# Expand Expand your Electron.

Now you can use your Electron computer with any standard printer using MUSHROOM's new printer and user-port interface.

Bring your Electron up to the same standard as the BBC Model B computer printer and user-port into which you can plug robot arms, joy sticks or any BBC user-port module.

On the whole range of MUSHROOM modules and interfaces, the Electron edge connector is extended to give you unrestricted compatibility with any other Electron interface.

All MUSHROOM interfaces can be used separately or can be combined into the unique MUSHROOM ELECTRO-RAK which is conveniently connected to the Acorn Electron by a short cable.

This greatly enhances the performance of the Electron and turns the system into a computer comparable with many larger mini systems and as you grow your computer can grow with you!

Ask for details on:

Mushroom

COMPUTERS LIMITED Aston Road, Bedford, Beds MK42 OLJ. Telephone: (0234) 88303.

Another Mushroom product from Broadway Electronics.

MINI Office, the £5.95 software package, is now being used to help the handicapped.

The package, which runs on the Electron and BBC Micros, offers four business programs, including a word processor. And it is this program that is proving a hit with partially-sighted users.

As well as being easy to learn, it offers the option of giant on-screen letters. And the printout can also be in extra-large type, if desired.

Now the Londonbased Foundation for Communication for the Disabled is working with Database on a new version for the visually handicapped.

The modified program will give the printer a double-strike action to make the printed characters extra black.

# Electron disc drive -and it's official

OFFICIAL disc drives come to the Electron with the mid-November launch of the Plus 3, the latest Acorn expansion module.

Packaged in a compact, L-shaped box the same colour as the Electron, the Plus 3 fits between the micro and the Plus 1 expansion, the disc drive being flush with the keyboard.

The unit consists of the Acorn DFS – the software that allows the Electron to talk to a disc drive – and a 3.5 inch, 320k single-sided disc drive allowing quick and reliable storage and retrieval of programs and data.

The DFS chip will be

the double density 8272 floppy disc controller, the same as that to be used on the new Acorn Business Computer.

Some 10,000 Plus 3s will be produced by Christmas and will be sold at a yet to be announced "competitive" price.

# Anticipation

Advance news of the Plus 3 means that Acom has broken its policy of not announcing new products until they are generally available. This is to allow software houses to produce software in anticipation of the launch.

In the race to get the disc unit to the market.

the Plus I has not been forgotten. October saw the release of three more cartridge ROMs for the unit, two of which are utility programs transferred from the BBC Micro.

View will give the Electron its first ROM-based word processor. Similarly Viewsheet will be the first spreadsheet on a chip for the Electron.

Combined with the ROM based software, the increased speed, storage capacity and reliability given by the disc drive moves the Electron into the realm of serious applications in both home and business.

The third cartridge is the long awaited RS423, a serial communications port. This will allow the Electron to communicate with other micros and even mainframes via a modem.

The third official expansion module for the Electron will be the seemingly illogically named Plus 2.

Available in the new year, this will be the Econet interface which will allow the Electron to network or work in tandem with other Electrons.

# Communications on show

IT's no longer true to say that using a computer makes you anti-social and puts you out of touch with other members of the human race.

Communications is the name of the game – and also the theme of the Electron and BBC Micro User Show at Alexandra Palace from October 25-28.

The October release

of the RS423 communications cartridge for the PLUS 1 means that the show will have even more to offer Electron users.

On a more basic level, Pace Electronics show how a schoolteacher can maintain control of a classroom full of pupils by means of an E-net networking system.

Micronet, the electronic magazine for the micro owner, is also being demonstrated in depth.

A portion of Prestel specifically aimed at the home micro user, Micronet has introduced more people to communications in the UK than any other system.

The use of the telephone to aid communication between computer owners is also covered at the show. demonstrating how exchange of data files between individual users avoids the tedium of hours of keyboard bashing.

Among many leading firms displaying their products are Acorn. Torch, Watford Electronics, Viglen, Alpha Disk, British Micro, M.T. Direct, Solidisk Technology and BBC Publications.

# BUYERS MORE CHOOSEY

A CLAIM that the software industry is facing a dramatic shake out has come from David Johnson-Davies, managing director of Acornsoft.

"The market has radically changed in the last 12 months – the consumer is much more discerning now", he insists.

BUYERS of Comsoft's latest game, SAS Commander, are being given the chance to profit from their skill.

More than 100 prizes, including a top award of £50 plus £20 of software, will be given to players recording the highest scores.

SAS Commander, for the Electron and BBC Micro, costs £4.95 and allows players to kill terrorists, rescue hostages and storm buildings.

The game includes high score tables, demonstration screens, practice mode and training course.

In order to differentiate between genuine scores and false claims, each score generates a coded key that Comsoft says cannot be broken.

An entry form is included with each cassette and the closing date for entries is March 31, 1985.

ENGLISH Software has released its first title for the Electron and BBC Micro.

Spaceman Sid, available on cassette for £7.95, features scrolling screens, sliding bridges, meteor storms, 100 per cent machine code action, five different play sectors and three progressive skill levels.

The company says it will also be releasing its Jet Boot Jack game for the Electron and BBC Micro in the near future.

# **CURRYS BOOSTS ELECTRON**

CURRYS, the High Street electrical giant, aims to grab 10 per cent of the £564 million home computer market by Christmas.

The company has selected the Electron as one of just six machines to be sold in most of its 530 stores in order to increase its share from around the current two per cent.

It will be supporting the launch with a £500,000 advertising campaign.

The other machines to be mass marketed alongside the Electron are the BBC Micro, the 48k Spectrum. Commodore C16 and CBM

64, and Toshiba's MSX, the HX-10.

Why the Electron? "It is a very nice machine and we believe that it will eventually become a big seller", said a Currys spokesman.

Fred Harris gets to grips with an Electron

# Fairy tale world on the screen

A NEW adventure game from Electron User allows young children to explore a fairy tale world peopled by familiar story book characters and sprinkled with magic.

The Magic Sword cassette comes with a 48 page full colour book that recounts all the events leading up to the start of the adventure.

There's a handsome prince, a beautiful princess, a castle with secret passages and mysterious dungeons, dense forests, deep caves – and a crooked house complete with wicked witch.

Colourful animated

graphics and lots of exciting sound effects encourage the child to travel through the countryside and explore the castle to find the princess and release her from the witch's clutches.

The text is in doubleheight characters and there is a compass on screen throughout the game showing, in flashing mode, directions in which moves are permitted – a useful aid for those new to adventure games.

The complete package – cassette and storybook – is available from Database Publications, price £8.95.

# **BUSINESS ROM**

THE Electron has become a low-cost business machine with the aid of a £29.95 add-on, according to Broadway Electronics.

The firm is the

latest to produce a sideways ROM card.

It plugs into the Electron's extension port without modification, enabling software to be called up instantly.

# TV SHOW RETURNS IN 1985

IF you missed Yorkshire TV's Electron-based computing show. "Me and My Micro" earlier this year, take heart – there will be another chance to see it in the new year, on Channel 4.

The five-part series, presented by Fred Harris — and his Electron — will be screened Monday evenings in January and February 1985.

Exact timings are not finalised, but a 5.30pm slot starting January 7 seems likely.

## Advantage

Viewers who don't yet have an Electron can take advantage of a special starter pack from Acorn

In addition to an Electron, user guide and programming manual, the pack contains a cassette recorder, a "Me and My Micro" book and a software cassette which ties in with the programme.

The pack costs £245.
Also coming up on Channel 4 is a new micro show, planned to run from mid-February to the end of March next year.

Jokily entitled "4 Computer Buffs", the seven-part series will feature the team from Thames TV's "Database" programme.

# Acornsoft launches new cult adventure

ACORNSOFT has launched a pre-Christmas blitz on Electron users with 20 new titles backed by a £150,000 promotional campaign.

And it is predicting it will enjoy a bumper Christmas with anticipated sales of around £2.5 million - more than double those for the same period last year.

It bases this forecast on the fact that its recent releases will boost its total of programs available for the Electron and BBC Micro to 120.

The company's latest offerings include four for the growing home education market which, according to Acomsoft. take computer learning back to first principles".

### Cocktails

The software publisher has also zeroed in on the non-hobbyist adult user, with home interest subjects ranging from how to make cocktails to a "sympathetic" weight-watchers program.

However Acornsoft

expects its real Christmas sales bonanza to come from Elite, which it is touting as the new cult game for the festive season.

This integrates 3D spaceflight simulation within a non-stop galactic adventure.

It places Electron and BBC Micro users in command of a Cobra space ship on what the promotional material describes as: "A fantastic voyage of discovery and adventure, representing the ultimate test of a human's flying, combat, navigational and entrepreneurial

Intergalactic trading

Acornsoft's Elite ... 3D space flight simulation in a galactic adventure

between countless planets exposes players to danger from pirates and, should profitable contraband be carried, from police ships as

# Coveted

The profits gained, however, buy better defences, which help the traders survive another day and, eventually, win the coveted rank of

Acornsoft believes Elite represents the state of the art in home computer entertainment taxing a player's skills both of coordination and intellect.

Elite took two years to develop in association with Cambridge undergraduates lan Bell and David Braben.

Priced at £12.95, the package includes a 64 page space traders flight training manual, a space ship identification chart, command reference card and function key strip, and to set the scene, a science fiction novella based on the game entitled The Dark Wheel.

THE "A" level art students of Sandbach School in Cheshire got some unexpected design experience recently when they produced a set of murals for Acorn's new Altrincham, Manchester offices.

The idea came from John Taylor, a director of 3SL, Acorn's West dis-North tributor.

The deal was that the lads would design and build the murals from materials paid for by Acorn. In return, they would get a BBC Micro for their school - plus a real project to get their teeth into.

In the event, Acorn was so pleased with the result that they also gave each boy an Electron as a personal memento.

# GOOD DEAL

UNDER 18s saving up to buy an Electron will find it a cheaper proposition if they have an account at the Luton branch of the Leeds Permanent Building Society.

If they successfully play one of three special building society games on micros installed at the branch youngsters up to 18 receive an automatic £1 voucher printout with which to open a savings account.

And distributors Broadway Electronics will knock £5 off the price of an Electron and give free software if the purchase is made with a Leads cheque.

Broadway is one of four Acorn dealers taking part in the pilot scheme in East Anglia.

# NIGEL PETERS deciphers another programming problem . . .

# HAIL CAESAR JCKN ECGUCT

THIS month we'll be using the Electron to help unravel one of the best-known ciphers in the world – the Caesar cipher. This method of writing secret messages got its name from its inventor, Julius Caesar.

It works by displacing each letter of the message a certain number of letters along the alphabet. If that sounds complicated, don't worry too much — it isn't.

All it means is that if I wanted to encode the word ELECTRON I would first decide on what the shift would be. Suppose I wanted it to be two letters. Then the encoded word would be GNGEVTQP.

This is because G is two letters along the alphabet from E. N is two letters along from L, and so on.

We could have made the shift four letters long (in which case ELECTRON is IPIGXVSR) or any other number up to 25.

The simple way to write a message in Caesar cipher is to decide on the displacement and write out two alphabets, as in Figure I.

Here the displacement is two letters. The top line, or plain, is the normal alphabet. The bottom line, or cipher, is the alphabet displaced by two letters.

Notice that when you get past Z the next letters are A and B — the alphabet wraps around.

Now it's easy to write your message. Just look up its letters in the top row and note down the corresponding letters from the cipher. USER in plain would become WUGT in cipher.

Of course you could have any of 25 cipher alphabets in a Caesar cipher, because the displacement can be anything up to 25 letters.

If the displacement is 26

letters you get back to the normal alphabet again - not so clever when you're trying to send a secret message.

Figure II, a sort of super Figure I, shows the plain alphabet on the top row with the 25 possible cipher alphabets below it. You can use it to encode your cryptic messages in Caesar cipher with the displacement of your choice.

If you want the micro version of Figure II then Program I will produce it for you.

But what, you may ask, has this to do with the Electron? Well, try decoding a Caesar cipher message such as LTTAA SDCT. It's not easy if you don't know what the displacement is.

You can spend ages searching through the table in Figure II trying out displacement after displacement until the message makes some kind of sense.

Have a go at figuring out LTAA SDCT using the table. It's not easy, is it?

Well Program II, which comes under the magnifying glass this month, makes life easier. It uses exactly the same method as above.

Let's see how it works, line by line.

The first two lines are just REM statements, telling what the program is and who wrote it. I'll do anything to see my name in print!

Line 30 is a \*FX command which ensures that the keyboard is in Caps Lock. The reason for this is that the program is easier to follow than if it allowed for lower case letters as well.

The INPUT statement of line 40 asks for a sample of the coded message to be entered and this is stored in the string variable word\$.

The next line's LEN just finds the number of characters in wordS and stores the result in the numeric variable length.

Having taken a sample of the enciphered message and measured the length of the sample, the program now enters a set of two nested loops.

The effect of these is to display the sample of the cryptic message in each of the 25 alternative alphabets available. It prints out each of these alternatives with the number of letters that it is offset.

If a sample actually makes some sort of sense you press Return and get the chance to have the Electron decode the whole message. Otherwise pressing any other key allows the micro to continue printing out the alternative versions of the sample until eventually one makes sense.

Lines 60 and 170 form a FOR . ... NEXT loop with the control variable offset. This ranges in value from 1 to 26, obviously once for every letter of the alphabet.

Each time round this outer

10 LET string\$="ABCDEFSH IJKLMNOPORSTUVWXYZ"

\$,25) +LEFT\$ (string\$,1)

50 PRINTstring\$

60 NEXT loop

Program I

loop line 70 sets up a string variable clear\$ and sets it to the null, or empty, string. This string is used in the inner FOR ... NEXT loop formed by lines 80 and 130.

The inner loop takes the sample word apart, letter by letter, and rewrites it in a new alphabet with the letters offset by the variable offset.

Since offser is the control variable of the outer loop and varies from 1 to 26, this means that the inner loop rewrites the sample word with each of the 26 available alphabets.

If the person who coded the message has done the job properly, then one of them

ABCDEFGHIJKLMNOPORSTUVNXYZ BCDEFGHIJKLMNOPORSTUVNXYZA CDEFGHIJKLKNOPERSTUVMXYZAB DEFGHIJKLHNOPORSTUVWXYZABC **EFGHIJKLMNOPORSTUVNXYZABCD** FGHIJKLMNOPDRSTUVWXYZABCDE GHIJKLMNDPORSTUVWXYZABCDEF HIJKLMNOPORSTUVMXYZABCDEFG 1JKLMNOP@RSTUVMXYZABCDEFGH JKLMNOP@RSTUVWXYZABCDEFGHI KLMNOPORSTUVWXYZABCDEFGHIJ LMNDPORSTUVNXYZABCDEFGHIJK MNOPORSTUVMXYZABCDEFGHIJKL NOPORSTUVWXYZABCDEF6HIJKEM **OPORSTUVNXYZABCDEFGHIJKLMN** PRRSTUVWXYZABCDEFGHIJKLMNO **QRSTUVMXYZABCDEFSHIJKLMNOP** RSTUVMXYZABCDEFGHIJKLMNOPG STUVWXYZABCDEF6H1JKLMNOPQR TUVWXYZABCDEFGHIJKLMNOPORS UVNXYZABCDEFGHIJKLMNOPORST VWXYZABCDEFGHIJKLMNDPQRSTU MXYZA9CDEF6HIJKLMMDP0RSTUV XYZABCDEF6HIJKLMNOPORSTUVM YZABCDEF6HIJKLMNDPQRSTUVWX ZABCDEFGHIJKLMNOPORSTUVNXY

Figure II. Cipher table

Figure 1: Offset alphabet

Plain: ABCDEFSHIJKLMNOPORSTUVWXYZ

Cipher: CDEFGHIJKLMNOPQRSTUVWXYZAB

myst make sense!

