In this course, students will gain a foundational understanding of critical race theory, including its genesis in legal theory. The course will examine its relationship and importance to social movements, including through key concepts like intersectionality. The course will also use critical race theory to grapple with law, racial segregation, and the criminal justice system in the United States.
Area: Writing Intensive

AS.191.304. Writing Politics in an Age of Crisis. 3 Credits.
We live in an age of crisis. Social, political, and environmental disruptions both in the United States and around the world are the new normal. How do we – as individuals, citizens, and scholars – come to understand these issues? And how should we write about them? This course is designed to help students improve as writers, readers, and editors for a world where powerful young voices are more necessary than ever. The substantive focus of the course will be on the dynamics of interlinked contemporary political crises and on the responses available to individuals to address them. We will read a variety of scholarly, journalistic, and literary sources to inform our discussion and inspire our writing. However, this course is designed not as a standard seminar, but as a writing workshop. Students will write and critique a variety of pieces of different lengths and styles – including a political memoir, an op-ed, a long-form critical essay, and a piece of speculative fiction - spending the majority of in-class time on peer review, presentations, and writing exercises, which they will compile into a writing portfolio. Reading will include works by Alexander Chee, Ta-Nehisi Coates, Mary Annaise Heglar, Hunter S. Thompson, James Baldwin, Dave Zirin, Elizbeth Rush, Charlotte Shane, and Teju Cole, among many others.
Area: Writing Intensive

AS.191.310. Sex(uality) and Race as the Politics of the Beat Generation. 3 Credits.
This course focuses on the literature of the Beat Generation writers (Ginsberg, Kerouac, Burroughs, Snyder, Kaufman) of the late 1940s through the 1950s and 1960s. The Beats were a group of nomadic writers traveling the North American continent between San Francisco and New York with memorable stops in Denver and St. Louis, Missouri. Beat literature revolted against the constraining normalizing values of post war USA and celebrated freedom of expression, wanderlust, and the search for euphoria of body and mind in stream-of-consciousness narration. The course examines the relationship between society's dominant mores and beliefs (both contemporary and those of the 50's and 60's) and the counterculture, non-conformist philosophy as espoused by The Beats. The course focuses on Beat depictions of sexuality, gender and race in order to understand if these identity markers are but symptoms of social structures of oppression (racism, patriarchy, heterosexism) or if, alternatively, they can also signal, express and enact a new and different understanding of politics. Can the Beats help us envision new forms of (non-toxic) masculinity? Can they help us think of race in non-racist ways?
Area: Writing Intensive

AS.191.325. Environmental Social Sciences meet Environmental Fiction. 3 Credits.
The course pairs readings of critical texts addressing environmental crises with literary fiction broadly dealing with the relationship between the human and the environment. We discuss the ways narratives affect our understanding of complex global phenomena, and how the tools of literary analysis can help us unpack the rhetorics and values of both fictional and nonfictional texts.
Area: Writing Intensive

AS.191.335. Arab-Israeli Conflict. 3 Credits.
The course will focus on the origin and development of the Arab-Israeli conflict from its beginnings when Palestine was controlled by the Ottoman Empire, through World War I, The British Mandate over Palestine, and the first Arab-Israeli war (1947-1949). It will then examine the period of the Arab-Israeli wars of 1956, 1967, 1973, and 1982, the Palestinian Intifadas (1987-1993 and 2000-2005); and the development of the Arab-Israeli peace process from its beginnings with the Egyptian-Israeli treaty of 1979, the Oslo I and Oslo II agreements of 1993 and 1995, Israel's peace treaty with Jordan of 1994, the Road Map of 2003; and the periodic peace talks between Israel and Syria. The conflict will be analyzed against the background of great power intervention in the Middle East, the rise of political Islam and the dynamics of Intra-Arab politics, and will consider the impact of the Arab Spring.

