electrical Code
NFGC (NFPA 54)	National Fuel Gas Code
UL 207	Refrigerant-Containing Components and Accessories, Nonelectrical
UL 295	Commercial-Industrial Gas Burners
UL 296	Oil Burners
UL 391	Solid-Fuel and Combination-Fuel Central and Supplementary Furnaces
UL 462	Heat Reclaimers for Gas-, Oil-, or Solid Fuel-Fired Appliances
UL 484	Room Air Conditioners
UL 727	Oil-Fired Central Furnaces
UL 729	Oil-Fired Floor Furnaces
UL 731	Oil-Fired Unit Heaters
UL 795	Commercial-Industrial Gas Heating Equipment
UL 896	Oil-Burning Stoves
UL 1482	Solid-Fuel Type Room Heaters
UL 1995	Heating and Cooling Equipment
UL 1996	Electric Duct Heaters
UL 2021	Fixed and Location-Dedicated Electric Room Heaters
UMC	Uniform Mechanical Code

Marking and Application Guide

LUMINAIRES

JANUARY 2013

PREFACE

UL has developed this guide for use by code and inspection authorities, electric utilities, contractors, installers, users, system designers, and other interested parties to aid in understanding the basic components of luminaires and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation.

This Luminaire Marking Guide contains information to make it easier to locate specific markings. The guide consists of 77 notes indexed by both luminaire type and subject matter. Each note describes a marking and briefly explains the meaning and terminology of the marking. This edition has been updated in accordance with the 2011 National Electrical Code (NEC)® and UL Luminaire Standards revisions through September 17, 2008.

UL Marking Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web Site at <http://www.ul.com/codeauthorities>.

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers in determining the suitability of specific luminaires in a particular installation and use, and to address concerns related to fire, shock, and mechanical hazards.

Products are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Guide information is available in the UL White Book and online at www.ul.com/database.

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

The numbering for code sections used in this document may change as the specific code is updated.

Additional information can be found at www.ul.com.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of this equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified”.

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on luminaires. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only

way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL's *safety* requirements. These requirements are primarily based on UL's own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word "Listed," the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word "Classified," a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

FIELD EVALUATIONS

You may encounter situations in which you are unable to determine if a product has been listed by a third-party organization. Or in other situations you might encounter a product bearing a listing label that may have been modified in the field, and now you question whether or not the product still complies with the applicable standard. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors, and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL's Web site at www.ul.com/field.

INDEX BY LUMINAIRE TYPE

INCANDESCENT SURFACE MOUNTED LUMINAIRES

Category Code Guide Designation: IEZR

ENVIRONMENTAL LOCATION MARKINGS

1. **DRY LOCATIONS** — A luminaire intended for use in a location not normally subject to dampness, but may include a location subject to temporary dampness, as in the case of a building under construction, provided ventilation is adequate to prevent an accumulation of moisture is marked “DRY LOCATIONS ONLY.”
2. **DAMP LOCATIONS** — Only luminaires marked “SUITABLE FOR DAMP LOCATIONS” or “SUITABLE FOR WET LOCATIONS” are intended to be installed in damp locations. A damp location is an exterior or interior location that is normally or periodically subject to condensation of moisture in, on, or adjacent to, electrical equipment, and includes partially protected locations.
3. **WET LOCATIONS** — Only luminaires marked “SUITABLE FOR WET LOCATIONS” are intended to be installed in wet locations. A wet location is a location in which water or other liquids may drip, splash or flow on or against electrical equipment. A luminaire marked “SUITABLE FOR WET LOCATIONS” may be additionally marked as specified below:
 - a. **Covered Ceiling Mount Only** — A wet locations luminaire marked “COVERED CEILING MOUNT ONLY” is intended for locations such as a vehicle washing area where the luminaire will not be subjected to water and precipitation from the back side. A ceiling mounted luminaire not identified for covered ceiling mount only is suitable for mounting in locations where it may be subjected to precipitation from the back side, such as under a metal grate-type catwalk.
 - b. **Less Than 1.2 M (4 Feet) Above Ground Level** — A wet locations wall or post mounted luminaire may be installed within 1.2 m (4 feet) of ground level if it is marked “SUITABLE FOR MOUNTING WITHIN 1.2 M (4 FEET) OF GROUND.” luminaires with this marking are intended to be subjected to water from lawn and garden sprinkler systems, but are not intended to be installed at or below ground level where they may be subjected to immersion in water.

Exception: A luminaire with an integral post (bollard type luminaire) needs to be so marked.
 - c. **Below Ground Level** — A wet locations recessed luminaire may be installed at or below ground level if it's marked “SUITABLE FOR GROUND-MOUNTED RECESSED.” A luminaire with this marking is intended to be subjected to infrequent immersion under water which may occur because of heavy precipitation. The luminaire is provided with instructions for its proper installation.
4. **INSTALLATION INSTRUCTIONS** — Installation instructions shall be provided for luminaires that require specific methods for sealing the mounting surface or specific fittings for supply connections.

RESTRICTED LOCATION MARKINGS

5. **OUTDOOR USE ONLY** — A fluorescent luminaire that is intended for outdoor use only is marked “OUTDOOR USE ONLY”. It is not required to have a Class P protected ballast.
6. **NOT FOR USE IN DWELLINGS** — An electric discharge luminaire that has a ballast with an output open circuit voltage greater than 1000V is marked “NOT FOR USE IN DWELLINGS”.

A luminaire marked for supply wire rated over 90°C is also marked “NOT FOR USE IN DWELLINGS.”

7. **WALL MOUNTING ONLY** — A luminaire that may be mounted only to a wall because of temperature, or other considerations, is marked “WALL MOUNT ONLY.”
8. **CEILING MOUNT ONLY** — track lighting luminaire assemblies intended for use with ceiling mounted track lighting systems only are marked “FOR USE WITH CEILING-MOUNTED TRACK ONLY.”
9. **NON-COMBUSTIBLE SURFACE ONLY** — A ceiling mounted or ground-mounted recess luminaire that is permitted to be mounted only to a noncombustible ceiling because of temperature or other considerations is marked “NONCOMBUSTIBLE SURFACE ONLY.”
10. **NON-FIRE-RATED RECESSED CEILINGS ONLY** — A recessed luminaire with a thermoplastic housing, or a housing with openings that exceed the maximum number or size permitted is marked “FOR USE IN NON-FIRE-RATED INSTALLATIONS ONLY.”
11. **FIRE RESISTANT CONSTRUCTION ONLY** — A recessed luminaire that produces a temperature rise greater than 65°C (117°F) on a mounting surface or recessed housing is marked “INSTALL IN BUILDINGS OF FIRE RESISTANT CONSTRUCTION - MOUNT ON NONCOMBUSTIBLE MATERIAL.”
12. **CONCRETE ONLY** — A recessed luminaire that is exempted from being thermally protected because it is intended for use only in a fire-resistant medium, such as concrete, is marked “FOR USE IN CONCRETE ONLY.”

PERMISSIVE LOCATION MARKINGS

13. **SUITABLE FOR USE IN POURED CONCRETE** — A recessed luminaire or track lighting system marked “SUITABLE FOR USE IN POURED CONCRETE” may be installed in poured concrete as well as in normal building materials.
14. **SUITABLE FOR USE IN SUSPENDED CEILINGS** — A recessed luminaire provided with means for mounting in a suspended ceiling may be installed in a suspended ceiling if marked “SUITABLE FOR SUSPENDED CEILINGS.”
15. **SUITABLE FOR UNDER CABINET MOUNTING** — A luminaire that is intended for mounting under a cabinet is marked “SUITABLE FOR UNDER-CABINET MOUNT.”

SPECIAL USE MARKINGS

16. **ELEVATED AMBIENT**— A luminaire intended for use in locations that experience a continuous elevated ambient temperature is marked “SUITABLE FOR OPERATION IN AMBIENT NOT EXCEEDING (___°C),” where the blank is filled in with the maximum ambient temperature.
17. **COMMERCIAL COOKING HOOD USE**— A luminaire intended for installation in non-residential occupancies in exhaust or hood ducts or hoods above cooking equipment, in accordance with the National Electrical Code and the Standard for Installation of Equipment for the Removal of Smoke and Grease-Laden Vapors from Commercial Cooking Equipment, NFPA 96, is marked with the minimum temperature rating of the supply wiring, and with the wording

“SUITABLE FOR USE WITHIN COMMERCIAL COOKING HOODS,” or the equivalent, and “MOUNT A MINIMUM OF 1.2 M (4 FEET) ABOVE COOKING SURFACE.” A recessed luminaire is additionally marked with the minimum acceptable spacing between the centers of adjacent units, the minimum spacing from the center of the luminaire to side building member, and the minimum spacing above the luminaire (see Item 55).

- 18. GERMICIDAL LAMP USE** — A luminaire intended for use with germicidal lamps is marked, “THIS LUMINAIRE IS DESIGNED FOR USE WITH GERMICIDAL LAMPS AND MUST BE INSTALLED IN COMPLIANCE WITH COMPETENT TECHNICAL DIRECTIONS SO THAT THE USER’S EYE AND BARE SKIN WILL NOT BE SUBJECTED TO INJURIOUS RAYS.”
- 19. AIR HANDLING USE** — A luminaire for use with heating, ventilating, and air conditioning systems in accordance with the National Electrical Code and the Standard for Installation of Air-Conditioning and Ventilating Systems of Other than Residence Type, ANSI/NFPA 90A, is marked, “SUITABLE FOR AIR HANDLING USE.” An air handling luminaire intended for cool air only is marked “COOLED AIR ONLY”. If the luminaire is shipped without a light diffuser, the luminaire is marked “USE WITH LISTED LIGHT DIFFUSER”. A plastic light diffuser or lens that depends on the luminaire for the provision of a frame and that is shipped separately from the luminaire is marked “USE WITH (manufacturer’s name) (catalog designation) LUMINAIRE.” For information on the use of air handling luminaires in fire rated constructions, refer to the design information section in the Fire Resistance Directory.
- 20. AIR HANDLING USE - EXCESSIVE OPENINGS** — A recessed luminaire intended for use as an air handling register and having a recessed housing with holes or openings that exceed the limits in size or number is marked “FOR NONCOMBUSTIBLE CEILING PLENUM ONLY.” A recessed luminaire that is intended for optional use as an air handling register and having a recessed housing with holes or openings that exceed the limits in size or number that are closed off by a removable cover or knockout is marked “ONLY FOR USE IN CEILING PLENUM OF NONCOMBUSTIBLE CONSTRUCTION OR WITH AIR HANDLING PARTS THAT COVER VENT OPENINGS.”

INSTALLATION MARKINGS

- 21. ADJUSTABLE MOUNTING POSITIONS** — A luminaire with adjustable or alternate mounting positions is marked to indicate the limits of adjustment or mounting positions necessary to comply with test requirements.
- 22. ORIENTATION** — If a luminaire that may be installed in more than one position has been evaluated for use only in one orientation, the luminaire is marked to indicate its proper orientation. This marking is typically provided on wet location and wall mount luminaires.
- 23. CHAIN OR HOOK SUSPENSION ONLY** — A luminaire with power supply cord that is not provided with hooks or chain is marked “FOR CHAIN OR HOOK SUSPENSION ONLY.”
- 24. ADAPTOR PLATE** — A recessed luminaire with an opening for an adapter plate but not shipped with the plate is marked with the catalog number or similar product identifier of the intended adapter plate.

- 25. CABLE WIRING METHOD ONLY** — A recessed luminaire with a wiring compartment (junction box) that is not suitable for pulling individual conductors into it and is intended for cable wiring methods only is marked “FOR CABLE USE ONLY - NOT FOR PULLING WIRES.”
- 26. PHOTOELECTRIC-CONTROLLED RECEPTACLE** — A luminaire provided with a receptacle for a photoelectric-controlled switch but not shipped with the photoelectric-controlled switch or with a shorting or open circuit plug is marked “INSTALL PHOTOCONTROL OR SHORTING PLUG.”
- 27. REFLECTOR KITS** — A reflector kit intended for installation in a fluorescent lighting luminaire sometime after the initial installation of the luminaire may consist of reflectors, electrical components and the like. A reflector kit that requires drilling or punching of holes into the luminaire is marked “WARNING — RISK OF FIRE OR ELECTRIC SHOCK. LUMINAIRE WIRING, BALLASTS, OR OTHER ELECTRICAL PARTS MAY

BE DAMAGED WHEN DRILLING FOR INSTALLATION OF REFLECTOR KIT HARDWARE. CHECK FOR ENCLOSED WIRING AND COMPONENTS.”
- 28. CORRELATION MARKINGS FOR TRACK SYSTEMS** — Track systems are composed of many individual sections. Each track section is marked “CAUTION — TO REDUCE THE RISK OF FIRE AND ELECTRIC SHOCK, USE ONLY LUMINAIRE ASSEMBLIES MARKED FOR USE WITH _____ TRACK.” The luminaire assemblies are marked “CAUTION — TO REDUCE THE RISK OF FIRE AND ELECTRIC SHOCK, USE ONLY WITH _____ TRACK.” The blank space is replaced by the manufacturer’s name and series number of the track.
- 29. NON-PENDANT** — A track lighting system that is not intended to be pendant mounted is marked “DO NOT PENDANT MOUNT THIS TRACK SUCH AS BY STEMS OR WIRES.”
- 30. INTEGRAL TO SUSPENDED CEILINGS** — A recessed track system intended to be an integral part of a building construction (for example, the recessed track is an integral part of a suspended ceiling grid) is marked “FOR USE IN _____.” The first blank is replaced by the name of the manufacturer making the building structural component. The second blank is replaced by the model number or other descriptive name of the building structural component.
- 31. CLIP MOUNT** — A track lighting system may be provided with track sections that are intended to be secured to the building structure only by clips. These sections are marked “FOR CLIP MOUNTING ONLY.”

INSTALLATION INSTRUCTIONS

- 32. CIRCUIT DIAGRAM** — luminaires are provided with instructions and a circuit diagram showing the proper method for making supply connections, including polarity and grounding, unless the luminaire carton is marked “THIS PRODUCT MUST BE INSTALLED IN ACCORDANCE WITH THE APPLICABLE INSTALLATION CODE BY A PERSON FAMILIAR WITH THE CONSTRUCTION AND OPERATION OF THE PRODUCT AND THE HAZARDS INVOLVED.”
- 33. POWER SUPPLY CORD** — A luminaire having a power supply cord that is electrically unconnected or unassembled to the luminaire is provided with instructions for the correct field assembly, including a means of strain relief and a wiring diagram.

34. INSTALLATION INSTRUCTION FOR CONVERTIBLE INCANDESCENT RECESSED LUMINAIRE—

A convertible recessed incandescent luminaire housing (rough-in section) is provided with instructions that tell the installer to remove the peel-off label with the text described in note 64, for Type IC installations.

35. INSTALLATION INSTRUCTIONS FOR TRACK SYSTEMS —

Each smallest unit package or carton of track assemblies is provided with installation instructions that contain (a) a product description, (b) a statement identifying which track system is to be used with the individual part, and (c) instructions on how the part or parts are to be installed in relation to the track system. Each track section is provided with installation instructions that identify the track system series number or model name, and the model catalog number of the track. The installation instructions also specify the electrical ratings of the track system and identify the mounting means (pendant, surface, etc.), and the distance between mounting clips, screws, stems, etc. Additional instructions and limitations of the use of track lighting systems are specified in the Important Safety Instructions provided with each track section.

36. DRILL GUIDE FOR TRACK SYSTEMS —

Those track systems designed such that mounting holes in each track section are to be drilled out by the installer are provided with a drill guide in the center of each track section. The proper location of the mounting holes is to be included in the accompanying installation instructions for the track system.

37. CUT TRACK SECTIONS —

Only those track systems with track sections that may be cut to length in the field by the installer are provided with installation instructions that indicate the proper method of cutting.

SUPPLY MARKINGS

38. SUPPLY WIRE TEMPERATURE —

luminaires that require greater than 60 °C supply wire are marked “MIN ____ °C SUPPLY CONDUCTORS” for which blank space is replaced with the temperature.

Luminaires intended to be installed in a dwelling, connected to or over an outlet box, and marked for supply wire rated 75°C or 90°C are additionally marked on the luminaire and on the carton “CAUTION - RISK OF FIRE. CONSULT A QUALIFIED ELECTRICIAN TO ENSURE CORRECT BRANCH CIRCUIT CONDUCTOR,” or just the carton may be marked “CAUTION – RISK OF FIRE. THIS PRODUCT MUST BE INSTALLED IN ACCORDANCE WITH THE APPLICABLE INSTALLATION CODE BY A PERSON FAMILIAR WITH THE CONSTRUCTION AND OPERATION OF THE PRODUCT AND THE HAZARDS INVOLVED.”

Track lighting systems that require supply wire with minimum temperature ratings are marked “FOR SUPPLY CONNECTIONS, USE WIRE RATED FOR AT LEAST ____ °C (____ °F)” for which the “(____ °F)” is optional and the blank space is replaced with the temperature.

39. PUSH LEADS INTO BOX —

Some surface-type wall mounted luminaires require the installer to push the supply leads into the outlet box to avoid contact with high luminaire temperatures, and are marked “PUSH CONDUCTORS INTO JUNCTION BOX”.

40. THROUGH CONDUCTORS IN A WIRING COMPARTMENT —

A luminaire that is suitable for use with through branch conductors is marked “MAXIMUM OF ____ NO. ____ AWG THROUGH

BRANCH CIRCUIT CONDUCTORS SUITABLE FOR ___°C PERMITTED IN BOX.”

41. **ACCESS REQUIRED** — A luminaire so constructed that the supply connections are accessible only from behind the luminaire is marked, “ACCESS ABOVE CEILING REQUIRED” or “ACCESS BEHIND WALL REQUIRED.”
42. **RACEWAY** — A luminaire may also be intended for use as a raceway if marked “SUITABLE FOR USE AS A RACEWAY.”
43. **PROPRIETARY WIRING SYSTEM** — A luminaire designed to be connected to a proprietary wiring system is marked with the following information:
 - a. The name and part number of the proprietary system to which the luminaire is to be connected.
 - b. All cautionary or other markings required by the system.
44. **REMOTE BALLAST** — A fluorescent or HID luminaire designed for use with a remote ballast is marked “USE BALLAST FOR ___ WATT ___ TYPE LAMP” where the blanks are filled with the lamp wattage and type, respectively. Additionally, a fluorescent luminaire designed for use with a remote ballast is marked “USE THERMALLY PROTECTED BALLAST FOR TYPE LAMP”.
45. **“X” OR “T” TRACK CONNECTORS** — An “X” or “T” shaped intercept track connector (a) provided with breakaway ground tabs, (b) provided with a connector not prewired, or (c) intended for field rewiring and reconfiguration is marked “WARNING — RISK OF FIRE AND ELECTRICAL SHOCK. THIS PRODUCT REQUIRES PROPER FIELD WIRING AND IS INTENDED TO BE INSTALLED BY A QUALIFIED ELECTRICIAN ONLY.”
46. **VOLTAGE OTHER THAN 120 V** — An incandescent luminaire designed for connection to other than a nominal 120 V supply is marked with its input voltage.
47. **TRANSFORMER VOLTAGE** — A luminaire that employs a device (such as a transformer) that is designed to operate only at a specified voltage is marked with its input voltage.
48. **A.C. ONLY** — A luminaire that employs a device (such as a transformer) for use only in an alternating-current circuit is marked “___ VOLTS ___ HERTZ” or “___ V ___ HZ” or “AC ONLY.”
49. **BRANCH CIRCUIT GREATER THAN 20 A** — A recessed luminaire intended to be connected to a branch circuit in excess of 20 amperes is marked “CONNECT TO A BRANCH CIRCUIT SUPPLY RATED ___ AMPS MAX” where the indicated ratings are 30 or 40.
50. **LINE VOLT-AMPERES** — Instead of the current in amperes, a fluorescent luminaire employing a high power-factor, reactor-type ballast or ballasts for bi-pin lamps (preheat or rapid start types) may be marked “FOR LINE VOLT-AMPERES, MULTIPLY TOTAL LAMP WATTAGE BY 1.5.” Similarly, a fluorescent luminaire employing a low-power-factor, reactor-type ballast or ballasts for bi-pin lamps may be marked “FOR LINE VOLTAMPERES, MULTIPLY TOTAL LAMP WATTAGE BY 2.5.” Instead of the current in amperes, a fluorescent luminaire employing single-pin lamps (instant start type) and a high-power-factor ballast or ballasts may be marked “FOR LINE VOLT-AMPERES, MULTIPLY THE TOTAL LENGTH OF ALL LAMPS IN INCHES BY ...” The multiplying factor may be “0.6,” “0.8,” “1.2” or “1.5.”

- 51. GROUND ID** — A luminaire and track system feed connector having a pressure wire terminal for the connection of an equipment ground conductor is marked, adjacent to the terminal or screw, “G”, “GR”, “GRD,” “GND, “GRND”, “GROUND”, or with the grounding symbol. A wire binding screw used to connect an equipment ground conductor is colored green or provided with a grounding abbreviation adjacent to the screw.
- 52. AIR HANDLING GROUNDING** — Recessed luminaires intended for installation only in environmental air handling spaces other than ducts or plenums that rely on a conductive connection to a metal-enclosed wiring system for equipment grounding are marked “INSTALL ONLY IN ENVIRONMENTAL AIR HANDLING SPACES WHERE A COMPLETE METAL ENCLOSED WIRING SYSTEM IS PROVIDED.”
- 53. NEUTRAL ID** — A luminaire and track system feed connector having a terminal for the connection of the neutral supply conductor is marked, adjacent to the terminal or screw, “N”, “NEUTRAL”, “W” or “WHITE”, or is colored white.
- 54. POLARIZED PLUG** — A luminaire with cord and a polarized attachment plug is marked “TO PREVENT ELECTRIC SHOCK, MATCH WIDE BLADE OF PLUG TO WIDE SLOT.”

RECESSED LUMINAIRE MARKINGS

- 55. CLEARANCE AND INSTALLATION** — Recessed luminaires may be installed in insulated or uninsulated ceilings (or walls when marked for wall mounting) depending on their type of Listing as follows:
- a. Suitable for Installation in Direct Contact with Insulation** — These luminaires are marked “TYPE IC,” or “INHERENTLY PROTECTED,” and may be installed where thermal insulation is placed in direct contact with the sides and top of the luminaire. They are protected against overheating by either thermal protection (See Note 58), or are inherently protected (See Note 59).
 - b. Suitable for Installation Only in Poured Concrete** — These luminaires are restricted to use only in a fire resistant medium such as concrete, and are marked “FOR USE IN CONCRETE ONLY.” An in-ground recessed luminaire may alternately be marked “SUITABLE FOR GROUND MOUNTED RECESSED ONLY”.
 - c. Luminaires Requiring Minimum Spacing from Thermal Insulation and Combustibles (Type Non-IC)** — luminaires that are NOT marked “TYPE IC,” “INHERENTLY PROTECTED,” are referred to as Type Non-IC Recessed luminaires. The luminaires are intended to be installed where minimum spacings are maintained between the luminaire and combustibles, side walls, and overhead building members, and may be identified by the spacing-to-thermal insulation marking as specified in Note 63. There are different purposes for the spacings. The minimum spacing to combustibles reduces the risk of the luminaire heat igniting combustibles. This spacing is always a minimum of ½ inch, unless the luminaire is marked: “INSTALL WITH MINIMUM SPACINGS BETWEEN (a) CENTER-TO-CENTER OF ADJACENT LUMINAIRES: ____ mm (____ in.); (b) TOP OF LUMINAIRE-TO-OVERHEAD BUILDING MEMBER: ____ mm (in); and (c) LUMINAIRE CENTER-TO-SIDE BUILDING MEMBER: ____ mm (in.). “ The blank spaces will be replaced by the minimum distances required.

- d. **Suitable for Installation Only in Environmental Air Handling Spaces** — These luminaires are restricted for use only in an environmental air handling space and are marked “INSTALL ONLY IN ENVIRONMENTAL AIR HANDLING SPACES WHERE A COMPLETE METAL ENCLOSED WIRING SYSTEM IS PROVIDED.”
56. **TYPE NON-IC** — Recessed luminaires that are NOT suitable for installation in direct contact with combustible materials or thermal insulation, including insulation installed over the top of the luminaire that entraps heat (Type Non-IC) are marked “DO NOT INSTALL INSULATION WITHIN 76 mm (3 in) OF ANY PART OF THE LUMINAIRE.”
57. **TYPE IC** — A luminaire marked “TYPE IC” may be installed where insulation and combustible materials are placed in direct contact with the sides and the top of the luminaire.
58. **LIGHT BLINKING, THERMAL PROTECTION** — Recessed luminaires provided with thermal protection to sense overheating conditions are marked “BLINKING LIGHT OF THIS THERMALLY PROTECTED LUMINAIRE MAY INDICATE OVERHEATING” to alert the user of a potential overheating condition.
59. **INHERENTLY PROTECTED** — luminaires that are intended for installation in direct contact with thermal insulation and combustible material, and are designed so that overheating conditions cannot be caused by overlamping or mislamping, are not thermally protected and are marked “INHERENTLY PROTECTED.”
60. **TRIM CORRELATION** — A recessed luminaire is marked “USE WITH (manufacturer’s name) (catalog number) TRIMS ONLY.” The trims are marked with the trim manufacturer’s name and catalog number.
61. **CONVERTIBLE INCANDESCENT RECESSED LUMINAIRE (TYPE IC/NON-TYPE IC)** — Convertible recessed incandescent luminaires can be installed in either insulated (Type IC) or non-insulated (noninsulated Type IC) applications. The Same luminaire housing (rough-in section) is used for both Type IC and Non-Type IC applications. The trim (finishing section) and light source determine the Type IC or Non-IC application of the luminaire. Convertible luminaires have been evaluated with respect to risk of fire by performance testing under conditions of misapplication of lamps or trims. Installation instructions are provided that tell the installer to remove the marking relating to spacing to thermal installation when the luminaire is installed as intended as a Type IC luminaire in an insulated ceiling application. (See note 34).
62. **CONVERTIBLE (TYPE NON-IC/IC) TRIM IDENTIFICATION** — The trim (finishing section) for a convertible recessed incandescent luminaire is provided with correlation markings which identify the trim/ luminaire (finishing/rough-in section) combinations that are suitable for either Type IC or Non-Type IC installation.
63. **ROUGH-IN AND FINISHING SECTIONS** — Some recessed luminaires are intended to be installed in two parts. The Rough-In Section usually consists of the plaster frame and junction box, and is marked “ROUGH-IN SECTION FOR USE WITH FINISHING SECTION _____”, or “ROUGH-IN SECTION _____ FOR CONVERTIBLE RECESSED LUMINAIRE.” The blanks are replaced by catalog numbers or series designations. The Finishing Section usually consists of the recessed housing and trim; it is marked with the manufacturer’s identification and catalogue number. A convertible recessed luminaire trim/finishing section is also marked “FINISHING-SECTION FOR USE WITH ROUGH-IN SECTION _____.” The blanks are replaced by the catalog number or series designations. If a light diffuser is not

provided, an additional marking on the finishing section indicates that the luminaire must not be used with a light diffuser.

- 64. RECESSED TRACK FOR RECESSED LUMINAIRE ASSEMBLIES** — A recessed track channel for recessed luminaire assemblies and intended for installation in a wall or ceiling cavity where thermal insulation is spaced at least 3 inches away from the recessed channel is marked “WARNING — RISK OF FIRE. DO NOT INSTALL INSULATION WITHIN 3 INCHES OF RECESSED CHANNEL IN SUCH A MANNER TO ENTRAP HEAT” or equivalent. In addition, a recessed track channel for recessed luminaire assemblies is marked “NOTICE — THERMALLY PROTECTED TRACK (OR LUMINAIRES). BLINKING LIGHTING MAY INDICATE INSULATION TOO CLOSE TO TRACK (OR OTHER CONDITION CAUSING OVERHEATING)”.
- 65. RECESSED LUMINAIRE ASSEMBLIES** — A recessed luminaire assembly intended for use with a recessed track system is marked with its minimum spacing to adjacent assemblies.

USER MARKINGS

- 66. LAMP REPLACEMENT MARKINGS** — Incandescent and HID type luminaires and track lighting luminaire assemblies are required to be marked with lamp replacement markings. This marking may be used in combination with the trim correlation marking in recessed luminaires (See Note 72). Generally, most fluorescent luminaires are not provided with lamp replacement markings (See Note 67 for compact fluorescent lamps). The lamp replacement marking for incandescent luminaires will state, “CAUTION - RISK OF FIRE. MAX ___ W(ATTS) TYPE ___”, where the blanks are filled in with lamp type and wattage, and may include the word “SHIELDED” if intended for use with a tungsten-halogen lamp which has an integral shield. HID-type luminaires are provided with a lamp replacement marking identifying the replacement lamp wattage and ANSI designation.
- 67. COMPACT FLUORESCENT LAMPS** — luminaires that employ a compact fluorescent lamp with a ballast that is not Class P are marked with the following or equivalent: “USE ONLY ___ TYPE _____ WATT LAMPS. “
- 68. HID LAMP WITH NO ANSI DESIGNATION** — An HID luminaire with a ballast designed to operate a lamp that does not have an ANSI designation is marked “USE MAX ___ WATTS TYPE _____ ONLY” and, if applicable, “USE _____ VOLT LAMPS.”
- 69. DOUBLE-ENDED LAMPS** — A luminaire that employs a double-ended tungsten halogen or HID lamp without an interlock switch is marked “CAUTION — RISK OF SHOCK. DISCONNECT POWER BEFORE SERVICING.” In addition, if the end contact may be energized and accessible during removal of the lamp, the luminaire is additionally marked “CAUTION — RISK OF ELECTRIC SHOCK. INSERT LAMP IN THIS LAMPHOLDER FIRST,” unless provided with an interlock switch. A track lighting luminaire is marked “NOT FOR USE IN DWELLINGS” and “CAUTION — RISK OF ELECTRIC SHOCK. REMOVE FROM TRACK BEFORE RELAMPING.”

- 70. TUNGSTEN HALOGEN LAMPS** — An incandescent luminaire with a tungsten halogen lamp and that does not have a lamp containment barrier is marked “CAUTION — RISK OF FIRE. MAX ___ WATTS TYPE ___ SHIELDED” or “CAUTION – RISK OF FIRE. MAX ___ WATTS TYPE ___ USE LAMP MARKED “SUITABLE FOR IS IN OPEN LUMINAIRES”.
- 71. METAL HALIDE LAMPS** — HID luminaires with Metal Halide (MH) lamps may be provided with a marking if the lamp enclosure is either: not provided or is inadequate for containing lamp particles. The marking is “CAUTION — RISK OF FIRE. DO NOT INSTALL A LAMP IDENTIFIED FOR USE ONLY IN ENCLOSED LUMINAIRES.” A luminaire with a lamp containment barrier that is removed during user maintenance is marked “KEEP PROTECTIVE BARRIER IN PLACE.” A luminaire with a UV attenuation barrier that is removed during user maintenance is marked “CAUTION – RISK OF PERSONAL INJURY. UV LIGHT SOURCE KEEP PROTECTIVE BARRIER IN PLACE”.
- 72. RECESSED LUMINAIRE LAMP REPLACEMENT MARKINGS** — Recessed luminaire housing or rough-in section may employ a marking system where the lamp replacement marking is dependent upon the trim or finishing section used. A luminaire housing is marked “USE ONLY WITH [Manufacturer] [Catalog Number] TRIMS”. A rough-in section is marked “ROUGH-IN SECTION FOR USE WITH FINISHING SECTION _____”. The blanks are filled in with manufacturer and trim or finishing section number as appropriate. All recessed luminaires are marked for lamp replacement “CAUTION – RISK OF FIRE. MAX ___ WATTS ___ TYPE”. A recessed luminaire that requires a different lamp wattage or type for an alternate trim or finishing section is marked “CAUTION – RISK OF FIRE” and a table specifying the trim or finishing section and the maximum lamp wattage and type permitted for use with it. Alternately the lamp replacement information can be included on the trim or finishing section. The lamp replacement markings can be concealed providing the trim or finishing section must be removed for relamping or it is additionally marked where visible during relamping “SEE OTHER (BACK) SIDE FOR RELAMPING INFORMATION.”
- 73. CLASSIFIED TRIMS** — A trim intended for field installation in specified incandescent recessed luminaires is provided with a lamp replacement marking (See Note 72) and identifies the luminaire for which the trim is suitable.
- 74. ADJACENT COMBUSTIBLES** — A track lighting luminaire assembly that produces a temperature greater than 90°C (194°F) on any exterior surface is marked “CAUTION — HOT SURFACE. KEEP AWAY FROM CURTAINS AND OTHER COMBUSTIBLES.”
- 75. PHOTOELECTRIC-CONTROLLED SWITCH** — A luminaire with a single-pole photoelectric controlled switch that is designed for connection to a line-to-line branch circuit is marked “CAUTION — RISK OF ELECTRIC SHOCK. DISCONNECT POWER BEFORE SERVICING.”
- 76. CONVENIENCE RECEPTACLE** — A luminaire provided with a convenience receptacle is marked “MAX__ W(ATTTS)” or “MAX ___ A(MPS)” for its maximum load rating.
- 77. FUSEHOLDER** — A luminaire provided with a fuseholder is marked “MAX ___ A(MPS) with its fuse replacement rating.

Marking and Application Guide

MOLDED CASE CIRCUIT BREAKERS

JANUARY 2013

PREFACE

UL has developed the Molded-Case Circuit Breaker (MCCB) Marking Guide for electrical inspectors, electric utilities, contractors, installers, users, designers, and other interested parties to aid in understanding MCCBs and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation of MCCBs. These circuit breakers are intended to be installed in accordance with the *National Electrical Code*® (*NEC*®) and their listing. These markings are required by UL 489, and are part of the listing.

The products covered by this Guide are:

Circuit Breaker Adapters	Circuit Breaker and Surge-protective Devices
Circuit Breaker Accessories	Circuit Breakers for use in Communications Equipment
High Fault Protectors	Combination Type Arc-Fault Circuit Interrupters
High Fault Modules	Branch Feeder Type Arc-Fault Circuit Interrupters
Molded-Case Circuit Breakers	Circuit Breakers with Equipment Ground Fault Protection
Fused Circuit Breakers	Circuit Breaker and Ground Fault Circuit Interrupters
Circuit Protectors	Circuit Breakers for use in Photovoltaic Systems

Complete information regarding the provision of markings and instructions for these circuit breakers is contained in the *Standard for Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures*, UL 489. References to the *National Electrical Code*® (*NEC*®) are to the 2011 edition.

Revisions to the 2008 edition of the NEC resulted in panelboards no longer being classified as “Lighting and Appliance Branch-Circuit Panelboards” and “Power Panelboards”, and the 2008 NEC no longer limits the number of overcurrent devices in a lighting and appliance branch-circuit panelboard to 42 circuits. Requirements in UL 489 permit manufacturers to identify “Class CTL” circuit breakers as those with a physical means to prevent the installation of more than 42 circuit breakers into a Class CTL panelboard (or if fewer than 42, that number for which the panelboard was designed and rated). Since existing optional requirements and legacy products continue to be utilized based on NEC requirements that were part of the 2005 and earlier editions, multiple references in this marking guide identify the earlier edition of the NEC as being the relevant NEC requirement.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web Site at; www.ul.com/codeauthorities.

Your comments or suggestions are welcome and appreciated. They should be sent to:

APPENDIX A:

UL Molded Case Circuit Breaker Product Categories 23

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers in determining the suitability of specific molded case circuit breakers in a particular installation and use, and to address concerns related to fire and shock hazards.

Products are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation. A list of molded case circuit breaker product categories evaluated by UL can be found in Appendix A.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Guide information is available in the UL White Book and online at www.ul.com/database.

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

Additional information can be found at www.ul.com.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of this equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified”.

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on molded case circuit breakers. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL's *safety* requirements. These requirements are primarily based on UL's own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word "Listed," the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word "Classified," a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

GENERAL

- 1. Type Designation**—All circuit breakers are marked with their type designation. Normally, this marking also includes a catalog number, because most often the location of additional suffix letters and/or numbers in the catalog number provides additional information on ratings. If the full catalog number is marked, the type designation marking is optional.
- 2. Manufacturer's Name** — All circuit breakers are marked with a name, trademark or other recognized means for identifying the organization responsible for the device. Usually, this is the manufacturer—for other references, the marking guide indicates the manufacturer's name.
- 3. Voltage Rating** — All circuit breakers are marked with a voltage rating, including: 60, 125, 125/250, 160, 250, 500 and 600 volts for dc; and 120, 127, 120/240, 240, 277, 347, 480Y/277, 480, 600Y/347 and 600 volts for ac. All circuit breakers are marked with the symbols  for AC,  for DC, or both, as applicable. For ac voltage ratings other than 60 Hz, the frequency is marked. Additional wording may be provided.

Circuit breakers for use in Communications Equipment may also carry ratings of 30, 65 or 80 Volts dc.

Two-pole independent-trip breakers and single-pole breakers with handle ties that are rated 120/240 V ac have been investigated for use in line-to-line single-phase circuits or line-to-line branch circuits connected to 3-phase, 4-wire systems, provided the systems have a grounded neutral and the voltage to ground does not exceed 120 V.

Two-pole independent-trip breakers and single-pole breakers with handle ties that are rated 125/250 V dc have been investigated for use in line-to-line connected 3-wire dc circuits supplied from a system with a grounded neutral, where the voltage to ground does not exceed 125 V.

Two-pole independent-trip breakers and single-pole breakers with handle ties that are rated 125/250 V (both ac and dc) have been investigated for use in accordance with either of the above two paragraphs, as applicable.

Two- and three-pole common-trip breakers rated 120/240V ac are intended for use on 1-phase, 3-wire circuits, where the voltage to ground does not exceed 120 V.

Two- and three-pole common-trip breakers rated 125/250 V or 125/250 V dc are intended for use on 1-phase and dc, 3-wire circuits, where the voltage to ground does not exceed 125 V.

Circuit breakers with a single voltage rating are intended for use in circuits where the circuit voltage and the voltage to ground do not exceed the voltage rating of the breaker.

“Slant (or slash)-rated” breakers with a rating such as 480Y/277 V are intended for use in circuits where the circuit voltage does not exceed the higher of the two voltages and the voltage to ground does not exceed the lower of the two voltages.

Based on the preceding paragraphs, “slant-rated” breakers (120/240, 208Y/120 V, etc., as opposed to 240, 480 V, etc.) are not intended for use on “slant-rated” delta systems. For example, a 3-pole, 120/240 V breaker is not intended for use on a 240/120 V, 3-phase, 4-wire, delta system, because on the high leg, the voltage to neutral is 208 V. In this instance, a 3-pole, 240 V breaker should be used.

4. Ampere Rating — All circuit breakers are marked with a current rating. For breakers rated 100 A or less, this marking is required to be on the handle or the escutcheon area of the breaker. If the marking is placed on the handle of the breaker, the numerical value alone is adequate.

5. Line and Load Identification — A circuit breaker may or may not be marked “Line” and “Load.” If it does not have this marking, it is acceptable for reverse connection. A breaker with interchangeable trip units is marked “Line” and “Load,” unless there is no risk of electric shock when changing the trip unit.

POSITION INDICATION

6. On and Off (Open and Closed) — All circuit breakers are marked to indicate whether they are open or closed. This marking is visible without removing the trim or cover. However, if the breaker is enclosed, it may be necessary to open a hinged cover or door.

7. Trip and Reset — If a circuit breaker handle takes an intermediate position when tripped, the breaker is marked to indicate it is tripped. Instructions for resetting the breaker are also required to be marked. These markings are optional if they already appear on the receiving device, for example the panelboard.

8. Electrical Operation (On and Off) — If the “On” and “Off” markings are not readily visible when an electrical operator is installed, the markings appear on the electrical operator.

9. Electrical Operation (Trip and Reset) — The electrical operator may also indicate the “Tripped” position of the circuit breaker.

INTERCHANGEABLE TRIP UNITS

10. Manufacturer’s Name — All interchangeable trip units are marked with the manufacturer’s name, trademark or other recognized means for identifying the manufacturer.

11. Ampere Rating — All interchangeable trip units are marked with their ampere rating. The numerical value alone is sufficient, if the word “amperes” or an appropriate abbreviation appears on the cover next to the trip unit.

12. Frame Designation — All interchangeable trip units are marked with the frames for which they are intended, unless the instructions provided with the trip units instruct the user on the proper use of the trip units.

13. Magnetic Settings — All interchangeable trip units are marked with the minimum and maximum settings for the adjustable magnetic tripping values.

INTERRUPTING RATINGS

14. Ratings — All circuit breakers with an interrupting rating other than 5000 A are marked with their interrupting rating. If the breaker is not marked with an interrupting rating, the interrupting rating for the breaker is 5000 A. The marking includes the words “Interrupting Rating” or “Current Interrupting Rating” and may include “Maximum RMS Symmetrical,” or an abbreviation. If the interrupting rating includes more than one current and associated voltage rating, all values of voltage and corresponding interrupting rating are marked. If more than one interrupting rating is marked, all ratings appear together. No asymmetrical voltage rating may be marked on the breaker. If the marked interrupting rating of the breaker exceeds the marked short circuit rating of the end-use equipment, such as a panelboard, in which the breaker is installed, the interrupting rating of the overall combination is still considered to be the lesser rating marked on the end-use equipment.

TERMINATIONS

15. Cu-Al Wire — All circuit breakers are marked to identify the type of wire for which they are suitable. The marking includes the words “Copper” and/or “Aluminum” or an abbreviation. If the breaker is intended for use with a copper wire only or an aluminum wire only, the marking includes the word “Only.” A breaker intended for use with No. 10-14 AWG solid wire only is marked “No. 10-14 AWG Solid,” or an equivalent wording.

16. Small Size Wire — Circuit breakers rated less than 15A that have been found acceptable for use with 16 or 18 AWG , rated 10A and 7A respectively are so marked. This marking may be included in the marked wire range.

17. Tightening Torque — All circuit breakers are marked with their rated tightening torque for all terminals intended for field wiring. This is a nominal value. If the torque is dependent on wire size, the marking indicates the range of tightening torques for each wire size.

18. Maximum Wire Size — If the terminals of a circuit breaker will not accept the next larger wire size than required for the breaker rating, the breaker or the terminal is marked to indicate the maximum wire size.

19. Multiple Conductor Connectors — If the terminals of a circuit breaker are acceptable for use with multiple connections in one hole, and the breaker is intended for this type of use, the breaker is marked to indicate the proper multiple connections. This is uncommon for breakers—ordinarily, the terminals are suitable for only one wire per hole.

20. 60/75°C Wire — All circuit breakers rated 125 A or less are marked for use with 60° C, 60/75°C or 75°C only wire. This marking indicates the proper wire size for termination in accordance with Table 310.15(B)(16) of the NEC [®]. It is acceptable to use wire with a higher insulation rating if the ampacity is based on the wire temperature rating marked on the breaker. For breakers rated more than 125 A, the proper wire temperature rating is 75°C and it is optional for the breaker to bear this marking.

21. Separately Shipped Connectors — If the wire connectors are not provided with the circuit breaker when shipped from the manufacturer, the breaker is marked to indicate the proper connectors or connector terminal kit for the breaker. The terminal kit indicates the manufacturer’s name or trademark and proper wire size.

22. Cable Connection Only — A circuit breaker rated more than 4000 A and intended for cable connections only is marked accordingly.

23. Bus Bar Sizes — A circuit breaker intended for use with bus bars other than 1000 A/in.² is marked to indicate the minimum size bus bar to which it should be connected. If not marked, the proper bus bar sizes for termination are based on the table shown below:

Circuit Breaker Frame Size, A	Bus Bars per Terminal	
	Number	Size, in.
1600	2	1/4 X 3
2000	2	1/4 X 4
2500	2	1/4 X 5
	or 4	1/4 X 2-1/2
3000	4	1/4 X 4
4000	4	1/4 X 5
5000	6	1/4 X 5
6000	6	1/4 X 6

ADJUSTABLE TRIP

24. Instantaneous Trip — All circuit breakers with an adjustable instantaneous tripping means are marked to indicate at least the minimum and maximum trip settings. This marking can either be in amperes or a percentage of the breaker's ampere rating. If it is an interchangeable trip unit, the marking may be on the trip unit.

25. Type A and Type B — A Type A adjustable circuit breaker can be repeatedly field adjusted for all changeable characteristics. A Type B adjustable circuit breaker — once set to a particular continuous current rating — cannot be adjusted to a higher value. The Type A breaker is marked with a single ampere rating and percentage, or similar markings, or with current markings for each continuous current adjustment setting. The Type B breaker can be marked with the ampere rating to which it is set. The ampere marking is to be applied by the installer at the time the breaker is set. The notations —Type A and Type B—are not required to be marked on the breaker. They are designations used to determine how to evaluate the breakers.