This inner loop has the control variable slice which varies from 1 to the value of length. We met length in line 50. It holds the number of characters in the sample word. This means that the loop cycles once for each letter in word\$.

Line 90 looks complicated but isn't all that hard when you take it bit by bit.

The function MIDS takes one letter from the string wordS. Which letter it takes depends on the value of slice which in turn depends on the stage the loop has reached.

Since slice varies from 1 to the length of wordS this means that every letter of the sample word is selected in turn.

When MIDS selects a letter the ASC function in front of it gives the Ascii value of that letter. The Ascii value is just a number that represents a letter. A is 65, B is 66, and so on until Z is 90.

So, as the loop cycles, each letter of the sample is turned into a number which represents it.

Line 90 doesn't stop there, however, It also adds the value of offset to the Ascii code for that letter and stores the result in the variable lettercode.

Depending on how many times the outer loop has cycled, offset will vary between 1 and 26 in value.

What this means is that when the inner loop has finished, the Ascii code for each letter of the sample has been increased by the same offset.

All that is needed to see the new word produced from the sample is to take each of these codes in turn and find out what letter they stand for.

This is what line 110 has been doing. CHR\$ produces the letter for that particular value of lettercode and stores it in the string letter\$.

Each time round the inner loop letter\$ is added to clear\$. When the loop stops, clear\$ holds all the letters of the original sample, offset letters along the alphabet.

But what, you might be wondering, does line 100 do? The answer is that it allows for the wrap around in the alphabet that we saw earlier.

Suppose the letter we were working on was Z and the offset was to be three letters. Well, you and I would have the sense to realise that we go back to A and start again. The required letter would be C.

If we didn't have line 100, however, the Electron would take the Ascii code for Z, which is 90, and add the offset to it. The answer would be 93 and line 110 would try to find out what 93 represents.

If you try:

### PRINT CHR\$ (93)

on your Electron, you'll see that it is a square bracket, not the letter C that it should be.

Line 100 allows for this by taking away 26 from the value of lettercode if it's over 90. In this case, the result of subtracting 26 from 93 is 67, which is the Ascii code for C.

Once the inner loop is finished the Electron goes onto line 140 which displays the new version of the sample word and the offset that

produced it.

The next line causes the program to halt until you press a key. This allows you to look at clear\$ to see whether it makes any kind of sense.

When you press a key that letter is placed in the string wait\$. The next line examines wait\$ and if you pressed the Return key — which you do when clear\$ makes some kind of sense — it takes you off to PROCmessage.

If you didn't press Return the Electron goes round the outer loop again, trying another value of offset.

Eventually when offset has got to 26, clear\$ will be the same as the coded sample and the program will go on to line 180 and end.

In this case either you haven't recognised the sample word or the person who created the ciphered text got it wrong.

And that's about it for this month. PROCmessage, which is defined in lines 190 to 310, comes into operation when you have recognised the word and pressed Return.

It asks you to type in the whole message, takes the value of offser and prints out the deciphered text. As it's almost the same as the first part of the program I've left it for you to try and figure out.

The only real difference is time 250 which just allows for the fact that the coded message might have spaces (Ascii code 32) in it. After all, there's no point in adding the offset to a space is there?

When you've figured it out, you might also be able to see that you could use PROC-message to translate your secret messages into Caesar cipher. WPKT UJC

# The joy of giving interfaces some stick

ALMOST as soon as the Electron was available a host of add-ons were announced from several suppliers. The most prolific was a joystick interface in some form or another.

The reason why such a thriving industry has grown up around the Electron is because —unlike its big brother the BBC Micro — the Electron has no interfaces built in when it is bought.

So what is an interface? What's the difference between analogue and switched joysticks? Why do you need software to allow the use of an interface with games?

To answer these questions it is necessary to look at basic micro hardware and the Electron's operating system.

Every byte of memory in a computer — both RAM and ROM — has an address. For the 6502 processor in the Electron this can range between 0

and 65535, or the more familiar 64k.

Every computer has its memory laid out in a different way. The Electron's is shown in Figure I.

It is possible in the Electron to read and write to RAM directly from Basic with instructions, such as in Figure II.

This instruction will write the value 45 to address FEO7. Do this on your own Electron and see the result.

The reason why such a dramatic effect occurs is because you are not actually writing to memory but directly to the Electron's ULA chip. So not only can we read and write to RAM, but we can also read and write to other devices which to the computer look just like memory.

This technique is called memory mapped input/output addressing, or memory mapped IO for short. In the memory map of the Electron you will see that there are a lot of locations not used from FC00 to FDFF. These amount to 512 addresses.

Wouldn't it be useful if we could somehow get hold of some of these addresses and attach our own devices to them – such as a joystick!

If we are going to go to the trouble of building a joystick interface, what type shall it be?

There are two types analogue and switched — and both require different interfaces.

An analogue joystick produces two signals, each of which changes in value as the stick is moved up and down and from left to right. This type is expensive to manufacture and costs around £20 to buy.

Analogue to digital converters, which are also expensive, are required to interface them to the Electron.

Switched joysticks on the other hand have five switches which close when the stick is moved in any direction or the fire-button is pressed.

They cost from £7.50, but deluxe models are available for more than twice that.

Like everything, the more expensive models tend to be better quality and more reliable. But some of the cheaper models like Quickshot II are very popular because of the trigger action fire button and a rapid fire mode for those players with an aching trigger finger.

The vast majority of home computer manufacturers have adopted switched joysticks as standard. There is no doubt that games players prefer the positive feel of them to the rather sloppy analogue type.

It is interesting to note that analogue joysticks are really a hangover from the very early arcade and video games which used paddles. Remember those first tennis games?

Fortunately, while the Electron hasn't got joystick and other interfaces built in, it does have an expansion bus poking out at the rear of the case.

On this bus are all the address and data lines straight from the 6502 processor. So it is possible to fill in those holes in the Electron's memory map with other devices. In other words – interfaces, A switched

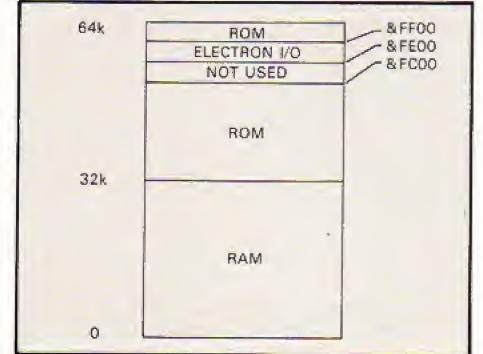

Figure I: Electron memory map

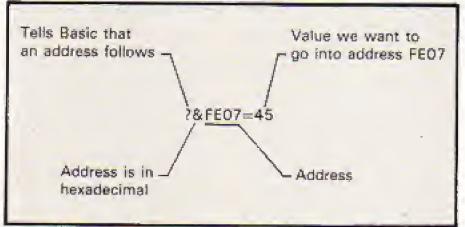

Figure II: Pokeing an address

If we arrange for the address decode circuit to enable the buffer chip when, say, address FCCO as in the First Byte interface, is used, then we can read in the status of the joystick switches.

This can be done from Basic like this:

### JOYSTAT=?&FCC0

The variable JOYSTAT will normally be zero when the stick is in its centre position and the fire button is not pressed, but will change when the stick is moved or the fire button is pressed.

So with a simple instruction we can read in all the joystick information.

This is a very quick method of getting a player's response when playing a fast action game. Using an analogue joystick would necessitate an A/D converter which would

slow up the Electron.

This is an important point for ardent games players who will already be aware of the decreased speed of the Electron compared with the BBC machine.

So we can now plug in a joystick interface to the Electron and in turn plug a switched joystick into that. But how do we make games look at the joystick and not at the keyboard?

When a games writer wants to test if a key is pressed there is a routine available in the Electron's operating system which can be used.

If this routine is intercepted before it looks at the keyboard and control is passed to a machine code program, the joystick can be looked at and any movements passed back

to the game which still thinks that a key has been pressed.

Unfortunately, there are two ways of looking for a key press. It is also possible to trick the Electron into thinking it has an analogue joystick connected when actually it has a good old faithful switched joystick.

Confused? There's no need to be – all this has been taken care of for you on games conversion tapes supplied with an interface.

These work by loading in a program before a game is played – an operation that takes less than a minute – and running it.

The Electron operating system is patched by the routine in such a way that any scan of the keyboard is intercepted and a scan of the

joystick is also made.

If the joystick has been moved the routine returns information to the calling program as if the corresponding key has been pressed.

By RAY

THREADGOULD

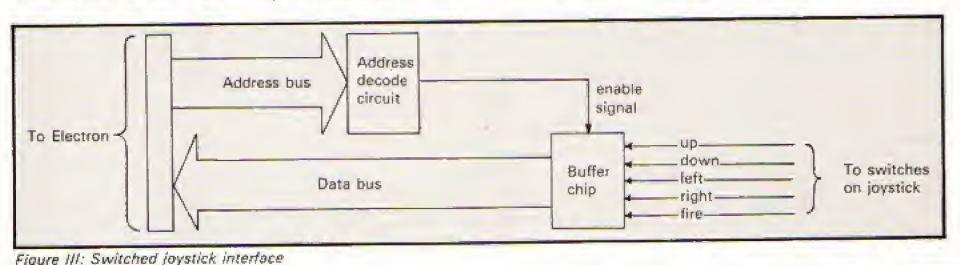

This technique allows you to use switched joysticks on more than 99 per cent of the games on the market – including Acornsoft. That's a statistic which no doubt causes some embarrassment to the designers of the Acorn Plus 1.

In due course, most games houses will release games which will have been written to read the Joystick interface directly and this will remove the need to use any additional software.

Incidentally, listings of games published in *Electron User* can also be modified to work directly with a joystick interface.

So now you know some of the finer points of joystick interfaces why not have a go and modify them?

One thing I'm certain of you'll certainly enjoy getting them working, and you'll save punishing that hard worked Return key!

ELECTRON JOYSTICK INTERFACE

# **ELECTRON JOYSTICK INTERFACE**

Electron users! This is the add-on everyone wants. its the new Electron switched joystick interface from First Byte available now with free conversion tape that vastly extends your game range right away.

The interface operates with all 'Atari-style' 9-pin joysticks, and its many advanced design features put it way out in front for quality and reliability. That's why, to date 15 major software houses are already bringing out games that work directly with the First Byle Electron Joystick Interface and many more are sure to follow.

# FREE conversion tape - play all these top games right now

Every Electron Joystick Interface comes with a free conversion tape, so you can use some of the most popular games around right now:

- Killer Görilla
- · Position
- Croaker
- Swoop
- Bandits at 3 o'clock Escape from

- Moonbase Alpha Cybertron Mission
- Kamakaza
- Chuckle Egg Atom Smasner
- Alien Break In
- Birds of Prey
- Galaxy Wars City Defence Monsters
- Pool
- Lunar Rescue
   Bugblaster
- Blagger Bed Bugs
- Alien Dropout
- Danedovil Dennis
- Snooket Diamond Mine
- Cylon Attack Pangwyn The conversion tape also allows you to configure most other games for joystick control.

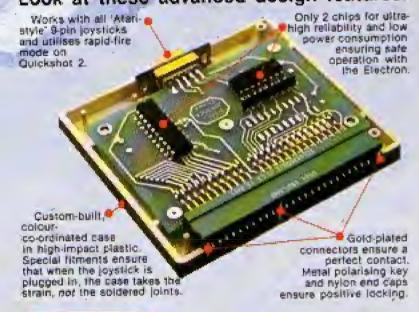

## Games specially for the First Byte Interface

All these major software houses are bringing out games that work with the First Byte Electron Interface, with no conversion tape needed.

- Superior
- Bug-Byte A & F Program Power Visigns
   Virgin
- 9 Somik
- Aardvark Optime
   Postezni
- Software Invasion
   MRM
- Beebug-soft

The First Byle Electron Joystick Interface - available now from all good dealers and W. H. Smith.

# **PROCEDURES**

PROCscreen

**PROCinstructions** 

**PROCinitialise** 

Draws the screen - delete PROCcolour-off to see it being done. Uses text windows to display the title and instructions.

Sets up the arrays, sets the high scores and names, defines the characters and the envelopes used. New ship.

PROCE PROCE PROCE PROCE PROCE

Enemy ship fires back. Move ground forward. Move enemy ship. Fire laser.

VARIABLES

Whether it is day or not.

P% Power left.
The enemy ship.

Z% Sco

G%

Score.

How many ships hit on screen 1.

Which ground colour is black.

DOOM RUN by Allan Morriss published in July edition of The Micro User inspired me to write this game.

I couldn't fully understand Doom Run – there were about 70 variables – but I managed to grasp the basic principles used in creating the 3-D effect which allowed me to create my own 3-D space game. Starfighter.

The ground appears to move below the ship although nothing actually moves at all.

It is made up of three colours, two are set to green and one to black. By changing the one set to black the ground appears to move.

By selecting the colours carefully, the enemy ship appears to pass under and over certain objects rather like a sprite.

The ship is exclusive-ored

with the background. The resulting colour is either the same as the ship — making it appear to pass over the object — or the same as the background — making it appear to pass under it.

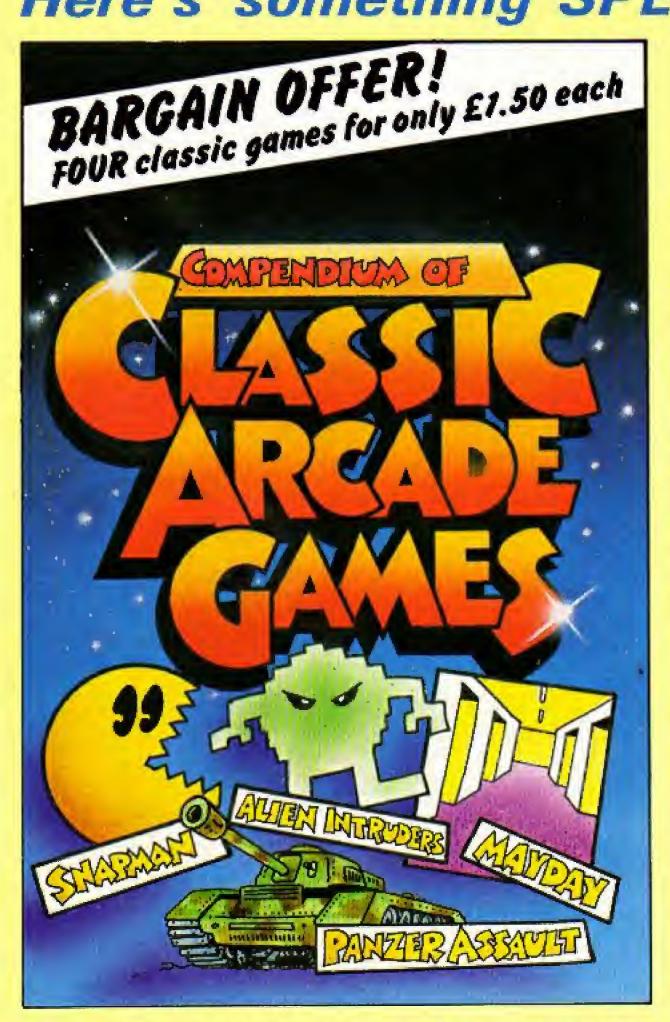

A game like Starfighter must be made to run as fast as possible, so the procedure names have been kept short and the resident integer variables have been used. Unfortunately this makes the program difficult to follow.