AS.191.340. Cities, Space & Power. 3 Credits.
Gentrify! 80% of people live in urban areas. These locations are key for solving political dilemmas, including climate change, class, segregation, gender & immigration. This class explores all of these through the lens of gentrification. What does 20th century urban planning have to do with it? How can I talk to my friends about gentrification in Baltimore? Find out this and more!

AS.191.345. Russian Foreign Policy. 3 Credits.
This course will explore the evolution of Russian Foreign Policy from Czarist times to the present. The main theme will be the question of continuity and change, as the course will seek to determine to what degree current Russian Foreign Policy is rooted in the Czarist(1613-1917) and Soviet(1917-1991) periods, and to what degree it has operated since 1991 on a new basis. The main emphasis of the course will be on Russia's relations with the United States and Europe, China, the Middle East and the countries of the former Soviet Union--especially Ukraine, the Baltic States, Transcaucasia and Central Asia. The course will conclude with an analysis of the Russian reaction to the Arab Spring and its impact both on Russian domestic politics and on Russian foreign policy.

AS.191.352. Race, Class, and America. 3 Credits.
Through an intensive and in-depth reading of theorists, thinkers, historians, and political scientists, this course will take students through the deeply interconnected story of American race relations and labor politics. We will examine primary source material, such as the essays of Richard Wright and Ralph Ellison, the speeches of A. Philip Randolph, Bayard Rustin, and Martin Luther King, Jr., the memoirs of Charles Denby and Angelo Herndon, and the pamphlets of Claudia Jones; we will read historical accounts which situate these figures in their context; and we will engage critically with the fundamental topic: in the United States, what is the relationship between race and class; racism and exploitation; civil rights and labor activism? Toward the end of the course, we will examine recent scholarship that has returned to these themes to show how deeply imbricated America—its people, its institutions, its political economy—remains to this history.
Area: Writing Intensive

AS.191.354. Congress and Foreign Policy. 3 Credits.
This course is an introduction to the Congressional role in foreign policy. The Constitution grants the President the authority to conduct foreign policy. Yet it also gives Congress a substantial role in the shaping of foreign policy. The roles are not always clear, creating an inherent tension between these two branches of government and efforts on each side to increase their power. This class will address the "rules of the road" in conducting American foreign policy and how they change. The class will go beyond theory to include case studies that show the tension between Congress and the Administration – including the Iran Agreement, Climate Change, the use of sanctions and American policy towards Cuba. The course will include guest lecturers who work in Congress on the various aspects of foreign policy – including appropriations, intelligence, oversight and investigations. We will address the Congressional role in ratification of treaties and in declaring war. The class will consider the different ways that each branch of government approaches human rights and sanctions. The class will also address the domestic political aspects of foreign policy – including the role of advocacy groups and special interests and the political use of Congressional investigations. One class might be held in Washington D.C. at the U.S. Senate, so would require additional time for travel.

AS.191.358. Use of Force and the American State. 3 Credits.
This course examines the growth and development of the American state's coercive institutions, namely, the military and police. We will explore the ways in which the American state makes war, fights crime, and polices the boundaries of citizenship. While we tend to approach these topics from the perspective of international relations, law, or political philosophy, this course focuses on American politics and institutions. How did the United States secure control over a transcontinental territory in the absence of a large standing army? Why did the federal government try to criminalize vices, and how were these statutes enforced? How did violence influence the development of the American state, and to what extent do these historical processes explain warfare and law enforcement today?
Area: Writing Intensive

AS.191.372. Making Social Change. 1.5 Credits.
Aitchison Students Only.

AS.191.375. Thinking Organizationally about Politics. 3 Credits.
Aitchison Students Only.

AS.191.376. Public Policy Writing. 3 Credits.
Aitchison Students Only.
Area: Writing Intensive

AS.191.379. Thinking Strategically. 1.5 Credits.
Aitchison Students Only.

AS.191.381. Education Policy. 1.5 Credits.
Aitchison Students only

AS.191.382. Thinking Economically. 3 Credits.
Aitchison Students Only.

AS.191.383. Visualizing Data. 3 Credits.