26. Adjustable Controls — Each control of an adjustable circuit breaker is marked to indicate its function and setting points.

SPECIAL MARKINGS

27. Non-Conducting Enclosure — A circuit breaker not intended for use in a metal enclosure is marked "Suitable for use in a non-conducting enclosure only."

28. Ventilated Enclosure — A circuit breaker for use in a ventilated enclosure is marked to identify the enclosure or to indicate the proper enclosure size, and location and size of the ventilating openings.

29. 40°C — A thermal-magnetic circuit breaker that is suitable for use in ambients up to 40°C is

marked “40°C.” Circuit breakers with electronic type trip units are not affected by the ambient temperature and are not required to be marked to indicate the suitability. These devices may be used in a 40°C ambient unless marked 25°C.

30. Current Limiting — A circuit breaker that meets UL requirements for current limiting is marked “Current Limiting.” The breaker is also marked with the peak current (I_p) and I^2t let-through and related frequency, or to reference a publication available from the manufacturer with this same information. These let-through current curves indicate the let-through currents versus prospective fault current across the range from the threshold level, where the breaker starts to exhibit current limiting characteristics, to the maximum interrupting rating, with at least one intermediate point also indicated. UL’s definition of a current limiting breaker is one that does not use a fusible element and, when operating within its current limiting range, limits the let-through I^2t to less than the I^2t of a 1/2-cycle wave of the available symmetrical current.

31. Class CTL — Circuit breakers for Class CTL panelboards or assemblies are marked “Class CTL” or “CTL.” A Class CTL breaker, because of its size or configuration in conjunction with the physical means provided in Class CTL panelboards, prevents more circuit breaker poles from being installed than the number for which the assembly is designed and rated. A Class CTL panelboard is a circuit limited panelboard. Both “half-sized” and “full-sized” breakers may be marked “Class CTL.” When properly installed, Class CTL circuit breakers will comply with the Lighting and Appliance Branch-Circuit Panelboard requirements in previous editions of the National Electrical Code.

32. “Delta” — A delta breaker is a 3-pole — 3-phase circuit breaker intended to have two poles connected to a bus structure and a third pole isolated, and is marked “For Replacement Use Only.”

33. 2-Pole — 3-Phase Rated — A 2-pole circuit breaker marked “1-Phase — 3-Phase” or “1Ø — 3Ø” may be used on 3-phase, corner-grounded delta circuits, or on single-phase circuits.

34. 3-Pole — 1-Phase Rated — 3-pole circuit breakers are suitable for use on 3-phase systems only, unless marked to indicate use on 1-phase systems, such as, “For 1-phase connections, use two outside poles,” or an equivalent statement. A 3-pole breaker may be used in place of a 2-pole breaker on a 3-phase system, such as a 2-pole breaker used in a branch circuit that is actually two legs of a 3-phase system, and is acceptable without the 3-pole breaker being specifically marked.

35. 4-Pole — 3-Phase Rated — 4-pole circuit breakers are suitable for use on 3-phase systems where a switched neutral is required. The fourth pole is provided either without overcurrent protection or with overcurrent protection of 50 or 100 percent of the other poles. The fourth (neutral) pole of a 4-pole circuit breaker is marked “Protection — % In”. The percentage indicated is 0, 50 or 100.

36. Multi-Wire Circuit — A multi-pole circuit breaker intended for use in a multi-wire circuit only is marked with a combination voltage rating only, such as 480Y/277 V ac, provided a 3-pole breaker intended only for use in a single-phase multi-wire circuit includes in its marked voltage rating the term “1-phase” or an equivalent.

37. DC Rated 3-Pole — A 3-pole circuit breaker rated 250 V dc or less is acceptable for use in DC voltage systems, when marked to indicate its DC voltage rating and it is necessary to use two of the poles to control the circuit. Three-pole breakers rated more than 250 V dc are generally intended to be connected with all three poles in series and are marked with a wiring diagram indicating that all three poles should be wired in series.

38. 100 Percent Continuous Rated — Unless otherwise marked for continuous use at 100 percent of its current rating, a circuit breaker is intended for use at no more than 80 percent of its rated current where in normal operation the load will continue for three hours or more. A breaker with a frame size of 250 A or more, or a multi-pole breaker of any current rating greater than 250 V, may be marked to indicate it is suitable for continuous use at 100 percent of its current rating. The marking is “Suitable for continuous operation at 100 percent of rating only if used in a circuit breaker enclosure Type ____ or in a cubicle space _____ by _____ by _____ inches” or an equivalent statement. This type of breaker may also be marked to indicate it is to be used with wire sized for a 75°C conductor with 90°C insulation and used with 90°C wire connectors.

39. “SWD” — A circuit breaker rated 15 or 20 A, 347 V ac or less, may be marked “SWD” and is suitable for switching fluorescent lighting loads on a regular basis.

40. Independent Trip — A 2-pole circuit breaker that does not have an internal common trip feature is marked “Independent Trip” or “No Common Trip.” An external handle tie alone does not qualify as a common trip mechanism — a breaker of this type is marked to indicate it is an independent trip breaker.

41. Special Characteristics — If the proper operation of a circuit breaker depends on a special characteristic, such as polarity or position, the breaker is marked to indicate this characteristic. If this includes a barrier, shield or similar member, the breaker is marked with all the necessary information. If it is necessary to replace a part, such as a barrier or shield, the marking also includes replacement instructions.

42. For Replacement Not CTL — The marking “For replacement use only not CTL assemblies” appears on breakers that do not have means to prevent their installation in Class CTL assemblies. These breakers are intended for replacement in older assemblies still in service, which pre-dates the Class CTL requirements for circuit breakers and panelboards.

43. Special Purpose Not General — Circuit breakers marked “Special purpose not for general use” have special features limiting their suitability to specific applications. Instructions are provided by the manufacturer detailing these applications.

44. “HID” — A circuit breaker rated 50 A maximum, 480 V or less, and intended to switch high intensity discharge (HID) lighting loads on a regular basis is marked “HID.”

45. Remotely Operated Circuit Breaker—A circuit breaker that can be opened remotely, such as by a utility, for purposes of shedding loads. These circuit breakers are marked “Remotely Operated” and are provided with a separate label marked: “Remotely-operated circuit breaker installed in this equipment” with instructions for attaching the label to the equipment.

FUSED CIRCUIT BREAKERS

46. Line and Load Identification — All fused circuit breakers are marked “Line” and “Load.” The “Load” marking is on the same side of the contacts as the fuses or high-fault protectors.

47. Identification of Fuses — All fused circuit breakers are marked to indicate the fuses or high-fault protectors with which they are to be used.

48. No Open Fuse Tripping — Any fused circuit breaker that does not trip automatically on clearing of one or more of the fuses or high-fault protectors is marked “Open Fuse Tripping Not Provided,” or an equivalent statement.

49. General Markings — These circuit breakers are marked as outlined for all breakers. See Items 1-4, 6-7, 14-23, 29-36, 39-42, 45-46 and 72-75.

CIRCUIT BREAKER/GROUND FAULT CIRCUIT INTERRUPTER

50. “Test” Function — The “Test” switch on a circuit breaker and ground fault circuit interrupter (CB/ GFCI) is marked to identify its purpose. When the test switch is depressed, a current simulating a ground fault is caused to flow and this should cause the internal mechanism to function to trip the breaker.

51. “Class A” Marking — All CB/GFCIs are marked “Class A,” indicating that the CB/GFCI has a ground fault trip threshold of 6mA maximum.

52. Instructions — All CB/GFCIs are provided with: instructions for the installer and user, including instructions on the proper use of the supervisory (test) circuit; and the need to test the device at least once a month. Also included in a marking on the CB/GFCI, or in literature supplied with the CB/GFCI, is information indicating that the user is not protected if contact is made with more than one circuit conductor.

53. Terminal Identification — At least three of the four terminals of a single-pole CB/GFCI and all but one of the terminals of a multi-pole CB/GFCI are identified. The terminals to the grounded conductor are white or gray; the terminals for the ungrounded conductors are a contrasting color. The color green cannot be used.

54. General Markings — These circuit breakers are also marked as outlined for all breakers. See Items 1-7, 14-20, 29, 31, and 39-42.

CIRCUIT BREAKER/EQUIPMENT GROUND FAULT PROTECTION

55. “Test” Function — The “Test” button on a circuit breaker with equipment ground fault protection (CB/ EGFP) is marked to identify its purpose. When the test button is depressed, a current simulating a ground fault is caused to flow and this should cause the internal mechanism to function to trip the breaker.

56. Trip Level Marking — All CB/EGFPs are marked to indicate the ground fault trip threshold of the device, in milliamperes.

57. Instructions — All CB/EGFPs are provided with instructions for the installer.

58. Terminal Identification — All but one of a CB/EGFPs terminals are identified. The terminals to the grounded conductor are white or gray; the terminals for ungrounded conductors are a contrasting color. The color green cannot be used.

- 59. Use Marking** – A CB/EGFP shall be marked “Equipment Protection Only”
- 60. General Markings** — These circuit breakers are also marked as outlined for all breakers. See Items 1-7, 14-20, 29, 31, 39-42 and 73-76.

CIRCUIT BREAKER SURGE-PROTECTIVE DEVICE

- 61. Types** – These devices are marked Type 1, 2 or 3 which delineates the appropriate installable location within the electrification system.
- 62. Voltage Protection Rating** — These devices are marked with a surge voltage protection rating.
- 63. Maximum Continuous Operating Voltage Rating (MCOV)** – These devices are marked in volts, for Type 1 and 2 SPDs at both line-to-line and line-to-neutral.
- 64. Nominal Discharge Current (In) Rating** - in amps or kA for Type 1 and 2 SPDs.
- 65. Short-circuit Current Rating (SCCR)** - in amps or kA for Type 1 and 2 SPDs.
- 66. General Markings** — These circuit breakers are also marked as outlined for all circuit breakers. See Items 1-7, 14-21, 29, 31, 39-42, and 43.

HIGH-FAULT PROTECTORS AND ACCESSORY HIGH-FAULT MODULES

- 67. Type Designation** - All high-fault protectors and modules are marked with their type designation.
- 68. Manufacturer’s Name** - All high-fault protectors and modules are marked with the manufacturer’s name, trademark, or other recognized means for identifying the manufacturer.
- 69. Terminations** - All high-fault modules are marked with their wire termination information. See Item 15-22.
- 70. Circuit Breaker** - All high-fault protectors and modules are marked to indicate the circuit breakers with which they are to be used.
- 71. Interrupting Rating** — All high-fault protectors and modules are marked to indicate their interrupting rating for which the protector and/or module and corresponding circuit breaker were investigated. The marking includes the words “Interrupting Rating” or “Current Interrupting Rating” and may include “Maximum RMS Symmetrical,” or an abbreviation. If the interrupting rating includes more than one current and associated voltage rating, all values of voltage and corresponding interrupting rating are marked. If more than one interrupting rating is marked, all ratings appear together.

ACCESSORIES

72. Ratings — All circuit breakers provided with accessories are marked to identify the accessories installed. This includes the accessory type, electrical ratings and proper connections, if the connections are not obvious. The electrical ratings include the voltage rating, and ac or the frequency in Hertz, dc, or both, as appropriate for all accessories. For alarm and auxiliary switches, the marking also includes either an ampere or pilot-duty rating. For shunt trip accessories, over- and under-voltage trip accessories and electrical operators, the marking also includes either an ampere or VA rating.

73. Shunt Trip — A circuit breaker provided with a shunt trip accessory intended for use with ground fault sensing and relaying equipment is marked to indicate the specific equipment with which it is to be used. As an option, it may be marked to indicate the voltage and frequency, or dc, of the tripping circuit; the rated tripping current at rated voltage; and “Suitable for Ground Fault Protection when combined with Class 1 (or manufacturer and catalog number) Ground Fault Sensing and Relaying Equipment,” or an equivalent statement.

74. Separately Shipped — If a circuit breaker and accessory are shipped separately, the accessory is marked to indicate the manufacturer’s name or trademark, catalog number and electrical ratings. Where there is no space for a permanent marking on the accessory, it is marked with some type of identification that references a removable tag or other type of alternate marking. Instructions are furnished with the accessory indicating the specific breakers with which it is to be used. A marking label indicating the installed accessory and its connections is furnished with the accessory, along with instructions indicating that the label should be attached to the breaker when installed. Installation and wiring instructions are also provided unless the proper installation is obvious.

75. External Dropping Resistor — A circuit breaker is marked to indicate when an external dropping resistor is intended to be used between the line terminals of the breaker and the line terminals of an under-voltage trip device. The marking also includes the manufacturer’s name, catalog number and the resistor’s electrical ratings.

CIRCUIT BREAKER ADAPTERS

76. Type Designation — All circuit breaker adapters are marked with their Type designation.

77. Manufacturer’s Name — All circuit breaker adapters are marked with the manufacturer’s name, trademark or other recognized means for identifying the manufacturer.

78. Terminations — All circuit breaker adapters are marked with their wire termination information. See Items 15-22.

79. Circuit Breaker — All circuit breaker adapters are marked to indicate the breakers with which they are to be used.

80. Instructions — All circuit breaker adapters are provided with installation instructions to guide the installer. A marking label indicating the adapter that has been installed is also furnished, along with instructions that the label should be attached to the breaker when installed.

CIRCUIT PROTECTORS

Circuit protectors are designed for installation in standard Edison base fuseholders and intended to provide overcurrent protection for services and branch circuits. They are not provided with manual “On” and “Off” switches, but do have a trip-free manual reset to reclose the circuit after automatic opening from overload or short circuit. They are suitable for use on circuits where the available fault current does not exceed 5000 A RMS symmetrical.

- 81. **Manufacturer’s Name** — All circuit protectors are marked with the manufacturer’s name, trademark or other recognized means for identifying the manufacturer.
- 82. **Voltage Rating** — All circuit protectors are marked with a voltage rating.
- 83. **Ampere Rating** — All circuit protectors are marked with a current rating.
- 84. **Reset Instructions** — All circuit protectors are marked with instructions for resetting the protector after it has tripped.

CIRCUIT BREAKERS FOR USE IN COMMUNICATIONS EQUIPMENT

- 85. **Ambient Operating Temperature** — Some circuit breakers for use in communications equipment have been investigated for use in ambient air at temperatures greater than 40°C. These circuit breakers are marked with either the intended operating ambient temperature or a range of temperatures.
- 86. **Wire Insulation Temperature Rating** — Circuit breakers for use in communications equipment that have been investigated for use in ambient temperatures greater than 40°C and that require use with wire having insulation temperature ratings greater than 75°C are marked with the temperature rating of the wire that should be connected to it. The ampacity of the wire should be as specified for 75°C.
- 87. **Same Polarity** — Circuit breakers for use in communications equipment that have accessories are marked “SAME POLARITY” when that is required to maintain spacings between the primary circuit and the accessory circuit.
- 88. **General Markings** — These circuit breakers are also marked as outlined for breakers. See items 1-7, and 14-21.

MOLDED CASE CIRCUIT BREAKERS ALSO LISTED AS COMBINATION TYPE ARC-FAULT CIRCUIT INTERRUPTERS

- 89. **Device Identifier** — These devices are marked with words “Combination Arc-Fault Circuit Interrupter” or “Combination AFCI” where visible with a dead-front removed while the device is installed so that the device will not be mistaken for a circuit breaker and GFCI.
- 90. **“TEST” Function** — The “TEST” switch on an arc-fault circuit interrupter is marked to identify its purpose. When the test switch is depressed, a signal that simulates an arc such that the arc detection circuit or software is caused to detect the simulated arc and this should cause the mechanism to function to trip the breaker.

91. Instructions — Combination Arc-Fault Circuit Interrupters are provided with installation instructions that tell the user the proper method of installing the device.

92. General Markings — These circuit breakers are also marked as outlined for all breakers. See items 1-7, 14-21, 29, 31, and 39-42.

MOLDED CASE CIRCUIT BREAKERS ALSO LISTED AS BRANCH/FEEDER TYPE ARC FAULT CIRCUIT INTERRUPTERS

93. Device Identifier — These devices are marked with words “Branch/Feeder Arc-Fault Circuit Interrupter” or “Branch/Feeder AFCI” where visible with a dead-front removed while the device is installed so that the device will not be mistaken for a circuit breaker and GFCI.

94. “TEST” Function — The “TEST” switch on an arc-fault circuit interrupter is marked to identify its purpose. When the test switch is depressed, a signal that simulates an arc such that the arc detection circuit or software is caused to detect the simulated arc and this should cause the mechanism to function to trip the breaker.

95. Instructions — All arc-fault circuit interrupters are provided with instructions for the installer and user, including wiring instructions, correct operation and test instructions.

96. General Markings — These devices are also marked as outlined for all breakers. See 1-7, 14 -21, 29, 31, and 39-42..

CLASSIFIED MOLDED CASE CIRCUIT BREAKERS FOR USE IN SPECIFIED EQUIPMENT

97. Classified Only and Compatibility List - A circuit breaker that is Classified only is marked on the side with the statement:

"Classified for use only in specified panelboards where the available short-circuit current is 10 kA, 120/240 volts ac or less. Do not use in equipment connected to circuits having an available system short-circuit current in excess of 10 kA, 120/240 volts ac. For catalog numbers (or equivalent) of specified panelboards, refer to Publication No. _____ provided with this circuit breaker. If additional information is necessary, contact [Classified circuit breaker manufacturer's name]."

98. Classified and Listed Compatibility List - A circuit breaker that is both Classified and Listed is marked on the side with the statement:

"This circuit breaker is Listed for use in circuit breaker enclosures and panelboards intended and marked for its use. This circuit breaker is Classified for use, where the available short-circuit current is 10 kA, 120/240 V ac or less, in the compatible panelboards shown in Publication No. _____ provided with this circuit breaker. When used as a Classified circuit breaker, do not use in equipment connected to circuits having an available system short-circuit current in excess of 10 kA, 120/240 V ac. If additional information is necessary, contact [Classified circuit breaker manufacturer's name]."

99. Compatibility List - The referenced publication is a compatibility list which tabulates the company name, catalog number, number of poles and electrical ratings of the Classified circuit

breaker, in addition to the company name and catalog number of the applicable UL Listed panelboards, and corresponding UL Listed circuit breakers in place of which the Classified circuit breaker has been investigated. The compatibility list also details the maximum permissible voltage and maximum available short circuit current of the supply system to the panelboard. The Classified circuit breaker is not suitable for the specified application if the system supply characteristics exceed the maximum values indicated in the compatibility list. One copy of the compatibility list is provided with each circuit breaker.

100. Classification and Listing Mark - Circuit breakers that are both Classified and Listed have markings as above, with the addition of the Listing Mark, located on the side of the circuit breaker.

The following mark:  appears on the front, visible surface of the circuit breaker.

101. General Markings- These circuit breakers are also marked as outlined for all breakers. See items 1-7, 14-21, 39-40, 42-43, 51-66 and 89-96.

MOLDED CASE CIRCUIT BREAKERS FOR USE IN PHOTVOLTAIC (PV) SYSTEMS

102. Voltage Rating - These circuit breakers are marked with a voltage rating up to 1000 V dc maximum

103. PV marking - These circuit breakers or circuit-breaker enclosures are marked "Photovoltaic" (or "PV") and may, in addition, be marked "Suitable for Use in Photovoltaic Systems in Accordance with Article 690 of the NEC," or equivalent.

104. Multi-pole PV Circuit Breakers - A multi-pole PV circuit breaker or PV circuit-breaker enclosure is intended for individual circuits on each pole unless specifically marked with a diagram and/or other verbiage detailing the correct electrical connections.

105. Temperature Rating - PV circuit breakers are marked "50°C."

106. Wire Range and Type - PV circuit breakers are marked with the applicable wire range, wire type, and stranding if different from building wire, temperature rating of the wire, and torque ratings for the pressure-wire terminations. For the wire type, the following abbreviations are used: copper (Cu), solid (sol), stranded (str). A breaker may, instead, be marked with the minimum size bus bar with which it can be used.

107. General - These devices are also marked as outlined for all breakers. See 1-7, 10-15, 17-23, 27, 28, 41, and 45.

LOCATION

General — All circuit breaker markings are assigned a location code indicating where a marking is to be applied on the breaker. The location codes are assigned a letter A through K, with A being the highest order and K the lowest. At the manufacturer's option, a higher order location code may be used for a marking.

Location Codes — The location codes are:

- A. The marking is visible without removing the trim or cover.
- B. The marking is visible without disassembling the device, when the trim or enclosure cover is removed, and may be visible with the trim or cover in place.
- C. The marking may be on any convenient location except the rear of the breaker.
- D. The marking need only be visible after removal of the CB frame cover, or the equivalent.
- E. The “TRIPPED” or “RESET” markings are not required on the breaker if the receiving device is so marked.
- F. For electrically operated breakers, the “ON” and “OFF” markings are not required on the breaker if the electrical operator is so marked.
- G. The “part replacement” marking does not need to be visible when the removable part is installed.
- H. The marking is visible when the wire connector is in place.
- I. The fuse or protector identification is to be visible when the cover over the fuse or protector compartment is removed.
- J. The marking or information may be shipped with the breaker.
- K. For breakers 1-1/2 inches wide per pole or less, the marking may be located at any convenient location except the rear of the breaker.

CIRCUIT BREAKER MARKINGS

The following gives the marking and associated location category.

GENERAL

Type Designation	B
Manufacturer's Name	B
Voltage Rating	B
Ampere Rating (more than 100 A)	B
Ampere Rating (100 A or less)	A
Line and Load Identification	B

POSITION INDICATION

On and Off (Open and Closed)	A

APPENDIX A
UL MOLDED CASE CIRCUIT BREAKER PRODUCT CATEGORIES

UL does list these types of devices and continues to develop new product categories to address the safety issues associated with these types of devices. Below is a list of product categories that UL currently lists to address these types of products. Each product category is tabulated with a UL Category Code. By clicking on the code, you will be linked to the UL Guide Information for the category and any Listings or Classifications under that Product Category in the UL Online Certifications Directory database at www.ul.com/database. The table also identifies the sections of this Marking Guide that are applicable.

Category Code	Category Name	Marking Guide Sections
AVZQ	Molded case circuit breakers also Listed as Branch/Feeder type Arc Fault Circuit Interrupters	94-97

Marking and Application Guide

PANELBOARDS

JANUARY 2013

PREFACE

Panelboards are no longer a simple assembly of switches, fuses and circuit breakers for single ampere and voltage systems. Today, there are panelboards for a variety of electrical supply systems with overcurrent protections for many short-circuit capabilities. This has resulted in a complex marking system.

UL developed the Panelboard Marking Guide for electrical inspectors, electric utilities, contractors, installers, users, designers, and other interested parties to aid in understanding panelboards and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation of panelboards used in ordinary locations, rated 600 volts or less. These panelboards are intended to be installed in accordance with the *National Electrical Code*® (NEC®) and their listing. These markings are required by UL 67, and are part of the listing.

The term “panelboard” used in this booklet also applies to modular panelboards unless otherwise noted.

The Table of Contents lists the main headings and their page numbers. The Index gives an alphabetical list of specific items and the section numbers where information about them can be found. Marking guides are available for Deadfront Switchboards and Molded Case Circuit Breakers.

Complete information regarding the provision of markings and instructions for these panelboards is contained in the Standard for Panelboards, UL 67. Unless otherwise noted, references to the *National Electrical Code*® (NEC) are to the 2011 edition.

Revisions to the 2008 edition of the NEC resulted in panelboards no longer being classified as “Lighting and Appliance Branch-Circuit Panelboards” and “Power Panelboards”, and the 2008 NEC no longer limits the number of overcurrent devices in a lighting and appliance branch-circuit panelboard to 42 circuits. Requirements in UL 67 permit manufacturers to identify “Class CTL” panelboards as those with a physical means to prevent the installation of more than 42 overcurrent devices (or if fewer than 42, that number for which the panelboard was designed and rated). Since existing optional requirements and legacy products continue to be utilized based on NEC requirements that were part of the 2005 and earlier editions, multiple references in this marking guide identify the earlier edition of the NEC as being the relevant NEC requirement.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web Site at <http://www.ul.com/codeauthorities>.

Your comments or suggestions are welcome and appreciated. They should be sent to:

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers in determining the suitability of panelboards in a particular installation and use, and to address concerns related to fire, shock, and mechanical hazards.

Products are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Additional information on marking requirements can be found in the guide information for Panelboards (QEUY) and Modular Panelboards (QFOF), which is located in the UL White Book and online at www.ul.com/database.

QEUY

QFOF

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

The numbering for code sections used in this document may change as the specific code is updated.

Additional information can be found at www.ul.com.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of power distribution equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified.”

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on power distribution equipment. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL’s *safety* requirements. These requirements are primarily based on UL’s own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word “Listed,” the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word “Classified,” a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

FIELD EVALUATIONS

You may encounter situations in which you are unable to determine if a product has been listed by a third-party organization. Or in other situations you might encounter a product bearing a listing label that may have been modified in the field, and now you question whether or not the product still complies with the applicable standard. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors, and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL’s Web site at www.ul.com/field.

1. GENERAL INFORMATION

The evidence of Listing is the Listing Mark on the product. The Listing Mark for panelboards includes the name and/or symbol of UL, together with the word “Listed,” a control number, and one of the following product names as appropriate: “Panelboard,” “Enclosed Panelboard,” and “Marine, Enclosed Panelboard For Use on Vessels Over 65 Feet.” The product name may include the wording “Class CTL” or “Suitable for Use as Service Equipment” where appropriate. The product name “Enclosed Panelboard” covers both the panel and enclosure with which it is provided.

The product names for modular panelboards are “Panelboard Module” and “Panelboard Accessory Module.”

The basic Standard used to investigate products in these categories is the Standard for Panelboards, UL 67. In addition, each accessory module in a modular panelboard system is investigated in accordance with the applicable UL Standard.

Panelboard markings may be molded, die-stamped, paint-stenciled, stamped, etched in metal that is permanently secured, or printed on a label secured by adhesive and located so that it will not be covered when the units are installed. Some markings may be located on a wiring diagram in a pocket within the panelboard.

2. GLOSSARY

Ampacity - The current in amperes a conductor can carry continuously under the conditions of use without exceeding its temperature rating.

Bonding - The permanent joining of metallic parts to form an electrical conductive path that ensures electrical continuity and the capacity to conduct safely any current likely to be imposed.

Bonding Jumper - A reliable conductor to ensure the required electrical conductivity between metal parts required to be electrically connected.

Bonding Screw - A screw that is used as a bonding jumper.

Cabinet - An enclosure designed for either surface mounting or flush mounting and is provided with a frame, mat, or trim in which a swinging door or doors are or can be hung.

Cartridge Fuse - A fuse consisting of a current-responsive element inside a fuse body with contacts on both ends.

Circuit Breaker - A device designed to open and close a circuit by nonautomatic means, and to open the circuit automatically on a predetermined overcurrent without damage to itself when properly applied within its rating.

Class CTL Panelboard - A panelboard that has physical means to prevent the installation of more than 42 overcurrent devices, or if fewer than 42, that number for which the panelboard was designed and rated. Note - When properly installed, Class CTL panelboards will comply with the

Lighting and Appliance Branch-Circuit Panelboard requirements in previous editions of the National Electrical Code.

Continuous Duty - Operation at a substantially constant load for an indefinitely long time.

Current-Limiting Device (AC) - An overcurrent protective device that, when interrupting currents in its current-limiting range, will reduce the current flowing in the faulted circuit to a magnitude substantially less than that obtainable in the same circuit if the device were replaced with a solid conductor having a comparable impedance.

Current Rating - The designated maximum direct or alternating current in rms A at rated frequency that a device can carry continuously under specified conditions.

Cutout Box - An enclosure designed for surface mounting that has swinging doors or covers secured directly to and telescoping with the walls of the box proper.

Device - A unit of an electrical system that is intended to carry or control, but not utilize, electrical energy.

Enclosed Panelboard - An assembly of buses and connections, overcurrent devices, and control apparatus with or without switches, or other equipment, installed in a suitable cabinet, cutout box, or enclosure suitable for a panelboard application.

Enclosed Recreational Vehicle (RV) Panelboard – An enclosed panelboard intended to be installed in a recreational vehicle (RV) in accordance with Article 551 of the National Electrical Code, ANSI/NFPA 70.

Enclosure - A surrounding case constructed to provide a degree of protection to personnel against incidental contact with the enclosed equipment and to provide a degree of protection to the enclosed equipment against specified environmental conditions.

Filler Plate – A plate intended to close an opening that would otherwise be closed by the subsequent installation of a circuit breaker or other device.

Flush-Mounted (Type) - A device designed to be set into and secured to a flat surface, with a minimal front projection.

Frame Size - A term applied to a group of molded case circuit breakers of similar physical configuration. Frame size is expressed in amperes and corresponds to the largest ampere rating available in the group. The same frame size designation may be applied to more than one group of circuit breakers.

Fuse - A non-resettable protective device which opens a circuit during specified overcurrent conditions by means of a current responsive element or elements.

Fuse Clips - The contacts of the fuseholder that support the fuse and connect the fuse terminals with the circuit.

Fusible Switch - A switch in which one or more poles have a fuse in series in a composite unit.

Fuseholder - An assembly of a base, fuse clips, and necessary insulation for the mounting and connecting of a fuse into a circuit.

Ground-Fault Protection of Equipment - A system intended to provide protection of equipment from damaging line-to-ground fault currents by operating to cause a disconnecting means to open all ungrounded conductors of the faulted circuit. This protection is provided at current levels less than those required to protect conductors from damage through the operation of a supply circuit overcurrent device.

Grounded Conductor - A system or circuit conductor that is intentionally grounded.

I^2t (Ampere Squared Seconds) - An expression related to the circuit energy as a result of current flow. The " I^2 " stands for the square of the effective (rms) let-through current and the "t" stands for the time of current flow in seconds. " I^2t " is a common expression for the circuit energy between the initiation of the fault current and the clearing of the circuit.

Interrupting Rating - The highest current at rated voltage that a device is intended to interrupt under standard test conditions.

Knockout - A portion of the wall of an enclosure so fashioned that it is capable of being readily removed by a hammer, screw driver, and pliers at the time of installation in order to provide an opening or hole for the attachment of a raceway, cable, or fitting.

Lighting and Appliance Branch Circuit Panelboard - A lighting and appliance branch circuit panelboard is one having more than 10 percent of its overcurrent devices protecting lighting and appliance branch circuits. Such circuits have a connection to the neutral of the panelboard and overcurrent protection of 30 A or less in one or more conductors.

Mains (Main Terminals) - The terminals, or main device, provided for the connection of the main incoming line conductors.

Neutral (Assembly); Solid Neutral - An assembly consisting of enough terminals to provide for the connection of the grounded (neutral) line and load conductors. When used as a component of service equipment, the neutral also includes the following: a) a means for making the required bonding connection between the neutral and the enclosure; and b) a terminal for the grounding electrode conductor.

Neutral Conductor - A conductor that is connected to the midpoint of a three-wire single-phase system, the center point of a wye-connected three-phase system, or the midpoint of one side of a delta-connected three-phase system. Note: The neutral conductor is the grounded conductor.

Overcurrent Protective Device - An individual fuse or circuit breaker pole.

Panelboard - A single panel or a group of panel units designed for assembly in the form of a single panel; includes buses, automatic overcurrent devices, and may be equipped with switches for the

control of light, heat, or power circuits; designed to be placed in a cabinet or cutout box placed in or against a wall or partition and accessible only from the front.

Plug Fuse - A screw-in type fuse for use in an Edison base type fuseholder.

Power Panelboard - A power panelboard is one having 10 percent or fewer of its overcurrent devices protecting lighting and appliance branch circuits.

Pressure Wire Connector - A reusable connector into which the conductor (wire) is secured by mechanical pressure applied by an integral screw, cone, or other mechanical parts.

Pullout Switch - A switch, enclosed or nonenclosed, that is operated to open a circuit by manually separating the movable contact from the stationary contact, and is operated to close a circuit by manually reconnecting the movable contact and the stationary contact.

Recreational (RV) Panelboard – A panelboard installed in a recreational vehicle (RV) in accordance with Article 551 of the NEC.

Service - The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

Service Equipment - The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s), and their accessories, connected to the load end of service conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply.

Short-Circuit-Current Rating - The maximum rms available current to which a device can be connected. The rating is expressed in amperes and volts.

Switch - A device, manually operated, unless otherwise designated, for opening and closing or for changing the connection of a circuit.

Symmetrical Current - Alternating current having no offset or transient component and, therefore, having a wave form essentially symmetrical about the zero axis. Symmetrical current is expressed in terms of rms A.

3. MANUFACTURER'S IDENTIFICATION

If there is a question on the design or construction of a panelboard, the identification of the organization responsible for the product is important. This is one of the basic markings required by Section 110.21 of the National Electrical Code® (NEC).

For manufacturers who produce panelboards at more than one factory, UL also requires a distinctive marking to identify the factory at which the panelboard was made. This information is generally found on the UL Listing label. It enables the manufacturer to pinpoint problems and take immediate action.

UL requires the manufacturer's identification be visible without disturbing interior parts and factory or field installed wiring. Whether the marking appears on an inside wall of the enclosure or on the side of a barrier, the manufacturer's identification must be located near the front edge of the box or barrier.

4. CATALOG DESIGNATION

Panelboards are marked with a catalog number, a general type designation, or other distinctive marking identifying the particular panelboard construction. Additional designations are provided on modular panelboards.

5. ELECTRICAL RATING

UL requires that the basic electrical rating markings be visible without disturbing wiring or other interior parts. Electrical rating information includes voltage and ampere ratings. For alternating current ratings, the information includes the number of phases, if other than single phase, and the frequency, if other than 50 or 60 hertz.

6. VOLTAGE RATING

The basic voltage rating markings must be visible without disturbing wiring and other interior parts. A panelboard designed and intended for use only on a supply circuit involving two different potentials (for example, 120/240 volts, three-wire; or 208Y/120 volts, three-phase, four-wire) is so marked.

In many cases, however, the basic voltage rating marking — for example, 480 volts, 3-phase — indicates that the panelboard is suitable for various supply systems (such as 208Y/120 volts, 3-phase, 4-wire; 120/ 240 volts, 3-wire; 240/120 volts, 3-phase, 4wire delta, etc.). These voltage ratings may be shown on a wiring diagram affixed to the panelboard or its enclosure.

A single-phase, 3-wire panelboard is not permitted to be marked with a 120/240 volt, 3-phase, 4-wire delta rating. 3-wire panelboards should not be used for this system. The use of a delta breaker to adapt a 3-wire panelboard to the system has been prohibited by Section 408.36(C) of the NEC.

Although delta breakers could be used properly in 3-wire, split-bus panelboards, they were being misused in 3-wire panelboards with a single main disconnect.

Misusing delta breakers in this manner allows voltage to backfeed through the delta breaker load when the panelboard main disconnect is opened. This allows voltage to be present on the main bus bars when none is expected.

7. CURRENT RATING

The current rating of a panelboard is the maximum continuous current that can be supplied through the main terminals.

Unless the assembly, including the overcurrent device(s), are marked for use at 100 percent of their current rating, overcurrent protection devices should not be loaded continuously to more than 80 percent of their rating if nuisance opening of the overcurrent device is to be avoided.

The current rating of a panelboard may be supplemented by one or more reduced ratings, each applicable under specified conditions.

For example, a manufacturer may wish to provide terminals suitable for both copper or aluminum wire but space in the panelboard may not be sufficient for terminals and wire bending space. In this case, the ampere rating is reduced to compensate for the size of aluminum wire that can be used. Sometimes there is a need for a lighting and appliance panelboard with a main circuit breaker to have a current rating less than the normally required rating of the panelboard. In this case, the marked current rating is followed by the words “Maximum — See main circuit breaker rating.” This does not apply to panelboards having a main fused switch. Such panelboards are not provided with fuses when stocked. Lower rated fuses within the same case size, however, can be installed later.

A lighting and appliance panelboard marked as suitable for use as service equipment is limited to two main disconnects. To prevent overloading, the current rating of such panelboards shall equal the combined current ratings of the two disconnects as required by Section 408.36(A) of the NEC (2005 Edition) or Section 408.36, Exception 2 (2011 Edition). Where main disconnects are not provided with the panelboard, the NEC requires that main overcurrent protection be provided in the feeder circuit supplying the panelboard.

If the ampacities of the ungrounded (main) bus bars and the grounded (neutral) bus bars are not identical, the current rating markings of the panelboard are required to show the ampacity of each bus bar.

While it is unusual for the phase bars to be of different ampacities, the neutral can be a reduced size according to Section 220.61 of the NEC.

Because neutrals are often fabricated from connector bars with unusual shapes, in most cases it is not possible to judge ampacity from physical dimensions. UL conducts a temperature test on the assembly to determine ampacity.

If a panelboard employs a snap switch rated 30 amperes or less in any branch circuit, it cannot be rated more than 200 amperes unless there is a supply side overcurrent protection at 200 amperes or less within the panelboard. This requirement assumes that panelboards rated 200 amperes or less will be installed with overcurrent protection in accordance with Section 408.36(A) of the NEC.

Section 408.36(A) of the NEC was adopted years ago when snap switch panelboards were common and short circuit problems were caused by small electrical spacings between live parts and the ground within snap switches. It should be noted that this Section does not apply to snap switches rated over 30 amperes or to switches or circuit breakers that have larger electrical spacings and are suitable for use as service disconnects.

8. SHORT-CIRCUIT CURRENT RATINGS

A panelboard is required to be marked with the phrase “Short-Circuit Current Rating” and the rating in rms symmetrical amperes. This phrase indicates that (1) that the overcurrent devices are capable of opening the circuit under fault conditions; and (2) the panelboard bus structure will withstand the magnetic forces generated by fault current passing through it. These markings are provided to ensure proper installation with respect to Section 110.10 of the NEC.

Also, switches and circuit breakers under switching operations must be capable of closing in on a fault of the magnitude indicated. In addition, they must open satisfactorily on lesser faults of such magnitude that the opening of the overcurrent feature is delayed.

The letters “rms” stand for root-mean-square. This is the value that would be read on an ordinary ammeter. The marked short circuit current rating on the panelboard is the steady-state value of the fault current the panelboard can withstand without extensive damage.

Since the ability of an overcurrent protection device to open on fault currents is affected by the voltage rating of the circuit, a panelboard may have several short-circuit current ratings, each associated with a specific voltage rating.

Panelboards that contain watt-hour meter sockets other than those intended for use with current transformers are additionally marked with the phrase “Watt-hour meter not included in the short-circuit current rating” since the meters are not evaluated during the performance of the short-circuit current test.

Many panelboards are designed to accept various types of circuit breakers or fused switches with different interrupting ratings. Some of these ratings may be less than the panelboard ratings. Panelboards are required to be marked to indicate that the short-circuit current rating is limited to the lowest interrupting capacity of any device installed in the panelboard.

Some panelboards may be marked to indicate one or more short-circuit current ratings which are dependent on the use of specific integral or remote main overcurrent protective devices. An example of such a marking is: “When protected by _____ ampere maximum Class _____ fuse or (Manufacturer’s name and type designation) circuit breaker rated not more than _____ amperes, this panelboard is suitable for use on a circuit capable of delivering not more than _____ rms symmetrical amperes, _____ volts maximum,” or an equivalent statement.

Some panelboards are marked for installation of circuit breakers having a lower interrupting rating than the panelboard short-circuit-current rating. The circuit breakers are acceptable for use above their marked interrupting rating if used on the load side of a specific overcurrent device. In such cases, the panelboard is marked as follows (the blank spaces would be filled with the appropriate information):

1. The short-circuit current rating of this panelboard is equal to the lowest interrupting rating of any installed circuit breaker or fused switch, but not more than _____ rms symmetrical amperes at _____ volts, 3-phase, or _____ rms symmetrical amperes at _____ volts, single-phase; and

2. The interrupting rating of a circuit breaker is 5,000 rms symmetrical amperes and for a fused switch is 10,000 rms symmetrical amperes, or as marked on the device, except for the following series combination ratings:

Load Side Circuit Breakers		Line Side Circuit Breakers	Interrupting Rating
Mfr. Rating	Type Poles Amp	Mfr. Type Amp Rating	Symmet. Amp rms Volts ac Phases
Load Side Circuit Breakers		Line Side Circuit Breakers	Interrupting Rating

A load side circuit breaker may be a branch, sub-main, or an integral main used on the load side of a remote main. A line side circuit breaker or fused switch may be a sub-main, integral main, or a remote main. This series combination interrupting rating shall not exceed that of the line side circuit breaker or fused switch.

There are other markings that identify special conditions when a short-circuit current rating is applicable. These markings must be followed whenever overcurrent devices are added or replaced.

9. SUITABLE FOR USE AS SERVICE EQUIPMENT

These are the basic requirements that a panelboard rated 600 volts or less must meet in order to be used as service equipment:

- A. Service disconnecting means must be provided.
- B. Each service disconnect provided must have a switching feature that disconnects all conductors from the service-entrance conductors and that is suitable for use as a service disconnect. There is one exception: the neutral service conductor can be disconnected by removing the wires from the pressure wire connectors on the service neutral bus as noted in Section 230.75 of the *NEC*.

Disconnects and overcurrent protection which are located on the supply side of the service disconnecting means may be located behind a deadfront or screwed-on cover if:

- (1) The circuit being controlled is installed as part of the Listed panelboard,
- (2) the circuit being controlled is contained within the panelboard enclosure, and
- (3) the panelboard is marked, adjacent to the main disconnect(s) to alert the user that the main(s) does not disconnect control and instrument circuits.

In general, snap, toggle or similar switches, are not acceptable because their internal electrical spacings are too small. The exception in Section 225.36 of the *NEC* for branch circuit switches used to disconnect garages and out buildings on residential property does not apply to the service disconnects in a panelboard.

Circuit breakers, either molded case, fused, or in combination with ground fault circuit interrupters, are suitable for use as service disconnects. Other devices that are used to protect individual circuits, circuits within equipment or appliances, or circuit protectors without on and off features, are not suitable for use as service disconnects.

The removal of a plug or cartridge fuse from its fuseholder, while serving to de-energize the circuit, does not provide service disconnection. Panelboard switches, pullout switches and some industrial control switches are suitable as service disconnects. Note that pullout switches, while they serve as a fuse puller, do have switchblades and contact jaws and are tested as switches.

- C. Overcurrent protection suitable as branch or feeder protection must be provided for service conductors. Miscellaneous, miniature and micro fuses, thermal cutouts, relays and other supplementary overcurrent protection are not acceptable; however, “special purpose fuses” which are suitably rated for use as branch circuit, feeder, or service overcurrent protection may be used if:
 - 1) The fuses are non-interchangeable with fuses of incompatible ratings, and
 - 2) The panelboard is marked for use with the specific special purpose fuses.
- D. The number of service disconnects and overcurrent devices must conform to the *NEC*, Section 230.71.
- E. As required in Section 230.95 of the *NEC*, Panelboards rated for use on solidly grounded wye electrical services of more than 150 volts to ground must provide ground fault protection for each service disconnect rated 1000 amperes, or more. An exception is covered under Item 53.
- F. There must be provision for connecting a grounded service conductor and a grounding-electrode conductor. If there is a neutral bus, a means to bond the panelboard enclosure or mounting pan to the neutral bus is required unless the bus is mounted in electrical contact with the enclosure or pan.

In general, the grounding-electrode connection in service equipment is required to be made to the grounded service conductor at the neutral bar. However, Section 250.24(A)(4) of the *NEC* permits this connection to be made to the equipment grounding terminal bar, provided the main bonding jumper is a wire or a bus bar and is installed from the neutral bar to the equipment grounding terminal bar. If in a panelboard suitable for use as service equipment, the main bonding jumper wire or bus bar is provided for field installation, instructions are marked on the panelboard for proper installation of the jumper.

A panelboard with the neutral insulated from the enclosure may be marked “Suitable for use as service equipment when not more than six main disconnecting means are provided” when the following conditions are met:

- A. There must be at least one combination of switching units that can be mounted to occupy all available space for switching units; and, whether by using handle ties or similar devices, not more than six main disconnects will result (including factory-installed disconnects).

- B. With this combination of switching units, no more than six overcurrent-protective devices will be connected to each ungrounded service conductor.

Note that a panelboard marked “Suitable for use as service equipment when not more than six main disconnecting means are provided” may permit some combinations of switching units varying in ampere ratings and physical size that would exceed the six disconnect rule on a completely filled panelboard. The six disconnect rule can be exceeded if handle-ties are not installed where needed.