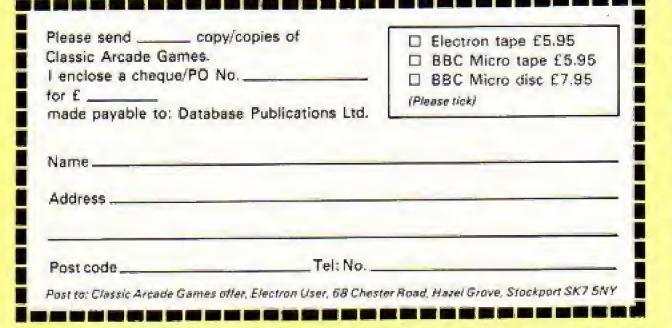

When typing in the program, some lines will be apparently too long to fit in. All the abreviations for the Basic key words must be used.

If you still have trouble, use two lines – it will not make any difference to the program.

# Here's something SPECIAL from

We've commissioned four rip-roaring games for the Electron and BBC Micro

Three of this highpowered collection
are top-rate machine-code
versions of arcade classics
and the fourth is a
thrilling real-time
adventure game.
There's hours of
enjoyment and something
to suit everyone in this
unique value for money
collection

SNAPMAN – Guide your man through the maze as he munches energy pellets and avoids hostile aliens

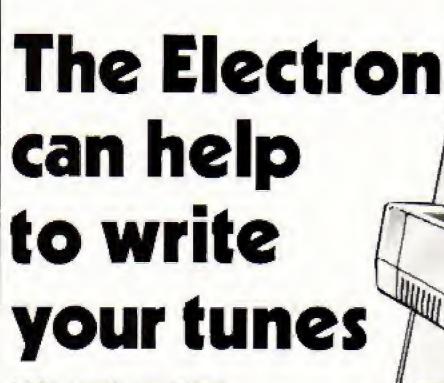

### ALIEN INTRUDERS -

With only your laser for protection you must destroy the waves of aliens who threaten to engulf you

PANZER ATTACK – You are a tank commander engaged in vicious combat against encircling enemy forces

MAYDAY – A futuristic adventure! As captain of an interstellar cruiser you must guide the sole survivor of a stricken space freighter through the wreckage of his craft. If you fail to recover those vital medical supplies a whole planet is doomed!

LAST month we talked about how to use the SOUND command to tell the Electron to make a noise.

We saw how entering:

SDUND 1,-15.30.20

OF:

SOUND 1,-15,90,40

could produce noises from the micro. The basic structure of the command was seen to be:

SOUND channel, loudness, pitch, duration

and, for the time being, we kept channel as 1 and loudness as -15, concentrating on the pitch and duration parameters. These had ranges between 0 and 255 and controlled the highness or lowness and the length of the note.

We also saw that in the West at least our ears have learnt to expect that the *pitch* changes in regular steps. The most fundamental of these steps is the semitone.

Run Program I and you'll hear a series of notes, each being higher than the next by a regular amount. This amount is a semitone and consists of an increase of four in the pitch parameter.

10 REM PROGRAM I
20 REM SEMITONES
30 FOR rise=0 TO 44 STEP
4
40 SOUND 1,-15,52+rise,5
50 NEXT rise

60 SOUND 1,-15,100,10

Program I

It's not all that interesting to listen to, is it? The next basic bullding block of Western music is the tone.

sound channels

Program II produces a rising series of notes, each one a tone apart.

10 REM PROGRAM II
20 REM TONES
30 FOR rise=0 TO 40 STEP
8
40 SOUND 1.-15.52+rise,5
50 NEXT rise
60 SOUND 1,-15,100,10

Program II

Again, it's not very interesting is it? However, there are two things to notice.

The first is that both the programs have used a FOR... NEXT loop which cycles around a single SOUND command. Each time round the loop control variable, rise, is

increased by four or eight.

10 REM PROGRAM III

20 REM A SCALE

Part II of NIGEL PETERS'

new series on making the

most of the Electron's

Since this is added to the pitch parameter each time round, the note rises in steps

Moise Music

30 SOUND 1,-15,52,5
40 SOUND 1,-15,60,5
50 SOUND 1,-15,68,5
60 SOUND 1,-15,72,5
70 SOUND 1,-15,80,5
80 SOUND 1,-15,88,5
90 SOUND 1,-15,76,5
100 SOUND 1,-15,100,10

Program III

of a semitone or a tone.

The second thing to notice is that using FOR ... NEXT loops ensures a regular increase in pitch for each successive note. But it's hardly

exciting and sounds somehow incomplete.

Run Program III and I think you'll agree it sounds much more satisfying.

These eight notes form a scale, a musically pleasing set of sounds that somehow seem grouped together. You'll notice that if you play the first note:

SOUND 1,-15,52,5 and then the last note:

SDUND 1.-15.100.10

they seem to be the same note, but one is higher than the other. The difference is known as an octave.

SOUND 1,-15,148,10

gives the same note, another octave higher.

If you notice the differences in the pitch parameters of each of the SOUND commands in Program III you'll see that the differences are 8, 8, 4, 8, 8, 8, 4. This ordered sequence of increases in pitch produces a scale.

The trouble is that we can't

easily use a FOR . . . NEXT loop to play the notes as the STEP would have to keep varying. And the way Program III does it, using one SOUND after another, is rather inelegant to say the least.

Program IV shows a much better way of playing a scale.

10 REM PROGRAM IV 20 REM A BETTER SCALE 30 FOR note=1 TO 7 40 READ pitch 50 SOUND 1,-15,pitch.5 60 NEXT note 70 SOUND 1,-15,100,10 30 DATA 52,60,68,72,80.8 8,96

### Program IV

Here we're back to the good old FOR ... NEXT loop again, eveling round a solitary SOUND statement.

This is achieved by putting all the pitch parameters we want in the DATA statement of line 80 and READing them. off one after another in line 40.

As you can see, it's a much more elegant way of doing things. Also it's very easy to change the DATA statements so you can have any scale you like.

Just put in the numbers you want and the program does the rest. With Program III we'd have had to change it line by line.

Program V shows another way of doing this. PROCpickscale allows you to choose which scale you want, while PROCplayscale does it for you.

PROCplayscale is very similar to Program IV, but we don't have to change the DATA for new scales.

This is because the DATA line doesn't contain the actual pitches of the notes to be played. It contains the numbers that have to be added to the first pitch to get the required note.

This is the offset. Each time round the loop in PROCplayscale, line 140 READs the DATA line to find the required

Line 150 then adds this to the basenate picked in PROCpickscale and plays it. The result is the scale of your choice.

This technique of using an offset around a base note comes in very useful when you're writing your own tunes. You can write the program and

10 REM PROGRAM V 20 REM MORE SCALES 30 REPEAT 40 PROCoickscale 50 RESTORE 60 PROColayscale 70 UNTIL FALSE 80 END 90 DEF PROCoickscale 100 INPUT "What number s hall the scale start at", ba senote 110 ENDPROC 120 DEF PROColayscale 130 REPEAT 140 READ offset 150 SOUND 1,-15, basenote +offset, 5 160 UNTIL offset=48 170 DATA 0,8,16,20,28,36, 44,48

### Program V

180 ENDPROC

all you have to do if you want to change the tune is adjust the DATA statements.

However, let's leave that for a minute and have a look at how to get the Electron to play tunes. So far all we've done is play notes which have increased in pitch by fixed amounts.

Each note (except the final one) lasted for the same amount of time and, frankly,

10 REM PROGRAM VI 20 SOUND 1,-15,100,10

30 SOUND 1,-15,108,10 40 SDUND 1,-15,92,10

50 SOUND 1,-15,44,10

60 SOUND 1,-15,72,20

### Program VI

the whole effect was boring.

If we want to play an interesting tune we have to vary both pitch and duration. Program VI does this to produce some very simple computer music.

It's just a string of SOUND commands, one after the

10 REM PROGRAM VIE

20 REPEAT 30 READ pitch.duration

40 SOUND 1,-15,pitch.dur

ation

50 UNTIL duration=0 60 DATA 100,10,108,10,92

,10,44,10,72,20,0.0

### Program VII

other, but it works.

A better way of doing it is shown in Program VII which outs the values of both pitch and duration in a DATA line.

This plays the same tune as before, but notice that it needn't always be the same

You could figure out your own tune, working out its pitch and duration parameters and replace line 60 with your own values.

In fact Program VII is a Universal Tune Playing Pro-

The trouble is that you have to figure out what goes into the DATA statements. Happily this isn't all that hard - you just mess around with the pitch parameters going up and down in steps of four and eight (and occasionally two).

A little practice and you'll soon get it right.

However, since you're trying to write tunes for your Electron, why not get the Electron to help you? Program VIII does the trick.

All you have to do is to enter the pitch and duration that you want for the beginning of your tune and after it play it by ear.

The Electron allows you to try out the note you want and, if it's right, add it to the tune.

When you're satisfied, just press the 3 key and you'll find the pitch and duration parameters of your tune displayed in order.

As it's written, there's only room for 20 notes, but you can increase this by changing the DIM statements. When you've written the tune, Program VII will play it for you.

And that's it for this month. I'll leave you to play around writing tunes on your Electron. If you come up with something nice, do send it in.

# You can work wonders with DIM statements

LAST month we finished, for the time being, our exploration of FOR ... NEXT loops.

Now we'll be taking another look at variables and seeing how we can group together a lot of similar information under a kind of collective variable name.

For the moment let's have a look at a fairly trivial program. As you can see, Program I just INPUTs three numbers and assigns them to variable names:

10 REM PROGRAM 1
20 INPUT "First number",
firstnumber
30 INPUT "Second number"
secondnumber
40 INPUT "Third number",

thirdnumber

It's hardly going to amaze the micro world, especially since it doesn't actually do anything with the variables it has given values to.

The point to notice is that the variables have meaningful names.

The first number input is assigned to the numeric variable firstnumber, the second to the variable secondnumber, and I leave it to you to figure out the name of the final variable.

These meaningful variable

names are extremely useful and the fact that Electron Basic allows you to use long variable names is a big plus in its favour. It makes figuring out how programs work a lot easier.

If Program I had been a vast 10,000 line epic, then all the way through we'd know that firstnumber was the first number we'd entered and so on.

These meaningful variable names help us keep track of the order that we entered the figures. The trouble is that it doesn't mean anything to the micro.

Take a look at Program II and you'll get some idea of what I'm talking about:

10 REM PROGRAM II
20 INPUT "First number",
thirdnumber
30 INPUT "Second number",
firstnumber
40 INPUT "Third number",
secondnumber

Here the first number entered is assigned to the variable thirdnumber, the second to firstnumber and the third to secondnumber.

To you and me it seems stupid — there's no rhyme, reason or order to it all. The Electron, however, doesn't give a hoot and carries on regardless.

You may now be getting

20 INPUT "First number",
firstnumber
30 INPUT "Second number",
secondnumber
40 INPUT "Third number",
thirdnumber
50 PRINT "First number",
firstnumber
60 PRINT "Second number",
secondnumber

70 PRINT "Third number".

thirdnumber

10 REM PROGRAM III

some Inkling of what I'm talking about. In the first couple of programs we entered three numbers and, as is obvious from our use of the variable names, we wanted to keep some track of their order.

However while giving each an individual name that is meaningful to human beings helps us, to the Electron there's nothing to show that they're linked.

Let's take a look at Program III which still uses the meaningful but unlinked variable names.

The program takes in three numbers and prints them out in the same order they were inputted. The trouble is that it's a bit laborious and the variable names, while obviously showing us their relationship, mean nothing to the micro.

Program IV is a step in the right direction. The variable names are all similar except for the number at the end.

The trouble is that the old problems still apply. While we could look at a listing and, at a glance, know the answer to the question: "Is the sum of the second and third numbers inputted equal to the first number?" on the Electron it's a lot harder. Try it.

What we want is a way of linking together a lot of

10 REM PROGRAM IV
20 INPUT "First number",
number1
30 INPUT "Second number",
number2
40 INPUT "Third number",
number3
50 PRINT "First number",
number1
60 PRINT "Second number",
number2
70 PRINT "Third number",
number3

variables – that is, making a list of them and being able to call them up by a number which refers to their position in

We need something similar to number1 and number2 so we could call up a value with numberx where x is the position in the list of variables we want.

Electron Basic makes all

this possible. Using a DIM command we can dimension an array of variables so that we can refer to each of the variables by a single number.

Don't worry too much about that last sentence – all it means is that we can put a lot of variables into an ordered list and then pick out whichever one we want by number.

Have a go at Program V which is the same as the previous one except that it now uses one of these mysterious arrays:

10 REM PROGRAM V

15 DIM number (3)

20 INPUT "First quaber", number(1)

30 INPUT "Second number" ,number(2)

40 INPUT "Third number", number (3)

50 PRINT "First number", number(1)

60 PRINT "Second number" number(2)

70 PRINT "Third number" number(3)

Line 15 is the interloper. It introduces a new Basic keyword DIM.

All DIM does is to dimension an array, which means it sets up a series of variables all with the same name except for a number in brackets at the end. It creates a numbered list of variable names.

In Program V the DIM number (3) statement tells the Electron that you want it to put aside memory space for four variables.

The first variable is number(0), the second number(1), the third number(2) and the fourth number(3).

These all have the initial value of zero. If you don't believe me add;

17 PRINT number(0), number(1), number(2), number(3)

to Program V and you'll see their values printed out.

The DIM statement of line 15 has set up four numeric variables, all with a similar name but with different numbers in brackets at the end.

If line 15 had been:

### 15 DIM number (5)

it would have set up six variables, all with the *number* stem followed by figures in brackets ranging from 0 to 5.

Notice that the DIM statement sets up the variables in the array — which are technically known as elements—in numerical order from 0 to whatever the figure in the brackets is.

Notice also that there is always one more variable than the number in the brackets.

This is because the list or array of variables begins with 0. Very often programmers ignore the 0 element of the array and start at 1 so as not to get confused.

This is wasteful of memory and so looked down on by the powers that be, I do it all the time!

While we're still with program V let's get acquainted now with what can go wrong with DIMs. Try leaving out line 15 altogether and you get the dreaded:

### Array at line 20

message. This is telling you that you're trying to use an array you haven't set up. You'd be surprised how often this can happen.

Another goodie is when you try to make the array so big that your poor little Electron doesn't have room for it all. If you change line 15 to:

### 15 DIM number (20000)

you'll get the awful:

### Bad DIM at line 15

Basically you've bitten off more than you can chew with your DIM.

But enough of this. I'm sure that, like me, you'd never make such elementary errors.

Let's get back to the arrays of linked elements that we've created with DIM.

So the DIM statement has set up an array. Big deall What's so special about an array?

What's special is that the number in brackets after each of the variables – known as the subscript – is a cunning little heast

It doesn't always have to be a number. It's quite possible to be a variable in itself.

If this sounds like one of those mirrors reflected in mirrors sort of things, don't worry, it's a lot easier than that.

Have a look at Program VI,

# 'The subscript is a cunning little beast'

# From Page 21

in which all is revealed.

The DIM of line 20 sets up six elements of an array from number(0) to number(5).

So far so good. The important part of the program comes in the next four lines which consist of a FOR ... NEXT loop. This has the control variable index, which ranges from 1 to 5, ensuring that the loop cycles five times.

If you don't know what line

# 10 REM PROGRAM VI 20 DIM number (5) 30 FOR index = 1 TO 5 40 PRINT "Input next num ber\* 50 INPUT number (index) **60 NEXT index** 70 FOR index = 5 TO 1 ST EP -1 80 PRINT "Number" number. (index) 90 NEXT index

40 is doing then you shouldn't be reading this article!

The real meat comes with the INPUT of line 50. Here the number you enter is placed in the variable number(index).

You'll notice that number (index) is a subscripted variable, like the ones we've met in the arrays set up with the DIM statement.

The difference is that instead of the brackets at the end of the variable containing a number such as 0.1 or 5 it contains a variable, index.

This isn't as odd as it may seem as, when you think about it, index is going to vary from 1 to 5 as the loop spins round.

The first time round the loop, index is 1 so number (index) becomes number(1).

When index is 2, the value typed in is put in number(2).

As the loop cycles and index changes, so each number input is placed in a different element of the array dimensioned in line 20.

Try doing this using the method of Program V and you'll see what an improve-

# 'Arrays are very powerful programming tools?

ment in efficiency is brought about using an array combined with a FOR ... NEXT loop.

The last three lines of the program form another FOR . . . NEXT loop with the loop control variable going downwards in steps of -1.

Line 80 prints out number (index) each time and as index is going down from 5 to 1 the numbers you entered are printed out in reverse order.

If you'd decided you only wanted every other number the STEP parameter of line 70 could be -2.

This would produce three numbers, in reverse order of entry. Don't just take my word for it - try it and see.

So setting up - dimensioning – arrays of linked variables. (elements) and combining them with FOR ... NEXT loops can give us a lot of power over how we can handle lists of numbers.

Program VII shows this in action.

Here we've actually used a

10 REN PROGRAM VII 20 INPUT "How many number rs", span 30 DIM number (span) 40 FOR index = 1 TO span 50 PRINT "Input next num 60 INPUT number (index)

70 NEXT index

80 INPUT "Which of the ! ist would you like", positi oninlist

90 PRINT \*The number is ";number (positioninlist)

variable span to decide how many elements we want in the array. Line 30 dimensions it according to the value entered in response to line 20.

Lines 40 and 70 form a FOR ... NEXT loop which tells you to enter the numbers you want to put into the array. This is where you regret it if you've made span too large.

All of that should be fairly familiar to you by now. What happens next isn't.

Line 80 asks you to enter which element of the array you wish to be printed out. In other words, which entry in the list you want referred to by its position in the list.

When you have made your choice it puts the number you enter into the variable positioninlist.

Then line 90 prints out that element of the array. If positioninlist is 3, number (positioninlist) will print out the third number you entered.

If it is 10, then it will print out the number in the 10th position.

As you can see, by using a variable in the subscript of an array - the bit in brackets - you can pinpoint each element of the array at will. This, as you will find later, is a very useful technique.

Finally, you may be asking yourself whether we can have string arrays as well as the numeric arrays we've been

The answer is yes, as Program VIII shows:

Here we've used a string array nameS and a numeric array mark. The FOR ... NEXT loop gets us to enter the

10 REM PROGRAM VIII 20 DIM name \$ (3), mark (3) 30 FOR topofclass=1 TO 3 40 PRINT "Enter name of number ":topofclass 50 INPUT names (topofclas 60 PRINT "Enter ":name# f topofclass);"'s mark." 70 INPUT mark(topofclass 80 NEXT tooofclass 90 IMPUT "Enter number o f position " position 100 PRINT names(position) ;" got ";mark(position);" a arks."

names of the top three children in a class and the marks they got.

Then all we have to do is to enter the child's position in class and the program will print out its name and mark.

I'll leave it for you to figure out how it works. It's not too different from the previous programs.

The point to note is that by having two arrays, one of names and the other of marks, we can refer to both with just one subscript.

If we had 10 parallel arrays like this we could still use the one subscript to get 10 pieces of information such as name, age, mark, sex and so on.

As you'll no doubt see. arrays are very powerful programming tools.

And there's lots more to them, as we'll find out next time.

# ASK any micro user what extra facilities he desires and a printer is sure to be near the top of the list.

The lack of a printer interface on the Electron must have put a number of potential users off the machine.

The Mushroom printer/user port is one of several that have been produced to fill the gap and it also includes another useful device — a BBC-type 8 bit user port.

Unpacking reveals a rather neat unit with an edge connector at one end and the normal Electron expansion connector at the other.

Down the side are the printer and user port connections, these being exactly as those on the BBC Micro.

With the unit comes a four page instruction booklet and a tape containing the software necessary to run a printer.

The bookiet tells you how to connect a printer in simple, easy to follow steps. The cable required is the same as that for a BBC Micro

The software driver tape will assemble machine-code at any address in memory that you desire. It is a good idea to make several versions at various addresses and save them for use with different programs.

The other side of the tape contains a separate program, allowing you to print graphics screens. This program is for the Epson MX80, but should work with Epson-compatible printers such as the Shinwa.

Incidentally, you may feel that having to load a separate program to make the printer work is something of a nuisance, but really the assembled code loads in a matter of seconds and the advantage to doing it this way, instead of having the program in ROM, is that it makes the unit compatible with other expansions.

The other half of the unit contains the user port — basically, a device which enables the micro to communicate with the real world.

In this unit you have eight lines which can be set individually for input or output, plus two lines for handshaking. This is a fancy term for a system which makes sure that the micro and the device attached to it only transfer

# User portal to whole new worlds

information when they are both ready.

As far as it goes, the booklet is clear in giving you instructions to use this port. However, it really doesn't go far enough for my liking.

The chip used to create these ports is the 6522, known as a Versatile Interface Adapter (VIA), which is the same as that used by the BBC Micro. It is quite a complex device but, if you take the trouble to master it, is extremely useful.

Applications include a switched-joystick interface, analogue/digital port, temperature controllers and plotters.

I appreciate that for Mushroom to include a treatise on its full use would have considerably increased the cost of producing the manual, but I do think that they could perhaps have pointed the user in the direction of a suitable reference.

I shall rectify this immediately by recommending a book that not only includes a detailed description of the 6522, but also gives you a number of applications to try—Interfacing Projects for the BBC Micro by Bruce Smith (Addison-Wesley £6.95).

To use this book (or, indeed, any BBC application for the user port), all you have to remember is that the Mushroom interface maps the user port one page lower in memory. That is, any references to memory at & FExx in the Beeb should be changed to & FDxx for the Electron.

To sum up, this is a very nice unit, well constructed, and assuming that you are prepared to do your own research on the VIA can be definitely recommended.

Please experiment with the user part – it will open up whole new worlds.

**Barry Pickles** 

# Snappy ROM

I HAD the opportunity recently to try out Acorn's ROM filing system with a couple of games, Hopper and Snapper.

The Plus 1 can accommodate both cartridges at once, so I plugged them in to the sockets beneath the spring loaded flaps on top and switched on.

A rather strangled beep is heard instead of the usual longer note, and by the time I had sat down Snapper had loaded. This is far better than the usual three or four minutes loading time of the cassette games.

The actual games them-

selves are no different to the cassette versions, but are far more convenient on ROM cartridges.

Whenever Break is pressed, or the Electron switched on, the game on the cartridge nearest to you is loaded, taking, about 10 seconds.

To load the program on the cartridge furthest away, you press Break, and while the loader is being transferred Esc can be pressed to abort the process.

The ROM filing system is still active, \*CAT printing a list of all the files on both cartridges. The other game can then be loaded and run with CHAIN "name".

If you want to load a program on cassette, the cassette filing system must be selected with \*TAPE and the program loaded in the normal manner.

The ROM filing system is great, and I can't wait to get my hands on a paged ROM such as Lisp, or Forth if it comes out.

My only criticism is that the cartridges cannot be left in all the time.

This is because whenever Break is pressed the software on the nearest cartridge is loaded, which could overwrite an important program you were working on, and whenever you switch on to use the Electron for something a little more serious, the game loads immediately.

It's too hard to resist not having just one more go . . .

Roland Waddilove

# IT'S A BOLT ON GOODY

IF you've ever envied Beeb users their sideways ROM facility, help is at hand in the form of this neat ROM/RAM expansion board from Slogger Systems.

It bolts on to the back of your Electron, the Electron bus is carried at the rear to allow other units to be attached and the unit is fully compatible with Acom's Plus 1 interface.

The unit is very well constructed and encased in tough plastic. It provides eight sockets for eight or 16k ROMs.

On the right hand edge are

three sets of jumper switches. These select the following options: all sockets accept 8/16k ROM; right hand socket accepts 4k ROM; right hand socket accepts 8k RAM; redefine ROM page numbers.

This latter option is necessary for use with the Plus 1 since it reserves certain ROM pages for its own use.

All this is explained in the manual supplied with the unit, which includes a detailed description of the ROM filing system, and is about the best piece of documentation I've

The ability to use RAM in

one of the sockets is something that will really come into its own when discs become available, and the manual includes a short machine-code routine to read/write to Ram or even to read any ROM plugged in.

Most of the ROMs available for the Beeb will work with this unit, including View and the Graphics ROM, but it might be as well before buying and if you are unsure to ask your dealer to try it out first.

What more can I say? It's well built, well documented and well recommended!

John King

# The Electron has added even more strings to its bow.

The list of top quality software for the Acorn Electron is growing all the time.

As you can see, there's already an outstanding selection of exciting programs covering everything from monsters to music and murder to marriage guidance.

And ultimately, the Electron will enjoy a range of software as comprehensive as that of its illustrious big brother, the much-acclaimed BBC Micro.

You'll find all the programs featured here at your local Acorn stockist. (To find out where that is, simply call 01-200 0200.)

Alternatively, you can send off for the Electron catalogue and order through the post by writing to Acornsoft, c/o Vector Marketing, Denington Estate, Wellingborough, Northants NN8 2RL. Tel: 0933 79300.

GRAPHICS: Graphs & Charts, Creative Graphics, Picture Maker.

BUSINESS: Personal Money

Management, Desk Diary.

EDUCATION: Tree of Knowledge, Peeko-Computer, Business Games.

LANGUAGES: LISP, FORTH, S-Pascal, Turtle Graphics.

GAMES: Starship Command, Monsters, Chess, Draughts and Reversi, Snapper, Meteors, Hopper, Sphinx Adventure, Arcadians, Free Fall.

QUIZZES: Theatre Quiz, Crime and Detection Quiz, Music Quiz, History Quiz, Science Fiction Quiz, ... I Do; The Dating Game.

CHILDREN'S EDUCATIONAL SOFTWARE: Happy Numbers, Timeman One, Timeman Two, Wordhang, Happy Letters, Map Rally.

# **CREATIVE ASSEMBLER: HOW** TO WRITE ARCADE GAMES For the BBC Microcomputer Model B and Acorn Electron Jonathan Griffiths

Creator of such top-selling games as Snapper and JCB Digging, Jonathan Griffiths steers you to a practical understanding of the powerful ASSEMBLER facility to produce an action-packed arcade game.

# **ELECTRON EDUCATIONAL SOFTWARE**

Our educational software is used in thousands of schools and homes throughout Great Britain. Now available on Electron.

Hours of fun and learning for children aged 5 to 9 years. Animated graphics will encourage children to enjoy maths, counting, spelling and telling the time. The tape includes MATH1, MATH2, CUBECOUNT, SHAPES, SPELL and CLOCK.

... 'An excellent mixture of games' ....

Personal Software - Autumn 1983.

EDUCATIONAL 2

Although similar to Educational 1 this tape is more advanced and aimed at 7 to 12 year olds. The tape includes MATH1, MATH2, AREA, MEMORY, CUBECOUNT and SPELL.

**FUN WITH NUMBERS** 

This program will teach and test basic counting, addition and subtraction to 4 to 7 years olds. The tape includes COUNT, ADD, SUBTRACT and ROCKET MATHS an arcade type game to exercise addition and subtraction. With sound and visual effects.

**FUN WITH WORDS** 

Start your fun with alphabet puzzle, continue your play with VOWELS, learn the difference between THERE and THEIR, have games with SUFFIXES and reward yourself with a game of HANGMAN. Complete with sound and graphics. The tape includes ALPHA, VOWELS, THERE, SUFFIXES and HANGMAN.

Very good indeed' . . . A&B Computing - Jan/Feb 1984.

JIGSAW AND SLIDING PUZZLES There are 2 Jigsaws and 4 sliding puzzles on a 3 x 3 and 4 x 4 grid. Each program starts off at an easy level to ensure initial success but gradually becomes harder. It helps children to develop spatial imagination and in problem solving. The tape includes 6 programs: OBLONG, JIGSAW, HOUSE, NUMBERS, CLOWN and LETTERS.

747 Flight Simulator

from DACC - The Simulation specialists

Activati screen

Unrivalled and unbeatable for accuracy and realism the DACC 747 Flight Simulator is the most successful of its kind on home computers. The only simulator which shows all the essential flight and engine instrumentation of the Jumbo Jet, as they really are - real dials - and with a precise 3D view of the runway. The control and response of the 747 are faithfully reproduced using genuine aero-dynamics formulae. Start options include take-off, random landing approach, passenger and fuel load selection, etc. You control the throttles, elevators, ailerons, flaps, spoilers, landing gear, brakes, reverse thrust, etc. Joysticks are optional on all but Dragon and Tandy versions.

Cassette £9.95 (inc. VAT and P&P)

### Special Offer on Joysticks

Normally £17.95 per pair. Yours for only £12.95 if ordered with 747 Simulator (Atari & CBM-64 types £14.95). Please state type of computer on all orders. WE DESPATCH WITHIN 48 HOURS

Order direct from:

# Defending cities is great fun

City Defence Bug Byte

AS sole defender of a group of cities you have to fight off deadly missiles using the almost inevitable laser bases.

You have four cities to defend and three bases from which you can fire. Sadly there are only 10 rockets available in each base. When your supply is exhausted the enemy continues to attack ruthlessly until your planet lies in ruln.

After you've seen off each wave of enemy missiles your supply of rockets is replenished. Provided you have managed to save at least one city from the preceding screen, away you go again.

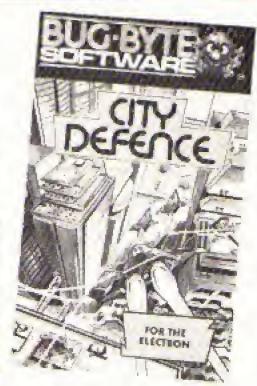

Extra cities are awarded for every 1,500 points, and other features include a two player option - very welcome when your friends play for hours and a hi-score facility.

All in all I was impressed by City Defence. The instructions were concise yet clear and appear on screen as well as on the inlay card.

The sound was good and did not become annoying, as often happens. Indeed the sound produced by an attacking wave of missiles was really quite tuneful, although it could not be turned off if it did become tedious.

The use of graphics was fair, if not exactly startling.

Perhaps a hardened arcade fanatic might be a little disappointed at the absence of one or two features present on

the original - for example there are no spaceships appearing from time to time.

Having said that, to most people this game will provide a good deal of entertainment and is great fun to play.

Steve Yarwood

# Beat the wizard and keep the peace

The Eye of Zolton Softsel

THIS review is in response to a request for help from Elizabeth Young of Stondon Massey in Essex. She says the game is fascinating and I agree.

Your ruler, the king, has had the five magic objects that enable him to maintain peace and prosperity in the land stolen by an evil wizard.

As the influence of this wizard descends upon the land, you are summoned and told by the king that he has chosen you to recover the magic objects and take them to the Temple of Zolton.

Here their beneficial influence will help the king defeat the wizard.

You begin your quest on a hilltop with the first task to equip yourself for the trials to come. You quickly discover a hut, two canyons, a lake, an island, a deadly forest and a mysterious castle.