Panelboards marked as noted above and used as service equipment must have the neutral bonded to the enclosure as required by Section 408.3(C) of the *NEC*. These panelboards are provided with means to accomplish this bonding. When the panelboard is not used as service equipment, the neutral bonding means must not be installed. This would violate Section 250.24(A)(5) of the *NEC* and would constitute a fire hazard as noted in Item 50 of this Marking Guide.

A panelboard with the neutral factory-bonded to the enclosure is marked “Suitable only for use as service equipment. Install no more than six main disconnecting means.”

Some panelboards may have the required number of handles and service overcurrent devices, when the maximum number of the smallest units are installed and used without handles ties or similar devices. These panelboards may have the shorter marking “Suitable for use as service equipment” or “Suitable only for use as service equipment.”

Class CTL lighting and appliance panelboards without main overcurrent protection usually are not marked suitable for service equipment use. Such panelboards, with not more than 10 percent of their overcurrent devices rated 30 amperes or less, however, may be suitable for use as service equipment. They are marked “Suitable for use as service equipment when not more than six main disconnecting means are provided and when not used as a lighting and appliance branch-circuit panelboard; see Section 408.34 of the 2005 *NEC*.”

A panelboard intended for service equipment use must have the marking “Service Disconnects” near the switch or circuit breaker handles. If this is not done in the factory, pressure sensitive labels must be provided. This marking identifies the service disconnects when branch disconnects are also present. This is required by Section 230.70(B) of the *NEC*.

10. CABINETS AND ENCLOSURES

Panelboards are installed in cabinets, cutout boxes, or within compartments of other equipment, such as deadfront switchboards. Some panelboards are shipped from the factory in an enclosure designed for their use. When they are, the manufacturer is permitted to place the UL Listing Mark “Enclosed Panelboard” with or without additional modifying phrases on the assembly or use a “Panelboard” Listing Mark with or without additional modifying phrases with an “Electric Cabinet Box” Listing Mark and an “Electric Cabinet Front” Listing Mark.

Except for the panelboards intended for service equipment use discussed in Item 27, it is the responsibility of the installer to match a panelboard with an enclosure that is suitable in size and construction. The enclosure must meet the requirements of the *NEC* including wiring space, wire

bending space, and environmental conditions.

Because of the importance of grounding and bonding at service locations, UL requires that a panelboard marked as suitable for use as service equipment be identified with a particular box. Unless the panelboard cannot readily be removed from the box in which it is shipped from the factory, UL also requires that the panelboard marking identify the box or boxes with which it is intended to be used. Panelboards intended to be used in certain enclosures (i.e., for a Short-Circuit-Current Rating greater than 10,000 amperes rms symmetrical) are either marked to identify the enclosure by manufacturer's name and catalog numbers, or may identify suitable enclosure by specifying minimum overall dimensions of length, height, and width.

The suitability of an enclosure for environmental conditions for which it has been investigated is indicated by an enclosure type designation. One or more of the type designations indicated on the following pages are marked inside or outside the panelboard enclosure. This marking helps inspection authorities to judge whether an enclosure is suitable for a specific environment as mentioned in Section 110.3(A)(1) of the NEC. Enclosure type designations are coordinated with requirements in Section 110.28 of the NEC.

***See page 17 for Enclosure Types.**

An enclosed panelboard marked with an enclosure designation of Type 3, 3S, 4, 4X, 6 or 6P may additionally be marked "Raintight" or "Rainproof." An enclosed panelboard marked with an enclosure designation of Type 3R may additionally be marked "Rainproof."

Some enclosed panelboards have a semi-flush enclosure which has a flange extending from the sidewalls. This type of enclosure is intended to be mounted such that the front portion of the enclosure projects out of the wall and the rear portion extends within the wall in which it is mounted. These panelboards are marked with instructions regarding the proper overlap or flashing to be provided in the installation.

An enclosed panelboard intended for use in a Recreational vehicle is marked "Enclosed RV Panelboard" or equivalent.

For some panelboards, it is intended that unused openings in the enclosure be closed by filler plates. These panelboards are marked with the catalog number of the filler plates to be used, and the manufacturer is required to have the plates available. Use of the filler plates facilitates compliance with Sections 110.12(A) and 408.7 of the NEC, which requires unused openings in cabinets, equipment housings, etc., to be effectively closed.

11. ENCLOSURE TYPES

Type	Number Intended Use and Description
1	Indoor use primarily to provide a degree of protection against limited amounts of falling dirt.
2	Indoor use primarily to provide a degree of protection against limited amounts of falling water and dirt.
3	Outdoor use primarily to provide a degree of protection against windblown dust, rain, sleet and damage from external ice formation.
3R	Outdoor use primarily to provide a degree of protection against rain, sleet and damage from external ice formation.
3S	Outdoor use primarily to provide a degree of protection against windblown dust, rain and sleet; external mechanisms remain operable while ice laden.
4	Indoor or outdoor use primarily to provide a degree of protection against splashing water, windblown dust and rain, hose-directed water, and damage from external ice formation.
4X	Indoor or outdoor use primarily to provide a degree of protection against splashing water, corrosion, windblown dust and rain, hose-directed water, and damage from external ice formation.
5	Indoor use primarily to provide a degree of protection against settling airborne dust, falling dirt and dripping non-corrosive liquids.
6	Indoor or outdoor use primarily to provide a degree of protection against hose-directed water, the entry of water during occasional temporary submersion at a limited depth, and damage from external ice formation.
6P	Indoor or outdoor use primarily to provide a degree of protection against hose-directed water, the entry of water during prolonged submersion at a limited depth, and damage from external ice formation.
12, 12K	Indoor use primarily to provide a degree of protection against circulating dust, falling dirt and dripping non-corrosive liquids.
13	Indoor use primarily to provide a degree of protection against dust and spraying of water, oil and non-corrosive coolants.

12. PANELBOARDS WITH OVER 42 OVERCURRENT PROTECTIVE DEVICES - OPTIONAL MARKING

A marking may be applied by the manufacturer to indicate compliance with Section 408.34 of the 2005 NEC. This marking indicates that “Lighting or appliance branch circuits are not to be supplied directly through more than 10 percent of the branch circuit overcurrent protective devices.”

If applied, this marking is required to be readily visible after the panelboard has been installed and is intended to alert the installer and inspection authorities that the panelboard does not meet the requirements for lighting and appliance panelboards as described in the 2005 NEC.

13. COPPER OR ALUMINUM WIRING

Panelboards intended for use with aluminum wire require special consideration. First, panelboard wire connectors must be recognized for use with aluminum wire. Second, the size of the enclosure must be increased because aluminum wire is larger than copper wire of the same ampacity. This requires more cross sectional area for the wiring gutters and more wire bending space at terminals and where wires enter the enclosure. Third, the larger wiring terminals may make it necessary to check through-air electrical spacings between adjacent terminals of opposite polarity.

Because of these considerations, UL requires the wiring diagram or nameplate to be marked to indicate the use of copper and/or aluminum wire if the symbol “AL” appears on any part that is intended for use in the panelboard. It may be necessary to remove a cover, front or trim to see the marking.

If the panelboard has not been evaluated for use with aluminum wire, the marking will read “Use Copper Wire Only.”

If the wiring terminals and other factors have been evaluated for use with copper and aluminum wire, the panelboard is required to be marked “Use Copper or Aluminum Wire.”

If only some terminals have been evaluated for use with aluminum and copper wire with the remainder acceptable for use with copper wire only, the panelboard is required to be marked “Use copper wire only, except at terminals...” Variations of this marking are also permitted if the terminals that have been evaluated for use with aluminum wire are identified.

14. TEMPERATURE RATING OF INSTALLED CONDUCTORS

In general, the testing and construction of panelboards are based on the use of 60°C ampacities for wire size Nos. 14–1 AWG and 75°C ampacities for wire size Nos. 1/0 AWG and larger, taken from Table 310.15(B)(16) of the NEC, with no adjustment made for correction factors. Panelboards are marked to indicate temperature ratings and sizes of conductors that can be used.

If the equipment is normally intended for wire sizes within the range 14–1 AWG but is marked 75°C only or 60/ 75°C, it means that the 75°C wire may be used at full 75°C ampacity.

Higher temperature rated conductors than specified may be used if the size is based on the preceding statements. When the connection is made to a circuit breaker or switch unit within the equipment, such a unit must also be marked for the temperature rating of the conductor.

Single-phase, 3-wire panelboards may be marked for use with reduced wire sizes as indicated in Section 310.15(B)(7) and Table 310.15(B)(7) of the NEC, when installed as residential service equipment.

A panelboard not having facilities for the normal size wire may have an ampere rating that is based solely on use in accordance with the requirement. In this case, the panelboard must be marked to indicate that the rating is applicable only if the panelboard is installed as single-phase, 3-wire residential service equipment. For example, a panelboard rated “200 ampere maximum— see main circuit rating” could be designed for an enclosure that provides 6 inches of wire bending space suitable for 2/0 AWG in accordance with Table 312.6(B) of the *NEC*. The panelboard would then have to be marked to indicate that the 200 ampere rating applies only if the panelboard is installed as single-phase, 3-wire residential service equipment. With a 175 ampere or smaller main breaker installed, the panelboard could be installed elsewhere since bending space would be adequate for the wire sizes required by Table 310.15(B)(16).

15. FIELD INSTALLED UNITS OR EQUIPMENT

A panelboard to which a unit, such as a circuit breaker, switch, or the like, may be added in the field is required to be marked to identify the units that can be added. Units made by different manufacturers or of a different style are not identical in all details and therefore may not be interchangeable.

Exceptions exist for:

- 1) Classified molded-case circuit breakers rated 15 to 60 A, 120/240 V ac, that have been investigated and found suitable for use in place of other Listed circuit breakers in specific Listed panelboards. These breakers are limited for use with panelboards rated 225 A or less, 120/240 V ac. The circuit breakers are Classified for use in specific panelboards in accordance with the details described on the circuit breaker, or in the publication provided therewith. These breakers are suitable for use in equipment connected to circuits having a maximum available system short-circuit current of 10 kA.
- 2) Classified surge-protective devices (SPDs) rated 120/240 V ac, that have been investigated and found suitable for use in specific Listed panelboards. These SPDs are limited for use with panelboards rated 120/240 V ac, for use in specific panelboards in accordance with details described on the SPD, or in the publication provided therewith. These SPDs are suitable for use in equipment connected to circuits having a maximum available system short-circuit current of 10 kA. Classified SPDs will be marked with one of the following Type designations:
 - a. Type 1 – Permanently connected SPDs intended for installation between the secondary of the service transformer and the line side of the service equipment overcurrent device, as well as the load side, including watt-hour meter socket enclosures and intended to be installed without an external overcurrent protective

device.

- b. Type 2 – Permanently connected SPDs intended for installation on the load side of the service equipment overcurrent device; including SPDs located at the branch panel.

Plug-in clips and blades must be matched if poor connections and overheating are to be avoided. Additionally, over-surface and through-air electrical spacings, between live parts of opposite polarity and to grounded metal, often depend on the proper mating of units and the bases into which they are plugged or bolted.

Panelboards are usually provided with the required main line and neutral terminals. The overcurrent protection units are furnished with required load terminals. However, if the pressure wire connectors are not provided on the panelboard when shipped, the panelboard is required to be marked stating which pressure wire connectors or component terminal kits are acceptable for use with the panelboard.

A main terminal kit consisting of individual wire connectors or an assembly of terminals, bus connectors and means for bolting or plugging, is required to be marked with the manufacturer's identification and catalog designation. If this is not done, the carton is required to be marked. A separate feed-through terminal kit requires similar marking and, if a separate enclosure is required for its use, this too must be marked and provided with instructions for its use.

If a panelboard is intended to be used in a certain box or boxes and neutral terminals are mounted in that box, both the panelboard and the box are required to be marked. These markings must indicate that each shall be used with the other unless the panelboard and box are shipped together from the factory. Some column type panelboards have the neutrals mounted in a separately listed junction box. In this case, correlating markings on each device are required.

Panelboards may have multiple ratings when intended for use on systems which include a neutral. For these panelboards, the neutral may be factory or field installed where marking on the neutral assembly and panelboard correlate and installation instructions are provided. The neutral may be omitted when no line to neutral loads are served.

A panelboard that has space for the installation of additional branch circuit switches, circuit breakers or fuseholders may be shipped from the factory without the necessary branch-circuit bus bars. In this case, the panelboard must be marked to indicate the catalog number or the equivalent of the bus bar kit that is to be used when the unit is installed.

A panelboard supplied with branch-circuit bus bars for adding a branch-circuit unit is required to be marked on a wiring diagram, on the branch-circuit bus bar or in some other location. This marking indicates the ampacity of the bus bar, unless its ampacity is equal to or greater than the maximum current rating of any unit to be connected to the panelboard.

Markings on panelboards that employ plug-in units require the use of a hold-down kit when the units are back-fed and field installed supply conductors are terminated on the plug-in unit. The marking indicates: "Back-fed _____ requires hold-down kit Cat. No. _____ " or the equivalent. An identification of the applicable back-fed unit is specified in the first blank - for example, circuit breaker, fused switch, or terminal kit; and the catalog number of the required hold-down kit is specified in the second blank.

16. MODULAR PANELBOARDS

A modular panelboard system includes the following types of modules: an enclosed panelboard or a column- type panelboard, and one or more accessory modules such as termination boxes, enclosed switches, or circuit breaker enclosures. Each module of the system has one or more openings in one or more sides of the enclosure for bus bar connections, or terminals for field wiring connections to other related modules. Typical applications for these modular systems include apartment houses and strip malls. Panelboard modules used in these modular panelboard systems are labeled “Panelboard Module” and all other system modules are labeled “Panelboard Accessory Module.”

A panelboard module to which another panelboard accessory module — such as a termination box, enclosed switch, circuit breaker enclosure or the like — may be added in the field is required to be marked to identify the panelboard accessory modules that can be added unless the entire modular panelboard system is marked with a common series designation. In this case, the series designation is marked on the panelboard module and each panelboard accessory module.

17. CLASS CTL PANELBOARDS

Section 408.34 of the 2005 *NEC* defines a lighting and appliance panelboard as a panelboard having more than 10 percent of its overcurrent devices rated 30 amperes or less, for which neutral connections are provided. Once a panelboard is classified as a lighting and appliance branch-circuit panelboard, certain limitations are placed on the number of overcurrent devices that may be installed.

Section 408.35 of the 2005 *NEC* states that physical means shall be provided to prevent the installation of more overcurrent devices than the number for which the panelboard was designed, rated and approved. In no case shall the number exceed 42 (other than those provided for in the mains) in any one cabinet or cutout box. This has the effect of limiting the number of circuits in a lighting and appliance branch-circuit panelboard.

Using this concept, UL adopted the term “Class CTL” (a contraction of “Circuit Limiting”) to help electrical inspectors approve installations of lighting and appliance panelboards. Panelboards classified as lighting and appliance branch-circuit panelboards may be marked “Class CTL Panelboard” before they leave the factory.

Some panelboards that have more than 42 branch- circuit overcurrent protective devices and neutral terminals have space for field installation of extra units. This could mean more than 10 percent of the overcurrent devices will be rated 30 amperes or less when the panelboard is completely filled. In order to prevent misapplications, specific markings are permitted on panelboards of this design. See Item 30 for details.

If more than one size unit is intended for use in a lighting and appliance branch-circuit panelboard (such as a full-size and half-size circuit breaker), the smaller unit is required to be marked “Class CTL” or “CTL.” The larger may also be so marked.

Since space is limited on these units, the marking may not be visible after the unit is installed. The CTL Unit marking is of significance only in those areas where the older style non-CTL, half-size,

twin, and similar units are still available to the installer.

18. IDENTIFICATION OF PHASE ARRANGEMENT AND THREE-PHASE, FOUR-WIRE DELTA SYSTEMS

Section 408.3(E) of the NEC specifies the required phase arrangement for 3-phase buses. This Section also notes that the B-phase shall be that having the higher voltage to ground on a 4-wire delta system. This Section does allow other busbar arrangements for addition to existing installations so long as the arrangement is marked. Section 110.15 of the NEC requires markings to identify the B-phase as the higher voltage to ground on a 4-wire delta connected system when the midpoint of one phase is grounded.

Accordingly, UL requires that panelboards with other than an A-B-C bus bar arrangement be marked to indicate the bus bar arrangement. Also, UL requires that panelboards intended for a 240/120 volt, 3-phase, 4-wire, delta system be marked to identify the different bus bars with reference to the voltage between them. However, if a panelboard is intended for use only on this system, the main bus bar having the higher voltage to ground may be identified by an orange marking or by tagging. Such a panelboard must be marked to indicate the necessary voltage rating of the device for each branch-circuit position.

B-phase is 208 volts to ground while the A- and C-phases are only 120 volts to ground. Some circuit breakers, like single-pole breakers for use with handle ties rated 120-240 volts, should not be connected to the phase that is 208 volts to ground. Also, fuse holders for plug fuses should not be connected where the voltage to ground exceeds 150 volts.

Generally, the B-phase is used only in conjunction with either the A- or C-phase for a 240 volt single phase branch circuit or with both the A- and C-phase for a 3-phase branch circuit. Circuit breakers or cartridge fuses rated for straight 240 volt systems are suitable for this use.

The NEC requirements in Section 408.3(E) do not cover 3-phase panelboards having two buses and a neutral and intended for use on a 240 volt, 3-phase, 3-wire grounded B phase system. In these panelboards, the neutral is connected to the grounded B-phase. UL requires a phase arrangement of A-, C-, with the neutral as the B-phase.

19. FACTORY BONDED NEUTRALS

Some panelboards are intended only for service equipment use on an AC system requiring grounding of the system (see Items 18-21 under "Suitable for Use as Service Equipment"). These panelboards may have the enclosure bonded to the neutral at the factory. This eliminates the need for a neutral insulating support base.

It is difficult to check for unintentional grounds on the installed building wiring when the neutral is mounted directly on the enclosure. Therefore, some manufacturers provide an insulating liner under the neutral to permit use of a megger or similar resistance measurement instrument. However, this does not provide the electrical spacings required for the neutral if the panelboard is used away from the service as a feeder or branch-circuit panelboard. These panelboards are

required to be marked “Bonded Neutral — Remove bonding device for test purposes only” or an equivalent marking.

Most installers recognize the importance of bonding the neutral to the enclosure at the service. Many do not realize, however, that it is just as important to omit the bonding and provide a fully insulated neutral when the panelboard is used in non-service applications

If neutrals are bonded at distribution points on the load side of the service disconnecting means, the neutral currents take parallel paths through neutral conductors and the grounding conductor (which may include metal raceways). If neutral conductors open, the full neutral current flows over the grounding conductor system (which may include metal raceways). As a result of this loss of the neutral connection, steel raceway joints and box connections overheat, creating a potential fire hazard.

20. EQUIPMENT GROUNDING TERMINAL BAR

Section 408.40 of the NEC requires the installation and use of a terminal bar for equipment grounding conductors for panelboards used with non-metallic raceway or cable, or where separate equipment grounding conductors are provided. This terminal bar may be installed on the panelboard or its enclosure. A terminal bar assembly kit must include instructions for installation and panelboard or enclosure markings.

Unless it employs a wire-binding screw, markings must show all acceptable wire sizes and wire combinations for each terminal. A panelboard for use without equipment grounding conductors is not required to provide for a grounding terminal bar. In this case, however, the panelboard must be marked to limit its use to installations in which equipment is grounded by connection to metal raceway or metallic cable sheaths.

The equipment grounding terminal or terminal assembly in a panelboard is identified by one of the following methods:

- The terminal assembly or the heads of the terminal screws being green;
- Marking adjacent to the terminal or on the wiring diagram indicating “Equipment Grounding Terminal” or equivalent wording; or
- Marking of the grounding symbol (see below) adjacent to the terminal or on the wiring diagram along with “Equipment Grounding Terminal” or other words defining the symbol. The symbol may be used without the additional wording if markings provided with the Panelboard define the symbol.

GROUNDING SYMBOL
(IEC417, Symbol 5019)

21. GROUND-FAULT PROTECTION OF EQUIPMENT

In accordance with Section 230.95 of the NEC, a panelboard marked for use as service equipment for 3-phase, 4-wire solidly grounded wye-connected services rated in excess of 150 volts to ground but not exceeding 600 volts phase-to-phase shall be provided with ground-fault protection for each service disconnecting means rated 1000 amperes or more.

Exception No.1 for Section 230.95 of the *NEC* indicates that this does not apply to service disconnects for a continuous industrial process, where a non-orderly shutdown introduces additional or increased fire and shock hazards.

In accordance with this Exception, UL permits a Listed panelboard marked for service equipment use and rated for use on solidly grounded wye-connected electrical services of more than 150 volts to ground to omit ground-fault protection if the panelboard is marked "Suitable For Use As Service Equipment Only When Supplying A Continuous Industrial Process." This shortened wording is not intended to circumvent the need for a judgment. Inspectors concerned about the hazards of a non-orderly shutdown decide whether or not ground-fault protection is needed.

In some panelboards, only a shunt trip service disconnect is provided. In this case, the marking on the panelboards gives the manufacturer's name and the catalog number of the ground-fault protection equipment with instructions covering its interconnections.

Panelboards provided with ground-fault protection are required to be marked to indicate the circuit-main, feeder, or branch-circuit that is so protected. If a marking on the ground-fault sensing or relaying equipment is not visible from the front of the panelboard with its cover removed, a separate marking, such as on the wiring diagram, is required.

If a transformer providing control voltage for ground-fault protection is connected to the line side of the main disconnect, this disconnect may be identified as the "main." In this case, the panelboard is required to be marked "Danger — this main does not disconnect control and instrument circuits" adjacent to the main disconnect.

In a panelboard with ground-fault protection, the part of the neutral bus used for load terminations is required to be marked “WARNING — Do not connect grounding conductors to these or any other neutral terminals, to do so will defeat ground-fault protection.” This marking must be placed on or adjacent to the neutral.

22. MAXIMUM SIZE FUSEHOLDERS OR CIRCUIT BREAKERS

If the ampacity of a branch bus bar or wire is less than the maximum current rating of any fuse accommodated by a fuseholder it supplies, or if it is less than the current rating of any trip unit (including rating plugs) of an interchangeable trip circuit breaker that it supplies, UL requires a clear and permanent marking, plainly visible when the fuse or trip unit is being replaced. This prevents the use of a fuse, trip unit, or rating plug having more ampacity than a bus bar or wire.

A panelboard with branch-circuit bus bars that permit adding a branch-circuit unit, circuit breaker, switch, or fuseholder requires markings on the wiring diagram, the branch-circuit bus bars, or some other location. Markings indicate the ampacity of the bus. This marking is not required if the ampacity of the bus bar is not less than a) the maximum current rating of any unit to be connected to it; or b) the current rating of the panelboard.

23. PANELBOARDS WITH PROVISIONS FOR WATT-HOUR METERS

Separate meter sockets are required to be marked with a continuous ampere rating. In some cases, meter sockets also may have a maximum use (intermittent) ampere rating of not more than 125 percent of the continuous ampere rating. Similar markings are required for any meter mounting base in a panelboard. The continuous ampere rating may be less than the circuit that contains the meter mounting base. This means that, for example, a 125 ampere panelboard can have a meter mounting base rated “125 Amps (100 Amps Continuous).” Some inspectors may judge that a continuous duty meter socket is not needed because of a panelboard’s load diversity. Continuous duty sockets can be required when load and environmental conditions would cause overheating in panelboards.

If the socket jaws of meter mounting bases are mounted on terminals intended for field wiring, the panelboard is required to be marked to indicate the maximum torque to be applied to these terminals.

24. CIRCUIT BREAKER TRIP INDICATION

If the handle of a circuit breaker, or a simple extension of that handle, assumes other than the off position when the breaker trips, the trip position of the handle is required to be indicated. The method for resetting the breaker is also a required panelboard marking.

Marking the tripped position is not required for a separate, external operating handle that is not part of the circuit breaker. Such a handle may remain in the on position when the breaker trips. These constructions may be encountered in panelboards Listed for use in hazardous locations where operating springs in the circuit breaker mechanism do not provide sufficient tension to operate

external handles.

25. WIRING TERMINALS

Section 110.14 of the NEC, states that terminals for more than one conductor must be identified. In all cases, marking is required to identify the combinations and sizes of conductors for each terminal. Marking is not required where conductors in parallel are secured by a single wiring terminal having individual holes and set screws for each conductor.

Where conductors in parallel are secured at a terminal (one connector with one or more barrels or multiple individual wire connectors) of an enclosed panelboard and where the connectors will accommodate more than one combination of conductors (size and number) that will have the required ampacity, the wiring diagram will state the number and size of wires for which the terminal is acceptable unless the wiring space is suitable for all combinations of conductors that have the required ampacity.

Tightening torque is marked for all panelboard terminals (other than wire binding screws) except when installed units have their own marking.

UL requires that an individual terminal be provided for the connection of each branch-circuit neutral conductor and, with one exception, that the number of individual terminals be not less than 75 percent of the total number of individual fuseholder or circuit-breaker poles capable of being installed in the panelboard. Under the exception, the number of terminals may be reduced to 50 percent if the panelboard is marked to indicate the maximum number of circuits and the need to use multipole branch-circuit units to limit the number of terminals to a specified number.

26. MAIN OR MAIN DISCONNECT

Except for a panelboard that has the “Service Disconnect(s)” identified, a switch or circuit breaker that controls all load circuits from the panelboard, other than a feed-through circuit, is required to be marked “Main” and no other switching device is permitted to have this marking. If two or more switches or circuit breakers control all load circuits, other than a feed-through circuit, they are required to be marked “Main Disconnect” either on or adjacent to each unit if there are other switches or circuit breakers in the panelboard.

27. WIRE BENDING SPACE

A panelboard constructed in accordance with Exception No. 3 of Section 408.55 of the NEC is required to be marked by means of a diagram that shows and specifies the method of wiring that shall be used to accomplish the 90-degree bend.

Minimum wire bending space requirements for panelboards rated for use with aluminum conductors are based on the use of compact stranded conductors made from AA-8000 series electrical grade aluminum alloy. See NEC Section 310.106(B).

28. ACCESSIBLE ONLY TO QUALIFIED PERSONS

Section 240.40 of the NEC requires a disconnecting means on the supply side of cartridge fuses where the fuses are accessible to other than qualified persons. Section 408.38 requires all panelboards to be deadfront unless they are accessible only to qualified persons. UL requires such panelboards to be marked “This panelboard shall be located where accessible only to qualified persons.”

29. INVESTIGATED FOR USE IN OPTIONAL STANDBY SYSTEMS (NEC ARTICLE 702 APPLICATION)

Panelboards may be constructed with interlocked switching devices or designed for use with interlock kits that have been investigated for use in optional standby systems in accordance with Article 702 of the NEC. Panelboards shipped with factory installed interlocked switching devices that have been investigated for use in optional standby systems are marked “Suitable for use in accordance with Article 702 of the National Electrical Code ANSI/NFPA 70;” panelboards available for use with field installable assemblies that have been investigated for use in optional standby systems are marked “Suitable for use in accordance with Article 702 of the National Electrical Code ANSI/NFPA 70 when provided with interlock kit Cat. No. _____.”

29A. INVESTIGATED FOR USE IN WITH INTERCONNECTED PARALLEL ELECTRIC POWER PRODUCTION SOURCES (NEC ARTICLE 705 APPLICATION)

Panelboards may be intended for interconnection with one or more electric power production sources operating in parallel with a primary source(s) of electricity, in accordance with Article 705 of the National Electrical Code, NFPA 70. Panelboards with this marking have provisions for connection(s) as noted in either (a) and/or (b):

- a) Supply Side Connection - Panelboards intended for use in accordance with Section 705.12(A) of Article 705 of the National Electrical Code, NFPA 70, shall be permitted to have provisions for interconnecting parallel power sources on the supply side of the service disconnecting means.
- b) Load Side Connection - Panelboards for use in accordance with Section 705.12(D) of Article 705 of the National Electrical Code, NFPA 70, shall be permitted to have one or more load side disconnects for the interconnection of parallel power sources.

Markings associated with this application are provided as noted below:

Disconnect Markings:

- 1) Each disconnect or provision for connection for interconnected parallel power production source(s) will be marked “Parallel Energy Source Disconnect”, or “Parallel Energy Source Tap”, or the equivalent, or be provided with a space for the source(s) to be labeled in the field.

- 2) A marking shall be placed near each Parallel Energy Source Disconnect to be visible when the terminals are visible to warn the user that both the line and load terminals may be energized when the breaker is in the open (Off) position.
- 3) Panelboards with the load side disconnect(s) intended for connection to parallel power sources positioned at the opposite end from the main input in accordance (NEC 705.12(D)(7)) are marked with the following, or equivalent:

WARNING
INVERTER OUTPUT CONNECTION
DO NOT RELOCATE THIS
OVERCURRENT DEVICE

Panelboard Markings:

- 1) “Suitable for use with interconnected parallel electric power production sources”, “Suitable for use in accordance with Article 705 of the National Electrical Code, NFPA 70”, or the equivalent.
- 2) “Turning Off Parallel Energy Source Disconnect does not deenergize this panel. Turn off power from all sources supplying this equipment before working inside.” or equivalent wording.
- 3) For panelboards intended for load side connections to other power production sources (item b above), the panelboard will be marked with the maximum ampere rating for all overcurrent devices intended for connection to electric power production sources operating in parallel with a primary source(s).

30. TAPS

Some panelboards may have terminals or provisions for terminals, marked as taps, located on the supply side of the service disconnecting means. The suitability of these terminals as taps connected on the supply side of the service disconnect is intended to be determined in accordance with *NEC*® Sections 230.46, 230.82, and 705.12.

Panelboards are not Listed to have their busbars tapped in the field unless there are existing holes in the busbars marked with the word “Tap” adjacent to the holes in the factory. Other holes in the busbar that are not marked with the word “Tap” are intended for the connection of overcurrent devices, other device’s as identified by the product markings and in the installation instructions, or other uses identified by the manufacturer. When the electrical equipment Listing does not include product markings or instructions for tapping busbars, this situation should be treated like any other field modification of Listed equipment.

Some Listed power equipment may have installation instructions with specific directions on tapping the busbars. If this is the case, this equipment can be field modified, following those manufacturer’s instructions, in accordance with the National Electrical Code® (NEC) Section 110.3(B). The UL White Book identifies the required markings for field-installed equipment that have been evaluated by UL. For additional information, please see the guide information for Panelboards (QEUY).

Drilling or enlarging holes in busbars can increase the current density and reduce current carrying capacity. Some equipment is constructed with fully rated busbars, which have a typical current density of 1000 A per square inch of cross sectional area for copper and 750 A per square inch of cross sectional area for aluminum. However, some equipment use busbars at a higher current density and have temperature testing conducted to determine compliance with UL's requirements.

Removing busbar material can result in higher operating temperatures, and additional holes can potentially weaken the busbar, which adversely affects the short circuit rating of the equipment required by NEC Section 110.10. Both sufficient wiring space and wire bending space need to be provided for the conductors and the wire connector at the tap connection. In measuring the wiring space, AHJs need to consider the possibility of the connectors rotating, which may result in reduction of the spacing between uninsulated live parts of opposite polarity and uninsulated live parts and ground.

Wire connectors (lugs) need to be Listed for the purpose and have the proper ratings for specific application, and the mounting hardware for wire connectors needs to be properly selected and attached with the correct torque. The potential reduction of required spacings from the wire connectors or fasteners to the enclosure or other busbars also needs to be evaluated. In completing the modification, all foreign material such as cutting oil, burrs and metal shavings needs to be removed from the equipment enclosure. Temporarily removed materials such as insulating barriers need to be returned to their original positions and secured. The above are just a few of the concerns and items that must be inspected, checked and reviewed where such modifications are made to this type equipment.

Marking and Application Guide

SWIMMING POOL EQUIPMENT, SPAS, FOUNTAINS AND HYDROMASSAGE BATHTUBS

JANUARY 2013

Swimming Pool Equipment, Spas,
Fountains and Hydromassage Bathtubs
Marking and Application Guide

PREFACE

The growing popularity of home swimming and related activities has led to an increase in the number of swimming pools, spas, hot tubs and hydromassage bathtubs in use. Each of these products has different UL markings and different installation requirements.

UL has developed the Swimming Pool Equipment, Spas, Fountains, and Hydromassage Bathtub Marking Guide for inspectors, utilities, contractors, installers, users, designers, and other interested parties to aid in understanding this equipment and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation. This equipment is intended to be installed in accordance with the *National Electrical Code*® (*NEC*®), as well as other mechanical, fuel gas, building and plumbing codes as applicable, and their listing. These markings are required by the applicable UL and other Standards, and are part of the listing.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web Site at <http://www.ul.com/codeauthorities>.

Your comments or suggestions are welcome and appreciated. They should be sent to:

Pool and Spa Codes and Standards 30

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers in determining the suitability of specific swimming pool, spa, hydromassage bathtub and fountain products in a particular installation and use, and to address concerns related to fire, shock, plumbing, gas, and/or mechanical hazards.

Products are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation. A list of product categories evaluated by UL, along with the applicable standard(s), can be found in Appendix B.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Guide information is available in the UL White Book and online at www.ul.com/database.

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

The numbering for code sections used in this document may change as the specific code is updated. A list of model codes and standards applicable for each product can be found in Appendix C.

Additional information can be found at www.ul.com.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of this equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified”.

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on alternative energy equipment. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL's *safety* requirements. These requirements are primarily based on UL's own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word "Listed," the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word "Classified," a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

FIELD EVALUATIONS

You may encounter situations in which you are unable to determine if a product has been listed by a third-party organization. Or in other situations you might encounter a product bearing a listing label that may have been modified in the field, and now you question whether or not the product still complies with the applicable standard. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors, and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL’s Web site at www.ul.com/field.

1. PERMANENTLY INSTALLED SWIMMING POOLS

1.1. GENERAL

This section covers UL Listed equipment that is wired and plumbed at the installation site for the construction of a swimming pool permanently installed in the ground or above the ground. The suitability of the interconnection of various components, as well as the supply connection is determined by the authority having jurisdiction. UL evaluates and Lists all electrical and mechanical components of these pools. This includes water heaters, pumps, luminaires, water treatment equipment such as ozone generators and chlorinators, junction boxes, transformers, potting compounds, pool cover operators, pool covers, pool alarms, and controls, as well as some pre-packaged assemblies of components referred to as equipment assemblies or “Skid Packs.” Equipment assemblies are usually intended for heated spas installed in the ground, but units without heaters are also suitable for small swimming pools permanently installed in the ground.

1.2. CONTROLS

General. These Listings cover units intended for the control of equipment used with swimming pools, spas or hot tubs. They typically consist of combinations of motor controllers and timers. Some may also have temperature-regulating circuits.

Listing Mark. The UL Listing Mark for these products includes a product name such as “Spa Controller,” “Swimming Pool Controller” or other similar product name.

Field Installation. UL Listed controls are intended for permanent connection to the electrical supply system and are intended to be mounted at a minimum of 5 feet from the inside walls of a swimming pool or spa. Some units have ground-fault circuit interrupter (GFCI)-protected convenience receptacles and are intended for mounting at a minimum of 10 feet away. These Listed products are suitable for both indoor and outdoor use, unless they are marked “For Indoor Use Only.”

Terminals On Load Side of GFCI Controls. A control with terminals on the load side of a ground-fault circuit interrupter (GFCI), provided to protect the field-installed conductors of an underwater lighting circuit, is marked to indicate that the field-installed conductors shall not occupy conduit, boxes or enclosures with the conductors of other circuits unless all other conductors are also on the load side of a GFCI.

Enclosures Intended For Direct Connection to a Wet-Niche or No-Niche Luminaire.

Controls intended for such use are marked “Suitable for direct conduit connection to a wet-niche or no-niche luminaire” or equivalent where visible after installation. Conduit termination locations suitable for such use are specifically identified.

1.3. JUNCTION BOXES

General. Products Listed under this category are suitable for use at the supply end of conduit that extends directly to the forming shell of a wet-niche luminaire or the mounting bracket of a no-niche luminaire in a pool, spa, or fountain. These junction boxes are also suitable for use as underwater junction boxes for fountains and decorative pools.

Listing Mark. The UL Listing Mark for these units includes the product name “Swimming Pool Junction Box.”

Field Installation. Swimming pool and spa luminaire junction boxes are provided with the means of independent termination for the equipment grounding conductors inside the box. Each termination for an equipment grounding conductor will accommodate one conductor in the range of No. 16 to No. 12 AWG. A junction box marked “Suitable for Use With a Low-Voltage Luminaire” has equipment grounding conductor terminations suitable for the range of No. 16 to No. 10 AWG. Junction boxes are also provided with means to terminate No. 8 AWG supplementary equipment grounding conductors for use where the wet-niche or no-niche luminaire is installed using non-metallic conduit. A junction box and cover combination with a volume of 100 cubic inches or less is marked with its volume in cubic inches. Installation instructions indicate the flexible cord type and conductor size or the range of cord diameter to be used with an installed strain relief device. If the strain relief means is to be field-installed, complete installation instructions are provided.

1.4. LUMINAIRES (See App. A–Figs. 1, 2, 4, 5)

Listing Mark. Underwater swimming pool luminaires come in six basic types as described below. Luminaires suitable for swimming pool and spa equipment are identified by a Listing Mark with one of these luminaire type designations, along with text to indicate they are suitable for swimming pools. The Listing Marks of these products include one of the following product names as appropriate:

“Dry-Niche Underwater Luminaire For Swimming Pool,”
“Mounting Bracket For No-Niche Luminaire,”
“No-Niche Underwater Luminaire For Swimming Pool,”
“Housing For Wet-Niche Luminaire,”
“Wet-Niche Underwater Luminaire For Swimming Pool,”
“Underwater Luminaire for Aboveground Non-Storable Swimming Pools,” “Convertible Underwater Luminaire for Aboveground Swimming Pools,” or
“Fiber-Optic Underwater Luminaire for Swimming Pools.”

Luminaires intended for fountains or other vessels not intended to accommodate the complete or partial immersion of persons have a different identification. These luminaires are identified as “Submersible Luminaires.” A typical Listing Mark would be “Dry-Niche Submersible Luminaire”. Luminaires with only this type of Listing Mark or product name have not been evaluated for swimming pool or spa installations. Some luminaires have been evaluated for use as both a swimming pool or spa luminaire and a submersible luminaire. Luminaires suitable for both uses bear Listing Marks identifying both uses.

Field Installation:

Dry-Niche Luminaires. These luminaires are intended for permanent installation only in the wall of a swimming pool or a field-fabricated spa, unless accompanying installation instructions describe the option of installation in the bottom of the pool or spa. These luminaires are intended to be installed with the top of the lens not less than 18 inches below the normal water level, unless otherwise marked. They are designed for servicing from the rear through a passageway behind the pool or spa wall, or, if mounted in the bottom of the pool or spa, in a tunnel underneath the pool or spa. When the luminaire is properly installed in a housing or “niche,” no water should enter the niche.

Wet-Niche Luminaires. These luminaires are intended for permanent installation only in the wall of a swimming pool or field-fabricated spa, unless accompanying installation instructions describe the additional option of installation in the bottom of the pool or spa.

These luminaires are also intended to be installed with the top of the lens not less than 18 inches below the normal water level, unless otherwise marked. These luminaires are intended for installation in permanently installed luminaire housings (forming shells) in which the luminaire will be completely surrounded by water in the normal installation. These luminaires are marked to indicate the proper luminaire housing or housings with which they are to be used, and the luminaire housings are marked to indicate the luminaire or luminaires with which the housing is to be used. These luminaires are provided with a factory-installed, permanently attached flexible cord that extends at least 12 feet outside the luminaire enclosure. This permits the luminaire to be removed from the luminaire housing and lifted to the pool or spa deck for servicing without lowering the water level or disconnecting the luminaire from the branch-circuit conductors. Luminaire housings that are intended to be used with luminaires provided with a No. 12 AWG or larger, Type SJ, SJT or SJTO flexible cord are marked for use with 3/4-inch or larger conduit. It is not intended that conduit reducers and conduit with a trade size less than the size accommodated by the threaded hub of the luminaire (fixture) housing be used.

No-Niche Luminaires. These luminaires are intended for permanent installation only in the wall of a swimming pool or a field-fabricated spa, unless accompanying installation instructions describe the option of installation in the bottom of the pool or spa. These luminaires are also intended to be installed with the top of the lens not less than 18 inches below the normal water level, unless otherwise marked. In addition, these luminaires are intended to be mounted to a bracket that is permanently secured in or on the wall where the luminaire will be completely surrounded by water. These luminaires, like wet-niche types, are provided with a factory-installed, permanently attached flexible cord that extends at least 12 feet outside the luminaire enclosure. The luminaires are marked with an identification of the mounting brackets for which they are suitable. The mounting brackets are also marked with an identification of the luminaires for which they are suitable.

Convertible Underwater Luminaires For Aboveground Swimming Pools. These luminaires are initially configured as underwater luminaires for aboveground storable swimming use (see Storable Swimming Pool section). They include provisions for the one-time field conversion of the luminaires to underwater luminaires for aboveground non-storable swimming pool use. Once converted, these luminaires are not suitable for modification back to their original configurations.

Fiber-Optic Underwater Luminaires. These luminaires consist of a lamp/electrical enclosure that is intended to be permanently mounted not less than 5 feet from the pool or spa wall and has a fiber-optic element and associated fittings to transmit the light to the pool or spa. The lamp/electrical enclosure is intended to be installed above the level at which water splashed from the pool or spa or from another source may collect.

Metal Conduit Only. A swimming pool luminaire housing (forming shell) for a wet-niche luminaire and a mounting bracket for a no-niche luminaire that is not provided with a grounding terminal for the supplemental No. 8 AWG grounding conductor that is required when non-metallic conduit is used is marked “CAUTION — For proper grounding use only with metal conduit.”

Orientation, Luminaire. A swimming pool luminaire that depends on its location or position to function correctly is marked to indicate the way it is to be installed or used, unless the position is obvious.

Orientation, Luminaire Housing and Mounting Bracket. If orientation of a swimming pool luminaire housing (forming shell) or mounting bracket is relied upon to orient the luminaire in a position necessary for its intended performance, the luminaire housing or mounting bracket is marked to indicate the position in which it is to be installed.

Underwater Luminaires for Aboveground Non-Storage Swimming Pools. These luminaires are intended only for permanent installation through or on the wall of an aboveground non-storage pool. They are intended to be installed with the top of the lens not less than 8 nor more than 10 inches below the top of the pool wall, unless the luminaire is otherwise marked. They are intended to be permanently connected to the supply with conduit. They may — for installation, maintenance or servicing — employ a maximum 5 feet length of jacketed flexible cord permanently connected between integral components of the luminaire. The installation instructions accompanying a luminaire with a non-enclosed flexible cord describe the method of proper routing and securement of the flexible cord and the method for installation of any guards or structural members to reduce the likelihood of unacceptable stress being imposed on the flexible cord.

Fresh and/or Sea Water Use. Luminaires for swimming pools filled with tap (municipal) or well water, including water that has been salt-treated for chlorine or bromine generation, are marked as suitable for fresh water. Luminaires for swimming pools filled with sea water are marked as suitable for sea water. Luminaires that have been evaluated for both applications may be marked for both.

Submerge Before Lighting. Luminaires that have been investigated for operation only while in contact with water are marked, where visible after installation, “CAUTION — To reduce the risk of electric shock, submerge before lighting”.

Special Markings:

One-Time Thermal Protection. Swimming pool luminaires employing a one-time operation, thermal sensitive device are marked “Out of water operation (for longer than 3 min.) will permanently disable luminaire.” Words in parentheses are optional.

Inoperable Out of Water. Swimming pool luminaires designed to be inoperable when **not** submerged are marked “This luminaire will not light out of water.”

1.5. POTTING COMPOUNDS

General. This Listing covers compounds intended to encapsulate the grounding and bonding conductor splices or terminations in swimming pool and spa equipment such as luminaires, luminaire housings (forming shells) and junction boxes where the splices or termination may be exposed to fresh water pool or fountain water and sunlight for varying lengths of time, including continuous exposure.

These potting compounds are also suitable for use to fill underwater junction boxes. The container or package is marked to identify that they have been evaluated for adhering to stainless steel, copper alloy, and any other materials, if applicable.

Listing Mark. The Listing Mark of Underwriters Laboratories is provided on the smallest unit container in which the product is packaged. The UL Listing Mark includes the product name “Swimming Pool, Fountain and Spa Equipment Conductor Splice Potting Compound.” Any of the three locations — “swimming pool,” “fountain” or “spa equipment” — may be omitted.

As the markings on the smallest unit container are the means by which the authority having jurisdiction determines if the product is UL Listed, the unit container should be retained at the site.

1.6. PUMPS

General. UL Listed pumps include those intended for permanent plumbing for use with permanently installed pools and spas, as well as portable units intended for use with storable pools.