The island is the last place you want to visit so you search everywhere thoroughly before tackling the castle.

There is a way into the castle and you will be surprised at the help you can get here, always assuming you can recognise it! Once you have figured it out you will be in the castle and the main body of the adventure.

There are some really dev-

# Maths for home and school

Maths level 1 (Age 4-6) Cheshire Cat Educational Series (AmpalSoft)

THIS is one of a series being produced for the pre-school or young child. It would be equally suitable for schools or the home Electron and colour television.

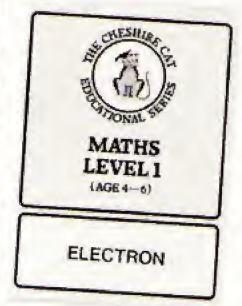

Like the others in the series. the package contains two cassettes which together contain 16 exercises.

These obviously begin at a very basic level with number recognition and matching. sorting of shapes and adding complements of five, through to matching pairs of objects which would eventually lead to some experience of set

The intention is that the child would soon learn to use the programs unaided, and I am sure this would be possible.

The key inputs are, after all, remarkably clear and easy to

However I would also see a

great advantage for a parent in working through these exercises with the child so that the mathematical vocabulary necessary later may be founded at this early stage.

There are also a variety of further activities which would present themselves during the operation of these programs, and a wise parent would do well to follow them up while the interest is shown by the child.

Full use is made of colour and sound so that the machine is well used. The graphics are not elaborate, but in a program of this kind they hardly need to

In a school situation, the child's name is input and full records are maintained of that child's performance.

One slight snag which I found at school was the time taken to load the cassettes they contain a wealth of programs which need to be accessed quite often during a morning"s work.

Schools may be interested to know that the programs also run on the BBC Micro, and with a bit of effort can be stored on disc.

Since schools are well advised to make a backup copy and to keep the original well away from dirty fingers, I wouldn't imagine that Ampal-Soft would mind the backup being on disc. It makes the running of a classroom much smoother!

Phil Taylor

# From Page 27

ilish puzzles to solve, yet no real red herrings.

I will give you one tip. Though the program description says you have to return the five magic objects to the temple, they are not the only things that have to go there.

The program is written in Basic and thus easily listable. This might not help you if you get stuck however, since many of the room descriptions and word parts have been tokenised.

For those who haven't met this term before, I'll try to explain. To save memory space the programmer has substituted the more commonly used words and word parts for symbols.

The tokeniser converts these symbols into English when they are to be displayed on the screen. It also converts your input into symbols the program can understand and respond to.

The Electron itself tokenises Basic keywords, though very little information is given in the User Guide.

Overall, an ingenious series of puzzles. Despite being written in Basic it's a very nice game to play and is about average difficulty. I am impressed and have no hesitation in recommending it for all types of adventurers.

Merlin

# GET IT RIGHT THIS TIME

Woodland Terror MP Software

THIS is the sequel to Firienwood, M+P's first adventure, which took its name from the forest in which much of the action took place.

M+P claim that no prior knowledge of Firienwood is required and since I haven't as yet seen it and I've managed to finish this adventure. I have to agree.

In rescuing the golden bird of paradise in the previous game you inadvertently released an evil genie. Now, a few years later, you set out to kill the genie and restore peace to the land.

Hopefully you'll get it right this time!

You start your quest close to the castle, scene of your previous triumph, and after a couple of turns (hint!), you manage to reach the castle and obtain some of the equipment.

This includes a password which will see you through to the main part of the adventure.

After a few more moves the pressure begins to tell (yet another hint!), and you find yourself in Firienwood itself.

From this point on the tension mounts and you are

presented with numerous puzzles to solve and red herrings to ignore. Also, for any Dungeons and Dragons fans who might be playing, you are frequently given the opportunity to fight goblins and thereby increase your score.

Since I managed to complete the adventure without killing a single goblin I can only assume that this option is merely to pad the adventure out a bit.

Perhaps the idea is that having completed the game, you can go through it again to try to achieve a high score. First time I ever heard of an adventure having a top ten!

Anyway, after a lot more red herrings, a trip underground and a visit to the diamond mines, you manage to complete the adventure.

At this point I felt it was all a bit of an anti-climax. In retrospect I can say that it is perfectly possible to solve this adventure without even meaning to.

Only about 20 per cent of the puzzles and locations have any bearing on what happens.

It's a large program, completely written in machinecode, very fast and has an excellent save-game routine. The layout on-screen – using different colours for text, messages and so on – is very impressive.

The thing lacking is a feeling of cohesion between the puzzles and the purpose of the adventure. In view of this I feel that the experienced adventurer would be disappointed if he bought this program.

For the novice, however, I think it is ideal. Many of the puzzles that have a direct bearing on the adventure are fairly easy to solve and there are plenty of locations to explore once the initial problems are overcome.

All in all, a competent piece of programming but for the complete novice only.

Merlin

# Right up your Milky Way

The Night Sky Bridge Software

IS gazing at heavenly bodies your scene? Do you know an Ursa Major from a Corona Borealis?

If your answers are yes, then this program is right up your street (or your Milky Way!). It will allow you to place yourself anywhere in the world, within certain generous limitations of longitude and latitude, and look at any constellation, or the sky in general.

There are more than 80 constellations listed, and they are identified by their three-letter abbreviations as used by the IAU.

Care must be taken to enter this with the correct sequence

of upper and lower case letters. Of course, we Electron users know it's easier to enter lower case letters on the Electron than on the BBC Micro.

The constellations contain over 1,000 stars, although not all will be available to view from our chosen location, even though a northerly or southerly aspect may be selected.

Various options are available, one being the facility to enter ANY as the answer to the name of the constellation.

The micro will then select one and display it, having made sure it is visible. You can then use this as a test, guessing the answer before it is revealed.

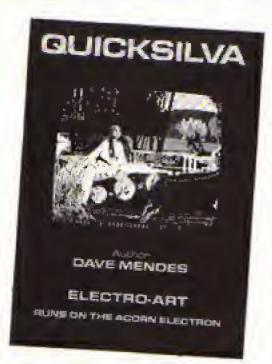

If your interest in astronomy is perhaps dormant, this is a super program to awaken it!

Phil Taylor

# But is it art?

Electro-Art Quicksilva

YET another title produced by the prolific Dave Mendes for Quicksilva, this is a graphics drawing package aimed at those wishing to implement the fine graphics capabilities of the Electron, but not being proficient enough to try it

themselves in Basic.

I must say straight away that it is not the best of its type, comparing rather badly on several points with the Salamander Graphics System, reviewed in the May issue of Electron User.

This tape can produce extremely detailed results as are shown on the accompanying sample pictures. Actually, I spent several frustrated minutes looking for these, before finding them at the start of the flipside.

When found, these files are well worth loading in to show the superb results possible with skill, care and patience.

One major handicap is that Electro-Art only operates in Mode 2, whereas the Salamander package allows the user to select Mode 0, 1 or 2.

I also found the controls less easy to remember than the mnemonic-type initials employed by Salamander. For instance, to colour-fill an area uses Key 1 on the Quicksilva tape, but F (for fill) on the Salamander.

There are a couple of plusses for Dave Mendes with some predefined triangles at the touch of a number key, as long as you can remember which is triangle one or two or three or four that is.

Both have the facility to save and load pictures using the cassette system, but Quicksilva score another plus with a built-in joystick facility – obviously an advantage.

Where Quicksilva lose totally though, is the complete absence of either a grid overlay for intricate designs or indeed any system of showing current coordinates for future manipulation.

No, in an application where user-friendliness has to be a prime consideration. I cannot really recommend this very highly. If I hadn't already seen the other system perhaps I could, but this does not emerge well from the comparison.

Phil Tayler

# A REAL BOON!

Sprites Version 2 Simonsoft

WHATEVER you enjoy doing on your Electron, writing games or education programs or just playing around, this program is without doubt a real boon.

It lets you produce beautifully fluid-smooth animation in minutes with a minimum of difficulty.

A sprite, for the uninitiated, is a block of graphics which can be moved around the screen pixel by pixel giving smooth movement. The micro takes care of deleting and moving the image, leaving the background undamaged.

The package consists of three definer programs, some ready made sprites – although it's more fun to make your own – and about 20 machine code routines, each incorporating different features and using varying amounts of memory.

Writing, changing and using the sprites is simplicity itself, with the use of the resident integer variables and calls to machine code routines from your Basic program.

All this is explained in the

comprehensive manual.

Also supplied are two demonstration games complete with listings. However these do not do the sprites justice, being simple and uninspiring.

What puts this program way ahead of other packages available is its many features. These include a collision detector, preset flight paths, extra-large super sprites, an amazing enlargement facility, and up to 48 sprites at once, each of which can have two alternating images giving instant animation as the sprite

Simonsoft Sprites has to be one of the best things for programmers wanting to write good programs since the Electron itself.

Andrew Oldham

# One for action men...

Invaders Superior Software

WOULD you do anything for a fast action game but never look an adventure in the face? If so, then this is the game for you.

Your ship is loaded with an infinite supply of fire-power with which to blast the aliens out of existence, but you only have a limited time before they land.

For extra points you must destroy any spaceship that wanders through your territory. Watch out, though. They often drop bombs that penetrate all defences.

The keys Z and X (for left and right) and Delete (to fire), respond promptly, giving smooth action.

It may not be the most original game ever written, but the graphics and sound facilities have been used well to give an enjoyable and addictive game which is good value for money.

Richard Tacagni

# You'll love it, and learn too

Map Rally Bourne Educational Software

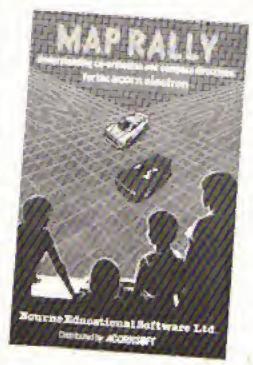

BOURNE have made many friends among primary school teachers (and children!) for their lovely Happy Letters and Happy Numbers programs for young learners.

This tape is aimed at a higher age group and combines practice in coordinates and compass directions.

There are actually two similar programs on the cassette, the first of which requires little experience of compass bearings, for the necessary prompts are made on screen.

The child takes the part of a rally driver, with the Electron acting as navigator around a course through a grid. This varies from 6×6 to 18×18, which increases the level of difficulty.

The most popular choice was that of two players

competing against each other, one with a red car, the other with blue. The courses set for each car are similar in terms of distance, but they are not the same, so nobody can benefit from someone else's suc-

cesses

The second program is very similar but the child has to calculate the desired new coordinates in order to make the move. This refinement adds a totally different skill from that already acquired in the first game.

Again the graphics are fair and the sound is quite reasonable but the great value of this tape is the superbly child-orientated feel it has.

Children love the idea of car rallies and they themselves love to compete. The fact that a considerable amount of information is learnt about compass points and coordinates is almost incidental to the child.

Yet parents and teachers can feel quite reassured that the educational purpose is fully achieved in this splendid cassette.

Phil Taylor

# KAY-ESS

# COMPUTER **PRODUCTS**

PROFESSIONAL PROGRAMS FOR THE MODEL B AND ELECTRON

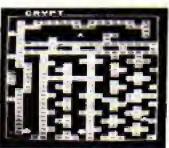

EACH TAPE ONLY £5.95 (Except H.O.H.)

Turn off the lights and gather around for the most creapy game of the year. How you laughed at those superstitious foots in the village when they warned you not to go need the old house. The clinib up the rocky path under the attention auri was swift and within an hour you had passed through the outer gates of this once great house. The dust and cobwebs hadn't bothered you as you climbed the old stairs to the towers on the too level. Did you notice how low the sun had fallen before the sounds of locks clicking reached your startled ears? Now can the moon be out already and what's that moving towards you??? This all action game will have you ducking and diving from the GHOSTS and ZOMBIES, and matching with a MUMMY, WEREWOLF, and VAMPIRE. 5 Hoors full of old CORRIDORS, BROKEN FLOORBOARDS, and riddled with SECRET PASSAGES await you. Superb sound effects and graphics. Can be played using either keyboard or joysticks. Top table. Pause option.

EARLY YEARS (8)(E) For children between 3-6 years of age

These two packages give an adult or older child a means to take a younger child through a series of simple game type tasks to entorce ideas. The amphasis is on learning through fun. Toxics covered include subtraction addition, recognition, colour, shapes sizes, sounds notes co-outmation, distances, estimates, directions

### EARLY YEARS 1

- A) MICKEY THE MONKEY and his apple tree make subtraction fun.
- COLOUR BLOCKS tring stres and colour into perspective MERRY MUSIC rurns the keyboard into a musical keyboard FUNNY FACES presents a line up, which one is the suspect?
- FRED THE FROG needs co-ordinated help to get across the pond.

### EARLY YEARS 2

- THE POND seems very active today SPEED is required to keep the cake on the conveyor belt.
- DIRECTIONS seem to be needed by everyone in Orlon village. ORDER the blocks
- SID THE SPIDER reads some help to get out of the mare

Watch out for HOUSE OF HORRORS at local dealers. ALSO AVAILABLE: Dealer enquiries welcome

# QUAL-SOFT

£9.95 (inc. VAT and p.p.)

QUAL-SOFT Comments: About our previous advert Mr J. Carter of Barnsley 'phoned'. Don't tell us what people think of LEAGUE DIVISION ONE for the BBC B, what do they say about SOCCER SUPREMO for the ELECTRON?" Copy dates being what they are, we hadn't sold any ELECTRON games when we wrote last months advert, but now, at the time of writing we've been delivering the program for four weeks lorobably eight to twelve as you read this), and, to escape accusations of selective quotes, we will give you the first paragraph of the first letter we had received about SOCCER SUPREMO, from J. Hooley of Twickenham: "Many thanks for the fantastic game. As soon as I received it, there was no stopping until the end of the season". We make that about six hours continuous play! And in the first telephone conversation P. Wright of Swansea began: "This is by far the best game I've found for the ELECTRON". OK Mr Carter?

NOT SO MUCH A GAME, MORE A WAY OF LIFE!

You have just been appointed Manager of a newly promoted 1st Division Club, and it is up to you to transform this very ordinary side into one that can realistically challenge for the 1st Division Championship within the next 5 seasons. You must assess your side's capabilities and then, through your youth policy and the transfer market, reinforce the strengths and eliminate the weaknesses. It's all so easy . . . or is it?

\*\*\* "3-D", 22 MAN, FULL PITCH, FULL MATCH GRAPHICS SIMULATION

- 42 match season, 21 home games, 21 away games. Opposition: 21 of the current 22 DIV 1 sides
- Transfer market (Rush, Robson, Hoddle etc).
- 4-4-2, 4-3-3 and 4-2-4 team formation.
- In match tactical adjustments.
- Opposition skills related to League record.
- Match injuries: Your physio reports
- Team selection by names, lenter initials)
- Home/away bias, opposition tactical play
- Tactical substitutions

And many more features, but will take a full page advert if we are to continue, (That'll be O.K. Ad. Man).

The game will be posted on the same day as the receipt of order. ACCESS telephone authorisations should take no more than two days to arrive.

QUAL-SOFT Dept. EU. 18, Hazlemere Rd., Stevenage, Herts. SG28RX Tel: (0438) 721936

To save your fingers most of the listings in Electron User have been put on tape.

### On the November tape:

STAR FIGHTER Anti-alien missions. SCROLLER Wrap around machine code. URBAN SPRAWL Environmental action game. SPELL Alphabetic education. JUMPER Level headed action. CAESAR Code breaking broken. KEYBOARD Typing game.

### On the October tape:

BREAKFREE Classic arcade action. ALPHASWAP A logic game to strain your brain. SOUND GENERATOR Tame the Electron's sound channels. MULTICHARACTER GENERATOR Complex characters made simple. RIGEL 5 Out of this world graphics. MAYDAY Help with your morse code. NOTEBOOK Palindromes and string handling.

### On the September tape:

HAUNTED HOUSE Arcade action in the spirit world, SPLASH A logic game for non-swimmers. SORT SHOWS How sorting algorithms work. SORT TIME The time they take. CLASSROOM INVADERS Multicoloured characters go to school. SAILOR Nautical antics. MATHS TEST Try out your mental powers.

# On the August tape:

SANDCASTLE The Electron seaside outing. KNOCKOUT Bouncing balls batter brick walls. PARACHUTE Keep the skydivers dry. LETTERS Large letters for your screen. SUPER-SPELL Test your spelling. ON YOUR BIKE Pedal power comes to your Electron. SCROLLER Sliced strings slide sideways. FLYING PIGS Bacon on the wing.

# On the July tape:

GOLF A day on the links with your Electron. SOLITAIRE The classic solo logic game. TALL LETTERS Large characters made simple. BANK ACCOUNT Keep track of your money. CHARTIST 3D graphs. FORMULAE Areas, volumes and angles.

## On the June tape:

MONEY MAZE Avoid the ghosts to get the cash. CODE BREAKER A mastermind is needed to crack the code. ALIEN See little green men — the Electron way! SETUP Colour commands without tears. CRYSTALS Beautiful graphics. LASER SHOOT OUT An Intergalactic shooting gallery. SMILER Have a nice day!

### On the May tape:

RALLY DRIVER High speed car control. SPACE PODS More aliens to annihilate. CODER Secret messages made simple. FRUIT MACHINE Spin the wheels to win. CHASER Avoid your opponent to survive. TIC-TAC-TOE Electron noughts and crosses. ELECTRON DRAUGHTSMAN Create and save Electron masterplecas.

### On the April tape:

SPACEHIKE A hopping arcade classic. FRIEZE Electron wallpaper. PELICAN Cross. roads safely. CHESSTIMER Clock your moves. ASTEROID Space is a minefield. LIMERICK Automatic rhymas. ROMAN Numbers in the ancient way. BUNNYBLITZ The Easter program. DOGDUCK The classic logic game.

### On the March tape:

CHICKEN Let dangerous drivers test your nerve. COFFEE A tantalising word game from Down Under. PARKY'S PERIL Parky's lost in an invisible maze. REACTION TIMER How fest are you ? BRAINTEASER A puzzling program. COUNTER Mental arithmetic can be fun! PAPER, SCISSORS, STONE Out-guess your Electron. CHARACTER GENERATOR Create shapes with this utility.

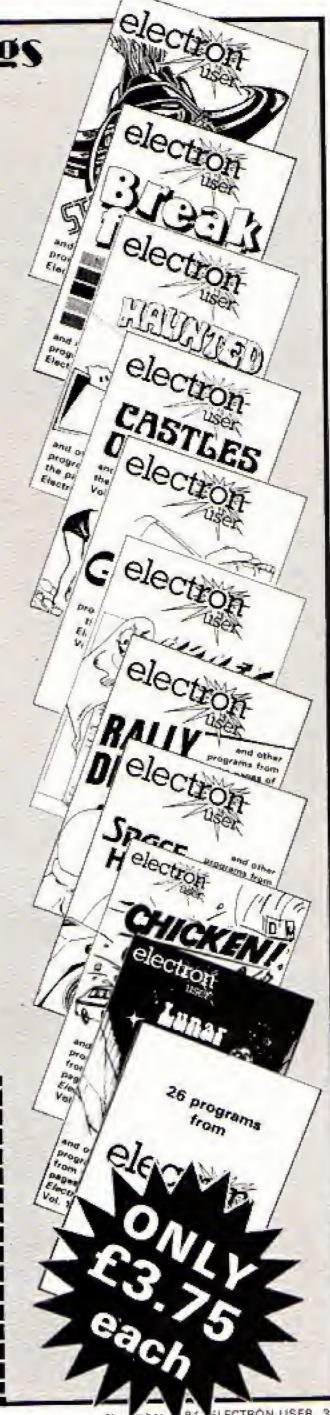

### On the February tape:

NUMBER BALANCE Test your powers of mental arithmetic. CALCULATOR Make your Electron a calculator. DOILIES Multi-coloured patterns galore. TOWERS OF HANOI The age old puzzle. LUNAR LANDER Test your skill as an astronaut. POSITRON INVADERS A version of the old arcade favourite.

### On the introductory tape:

ANAGRAM Sort out the jumbled letters. DOODLE Multicoloured graphics, EUROMAP Test your geography. KALEIDOSCOPE Electron graphics run riot. CAPITALS New upper case letters. ROCKET, WHEEL, CANDLE Three fireworks programs. BOMBER Drop the bombs before you crash. DUCK Simple animation. METEORS Collisions in space.

### HOW TO ORDER Please send me the following Electron User cassette tapes: Nine programs from the November issue ...... £ Seven programs from the October issue ...... £ Nine programs from the September issue ......£ Fourteen programs from the August issue ..... Ten programs from the July Issue ......£ Ten programs from the June issue ,..... £ Twelve programs from the May issue ...... E Eleven programs from the April Issue ......£ Twelve programs from the March Issue ......£ Nine programs from the February issue ......£ I enclose the sum of Name ...... POST TO: Tape Offer, Electron User, Europa House, Address 68 Chester Road, Hazel Grove, Stockport SK7 5NY.

# COTO TO

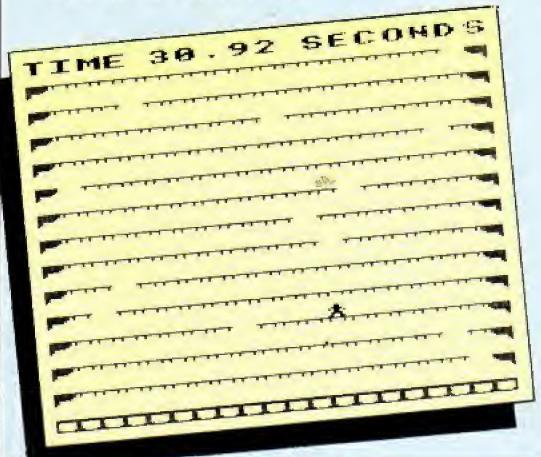

JUMPER is a fast arcade game in which the objective is to move the man up through gaps in floors as quickly as possible.

You have to be quick as the gaps keep moving, and if you get caught by a fireball you go back to the beginning.

Line 700 is a delay, controlling running speed – but you may find if you make the program go faster your reactions can't keep up.

You'd better jump for your life in this exciting arcade action game by CHARLES FRANCIS

SREM JUMPER GREM BY CHARLES FRANCIS 7REM (C) ELECTRON USER 10DIMGP1(30),R\$(8),R(8) 20MODEL: 30VDU23,224,255,255,255, 254,252,192,192,128 40VDU23,225,255,66,66,0, 0,0,0,0 50VDU 23,226,24,24,60,90 .24.60.36.102 5070023,227,255,255,255, 127,63,3,3,1 70VDU23, 228, 24, 126, 126, 2 55, 255, 126, 126, 24 80VDU23,235,255,255,129, 129,129,129,195,255 90VDU23,240,12,12,50,47, 12,14,58,35 10040023,241,48,48,60,244 .48, 112, 92, 196 11000023,1,0;0;0;0;0; 12000019,3,4,0,0,0 130FORIX=0T08:R\$(II)="":R (IX)=-1: NEXT

# URBAN SPRAWL

TAKE on the planners and fight to save the green belt with this fast moving and original game from PATRICK HEIGHES.

Stop the planners building on the green belt round the edge of the screen. The city starts in the middle of the screen and sprawls outwards.

You are the Lone Conservationist, running around the screen blasting each building as it gets too near the belt.

Whenever you get one, the builders go back to the Town Hall in the centre and start again, giving you a breather. Then you're back in action.

The controls are simplicity itself:

Key Function

Z Left

X Right

Up

Down

Return Fires blaster

Your score is based on the length of time you keep the buildings off the green belt. Good luck!

# National Micro

# Everything on this page is 5% less than our normal price

This special offer is exclusively for readers of Electron User and applies to mail order sales only.

We will also send you FREE membership of NMC's Computer Club – enabling you to enjoy generous discounts on all your future purchases!

Benefits for Club members include a big saving of 10% on software and 5% on hardware purchases over £25.

Personal shoppers are welcome at our retail stores:

National Micro Centres. 36 St. Petersgate. Stockport SK7 5NY. Tel: 061-429 8080

Wilmslow Micro Centre, 62 Grove Street, Wilmslow, Cheshire, Tel: 0625 530891

# **PRINTERS**

Nowyou can add a printer to your Electron, using Plus 1, we have selected four of the most popular dot-matrix printers. All allow you to condense or embolden text, offer high definition characters and allow you to produce clear-cut graphics and charts:

Brother HR5 (30cps) £170.95
Epson RX80 (100cps) £272.00
Epson RX80FT (incl. friction feed) £315.00

(Without Electron Interface: £286.90)

## MONITORS

You can happily operate your Electron with your domestic TV set. But more and more users are finding that for a really crisp picture you need a special monitor. We offer a monochrome and three colour monitors:

Zenith 12" (green screen)	£81,00
Microvitec (14" colour - low res)	£217.41
Microvitec (14" colour med res)	£326.66
Microvitec (14" colour - hi res)	£480.70

For the best of both worlds there is the 14"

Nordmende, which can double as a monitor and normal TV, at a very attractive price ...........£238.00

(with remote control £251.00)

From a wide selection of cassette recorders we recommend the Pye Data Cassette Recorder, which is a perfect match for the Electron. With it comes a FREE power pack and Electron lead.

£38.00

# A FREE dust cover with every Electron

We have ample stocks of Electrons and can promise mainland delivery within 24 hours of receiving your order. With it comes an introductory cassette of 15 programs, a very comprehensive User Guide, an easy-to-understand DIY book on programming AND a free dust cover with the compliments of National Micro Centres £189.00

JOYSTICKS

Use a joystick to play arcade games and watch your score increase dramatically! For serious games a joystick really is a must – and we have two we specially recommend. Both provide twin fire buttons.

Sureshot (self-centering action) .. £15.67 Clares (non self-centering) .. pair £19.50

These will take Kempston & Sureshot Jousticks.

# Selling well...First Byte's switched joystick interface

Since it was launched at the Electron & BBC Micro User Show the switched joystick interface from First Byte has been one of our top sellers. This plug-in cartridge takes standard Atan-style joysticks which are much more popular – and cheaper—than

analogue joysticks......£23.70

### AT LAST! Plus 1 is the Electron add-on we've all been waiting for!

ELECTRON PLUS 1 is Acom's answer to a growing demand from Electron users to be able to extend their micro's capabilities. With it you can add a printer and use your Electron for word processing and financial calculations. Its joystick input is designed to take two fully-proportioned joysticks - giving an entirely new dimension to games playing. And its two unique cartridge slots enable you to plug in games, educational and business programs - and that means no more waiting for programs to load. Many other manufacturers are now planning cartridges that will use Plus 1 to expand the Electron in many more exciting ways and considerably increase its power and versatility.

ELECTRON PLUS 1 is a must for every user who wants to really make the most of his micro.

# SCRAPBOOK

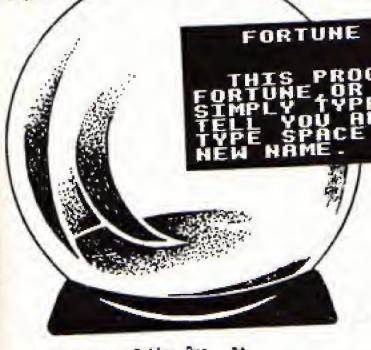

SCRAPBOOK is the feature that contains a selection of all the short, simple programs sent in by our readers. It's where we keep a record – a scrapbook would you believe – of all the interesting little routines that don't end up in the Notebook or in Program Probe but are too good for us not to share.

The emphasis this month is very much on graphics programs but next month, who knows? It's up to you

and the programs you send in.

A must for every parent and teacher, the Micro User Educational Special will help turn your BBC Micro into a learning centre.

Its 15 original programs have been specially chosen to combine educational validity with sheer good fun.

Tested in the classroom, and ranging in scope from pre-reading to sixth form maths, each program is fully listed and explained in detail – in the clear style for which Micro User is renowned. Can you or your children afford to miss this vital educational resource?

## BOOK! SHELF

## Genuinely practical

Practical Programs for the Electron by Owen and Audrey Bishop (Granada).

I HAVE seen books of practical programs before, and they often prove a laborious means of performing the trivial.

This book, I am pleased to report, is of a considerably higher calibre, and the listings could be genuinely useful.

There are 14 listings, which, works out at a very modest 42½ per program, and most Electron users will find plenty to interest them here.

The range of subjects is as wide as the Electron's capabilities, and include graphics, sound and spreadsheet programs.

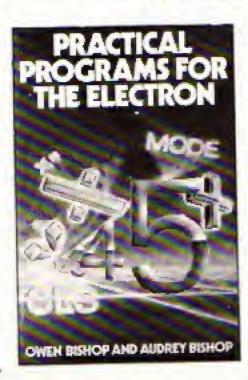

As usual with Granada, their listings are computer dumped, so that there is little likelihood of an error creeping in.

There is also a section on errors which might appear when tired fingers hit the wrong keys, and this shows a helpful and well thought-out attitude to the users of the book.

I found no errors in the listings, although I do confess to a few creeping in via my typing.

Each program is clearly annotated with helpful explanations of the routines used, and there are copious notes on alterations which might be tried. An Interesting note is that the programs will be compatible with discs when we all upgrade.

Info File on its own would be worth the cost of this book, being a very adaptable datafile program. Certain other ones

appear less useful, such as the one to plan a room such as a kitchen.

Supersound tames the Sound and Envelope commands of the Electron, and allows sounds and sound effects to be designed, adapted and played around with.

Cashflow was fascinating, producing a spreadsheet of one's finances – again this will be of use to many.

Overall it is a book which contains 14 useful listings, but more than that it will allow the user to gain familiarity with the micro so that one's own programming more closely resembles the well-structured approach of the Bishops.

Phil Tayler

### Top of the list

Creative Assembler by Johnathan Griffiths (Penguin).

TWO thirds of this book is devoted to discussing the techniques involved in

writing large assembly language programs with many routines listed, and one third is devoted to the novice programmer.

When I tell you that the author Johnathan Griffiths wrote Acornsoft's JCB Digger and Snapper you will get an idea of the standard of programming the author is attempting to teach.

The middle section contains explanations of macros, conditional assembly and how to create macro source files. Several examples are listed.

Section three is specifically aimed at programmers who are writing arcade games in assembly language. A number of routines are listed which

CREATIVE ASSEMBLER
How To Write Arcade Games
for the BBC Microcomputer Model B
and Accen Electron
Jonathan Griffichs

PENGLIN ACORN COMPUTER LIBRARY

can be incorporated into your own programs.

Very little explanation is given and the reader is left to puzzle out how they work.

This section is just what the advanced programmer needs, and is the only book I have seen with an explanation of how to poke the screen directly to move characters around.

An example game is listed at the end which is a mixture of Basic and assembler.

Although one third of the

book is an introduction to assembly language and the assembler. I would not really recommend it for the beginner as the jump to the second and third sections is too great.