A pump with means for permanent wiring connections or a 3-foot flexible cord and plug, suitable for permanently installed pools is marked:

“This Pump is for Use with Permanently Installed Pools Only — Do Not Use with Storable Pools. A permanently installed pool is constructed in or on the ground or in a building such that it cannot be readily disassembled for storage. A storable pool is constructed so that it may be readily disassembled for storage and reassembled to its original integrity.”

Only pumps with this marking should be used with permanently installed pools.

Listing Mark. UL Listing Marks with the product names “Swimming Pool Pump,” “Spa Pump,” or “Swimming Pool or Spa Pump” indicate units suitable for use with swimming pools and spas. A unit for which the name includes “Spa Pump” has also, in addition to the swimming pool pump requirements, been evaluated for use with heated (122°F) water.

Field Installation:

Ground-Fault Protection. Cord-and-plug-connected pumps for use with permanent in or above ground pools or spas are intended to be connected to a circuit protected by a GFCI and are so marked. Each unit is provided with the following marking or equivalent: “WARNING — Risk of electric shock. Connect only to a grounding type receptacle protected by a ground- fault circuit interrupter (GFCI).”

Supply Connection. Unless constructed as indicated below, pumps intended for permanent plumbing connection are provided with means for permanent wiring connections.

Pumps intended for permanent plumbing connection and location at a minimum of 6 feet from the inside walls of a pool or spa may be provided with a 3-foot cord terminating in a grounding-type attachment plug that is the locking type.

Pumps intended for permanent plumbing connection and location at least 10 feet from the inside walls of a pool or spa may be provided with a 3-foot power supply cord with an attachment plug that is *not* the locking type. These units are marked “CAUTION — To reduce the risk of electric shock, install at least 10 feet from the inside walls of a pool. Do not use an extension cord.”

Pumps supplied with a minimum 25-foot cord and attachment plug are intended for use with storable pools only and are so marked. These pumps are not suitable for permanently installed pools (in-ground and aboveground non-storable).

1.7. TRANSFORMERS AND POWER UNITS

General. Products Listed in this category are enclosed transformers and DC output power supplies. They are intended to supply luminaires in fountains, swimming pools, and spas in accordance with Article 680 of the NEC®. The primary rating is 120 volts and the maximum secondary rating is 15 V rms or 30 Vdc and 1 kVA.

Listing Mark. The UL Listing Mark for these units includes by the product names “Fountain Transformer”, “Swimming Pool Transformer,” “Spa Transformer,” or “Fountain, Swimming Pool or Spa Transformer”, “Fountain Power Unit,” “Swimming Pool Power Unit,” “Spa Power Unit,” or “Fountain, Swimming Pool or Spa Power Unit.”

Special Markings:

Swimming Pool Junction Box Use. Unless marked otherwise, these transformers are not suitable for connection to a conduit which extends directly to a wet-niche or no-niche luminaire. Transformers not suitable for this use are to be used with a swimming pool junction box.

1.8. WATER HEATERS

Listing Mark. The UL Listing Mark with the product name “Swimming Pool Heater” or “Spa Heater” indicates suitability for use with permanently installed pools. Gas- or oil- red units are identified by the product names “Gas-Fired Swimming Pool Heater” and “Oil-Fired Swimming Pool Heater”.

Field Installation:

Flow Rate. If a heater is marked with a minimum required water circulation capacity (flow rate), the swimming pool must have pumps with at least that capacity and circuit interlocks that permit heater operation only when the water is being circulated. This flow rate would either be marked on the circulating pump or provided in literature accompanying the pump.

Leakage Current Collectors (Electrical Heaters). If leakage current collectors are not integral to the heater but are provided for field installation, the installation and grounding of the collectors must be exactly as indicated in the installation instructions.

The heater grounding conductor and the leakage current collector grounding conductors should be the same size or larger than the power supply conductors and not smaller than No. 12 AWG.

Outdoor Use. Only heaters marked “Outdoor Use” are suitable for installation outdoors.

Special Markings:

Shutoff Valve. If the heater installation instructions indicate use of a shutoff valve, the heater is marked with its maximum working pressure. The heater is marked to indicate it should be used with a pressure relief valve certified as complying with requirements of either (1) the ASME or (2) ANSI Z21.22, Relief Valves and Automatic Gas Shutoff Devices for Hot Water Supply Systems. The heater is also marked to indicate that the pressure relief valve shall have a marked maximum set pressure not to exceed the marked maximum working pressure of the water heater and that the valve inlet should be able to accommodate a 3/4-inch or larger trade size pipe.

1.9. HEAT PUMPS

Listing Mark. The UL Listing Mark with a product name “Swimming Pool Heat Pump,” “Spa Heat Pump,” or “Swimming Pool and Spa Heat Pump” indicates suitability for use with permanently installed pools.

Field Installation:

Outdoor Use. Only heat pumps marked “For Outdoor Use” or the equivalent are suitable for installation outdoors.

1.10. WATER TREATMENT EQUIPMENT

General. Most water treatment equipment is Listed in the category “Water Treatment Equipment” (WDLC). This category includes chlorinators, ozone generators, ion generators, ultraviolet sanitizers and similar equipment intended to sanitize water in pools, spas and hot tubs. It also includes equipment designed to monitor water chemistry in pools, spas and hot tubs. This monitoring equipment may also have the capability of adding chemicals to the water to adjust water chemistry. Ozone generators may also be Classified in the category “Ozone Generators” (WCKA).

The ability of this equipment to sanitize pool and spa water has not been determined. Equipment that has been evaluated for sanitation is Classified in accordance with the requirements of the National Sanitation Foundation Standard Number 50 and can be located under the category (WCNZ) Pool and Spa Equipment Classified in accordance with NSF Standard Number 50”.

Listing Mark. The UL Listing Mark for water treatment equipment other than ozone generators includes the product name “Swimming Pool Chlorinator,” “Spa Chlorinator,” “Swimming Pool and Spa Chlorinator,” or other appropriate product name.

Unique Hazard Considerations. Hazards related to the chemicals generated from chlorinators, brominators, or ion generators are not evaluated by UL as part of Listing or Classification investigations.

1.11. OZONE GENERATORS

Listed Units. Physiological effects of the ozone output of UL Listed units marked “For Outdoor Use Only” have not been evaluated. Listed units marked for indoor use have been evaluated in a standard room installation to determine if any ozone emitted from a test tank is within established limits. Listed units are evaluated to determine that no ozone is emitted from unintended locations of the unit during normal use or abnormal operation such as a blocked output or no flow through a venturi. The Listing Mark for these units has the product identity “Ozone Generator.”

Classified Units. Physiological effects of the ozone output of Classified units have not been evaluated. Classified units are evaluated to determine that no ozone is emitted from unintended locations of the unit in normal use or abnormal operation such as a blocked output or no flow through a venturi.

Classified units are identified by the following Classification Marking on the product:

“OZONE GENERATOR
CLASSIFIED BY UNDERWRITERS LABORATORIES
WITH RESPECT TO RISKS OF ELECTRIC SHOCK,
FIRE AND MECHANICAL INJURY ONLY”

Installation. Ozone generators are not intended for field installation under the skirt of a spa or hot tub, unless the spa is specifically marked for this use.

2. MOTORIZED POOL COVER OPERATORS

2.1. GENERAL

Motorized pool cover operators are covered by the product category “Swimming Pool and Spa Cover Operators, Electric” (WDDJ). They are evaluated for fire, electric shock and mechanical hazards only. Some motorized pool cover operators may incorporate pool covers Classified under the category “Covers For Swimming Pools and Spas” (WBAH). Unless Classified as a power safety cover under the category “Covers For Swimming Pools and Spas,” (WBAH), a cover provided with the operator has not been evaluated as a safety cover.

2.2. LISTING MARK

The UL Listing Mark for these products includes the product name “Swimming Pool Cover Operator,” “Spa Cover Operator” or “Pool Cover Operator.”

3. STORABLE SWIMMING POOLS

3.1. GENERAL

Equipment Listed for use with storable pools includes pumps, Luminaires (Lighting (Fixtures) and water treatment equipment. This equipment is Listed under the product categories of “Pumps” (WCSX) and “Luminaires and Forming Shells” (WBDT), and “Water Treatment Equipment”(WDLC).

3.2. LUMINAIRES (See App. A–Fig. 3)

General. Underwater luminaires for aboveground storable swimming pools are intended for temporary installation only through or on the wall of an aboveground storable pool. UL considers a storable pool to be one that is constructed above the ground and is capable of holding water to a maximum depth of 42 in. (1.07m). These luminaires are intended to be installed with the top of the lens not less than 8 nor more than 10 inches below the top of the pool wall unless the luminaire is otherwise marked. These luminaires are provided with a minimum of 25 feet of jacketed flexible cord, which is intended to be routed away from the pool to the transformer or ground- fault circuit interrupter assembly. The transformer or GFCI assembly is intended to be temporarily mounted to a building or structure and is provided with a minimum 3-foot/ maximum 6-foot power supply cord for connection to the supply source.

Listing Mark. The UL Listing Mark for these products includes the product name “Underwater Luminaire for Aboveground Storable Swimming Pool.”

3.3. PUMPS

Listing Mark. Pumps suitable for this application have a Listing Mark with the product name “Swimming Pool Pump” or “Swimming Pool Pump or Spa Pump.”

Storable Pools Only. The type of pump suitable for use with storable pools has a 25-foot flexible cord and attachment plug. It is marked:

“This Pump is for Use with Storable Pools Only — Do Not Use with Permanently Installed Pools. A storable pool is constructed so that it may be readily disassembled for storage and reassembled to its original integrity. A permanently installed pool is constructed in or on the ground or in a building such that it cannot be readily disassembled for storage.

Field Installation:

Double Insulation. Pumps with a minimum 25-foot supply cord are double insulated and have inaccessible metal parts grounded with the equipment-grounding conductor terminated at the attachment plug. These pumps do not have a bonding connector. They are not intended to be connected to an equipotential bonding grid.

Ground-Fault Protection. Pumps for storable swimming pools are provided with a factory installed Class A ground-fault circuit-interrupter. It is an integral part of the attachment plug or in the supply cord within 12 inches of the attachment plug.

3.4. WATER TREATMENT EQUIPMENT

General. UL Listed chlorinators or brominators, as well as Listed or Classified ozone generators, may be used with this equipment. Their limitations are specified in the section titled “PERMANENTLY INSTALLED SWIMMING POOLS.”

4. FIELD CONSTRUCTED SPAS

4.1. GENERAL

This section covers field constructed spas or hot tubs in which separately Listed equipment is plumbed and wired in the field. This equipment includes heaters, blowers, pumps, controls, water treatment equipment, luminaires, heat pumps, transformers and suction fittings. Each is intended to be installed in accordance with the *National Electrical Code*®, NFPA 70, and model building, plumbing, mechanical, fuel gas codes, manufacturer’s instructions, and with provisions detailed in the section following.

A group of the above components may be pre-packaged in a Listed equipment assembly. These assemblies are designed for installation with a field-supplied tub.

4.2. BLOWERS

General. UL Listed blowers are intended for both indoor and outdoor use, unless marked otherwise. Unless otherwise indicated in the installation instructions, blowers should be mounted at least 12 inches above the over flow of a spa or hot tub.

4.3. CONTROLLERS

These are identical to and should be used with the same limitations as those previously specified under “PERMANENTLY INSTALLED SWIMMING POOLS.”

4.4. LUMINAIRES

Luminaires used in this installation are the same as those previously detailed under “PERMANENTLY INSTALLED SWIMMING POOLS.”

4.5. PUMPS

Pumps in this application are essentially identical to those previously discussed under “PERMANENTLY INSTALLED SWIMMING POOLS.” The one exception is the product name accompanying the UL Listing Mark should indicate if the pump is either a “Spa Pump” or “Swimming Pool or Spa Pump.” A pump with a Listing Mark indicating only “Swimming Pool Pump” has not been investigated for use with maximum 50° C (122°F) water.

4.6. SUCTION FITTINGS

General. These units are intended to be provided at all the intake ports of the spa. They have been evaluated to determine that they would not pose a hair entrapment danger when operated at or below their marked flow rates. The maximum flow through the suction fitting should not exceed the marked maximum flow rate of the suction fitting.

4.7. WATER HEATERS

Water heaters can be used with the same limitations described in “PERMANENTLY INSTALLED SWIMMING POOLS.”

4.8. WATER TREATMENT EQUIPMENT

Water treatment equipment can be used in this type of installation in accordance with the limitations previously detailed for water treatment equipment under “PERMANENTLY INSTALLED SWIMMING POOLS.”

4.9. EQUIPMENT ASSEMBLIES

General. Equipment assemblies (“Skid Packs”) are pre-packaged combinations of equipment such as pumps, filters, heaters, blowers, luminaires, and controls. They are intended to be permanently plumbed to a field supplied spa or hot tub using non-metallic piping only. They are designed for indoor or outdoor use and are intended to be installed at least 5 feet from the inside walls of a spa or hot tub.

UL Listed equipment assemblies have not been evaluated for below-grade installation and are not suitable for use within an outer enclosure, or under the skirt of a spa or hot tub, unless so marked.

Listed equipment assemblies that contain a gas- red water heater have not been evaluated for (1) indoor use, (2) use within an outer enclosure, or (3) use under the skirt of a spa or hot tub, unless so marked.

Some equipment assemblies do not contain a heater and, therefore, do not have a water temperature regulating control or water temperature limiting control. Units of this design are intended to have a water heater, a temperature regulating control, and a temperature limiting control provided in the final installation.

Listing Mark. The UL Listing Marks for these products include the following product names, as appropriate:

“Equipment Assembly for Spa/Hot Tub,”
“Hot Tub Equipment Assembly,” or
“Spa Equipment Assembly.”

Field Installation:

GFCI Protection. Cord-connected equipment assemblies have GFCI protection provided. Convertible equipment assemblies have protection provided in the 120-volt configuration. They are protected in the 240-volt configuration, unless marked “Connect To A Circuit Protected By A GFCI When Connected In The 240-volt Mode” or the equivalent. Permanently connected equipment assemblies may or may not have integral GFCI protection. If not, the installation instructions indicate the unit should be connected to a circuit protected by a GFCI. If integral GFCI protection is provided, it protects all circuits.

Disconnecting Means. A convertible or permanently connected unit may be additionally provided with an integral disconnecting means not intended to substitute for that required by NEC® section 680.12.

Suction Fittings. To reduce the risk of hair and body entrapment, equipment assemblies are intended for use with a UL Listed suction fitting, the flow rate of which meets or exceeds the flow rate marked on the equipment assembly. Each equipment assembly is marked with “WARNING — PREVENT DROWNING”

1. Supervise children at all times. 2. Attach spa cover after each use. Install a suction fitting with a marked flow rate of not less than ___ gallons per minute.” In this case, the ___ is filled in by the manufacturer with the gallons per minute flow rate of the assembly.

Supply Connection. These units may be designed for either permanent wiring or connection with a flexible cord and plug. They may also be designed for field convertibility from a 120-volt cord connected configuration to a 240-volt permanently wired configuration only. The electrical rating includes the minimum supply conductor ampacity and the ampere rating of the supply conductor overcurrent protective device.

Underwater Lighting Circuit. Equipment assemblies that have terminals on the load side of a ground-fault circuit interrupter, which protects field-installed conductors of an underwater lighting circuit, are specially marked. The markings indicate that the field-installed conductors shall not occupy conduit, boxes or enclosures with conductors of other circuits, unless all other conductors are also on the load side of a ground-fault circuit interrupter. Suitable segregation or isolation of the circuits is maintained within the equipment.

Special Markings:

Multiple Disconnects. If more than one disconnect switch is required to disconnect all power to a unit, the unit is marked — in a place readily visible to service personnel prior to disconnecting the main supply for the unit — with the word “WARNING” and the following or equivalent, “PREVENT ELECTROCUTION — Disconnect all supply connections before servicing. This appliance has _____ supply connections.”

5. SELF-CONTAINED SPAS

5.1. GENERAL

This section covers self-contained spas for aboveground use, for household or commercial

use, and for indoor and outdoor use, unless marked otherwise. Spas are not designed or intended to be drained after each use. They are intended for installation in accordance with Article 680 of the *National Electrical Code*®, NFPA 70 and model building, plumbing, mechanical, fuel gas codes, and the manufacturer’s installation instructions.

Units come in three basic designs:

1. Most units are shipped completely assembled from the factory and require only supply connection in the field.
2. Some units, referred to as “Knockdown” spas, are types for which a spa shell, equipment assembly and skirt are shipped separately. The shell and equipment assembly are plumbed at the factory and connected together in the field with threaded unions.
3. Additional units, referred to as “Modular” spas, are similar to “Knockdown” units except they are plumbed in the field. All parts are provided and pre-cut, if needed, and accompany applicable instructions and accessories such as polyvinyl chloride (PVC) solvent. They are intended for assembly by untrained users and the suitability of all interconnections and wiring is to be determined by authorities having jurisdiction.

“Modular” or “Knockdown” designs are accompanied by detailed assembly instructions and have identifying markings on each sub-assembly. The names or model numbers are specified in the assembly instructions so the user can correctly assemble the unit and the inspection authority can determine that the unit was assembled using the correct parts.

5.2. LISTING MARK

The UL Listing Mark includes the product name “Self-Contained Spa.”

5.3. FIELD INSTALLATION:

Branch-Circuit Protection. A permanently-wired spa intended to be protected by a branch-circuit overcurrent device rated less than the maximum rating of the branch-circuit overcurrent device permitted by the NEC® is marked to indicate the maximum rating of the branch-circuit overcurrent device for which the unit has been investigated and found acceptable. The electrical rating includes the minimum supply conductor ampacity and the ampere rating of the supply conductor overcurrent protective device.

Gas-Fired Heaters. Self-contained spas may be provided with gas fired heaters. Spas with gas-fired heaters are intended for permanent wiring and permanent installation, and unless otherwise marked, are intended for outdoor use only.

Options. The installation instructions of self-contained spas may indicate options such as lighting kits, blowers, additional pumps or ozone generators. These option kits are only to be used in spas with installation instructions that indicate the spas are factory-wired to accommodate them.

Supply Connection. Self-contained spas may be cord-connected, convertible or permanently wired. A convertible spa is shipped from the factory with a power supply cord but is designed for field conversion to a permanently wired configuration, either 120-volt, 240-volt or both. Once a convertible spa is converted to permanently wired, it is not intended to be returned to a cord-connected configuration.

Ground-Fault Protection. Cord-connected spas have GFCI protection provided. Convertible spas have protection provided in the 120-volt configuration. They are also protected in the 240-volt configuration, unless marked “Connect To A Circuit Protected By A GFCI When Connected In the 240-volt Mode,” or equivalent. Permanently connected spas may or may not have integral GFCI protection. If not, the installation instructions indicate the unit should be connected to a circuit protected by a GFCI. If integral GFCI protection is provided, it protects both 120-volt and 240-volt circuits.

5.4. SPECIAL MARKINGS:

Spa Caution Marking. To help reduce the risk of electric shock from other electrical appliances used near the spa, each unit is marked “WARNING” — Risk of Electrical Shock. Do not permit any electrical appliance (such as a light, telephone, radio, or television) within 5 feet of this spa.”

6. HYDROMASSAGE BATHTUBS

6.1. GENERAL

This section includes UL Listed indoor hydromassage bathtubs (whirlpool bathtubs) for residential or commercial use. They are intended for permanent connection to the building plumbing. The hydromassage bathtub consists of a drainable tub and a water or air pump, and may include other equipment such as a luminaire, control, air blower, heater or suction fittings. These units are intended to be drained after each use. These units are not intended to be field assemblies of Listed parts. Although they may include a Listed swimming pool or spa pump, the entire unit — consisting of shell, pump and any other related electrical components — is evaluated and Listed as a complete appliance. The pump is not intended to be installed away from the tub.

6.2. LISTING MARK

These Listings appear in the Electrical Appliance and Utilization Equipment Directory (Orange Book and online at www.ul.com/database). The Listing Mark for this category contains the product name “Hydromassage Bathtub.” The Listing mark for heaters intended to be installed after the bathtub leaves the factory contains the product name “Hydromassage Bathtub Accessory”.

6.3. PLUMBING ASSESSMENT

UL Listed hydromassage bathtubs may also be Classified to either the water retention requirements or all requirements of ASME/ANSI A112.19.7 - +. The combined Listing Mark/Classification marking consists of the Listing Mark described at the beginning of this section and the following marking: “Also Classified by Underwriters Laboratories in accordance with “*,” where “*” is one of the statements detailed below:

1. “ANSI A112.19 - +”
2. “Water Retention Test requirement from ANSI A112.19.7 - +”

+ issue date of Standard or latest addendum.

6.4. FIELD INSTALLATION:

Supply Connection. Most units are intended for permanent connection to the branch circuit. Bathtubs may be provided with a factory- installed maximum three-foot length of jacketed flexible cord terminating in an attachment plug.

Branch-Circuit Protection. A unit intended to be protected by a branch-circuit overcurrent device rated less than the maximum rating of the branch-circuit overcurrent device permitted by the NEC® is marked to indicate the maximum rating of the branch-circuit overcurrent device for which the unit has been investigated and found acceptable.

Factory Configuration Information. Each hydromassage bathtub is provided with a marking on the wiring diagram, in the installation instructions or on a separate configuration sheet, to identify the factory-installed components of the unit. These components include pumps, controls, heaters, luminaires, and supply cords. The configuration marking and the installation instructions are intended to be available during installation and inspection.

Ground-Fault Protection. Whether they are permanently wired or use a cord and plug, these units are intended to be protected by a ground-fault circuit interrupter. Each unit is plainly marked with the following or equivalent statement: “Connect only to a circuit protected by a ground-fault circuit interrupter (GFCI).”

Multiple Supply Sources. A hydromassage bathtub may have provision for a maximum of two supply sources. If the unit is cord-connected, each single source must be an individual branch circuit rated not more than 20 amperes. Units requiring more than one disconnect switch to disconnect all power are provided with a marking warning to this effect.

Options. Hydromassage bathtubs may have option kits indicated in the installation instructions. These typically include blowers, heaters or luminaire assemblies. Hydromassage bathtubs intended for heaters to be installed after the bathtub leaves the factory are factory configured with a fitting to be removed and replaced by the heater. These units are marked “Suitable for Field-Installed Heater Accessory” and “Use only Accessory Heaters Marked for Use With This Bathtub.” Bathtubs not factory-configured for a field-installed heater are marked “Not Suitable for Field-Installed Heater.”

7. FOUNTAINS

7.1. GENERAL

This section covers fountains with UL Listed equipment assembled and connected in the field. Electrical products for use in fountains are Listed under the following categories: “Pumps, Motor-Operated Water” (REUZ), “Plumbing Accessories” (QMTX) and “Submersible Luminaires (Fixtures)” (IFEV), “Pumps” (WCSX) and “Industrial Control Panels” (NITW) (identified as fountain control panels).

7.2. SUBMERSIBLE LUMINAIRES

General. Products Listed in this category include submersible luminaires and submersible junction boxes. Submersible luminaires for use in fountains are not suitable for use in vessels intended for partial or complete immersions of persons.

Listing Mark. UL Listed submersible luminaires and junction boxes for use in fountains have a Listing Mark with the product names:

“Mounting Bracket for No-Niche Luminaire (Fixture),”
“Housing for Wet-Niche Luminaire (Fixture),”

“Submersible Luminaire (Fixture) Wet-Niche Type,”
“Submersible Luminaire (Fixture) Dry-Niche Type,”
“Submersible Luminaire (Fixture) No-Niche Type,”
“Submersible Luminaire (Fixture) Special Use,” or
“Submersible Junction Box.”

Field Installation:

Dry-Niche Submersible Luminaire. This luminaire type is intended for permanent installation only in the wall of built-in fountains, unless accompanying installation instructions describe additional option of installation in the bottom of the fountain. These luminaires are designed for servicing from the rear through a passageway behind the fountain wall or, if mounted in the bottom of the fountain, in a tunnel underneath the fountain. For the purposes of installation, maintenance or servicing, the luminaire may include a factory-installed length of flexible cord terminating in an attachment plug. A receptacle outlet assembly for connection of the attachment plug to the branch-circuit may be provided as an integral part of the niche included with the luminaire.

Wet-Niche Submersible Luminaire. These luminaires are intended to be installed in the wall of built-in fountains, unless accompanying installation instructions describe additional option of installation in the bottom of the fountains. They are intended for installation in a permanently installed luminaire housing (forming shell) in which the luminaire will be completely surrounded by water. These luminaires are marked to indicate the proper luminaire housing or housings with which they are to be used. Luminaire housings are marked to indicate the luminaire or luminaires with which the luminaire housings are to be used. These luminaires are provided with a factory-installed, permanently attached flexible cord that extends at least 12 feet outside the luminaire enclosure to permit the luminaire to be removed from the luminaire housing and lifted to the fountain deck for servicing without lowering the water level or disconnecting the branch-circuit conductors. Luminaires with longer cords are available for installations with a junction box or splice enclosure located where a longer cord is necessary to permit luminaire removal from the luminaire housing and placement on the deck for servicing.

No-Niche Submersible Luminaire. These luminaires are intended to be installed on the walls of built-in fountains, unless accompanying installation instructions describe the additional option of installation in the bottom of the fountains. These luminaires are to be mounted to a bracket and permanently secured in or on the wall, with the luminaire completely surrounded by water. These luminaires are provided with a factory installed, permanently attached flexible cord that extends at least 12 feet outside the luminaire enclosure. The cord is intended to function similarly to those provided with a wet niche type luminaire. The luminaires are marked with an identification of the mounting bracket for which they are suitable. The mounting brackets are also marked with an identification of the luminaires for which they are suitable.

Submersible Luminaire Special Use Type. These luminaires are intended to rest directly on the fountain or on other surfaces within the perimeter of the fountain. The luminaires are provided with a permanently attached flexible cord intended to terminate in a submersible junction box or to be routed out of the fountain through conduit to a junction box.

Metal Conduit Only. A submersible luminaire housing (forming shell) that does not have a

grounding terminal is marked “CAUTION — For proper grounding use only with metal conduit.”

Orientation, Luminaire. A submersible luminaire that depends on its location or position to function correctly is marked to indicate the way it is to be installed or used, unless the position is obvious.

Orientation, Luminaire Housing and Mounting Bracket. If a submersible luminaire housing (forming shell) is relied upon to orient the luminaire in a position that is necessary for its intended performance, the luminaire housing or mounting bracket is marked to indicate the position in which it is to be installed.

Submerge Before Lighting. Luminaires that have been investigated for operation while submerged under water are marked “Submerge Before Lighting” or the equivalent, and such a marking must be visible after installation of the luminaire. +

7.3. SUBMERSIBLE PUMPS

These are UL Listed under the product categories of “Plumbing Accessories” (QMTX) or “Pumps, Motor-Operated Water” (REUZ). The Listing Mark product name is “Submersible Pump” or equivalent. These pumps have not been investigated for use with or in proximity to swimming pools or spas.

7.4. CONTROL PANELS

Control panels intended for use with floating or permanent architectural fountains are UL Listed under the Product category “Industrial Control Panels” (NITW). The control panel nameplate includes the marking “Industrial Control Panel for Floating Fountain” or “Industrial Control Panel for Permanently Installed Fountain” or “Fountain Control Panel”

8. COVERS FOR SWIMMING POOLS AND SPAS

8.1. GENERAL

This section covers swimming pool and spa safety covers, including both manually and power-operated types. Also included are special-purpose covers such as energy conservation or solar energy covers.

Manual safety covers are intended to impede access to the contained body of water. They are provided with means for removing significant levels of collected surface water.

Power safety covers are barriers that can be placed over the water area and are removed with a motorized mechanism. They are intended to impede access to the contained body of water. A power safety cover includes an operator that is Listed under the category “Swimming Pool and Spa Cover Operators, Electric” (WDDJ).

Other types of covers such as energy conservation or solar energy covers are not intended to impede access to the contained body of water. Such covers are marked “This Is Not A Safety Cover.”

8.2. CLASSIFICATION MARKING

The Classification marking for these products includes the names “Manual Safety Cover,”

“Power Safety Cover” or “Pool Cover.”

9. SUCTION FITTINGS

9.1. General

This category covers suction fittings intended for use in swimming pools, wading pools, in-ground and self-contained spas, hot tubs, and similar installations. These fittings have been investigated for resistance to hair, body, finger and limb entrapment. Suction fittings have been investigated for both indoor and outdoor use. They are intended to be installed following the instructions that are packaged with each fitting.

9.2. Ratings

Each suction fitting is marked with a water flow rate in gallons per minute. This rate must equal or exceed the maximum flow rate of the pump(s) used in the water circulating system.

9.3. Installation Markings.

These fittings are marked with the intended installation position: "Wall Only", "Floor Only" or "Wall or Floor." They may additionally be marked with the statement, "For Single or Multiple Drain Use", "For Single Drain Use" or "For Multiple Drain Use Only." Units marked "For Multiple Drain Use Only" are intended for installations with at least two fittings per return. The fittings are intended to be installed in accordance with local installation codes so that it is unlikely both could simultaneously be blocked.

9.4. Listing Mark.

The Listing Mark for these products includes one of the following product names: "Swimming Pool Suction Fitting" (or "Sw Pool Sctn Ftn").

10. SPEAKERS

10.1 General

The category UEAY (Speakers) covers underwater speakers.

10.2 Listing Mark.

The Listing Mark for these products includes the product name “Underwater Speaker”.

APPENDIX A

Schematic Diagrams for Luminaire Installations

Fig. 1 - Underwater Luminaire for aboveground non-storable swimming pool.

Fig. 2 - Underwater Luminaire for aboveground non-storable swimming pool.

Fig. 3 - Underwater Luminaire for aboveground storage swimming pool.

Fig. 4 - No-Niche Underwater Luminaire.

Fig. 5 – Wet-Niche Underwater Luminaire.

- B. No. 8 AWG insulated supplemental equipment grounding conductor where nonmetallic conduit used.
- C. No. 8 AWG solid bonding conductor to pool common bonding grid.

**APPENDIX B:
UL SWIMMING POOL, SPA, FOUNTAIN, AND HYDROMASSAGE BATHTUB PRODUCT
CATEGORIES**

UL does list this type of equipment and continues to develop new product categories to address the safety issues associated with this type of equipment. Below is a list of product categories that UL currently lists to address these types of products. Each product category is tabulated with a UL Category Code. By clicking on the code, you will be linked to the UL Guide Information for the category and any Listings or Classifications under that Product Category in the UL Online Certifications Directory database at www.ul.com/database.

Category Code	Category Name	Standard Used
WABX	Swimming Pool and Spa Equipment	
WAGN	Blowers	UL 1563
WAWU	Controls	UL 1563
WBAH	Covers for Swimming Pools and Spas	ASTM F1346
WBRR	Heaters	UL 1261
WBYQ	Hot Tub and Spa Equipment Assemblies	UL 1563
WCEZ	Junction Boxes	UL 1241
WBDT	Luminaires and Forming Shells	UL 676
LSHW	Oil-Fired Swimming Pool and Spa Heaters	UL 726 and UL 1563
WCKA	Ozone Generators	UL 1563
WCNZ	Pool and Spa Equipment Classified in Accordance with NSF 50	ANSI/NSF 50
WCRY	Potting Compounds	UL Subject 676A
WCSX	Pumps	UL 1081
UDGJ	Residential Water Hazard Entrance Alarms (pool alarms)	UL 2017
WCZW	Self-Contained Spas	UL 1563
UEAY	Speakers	UL 1480
WEBS	Suction Fittings for Swimming Pools, Wading Pools, Spas and Hot Tubs	ANSI/ASME A112.19.8 ANSI/APSP 16
WDDJ	Swimming Pool and Spa Cover Operators, Electric	UL Subject 2452
WDUT	Swimming Pool and Spa Equipment, Miscellaneous	UL 1563 and UL 1081
WDGV	Swimming Pool and Spa Transformers	UL Subject 379
WDLC	Water Treatment Equipment	UL 1081, UL 1563
	Fountains and Fountain Equipment	
AWEG	Architectural and Floating Fountains	UL 778, UL 676, UL 508 ^A
QMTX	Plumbing Accessories	UL 1951
REUZ	Pumps, electrically operated, liquid	UL 778
IFEV	Submersible Luminaires	UL 676
	Hydromassage (Whirlpool) Bathtubs	
NCHX	Hydromassage Bathtubs	UL 1795, ASME A112.19.7
PIDF	Medical Electrical Equipment, Professional (hydrotherapy tubs)	UL 60601-1

APPENDIX C: POOL AND SPA CODES AND STANDARDS

Pool and spa equipment must be installed in accordance with model codes and installation standards. These codes require these products to be listed and labeled in accordance with applicable product standards.

UL standards are typically identified as Standards for Safety and cover reasonably foreseeable risks associated with a product. Limitations applicable to the products covered by the standard are delineated in the Scope section of the standard. UL standards are intended to:

- Identify requirements for evaluation of products and provide consistency in the application of these requirements.
- Provide guidance for development of products by manufacturers.
- Provide requirements compatible with nationally recognized installation codes

An UL Outline of Investigation is a document that contains the construction, performance, and marking criteria used by UL to investigate a product when the product is not covered by the scope of an existing UL Standard for Safety. Outlines are not consensus documents and do not require review by an UL Standards Technical Panel (STP) or other external group.

ANSI/ASME A112.19.7	Requirements for Whirlpool Bathtub Appliances
ANSI/ASME A112.19.8	Suction Fittings for Use in Swimming Pools, Wading Pools, Spas, and Hot Tubs
ANSI/APSP 16	Suction Fittings for Use in Swimming Pools, Wading Pools, Spas, and Hot Tubs
ASTM F1346	Standard Performance Specification for Safety Covers and Labeling Requirements for All Covers for Swimming Pools, Spas and Hot Tubs
IBC	International Building Code
IFGC	International Fuel Gas Code
IMC	International Mechanical Code
NFPA 54 (NFGC)	National Fuel Gas Code
NFPA 70 (NEC)	National Electrical Code
NSF/ANSI 50	Circulation System Components and Related Materials for Swimming Pools, Spas/Hot Tubs

	Professional Use
UL 1563	Electric Spas, Equipment Assemblies, and Associated Equipment
UL 1795	Hydromassage Bathtubs
UL 1951	Electric Plumbing Accessories
UL 2017	General-Purpose Signaling Devices and Systems
UL Subject 2452	Outline of Investigation for Electric Swimming Pool and Spa Cover Operators
UMC	Uniform Mechanical Code
UPC	Uniform Plumbing Code
USEC	Uniform Solar Energy Code
USPSHTC	Uniform Swimming Pool, Spa, and Hot Tub Code

Marking and Application Guide

WIRE AND CABLE

JANUARY 2013

Wire and Cable
Marking and Application Guide

PREFACE

Each year, millions of feet of wire and cable are installed in all types of buildings and are subjected to many different environmental conditions. Because of the choices available, it is important to know which wiring is suitable for a specific situation. It is also important to be able to properly identify these locations. Markings on or associated with the product, the UL Listing, Classification, or Verification information, and requirements in the current edition of the National Electrical Code® all convey the information needed to ensure a compliant installation.

This publication explains markings found on UL Listed, Classified, or Verified wire and cable.

UL has developed this guide for use by code and inspection authorities, electric utilities, contractors, installers, users, designers, and other interested parties to aid in understanding the markings found on wire and cable, and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation.

Although they may be broadly worded, required or optional product markings (and their locations) are specific to the product with which they are associated. This document is intended to be used in determining the suitability of a particular UL Listed, Classified, or Verified wiring product that complies with all the applicable UL requirements, in a particular application.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web site at www.ul.com/codeauthorities.

Your comments or suggestions are welcome and appreciated. They should be directed to:

Wire and Cable
Marking and Application Guide

INTRODUCTION

This guide is intended to assist installers, contractors, and authorities having jurisdiction in determining the suitability of UL Listed, Classified, or Verified wire and cable for use in a specific installation. Toward this goal, the guide:

- a) Clarifies the means used to identify UL Listed, Classified, or Verified wire and cable (see the sections titled "Identification of Listed Products", "Identification of Classified Products," "Identification of Verified Products).
- b) Provides an explanation of the ratings and intended uses of UL Listed, Classified, or Verified wire and cable (see Appendix A for designations).
- c) Focuses on the information contained in UL Listed, Classified, or Verified wire and cable product markings (what the markings mean, where they may be located, etc.).

This guide does not address wire and cable evaluated only for suitability as factory-installed component wiring in other Listed equipment. Those products are Recognized by UL under the Component-Appliance Wiring Material (AWM) and Component-Nonshielded cable categories and are not identified with an NEC[®] wire Type designation.

In general, Component Wire or Cable is not evaluated for field installation unless it is included as a part of a complete, Listed product or system. For example, data processing equipment Listed under the Information Technology Equipment Including Electrical Business Equipment (NWXG) category will use external interconnect cables, such as AWM Style 2464, only if the AWM has been evaluated and described in the Listing for the particular piece of equipment. The limitations on the installation of the Listed end-use product or system also apply to the wiring. Some interconnect cables may have connectors assembled on one or both ends as a computer-interconnection assembly. When these assemblies use Recognized cable and are sent to a building site separately, instead of being supplied with the equipment, these cable assemblies may be identified as Listed Computer Interconnection Cable Assemblies (DVPJ). Similarly, for communication equipment, Listed Communication Cable Assemblies (DUNH) may be used. AWM ratings and conditions of acceptability are shown on a tag affixed to the reel or carton. Some ratings may appear on the surface of the wire or cable.

The UL label is required for Listed, Classified, and Verified wire and cable products and can be applied in various manners. It can be applied to a coil, reel, flange, or box.

The UL Mark appearing on the coil, reel, flange, or box is the only means to identify wire/cable covered under UL certification and Follow-Up Service. The UL symbol or letters "UL" surface printed on the wire/cable is only a supplemental method of marking the product and should not be considered as evidence of UL coverage. UL's Guide Information located in the Online Certification Directory will indicate if the UL symbol or letters on the wire/cable itself is required or permitted. Engineering markings, which appear on the wire/cable are only intended to provide information related to the product's ratings or testing scope.

This guide should be particularly useful for those who:

- a) Have a working knowledge of the current edition of the National Electrical Code® (NEC®) and how locally applicable electrical codes relate to the NEC®.
- b) Are already familiar with the requirements of the electrical installation under consideration.
- c) Can identify the cable as a particular type.

This guide is intended to supplement the Guide information for the appropriate wire and cable categories in the UL White Book and the NEC®. The UL Category Code for each wire and cable category is identified in Tables 1, 2, and 3 of this Marking Guide.

1. HOW TO USE THIS GUIDE

The wire and cable types covered in this guide have been divided into three tables as follows:

Table 1 — Building Wires and Cables, including some industrial cables

Table 2 — Low Voltage Cables, Flexible Cords, and Fixture Wires

Table 3 — Special Purpose Wire and Cable

In each table, wire and cable types are identified by the name of the category under which they appear in the UL White Book. Most wire and cable types have the same category designation in the NEC® as they do in the UL White Book.

Definitions of the column headings and codes used in each column are provided in the section titled “Explanations and Notes for Marking Tables.” Table entries consist of:

Table Entry	Indicates
Yes	The wire or cable is always evaluated for the use specified by the particular column. These uses are explained in the section titled “Explanations and Notes for Marking Tables.”
— (dash)	The wire or cable is not evaluated for the indicated use, either as a requirement or as an option.
Numbers	A specific rating. For example, 250 in the column headed by “Temperature (°C) Dry” indicates a 250°C temperature rating for dry locations.
Numbers in parentheses e.g., (3), (21)	Specific notes detailing a rating and/or associated marking. The explanations of the notes can be found in “Explanations and Notes for Marking Tables,” following the tables.

2. IDENTIFICATION OF LISTED PRODUCTS

The UL Mark may have various information around it as authorized by Underwriters Laboratories.

The Listing Mark of Underwriters Laboratories on the attached tag, the reel, or the smallest unit container in which the product is packaged, with or without the UL symbol on the product, is the only method provided by UL to identify these products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated above) together with the word “LISTED,” a serial number, and the product or category name.

A product bearing the UL Mark for Canada is Listed to Canadian Standards for that specific product. A product bearing the combined Canada/U.S. Mark is Listed to both UL’s (U.S.) Standards and Canadian Standards for that specific product.

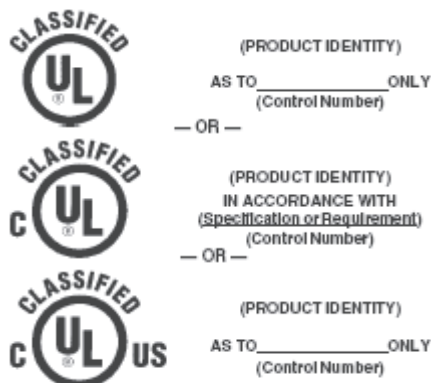

For wire and cable products, the complete Listing Mark is located on a tag attached to the reel or smallest unit container. Two types of UL symbols — “UL” in a circle or “UL” in parentheses — may be found on the wire or cable itself. These UL symbols may also be preceded by the letter “C”, indicating certification only for Canada, or preceded by a “C” and followed by “US”, indicating certification for both the US and Canada. The product markings are intended to provide information only, and the complete Listing Mark is the only proof that a particular unit of wire or cable is actually Listed.

To provide consistent control and marking, and to address potential counterfeiting issues, Holographic labels are required on all Listed, Flexible Cords and Cables, Communications cable, Communications cable verified to UL Performance Category Program, Data transmission cable verified in accordance with national or international specifications, Community antenna television cables, Data processing cable, Non-power-limited fire-alarm cable, Power-limited fire alarm cable, Instrumentation tray cable, Network powered broadband communications cable, Optical fiber cable and Power-limited circuit cable.

3. IDENTIFICATION OF CLASSIFIED PRODUCTS

With UL’s Classification Service, UL determines that a manufacturer has demonstrated the ability to produce a product that complies with its requirements for the purpose of classification or evaluation regarding one or more of the following: (1) specific risks only, such as casualty, fire or shock; (2) performance under specified conditions; (3) regulatory codes; (4) other standards, including international and regional standards; or (5) other conditions UL may consider desirable. UL conducts a Follow-Up Service as an audit of the means the manufacturer uses to determine continued compliance of the product with UL’s requirements. The UL Classification Marking may appear in various forms as authorized. The Classification Marking includes: (1) the symbol of Underwriters Laboratories – ; (2) the word “CLASSIFIED”; (3) a product identity and a statement

to indicate the extent of UL’s evaluation of the product such as “AS TO (nature of hazard) ONLY,” or a rating or classification as specified in the general information pertaining to the product category, or designation and title of standard published by other organization, or identification of specified product; and (4) a control number assigned by UL.

4. IDENTIFICATION OF VERIFIED PRODUCTS

The UL Verification Mark is used to identify products evaluated under UL’s Performance Verification Services. Some examples are products tested under the UL Performance Verification program for cable, Levels XP Structured Cabling Program, Proprietary Structured Cabling Program, ISO/IEC 11801, ANSI/TIA 568C.2, and NEMA.

The presence of this mark provides assurance to end-users, IT managers, LAN system designers, and the regulatory community that products have been evaluated for transmission performance, in order to meet the unique needs of the telecommunications industry community.

There are two formats to the Verification Mark (holographic label) that appear on products: Listing and Verification (as shown in Illustration A below) and Verified-Only (as shown in Illustration B below).

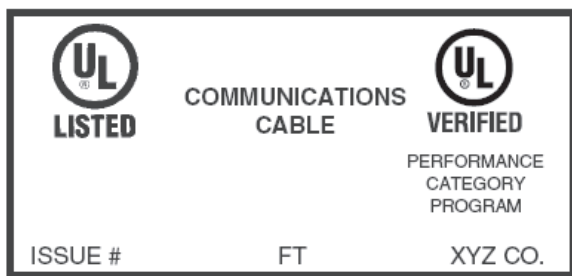

Illustration A

Illustration B

Listed cable also tested under the UL Performance Verification Program for cable in accordance to ANSI/TIA 568C.2 have the label marking “Listed Communications Cable” also “Verified to UL Performance Category Program,” on the tag, reel or smallest unit container, as shown in Illustration A. Cable Verified to another transmission performance specification, (NEMA WC63, 63.1, 66, ISO 11801, etc.), have the label marking “Listed Communications, Cable” also “Verified

in Accordance with [Specification name and/or number]" on the tag, reel or smallest unit container. In addition, surface marking on these products would be as follows:

- 1) For performance Category Cable: "Verified (UL) Category 3, 5, 5E, 6 or 6A [including latest draft number if applicable].
- 2) For performance Category Patch Cable: "Verified (UL) Category 3, 5, 5E, 6 or 6A [including latest draft number if applicable] Patch Cable" for stranded conductor cables.
- 3) For all other Performance Verified Cable: "Verified in Accordance with [Specification name and/or number]"

Cabling products that are Verified Only (Non-UL Listed) will use the label as shown in Illustration B. The UL Logo (UL in a circle with the two letters offset at a 30 angle from one another) is not permitted in the label artwork. The Verification Mark of Underwriters Laboratories on the attached tag, the reel, or the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under this Verification and Follow- Up Service. The Verification Mark for these products includes the "VERIFIED by Underwriters Laboratories," an issue or serial number, the product name "Data Transmission Cable", and the Specification name and/or number. In addition to the marking on the tag, reel, or smallest unit container, cables that have been Verified by UL in accordance with the signal transmission characteristics, and have not been Listed by UL as Communications Cable are surface marked with the statement "Verified by Underwriters Laboratories in accordance with [Specification name(s) and/or number(s)] Only" in the surface print legend. The UL symbol [either the UL in a circle symbol or "(UL)"] is not used in place of the wording "Underwriters Laboratories" in the statement.