There are other books available that are more suitable.

This is an absolute godsend for anyone struggling to write arcade games in machine code. Johnathan Griffiths' discussion of macros and program structure, and his routine for poking the screen are fantastic, making this an absolute must.

Put it at the top of your shopping list immediately.

Roland Waddilove

## ABC of assembly

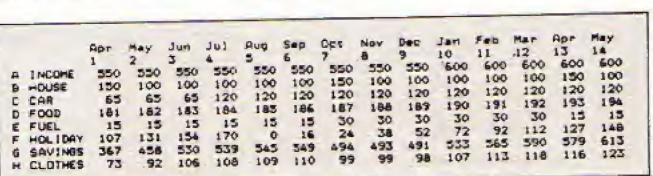

Beyond Basic by Richard Freeman (BBC NEC).

BEYOND Basic is written for anyone who has a good grasp of Basic and who wants to learn how to program in assembly language.

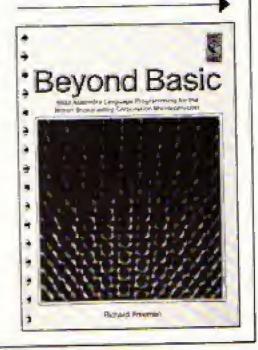

The chapters include addition and subtraction, jumps, addressing modes, multiplication and division, and operating system calls.

The reader is taken from his first assembly language program — simply loading the accumulator with a number — to sorting a Basic string array. Each step along the way is explained very simply and clearly.

There are many exercises at each stage to test the reader's

Household cashflow from Practical Programs for the Electron

#### From Page 43

understanding of the important principals involved.

There are several books around now which aim to teach assembly language programming, but in my opinion this is by far the best text for beginners.

There is a cassette available which has all the programs in the book on it. If you're the lazy type, you can load each program from tape instead of tapping it in at the keyboard.

This is an excellent manual, which I strongly recommend.

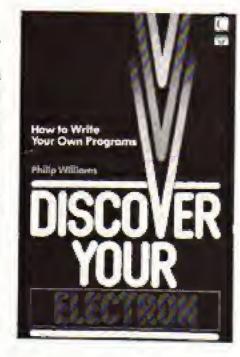

Roland Waddilove

### Room to doodle

Discover Your Electron by Philip Williams (Century Publishing).

YES, the price really is just £2.95, and it contains 120 pages of information about how to program the Electron.

One slight drawback to this

seemingly lovely state of affairs is that each page measures over 12cm in width, yet the text only covers some 7cm.

Some of the enormous margin space is occasionally filled with diagrams, but mostly it simply contains huge titles which emphasise the space even more.

So perhaps Mr Williams could have condensed the book into about 70 pages of normally spaced script, but I don't suppose it would have seemed such good value...

Still, back to the book, which is subtitled 'How to write your own programs',

The reader willing to try out the ideas as they are broached in the course of the book will doubtless gain much which will help towards writing programs for the Electron.

It really covers less ground than the excellent Users' Manual, but perhaps Mr Williams scores by making the steps through the book small and simple enough for the average reader to follow quite happily.

I wasn't too sure why the author explains GOTO and GOSU8 at some length before he introduces the idea of a PROCedure.

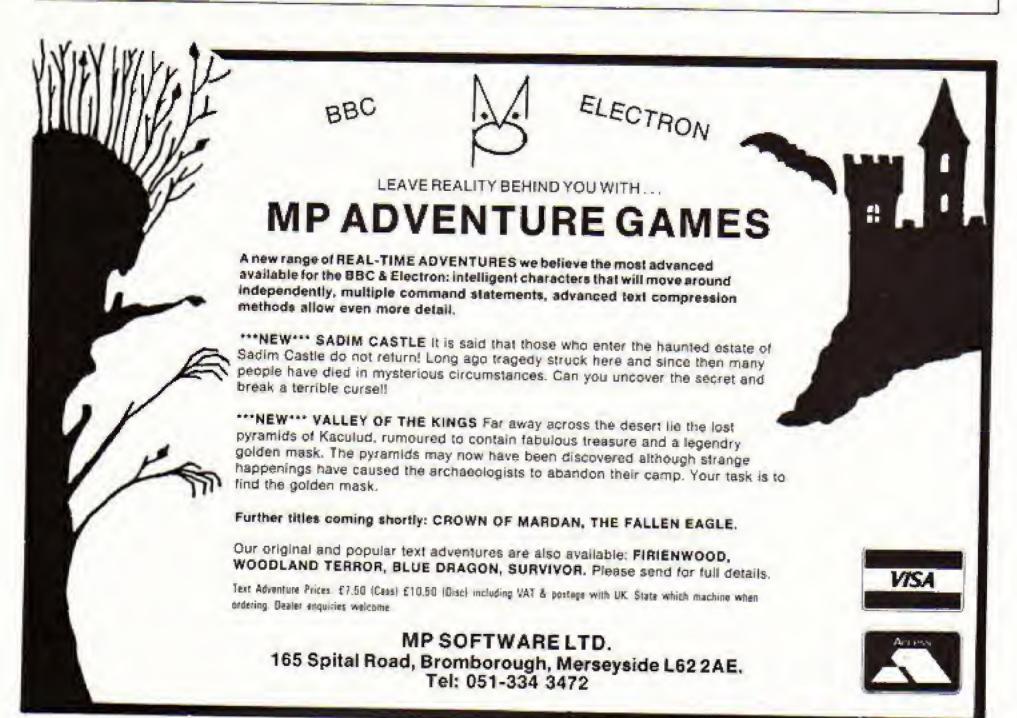

As I said earlier, there is nothing at all in this book which is not dealt with in the manual. But it is user-friendly – to use the jargon – and for £2.95 it will give many people a little more encouragement as they move from playing with their Electron (or is it the Electron playing with you?) to making it do as it is told.

A useful stocking filler perhaps, and plenty of room to doodle in the margins!

Phil Tayler

Discover Your Electron leaves ample margins for notes

#### **Electron Joysticks**

Fully analogue, ACORN compatible, sprung return to centre jaysticks to work with your Plus 1 interface or other analogue interfaces. Already in use by tens of thousands of BBC owners, these British made joysticks are fully guaranteed and backed by our years of experience in the video games industry.

- Delta 3b "twin"—A pair of analogue joysticks wired to a single plug. One joystick has red fire buttons the other green. £19.95
- ▲ Delta 3b "single"—A single joystick but with the fire buttons of two joysticks. £12.00

Coming soon: Conversion software utilities that will make non standard games work on these standard joysticks.

Delta 3b joysticks should be available where you bought your Plus 1 or other analogue interface. If not they can be ordered direct from our factory.

## Now they're all together -in ONE simple package

Word Processor: Ideal for writing letters and reports. There is a constant display of both time and word count, plus a words-per-minute display to encourage the buddling typist! A unique feature is the double-size text option in both edit and printer mode – perfect for young children and people with poor vision.

Spreadsheet: Enables you to use your micro for home accounts or pocket money records. It creates a display of numbers in rows and columns. Continuous updating is possible, and a changed figure can be instantly reflected throughout the rest of the spreadsheet. Your results can be saved, to be used for future updates,

If you want to start doing more with your micro than just playing games, this package is your ideal introduction to the four most popular applications for professional computers. All the programs have been designed for simplicity, so even a child can use them. Easy, fully-detailed instructions are included.

ONLY £5.95 / £7.95

or can be fed into its associated program ...

Graphics: Part of the spreadsheet section, it lets you draw bar charts, pie charts and histograms to give a graphic presentation of your figures.

Database: You use this for storing information, just like an office filing cabinet. Facts you have entered can be quickly retrieved by just keying in a word or part of a word. They can be sorted, replaced, saved for future use or printed out.

Graphics tablets

ROM chips

Monitors

**Printers** 

Everyone who is anyone in the exciting world of the BBC Micro and Electron will be at our greatest ever autumn show. And that includes all the big names you see advertising in the pages of our magazines.

Waiting for you will be more than 150 stands, packed with hardware, software and peripherals – some on show for the first time.

And everything will be for sale – much at really low, show prices!

Once again our team of writers will be there to give you free advice — an ideal opportunity to find out all the facts on the latest computing techniques. Don't miss this chance to meet in person the names you see in these pages every month!

Free buses!

To get you to the show as easily as possible we are running free Show Buses from Alexandra Palace station, leaving every 10 minutes.

Free parking!

There's plenty of free parking, too. All part of the service to make this an enjoyable and relaxing computer day out!

10am-5pm 10am-5pm 10am-5pm 10am-4pm

Thursday, 25 October Friday, 26 October Saturday, 27 October Sunday, 28 October

#### This voucher is worth £1 per head

#### Reduced prices for SAVE MONEY with School/College Groups

Entry only £1 per student if bookings are made in advance. Send your cheque (made payable to Database Publications) and SAE to:

Electron & BBC Micro User Show 68 Chester Road, Hazel Grove, Stockport 5K7 5NY Tel: 061-456 8383

Valid for a minimum of 10 people

#### our Special Travel and Hotel Offer

Visitors to the Show can obtain cut-price rall tickets from ANY station in the United Kingdom - plus special reduced prices at London hotels. Write to:

Travel Offer, P.O. Box 1, St. Albans AL1 4ED with SAE or Telephone: St Albans 34475 quoting: The Electron & BBC Micro User Show.

By handing in this voucher at the door you save £1 off the normal admission price of £3 (adults) and £2 (children).

(Valid for a maximum of 4 people)

10am-5pm, Thursday, 25 October 10am-5pm, Friday, 26 October

10am-5pm, Saturday, 27 October 10am-4pm, Sunday, 28 October

Alexandra Palace Wood Green, London N22.

Number attending: 1 2

YOU can go for gold with the M

Fancy pitting yourself against the world's best at this summer's Olympics?

You can do so without going anywhere near Los Angeles - with the most challenging package of programs of 1984.

MICRO OLYMPICS is more than a game. It's a brilliantly written collection of ELEVEN track and field events.

And because we know we're going to sell many thousands of them we've brought the price right down - to just £5.95.

Ever imagined yourself as another Seb Coe? Then try to run against the world record holder at 1500 metres. And if that distance is too much for you then there's always the 100, 200, 400 and 800 metres to have a go at.

Not much good at running? Don't worry, MICRO OLYMPICS has many more challenges for you. Why not try your skill at the high jump or the long jump?

And if you can't beat the computer at running or jumping then you can always throw things around in frustration! The trouble is that it's just as hard to be a champion at the discus, the hammer or the javelin.

And the pole vault takes the event to new heights!

Yes, it's fast, furious fun, pitting yourself against the world's best times and distances on your micro.

You may not be another Steve Ovett or Alan Wells, but with practice you COULD become the Micro Olympics Champion!

Also available from WH Smith and all other leading stores

end for it tod

## TEST YOUR SPELLING

#### ... with this entertaining and educational game by STEVE LUCAS

#### THIS program was written to help children with their spelling.

Very young children find difficulty relating the capital letters on the keyboard to their equivalent small letters so the only response required by them is hitting the space bar.

When the program is run you will be asked how many children are to use it. The program stores details of the performance of each child so that the teacher or parent can check their progress. You are given the option of turning off the sound effects.

Each child is presented with 10 questions chosen at random from the 60 data lines. in the program. These can be adapted for children of different ages by changing the vocabulary.

A dictionary definition of the word appears at the bottom of the screen and four alternative spellings of the word appear in turn. The pupil should hit the space bar when the correct alternative is displayed.

A wrong answer causes the computer to display what the correct response should have been, together with the alternative selected. A correct answer increments the score.

#### VARIABLES

Pupil number SC(X) Scores

AD Random choice of start question DX Number of answer selected

A\$(X,Y) Holds the words N\$(X) Pupil's name

XX,YY Used for sound effects AAS Holds keyboard response B\$(X) Holds definitions A%(X)

Holds number of correct answer

#### **PROCEDURES**

**PROCtitles** PROCread\_data

**PROCerror PROCcorrect PROCWrong** 

**PROCspacebar PROCyes** PROCno

Gives instructions Reads data into arrays Error handling Correct response

Waits for space bar to be pressed Prints results to printer (if available) Prints results to screen in paged mode

#### **GET LOST** IN AN EPIC ADVENTURE!

JOIN THE GROWING BANKS OF ADVENTURERS WHO REGARD OUR GAMES AS THE ULTIMATE ELECTRON ADVENTURES

"Having now tried all of the Epic adventures they must be the yardstick by which all future adventures for the Electron should be judged" - Electron User.

Sophisticated compression techniques allow us to pack approx. 230 locations and an average of 25 thousand characters of text into each game.

CASTLE FRANKENSTEIN: The Frankenstein Monster was thought to have been killed in a fire at the Castle 20 years ago, but a series of unsolved murders has taken place and the people fear that the Monster is on the loose again. Explore the graveyard and Castle rules, with its secret passages. sulphur pits, etc., to find and destroy the Monster. - £7.95 "This, I feel, is the proper way to write an adventure".

"One of the best all-round adventures I have over seen for the Electron" - Electron User.

THE QUEST FOR THE HOLY GRAIL: To become a knight of the round table you must find the Holy Grail and return with it to Camelot. Your search will take you through forest, swamp, castle, dungeons and rivers, and on the way you will meet many characters, some friendly some hostile. Can you outwit them all and solve the many puzzles to successfully complete your quest? - £7.95

Yet another superb adventure from Epic\*

"The puzzles are superb and I think praise is due to the program's writer" - Electron User.

THE KINGDOM OF KLEIN: The Wicked Witch has stolen the Magic Klein Bottle from its pedestal in the palace. She swore that she would put a hideous curse on anybody who was foolish enough to try to recover it. Your task is to defy the Witch's curse and solve the mystical properties of the 5 solids, in order to kill the Witch and return the Sottle to the Klein Kingdom. - £7.95

Overall, a definite must for the experienced adventurer

"An extremely good adventure and excellent value for money. Recommended" - Electron User.

THE WHEEL OF FORTUNE: Whilst walking along a lane you notice the Wheel of Fortune lying on the ground. On spinning it you find yourself in a strange and mysterious world, but the Wheel is gone. How can you return to civilisation without it? Perhaps the begger knows something, or the policeman. These are just 2 of the intelligent characters that you will meet in your adventure This game contains a unique multi-statement language interpreter, intelligent characters acting in real-time, and a number of other advanced features too

numerous to mention here. - £9.95 This is an exciting new adventure with some novel features'

"The definitive Electron adventure. Highly recommended" - Electron User.

Please make chaques payable to EPIC SOFTWARE and state clearly whether BBC or Electron versions are required P&P FREE if ordering 2 or more games, otherwise add 50p.

This listing is included in this month's cassette tape offer. See order form on Page 47.

CODE SCROLLER is a short assembly language routine which provides a wrap-around screen in Mode 4 or 5.

The routine as presented scrolls the whole of the screen off to the left and brings it back to the starting position from the right.

This in itself may not appear too useful. But if line 580 (CPX #&20) is altered to read CPX# (any hex number between &01 and &20) then one can scroll as many lines as required, starting from the top of the screen.

For example:

#### 580 CPX#408

will scroll just the top eight lines and leave the remainder of the screen intact.

However, before you start playing around with the program, save it in case a typing error has been made. Machine code is lethal if it has been mistyped.

If you need to scroll a part of the screen other than the top, all you do is calculate the new address where the scrolling is to start and alter the program accordingly.

This start address depends on where you want the scroll to start and is given by the equation:

#### Start Location=&5800+ (Y\*&140)

Here, Y is the first line to be scrolled, the lines being numbered 0 to 31 from top to bottom.