Cabling products tested under the Levels XP Structured Cabling Program and the Proprietary Structured Cabling Program are field assembled cabling and connectivity products. The Type R UL Verification Mark (label) is not directly applied to structured cabling products. The complete Verification Mark (illustrated below) may appear on a Bill of Lading, a Bulk Shipment Certificate, or on UL's Certificate of Conformity Assessment. In these cases, the Mark must be reproduced in its entirety and clearly associated with the structured cabling product that was investigated by UL.

5. GENERAL CHARACTERISTICS

Markings

The requirements for the exact text and location of the markings, and the method of identification, vary among the different types of wire and cable. Wherever possible, the product is surface marked with information necessary for proper installation. When surface marking is not possible — or for other considerations — a portion of the marking may be located on a marker tape, or on the tag, reel or the smallest unit container as permitted by the requirements of each product category. Whenever possible, the rating or characteristic is plainly indicated. Other methods — for example, colored tracers under the jacket or insulation — may be used to identify a certain characteristic, such as temperature rating for some fixture wires. To completely determine the suitability of a particular wiring system, review of the product itself, tag markings and carton markings may be necessary.

Some wire and cable may be marked with multiple Type designations. These products have been evaluated for uses of all Type designations marked.

All markings on or associated with wire and cable, as well as the Listing and Guide Information of the appropriate category, should be consulted to determine all ratings and limitations for proper installation in accordance with requirements of the NEC[®].

UL evaluates wiring products with respect to the marked ratings and uses indicated by the Type designation associated with the UL Mark. Wiring products are not evaluated with respect to marked ratings and uses associated with other certification organizations.

Conductor Material

Compact stranded copper conductors are identified by “compact” or “cmpct,” otherwise wire and cable with bare or coated copper conductor material is not marked with stranding identification.

If the conductor material is either aluminum or copper-clad aluminum, the product, tag or carton markings (depending on the product category) identify the conductor material. These markings will appear as “AL,” “ALUMINUM,” “AL (CUCLAD),” “ALUMINUM (COPPER-CLAD),” “CU-CLAD AL” or “COPPER-CLAD ALUMINUM.”

For some wire and cable, other metals may be used as conductor material. The associated markings for that wire and cable are explained under the heading “OTHER.”

Flammability

UL investigates wiring products with respect to their intended locations and uses as permitted by the NEC[®]. Flammability or resistance to spread or propagation of fire is one of the considerations that enters into the overall investigation of wire and cable. For instance, products that are inherently permitted by the NEC[®] to be installed in cable trays or that are marked for such use are investigated for fire conditions that could exist in a cable tray.

Similarly, cables covered for use in accordance with Articles 725, 760, 770, 800, 820, and 830 of the NEC[®] are investigated with respect to their application: plenum, riser, general use or restricted

residential use. Suffixes to the Type designation identify the use as defined in the appropriate NEC® articles:

- P: Plenum
- R: Riser
- No Suffix, -G: General purpose
- X: Limited residential use

Some wire and cable may also have a suffix “-LS” or “ST1” which means that the entire construction complies with the requirements for flame retardant, limited smoke wiring materials as evaluated per UL 83, UL 1685 or UL 2556.

6. WIRE AND CABLE MARKING

7. EXPLANATIONS FOR COLUMN HEADINGS IN MARKING TABLE

The column headings of Tables 1, 2 and 3 identify:

WIRE AND CABLE CATEGORY/TYPE

Lists each wire, cable and flexible cord category as it appears in the UL White Book and UL's Online Certifications Directory. Generally, the category, type or both are on the product.

NEC® ARTICLE

Indicates the primary NEC® Article that references the category/type. The NEC® article is typically not marked on the product.

(CCN)- UL CATEGORY CODE

Products are Listed or Classified by UL under an appropriate product category. A four-letter category code is the UL product category code designation. Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Guide Information is available in the UL White Book and UL's Online Certifications Directory at www.ul.com/database. This category code is not marked on the product.

UL MARK ON PRODUCT

Indicates whether the UL Mark ("UL" in a circle or parentheses) is required (R), optional (O) or prohibited (P) on the product. See the section titled "UL Listing Mark."

8. EXPLANATION OF NOTES FOR MARKING TABLES

9. TEMPERATURE (°C) DRY AND TEMPERATURE (°C) WET

These two columns indicate temperature rating for the wire and cable when used in dry locations or when exposed to water or moisture such as in wet and damp locations.

Numbers in parentheses indicate the following:

- (1) Wire evaluated for use at 90°C dry and wet is marked with the suffix "-2" after the Type designation.
- (2) Cable is to be used at the ampacity for 60°C conductors in accordance with NEC®, Table 310.15(B)(16).
- (3) Cords evaluated for water resistance have a "W" in the Type designation, i.e. Type SJTW. The terms "water resistant" or "water resistant 60°C" may also be marked in addition to the "W" designation.

- (4) The wire or cable has been investigated for the temperature rating marked on the product, tag, reel or smallest unit container.
- (5) Types MV-90 and MV-105 are evaluated for use in wet or dry locations at 90°C and 105°C, respectively. Type MV- 90 DRY is only evaluated for use in dry locations at 90°C.
- (6) Cable evaluated for wet-location use is marked “WET-LOCATIONS CABLE” or “WET-LOCS CABLE.” Cable containing conductors evaluated for wet-location use may be marked, but such marking is not required.
- (7) 250°C for special applications in locations where environmental conditions require operation at above 90°C temperature. Temperatures of fittings are limited to 85°C in dry locations and 60°C in wet locations.
- (8) Wire or cable evaluated for wet-location use is marked “60°C WET” or “75°C WET.”
- (9) Temperature rating may be indicated on the product by colored marker threads located under either the insulation or separator as in the following table:

Table	Rating (°C)	Color
RFH-2, FFH-2	75	Green
TFN, TFFN RFHH-2, RFHH-3	90	Red
XF, XFF, SFF-1, SFF-2, PFF, PGFF, PAFF, PTF, ZF, ZFF	150	Orange
SF-1, SF-2, PF, PGF, ZHF, KF-1, KF-2, KFF-1, KFF-2	200	Black
PAF, PTF	250	Two black

- (10) The cable is marked with one of the following temperature ratings or codes; when no code is indicated, the product is marked with the rating.

Rating	Code
60°C dry 60°C wet	BC-1W1
75°C dry 60°C wet	BC-2W1
75°C dry 75°C wet	BC-2W2
80°C dry 60°C wet	BC-3W1
80°C dry 75°C wet	BC-3W2
90°C dry 60°C wet	BC-4W1
90°C dry 75°C wet	BC-4W2
90 C dry 90 C wet	BC-4W3
105°C dry 60°C wet	BC-5W1
105°C dry 75°C wet	BC-5W2
105 C dry 90 C wet	BC-5W3
105°C (dry only)	-
125°C (dry only)	-
200°C (dry only)	-

- (11) Welding cable rated 600V is investigated for use in 75°C dry or wet locations.
- (12) 90°C dry and damp location. 150°C dry locations for special applications in locations where environmental conditions require maximum conductor operating temperatures above 90°C.
- (13) 200°C in dry locations for special applications.
- (14) The temperature rating of the cable is the rating marked on the cable or implied by the conductor type in the cable.
- (15) Indicates minimum temperature rating. Suitable for use at higher temperatures if marked on the cable or cord. The higher temperatures (above 60°C) only apply to dry applications.
- (16) Note relocated to (29)
- (17) Cable evaluated for wet location use is marked "wet" or "wet location."
- (18) Cable evaluated for wet location use is marked "90C Wet or Dry".
- (19) Note not used.

10. VOLTAGE (V)

Indicates voltage rating. If the rating is not marked on the product, the wire or cable has been evaluated for the rating entered in the table. If marked higher than the rating in the table, it is rated as marked. Notes in the tables indicate the following:

(20) The voltage rating (kV) is one of the following, as marked: 2.4, 5, 8, 15, 25, 28 or 35.

(21) 600V or 2kV. Type MC cable containing Type MV conductors has the voltage rating of the conductors. Type MV cable in Type MC cable armor is surface or tape marked "Type MV Type MC" and it has a Type MV cable Listing Mark.

(22) Type designation indicates suitability for use in accordance with the appropriate NEC® Article, with respect to voltage and power limitations.

(23) The voltage rating (dc) is one of the following, as marked: 30, 48, 60, 90 or 150

(24) Rating is indicated by number in the Type designations as follows:

Suffix	Rating (V)
-1	300
-2	600

(25) The wire or cable may be evaluated for various voltage ratings. The rating is marked on the product, a tag attached to the reel or smallest unit container.

(26) Voltage rating is indicated on the product by a suffix after the Type designation as follows:

Suffix	Rating (kV)
-5	5
-10	10
-15	15

(27) Some Mineral-Insulated cable may be rated 300V for use in Class 1 remote control and signaling circuits not exceeding 300V.

(28) Rated ac or dc

(29) May be rated 600 volts when employing 45-mil insulation.

11. OUTDOOR USE

“Yes” indicates that the wire or cable has been evaluated for direct exposure to outdoor conditions. Generally, there is no marking indicating outdoor use coverage. Notes in the tables indicate the following:

(30) A product evaluated for outdoor use has a “W” in its Type designation, e.g. “SJTW.” For a cord evaluated and marked for recreational vehicle or mobile home use, outdoor use always applies and the marking “W” is optional.

(31) Type UF and UF-B cables evaluated for installation above-ground are marked “SUNLIGHT RESISTANT.”

(32) Cable evaluated for outdoor use is marked "outdoor" or "outdoor use".

(33) Cable evaluated for outdoor use is marked “SUNLIGHT RESISTANT” or “SUN. RES.” plus “60°C WET”, “75°C WET”, or “90°C WET”.

(34) Type CMX cable marked “Outdoor” is suitable for installation outdoors on dwellings.

12. SUNLIGHT RESISTANCE

“Yes” indicates that the outer nonmetallic covering of the product has been evaluated for direct exposure to ultraviolet (UV) radiation from the sun. This coverage is not generally marked on the product. Cables with an overall metallic covering are always considered suitable for exposure to sunlight. The use limitations and associated markings are specified in the tables by the following:

(35) A product evaluated for sunlight resistance is marked “SUNLIGHT RESISTANT”, “SUN. RES.” or "SR."

(36) A product evaluated for sunlight resistance is marked “SUNLIGHT RESISTANT”, “SUN. RES.”, or "W."

(37) Cords with the 'W' suffix are suitable for use in wet locations and are sunlight resistant

(38), (39) Notes not used.

13. CABLE TRAY USE

"Yes" indicates that the cable has been evaluated for use in cable trays in accordance with NEC® Articles 310, 318 and other applicable Articles. Generally, this coverage is not marked on the product. Notes in the tables indicate the following:

(40) When evaluated for use in cable trays, the product is marked "for cable tray use," "for CT use" or "for use in cable trays."

(41) For trays dedicated to welding cable only, per NEC® section 630.42. May be marked on the product.

(42), (43), (44) Notes not used.

14. OIL RESISTANCE

"Yes" indicates that the product has been investigated for use in locations exposed to oil at a temperature of 60°C or less. Generally, this coverage is not marked on the product. If the product has been investigated for oil resistance at higher than 60°C temperatures, it is rated as marked.

(45) A product evaluated for 60°C oil resistance is marked "OIL RESISTANT I", "OIL RES I", "OIL RESISTANT", or "PRI." A product evaluated for 75°C oil resistance is marked "OIL RESISTANT II", "OIL RES II", or "PRII."

15. GASOLINE RESISTANCE

"Yes" indicates that the product has been evaluated for use in locations exposed to liquid gasoline, gasoline vapors and vapors from similar light petroleum solvents. Generally, this coverage is not marked on the product. Notes in the tables indicate the following:

(46) A product evaluated for 60°C oil resistance and for gasoline resistance is marked "GASOLINE AND OIL RESISTANT I", or "GR1." Similarly, for 75°C oil and for gasoline resistance, the product is marked "GASOLINE AND OIL RESISTANT II" or "GR2."

(47) When evaluated for gasoline resistance only, the insulated conductors are marked "GASOLINE RESISTANT". If this marking appears on the outer covering of the cable, "GASOLINE RESISTANT" is followed by "CDRS", "CONDS" or "CONDUCTORS".

(48) A product marked with the suffix "G" has been evaluated for gasoline resistance.

(49) Note not used.

16. DIRECT BURIAL

“Yes” indicates that the wire or cable has been evaluated for direct burial in the earth. Generally not marked on the product. Notes in the tables indicate the following:

(50) When evaluated for direct burial use, the product is marked “FOR DIRECT BURIAL,” “DIRECT BURIAL,” “DIR BUR” or “DIR BURIAL.”

17. SUBMERSIBLE PUMP USE

“Yes” indicates that the wire or cable has been evaluated for use in wiring of pumps and/or submersible pumps. Product name identifies the use. Notes in the tables indicate the following:

(51) When evaluated, the product is marked “PUMP CABLE” or “SUBMERSIBLE PUMP CABLE.”

(52), (53), (54) Notes not used.

18. OTHER

Uses, exposures, and constructional features not otherwise covered in the tables are referenced in this column through the following notes. If not otherwise specified, the product has not been evaluated for any other condition unless marked on the product.

(55) Nickel or nickel-based alloy may be used with the product. Marking not required.

(56) Product is marked with the ampacity: “___ amp” or “___ A.”

(57) Optical Fibers. When these are present, the product is marked “Contains optical-fiber member(s)” or “OF” after the wire or cable Type designation.

(58) Gas/Vapor Blocked. When evaluated for gas/vapor blocking, the product is marked with “Gas/Vapor Blocked,” the minimum length required to attain the blocking, and the designation of the hazardous location for which the wire or cable is intended, such as “Class ____, Group ____.”

(59) The overall jacket on Types ITC, TC and PLTC is a “gas/vapor tight continuous sheath” as discussed in Sections 501.15(D) and 501.15(E) of the NEC®.

(60) Copper-clad steel conductor may be used with product. . Copper clad aluminum may be used as the center conductor in a coaxial construction. Marking not required.

(61) Each pair of thermocouple-extension wires is marked with the nominal AWG size and one of three designations —“THCPLXTN,” “For thermocouple-extension use only” or “Thermocouple-extension wire only,” — plus an identification(s) from either of the following columns for the combination(s) of thermocouple-extension conductor metals used:

Type	Designation	Combination of Metals
JX		Iron/Constantan
KX		Chromel/Alumel
TX		Copper/Constantan

EX	Chromel/Constantan
SX, RX	Copper/Alloy
BX	Copper/Copper
NX	Nickel-Chromium-Silicon/Nickel-Silicon-Magnesium
GX	Tungsten/Tungsten-26% Rhenium
CX	Tungsten-5% Rhenium/Tungsten-25% Rhenium
DX	Tungsten-3% Rhenium/Tungsten-25% Rhenium

Only cables containing thermocouple-extension wire may have the markings on the cable instead of having each pair marked.

(62) Recreational Vehicle or Mobile Home Use. When evaluated for this use, the product is marked "For Mobile Home or Recreational Vehicle Use: _____ Amperes."

(63) Low Leakage Current Rating. When evaluated for use as low leakage-current cord in a cord set or power-supply cord for earth-grounded, direct-patient, contact medical and dental equipment, the cable is marked "Max leakage/10 ft. at _____ V: _____ μ A to green and _____ μ A thru jacket."

(64) Various conductor materials may be used. The metal type is marked on the tag attached to the reel or smallest unit container.

(65) Insulated conductors evaluated for a 600V rating are marked "Power Leg" on the insulation surface.

(66) Conductive Thermoplastic Shield or Jacket. Jacket or thermoplastic shield is conductive when the product is marked "Conductive PVC shield" or "Black material is conductive."

(67) Flexing and Constant-Flexing Services. When evaluated for flexing services, the product is marked "Flexing" or "Class K." When evaluated for constant-flexing services, the product is marked "Constant flexing," "Class M" or "Class K."

(68) Listed cables that are additionally marked "Verified UL Category 3, 5, 5E, 6 or 6A" comply with the UL Data Transmission Performance Category Marking Program. "CAT" may be substituted for "Category." Listed cables that are additionally marked "Verified in Accordance With (Specification: Name and/or number)" comply with the requirements of a referenced transmission performance specification. For example, "Verified (UL) Category 6 or 7 NEMA WC-66." Effective January 31, 2012, cables are evaluated in accordance with ANSI/TIA-568C.2, "Balanced Twisted-Pair Telecommunications Cabling and Components Standards and Category 5 cables can no longer reference the ANSI/TIA-568C.2 Standard. Category 5 cables intended to bear a UL Verification Mark (label) and Verification surface markings can only be Verified under the "UL Performance Category Program". Any surface print reference to TIA/EIA-568B or ANSI/TIA-568C.2 is prohibited.

(69) Classified in accordance with International Municipal Signal Association, Inc. (IMSA) specifications. Intended for use in underground conduit or as an aerial cable only. Not evaluated for use as a substitute for cables or wiring systems covered in the NEC[®].

(70) "OO" indicates oil resistant insulation and jacket. "O" indicates oil resistant jacket only.

(71) Cable suitable for use as described in NEC[®] Sections 336.10(7), 725.154(D)(1), or 727.4(5) is surface marked with the suffix "- ER" (formerly "Open Wiring") directly following the Type letters.

(72) Cables marked "Integral Sleeve" have been evaluated for equivalence to a GTO cable with a sleeve installed over it as required in some electric signs.

(73) MI Cables with outer nonmetallic jackets are:

- (1) not suitable for use in ducts, plenums, or other spaces used for environmental air and are so marked.
- (2) marked "not suitable for use on or in buildings" if they have not been investigated for flame retardance. Such cables are sunlight resistant.
- (3) marked for cable tray use if they comply with the applicable flame test. These cables may be marked for sunlight resistance if applicable.

(74) Note not used.

(75) Plenum cables (those with a "P" as the last letter) may also be Listed as "Limited Combustible Cable." All marking requirements apply.

APPENDIX A

WIRE, CABLE AND CORD DESIGNATIONS

In general, the letter designations assigned to wire, flexible cord and cable in the NEC[®], for identification purposes, are established according to a coding system that provides information on intended use, insulation type and insulation temperature rating. This coding system, to which there are exceptions, does not cover all NEC[®] designations. The coding system is as follows:

CONDUCTORS FOR GENERAL WIRING NEC[®] Article 310, Table 310.104(A)

B	Braid
FEP	Fluorinated ethylene propylene insulation
H	75°C (Note: Lack of "H" indicates 60°C)
HH	90°C
N	Nylon jacket
PFA	Perfluoroalkoxy insulation
R	Thermoset insulation
S	Silicone (Thermoset) insulation
T	As first letter - Thermoplastic insulation
TFE	Polytetrafluoroethylene
U	Underground use
W	Moisture resistant
X	Cross-linked polymer insulation
Z	Modified ethylene tetrafluoroethylene insulation

Examples: RHW –Thermoset Insulation, 75°C, Moisture resistant
THHN –Thermoplastic Insulation, 90°C dry, nylon jacket

FLEXIBLE CORD AND CABLE NEC[®] Article 400, Table 400.4

E	As first letter — Elevator cable
E	After first letter — Thermoplastic elastomer insulation and jacket
EV	Electric Vehicle Cable
H	Heater cord
NI	“Non-Integral,” used for parallel cords such as Type NISPT-1 to denote insulated conductors and jacket are separate
O	Oil resistant. Single “O” means jacket only is oil resistant; double “O” means jacket and conductor insulation are oil resistant
P	Parallel conductor cord
S	Extra hard usage Flexible Cord
SJ	Hard usage Flexible Cord
SV	Not hard usage Flexible Cord
T	As the first letter — Tinsel cord. Single flattened 27 AWG conductor wound around insulating core, for very low current, highly flexible application
T	After the first letter — Thermoplastic insulation and jacket

-1, -2, -3	Insulation thickness for parallel cords, thinnest to thickest. Actual insulation thickness varies with cord type and AWG size
XTW	Parallel cord for decorative lighting strings
CXTW	Twisted pair cord or single conductor for decorative lighting strings
W	As the Last letter — Suitable for use in wet locations and sunlight resistant
W	As the only letter — Portable Power Cable

Examples: SJTO—Hard usage, thermoplastic, oil resistant jacket
SPT-2—Parallel Cord, thermoplastic

Fixture Wire **NEC® Article 402, Table 402.3**

F	Fixture wire, standard stranding
FF	Fixture wire, flexible stranding
G	Glass braid
H	75°C insulation
HH	90°C insulation
K	Aromatic polyimide tape insulation
N	Nylon jacket
P	Fluorinated ethylene propylene insulation
R	Thermoset insulation
S	Silicone (Thermoset) insulation
T	Thermoplastic insulation
X	Cross-linked synthetic polymer insulation
Z	Modified tetrafluoroethylene insulation
-1, 2, 3	Insulation thickness, thinnest to thickest for some types. Actual insulation thickness varies, with insulation types and AWG size.

Examples: SF-1—Silicone rubber fixture wire
TFF—Thermoplastic, flexible stranded fixture wire

Marking and Application Guide

ALTERNATIVE ENERGY EQUIPMENT AND SYSTEMS

JANUARY 2013

PREFACE

Interest in the use of alternative energy in the form of renewable energy has increased substantially because of the potential to provide increased reliability and lower cost of power delivery to the customer, particularly with customer-site generation. There are also substantial environmental benefits in reduced or no emissions as compared with traditional technologies.

The new means for generation, storage and transmission of energy present exciting possibilities but raise many questions about safety and reliability, questions that must be answered to ensure public acceptance. For example, the integration of new generation and storage technologies with existing systems need to provide safe and reliable service during peak and off peak demand.

UL is committed to the advancement of safe, renewable and sustainable energy through doing the necessary research, testing and development of standards to help society make a smooth and safe transition to alternative energy.

The equipment and systems used for alternative energy are required to comply with numerous electrical, fire, mechanical, plumbing, and building-related codes and installation requirements. These different codes require compliance with different standards and installation requirements.

UL has developed this guide for use by code and inspection authorities, electric utilities, contractors, installers, users, system designers, and other interested parties to aid in understanding the basic components of alternative energy systems and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web site at www.ul.com/codeauthorities.

Your comments or suggestions are welcome and appreciated. They should be sent to:

Alternative Energy Codes and Standards	21

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers in determining the suitability of specific alternative energy equipment in a particular installation and use, and to address concerns related to fire, shock, plumbing, gas, and/or mechanical hazards and performance reliability.

Products are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation. A list of alternative energy equipment product categories evaluated by UL, along with the applicable standard(s), can be found in Appendix A.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Guide information is available in the UL White Book and online at www.ul.com/database.

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

The numbering for code sections used in this document may change as the specific code is updated. A list of model codes and standards applicable for each product can be found in Appendix B.

Additional information can be found at www.ul.com/renewable.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of this equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified”.

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on alternative energy equipment. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL's *safety* requirements. These requirements are primarily based on UL's own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word "Listed," the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word "Classified," a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

PV Global Approval Mark (GAP)

Although this certification may be issued in conjunction with a safety certification, this certification is not considered a safety certification. This certification is for design qualification and type approval of PV modules and panels in accordance with IEC 61215 and IEC 61646.

This Mark is for photovoltaic (PV) products that have only been evaluated for an extension of the CB Full Certification Scheme (CB-FCS) based on authorization from the International Electrotechnical Commission's System for Conformity Testing and Certification of Electrical Equipment and Components (IECEE). In addition to the CB Certification under the CB-FCS program, ISO 9000 registration and an ongoing product follow-up surveillance program are required. UL is a member of the IECEE, and is a National Certification Body (NCB).

For more information, refer to the Guide Information for “Photovoltaic Modules and Panels – PV GAP Mark” (QIMY) or “Photovoltaic Lanterns – PV GAP Mark (QIMV).

PV GAP QUALITY MARK

FIELD EVALUATIONS

You may encounter situations in which you are unable to determine if a product has been listed by a third-party organization. Or in other situations you might encounter a product bearing a listing label that may have been modified in the field, and now you question whether or not the product still complies with the applicable standard. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors, and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL’s Web site at www.ul.com/field.

1. ALTERNATIVE ENERGY EQUIPMENT AND SYSTEMS

Alternative energy is either distributed or localized generation. The power source of alternate energy equipment and systems is one of the following or a hybrid combination – photovoltaic panels, wind turbines, engine generators, microturbines, or fuel cells. There are three system types:

- Interactive – operates in parallel with and may deliver power to an electrical production and distribution network
- Hybrid – comprised of multiple power sources
- Stand alone – supplies power independently of an electrical production and distribution network

The main concerns regarding the installation and use of distributed or localized generation are safety, power quality, harmonic distortion, and “islanding”. “Islanding” is when the distributed generation equipment continues to feed power to the grid when the utility source has been disconnected, resulting in sourcing an “island” or part of the grid. Installation requirements for interconnection with electrical power production sources are covered by NEC Article 705.

Inverters and converters (QIKH)

An inverter provides AC power at a useable voltage and frequency for connection to the utilities' electric power grid or to provide power for off-grid loads. In general, it converts the output of photovoltaic panels, fuel cells, wind turbines, and microturbines to an appropriate AC voltage and frequency for direct domestic and industrial use. More complex units can also supply power with the proper characteristics to the utility grid.

A converter is a device that accepts AC or DC power and converts it to another form of AC or DC power for direct utilization by a load or accumulation in an energy storage system.

Tests are conducted in accordance with the requirements of UL 1741. The extent of the test work depends on whether the product is a stand-alone unit or intended for interconnection with the local utility. The standard addresses the risks of fire and shock to service personnel and the general public. Inverters and converters for RV and land vehicles use (QPPY) and marine use (QPQL) are investigated using ANSI/UL 458.

There are three classes of inverters:

- Utility interactive – operate in parallel with, or backfeed power to the utility grid to supply common loads
- Stand alone – supply power to loads independent of the utility grid
- Multimode – can operate in both utility interactive and stand-alone modes in case of utility failure.

For inverters identified as utility interactive, the standard addresses power quality, synchronization of power back into the grid, and anti-islanding protection. The utility-interactive inverters prevent the exportation of power after a utility outage in order to mitigate potential shock hazards to utility line crews, current contribution to the utility fault, potential problems in re-energizing the power lines, and damage to equipment if the power line is re-energized out of sync with the inverter.

Markings on inverters include the following:

- The name of the manufacturer and the model number
- Range of input operating voltage
- Maximum input current (AC or DC)
- Output power factor rating
- Operating voltage range (AC)
- Operating frequency range or single frequency
- Nominal output voltage (AC)
- Normal output frequency
- Maximum continuous output current (AC)
- Maximum continuous output power (AC)
- Maximum ambient temperature rating (if evaluated for higher than 25°C / 77° F)
- Installation environment (e.g. “indoor use only”)
- “Utility-Interactive” or “Interconnection System Equipment” if appropriate

The model ratings for each inverter are posted on UL’s Online Certification Directory. Some inverters need to be installed and operated with an external transformer and/or overcurrent protection (input or output), as specified in the markings and installation instructions. The required external overcurrent protection is to be sized at 125% of the inverter’s output current rating unless otherwise specified.

Installation instructions for inverters identify the wire size, wire type, wire rating, location limitations of the product, clearances, torque values for the wire terminals, and the electrical ratings.

Distributed Resource Power Systems (QI/L)

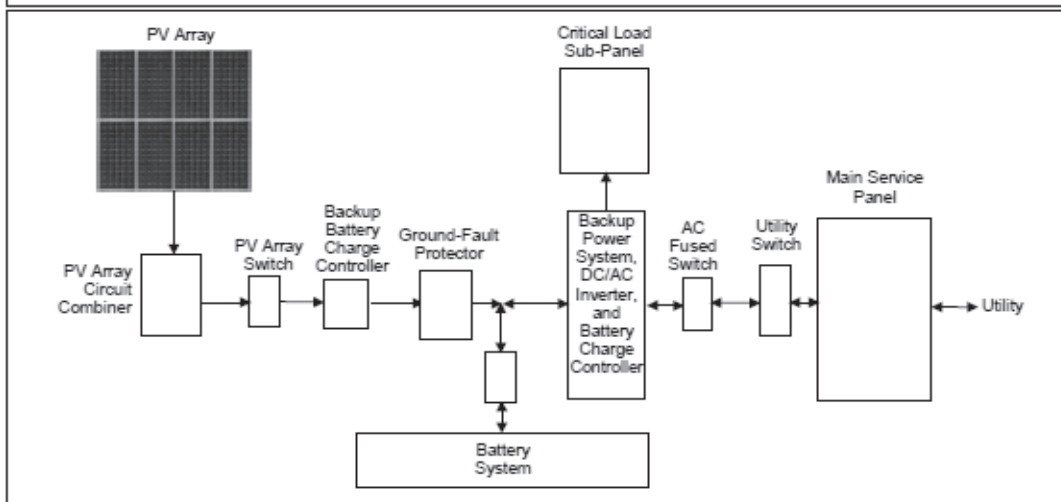

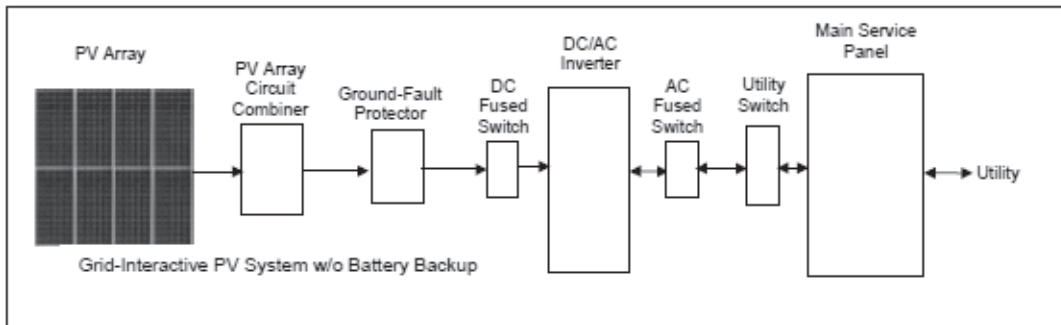

Distributed resource power systems, consisting of combinations of batteries, energy storage devices, utility interconnection systems equipment, and protective relays, are investigated in accordance with applicable requirements from UL 1703, UL 1741, and ANSI/UL 2200. This combination of equipment is intended to combine, convert, transform or relay energy from one or more ac or dc sources for use in stand-alone and/or utility-interactive power systems. They are factory or field wired assemblies in which the combination has been investigated for operation as a system assembly when installed in accordance with the installation instructions.

Solar Power

There are two types of solar power – photovoltaic and thermal. Photovoltaic converts light directly into electricity using semi-conductor technology. Thermal solar uses the sun’s radiation to heat water for buildings and swimming pools.

2. PHOTOVOLTAIC SYSTEMS

Photovoltaic (PV) technologies use treated crystalline silicon operating as a semiconductor to generate a flow of direct current electricity when exposed to light. PV technologies are evolving, allowing PV use in products such as flexible roofing applications and using other materials such as thin-film polymer.

Photovoltaic (PV) systems convert sunlight directly into electricity, which enables the generation of some or all of the daily electrical energy demand for a building. Utility interactive systems remain connected to the electric utility at all times, so any power needed above what the solar system can produce is simply drawn from the utility. PV systems include mounting systems and wiring systems used to integrate the solar modules into the structural and electrical systems of the building. The wiring systems include disconnects for the dc and ac sides of the inverter, ground-fault protection, combiner boxes, and overcurrent protection for the solar modules. Some inverters include this fusing and combining function within the inverter enclosure. PV systems can also include battery backup or uninterruptible power supply (UPS) capability to operate selected circuits in the building for hours or days during a utility outage.

Product installation concerns for photovoltaic systems include:

- Utility compatibility and interaction
- Environment (e.g. indoor, outdoor, hazardous location)
- Maximum number of modules (effecting voltage/current/short-circuit)
- Fire exposure ratings (effect on roof covering)
- Wind and snow loading
- Mounting and attachment
- Grounding and bonding
- Shading

Modules and Panels

A PV module consists of solar cells connected together in the factory. The most common PV module is 5 to 25 ft². PV modules have ratings from 12V to 100V and power ratings from 5w to 400w. Often sets of four or more smaller modules are framed or attached together by struts in what is called a panel. This panel is typically around 20-35 ft² in area. This allows some assembly and wiring functions to be done on the ground in the factory or in the field in accordance with the installation instructions.

PV panels are "strung" together in series, referred to as a PV array, to increase the voltages from 120Vdc up to 600Vdc. Under normal conditions the current of these strings is usually from 5 to 10 amps. The NEC limits residential PV maximum system voltage to 600Vdc. PV panels can also be connected together in parallel to increase the current.

The construction of the product, the safety performance, materials and the manufacturing process are all assessed in determining the compliance of the module or panel to the requirements of the applicable standards. The product's output wiring system is also investigated for conformance with the conventions of the NEC. The safety performance includes electrical, temperature, mechanical loading, and fire tests.

AC modules (QHYZ) provide single-phase power at 50/60 Hz when exposed to sunlight. An AC module consists of a photovoltaic module and an integral static inverter that changes dc power to ac

power. AC modules may be connected in parallel and are intended for operation interactive with an electric utility supply. They have been evaluated to de-energize their output upon loss of utility power. These modules are rated up to 600 V dc input; 10 kW, 120/240 V ac or less, single-phase output. The basic standards used to investigate these modules are UL 1703 and UL 1741.

PV modules and panels (QIGU) intended to be connected to electrical loads, controllers, or to static inverters that convert the dc power the modules or panels generate to other types of power compatible with the intended loads are investigated using UL 1703. Flat-plate PV modules and panels rebuilt (QIGZ) by the original manufacturer or a third party manufacturer are subject to the same requirements as new flat-plate photovoltaic modules and panels. PV modules and panels for use in hazardous locations (FCJU) are identified with the aforementioned ratings and Class and Division ratings.

Concentrator Photovoltaic (CPV)

Concentrator photovoltaic modules and assemblies (QICP) use lenses and reflectors to concentrate sunlight on photovoltaic cells to increase output power. The installation class for CPV modules and assemblies identifies the intended installation location as either general access areas designated "General," or restricted access areas designated "Restricted." General access units are able to be installed in open areas that may be contacted by the general public. Restricted access units are intended to be installed in areas that prevent general public access, such as a locked and fenced-in area. The basic requirements used to investigate products in this category are contained in UL Subject 8703.

PV modules and panels are intended for mounting on buildings or on ground-supported frames. Roof-mounted modules or panels are investigated for one of three mounting methods: (1) integral to the roof of a building, (2) directly on a building's roof, or (3) on a rack with a space above the roof surface.

When mounted integral to a building's roof the module (also know as BIPVs) serves as the waterproof membrane. Direct-mounted panels are placed upon the building's waterproof membrane, such as roofing shingles. Rack-mounted styles are spaced away from the building's roof membrane. Rack-mounted styles may also be installed separate from buildings. Installation of modules on or integral to a building's roof system may or may not adversely affect the roof-covering materials' resistance to external fire exposure if the module has a lesser or no fire-resistance rating. Roof-covering materials will not be adversely affected when the modules have an equal or greater fire-resistance rating than the roof-covering material.

PV modules or panels are additionally identified as Class A, B or C to denote their Classification for resistance to external fire exposure to correlate with the rating of other roofing materials and systems as required by the International Building Code (IBC) Chapter 15. Rack-mounted modules or panels that have not been identified with respect to their resistance to external fire exposure are marked "Not Fire Rated." Photovoltaic roofing shingles (TFXX) are intended to be applied directly to a combustible deck in accordance with manufacturer's instructions. Roofing systems (TGFU) that are an assembly of several components, including the PV modules and panels, may require special equipment for application and are intended to be installed on a roof deck as specified by the system.

Building-Integrated Photovoltaic (BIPV)

Building-integrated photovoltaic modules and panels (QHZZ) are intended for mounting integrally to the structural or protective surfaces of a building in one of three primary installation methods: (1) to serve as the roof, or as a majority component of the roofing system of a building (TFXX, TGFU), (2) to serve as part of a structural component of a building, such as a curtain-wall, facade, atrium, skylight, etc., or (3) to serve as part of a nonstructural component of a building, such as a curtain-wall, facade, atrium, skylight, etc., which is applied extant to the primary building structure. These modules and panels and their mounting systems (QHZZ) are investigated using UL 1703, and ANSI/UL 790 and UL 997 as appropriate.

PV Markings and Installation Instructions

Markings for PV modules and panels include:

- Electrical ratings - $V_{Open\ Circuit}$, $V_{Operating}$, $V_{Max\ System}$, $I_{Short\ Circuit}$, I_{Rated} , P_{max}
- Terminal polarity and temperature of output connections
- Maximum series overcurrent device rating
- Minimum acceptable diode bypassing (if needed)
- Fire Rating – “Not Fire Rated” or Class A, B, or C

Grounding and bonding of the panels and modules and racking systems are required to be done in accordance with the manufacturer’s installation instructions, due to concerns of dissimilar metals and exposed terminations.

The installation instructions for the PV modules and panels include:

- Max. System Voltage (to not exceed the inverter)
- Wire sizing
- Maximum series fuse rating (dc rating)
- Electrical Data - V_{oc} , I_{sc} , Temperature, V_{mp} , I_{mp} , P_{max}
- Grounding methods & location
- Clearances to roof for rack-mounted
- Designation of attachment

Model code requirements for photovoltaic systems are found in the National Electrical Code (NEC®) Article 690; International Building Code (IBC) Chapters 15, 16, and 24; and Uniform Solar Energy Code (USEC) Chapter 10.

The standards IEEE 1262, IEC 61215, and IEC 61646 are used for design qualification of modules and panels (QIMY). This is not a safety certification.

PV Accessory Equipment

PV accessory equipment (QIIO) include:

- Actuators
- Blocking diodes
- Conduit boxes

- Connectors
- Controllers (control boxes)
- Communication modules
- Disconnects
- Distribution panels
- Transition boxes

Most systems include a combiner box since most modules require fusing for each module source circuit. Manufacturer’s installation instructions for combiner boxes include:

- Wire size
- Terminal Ratings and torque values
- Mounting orientation / Location
- NEMA enclosure rating

A charge controller (QIBP) is a device to control the charging process of energy storage products such as batteries. These devices are necessary to match the output voltage of the DG source with the rated voltage of the battery or other storage medium. They also control the level and rate of charge to prevent damage to the storage medium.

An output controller is a device external to an inverter, converter or utility interactive distributed generation source that performs utility interface functions including over- and under-voltage, over- and under-frequency, synchronization, and anti-islanding protection.

PV panels are inherently limited sources and are not provided with direct output overcurrent protection. They are designed to operate within 20% of the short circuit current. The NEC® Section 690.5 requires a means to detect a ground fault in the PV system caused by abuse, wear, cutting, and pinching of the wire. Ground fault detector interrupters (QIIO) interrupt the flow of fault current, and provide an indication of the fault. Inverters and controllers either incorporate these devices or are marked to require these devices to be added in the field.

PV Wire (ZKLA)

A new wire has been specifically designed for interconnection wiring of grounded and ungrounded photovoltaic power systems as described in NEC® Section 690.31(A). The Photovoltaic Wire is a single-conductor, insulated and integrally or non-integrally jacketed, sunlight resistant, rated 90, 105, 125 or 150°C dry, and 90°C wet, 600, 1000 or 2000 V. The basic requirements used to investigate the wire is UL Subject 4703. The wire is labeled “Photovoltaic Wire”.

Connecting to Panelboards and Switchboards

Panelboards and deadfront switchboards are not Listed to have their busbars tapped unless there are existing holes in the busbars marked with the word “Tap” adjacent to the holes. Other holes in the busbar that are not marked with the word “Tap” are intended for the connection of overcurrent devices, other device’s as identified by the product markings and in the installation instructions or other uses identified by the manufacturer. When the electrical equipment Listing does not include product markings or instructions for tapping busbars, this situation should be treated like any other field modification of Listed equipment.

Some Listed power equipment may have installation instructions with specific directions on tapping the busbars. If this is the case, this equipment can be field modified, following those manufacturer’s

instructions, in accordance with the National Electrical Code® (NEC) Section 110.3(B). The UL White Book identifies the required markings for field-installed equipment that have been evaluated by UL. For additional information, please see the guide information for panelboards (QEUY) and for dead-front switchboards (WEVZ).

If not addressed in the installation instructions, any modifications must be evaluated by the Code Official according to NEC Section 110.3(A) or by having a UL Field Evaluation conducted. A terminal or provision for a terminal in a panelboard or switchboard which has been evaluated for use as a tap, other than those to be used by the supply utility for voltage metering pick-up, are marked "Tap" in the factory. Drilling or enlarging holes in busbars can increase the current density and reduce current carrying capacity. Some equipment is constructed with fully rated busbars, which have a typical current density of 1000 A per square inch of cross sectional area for copper and 750 A per square inch of cross sectional area for aluminum. However, some equipment uses busbars at a higher current density and have temperature testing conducted to determine compliance with UL's requirements.

Removing busbar material can result in higher operating temperatures, and additional holes can potentially weaken the busbar, which adversely affects the short circuit rating of the equipment required by NEC Section 110.10. Both sufficient wiring space and wire bending space need to be provided for the conductors and the wire connector at the tap connection. In measuring the wiring space, code officials need to consider the possibility of the connectors rotating, which may result in reduction of the spacing between uninsulated live parts of opposite polarity and uninsulated live parts and ground.

Wire connectors (lugs) need to be Listed for the purpose and have the proper ratings for specific application, and the mounting hardware for wire connectors needs to be properly selected and attached with the correct torque. The potential reduction of required spacings from the wire connectors or fasteners to the enclosure or other busbars also needs to be evaluated. In completing the modification, all foreign material such as cutting oil, burrs and metal shavings needs to be removed from the equipment enclosure. Temporarily removed materials such as insulating barriers need to be returned to their original positions and secured. The above are just a few of the concerns and items that must be inspected, checked and reviewed where such modifications are made to this type equipment.

3. THERMAL SOLAR SYSTEMS

Thermal solar systems involve direct utilization of solar energy for space heating, space cooling and/or water heating systems. The basic requirements used to investigate products in these systems are contained in UL Subject 1279.

UL's Solar Energy Systems Equipment product categories are:

- Solar Energy Systems Equipment (UZST)
- Controllers, Electrical, Solar (UZVY)
- Thermal Storage Units, Solar (UZWW)
- Water Heaters, Solar (UZWZ)
- Collectors, Solar (UZUW)
- Energy Transfer Units, Solar (UZWT)
- Radiant Heating Hose (MEKC)

Product installation concerns include:

- Environment (unless evident for outdoors or marked as such, indoor use only)
- Type of storage media or fluid
- Max temperature and pressure ratings
- Roof classification
- Mounting methods

Applicable installation codes and standards are UMC Chapter 15; IMC Chapter 14; IBC Chapters 15, 16, and 26; and USEC. The codes include specific requirements for roof mounting of the collectors, heat transfer fluids, and equipment and materials.

Using solar for thermal heating provides credits in various green building codes and standards, such as Section 704.3.2 of ICC 700.

4. FUEL CELLS AND HYDROGEN GENERATORS

A typical Fuel Cell is an electrochemical device that converts hydrogen into electrical energy and heat. Current technologies are the proton exchange membrane fuel cell (PEMFC), the phosphoric-acid fuel cell (PAFC), the solid oxide fuel cell (SOFC), and the molten carbide fuel cell (MOFC).

The technology is broad and includes a wide variety of applications. Currently, UL evaluates stationary fuel cells used as electric power sources for residential and commercial and backup voltage sources for uninterruptible power supplies for critical computer and telephone applications (IRGZ), portable battery replacement power sources for cell phones and other electronic equipment (IRGU), battery replacement power sources for industrial trucks (IRGQ), Additionally, fuel cells are beginning to be used by the utility companies as a source of supplemental power during periods of peak demand.

A basic summary of a fuel cell power system is that it consists of either a reformer to extract hydrogen from fuel or can be supplied with a direct source of hydrogen, a fuel cell, and power conditioning circuitry which may include an inverter. Applicable codes and standards are NFPA 853, NEC Articles 692 and 705, CSA FC-1, UL Subject 2262, UL Subject 2265A, UL Subject 2265C, ANSI/UL 2267, UL 1741, IFGC Section 633, IMC Section 924, and UMC Chapter 16.

PEM Fuel Cell technology

5. ENGINE GENERATORS AND MICROTURBINES

Microturbine and engine generator products are electricity-producing assemblies typically located at or near the point of use. They are typically installed so that back-up (standby or emergency) power is available to the user in the event of a utility grid failure. In some installations, these units can be connected in parallel with the local electric utility power grid and used for peak shaving or excess power can be sold back to the utility. In other applications, microturbines and engine generators are located off the grid in rural and remote areas where they provide the sole source of power (prime or continuous), or they operate in combination with other sources such as photovoltaic or wind turbine installations.

Internal combustion gasoline, natural gas, propane and diesel engines from the automotive and marine industries have been coupled to rotating field alternator and generator devices for many years. In addition, the turbine engines now being coupled to high-speed generators in microturbine applications are from the same family of small jet engines that have been employed in the military and transportation industries for the past 50 years. These systems are considered to employ the most reliable power producing technologies ever used in stand-alone and distributed systems.

Tests for stationary engine generators are conducted in accordance with the requirements of UL 2200, which include an evaluation of fire hazards, electric shock hazards, casualty hazards (including power interruption consequences) and reliability analysis. Additional tests may be conducted based on NFPA 110 and to deal with special situations such as the evaluation to show that abnormal leakage is handled appropriately, or gas component sections of the product are ventilated as designed.

Tests for portable engine generators are conducted in accordance with UL 2201. The electrical evaluation includes control panels, safety control reliability analysis, cycling durability tests, circuit analysis, and system software. The mechanical evaluation includes fuel tanks, venting, and the combustion engine.

Model installation code requirements for engine generators are covered in IFGC Section 616, IMC Section 915, IBC Section 2702, IFC Section 604 NFPA 37, NFPA 99, and NFPA 110.

6. WIND TURBINE GENERATING SYSTEMS

Large and small wind turbine generating systems and assemblies (ZGAA)

Wind turbine generating systems produce electric power from a wind driven generator. Wind turbines consist of blades, hub, generator, drive train, support structure, control, power collection, power distribution and protection systems. Small wind turbine generating systems (ZGEN) are defined as wind turbines with a rotor swept area of 200 m² (16 meters rotor diameter) or less, and an output terminal voltage of 600 Volts or less. Large wind turbine generating systems (ZGEA) are defined as turbines with a rotor swept area larger than 200 m² (16m rotor diameter). Large Wind Turbine Assemblies (ZGBP) and small wind turbine sub-assemblies (ZGZJ), consisting of various electrical hardware components and subassemblies constructed and interconnected in accordance with electrical safety requirements, are used to create a complete wind turbine.

These systems are evaluated for risk of fire and shock, including safety related control system electrical performance and utility grid-interconnect performance for Utility Interactive models. The basic requirements used to evaluate large and small wind turbine generating systems, and large and small wind turbine assemblies, and safety related control systems, is Subject 6140-1, UL's "Outline of Investigation for Wind Turbine Generating Systems".

The electrical equipment systems are intended for installation in accordance with the requirements in NEC[®] Article 705. Mounting means, support structures, wind turbine blades, and/or rotors are only evaluated to the extent that they include the necessary electrical components to comply with the applicable electrical safety standards. Local wind, snow, and seismic loading, and local soil conditions are unique for each jobsite location, and thus should be evaluated by the local jurisdiction.

Safety Related Control Systems (ZGCP)

Safety Related Control Systems consist of electrical hardware and software which operate to control and protect the wind turbine generating system, and functions up to the electro-mechanical interface of the associated power and control circuits. These systems are for use with specific wind turbine generating systems as defined by each product's UL Classification.

These systems are evaluated to perform specific wind turbine control and protection functions to maintain the overall system within the manufacturer's specified operational limits. These control and protection functions are evaluated with respect to risk of electric shock and fire, and electrical response time. It is intended that the electrical subassemblies that address power transfer control and protection functions evaluated by UL be coordinated with a mechanical and structural

evaluation of the wind turbine generating system in accordance with standards such as the IEC 61400 series documents or Germanischer Lloyd WindEnergie GMBH: Guideline for the Certification of Wind Turbines documents.

The Safety Related Controls System, as defined in UL Subject 6140, embodies the “Controls System” and “Protection System” functions defined in IEC 61400 and Germanischer Lloyd WindEnergie GMBH: Guideline for the Certification of Wind Turbines documents, GL-IV.

Inverters and Converters (ZGFA)

Inverters are devices that change DC power to AC power. Converters are devices that accept AC or DC input power and convert it to another form of AC or DC power for direct utilization by a load or accumulation in an energy storage system (batteries, capacitors, etc.).

Both of these devices are classed as Utility Interactive, Stand-alone or Multimode. Utility Interactive devices operate in parallel with the utility grid. Stand-alone devices are intended to operate independent of the utility grid. Multimode devices can operate as both or either Stand-alone (utility independent) or Utility Interactive devices. Each product is marked to identify its class.

Electric utility grid interconnection performance is evaluated to limits defined by the manufacturer for synchronization, overvoltage, undervoltage, overfrequency, underfrequency, clearing times, reconnect time, power factor, DC injection, harmonic distortion, unintentional islanding, power range and low voltage ride-through (if provided).

Inverters and converters may contain energy storage devices and associated charge controllers. Some devices must be installed and operated with an external transformer. Such devices are provided with markings and instructions to indicate the type of transformer required. Some devices may require external input and / or output overcurrent protection, which will be specified in product markings and installation instructions.

Some devices in this category must be installed and operated with an external transformer. Such devices are provided with markings and instructions to indicate the type of transformer required. These products may require external output overcurrent protection, which will be specified in product markings and installation instructions.

The basic requirements used to evaluate inverters and converters is UL Subject 6141, which requires that all converters be evaluated for both normal and abnormal conditions associated with the application (less electric utility “grid” interconnection protection). For electric utility connected converters this includes the evaluation of the unit’s ability to parallel two sources of power, operate during normal utility operating conditions, provide a minimum level of output power quality including DC injection and operate safely during abnormal utility grid conditions defined by the manufacturer’s specified product ratings.

Products that have not been evaluated for electric utility “grid” interconnection protection will be marked to indicate that the electric utility grid interconnection protection functions have not been evaluated and need to be addressed at the end installation with the local utility AHJ per local codes and standards. This will often require the installation of additional electric utility interconnection protection equipment and field-testing per the local utility interconnection requirements.

APPENDIX A

UL ALTERNATIVE ENERGY PRODUCT CATEGORIES

UL does list this type of equipment and continues to develop new product categories to address the safety issues associated with this type of equipment. Below is a list of product categories that UL currently lists to address these types of products. Each product category is tabulated with a UL Category Code. By clicking on the code, you will be linked to the UL Guide Information for the category and any Listings or Classifications under that Product Category in the UL Online Certifications Directory database at www.ul.com/database.

Category Code	Category Name	Standard Used
QHWJ, FCHD	Distributed generation power systems equipment	
QIKH	Static Inverters and Converters for Use in Independent Power Systems	UL 1741
QPPY	Power Converters/Inverters and Power Converter/Inverter Systems	UL 458
FFZS	Power Converters for Use in Electric Land Vehicles	UL Subject 458A
QPQL	Converter and Inverter Systems -- Marine	UL 458
QIIO	Distributed Generation Power Systems Accessory Equipment	UL 1741
QIJL	Distributed Resource Power Systems	UL 1703, UL 1741, and/or UL 2200
BBFX	Batteries for Use in Light Electric Rail and Stationary Applications	UL Subject 1973
	Photovoltaics	
QHYZ	AC Modules	UL 1703 and UL 1741
QIGU	Photovoltaic Modules and Panels	UL 1703, IEEE 1262
QIIA	Photovoltaic Modules and Panels with System Voltage Ratings Over 600 Volts	UL 1703
QIGZ	Remanufactured Photovoltaic Modules and Panels	UL 1703
FCJU	Photovoltaic Modules and Panels for use in Hazardous Locations	UL 1703
QICP	Concentrated Solar Power Equipment	UL Subject 8703
QIHC	Concentrator Photovoltaic Modules and Assemblies Classified in Accordance with IEC 62108 and/or CEI 82-85	IEC 62108, CEI 82-85
QIHS	Photovoltaic Modules and Panels Classified in Accordance with IEC 61646 and/or EN 61646	IEC 61646 and/or EN 61646
QIHZ	Photovoltaic Modules and Panels Classified in Accordance with IEC 61730-1 and 61730-2 and/or EN 61730-1 and 61730-2	IEC 61730-1 and 61730-2 and/or EN 61730-1 and 61730-2
QIHO	Photovoltaic Modules and Panels Classified in Accordance with IEC 61215 and/or EN 61215	IEC 61215 and/or EN 61215
QHZK, TFXX, TGFU	Building-Integrated Photovoltaic Modules & Panels	UL 1703, UL 790, UL 997

QHZZ	Building-Integrated Photovoltaic Mounting Systems	UL 1703, UL 790, UL 997
QHZZ	Flat-plate, Low-concentration Photovoltaic Modules and Panels	UL Subject 8703 or UL 1703
QIBP	Photovoltaic Charge Controllers	UL 1741
FCJC	Photovoltaic Charge Controllers for Use in Hazardous Locations	UL 1741
QIKA	Photovoltaic Solar Trackers	UL Subject 3703
QIMS	Rack Mounting Systems and Clamping Devices for Flat-plate Photovoltaic Modules and Panels	UL Subject 2703
ZKLA	Photovoltaic Wire	UL Subject 4703
QIMV	Photovoltaic Lanterns – PV GAP Mark	
QIMY	Photovoltaic Modules and Panels – PV GAP Mark	IEC 61215, IEC 61646
IZMR	Fuseholders, Photovoltaic	UL Subject 4248-18
JFGA	Fuses for Photovoltaic Systems	UL Subject 2579
DIUR	Circuit Breakers, Molded Case and Circuit-breaker Enclosures for Use in Photovoltaic Systems	UL Subject 489B
QIDC	Photovoltaic DC Arc-fault Circuit Protection	UL Subject 1699B
WHXX	Switches, Dead-front for Use in Photovoltaic Systems	UL Subject 98B
WIBC	Switches, Enclosed for Use in Photovoltaic Systems	UL Subject 98B
WJBE	Switches, Molded Case, for Use in Photovoltaic Systems	UL Subject 489B
WHVA	Switches, Open Type for Use in Photovoltaic Systems	UL Subject 98A and UL Subject 98B
UZST	Thermal Solar - Solar Energy Systems Equipment	
UZUW	Solar collectors	UL Subject 1279
UZVY	Electrical solar controllers	UL Subject 1279
UZWT	Energy transfer units	UL Subject 1279
UZWW	Thermal storage units	UL Subject 1279
UZWZ	Solar water heaters	UL 174, UL 1453
IRGN	Fuel Cells and Hydrogen Generators	
IRGQ	Industrial trucks	UL 2267
IRGU	Handheld fuel cells	UL Subject 2265A or UL Subject 2265C
IRGZ	Stationary fuel cells	ANSI/CSA FC-1
NCBR	Hydrogen generators	UL Subject 2264B
FTCA	Engine Generators and Microturbines	
FTSR	Stationary Engine Generators	UL 2200
FTPU	Engine Generators fueled by biogas or raw natural gas	UL 2200
FTWG	Stationary Engine Generators for use in Hazardous Locations	UL 2200
FTCN	Portable Engine Generators	UL 2201
FTCZ	Engine Generators for use with Recreational Vehicles	UL 1248
EFVT	Special purpose tanks	UL 142, UL 2085,

		UL 2080
FTVV	Engine control equipment and Engine Generators for Use in Hazardous Locations	
FTWD	Engine controls for Use in Hazardous Locations	UL 508, UL 61010-1, UL 6200
FTWL	Ignition controls for Use in Hazardous Locations	UL 1012
JZGZ	Generator heads	UL 1004-1, UL 1004-4
IUXX	Fuel Gas Booster Compressor Equipment	UL 2200
ZGAA	Wind Turbine Generating Systems	
ZGEA	Large wind turbine generating systems	UL Subject 6140
ZGBP	Large wind turbine assemblies	UL Subject 6140
ZGEN	Small wind turbine generating systems	UL Subject 6140
ZGZJ	Wind turbine sub-assemblies	IEC 61400-1 or IEC 61400-2
ZGTA	Wind Turbine Tower Assemblies	UL Subject 6140
ZGDT	Wind Turbine Drive-train Systems and Equipment	UL Subject 6141
ZGCP	Safety-related control systems	UL Subject 6140
ZGFA	Inverters/converters	UL Subject 6141
ZGZN	Wind turbine tray cable	UL Subject 2277

APPENDIX B: ALTERNATE ENERGY CODES AND STANDARDS

Alternative energy equipment must be installed in accordance with model codes and installation standards. These codes require these products to be listed and labeled in accordance with applicable product standards.

UL standards are typically identified as Standards for Safety and cover reasonably foreseeable risks associated with a product. Limitations applicable to the products covered by the standard are delineated in the Scope section of the standard. UL standards are intended to:

- Identify requirements for evaluation of products and provide consistency in the application of these requirements.
- Provide guidance for development of products by manufacturers.
- Provide requirements compatible with nationally recognized installation codes

An UL Outline of Investigation is a document that contains the construction, performance, and marking criteria used by UL to investigate a product when the product is not covered by the scope of an existing UL Standard for Safety. Outlines are not consensus documents and do not require review by an UL Standards Technical Panel (STP) or other external group.

CEI 82-25	Guide for Design and Installation of Photovoltaic (PV) Systems Connected to MV and LV Networks
CSA FC-1	Standard for Stationary Fuel Cell Power Systems
EN 61215	Crystalline silicon terrestrial photovoltaic modules - Design qualification and type approval
EN 61646	Thin-film terrestrial photovoltaic modules - Design qualification and approval
EN 61730-1	Photovoltaic (PV) Module Safety Qualification - Part 1: Requirements for Construction
EN 61730-2	Photovoltaic (PV) Module Safety Qualification - Part 2: Requirements for Testing
IBC	International Building Code

Marking and Application Guide

LIGHTNING PROTECTION

Lightning Protection
Marking and Application Guide

JANUARY 2013

PREFACE

With the increased use of sensitive electronic equipment and greater awareness of structural protection, the need for certified lightning protection is increasing. Lightning Protection Systems installed by contractors, can be Listed by UL using the UL96A Standard and information from NFPA 780. The installing contractors use UL listed products based on the UL 96 Standard. Listed products, correct installations in accordance with the standards, combined with a skilled installer can assure that the system will become certified when completed and field evaluated by UL.

The equipment and systems used for lightning protection are required to comply with the electrical code and installation requirements. NFPA 70 and NFPA 780 require compliance with different standards and installation requirements.

UL has developed this guide for use by code and inspection authorities, electric utilities, contractors, installers, users, system designers, and other interested parties to aid in understanding the basic components of lightning protection systems and the applicable codes and standards in order to facilitate a reasonably safe and code-compliant installation.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes, or the need for clarification. To confirm the current status of any UL Marking Guide, please consult the Code Authorities page of the UL Web site at www.ul.com/codeauthorities.

Your comments or suggestions are welcome and appreciated. They should be sent to:

Regulatory Services Department
UL
333 Pfingsten Road
Northbrook, IL 60062
ulregulatoryservices@us.ul.com
800-595-9844

UL Knowledge Services (www.ulknowledgeservices.com) provides workshops to learn the key elements of UL 96A and its practical application. Attendees learn how UL 96A and NFPA 780 relate to each other. Helpful calculation tools for determining a zone of protection are provided.

INTRODUCTION

USE OF THIS GUIDE

This guide is intended to assist regulatory authorities, designers, and installers to develop, and install a complete lightning protection system that can withstand the tremendous power of a lightning strike. Depending on the type, a strike can exceed 300,000 Amperes, over one giga volt (one billion volts) and with temperatures as high as 36,000 Deg. F., or about three times as hot as the surface of the sun. This guide does not include information on protection of equipment inside a building.

The dissipation of a lightning strike requires correct system design, installation in accordance with UL 96A, NFPA 780 and all listed components correctly installed and connected to earth. And common bonded to the building electrical system in accordance with Article 230, 250, 280, 800 and 810, of the NEC. This installation guide covers definitions and installations used on virtually all types of structures designed and built today. The installation must be designed to protect the entire structure not just a small portion or section of the structure.

It should be understood that this application guide is not a substitute for the correct use of the UL and NFPA Installation Standards that are published and could be adopted by a jurisdiction. Its intent is to simplify and help the user better understand the concept of developing a correct protection scheme for a structure.

UL LISTED AND CLASSIFIED PRODUCTS AND MASTER LABEL CERTIFICATE

System components that are described in this application guide are evaluated in accordance with UL 96, the Product Standard for Lightning Protection Components and are Listed or Classified by UL under an appropriate product category. A four-letter code (shown in parenthesis) following every category title in this guide is the UL product category code designation. A list of lightning protection equipment and related product categories evaluated by UL, along with the applicable standard(s), can be found in Appendix A.

Each UL product category code provides a direct link to the Guide Information for the product category. The Guide Information includes the scope of the products covered, information relating to limitations or special conditions applying to the product, the requirements used for the investigation of the products, installation and use information, and information on product markings and the UL Mark to be used on the product. Guide information is available in the UL White Book and online at www.ul.com/database.

The product markings identified in this guide do not include every possible marking that could be provided either on a product or in its installation or operation instructions. The purpose of these markings is to provide you with an indication of the type of text and location of markings that address features that may be critical in determining if a product is certified and / or if it is installed correctly. Refer to the specific Guide Information for the product category for additional marking information.

The numbering for code sections used in this document may change as the specific code is updated. A list of model codes and standards applicable for each product can be found in Appendix B.

Additional information can be found at www.ul.com.

Lightning Protection System components are intended to be installed and used in accordance with UL 96A, the Standard for Installation Requirements. Following the installation of the lightning protection system it can be site inspected and a UL Master Label Certificate will be issued to compliant systems. The on-site inspection process provides assurance that the Lightning Protection System complies with the appropriate Standards. The system certification has a five-year life span. After five years, the system must be re-certified through a site inspection and a new certificate issued. This five-year reinspection program takes into consideration any possible damage from a lightning strike, possible damage by maintenance personnel walking on components, building structural changes or possible remodeling.

INFORMATION ON LISTING VERSUS CLASSIFICATION

Most codes and regulations require the certification of this equipment to applicable safety-related standards. They also may require this equipment to be certified to energy performance standards as well. Products that are certified to safety-related standards have been evaluated with regard to all reasonably foreseeable safety-related hazards, including fire, electrical shock and mechanical hazards. Such products are termed “UL Certified” or “UL Listed.” Products that are certified to a limited range of hazards, or for use under specific conditions are termed “UL Classified”.

It is important to distinguish the difference between “UL Certified” or “UL Listed” and “UL Classified” and the relation these terms have with the term “listed,” as used in various codes. The term “listed” in the codes generally indicates that the product is required to be evaluated in accordance with the appropriate standard(s) by an independent third party certification organization such as UL. The term “listed” in the codes should not be confused with the term “UL Listed,” as explained above. It is important to recognize that not all certification agencies make this distinction in their certification services.

INFORMATION ON UL MARKS

There are several types of UL Marks that can be found on lightning protection related equipment. General information on each of these Marks is provided below. Each has its own specific meaning and significance. The only way to determine if a product has been certified by UL is to look for the UL Mark on the product itself.

The UL Mark on a product means that UL has tested and evaluated representative samples of that product and determined that they meet the requirements in the applicable standard(s). Under a variety of UL programs, certified products are periodically checked by UL at the manufacturing facility to determine that they continue to comply with the standard(s).

The UL Marks may only be used on, or in connection with products certified by UL, and under the terms of a written agreement between the manufacturer and UL.

UL Listing Mark

This is one of the most common UL Marks. If a product carries this Mark, it means UL found that representative samples of this product met UL’s *safety* requirements. These requirements are primarily based on UL’s own published Standards for Safety, or other recognized third party standards. The UL Listed Mark includes the UL symbol, the word “Listed,” the product or category name, and a control number assigned by UL.

UL Classification Mark

This Mark appears on representative samples of products that UL has evaluated but only with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. The UL Classified Mark includes the UL symbol, the word “Classified,” a statement of the scope of evaluation, the product or category name, and a control number assigned by UL.

FIELD EVALUATIONS

You may encounter situations in which you are unable to determine if a product has been listed by a third-party organization. Or in other situations you might encounter a product bearing a listing label that may have been modified in the field, and now you question whether or not the product still complies with the applicable standard. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors, and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL’s Web site at www.ul.com/field.

1. DEFINITIONS

AIR TERMINAL – A type of strike termination device intentionally installed for the purpose of intercepting lightning flashes. These items are sometimes referred to as lightning rods.

BONDING – An electrical connection between an electrically conductive object and a component of a lightning protection system with secondary conductor that is intended to significantly reduce potential differences created by lightning currents.

BUILDINGS:

- a) Ordinary Building – A building of common or conventional construction used for ordinary purposes, whether commercial, farm, industrial, institutional, or residential.
- b) Class I Ordinary Building – A building that is not more than 75 feet (22.9 m) high.
- c) Class II Ordinary Building – A building that is more than 75 feet (22.9 m) high or greater.
- d) Metal-Clad Building – A building with either sides or roof made of or covered with sheet metal.
- e) Metal-Framed Building – A building with electrically continuous framing of sufficient size and conductivity to be used as part of the lightning protection system.

CHIMNEY – A smoke or vent stack not meeting the requirements of a heavy-duty stack.

CONDUCTOR – The portion of a lightning protection system intended to transfer lightning discharge currents between strike termination devices and ground or to provide potential equalization between conductive bodies in/on the structure.

- a) Main Conductor – A conductor intended to conduct primary lightning currents that interconnects strike termination devices with grounding electrodes.
- b) Secondary Conductor – A conductor that connects metal bodies within the zone of protection to the lightning protection system to eliminate electrical potential that may create arcing.

EARTH – Finished grade level around a structure.

FASTENER – An attachment to secure a conductor to a structure.

GROUND GRID – A system of grounding electrodes consisting of interconnected bare cables buried in the earth to provide a common ground.

GROUNDING ELECTRODE – That portion of a lightning protection system extending into the earth, such as a ground rod, ground plate, or conductor, serving to bring the lightning protection system into electrical contact with the earth.

GROUNDING – Connected to earth, or to a conductive material that is connected to earth, so that electric charges are distributed freely to the earth.

LIGHTNING PROTECTION SYSTEM – A complete system of strike termination devices, conductors, grounding electrodes, interconnecting conductors, surge protective devices, connectors or fittings.

LOOP CONDUCTOR – A conductor:

- a) That encircles a structure; and
- b) That is used to interconnect grounding electrodes, main conductors, or other grounded bodies.

METAL BODY:

- a) Grounded (Non-Isolated) Metal Body – A metal body having a ground path independent of the lightning protection system.
- b) Isolated (Ungrounded) Metal Body – A metal body having no ground path.

ROOF, FLAT OR GENTLY SLOPING – A roof having a span of 40 feet (12.2 m) or less and a pitch of less than 1/8, or a roof having a span exceeding 40 feet (12.2 m) and a pitch less than 1/4. Roof pitch is determined by the method illustrated in Figure 5.1.

Example: If Rise = 3 units, and Run = 12 units, Pitch = 3/12 = 1/4

Figure 5.2
Roof types
(Top and end views of each roof type are shown)

○ = Air Terminal - - - - = Conductor ⊥ = Ground
S2112B

SECONDARY ROOF AREA – A secondary roof is less than 10 percent of the total roof area of the protected building and lower than adjacent roofs.

STACK, HEAVY-DUTY – A smoke or vent stack more than 75 feet (22.9 m) high, and in which the cross-sectional area of the flue is more than 500 square inches (0.3 m²).

STRIKE TERMINATION DEVICE – A metallic component of a lightning protection system that intercepts lightning flashes and connects them to a path to ground.

STRIKING DISTANCE – The distance over which final breakdown of the initial strike to ground or to a grounded object occurs.

SURGE PROTECTIVE DEVICE (SPD) – A device composed of at least one non-linear component and intended for limiting surge voltages on equipment by diverting or limiting surge current and is capable of repeating these functions as specified.

ZONE OF PROTECTION – The space adjacent to a grounded air terminal or mast or overhead ground wire that is substantially immune to direct strokes of lightning.

2. STRUCTURE PROTECTION

Determining the correct methodology for designing a system of protection is critical to its efficiency and functionality. An average size structure, with a simple roof type, one roof elevation, no uneven vertical changes, and the protection techniques can be rather straightforward and easy to design.

However, if the building structure becomes complex with changes in roof elevations such as a multi-story section, defined shapes such as dormer projections, or tall objects such as stacks, it will require different considerations for design to afford proper protection of the entire structure.

There are three basic methodologies for determining a protection design scheme. Each of the methods listed below is important, and can be used to develop an effective basic design.

The protection schemes shown here are considered Class I; those are buildings less than 75 feet in height.

For Class II structures (those exceeding 75 feet in height or structures such as stacks, steeples etc.) the protection shall include those for Class I but with Class II Air Terminals, cable connectors and splices shall be bolted or welded and rated Class II.

Cable and cable connectors for Class II shall be rated as such and conductor cable shall be rated Class II and be continuous from air terminal to ground and interconnected with the balance of the system.

a. **Air Terminal Placement** using the standard grid placement scheme.

When establishing a zone of protection the air terminal tip is located at not less than 10 inches above the protected object if the interval spacing is not more than 20 feet between air terminals. If a 24-inch air terminal is used, the air terminal spacing may be increased to 25 feet

When the roof exceeds 50 feet in length or width or both directions the spacing can be increased up to 50 feet between terminals on flat or gently sloping roofs. Pending roof design, air terminals may be permitted to be in a pattern not exceeding 50 feet apart in the center part of the roof plan. The perimeter edge spacing can be up to 25 feet between terminals when 24-inch air terminals are used.

When the roof is pitched with eaves height of 50 feet or less above grade and having no structural projections such as roof dormers or other projections, it requires protection only be mounted to the ridge of the projection roofline.

Air terminals can be mounted on the ridge at spacing not greater than 25 feet. If other projections or are present such as a dormer, irregular roof lines or lower or higher elevations that area may need air terminal placement based on its physical size and shape. Air terminals 10 inches in height and spaced not greater than 20 feet apart are permitted, interval spacing may be increased to 25 feet when 24-inch terminals are installed.

The figures below (fig. 8.1 & 8.2) will illustrate the typical roof protection scheme for most installations with flat roof structures that would be found on warehouse, strip malls and many commercial office structures. Air terminal spacing can be either 20 or

25 feet pending on terminal height. Perimeter and down conductors, with connections to ground rods are also shown.

Figure 8.1

C - Air terminal support height. See 8.1.6.

A= 10 inches minimum height
 B= 24 inches or more in height
 C= support shall be located at
 not less than one half the height
 of the terminal

b. Rolling Sphere Design.

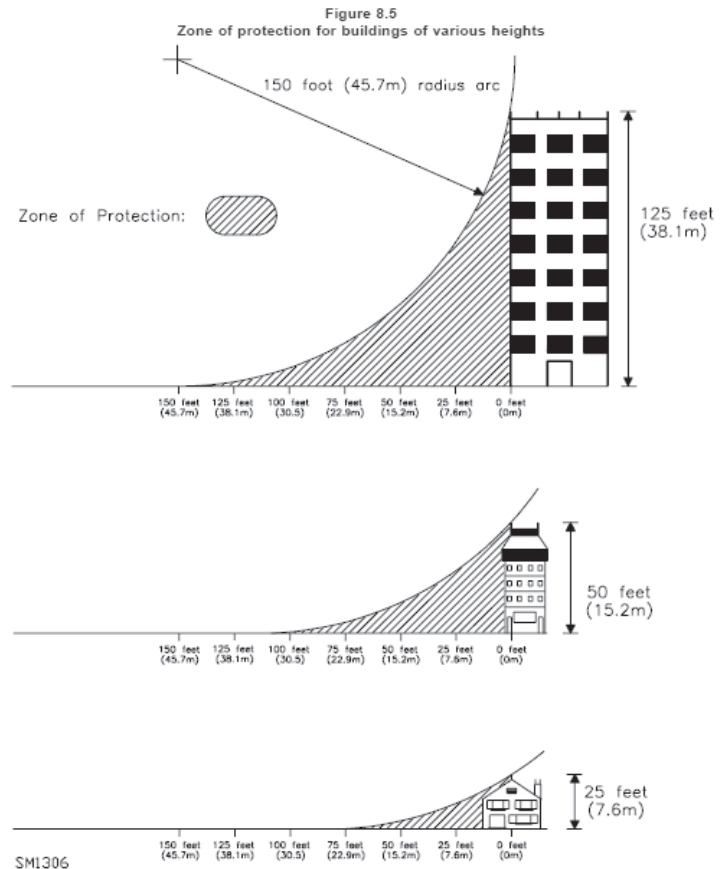

The rolling ball or more correctly the rolling sphere method uses an imaginary spherical shaped ball with a 150-foot radius that rolls over the building structure touching only the tips of the air terminals mounted on the roof. This dimension is based on the fact that the lightning strike distance near the surface of the earth is about 150 ft. or less. The sphere is tangent to earth and will contact three or more correctly spaced air terminals when rolled over any portion of the roof structure.

When using this imaginary sphere and rolling up over and down the other side of the building, it will only touch the roof mounted air terminals, never the building structural roof surfaces. When using the spherical shape to determine the zone of protection for the building structure all possible placements of the sphere on the structure shall be considered for terminal placement.

A protected building that exceeds the height of the lower building structure will protect the lower structure when it lies within the zone of protection of the rolling sphere. Remember that the protective sphere has a 150 ft. radius or is really a 300 foot diameter round ball.

A protected building that is more than a 150 feet high will provide protection for lower elevation roof areas of adjacent, or connected structures, when the lower structure

roof is protected by the arc of the sphere that is tangent to the side of the protected

building, and to the earth.

c. Protective angle

The protective angle method is not depicted diagrammatically in UL 96A but is based on a ratio of upper building height and size to lower building area height and size with location and placement of air terminals. These methods do not apply to structures over 50 ft. in height. Methods A, B should be utilized.

If not more than 25 feet to the lower eaves, a 2:1 ratio (2 horizontal feet of building coverage for each vertical foot in elevation) can protect the lower portion of a building or out to the first air terminal location on a large roof structure. If not more than 50 feet to the eaves or to the perimeter air terminal location on a higher flat roof, the lower roof is protected by the higher roof in a 1:1 ratio (1 foot horizontal coverage for each vertical foot from the upper structure). This ratio would also cover the larger flat roof to the first air terminal based on the height ratio. In the diagrams below you can see how this ratio is applied.

Heavy Duty Stacks

3. Heavy-Duty Stacks

Stacks above 75ft in height require some special consideration in both design and material used for the system. All components shall be Class II and class II modified. The components in the upper 25 feet shall be copper, copper alloy, bronze or stainless steel. The top 25 feet can be a high corrosion zone and extra protection of a min of 1/16 in coating of lead is required for terminals, mounting brackets and conductors. Aluminum components are prohibited in this installation.

Class II air terminals on stacks shall be solid copper, copper alloy, stainless steel, titanium or monel metal. The installation shall be evenly distributed around the top of a round stack at intervals not to exceed 8 feet. If the stack is square, the location shall be not more than 2 feet from corners and spaced not more than 8 feet apart.

Each Class II air terminal shall be not less than 18 inches in height and not more than 30 inches in height. The diameter shall be not less than 5/8 inch in diameter. All terminals shall be connected together and there shall be at least 2 down conductors on opposite sides of the stack. Reinforcing steel in concrete stacks shall be electrically continuous and shall be bonded to the lightning protection system at its upper and lower ends at down-lead locations.

4. Components Selection

A protection system and its components are really simplistic when you step back and look at the overall system. What is required is a means to catch a lightning strike at some point on the structure, and then conduct it to an electrode buried in the earth so it can be dissipated.

Along the route to earth, terminals, conductors and grounding electrodes minimize damage to the structure and contents within it. However simple as it may appear, there are some complexities along the way. In accordance with NFPA 780 if an LPS component product is listed, labeled per UL 96 than that product shall be selected and installed. The use of listed products gives greater assurance that when correctly installed in accordance with 96A or NFPA 780 that the entire lightning protection system can be "Site inspected" and receive the UL Master Label Certificate. All components used in an LPS shall be of the following: copper, copper alloy, or electrical grade aluminum unless otherwise specified in the UL 96A Standard. Copper components shall not be installed on or in contact with surfaces of aluminum or external galvanized steel surfaces.

Any aluminum or aluminum alloy product shall not come into direct contact with earth, and any bimetallic fitting shall not be installed within 18 inches above earth level. Aluminum products shall not be embedded in concrete or masonry, in direct contact with a surface coated with alkaline paint, installed in wet locations such as inside of eaves or downspouts.

Air Terminals: shall be not less than 10 inches long, less than 3/8-inch in diameter and may be manufactured in separate parts if longer than 10 inches. The terminal shall be provided with an integral base support, or shall have not less than five full threads of engagement with a separate attachment base mounted to the structure. If the terminal has internal threads the wall thickness shall be not less than 1/16 inch at the base of the threads. Ornaments or decorations are permitted on air terminals, but shall not exceed 20 square inches in any plane. Air Terminals longer than 24 inches shall have bracing at half its height and listed for the purpose

Base Supports: The air terminal bases are permitted to be stamped or cast construction. If stamped, the thickness shall be 0.097 for aluminum and 0.061 for copper material. If cast either copper or aluminum shall be at least 3/32 inches thick. A base support must incorporate a

connector fitting for connection of the lightning conductor. The conductor contact area must be at least 1-1/2 inches on all sides of the cable.

Air Terminal Braces: When air terminals exceed 24 inches in height, they shall be braced or supported at least one-half of the terminal height in accordance with section 8.1.6 of UL 96A. The brace shall be at least ¼ inch rod, constructed from aluminum, copper/copper alloy, stainless steel, or hot dipped galvanized if made of steel and shall be flattened on the end for attachment to the structure with at least a 10-24 bolt or screw.

Conductors: Lightning conductors do not fall into the basic wire size categories, as most field electricians know them.

Class I- main conductors: Stranded copper conductors shall be at least 57,400 circular mils at 187 lbs per 1000 ft. Aluminum conductors shall be at least 98,600 cir.mils at 95 lbs per 1000 ft.

Secondary or bonding conductors the minimum size shall be 26,240 cir. mils for copper and 41,100 cir. mils for aluminum

Class II- main conductors; shall be not less than 115,000 cir. mils for copper conductor at 375 lbs per 1000 ft and, 192,000 cir. mils. for aluminum conductors at 190 lbs per 1000 ft.

Secondary or bonding conductors the minimum size shall be 26,240 cir. mils for copper and 41,100 cir. mils for aluminum.

Grounding Electrodes: Air Terminals, main and secondary conductors plus all other ancillary parts are for the sole purpose of conducting a lightning stroke to earth and dissipating it through the use of various grounding electrode methods.

The grounding electrode shall be a rod of not less than ½ inch in diameter, and 8 feet in length and be of copper-clad steel, solid copper, or stainless steel. The rod shall extend vertically not less than 10 feet into the earth and below the frost line where possible.

Concrete encased shall only be used in new construction. It shall be the same diameter as the main-size conductor. It shall be 20 feet in length and be encased in at least 2 inches of concrete. Or Steel rebar shall also be permitted as a grounding electrode. At least 20 feet of (#4 or ½ in dia.) steel reinforcing bar shall be used. Overlapping at least 20-rod diameters shall be maintained if more than one piece is spliced in the footing, using tie wire or welding.

A main-sized conductor can also be buried from each down conductor in the form of a radial. A radial conductor must be at least 12 feet in length and buried at least 18 in depth.

A ground ring shall be permitted if at least 18 inches under the earth and equal in size to the main-size conductor.

Ground plate(s) shall be permitted if 2 sq. feet or more in size and 0.032 in thick or more and buried not less than 18 inches under the soil.

Where there is shallow topsoil, a combination of the methods above shall be permitted to provide an effective means for dissipating a lightning stroke.

Common Grounding and Bonding: The lightning protection system grounding system shall be bonded and connected to the grounding electrode system for the electrical service, communication system ground, any antennae system grounds, as well as underground metallic piping systems With main size lightning protection cable and connectors see exception in 10.4.2 for the utilization of ground in accordance with Articles 250, 620,800, and 810.

These systems shall include the water service, well casings located within 25 feet of the structure, gas piping, underground conduits, underground liquefied petroleum gas piping etc. The connection to any utility gas line shall be on the customer's side of the meter. The bonding conductor shall be sized the same as the main down conductor and main system conductor.

5. Basic Requirements for System Certification and the UL Master Label Certificate Program

Once the system is completed, Underwriters Laboratories Field Staff can perform an on-site inspection. The system inspection begins with an overall visual inspection for neat and professional installation of the following but not limited to:

- Air terminal layout and placement position with at least 2 directional paths to ground based in structure elevation, roof style, and projections as specified within the Zone of Protection.
- Air terminals tips shall be a minimum of 10 inches in height above the structure spaced not more than 20 feet apart for perimeter protection
- When terminals greater than 24 inches in height are used, they shall be supported at a point at least half the height the rod and be spaced more than 20 but not less than 25 feet apart for perimeter protection
- Any object elevated above the normal roof height and with a surface thinner than 3/16 inch shall be protected, i.e.: exhaust fan housings, camera masts, etc.
- All lightning protection system components shall be listed, excepting hardware screws, bolts etc.
- Main size conductors shall be used for bonding other systems to include but not limited to: metallic water systems, steam or hot water heating systems, electric services, telephone systems, antenna grounds, other large grounded metallic masses and shall not be smaller than 6 AWG.
- The grounding terminal rod shall be at least 8 ft in length and not less than 1/2 in. dia., buried not less than 10 ft plates, concrete encased, rings and trenched systems are permitted as well.
- Copper components are not mounted on aluminum or external galvanized surfaces.
- Cable bend radius at corners or over the building sidewall with 90 deg minimums 8 in radiuses.
- Attachment of cable secured to air terminals, and building shall be secured along the cable run and attachments shall not be more than 3 ft apart.
- Aluminum components shall not be installed in direct contact of copper roof material or below any run off from copper surfaces.
- Aluminum components shall not be in direct contact with earth

- Aluminum down conductors shall be connected to copper conductors using bimetallic fittings within 18 inches of earth.
- Stacks above 75ft in height require Class II components.

6. Summary

When we look at a Lightning Protection System in its most elementary form, it is quite simple. An air terminal(s) to attract and catch a lightning strike, a low resistance conducting cable that connects the air terminal to the earth using a conducting electrode and provide a pathway to dissipate the high energy into the earth. This system provides protection for the structure.

While the overall concept may appear to be simplistic in what it takes to get a lightning strike grounded into the earth, there has been a great amount of science and theoretical investigation developed over the last two plus centuries. Today's modern products, such as air terminals, mounting and support hardware, main and secondary conductors conducting the path to earth along with grounding electrodes have undergone testing and evaluation to achieve product listing and compliance with the Standards for installation. The physical science has been studied and modern theories have evolved to help give a structure better protection by maximizing air terminal placement on roof surfaces.

The UL Lightning Protection Master Label Certificate assures that the system has been installed and inspected to the UL 96A Standard. This certification has a 5-year lifespan and can demonstrate that the building has an extra margin for safety for the structure.

APPENDIX A

UL LIGHTNING PROTECTION CATEGORIES

UL does list this type of equipment to address the safety issues associated with lightning strikes. Below is a list of product categories that UL currently lists to address these types of products, as well as related product categories. Each product category is tabulated with a UL Category Code. You can view the UL Guide Information for the category and any Listings or Classifications under that Product Category in the UL Online Certifications Directory database at www.ul.com/database and enter the category code at the category code search field.

Category Code	Category Name	Standard Used
KDER	Grounding and Bonding Equipment	UL 467
OVGR	Lightning Protection	
OVTZ	Lightning Conductors, Air Terminals and Fittings	UL 96
OWAY	Lightning Protection Systems Installations	UL 96A
	Surge Arresters and Protective Devices	
VZCA	Surge Protective Devices	UL 1449
OWIW	Surge Protective Devices Classified for Use in Specified Equipment	UL 1449
VZQK	Surge Arresters 1000 Volts and Higher	IEEE C62.1 and IEEE C62.11
VZQO	Surge Protectors & Isolators for Use on Cathodically-protected Systems for Use in Hazardous Locations	Hazardous Location standards
XUPD	Surge-protective Device/Panelboard Extension Modules Classified for Use with Specified Equipment	UL 1449 and UL 67
DIMV	Circuit Breakers & Surge-protective Devices	UL 1449 and UL 489
QVGK	Protectors	
QVGQ	Isolated Loop Circuit Protectors	UL 497B
QGVV	Primary Protectors for Communications Circuits	UL 497
QVKC	Primary Protectors for Coaxial Communications Circuits	UL 497C
QVLA	Protectors for Antenna Lead-in Conductors	UL Subject 497E
QVRG	Secondary Protectors for Communications Circuits	UL 497A

APPENDIX B: LIGHTNING PROTECTION CODES AND STANDARDS

Lightning protection equipment must be installed in accordance with model codes and installation standards. These codes require these products to be listed and labeled in accordance with applicable product standards.

UL standards are typically identified as Standards for Safety and cover reasonably foreseeable risks associated with a product. Limitations applicable to the products covered by the standard are delineated in the Scope section of the standard. UL standards are intended to:

- Identify requirements for evaluation of products and provide consistency in the application of these requirements.
- Provide guidance for development of products by manufacturers.
- Provide requirements compatible with nationally recognized installation codes

An UL Outline of Investigation is a document that contains the construction, performance, and marking criteria used by UL to investigate a product when the product is not covered by the scope of an existing UL Standard for Safety. Outlines are not consensus documents and do not require review by an UL Standards Technical Panel (STP) or other external group.

IEEE C62.1	Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits
ANSI/IEEE C62.11	Standard for Metal-Oxide Surge Arresters for AC Power Circuits
NFPA 70 (NEC)	National Electrical Code
NFPA 780	Standard for the Installation of Lightning Protection Systems
UL 67	Panelboards
UL 96	Standard for Installation Requirements for Lightning Protection Systems
UL 96A	Lightning Protection Components
UL 467	Grounding and Bonding Equipment
UL 489	Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures
UL 497	Protectors for Paired-Conductor Communications Circuits
UL 497A	Secondary Protectors for Communications Circuits
UL 497B	Protectors for Data Communications and Fire Alarm Circuits
UL 497C	Protectors for Coaxial Communications Circuits
UL Subject 497E	Outline for Protectors for Antenna Lead-In Conductors
ANSI/UL 1449	Surge Protective Devices

Application Guide

GREEN CONSTRUCTION

JANUARY 2013

PREFACE

Interest in green construction has increased substantially because of environmental and sustainability concerns. All levels of government and building safety professionals recognize the need for a mandatory baseline of codes and standards addressing green construction, providing a framework linking sustainability with safety and performance. To be viable, green construction practices need to address environmental concerns, but they cannot undermine the fundamental levels established for public safety.

UL is committed to the advancement of safe, green construction by conducting the necessary research, developing standards, and testing and certifying products to help society make a smooth and safe transition to green construction methods. UL is an active participant in the development of model construction codes and standards, such as the International Green Construction Code (IgCC), the International Energy Conservation Code (IECC), the National Green Building Standard (ICC 700), Standard for the Design of High-Performance Green Buildings Except Low Rise Residential (ASHRAE 189.1), and the Green Plumbing and Mechanical Code Supplement (GPMCS).

Five UL business units – UL Environment, UL Product Safety, UL Verification Services, UL Life & Health, and UL Knowledge Services – provide services addressing various aspects of green construction.

UL has developed this guide for use by code and inspection authorities, architects, system designers, contractors, installers, users, specifiers, and other interested parties to aid in understanding (1) the basic components of green construction systems, (2) the applicable codes, standards, and product and system certifications needed to facilitate a reasonably safe and code-compliant installation, and (3) UL's services related to green construction.

UL Marking and Application Guides are updated as necessary due to new product development, changes in the codes and standards, or the need for clarification. To confirm the current status of any UL Marking and Application Guide, please consult the Code Authorities page of the UL Web site at www.ul.com/codeauthorities.