Once the start location has been found, the three addresses contained in lines 110 to 180 must be changed in line with this new location.

Suppose you just want to scroll the bottom eight lines of the screen. These lines are

# What the Acorn Electron has been waiting for!

Latest version of Forth for the Electron (Not re-hashed Forth 79 Code)

Unique Stack Display Utility

16k Eprom type 27128

Available as a 'bare' ROM or a ROM Cartridge for the 'Plus I' interface

> Multi-tasking operating system for Real Time use.

Here's another first from Skywave Software. A Forth Epromfor the Acom Electron which can Multi-task, It's called Multi-Forth

It's the same Forth that has already revolutionised the BBC Micro and, since it follows not on the heels of the ZX81-Forth ROM and Spectrum Forth-I/O Cartridge, you can probably guess that David Husband is the genius behind it.

Multi-Forth 83 is a 16k Eprom type 27128 which sits sideways in the ROM area along with any other ROMs in use. It then allows a number of Forth programs to run simultaneously and transparently of each other, placing each task in a queue, up to a maximum of twenty-eight!

Multi-Forth 83 is also compatible with the MO5 and specially vectored to enable a system to be reconfigured. It contains a Standard 6502 Assembler, a Standard Screen Editor and a unique Stack Display Utility, too.

At a later date a Cartridge version for the Acorn 'Plus I' will be available, but for now Multi-Forth 83 is sold as a 'Bare' ROM which means an interface is needed for the Standard Acorn Electron.

This unique Eprom comes with an extensive Manual and, at £45+VAI it is superb value. Order it using the coupon, adding £2.30-p&p (£5 for Europe, £10 outside) or, for more information, simply tick that box instead. Either way, you'll be one step ahead of the competition.

Varne		Please send the more informatic Title 1 - Forth BB - 3 and the si

MULTI-FORTH 83 FOR THE ACORN ELECTRON

numbered from 24 to 31, so the formula for giving the start address is:

#### Start Location=&5800+ (24\*&140)

which is & 7600.

Now we've got the start address, we can make the necessary changes to lines 10 to 180.

First of all we put the start address into the accumulator by putting # & 76 and then #8.00 after the LDA of lines

110 and 120. This gives:

> 110 LDA #\$76:STA \$71 120 LDA #400:STA 470

Next, we have to give the Electron the address of the location eight bytes above the start address. To do this we just add eight to the start address.

In this case, our start address is & 7600, so adding eight to it gives us & 7608. As

before, we split the number in two and pass it to the Electron in lines 140 and 150:

> 140 LDA #&76:STA &73 150 LDA #408:STA 472

Finally, we add & 138 to the start location - which gives us &7738 - and pass thisaddress to the Electron via lines 170 and 180:

170 LDA #&77:STA &75 180 LDA #438:STA 474

Having changed all the

addresses so that the routine affects only the bottom eight rows of the screen, we now inform the Electron that we want all eight of these rows to scroll with:

#### 580 CPX 108

Now all you have to do is run the program, press the space bar and there's your eight lines scrolling left. Try changing the figure after the CPX and see what happens.

Have fun.

the left

ross the screen and off to

#800 after the LDA of lines

#### CONTRACT BRIDGE

N.B. NOT A FEEBLE ATTEMPT TO PLAY RANDOM HANDS! BRIDGE-MENTOR is an ideal bridge partner for the Electron.

- Perfect your cardplay improve your bidding
- Archive interesting hands
   Create/Analyse random deals

With high resolution colour graphics and sound of the Acorn Micro. BRIDGE-MENTOR guides you through pre-analysed hands. A host of features (including the spectacular AUTOPLAY option) and grand slam guiz,

- Ideal for individual PRACTICE, ANALYSIS and ARCHIVING Superb teaching aid for CLUBS and PROFESSIONALS
- FOR BBC "B" and ELECTRON £9.50 inc. post, packing, etc.

Cheques to: MINIC BUSINESS SERVICES 12 Woburn Close, Bushey, Herts. WD2 3XA.

## Micro Messages

RECENTLY I have bought a Plus One interface for my Electron. When I type \*HELP I get the message:

#### Expansion 1.00 ADC/Printer/RS423 OS 1.00

I was rather confused at this message as my Plus One does not have an RS423 interface.

Does this mean that Acorn will be updating the Plus One later? If so, will I be getting an upgrade? - Mark Stanley, Weymouth, Dorset.

PS. Keep up the good work on a terrific magazine that I get every month.

 The Plus One is a very interesting beast, not least because it purports to be something that it is not. Certainly Acorn have an RS423 up and running for the Plus One.

The rumour is that the guy who wrote the software was told that there would be an RS423 and allowed for it, while the guy who did the hardware was told that it wasn't going to be included.

The result, so the story goes, is the misguided message.

Rumour also has it that the RS423 interface, which will slot into one of the Plus One's cartridge sockets, will be available before Christmas.

#### Missing commas

I THINK you may have made a mistake in the First Byte joystick program that you printed in September's Micro Messages. Surely you've left out a couple of inverted commas in lines 25 and 2671 think they should read:

25 OSCL1("FX248,"+STR\$(5 U MOD 256)+\*,0\*) 26 OSCLI(\*FI249, \*+STR\$(S U DIV 256)+",0")

This should now work. -Kevin Wards, Glamorgan.

Quite right Kevin, we hang

## Rumours surround the 'interesting beast'

our heads in shame. Happily we think most people will have figured it out.

#### Short, but effective

I WROTE this short program in my lessons last week and I find it quite effective:

10 REN CIRCLES 20 REM NEIL HAYWARD 30 MODE 2 40 VDU 23,1,0:0:0:0:0: SO REPEAT 40 MOVE 900.500 70 FOR t=10 TO 360 STEP 80 x=400@COS(RAD(E)) 90 v=400+SIN(RAB(t)) 100 MOVE 900,500 110 PLOT B5,x+500,y+500 120 NEIT 130 GCOL 0,RND(16) 140 #FX9.2 150 #FX10.2 160 UNTIL FALSE

#### Neil Hayward (14), Windsor, Berks.

· You're guite right Neil, it's very effective indeed. especially considering that it's all done in Basic.

#### BBC has the edge on speed

COULD you explain why programs I have typed from your sister publication, BBC Micro User, run significantly slower on my Electron than on the BBC itself.

I noted a similarly dramatic increase in speed when I ran Electron Golf (Electron User July 1984) on the BBC.

The differences are most

notable in the production of sound and animation. Is my machine faulty? - I. Reid, Market Harborough, Leics.

 The answer is that, owing to some cost-cutting arrangements of the Electron's memory chips, it takes twice as many goes to get information from its memory as the BBC Micro.

This means that in programs and modes that access a lot of memory the BBC has the edge.

You'll find that in some modes, such as Mode 6, this makes little appreciable difference, whereas in Mode 2 all the extra colours slow things down noticeably.

When programs go from the Electron to the BBC, the reverse applies. If you really want to see a fast game, try September's Haunted House on a BBC Micro.

#### Software for four year olds

COULD you help me with a query regarding the Electron which I recently bought for my four year old son.

I now find that I am having great difficulty buying software suitable for his age

My local W.H. Smith gave me an Acornsoft booklet listing games etc, but these do not cover pre-reading skills, number, counting, shape, size

I now wonder whether I should have bought the Sinclair Spectrum as the range of software for the pre-school child is excellent.

I do hope you can help me. Mrs D.A. Davidson, Liverpool.

 Actually Mrs Davidson, there's a great deal of educational software available for the Electron, as you'll see from the adverts and reviews in Electron User.

The problem is that after all the fanfare of last Chrstmas a lot of dealers stocked up with software. When the Electron supplies failed dismally to meet demand they were left with a lot of unsold stock and are now wary of buying more.

Happily the situation is changing rapidly and the advent of Christmas should

And if you can't wait, try a mail order dealer.

#### Filling in Mike Cook!

I WAS very interested in Mike Cook's Quick on the Draw program and like some of your

see in future issues of Electron User?

What tips have you picked up that could help other readers?

Now's here is your opportunity to share your experiences.

Remember that these are the pages that you write vourselves. So

WHAT would you like to tear yourself away from your Electron keyboard and drop us a line.

The address is:

Micro Messages Electron User Europa House 68 Chester Road Hazel Grove Stockport SK7.5NY.

## Micro Messages

#### From Page 61

other correspondents, wanted a filling procedure.

After hours of trying to understand the program and using bits and pieces out of it I came up with the following listing which will fit in with the line numbers as they are in Electron User:

335IF AS="F" THEN PROC FI 2252PRINT 'F - To FILL a s hape previously drawn\* 2254PRINT \* sove the do t inside the shape." 2256PRINT \* then press RETURN." 2310DEF PROC FILL 2320PRINT"FILL": 2330PROC BAND1 23406C0L0.0 2350PLOT69,17,Y1 23&0GCGL3,C1 2370PROC FILL! (4) 2380YCZ=YCZ-2 2390MOVEXCX.YCX 2400PROC FILL1 (-4) 2410ENDPROC 2420BEF PROC FILLI (NZ) 2430XCZ=XZ:YCZ=YI 2440REPEAT 2450PLOT77, XCX, YCX 2460YEX=YEX+NX 2470SX=PDINT(XCX,YCX) 2480UNTILSZ=CZ OR YCX>1000 OR YEXCO 2490ENDPROC

Having a four year old son ! also found that if line 1920 was replaced by the following four lines, it made life much easier:

1920 IF XX>1279 THEM XX=12 79:SOUND 1,-15.54.10 1922 IF XXKO THEN XX=0:SOU ND 1,-15,54.10 1924 IF YI)1000 THEN YI=10 00:SOUND 1,-15,62,10 1926 IF YX(0 THEN YX=0:50U ND 1,-15,48,10

 John Richardson, Chester-le-Street, Co. Durham.

 Many thanks John, it's always interesting to hear from people who've improved our programs.

#### Electron on the air

AFTER reading about an incident reported in the July edition of Electron User by T. Skinner I felt I had to write to tell what I do on the subject.

He said that he picked up his Electron's sound coming through on his radio.

I also discovered this, I tuned in my radio in, turned up the volume and got great sound effects on my games.

The best frequency was about 94.5 VHF. - G. Tatton, St. Annes on Sea.

 We can't get it to work here but from the number of letters we've got, it's no rare occurrence. Let's bring this correspondence to a close.

#### Instant BBC

DO you want to know how to turn your Electron into a BBC Micro? Type in the following and press Break.

10 \*KEY10":L:J BBC COMPU IALE\*

Stephen Manser, Tonbridge, Kent.

 Many thanks for the tip Stephen, Any ideas of how to use software to get an RS423 and a User Port as well?

#### Gorilla scoreboard

AFTER seeing the record for Killer Gorilla was 116,800 I was doubtful that a score like that was possible but after receiving a copy of 'Killa' the Upgrade from Bit Twiddlers I began to believe it.

Although my highest score without it is only 52,200 I have been very successful with my scores.

My two highest scores are 333,600 and 347,000! I hope you believe these scores because they are not made up. I would highly recommend

it to anyone as it has at least doubled my liking of Killer Gorilla. - Chris Jones (age 12), Cheadle Hulme, Che-

 It's amazing the number of letters we've had about high scores on Killer Gorilla. Certainly it seems to have captured the games player's imagination. Yours is by far the highest score so far. Incidentally, how are you all doing at Micro Olympics?

#### Mayday mishap

SOS. Surely there's something wrong with the Mayday program on Page 48 of the October issue of Electron User? I reckon lines 340 and 350 are missing but can't

work out what they should be. Am | right? - Tom Sherp, Cleethorpes.

· Curses! You are right. The program was fine when the page was laid out, the trouble is a bit of the listing dropped

Our apologies to all those frustrated embryo radio hams, we promise to use stickier glue in future. Here are the missing lines:

340 ENDPROC 350 DATA A,25,B,5222,C,52 52.0,522,E,2,F,2252,6,552,H ,2222,1,22,J,2555,K,525,L,2 522,M,55,N,52,0,555,P,2552. @.5525,R,252,S.222,T,5,U,22 5, V, 2225, W, 255, X, 5225, Y, 525 5,2,5522, 1,1

Just type these in, ignoring the unnumbered data, and the program will work. Honest!

#### **AND A CYLON BASE** STAR FROM BOOTS!

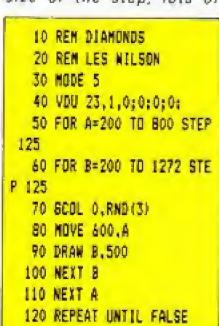

I THOUGHT you might be interested in the following program - it uses nested loops to draw a 3D diamond.

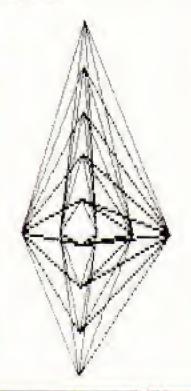

Afficionados of Battlestar Galactica may also note the similarity to a Cylon Base Star!

Furthermore, by altering the range of numbers assigned to A and B, and by aftering the size of the step, lots of

different effects can be achieved. - Les Wilson, Leighton Buzzard, Beds.

 Nice one Les, especially when I learn that you won't have an Electron until November and wrote it on one at your local Boots.

## TOP QUALITY SOFTWARE FOR THE ACORN ELECTRON

----.....

The best version available for the Electron

micro. Percy is tropped in an ice more which is populated by the deadly Snobles. His only hope of survival is to squash them by hurling ice cubes at them. Unfortunately, whenever it seems that he has won, a deadler breed appears. Hi score, rankings, excellent graphics and sound. Net ARLEASE

from the author of Percy Penguin, Mr. Witz Isia fast-action multi-scene game. Guide Mr. Wiz-around the garden to eat the chemies whilst avoiding the evil gremlins. The gremlins can be killed by dropping apples on them or by throwing the aystal ball. Extra points can be gained by eating the magic mushroom, but bewore, this is the home of the gramlins and makes them permanently furious Sound effects and tunes, hi-score, rankings, Superb arcade-style action. NEW ACLERGE

**NELLI MELERSE** 

A highly versatile implementation of Chess. Play block or white against the computer or a human apponent. The skill level of the computers play can be varied widely, and moves are entered either by co-ordinates, cursor control or joystick control. Moves can be called to deliver the control or joystick control. Moves can be called to deliver the control or joystick control. taken back if an error has been made, and the board can be modified at any time. Games can be "saved" or "loaded", and the last game con be reployed. The computer will, if requested, suggest your moves.

The rantibug descends from the top of the

screen weaving intimidatingly between the mustrooms. Your objective is to shoot all the segments of the centibug before it reaches the bottom of the screen.

Features Include: Spiders, shalls, flies, & shill levels, hi-score, rankings, and increasing differently

ft novel and unusual program, fixede-action with this exciting multi-stage shooting game. The objective of the game is to shoot the aliens out of their "bases" before the "bases" fill up. Once full, the oliens fly down relentlessly, explading as they hit the ground. The game features include: a skill levels, rankings, hi-score, increasing difficulty.

An adventure game using hiresolution fullcolour graphics. Vou are stranded an a strange. planes, and your mission is to return to civilization and home. Many of the locations are shown graphically, including the spaceship, the cliffs, the mountains, and (if you succeed) your home. You must corefully explore your environment searthing for hidden dues to help you in your quest. NEW ACTERISE

This program covers 100 countries which are divided into 8 categories of difficulty facti country is pinpointed on an acturate hi resolution screen mop of the world, and the user is asked the capital and or population. Rt the end of the test, the percentage of correct onsiders is given, so that the student can monitor his geographical knowledge.