Your comments or suggestions are welcome and appreciated. They should be sent to:

GENERAL INFORMATION

SCOPE OF THIS GUIDE

This Guide is intended to assist regulatory authorities, designers, and installers in finding products and systems evaluated and certified for sustainability. These certifications are intended to help achieve compliance with green construction codes and standards such as IgCC, IECC, ICC 700, ASHRAE 189.1 and GPMCS.

The product markings identified in this Guide are intended to provide general information on the types of certification markings that may appear on products, their packaging or related documentation. Refer to the specific Guide Information published for each product category for additional product marking information.

Additional information can be found at www.ul.com and www.ul.com/environment.

UL SERVICES

Third-party certifications, validations, verifications and testing help code officials and designers in determining compliance with green codes, such as the IgCC and GPMCS, without having to do exhaustive research and verification of data. There are several UL programs and services for various types of products and attributes.

Sustainable Product Certification Service

This service evaluates whether products meet UL or other sustainable product standards (such as BIFMA level or TCNA Green SquaredSM), which measure a product's performance throughout its entire lifecycle, from sourcing to disposal, reuse, and take-backs. These environmental certifications indicate that a product has undergone rigorous scientific testing, exhaustive auditing, or both, to demonstrate its compliance with stringent, third-party environmental performance standards. These standards set metrics for a wide variety of criteria, including energy reduction, waste diversion, recyclability, salvaged material usage, site preservation, transportation reduction, human health impacts and natural resource conservation.

Product Emissions Certifications and Testing

The indoor air quality requirements in the green construction codes include maximum levels of volatile organic compound (VOC) emissions dispersed from specific products and materials. Products that have low chemical emissions, as determined by levels in the GREENGUARD Certification Programs, and bear the GREENGUARD Certification Mark, meet those code requirements.

Environmental Product Declarations (EPDs)

An EPD is a comprehensive, internationally harmonized report that documents the ways in which a product, throughout its lifecycle, affects the environment. EPDs enable manufacturers to disclose all of their products' cradle-to-grave impacts in a credible, streamlined, and universally understood manner. As a program operator, UL Environment also helps develop Product Category Rules (PCRs) for EPDs. The PCR is utilized as a common set of definitions and base information that each EPD for that product category has to disclose and how they should disclose it in the EPD. Typically, an EPD will include information about a product's impact on global warming, ozone depletion, water pollution, ozone creation, and greenhouse gas emissions. An EPD can also include other impacts that are of particular interest to the discloser, such as human toxicity risk.

EPDs act as neither product ratings nor ecolabels; rather, they help architects, designers, specifiers, and other purchasers better understand a product's sustainable qualities. Thus, EPDs are primarily used to make more informed purchasing decisions by providing additional transparency.

Energy Efficiency Certification

As an official EPA-recognized certification body, UL helps manufacturers comply with the latest requirements, conserve resources, reduce energy costs and deliver quality products. By offering premier qualification and verification testing on 30 ENERGY STAR® product categories and as an EPA-recognized CB for 35 product categories, UL is also providing product manufacturers, engineers and designers with various educational resources on the latest enhancements to the ENERGY STAR® program. As an approved certification body by the U.S. Environmental Protection Agency (EPA), UL provides a service to review all new product submissions from manufacturers participating in the ENERGY STAR® program, and to perform qualification testing under specific criteria. Certified products are authorized to bear the ENERGY STAR® label.

Additional Green Certifications

There are additional specific certification services for other sustainable products and systems, such as for cool roofs, used equipment, sound transmission, and renewable energy. Specific references to these certifications are provided later in this Guide.

Environmental Claim Validation

This service validates, through independent evaluation, one or more environmental claims made by manufacturers for specific products. UL validated products may bear the Environmental Claim Validated logo on their marketing materials and packaging. Also, validation can be provided for environmental claims that are new to the market or do not have an existing testing protocol. The typical process for nonstandard claims includes a preliminary assessment of the proposed environmental claim, an evaluation of the claim, and development of a protocol to test the product and validate the claim. Product attributes that are validated include recycled content, rapidly renewable materials, use of regional materials, VOC content, energy efficiency, water efficiency, hazardous or toxic substances, "absence of" claims, reclamation programs, mold resistance, degradability, and compostability.

The EcoLogo Program identifies environmentally preferable products in more than 80 product categories. Founded in 1988, the EcoLogo Program awards its mark to products that demonstrate environmental leadership within their category. EcoLogo is an ISO 14024 Type 1 program. An audit process verifies that each product complies with the criteria established in EcoLogo standards. More than 11,000 EcoLogo-certified products are currently available on the market.

VALUE OF THIRD-PARTY CERTIFICATION

Environmental and public health claims should always be certified by an independent, third-party organization. This contributes rigor, stringency and credibility, protects manufacturers' and specifiers' reputation and reduces liability.

One helpful step in evaluating an eco-label is to consider the organization that stands behind it. Using these criteria, certifications will fall into one of the three basic categories as outlined below:

- First-party certification equates to a self-declaration. This type of certification is not based on verification by independent third parties. The rigor and credibility of such claims, therefore, is less certain than claims that have been independently certified.
- Second-party certification is performed by an industry, trade or special interest group that purchases or otherwise has a user interest in the products being certified, and has critical involvement in the certification, either through administration of the certification program, verification of the claims or creation of the standards and methods. Second-party certifications are very common and often confused as being third party.
- Third-party certification refers to certification programs in which declaration of conformance to requirements is made by a body that is independent of the body that provides that product and of user interests in that product.

Look for products that have undergone testing and analysis that is scientifically based and can be easily replicated. For more information on evaluating green product claims, see <http://sinsofgreenwashing.org/findings/the-seven-sins/>

UL CERTIFICATION MARKS AND DATABASES

UL has several third-party certification marks to identify those products that have been evaluated as meeting environmental test protocols and standards as required by various green codes. UL certification databases provide a means for code officials and designers to readily find products that are third party certified by UL. These marks and databases are detailed below.

UL Sustainable Product Certification Mark

The UL Sustainable Product Certification Mark indicates that a product has been tested/audited by UL and found to comply with the terms of the standard used for evaluation. Examples of the types of products that will carry the Sustainable Product Certification Mark include carpeting, office furniture, information technology equipment, building products and consumer electronics. More products will be added as sustainable product standards become available.

UL Environmental Claim Validation

A UL Environmental Claims Validation (ECV) logo on a product's packaging indicates that the product meets UL Environment's claim-specific validation requirements.

Claims validated include: recycled content, recyclability, degradability, compostability, rapidly renewable materials, regional materials, volatile organic compounds (VOCs) content, energy efficiency, energy audits, water efficiency, hazardous or toxic substances, reclamation and mold resistance.

Once the product claims have been validated, details are posted on UL Environment's **Database of Validated and Certified Products**, an online tool that allows users to identify sustainable products by product category, company name, product name or type of claim. Manufacturers may use the Environmental Claims Validated logo on marketing materials and packaging.

Information on validated and certified products is located in UL Environment's **Database of Validated and Certified Products**. To be included in this database, a product must have been validated through Environmental Claims Validation or certified through Sustainable Product Certification. This online tool allows users to quickly sort and identify products by product category, company name, product name or type of claim.

<http://www.ul.com/global/eng/pages/offerings/businesses/environment/databasesearch/>

UL Energy Verification and Efficiency Marks

The UL Energy Mark appears on air conditioners, furnaces, refrigerators, freezers, dishwashers, washers, dryers, water heaters, cooking equipment, high tech equipment, lighting products and similar products evaluated to specific U.S. and Canadian energy efficiency standards. These products are already certified for safety by UL before earning the UL Energy Mark. These energy verified products can be found in the UL Online Certification Directory at www.ul.com/database.

This Mark appears on products and the packaging of products that meet energy efficiency requirements in regulations such as ENERGY STAR[®], Natural Resources Canada (NRCAN) and California Energy Commission (CEC). The mark incorporates a leaf encapsulating the familiar “UL” initials and includes the words “Energy Verified” in black text.

The results of products earning the EEC Mark appear in UL Environment’s Database of Validated and Certified Products.

<http://www.ul.com/global/eng/pages/offerings/businesses/environment/databasesearch/>

GREENGUARD Indoor Air Quality Certification

This Certification Mark appears on products designed for use in office environments and other indoor spaces that have been tested/audited and found to meet strict chemical emissions limits.

GREENGUARD Children & Schools Certification

This Certification Mark shows compliance to all of the green code low-emitting product requirements for products intended for use in schools, daycares or other environments where children spend significant periods of time. More stringent than the indoor air quality certification, this certification was originally intended for products used around sensitive populations, and has now evolved into a primary certification program that is also applicable for building products, furniture, and children’s focused products.

GREENGUARD SELECT CERTIFICATION

This Certification Mark is used to identify products for use in specific environments (e.g. commercial, educational, healthcare, and home) that meet strict chemical emissions limits.

For more information, or to view a complete list of certified products, visit www.greenguard.org.

Listed and Classified Products

Products are Listed or Classified (Certified) by UL under a variety of product categories that are identified by a four-letter UL category code. The category code is shown in parenthesis following every product category title in this guide.

- Information on products and systems Certified by UL for applications regulated by the IgCC and IECC, along with the applicable standard(s), can be found in Appendix A.
- Information on products and systems Certified by UL for applications regulated by ICC 700, along with the applicable standard(s), can be found in Appendix B.
- Information on products and systems Certified by UL for applications regulated by the GPMCS, along with the applicable standard(s), can be found in Appendix C.

Each UL Product Category code in these Appendices provides a direct link to the Guide Information for the product category. The Guide Information typically includes (1) a description of the products covered, (2) the associated installation code, (3) a description of limitations or special conditions associated with the product, (4) the requirements or standards used to investigate the products, and (5) a description of the UL Mark used on certified products. Guide Information is also available in the UL Online Certifications Directory at www.ul.com/database.

UL Listing Mark

The UL Listing Mark is one of the most common UL Certification Marks. If a product carries this Mark, it means UL found that representative product samples met UL's safety requirements. These requirements are primarily based on UL's own published Standards for Safety. This type of Mark is seen commonly on appliances and computer equipment, furnaces and heaters, fuses, electrical panel boards, smoke and carbon monoxide alarms, fire extinguishers and sprinkler systems, personal flotation devices, bullet resistant glass, and thousands of other products.

There are three variations of UL's Listing Mark: one used only in the United States, one used only in Canada, and one for both the United States and Canada. The C-UL Mark is applied to products for the Canadian market. The products with this type of Mark have been evaluated to Canadian safety requirements, which may be somewhat different from U.S. safety requirements. The optional C-UL-US Mark indicates compliance with both Canadian and U.S. requirements.

The UL Listing Mark appears on end products and complete components suitable for factory and field installation. All of the products carrying a UL Listing Mark are covered by UL's Follow-Up Services program to verify that end products and components carrying the UL Listing Mark continue to be manufactured in compliance with UL's safety requirements. A UL Listing Marking typically consists of four required elements:

- The UL symbol
- "Listed"
- The product name
- An alphanumeric control or issue number

Additional elements and markings may be present for products that carry UL's EU Mark.

UL Classification Mark

This Mark appears on products that UL has evaluated with respect to specific properties, a limited range of hazards, or suitability for use under limited or special conditions. Typically, products Classified by UL fall into the general categories of building materials and industrial equipment. Examples of types of equipment Classified by UL include immersion suits, fire doors, protective gear for fire fighters and industrial trucks.

Just like the UL Listing Mark, there are also three variations of UL's Classification Mark: one used only in the United States, one used only in Canada, and one for both the United States and Canada. The C-UL Classification Mark is applied to products for the Canadian market. The products with this type of Mark have been evaluated to Canadian standards for a specific hazard or property. The optional C-UL-US Classification Mark indicates compliance with both Canadian and U.S. requirements.

All of the products carrying a UL Classification Mark are covered by UL's Follow-Up Services program to verify that products carrying the Mark continue to be manufactured in compliance with UL's safety requirements. A UL Classification Marking typically consists of four required elements:

- The UL symbol
- "Classified" and a qualifying statement as to the specific hazard or property
- The product name
- An alphanumeric control or issue number

Field Evaluations

You may encounter situations in which you are unable to determine if (1) a product has been listed by a third-party organization, (2) a product bearing a Certification Mark that was modified or rebuilt in the field still complies with the applicable standard, or (3) a used or rebuilt product is suitable for use in a new application. UL offers a field evaluation service that provides data to assist you in making your decision whether to accept the product and/or approve the installation. Anyone directly involved with a product – including manufacturers, owners, contractors and regulatory authorities – can request a Field Evaluation. Detailed information for this program can be found on UL's Web site at www.ul.com/field.

CODES AND STANDARDS

UL participates in the development and maintenance of model codes and sustainability standards published by other standards development organizations and model code organizations, and develops additional standards as needed. A list of model codes and standards applicable for sustainable construction can be found in Appendix D. The numbering for code sections used in this document may change as the specific code is updated.

International Green Construction Code (IgCC)

The IgCC, published by the International Code Council (ICC) is a comprehensive model code establishing minimum regulations for buildings and systems using prescriptive and performance-related provisions, working as an overlay to the other I-Codes. For example, the requirements of the 2012 *International Energy Conservation Code* were targeted as a baseline for the *International Green Construction Code* energy provisions that can be increased through the selection of “Jurisdictional Requirements” and “Project Electives.” It is founded on the principle that a model code must address the market segments beyond those captured by rating systems or other evaluation guides, and therefore, must be enforceable, useable and adoptable.

National Green Building Standard (ICC 700)

ICC 700 is an ANSI residential green building rating system, published by the ICC. The standard defines green building for single- and multifamily homes, residential remodeling projects, and site development projects while still allowing for the flexibility required for regionally-appropriate best green practices.

International Energy Conservation Code (IECC)

The IECC is a model code published by ICC that regulates minimum energy conservation requirements for new buildings. The IECC addresses energy conservation requirements for all aspects of energy uses in both commercial and residential construction, including heating and ventilating, lighting, water heating, and power usage for appliances and building systems.

Standard for the Design of High-Performance Green Buildings Except Low Rise Residential, (ASHRAE 189.1)

ASHRAE has published Standard 189.1. The standard focuses on building sustainability designs and operational issues of green buildings. From site location to energy use to recycling, this standard sets the foundation for green buildings by addressing site sustainability, water use efficiency, energy efficiency, indoor environmental quality, and a building’s impact on the atmosphere, materials and resources. Standard 189.1 serves as a compliance option in the 2012 IgCC.

Green Plumbing and Mechanical Code Supplement (GPMCS)

The International Association of Plumbing and Mechanical Officials (IAPMO) publishes the GPMCS. The supplement is a separate document from the Uniform Plumbing and Mechanical Codes and establishes requirements for green building and water efficiency applicable to plumbing and mechanical systems. The GPMCS serves as an adjunct to the Uniform Codes or any of the plumbing and mechanical codes used in the United States.

Recommended Practice for Commissioning and Integrated Testing of Fire Protection and Life Safety Systems (NFPA 3)

NFPA 3, published by the National Fire Protection Association (NFPA), provides building commissioning requirements and direction to confirm that active and passive fire protection and life safety systems function as they were intended.

UL Standards for Sustainability

UL Sustainability Standards are used to establish the basis for identifying environmentally preferable products, based on environmental sustainability criteria associated with a product's manufacture, distribution, use, and eventual disposal. The requirements in UL Standards are developed based on the life cycle stages of the associated products. Additional UL Standards have been developed based on the criteria used for the EcoLogo Program.

All of UL's Sustainability Standards can be found at

http://www.ul.com/global/eng/pages/offerings/businesses/environment/resources/standard_s/index.jsp and are free to download. UL is seeking stakeholders to participate in the development of sustainability standards. Interested stakeholders should contact UL at **Standards@ULEnvironment.com**.

GREENGUARD Standards and Testing Methods

UL establishes standards and testing methods for the GREENGUARD certification programs to reduce human exposure to chemicals and to improve indoor air quality. These standards are based on available standards and guidelines from national and international public health agencies. All GREENGUARD standards are publicly available, along with test protocols, and all public comments are considered. These standards include GREENGUARD IAQ Standard for Building Materials, Finishes and Furnishings, and GREENGUARD Children & Schools Standard. The certifications established using these standards, such as GREENGUARD Children & Schools and GREENGUARD Select, qualify for numerous low-emitting criteria or credits in major sustainable codes, rating systems and standards, and can be found at **www.greenguard.org**.

Environmental test chambers and indoor exposure models are used to characterize emissions performance of products and their components. Achievement of test results requires rigorous sample selection procedures, defined sample collection and handling procedures, and implementation of precise and accurate analytical measurement systems and procedures. Additionally, a product manufacturer must have a production quality control system in place that is capable of assuring that products are manufactured consistently with similar emissions characteristics over time. Emission criteria are established for total VOC (TVOC), formaldehyde, total aldehydes, all individual chemicals with currently published Threshold Limit Values (TLVs), respirable particles, and certain odorants and irritants. In addition, all products are screened and reported for carcinogens and reproductive toxins as listed by key government and regulatory programs. Emission criteria may vary, based on the product formulation and its use.

ENERGY STAR®

Products can earn the ENERGY STAR® label by meeting the energy efficiency requirements set forth in ENERGY STAR® product specifications. EPA establishes these specifications based on the following set of key guiding principles:

- Product categories must contribute significant energy savings nationwide.
- Qualified products must deliver the features and performance demanded by consumers, in addition to increased energy efficiency.
- If the qualified product costs more than a conventional, less-efficient counterpart, purchasers will recover their investment in increased energy efficiency through utility bill savings within a reasonable period of time.
- Energy efficiency can be achieved through broadly available, nonproprietary technologies offered by more than one manufacturer.
- Product energy consumption and performance can be measured and verified with testing.

Labeling effectively differentiates products and is to be visible for purchasers. ENERGY STAR® product specifications can be found at http://www.energystar.gov/index.cfm?c=product_specs.pt_product_specs.

BUILDING DEVELOPMENT

Green codes include requirements for the development and maintenance of buildings to minimize negative environmental impacts. The heat island effect of a building can be mitigated by installing cool roofs.

COOL ROOFS (SOLAR REFLECTANCE AND THERMAL EMITTANCE)

Roofing materials with solar reflectance and thermal emittance properties are sometimes referred to as “cool roofs.” A cool roof works by both absorbing the sun’s heat and reflecting (or radiating) it back to the sky instead of transferring it into the building structure. The effectiveness of a cool roof is measured by solar reflectance and thermal emittance. Both properties are measured individually from 0 to 1.0, with 1.0 being the material with the best performance.

Solar reflectance measurements, which evaluate temperatures and heat flows across surfaces exposed to solar radiation, are typically determined in accordance with ASTM C1549. Thermal emittance measurements, which evaluate temperatures, heat flows, and derived thermal resistances of materials, are typically determined in accordance with ASTM C1371.

UL certifies solar reflectance roof covering materials based on them meeting or exceeding the minimum initial solar reflectance measurements as specified in Product Specification Eligibility Criteria of the ENERGY STAR® Program Requirements for Roof Products, which includes a three-year weather exposure test. Materials evaluated for low-slope installations are intended for use on roof surfaces with an incline of 2-inch or less rise per horizontal foot. Materials evaluated for steep-slope installations are intended for use on roofs with an incline of greater than 2-inch rise per horizontal foot.

For Classification (certification) of field applied roof coatings, the products are investigated on a smooth light-gauge metal substrate at the intended application thickness. For information on varying thicknesses of coating and alternate substrates, refer to the detailed installation instructions accompanying the UL Certified product.

Roofing materials complying with these requirements are Classified under the Solar Reflectance, Roof Covering Materials product category (TGFE). Individual certifications include the manufacturer's name and material designation, along with the initial and maintained (three-year) solar reflectance and thermal emittance values. When "NA" is indicated in an individual Classification, the three-year weather exposure data is not available but is awaiting completion of the exposure period. Information concerning the specific initial solar reflectance values is provided in the detailed installation instructions accompanying the UL certified product.

The information included with these UL certifications makes it easy to determine compliance with code requirements. In addition, the UL Classification Mark appears on certified materials or their packaging, along with information on whether the material is suitable for a low-slope or steep-slope application as well as the initial and maintained (three-year) solar reflectance and thermal emittance values.

MATERIAL RESOURCE CONSERVATION AND EFFICIENCY

Green codes contain requirements addressing the re-use of equipment, material properties including recycled content, and limitations on the amount of mercury in fluorescent lamps.

USED EQUIPMENT

One aspect of green construction practices involves recycling used equipment, including various degrees of rebuilding, remanufacturing, refurbishing, repairing or reconditioning of equipment. The result is commonly referred to as a "rebuilt" product.

Rebuilding Equipment Raises Safety Concerns

The UL Listing Mark on a newly manufactured piece of equipment is an indication that the product complies with nationally recognized safety requirements when the product was shipped from the factory, and that it is suitable for installation and use in accordance with specific model codes. However, if a product is rebuilt, UL cannot confirm that it continues to comply with appropriate safety requirements without an additional investigation.

A Field Evaluation is an effective way to determine if a rebuilt product continues to comply with UL safety requirements. However, a separate evaluation is needed to determine the acceptability of each rebuilt equipment installation.

To address situations where a company rebuilds equipment on a regular basis, UL has developed programs to determine the suitability of equipment rebuilt under a more structured equipment rebuilding program.

Rebuilt Equipment Certification Programs

UL's rebuilt equipment certification programs primarily address safety concerns, but also address green construction practices, since the rebuilt equipment can be reused, instead of disposed in a landfill. These programs cover specific types of products that can be fully evaluated to the same safety requirements used to evaluate newly constructed products. For a rebuilt product to be considered for certification, UL first needs to establish the feasibility of determining compliance of the product with all the applicable product safety requirements. Concerns that need to be addressed include the potential effects of deterioration due to normal use and aging or damage caused by fire, flood, seismic, wind or electrical faults.

UL has established rebuilt equipment certification programs when either an original manufacturer or another party has the necessary facilities, technical knowledge and manufacturing skills to rebuild products that continue to comply with UL safety requirements. These programs require the equipment rebuilder to comply with the following requirements:

- The original UL Mark must be removed from the equipment being rebuilt, or permanently defaced.
- The equipment can only be modified using materials and procedures that are suitable for the application.
- Production line testing may be conducted to verify that the rebuilt equipment complies with specified performance requirements.
- Rebuilt equipment complying with all program requirements is plainly and permanently marked with the name of the rebuilder and a UL Mark containing the term "Rebuilt" or other terminology suitable for the product category.
- The rebuilt equipment is to be subjected to the same requirements as newly constructed equipment.

There are types of products for which UL has chosen not to establish equipment rebuilding programs due to safety considerations that cannot be adequately addressed. For example, UL does not have a certification program for rebuilding or refurbishing molded case circuit breakers.

Over the years, UL has created certification programs for rebuilt cooking appliances, refrigerators, vending machines, uninterruptible power supplies, motor controllers, motors for use in hazardous locations, office furnishings and electric signs, to name a few. The Guide Information for each product category with a rebuilt certification program references the existence of such a program and identifies the applicable UL Mark for rebuilt products.

UL certified rebuilt products are marked "Rebuilt," "Remanufactured," or "Reconditioned." Product categories that include provisions for rebuilt equipment can be located in UL's Online Certification Directory by performing a keyword search for "rebuilt."

RECYCLED CONTENT

There is significant discussion within the environmental and manufacturing communities about which materials can be claimed as pre-consumer recycled content. UL Environment has developed a white paper to provide clarity on interpreting existing guidelines to validate claims of pre-consumer recycled content and to serve as a reference for manufacturers. See:

http://lms.ulknowledgeservices.com/common/lmsform.aspx?Form=WhitePaperAccount&Doc=UL_E_RCC_070810.pdf

Definitions of Key Recycled Content Terms

Many sustainable product consensus standards base their recycled content definitions on ISO 14021:2001. However, each standard has variations on key terms, and these differences create confusion in applying requirements to the waste products. In some instances, broad interpretation of existing terms may exclude any waste from being called “recycled content,” or may result in inconsistent applications of the definitions.

UL Environment has developed definitions for the most relevant terms associated with pre-consumer recycled content, as noted below. These key terms are based on publicly available definitions from various sources as well as UL Environment’s experience and insight.

By-Product (Co-Product) — A production material that is not waste and possesses characteristics that make it ready for further use in the marketplace without any further processing.

Post-Consumer Material — Material that has reached its intended end user which is no longer being used for its intended purpose.

Pre-Consumer (Post-Industrial) Material — Material diverted from the waste stream during a manufacturing process that has never reached the end user. Excluded is the reutilization of materials generated in a process and capable of being reused as a substitute for a raw material without being modified in any way.

Manufacturing Process — Sequence of interdependent and linked procedures or actions designed to convert inputs (material, parts, etc.) into outputs (waste, by-product, etc.) until an intermediate or final product is produced.

Unit Process — A single procedure or action designed to convert inputs (material, parts, etc.) into outputs (waste, by-product, etc.) resulting in an intermediate or final product.

Recovered (Reclaimed) Material — Material that would have otherwise been disposed of as waste or used for energy recovery, but has instead been collected and recovered (reclaimed) as a material input, in lieu of new virgin material, for a recycling or manufacturing process.

Recycled Content — The proportion of pre-consumer or post-consumer recycled material, by mass, in a product or packaging.

Recycled Material — Material that has been reprocessed from recovered (reclaimed) material by means of a manufacturing process and made into a final product or into a component for incorporation into a product.

Waste — Material from a generator or holder that does not possess characteristics or meet technical specifications for use in the marketplace without further processing, and that the generator/holder intends or is required to discard or release to the environment.

Waste Stream — The total flow of solid waste from homes, businesses, institutions and manufacturing plants that is recycled, burned or disposed of in landfills or segments thereof.

MERCURY CONTENT IN COMPACT FLUORESCENT LAMPS (CFLS)

IgCC Section 506.3 requires single-ended pin-base and screw-base CFLs to contain no more than 5 milligrams of mercury per lamp, except lamps rated at 25 watts or greater are required to contain no more than 6 milligrams of mercury per lamp. CFLs are required to be listed and labeled in accordance with UL 1993.

Compact Florescent Lamps are listed under the Self-ballasted Lamps and Lamp Adapters product category (OOLR) in accordance with UL 1993. This category covers self-ballasted lamps consisting of a ballast, transformer or power supply, and an integrated or replaceable lamp, for direct connection to a lampholder. UL 1993 requires the CFLs that contain mercury to be marked in accordance with federal law. The smallest unit packaging, point-of-sale package, carton or “stuffer sheet” packed with each lamp additionally identifies lamps that contain mercury and provide information for their safe cleanup, disposal and recycling.

ENERGY CONSERVATION, EFFICIENCY AND CO₂E EMISSION REDUCTION

Green codes contain requirements addressing energy metering and monitoring, building energy management and control systems, use of electric vehicles, energy efficient appliances and equipment, and renewable energy systems.

ENERGY METERING AND MONITORING

Green codes require a means to be provided to measure, monitor, and report on the energy use, production and reclamation in a building. This includes the design of energy distribution systems so as to isolate load types, the installation of or ability to install in the future meters, devices and a data acquisition system, and the installation of or the ability to provide for public displays and other appropriate reporting mechanisms in the future.

UL lists this equipment under the Energy Usage Monitoring Systems product category (FTRZ). This category covers products intended for use in metering of utility and nonutility electric power. The primary function of these devices is to monitor power consumption on a building main supply or separate branch circuits. These devices may communicate with other devices by means of power line carrier, satellite/radio frequency, telephone, cable or other means. UL provides a service for the Classification of watt-hour meters for use in metering of utilities that not only meet the appropriate requirements of UL but also have been investigated in accordance with standards or parts detailed below from the American National Standards Institute (ANSI):

- ANSI/NEMA C12.1, Code for Electricity Metering
- ANSI/NEMA C12.10, Physical Aspects of Watthour Meters
- ANSI/ NEMA C12.11, Instrument Transformers for Revenue Metering, 10 kV BIL through 350 kV BIL (0.6 kV NSV through 69 kV NSV)
- ANSI/NEMA C12.20, Electricity Meters – 0.2 and 0.5 Accuracy Classes

ENERGY MANAGEMENT EQUIPMENT

Green codes require a building energy management and control system (EMCS) to be provided and integrated with building HVAC systems controls and lighting systems controls to receive an open and interoperable automated demand response (Auto-DR) relay or internet signal. Building HVAC and lighting systems and specific building energy-using components are required to incorporate preprogrammed demand response strategies that are automated with a demand response automation internet software client.

UL lists equipment that energizes or de-energizes electrical loads to achieve the desired use of electrical power under the Energy Management Equipment product category (PAZX) in accordance with UL 916. This equipment normally controls electrical loads by responding to sensors or transducers monitoring power consumption, sequencing, cycling the loads through the use of preprogrammed data logic circuits, or any combination thereof. Devices responding to signals from a utility company may receive the signals over the power lines or as radio signals. Typical loads controlled by this equipment include space heating, air conditioning and lighting.

ELECTRIC VEHICLE CHARGING EQUIPMENT

The IgCC requires parking spaces dedicated for electric vehicles to be provided for the occupants of green buildings. UL lists electric vehicle charging equipment under the product category Electric Vehicle Charging System Equipment (FFTG), in accordance with UL 2202, or electric vehicle supply equipment under the product category Electric Vehicle Supply Equipment (FFWA), in accordance with UL 2594. The FFTG category covers conductive charging system equipment, with a DC output, intended for use with electric vehicles. The equipment can be either off board or on board type equipment. Off-board equipment is intended for indoor or outdoor use; on board equipment is always considered outdoor use. This equipment is rated 600 V or less at the input. The FFWA category covers conductive supply equipment, with an AC output, that is intended to supply power to a vehicle's on board charger. This equipment is always off board and can be intended for indoor or outdoor use. In both categories, the off board equipment is intended to be connected to the vehicle by means of a flexible cable and an electric vehicle connector, and intended for installation in accordance with NFPA 70.

ENERGY EFFICIENCY

The IECC and IgCC address the need for the effective use of energy through the use of energy efficient equipment. The IgCC requires certain products to comply with ENERGY STAR[®] requirements.

The ENERGY STAR[®] program is a voluntary labeling program jointly administered by the U.S. Environmental Protection Agency (EPA) and the Department of Energy (DOE). It was launched in 1992 to help consumers identify products that are more energy efficient.

Effective Jan. 1, 2011, the U.S. Environmental Protection Agency (EPA) requires that all new product submissions from manufacturers participating in the ENERGY STAR[®] program be reviewed by an EPA-recognized Certification Body (CB), and that qualification testing be performed under specific criteria. Product qualification requires testing to be performed at EPA-recognized facilities.

UL was one of the first organizations to earn recognition by the EPA as an approved certification body. Recognized certification bodies are required to comply with ISO/IEC 17025 for testing, calibrations and sampling, if they perform those functions, as well as be accredited to ISO/IEC Guide 65 for bodies operating product certification systems.

UL also verifies various products, such as room air conditioners, packaged liquid chillers, refrigerated beverage vending machines, clothes dryers, dehumidifiers, exit signs, ceiling fans, fluorescent lamp ballasts, gas-fired furnaces, refrigerators, dishwashers, and clothes washers for energy efficiency in accordance with specific regulations or standards in the United States and Canada. These regulations and standards include specific test procedures established by AHAM, AHRI, ASHRAE, CSA, and U.S. Department of Energy (DOE). Certified products bear the UL Energy Mark and identify the regulation or standard used to verify compliance. A list of product categories for these verifications is in Appendix A.

Nonregulated electric motors are verified for energy efficiency in accordance with CSA, IEC and IEEE standards under the product category for Electric Motors Verified for Energy Efficiency (ENVR). Electric signs are verified for energy efficiency in accordance with the California Code of Regulations, Title 24, Part 6, Section 148 under the product category for Electric Signs Verified for Energy Efficiency (ENVS).

BUILDING ENERGY RENEWABLE ENERGY SYSTEMS

Some jurisdictions require each building or surrounding lot or building site to be equipped with at least one renewable energy system – solar photovoltaics, wind energy or solar water heating. UL's certifications and services related to renewable energy are covered in UL's **Alternate Energy Application and Marking Guide** at www.ul.com/markingguides.

WATER RESOURCE CONSERVATION AND EFFICIENCY

Green codes require a means be established for conserving water used indoors, outdoors and in wastewater conveyance. Specific plumbing appliances are required to limit water consumption. Water treatment devices and equipment are required to limit water consumption and address quality and efficiency.

PLUMBING APPLIANCE ENERGY EFFICIENCY

Household clothes washers listed under the Household Clothes Washers Verified for Energy Efficiency product category (ZZSR) and household dishwashers listed under the Household Dishwashers Verified for Energy Efficiency product category (ZYHZ) are investigated to verify their energy efficiency, and their consumption and efficient use of water.

WATER TREATMENT DEVICES AND EQUIPMENT

IgCC Section 704 requires specific water treatment devices and equipment to meet various standards. UL's Drinking Water Treatment Units product category (FDQD) covers point-of-use and point-of-entry drinking water treatment units intended to reduce specific health or aesthetic-related

chemical substances, particulates or microbiological contaminants from private or public drinking water supplies.

The basic standards used to investigate products in this category are NSF 42, 44, 53, 55, 58, 62 and 177. These standards establish minimum requirements for the design, materials, construction and performance of products such as cation exchange water softeners, activated carbon filter systems, reverse osmosis drinking water treatment systems, ultraviolet microbiological water treatment systems, drinking water distillation systems, and their components. Products covered under NSF 44 are intended to be used for the removal of hardness and the reduction of specific contaminants from public or private drinking water supplies. Products covered under NSF 58 are intended for the reduction of total dissolved solids and specific contaminant substances that may be present in public drinking water supplies.

INDOOR ENVIRONMENTAL QUALITY AND COMFORT

Areas covered by indoor environmental quality and comfort requirements include material emissions and pollutant control, fuel-fired appliances, and sound transmission.

MATERIAL EMISSIONS AND POLLUTANT CONTROL

An interior environment that is conducive to the health and well-being of building occupants and construction personnel is what is intended by the IGCC. People spend over 90 percent of their time indoors where they may be exposed to thousands of airborne pollutants. Products and materials indoors release volatile organic compounds (VOCs) and particles into the air that may negatively affect human health or result in unacceptable odors. VOCs are chemicals used to manufacture and maintain building materials, interior furnishings, cleaning products and personal care products. “Volatile” means that at room temperature these chemicals evaporate or can easily get into the air.

Inadequate ventilation, high temperatures and high humidity levels increase concentrations of some pollutants, leading to indoor air pollution levels up to 1000 times higher than those outdoors. The United States Environmental Protection Agency (U.S. EPA), the American Lung Association, the World Health Organization, and other public health and environmental organizations view indoor air pollution as one of the greatest risks to human health. There may be anywhere from 50 to hundreds of individual VOCs in the indoor air of a building.

Studies from around the globe (see below for links to some of these) continue to show that exposure to high levels of harmful chemicals in our indoor environment can cause not only severe discomfort, but headaches, nose bleeds, increased asthma attacks, the onset of asthma, and potential long-term health effects. High levels of chemical exposure have even led to an increase in C-reactive protein levels in human subjects, which is the body’s response to inflammation. Once airborne, VOCs can be easily inhaled by building occupants and trigger a number of health problems.

What Contributes to Poor Indoor Air Quality?

Chemicals — The primary sources of indoor exposure to airborne chemicals are products used in interior environments including furnishings, building materials, and other household and office products, that can emit thousands of VOCs and particles into the air. Of all the culprits that can affect indoor air quality, chemical emissions are the most harmful as they can contribute to a wide range of health effects.

Mold — Moisture problems are another common source of indoor air pollution as they can lead to indoor mold growth. Mold can also emit VOCs and particulates, compromising indoor air quality and leading to negative health effects. Since it is impossible to eliminate mold spores, the best way to reduce the impact of mold on indoor air quality is to prevent or promptly repair the moisture problems that enable mold growth.

Particulates — The particles emitted from products such as furnishings, building materials, and other household and office products are another source of indoor air pollution. Airborne particulates can also come from dirt and dust that is tracked in from outside. Particulates can trigger allergies and other respiratory problems in many people. Installing walk-off mats at doorways and changing air filters regularly are both good strategies to limit these pollutants.

Decreased Ventilation — Most of the buildings in which people spend the majority of their time are tightly sealed and insulated to keep out unconditioned outdoor air. Furthermore, most ventilation systems are designed to bring in very little outdoor air and instead recirculate the indoor air that has already been heated or cooled. While this strategy is effective for minimizing energy costs, it can have a negative impact on indoor air quality.

The Solution: Keep Pollutants Out in the First Place

Improving the quality of indoor air is vital for human health. The USEPA names source control as the best strategy to reduce indoor air pollution and limit chemical exposure. Source control can include selecting products that have been GREENGUARD Certified for low chemical emissions. Certified products are listed in the free GREENGUARD Product GuideSM at <http://greenguard.org/en/QuickSearch.aspx>.

Using GREENGUARD Certified products is among the most effective and easiest ways to help create healthier educational, healthcare, office and home environments. UL Environment's IAQ

Management Plan outlines requirements for managing indoor air quality during building construction. It can be used as a supplement to Master Specification Section One. This specification also provides instruction for selecting construction products, construction site management, construction sequencing, HVAC operation during construction, product installation, building flush-out and indoor air quality testing.

GREENGUARD Certification Types

GREENGUARD Indoor Air Quality Certified® — A product certification program for low-emitting building materials, furniture, furnishings, finishes, cleaning products, electronics and consumer products. All GREENGUARD Indoor Air Quality Certified products meet stringent certification requirements and must undergo both annual re-certification and quarterly quality monitoring to ensure ongoing compliance. Certified products are showcased in the free **GREENGUARD Product Guide**

GREENGUARD Children & Schools CertifiedSM — A product certification program for low-emitting building materials, furniture, finishes, cleaning products, electronics and consumer products used in environments where children and other sensitive populations spend extended periods of time. All GREENGUARD Children & Schools Certified products meet the stringent GREENGUARD Children & Schools Certification requirements, including limits outlined in California’s Department of Public Health Services Standard Practice for Specification Section 01350, and undergo both annual re-certification and quarterly quality monitoring to determine ongoing compliance. Certified products are displayed in the free GREENGUARD Product Guide at <http://www.greenguard.org/en/QuickSearch.aspx>.

Products are tested for emissions of formaldehyde, volatile organic compounds (VOCs), aldehydes, respirable particles, ozone and other pollutants using stringent environmental chamber protocols. Specific measurements may vary, based on the requirements of a specific certification program and type of product. Testing takes place in dynamic environmental chambers designed to simulate product use in typical indoor environments. Environmental chamber operation and testing protocols follow scientific principles established by the US Environmental Protection Agency (EPA) and its Environmental Technology Verification Program, the American Society of Testing Materials (ASTM), the state of Washington, Germany’s Federal Environment Agency (Blue Angel Program), and other applicable government or industry programs. For technical details, visit the Testing Procedures as presented in the Technical Center at <http://www.greenguard.org/en/technicalCenter.aspx>.

GREENGUARD Children & Schools Certified products meet and exceed the California Section 01350 materials emissions specification requirements. The California Section 01350 specification was originally written on behalf of the California Sustainable Building Task Force for the design and construction of the state’s Capitol Area East End Complex in 2002 to 2003. Material testing for VOCs was a key element of this specification, requiring materials to meet exposure limits for VOCs with chronic reference exposure level (CREL) values. The material testing methodology and criteria became known as the “Standard Practice.” GREENGUARD product handling, testing and analysis procedures have been harmonized with California Section 01350. In addition, any product certified within the GREENGUARD Children & Schools Program meets health-based criteria including one-half of the CA CRELs called out in CA 01350. All GREENGUARD Children & Schools Certified products meet these requirements and are recognized as suitable for use in all major sustainable

building rating systems or codes or any other building program recognizing California Section 01350.

FUEL-FIRED APPLIANCES

Gasketed Fireplace Doors

The 2012 IECC and the 2012 International Residential Code require gasketed doors on wood-burning fireplaces. Gasketed doors cannot be retrofit onto an already-installed factory-built fireplace unless this type of configuration is specifically indicated in the manufacturer's instructions, as this changes the combustion chamber from an open to a closed type. To date, UL has not investigated and certified such an arrangement.

Some factory-built fireplaces have been evaluated and certified with factory-installed gasketed doors. However, the use of these doors may require a Type HT chimney system, which would be detailed in the manufacturer's installation instructions.

Gasketed fireplace doors retain more heat within a firebox during the operation of the fireplace as compared to units with nongasketed doors. The increased heat raises the outside surface temperatures of a firebox, which may affect the clearances of the fireplace to combustible materials within walls and floor, and to trim and finish material, such as mantles. Only those fireplaces that have been evaluated with gasketed fireplace doors are identified in the installation instructions.

Factory-built wood-burning fireplaces are certified in accordance with UL 127, the Standard for Safety for Factory-Built Fireplaces, which is consistent with requirements in the International Mechanical Code and the Uniform Mechanical Code. These fireplaces are intended to be installed and used in accordance with the product Listing and the manufacturer's installation instructions.

Biomass-Burning Appliances

Biomass and pellet stoves and inserts, as covered in IgCC Section 804.1.3, are listed under the Solid-Fuel Type Room Heaters product category (DGAW) in accordance with UL 1482. Solid-fuel-burning air heaters designed for connection to a supply-and-return air duct system are listed under the Solid-fuel-fired Central Furnaces product category (LBHZ) in accordance with UL 391.

Factory-built, manually and/or automatically fueled, solid-fuel-fired hydronic heating appliances and boiler assemblies that burn biomass are listed under the Solid-fuel-fired Hydronic Heating Appliances and Boiler Assemblies product category (KXBW). Biomass water heaters are listed under the Solid-fuel-fired Water Heaters product category (LVHO). Products under both of these product categories are listed in accordance with UL 2523.

ACOUSTICS (SOUND TRANSMISSION)

Some green codes require buildings and tenant spaces to comply with minimum sound transmission class and maximum sound level requirements.

In addition to the fire-resistance ratings, where indicated in the individual designs under the Fire Resistance Ratings product category (BXUV), the Sound Transmission Class (STC) rating is published for those designs where the sound transmission loss (STL) test was also investigated in accordance with ASTM E90. The STC rating applies to the assembly of materials as indicated in the individual designs.

The following products have been investigated by UL in accordance with ASTM E90 and/or ASTM E492, where indicated in the individual Classifications:

- Suspension systems for ceiling membrane materials, direct or indirect supporting members for surfacing materials and support members for glazing in the Framing Members product category (CIKV)
- Concrete units, blocks and panels in the Precast Autoclaved Aerated Concrete Blocks product category (CFMW)
- Noncombustible panels used as a combination subfloor and underlayment in the Structural Cementitious Floor-sheathing Panels product category (CIYX)

Precast autoclaved aerated concrete is a lightweight precast building material with a uniform cellular structure intended for use in floor, roof and wall assemblies. Structural cementitious floor-sheathing panels are intended to be installed over cold-formed steel framing in interior locations.

The Sound Transmission Class (STC) is determined by ASTM E90. The STC is published as a single number (such as 50) and is applicable to the assembly of materials noted in the designs in the individual Classifications.

The Impact Insulation Class (IIC) is determined by ASTM E492. The IIC is published as a single number (such as 28) and is applicable to the assembly of materials noted in the designs in the individual Classifications.

Where indicated in the individual Classifications of acoustical materials under the Acoustical Materials product category (BIYR), these Classified products have been investigated to ASTM E423, ASTM E1414, and/or ASTM E1111. The Classifications are confined to the materials themselves and to the methods of application indicated and do not pertain to the structures in which the materials may be installed.

The noise reduction coefficient (NRC) is determined by ASTM C423. The NRC is published as a single number, such as 0.60.

The ceiling attenuation class (CAC) is determined by ASTM E1414. The CAC is published as a single number such as 32.

The articulation class (AC) is determined by ASTM E1111. The AC is published as a single number such as 170.

APPENDIX A: UL PRODUCT CATEGORIES FOR THE IGCC AND IECC

UL certifies products and continues to develop new product categories to address sustainability issues, without compromising safety. Below is a list of product categories in which UL certifies products suitable for the IgCC and IECC. Each product category is tabulated with a UL Category Code or a link to a certification database. By clicking on the code, you will be linked to the UL Guide Information for the category and any Listings or Classifications under that Product Category in the UL Online Certifications Directory at www.ul.com/database. The UL Guide Information may provide information or a link to additional safety related UL Guide Information.

Information on validated and certified products addressing the requirements in Sections 304.1, 503.2.3, and 508.3 of the IgCC is located in UL Environment’s Database of Validated and Certified Products, at www.ulenvironment.com/database. This online tool allows users to quickly sort and identify products by product category, company name, product name or type of claim. This database also includes products evaluated to ENERGY STAR® requirements.

For more information and to view a complete list of certified products for product emissions, visit www.greenguard.org.

Category Code	Category Name	Standard Used
CONSTRUCTION		
TGFE	Roof coverings	ASTM C1549 & ASTM C1371
MATERIAL RESOURCE CONSERVATION AND EFFICIENCY		
SCKG	Commercial Refrigerant Recovery/Recycling Equipment	UL 1963 , Clean Air Act, Title VI, Section 608
QVBC	Commercial Refrigeration Recovery/Recycling Equipment Certified for Performance Characteristics in Accordance with the United States Clean Air Act	40CFR82.158 Clean Air Act, Title VI, Section 608
YXMTC	Exhaust Cleaning and Recycling Assemblies for Commercial Kitchen Exhaust Systems	ULC-S647
SCIJ	Commercial Refrigerant Recovery Equipment	UL 1963 , Clean Air Act, Title VI, Section 608
VBIE	Solvent Distillation Units	UL 2208
VBFY	Solvent Distillation Units for Use in Hazardous Locations	UL 2208
GLET	Halon Recovery/Recharge Equipment	UL 2006
OOLR	Compact fluorescent lamps (single-ended pin-base and screw-base) (Self-Ballasted Lamps and Lamp Adapters)	UL 1993

ENERGY CONSERVATION, EFFICIENCY AND ATMOSPHERIC QUALITY		
ENVR	Electric Motors Verified for Energy Efficiency, Nonregulated, Certified to IEEE, CSA or IEC Standards	CSA C390, CSA C747, IEC 60034-2-1, ANSI/IEEE 112, IEEE 114
ENVS	Electric Signs Verified for Energy Efficiency in Accordance with California Code of Regulations, Title 24, Part 6, Section 148	CCR, Title 24, Part 6, Section 148
ZWAA	Products Verified for Energy Efficiency in Accordance with United States Regulations or Standards	
ZWAT	Air Conditioners, Room Verified for Energy Efficiency	10CFR430 Appendix F
ZWBN	Packaged Liquid Chillers Verified for Energy Efficiency	AHRI 550/590
ZWHP	Dehumidifiers, Refrigeration Type Verified for Energy Efficiency	AHAM DH-1, 10CFR430 Appendix F
ZWKG	Electric Motors Verified for Energy Efficiency	US DOE 10CFR431
ZWKL	Electric Motors for Use in Hazardous Locations Verified for Energy Efficiency	US DOE 10CFR431
ZWMR	Fluorescent Lamp Ballasts Verified for Energy Efficiency	10CFR430 Appendix Q
ZWQL	Heating & Cooling Equipment Verified for Energy Efficiency	10CFR430 Appendix M
ZWRP	Ice Makers Verified for Energy Efficiency	AHRI 810, AHRI 820, and 10CFR431.136
ZXIX	Refrigerators, Commercial Verified for Energy Efficiency	AHRI 1200 and ASHRAE 72
ZXJL	Refrigerators, Freezers & Wine Chillers, Household Verified for Energy Efficiency	US DOE 10CFR430 Appendix A1 and ANSI/AHAM HRF-1
ZXTH	Water Heaters, Electric Storage Tank Verified for Energy Efficiency	US DOE 10CFR430 Appendix E
ZYAA	Products Verified for Energy Efficiency in Accordance with Canadian Regulations or Standards	
ZYAT	Air Conditioners, Room Verified for Energy Efficiency	CAN/CSA-C368.1
ZYBU	Packaged Liquid Chillers Verified for Energy Efficiency	CSA-C743
ZYDI	Beverage Vending Machines, Refrigeration Type Verified for Energy Efficiency	ASHRAE 32.1
ZYFX	Clothes Dryers, Household, Electric Verified for Energy Efficiency	CAN/CSA-C361
ZYHM	Dehumidifiers, Refrigeration Type Verified for Energy Efficiency	CAN/CSA C749
ZYKH	Electric Motors Verified for Energy Efficiency	CSA C390 or CSA C747
ZYKN	Electric Motors for Use in Hazardous Locations Verified for Energy Efficiency	CSA C390 or CSA C747
ZYLC	Exit Signs Verified for Energy Efficiency	CSA C860
ZYMA	Fans, Ceiling Suspended Verified for Energy Efficiency	CSA-C22.2 No. 9.0

ZYMV	Fluorescent Lamp Ballasts Verified for Energy Efficiency	CAN/CSA-C654
ZYOD	Furnaces, Gas- & Oil-fired Verified for Energy Efficiency	CGA-2.3
ZYQL	Heating & Cooling Equipment Verified for Energy Efficiency	CSA-C656
ZYRR	Ice Makers Verified for Energy Efficiency	CAN/CSA-C742
ZYWX	Lamps, General-service Fluorescent Verified for Energy Efficiency	CAN/CSA-C819
ZYXA	Lamps, Incandescent Reflector Verified for Energy Efficiency	CAN/CSA-C862
ZYXE	Lamps, Self-ballasted Compact Fluorescent & Ballasted Adapters Verified for Energy Efficiency	CAN/CSA-C861
ZZED	Transformers, Distribution, Dry & Liquid-filled Types Verified for Energy Efficiency	CSA C802.2
ZZKM	Ranges, Household Electric Verified for Energy Efficiency	CAN/CSA-C358
ZZLG	Refrigerators, Commercial Verified for Energy Efficiency	AHRI 1200 and ASHRAE 72
ZZLI	Refrigerators, Freezers & Wine Chillers, Household Verified for Energy Efficiency	CSA-C300
ZZTH	Water Heaters, Electric Storage Tank Verified for Energy Efficiency	CAN/CSA-C191
FTRZ	Energy metering and monitoring for electricity, gaseous fuels, liquid fuels, and renewable energy consumption	UL 916, NEMA C12 standards
PAZX	Energy management equipment	UL 916
FFTG	Electric vehicle charging equipment	UL 2202
FFWA	Electric vehicle supply equipment	UL 2594
GQHG	HVAC system controls	UL 1917
XAPX	Programmable thermostats	UL 873
LZTW	Energy recovery devices (Ducted Heat Recovery Ventilators)	UL 1812
LZUU	Energy recovery devices (Non-ducted Heat Recovery Ventilators)	UL 1815
WATER RESOURCES CONSERVATION AND EFFICIENCY		
FDQD	Drinking Water Treatment Units	NSF 42, NSF 44, NSF 53, NSF 55, NSF 58, NSF 62, NSF 177
ZZSR	Clothes Washers, Household Verified for Energy Efficiency	CAN/CSA-C360
ZYHZ	Dishwashers, Household Verified for Energy Efficiency	CSA-C373
INDOOR ENVIRONMENTAL QUALITY AND COMFORT		
AGGZ	Air filters (construction phase) (Electrostatic Air Cleaners)	UL 867
AJZV	Air filters (construction phase) (Air Filter Units)	UL 900
AKNT	Air filters (construction phase) (High-Efficiency, Particulate, Air Filter Units)	UL 586
ALEV	Air filters, mechanical	UL 900

AGGZ	Air filters. electrostatic	UL 867
AJZV	Air filters (ducted space conditioning)	UL 900
AKNT	Air filters, high efficiency	UL 586
DEAZ	Wood stoves and wood fireplace inserts (Solid-Fuel Type Room Heaters)	UL 1482
DEET	Factory-Built Fireplaces	UL 127
DEAQ	Fireplace chambers	UL 127
DGAW	Biomass stoves and inserts (Room Heaters, Solid Fuel Type)	UL 1482
DGAW	Pellet (biomass) stoves and furnaces (Solid-Fuel Type Room Heaters)	UL 1482
KXBW	Solid Fuel-Fired Hydronic Heating Appliances, Water Heaters, and Boilers	UL 2523
LVHO	Solid Fuel-Fired water heaters	UL 2523
LBHZ	Solid-fuel-fired Central Furnaces	UL 391
Greenguard Children's and Schools adhesives/ sealants	Adhesives and sealants	EPA Method 24, SCAQMD Method 304, 316A or 316B or CDPD/EHLB/Standard Method V.1.1
Greenguard Children's and Schools paints and coatings	Architectural paints and coatings	CDPD/EHLB/ Standard Method V.1.1
Greenguard Children's and Schools flooring	Floor coverings	CDPD/EHLB/ Standard Method V.1.1
Greenguard Children's and Schools ceiling systems	Acoustical ceiling tiles and wall systems	CDPD/EHLB/ Standard Method V.1.1
Greenguard Children's and Schools insulation	Insulation	CDPD/EHLB/ Standard Method V.1.1
BXUV	Sound transmission (wall assemblies)	UL 263 , ASTM E90 ASTM E492
CIKV	Sound transmission (wall assemblies) (Framing Members)	UL 263 , ASTM E90 ASTM E492
CFMW	Sound transmission (wall assemblies) (Fire Tests of Building Construction and Materials)	UL 263 , ASTM E90 ASTM E492
CIYX	Sound transmission (wall assemblies) (Fire Tests of Building Construction and Materials)	UL 263 , ASTM E90 ASTM E492
BIYR	Acoustical Materials	ASTM C423, ASTM E1414, ASTM E1111

APPENDIX B: UL PRODUCT CATEGORIES FOR THE ICC 700

UL certifies products and continues to develop new product categories to address the requirements in ICC 700. Each product category is tabulated with a UL Category Code. By clicking on the code, you will be linked to the UL Guide Information for the category and any Listings or Classifications under that product category in the UL Online Certifications Directory at www.ul.com/database. These products also have typically been evaluated for safety.

Category Code	Category Name	Standard Used
TGFE	Roof coverings, Solar Reflectance	ASTM C1371 ASTM C 1549
GPRT	Ceiling fans	UL 507
UZUW	Solar water heater system (Outline of Investigation for Solar Collectors)	UL Subject 1279
UZVY	Solar water heater system Controllers (Outline of Investigation for Solar Collectors)	UL Subject 1279
UZWT	Solar water heater system (Energy Transfer Units)	UL Subject 1279
UZWW	Solar water heater system Thermal Storage Units (Outline of Investigation for Solar Collectors)	UL Subject 1279,
UZWZ	Solar water heater system Alternative-energy Water-storage Tanks and Multi-energy Water Heaters (Household Electric Storage Tank Water Heaters) (Electric Booster and Commercial Storage Tank Water Heaters)	UL 174, UL 1453
DEET	Factory-built, wood-burning fireplaces (Factory-Built Fireplaces)	UL 127
DEAZ	Wood stove and fireplace inserts (Solid-Fuel Type Room Heaters)	UL 1482
DGAW	Pellet (biomass) stoves and furnaces (Room Heaters, Solid Fuel Type)	UL 1482
CZHF	Carbon monoxide alarms (Single and Multiple Station Carbon Monoxide Alarms)	UL 2034
XAPX	Programmable thermostat (Temperature-Indicating and -Regulating Equipment) (Automatic Electrical Controls for Household and Similar Use)	UL 873, UL 60730-1A
OOLR	Luminaires (lighting fixtures) and lamps (light bulbs)(Self-Ballasted Lamps and Lamp Adapters)	UL 1993
SHZZ	Refrigerators, dishwashers, washing machines (Household Refrigerators and Freezers)	UL 250
DMIY	Refrigerators, dishwashers, washing machines (Household Dishwashers)	UL 749

ZCTT	Refrigerators, dishwashers, washing machines (Electric Clothes Washing Machines and Extractors) (Electric Commercial Clothes-Washing Equipment) (Combination washer-dryers) (Electric Clothes Dryers) (Electric Commercial Clothes-Drying Equipment)	UL 2157, UL 1206, UL 2158, UL 1240
GPWV	Exhaust fans (Electric Fans)	UL 507
ZACT	Exhaust fans (Power Ventilators)	UL 705
ALLU	Duct insulation materials (Factory-Made Air Ducts and Air Connectors)	UL 181
Greenguard Children's and Schools adhesives/sealants	Adhesives and sealants	EPA Method 24, SCAQMD Method 304, 316A or 316B or CDPD/EHLB/Standard Method V.1.1
Greenguard Children's and Schools paints and coatings	Architectural paints and coatings	CDPD/EHLB/Standard Method V.1.1
Greenguard Children's and Schools flooring	Floor coverings	CDPD/EHLB/Standard Method V.1.1
Greenguard Children's and Schools ceiling systems	Acoustical ceiling tiles and wall systems	CDPD/EHLB/Standard Method V.1.1
Greenguard Children's and Schools insulation	Insulation	CDPD/EHLB/Standard Method V.1.1

APPENDIX C: UL PRODUCT CATEGORIES FOR THE GPMCS

UL certifies products and continues to develop new product categories to address the requirements in IAPMO's Green Plumbing and Mechanical Code Supplement (GPMCS). Each product category is tabulated with a UL Category Code. By clicking on the code, you will be linked to the UL Guide Information for the category and any certifications under that product category in the UL Online Certifications Directory at www.ul.com/database.

Category Code	Category Name	Standard Used
QMTX	Automatic Faucets	UL 1951 ASME
QNNK	Ceramic water closets	ASME A112.19.2
QNNP	Plastic Urinal Fixtures	IAPMO Z124.9
BRGU	Pipe insulation	UL 723
ZXTH	Water Heaters, Electric Storage Tank Verified for Energy Efficiency	10CFR430
UZWT	Solar heat exchanger	UL Subject 1279
ZDUZ	Water softener	UL 979
BRGU	Duct insulation	UL 723
ALKW	Duct closure systems	UL 181A
XAPX	Programmable thermostat	UL 873, UL 60730-1A
ZWQL	Heating & cooling equipment verified for energy efficiency	10CFR430 Appendix M
ZWHP	Dehumidifiers, refrigeration type verified for energy efficiency	AHAM DH-1, 10CFR430 Appendix F
ZWAT	Room air conditioners, verified for energy efficiency	10CFR430
LZTW	Ducted heat recovery ventilators	UL 1812
LZUU	Non-ducted heat recovery ventilators	UL 1815
OGOY	Laboratory hood	UL 1805
YXZR	Compensating grease hoods	UL 710

APPENDIX D: SUSTAINABILITY-RELATED CODES AND STANDARDS

This appendix provides a list of the model green construction codes and installation standards, UL Standards and Outlines of Investigations related to green construction, and standards developed by other organizations that are used by UL to evaluate and certify products.

Green products must be installed in accordance with model codes and installation standards. These codes require these products to be listed and labeled in accordance with applicable product standards.

UL sustainability standards are typically identified as Standards for Sustainability and are designed to support a continuing effort to improve and/or maintain environmental quality by reducing energy and materials consumption and by minimizing the impacts of pollution generated by the production, use and disposal of goods and services. Limitations applicable to the products covered by the standard are delineated in the scope section of the Standard. UL Standards are intended to:

- Identify requirements for evaluation of products and provide consistency in the application of these requirements.
- Provide guidance for development of products by manufacturers.
- Provide requirements compatible with nationally recognized installation codes

UL Outlines of Investigation are documents that contain the construction, performance and marking criteria used by UL to investigate a product when the product is not covered by the scope of an existing UL Standard. Outlines are not consensus documents and do not require review by a UL Standards Technical Panel (STP) or other external group.

Comments or proposals for revisions on any part of UL Standards may be submitted to UL at any time. Proposals should be submitted via a Proposal Request in UL's Online Collaborative Standards Development System (CSDS) at <http://csds.ul.com>.

Model Green Construction Codes and Installation Standards	
ASHRAE 189.1	Standard for the Design of High-Performance Green Buildings Except Low Rise Residential
GPMCS	Green Plumbing and Mechanical Code Supplement
ICC 700	National Green Construction Standard
IECC	International Energy Conservation Code
IgCC	International Green Construction Code
NFPA 3	Recommended Practice for Commissioning and Integrated Testing of Fire Protection and Life Safety Systems
UL Standards and Outlines of Investigation	
GEI MMS1001	GREENGUARD Building Construction Standard
GGPS.001	GREENGUARD IAQ Standard for Building Materials, Finishes and Furnishings
GGPS.002	GREENGUARD Children & Schools Standard
GGTM.P040	Method for Measuring Microbial Resistance from Various Sources Using Static Environmental Chambers
GGTM.P066	Standard Method for Measuring and Evaluating Chemical Emissions from Building Materials, Finishes and Furnishings Using Dynamic Environmental Chambers

ULE ISR 100	Interim Sustainability Requirements for Gypsum Boards and Panels
ULE ISR 102	Interim Sustainability Requirements for Door Leafs
UL 108	Environmental Claim Validation Procedure (ECVP) for Estimating Energy Savings for Energy Saving Power Strips
UL 126	Sustainability for Plastic Film Products
UL 391	Solid-Fuel and Combination-Fuel Central and Supplementary Furnaces
UL 773	Plug-In Locking Type Photocontrols for Use with Area Lighting
UL 773A	Nonindustrial Photoelectric Switches for Lighting Control
UL 916	Energy Management Equipment
UL 1482	Room Heaters, Solid Fuel Type
UL 1598B	Supplemental Requirements for Luminaire Reflector Kits for Installation on Previously Installed Fluorescent Luminaires
UL SU 1615	Outline for Refrigerant Heat Recovery Units
UL 1812	Ducted Heat Recovery Ventilators
UL 1815	Nonducted Heat Recovery Ventilators
UL 1963	Refrigerant Recovery/Recycling Equipment
UL 1993	Self-Ballasted Lamps and Lamp Adapters
UL 2006	Halon 1211 Recovery/Recharge Equipment
UL 2523	Solid Fuel-Fired Hydronic Heating Appliances, Water Heaters and Boilers
UL SU 2735	Outline for Electric Utility Meters
UL 2760	Sustainability for Surface Coatings: Recycled Water-borne
UL 2761	Sustainability for Sealants and Caulking Compounds
UL 2762	Sustainability for Adhesives
UL 2763	Sustainability for Energy Efficient Harmonic Cancellation Transformers
UL 2764	Sustainability for Gas-Fired Condensing Hot Water Heating Boilers
UL 2765	Sustainability for Indirect Fired Domestic Hot Water Tanks
UL 2766	Sustainability for Energy Efficient Heating/Cooling Systems for Buildings
UL 2767	Sustainability for Paint and Varnish Remover
UL 2768	Sustainability for Architectural Surface Coatings
UL 2769	Sustainability for Corrosion Protection Control
UL 2770	Sustainability for Commercial Car Wash Services
UL 2777	Sustainability for Hard Floor Care Products
UL 2778	Sustainability for Products Made From Recycled Plastic
UL 2779	Sustainability for Dust Suppressants
UL 2780	Sustainability for Urinal Blocks
UL 2781	Sustainability for Pool and Spa Water Treatment Products
UL 2782	Sustainability for Solid Biofuels
UL 2789	Environmental Claims Validation Procedure for Calculation of Estimated Recyclability Rate
UL 2791	Sustainability for Drain and/or Grease Trap Additives: Biologically-based
UL 2796	Sustainability for Odor Control Products
UL 2799	Environmental Claim Validation Procedure (ECVP) for Zero Waste to Landfill
UL 7001	Sustainability for Household Refrigeration Appliances

UL SU 3200	Outline for Performance Testing of Engine and Turbine Generators
UL 61215	Crystalline Silicon Terrestrial Photovoltaic (PV) Modules - Design Qualification and Type Approval
UL 61646	Thin-Film Terrestrial Photovoltaic (PV) Modules - Design Qualification and Type Approval
UL 62108	Concentrator Photovoltaic (CPV) Modules and Assemblies - Design Qualification and Type Approval
Other Standards Used for Evaluation	
10CFR430, Appendix A1	“Uniform Test Method for Measuring the Energy Consumption of Electric Refrigerators and Electric Refrigerator-Freezers,” of U.S. Department of Energy (DOE) Test Procedure 10CFR430, “Energy Conservation Program for Consumer Products,”
10CFR430, Appendix E	“Uniform Test Method for Measuring the Energy Consumption of Water Heaters,” of U.S. Department of Energy (DOE) Test Procedure 10CFR430, “Energy Conservation Program for Consumer Products.”
10CFR430, Appendix F	“Uniform Test Method for Measuring the Energy Consumption of Room Air Conditioners,” of U.S. Department of Energy (DOE) Test Procedure 10CFR430, “Energy Conservation Program for Consumer Products.”
10CFR430, Appendix M	“Uniform Test Method for Measuring the Energy Consumption of Central Air Conditioners and Heat Pumps,” of U.S. Department of Energy (DOE) Test Procedure 10CFR430, “Energy Conservation Program for Consumer Products.”
10CFR430, Appendix Q	“Uniform Test Method for Measuring the Energy Consumption of Fluorescent Lamp Ballasts,” of U.S. Department of Energy (DOE) Test Procedure 10CFR430, “Energy Conservation Program for Consumer Products.”
10CFR430, Appendix X	“Uniform Test Method for Measuring the Energy Consumption of Dehumidifiers,” of U.S. Department of Energy (DOE) Test Procedure 10CFR430, “Energy Conservation Program for Consumer Products.”
10CFR431	Energy Efficiency Program for Certain Commercial and Industrial Equipment
10CFR431.136	Energy Conservation Standards and Their Effective Dates
40CFR82.158	Standards for Recycling and Recovery Equipment
AHAM DH-1	Dehumidifiers
AHAM HRF-1	Energy, Performance and Capacity of Household Refrigerators, Refrigerator-Freezers and Freezers
AHRI 550/590	Performance Standard for Rating of Water-Chilling Packages Using the Vapor Compression Cycle
AHRI 810	Automatic Commercial Ice Makers
AHRI 820	Ice Storage Bins
AHRI 1200	Performance Rating of Commercial Refrigerated Display Merchandisers and Storage Cabinets
ASHRAE 32.1	Methods of Testing for Rating Vending Machines for Bottled, Canned, and Other Sealed Beverages
ASHRAE 72	Method of Testing Commercial Refrigerators and Freezers, “CGA-2.3, “Gas-Fired Central Furnaces
ASTM C423	Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method

ASTM C1371	Standard Test Method for Determination of Emittance of Materials Near Room Temperature Using a Portable Emisometer
ASTM C1549	Standard Test Method for Determination of Solar Reflectance Near Ambient Temperature Using a Portable Solar Reflectometer
ASTM E90	Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements
ASTM E492	Standard Test Method for Laboratory Measurement of Impact Sound Transmission Through Floor-Ceiling Assemblies Using the Tapping Machine
ASTM E1111	Standard Test Method for Measuring the Interzone Attenuation of Ceiling Systems
ASTM E1414	Standard Test Method for Airborne Sound Attenuation Between Rooms Sharing a Common Ceiling Plenum
CCR, Title 24, Part 6, Section 148	California Building Standards Code; California Energy Code
CSA-C22.2 No. 9.0	General Requirements for Luminaires
CAN/CSA-C191	Performance of Electric Storage Tank Water Heaters for Domestic Hot Water Service
CSA-C300	Energy Performance and Capacity of Household Refrigerators, Refrigerator-Freezers, Freezers, and Wine Chillers
CAN/CSA-C358	Energy Consumption Test Methods for Household Electric Ranges
CAN/CSA-C360	Energy Performance, Water Consumption, and Capacity of Household Clothes Washers
CAN/CSA-C361	Test Method for Measuring Energy Consumption and Drum Volume of Electrically Heated, Household, Tumble-Type Clothes Dryers
CAN/CSA-C368.1	Performance Standard for Room Air Conditioners
CSA-C373	Energy Consumption Test Methods and Limits for Household Dishwashers
CSA C390	Energy Efficiency Test Methods for Three-Phase Induction Motors
CAN/CSA-C654	Fluorescent Lamp Ballast Efficacy Measurements
CSA-C656	Performance Standard for Split-System and Single-Package Central Air Conditioners and Heat Pumps
CAN/CSA-C742	Performance of Automatic Ice-Makers and Ice Storage Bins
CSA-C743	Performance Standard for Rating Packaged Water Chillers
CSA C747	Energy Efficiency Test Methods for Small Motors
CAN/CSA C749	Performance of Dehumidifiers
CSA C802.2	Minimum Efficiency Values for Dry-Type Transformers
CAN/CSA-C819	Performance of General Service Fluorescent Lamps
CSA C860	Performance of Internally Lighted Exit Signs
CAN/CSA-C861	Performance of Self-Ballasted Compact Fluorescent Lamps and Ballasted Adapters
CAN/CSA-C862	Performance of Incandescent Reflector Lamps
IEC 60034-2-1	Rotating Electrical Machines - Part 2-1: Standard Methods for Determining Losses and Efficiency from Tests (Excluding Machines for Traction Vehicles)
ANSI/IEEE 112	Standard Test Procedure for Polyphase Induction Motors and Generators
IEEE 114	Standard Test Procedure for Single-Phase Induction Motors
NSF 44	Cation Exchange Water Softeners
NSF 58	Reverse Osmosis Drinking Water Treatment Systems

Appendix B

UL Online Certifications Directory Quick Guide

Free of charge to all users, UL's Online Certifications Directory is an electronic, "intelligent" version of our renowned UL Product Directories. Updated daily, the Online Certifications Directory has advanced search capabilities and, for most product categories, contains more information about product Listings than is available in print.

Log on to the UL Online Certifications Directory today at www.ul.com/database to verify UL Certifications.

The following UL Online Certifications Directory Quick Guide provides tips for searching UL's Online Certifications Directory using various types of information such as company name, UL File Number, model number, etc.

Contact your local Regulatory Services Representative for further assistance with the UL Online Certifications Directory.

UL's Online Certification Directory Quick Guide

Welcome to the UL Online Certifications Directory, a faster way to access UL Certifications. You can use the UL Online Certification Directory to:

- Verify a UL Certification
- Verify a UL Certified product use
- Verify a product safety standard

Search The UL Online Certification Directory Using: General Searches

- Company name/location and/or Keywords
- Standard Number
- UL File Number
- UL Category Code

Specific Searches

- Appliance Wiring Material (AWM)
- Authorized Label Supplier Label Type
- Component Supplier
- Components for Transportation Applications
- Fire-resistance-rated Systems & Products
- Food Safety Equipment
- Registered Firms
- Sprinkler Identification Number (SIN)

To begin, log on to www.ul.com.

To access the UL Online Certifications Directory, click "Certifications" located in the red bar at the top right of the page. Or for direct access go to www.ul.com/database.

Search By Company Name:

To begin a search for information regarding a specific company, enter the company name and other available information in the fields provided, and then click "Search".

LINKS OF INTEREST

[Notice of Disclaimer](#)

Search results often yield multiple "hits," which are listed in alphabetical order by Company Name.

UL ONLINE CERTIFICATIONS DIRECTORY OCD Home Quick Guide Contact Us UL.com

Search results

Number of hits: 110 The maximum number of hits returned is 5000.

You may choose to [Refine Your Search](#).

Company Name	Category Name	Link to File
SAMPLE COMPANY NAME	Printing Materials Certified for Canada - Component	Sample File
SAMPLE COMPANY NAME	Printing Materials Certified for Canada - Component	Sample File
SAMPLE COMPANY NAME	Printing Materials Certified for Canada - Component	Sample File
SAMPLE COMPANY NAME	Direct Plug-in and Cord-connected Class 2 Power Units	Sample File
SAMPLE COMPANY NAME	Audio and Video Equipment	Sample File

To reduce the number of "hits," choose "Refine Your Search."

To refine, enter additional information in the "Keyword" field and click "Search".

Refining using multiple pieces of information is possible by using "and", "or" and "not" statements, and wildcards as demonstrated through the "Search Tips" link or the following Tips for Effective Searches:

TIPS FOR EFFECTIVE SEARCHES

Select a search method

- Match all words - type AND between words (i.e., display and nwgg)
- Match any word - type OR between words (i.e., hair dryer or blow dryer)
- Match phrase(s) - type exact phrase (i.e., washing machine)
- Exclude a word - type NOT before word (i.e., roof panel not metal)
- Match a partial word or phrase - To replace any characters or words that you may not know, add an asterisk (*) in the middle or at the end of the characters or words in your search.

Examples

- Company Name - company*
- Keyword - submersible*

Once the number of "hits" has been reduced, click on the appropriate link in the "Link to File" column to view the company's current Certification(s) or refine further by again clicking "Refine Your Search."

Number of hits: 15 The maximum number of hits returned is 5000.

1. **Armor SA "AXR-7+" or "AXR-600", Autronics Co., Ltd. "HD", Dynic "CD-20", Ricoh Co., Ltd. "B110C" or**

To view the description/specifications for the category, click the “See General Information for...” link located above the company name.

Note: wording may read “Guide Information for ...” in place of General Information.

UL Guide Information outlines the scope and limitations of a product category, the Standard for Safety used to evaluate products, and the applicable UL Mark by which the products can be identified in the field. View the next level of Guide Information by again clicking the “See General Information for...” link.

Search By Keyword:

This “Keyword” search function will search the entire Online Certification Directory database. Using the “Search Tips” provided, enter the available information and click “Search”.

Search by Standard Number:

This option searches all UL Guide Information for the requested standard number (UL and other). Your results, a list of product categories whose products were evaluated to or whose Guide Information references the standard.

To begin search, enter the exact standard (ASTM E84, UL 300, ANSI/NSF 61, etc.) number in the available “Standard Number” field and click “Search.”

Company Name	Category Name	Link to File
Guide Information	Fire Door and Window Frames	GVTV.GuideInfo

Model number information is not published for all product categories. If you require information about a specific model number, please contact Customer Service for further assistance.

Note: If your search does not result in any “Hits”, try it again using only the number (i.e. E84, 300, 61, etc.).

Search By UL File Number:

A “File Number” is an alphanumeric designation (e.g. E12346, MH3456, R4600, etc.) assigned by UL and associated with a specified company and product category.

To search by “File Number”, first use the drop-down menu on the main page.

The screenshot shows the UL Online Certifications Directory search interface. On the left, there is a 'BEGIN A BASIC SEARCH' form with fields for Company Name, City, U.S. State (dropdown), U.S. Zip Code, Country (dropdown), Region (dropdown), and Keyword. On the right, there is an 'ABOUT THE OCD' section and a 'SPECIFIC / ADVANCED SEARCHES' dropdown menu. The dropdown menu is open, showing options: Keyword, UL File Number (highlighted), UL Category Code, Standard Number, Appliance Wiring Material (AWM), Authorized Label Suppliers, Component Suppliers, and Components for Transportation Applications.

Next, enter the file number and click “Search”.

The screenshot shows the UL Online Certifications Directory search interface after a search. The search bar contains 'UL File Number (E12345):' and the 'SEARCH' button is highlighted. Below the search bar, there are links for 'Search Tips' and 'Disclaimer'. At the bottom, there is a copyright notice: 'Copyright © 2005 Underwriters Laboratories Inc.'

As in the previous example, click the appropriate File Number link in the “Link to File” column.

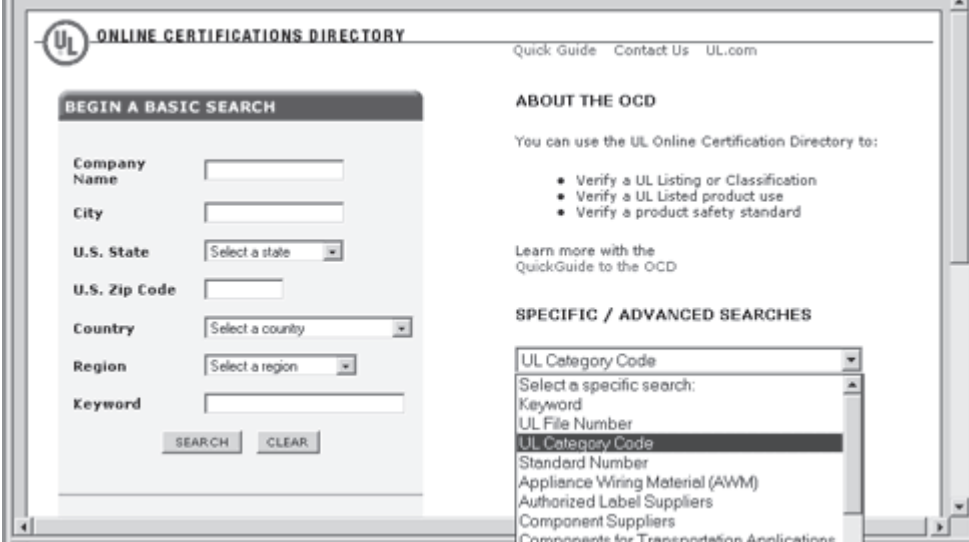

The screenshot shows the UL Online Certifications Directory search results page. The search results are displayed in a table with three columns: Company Name, Category Name, and Link to File. The table contains three rows of sample data.

Company Name	Category Name	Link to File
SAMPLE COMPANY NAME	Printing Materials Certified for Canada - Component	Sample File
SAMPLE COMPANY NAME	Printing Materials Certified for Canada - Component	Sample File
SAMPLE COMPANY NAME	Printing Materials Certified for Canada - Component	Sample File

Search by UL Category Code:

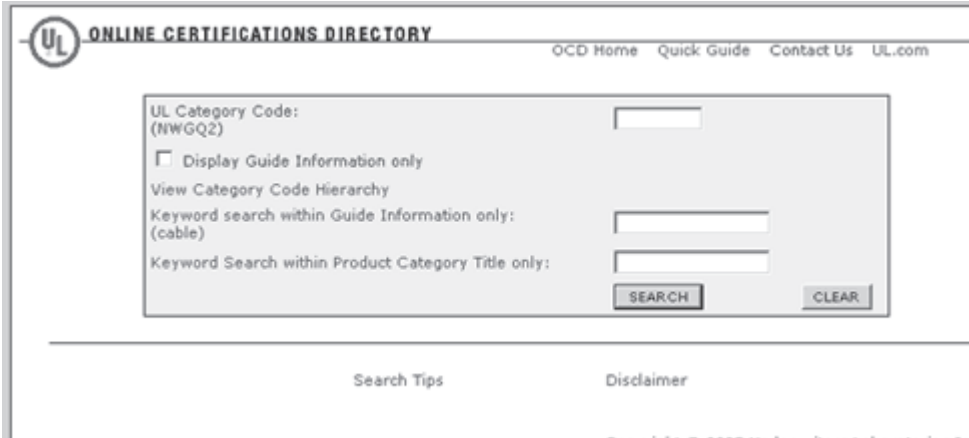

“Category Code” allows for four search options. They are 1) UL Category Code, 2) Keyword search within Guide Information only, 3) Keyword Search within Product Category Title only, and 4) Category Code Hierarchy view.

A UL Category Code is an alphanumeric designation (GBTV, QMFZ2) assigned by UL and associated with a specific product category. To search by UL Category Code, use the drop-down menu on the main page.

The screenshot shows the 'ONLINE CERTIFICATIONS DIRECTORY' search interface. On the left, there is a 'BEGIN A BASIC SEARCH' section with input fields for Company Name, City, U.S. State (a dropdown menu), U.S. Zip Code, Country (a dropdown menu), Region (a dropdown menu), and Keyword. Below these fields are 'SEARCH' and 'CLEAR' buttons. On the right, there is an 'ABOUT THE OCD' section with a list of uses: 'Verify a UL Listing or Classification', 'Verify a UL Listed product use', and 'Verify a product safety standard'. Below that is a 'SPECIFIC / ADVANCED SEARCHES' section with a dropdown menu currently showing 'UL Category Code' and a list of other search options: 'Keyword', 'UL File Number', 'Standard Number', 'Appliance Wiring Material (AWM)', 'Authorized Label Suppliers', 'Component Suppliers', and 'Components for Transmittance Applications'.

To search for keywords in either the Guide Information or product category title, enter the information in the respective “Keyword search within Guide Information Only” “or “Keyword search within Product Category Title only” field and click “Search.” **Note:** This “keyword” search function searches only the UL Guide Information. To search for keyword(s) throughout the entire database, use the Keyword option described in full below.

This screenshot shows a more detailed search interface. At the top, it says 'ONLINE CERTIFICATIONS DIRECTORY' and 'OCD Home Quick Guide Contact Us UL.com'. The main search area contains a 'UL Category Code: (NWGQ2)' field with an input box. Below this is a checkbox labeled 'Display Guide Information only' which is currently unchecked. There is a link 'View Category Code Hierarchy'. Below that are two input fields: 'Keyword search within Guide Information only: (cable)' and 'Keyword Search within Product Category Title only:'. At the bottom of this section are 'SEARCH' and 'CLEAR' buttons. At the very bottom of the page, there are links for 'Search Tips' and 'Disclaimer', and a copyright notice: 'Copyright © 2005 Underwriters Laboratories Inc.'.

To search for the UL Guide Information for a specific category code, enter the category code in the available “Category Code” field, click the “Display Guide Information Only” box and then click “Search”.

Note: Omitting the “Display Guide Information Only” box will result in the UL Guide Information AND all current Certifications for a given category code.

GENERAL

This category covers fire door frames, fire window frames, and twenty minute type door frames or window frames without hose stream.

Fire door and fire window frames are intended for the protection of openings in walls when installed in accordance with ANSI/NFPA 80, "Standard for Fire Doors and Fire Windows" and ANSI/SDI A250.11, "Recommended Erection Instructions for Steel Frames". Installation instructions are not required to be shipped with frames that are to be installed in accordance with ANSI/NFPA 80.

Click the appropriate link in the “Link To File” to view the individual UL Certifications.

APPENDIX C - INDEX OF UL PRODUCT CATEGORIES AND INDUSTRY TERMS

This index includes all product categories sorted alphabetically. In addition, those product categories that are a sub-set of a main product category are indented under the main category to illustrate the grouping of a family of related categories. This index also includes specific product types covered within a product category and these product names are followed by the applicable product category in parentheses.

Cord Sets and Power-supply Cords (ELBZ) ..	132	
Cord-restraint Devices (ELDW)	133	
Outdoor Seasonal-use Cord-connected Wiring Devices (ELEI)	133	
Seasonal-use Cord Sets (ELEV)	134	
Utility-service Cord Sets (ELFT)	134	
Cord Sets, Convention Center (see Exhibition Display Units, Accessories (XNRU))	462	
Cord Sets, Electric Vehicle (see Electric Vehicle Supply Equipment (FFWA))	148	
Cord Sets for Recreational Vehicles (see Cord Sets and Power-supply Cords (ELBZ))	132	
Cord Sets, Seasonal Use (see Seasonal-use Cord Sets (ELEV))	134	
Cord Sets, Utility Service (see Utility-service Cord Sets (ELFT))	134	
Cord Sets with Leakage-current Detection and Interruption (ELGN)	134	
Cord, Zip (see Flexible Cord (ZJCZ))	487	
Cord-restraint Devices (ELDW)	133	
Cord-connected Class 2 Power Units (see Direct-plug-in and Cord-connected Class 2 Power Units (EPU))	142	
Cord-connected EMI Filters (see Electromagnetic Interference Filters (FOKY))	155	
Cord-connected Multiple-receptacle Extension Boxes (see Relocatable Power Taps (XBYS))	455	
Cord-connection Kits, Rangehood (see Rangehood Cord-connection Kits (GQFM))	175	
Cord-grip Attachments (see Outlet Bushings and Fittings (QCRV))	329	
Cordless Glue Guns (see Heaters, Specialty (KSOT))	243	
Cordless Telephones (see Information Technology Equipment Including Electrical Business Equipment (NWGQ)) ..	277	
Corn Popper Cookers (see Household Cooking Appliances (KNUR))	236	
Corn Poppers (see Household Cooking Appliances (KNUR))	236	
Corridor Dampers (see Dampers for Fire Barrier and Smoke Applications (EMME)) ..	137	
Corrosion-measuring Equipment for Use in Hazardous Locations (ELHS)	135	
Corrosion-measuring Equipment for Use in Zone Classified Hazardous Locations (ELHN)	134	
Corrosion-resistant Compounds, Electrically Conductive (see Electrically Conductive Corrosion-resistant Compounds (FOIZ))	155	
Cosmetology Equipment (see Personal Grooming Appliances, Commercial (QGRT))	334	
Cotton-covered Wire (see Fixture Wire (ZIPR))	487	
Counter Top Toaster/broiler-ovens (see Household Cooking Appliances (KNUR)) ..	236	
Counter-mounted Cooking Units, Electric (see Ranges, Household Electric (KRMX)) ..	241	
Counter-top Pop-up GFCIs (see Ground-fault Circuit Interrupters (KCXS))	223	
Couplant Warmers (see Heaters, Specialty (KSOT))	243	
Couplers (see Conduit Fittings (DWTT))	122	
Couplers, Appliance (see Attachment Plugs with Switches (AYIR))	75	
Couplings (see Conduit Fittings (DWTT))	122	
Couplings (see Electrical Metallic Tubing Fittings (FKAV))	151	
Couplings (see Fittings, Flexible Metallic Tubing (ILNR))	201	
Couplings (see Reinforced Thermosetting Resin Conduit (DZKT))	126	
Cover Plates for Flush-mounted Wiring Devices (see Illuminated Cover Plates for Flush-mounted Wiring Devices (QBSA))	326	
Cover Plates, Metallic (see Metallic Outlet Boxes (QCIT))	326	
Cover Plates, Nonmetallic (see Nonmetallic Outlet Boxes (QCMZ))	328	
Coveralls, Protective (see Protective Clothing for Electrical Workers (QGVZ)) ..	335	
Covers for Swimming Pools and Spas (WBAH)	422	
Covers for Underground Boxes (see Boxes, Enclosures, Handholes and Vaults, Underground, Utility Specification (BGHL)) ..	80	
Covers for Underground Enclosures (see Boxes, Enclosures, Handholes and Vaults, Underground, Utility Specification (BGHL)) ..	80	
Covers for Underground Handholes (see Boxes, Enclosures, Handholes and Vaults, Underground, Utility Specification (BGHL)) ..	80	
Covers for Underground Vaults (see Boxes, Enclosures, Handholes and Vaults, Underground, Utility Specification (BGHL)) ..	80	
Crane and Hoist Electrification Systems (ELPX)	135	
Crane and Hoist Optical Fiber Cable (see Wire, Special Purpose (ZMHX))	492	
Crane Equipment Over 600 Volts (ELRK)	135	
Crepe Makers (see Household Cooking Appliances (KNUR))	236	
Crimp Tools Classified for Use with Specified Wire Connectors (ZMLS)	493	
Crock Griddles, Ovens, Plates (see Household Cooking Appliances (KNUR)) ..	236	
CTL Circuit Breakers (see Circuit Breakers, Molded Case and Circuit-breaker Enclosures (DIVQ))	107	
Cube Taps (see Current Taps and Adapters (EMDV))	136	
Cup Vending Machines (see Vending Machines (YWXV))	475

Take the journey of discovery with other professionals

If you support safety through code-compliance and established standards, you need to belong to the only association that fulfills the interests of electrical professionals.

IAEI membership gives you access to:

Association leadership and International networking

IAEI leaders are always available to you. Members in 30 countries reach out to share technical information and code comparisons.

Career training and Seminar events

IAEI provides many code-based seminars each year, all of which offer CEU opportunities.

Articles on latest issues and technology

IAEI News focuses on printing complete information on the newest and hottest situations in the electrical industry.

User-friendly website

IAEI.org is updated from the members' viewpoint and focuses on helping them maximize their careers.

Stay current in today's competitive market.

Join now at: www.iaei.org

And share *unexpected values*

What would it be worth to you to have...

- an archive of articles that saved you from re-doing an installation?
- products in front of users, approvers and code writers at the same time?
- your name and phone number in the truck with the contractor?
- immediate access to local gatherings of users and approvers, without having to do the research yourself?
- free code information just by making a phone call?
- instant access to an archive of electrical codes?
- a guide to help you find information quickly?

IAEI, as the keystone of the electrical industry, is a membership driven, non-profit association promoting electrical safety throughout the industry by providing premier education, certification of inspectors, advocacy, partnerships and expert leadership in Electrical Codes and Standards development.

MEMBERSHIP APPLICATION

For Inspector Member/Associate Member

Services from IAEI for you and your organization include all this and more:

- IAEI News magazine subscription
- Educational Opportunities
- Networking
- Career Advancement
- Great Discount Savings

Inspector \$102 Associate \$102

Inspector Members **MUST** sign below:

I, _____, meet the qualifications for inspector member type as described below.

Inspector members must regularly make electrical inspections for preventing injury to persons or damage to property on behalf of a governmental agency, insurance agency, rating bureau, recognized testing laboratory or electric light and power company.

Contact the IAEI Customer Service Department for information on our special membership categories - Section, National, and International Member; Sustaining Member (Bronze, Silver, Gold, or Platinum); and Inspection Agency Member.

Email addresses and telephone numbers are not required but are requested to facilitate IAEI's communicating with members and conducting IAEI/member business.

Mail to: IAEI, P. O. Box 830848 Richardson, TX 75083-0848 For information call: (972) 235-1455 (8-5 CT)