AS.191.405. Modernity and the Slaughterhouse: Labor, Violence, and Animals in Contemporary Society. 3 Credits.
Steven Pinker opens his influential bestseller The Better Angels of Our Nature with the claim that "If the past is a foreign country, it is a shockingly violent one," going on to argue that the contemporary age is one marked by relatively more peace and less violence than ever before. Drawing on a long tradition of optimist thinkers, he credits this civilizational progress to a combination of the intellectual legacy of Enlightenment humanism, greater faith in scientific rationality and technological progress, a strong system of states and social institutions, and the development of democracy and the liberal market economy. For Pinker, this account holds as much for humans as it does for animals, and he goes so far as to claim the emergence of animal rights as "another rights revolution" akin to civil rights and women's rights. But does this account of modern society hold up under scrutiny? Or, more specifically, where does it fail? And how exactly does contemporary society relate to different forms of violence (against humans and animals) that it has not done away with?The historical processes described by Pinker have not only drastically changed human society, but they have also impacted how we interact with animals. The United States today produces and consumes more meat than ever, but most Americans live at an increasing geographic and perceptual distance from animals and the humans who work with them, relying on a system of industrial production and a complex division of labor. This course approaches the politics of this distribution of labor, violence, and human-animal relations from a site rarely considered in political analysis: the modern slaughterhouse. It engages with this institution as a historical and cultural object, using the story of its emergence and operation to ask broader questions about the politics of social change. We will draw on an interdisciplinary range of academic and non-academic works to explore a range of questions about the relationships between institutions and rationality, visibility and invisibility, hygiene and marginalization, and labor and society, and to examine the narratives ostensibly peaceful, liberal democracies tell themselves about violence, history, and progress
Area: Writing Intensive

AS.191.406. Capitalism: Politics and Political Thought in a Market Economy. 3 Credits.
The United States is a capitalist economy and we live in a capitalist world. This a fact we take for granted and therefore spend little time examining. Capitalism' proponents attribute our society's unprecedented wealth and technological advances to this economic system. Some go so far as to claim that modern democracy and social progress are impossible without a capitalist economy. Critics point to growing social inequality and a slew of environmental ills as proof of capitalism's unsustainability. Some suggest that capitalism is antithetical to true democracy and human flourishing. But what exactly is capitalism? How did it evolve in the USA and how does the form capitalism takes in the United States differ from the forms it takes elsewhere? And, crucially, how is capitalism shaped by – and how does it shape – contemporary politics? And how exactly is this all related to liberalism, conservatism, neoliberalism, libertarianism, socialism, and democratic socialism? This seminar is designed to help students critically approach these questions.Rather than taking simplistic pro-contra approach, this seminar will examine capitalism along four axes: as a political-economic system, a corollary set of structures and institutions, the force behind a specific form of state organization, and the determinant of how society and individuals act and see themselves. To explore these issues, we will focus on a number of contemporary political issues, with a primary geographic focus on the United States, including the following: the debates over the welfare state and socialized healthcare; unions, lobbies, and special interests; the connection between capitalism, culture, and ideology; the effects of a capitalist organization of labor of questions of race, gender, and citizenship; the commodification of the environment and other species; and the process of critique, resistance, and social change in a capitalist system. Throughout, we will discuss the theoretical and empirical arguments put forward by a historically and disciplinarily broad range of thinkers including Karl Marx, Simone Weil, John Locke, Adam Smith, Robert Nozick, Thomas Sewell, Nancy Fraser, David Graeber, Melinda Cooper, Andreas Malm, and Guy Debord, through to Alexandria Ocasio-Cortez and Elon Musk.
Area: Writing Intensive

AS.191.415. Fear and Loathing: Writing About Contemporary American Politics. 3 Credits.
This course is focused on reading, analyzing, and, most importantly, producing writing about the American political experience and contemporary events in American politics. We will use scholarly, print, and new media sources from different sides of the political spectrum, drawing on political and literary theory to inform our discussions. We will then try to do better: Students will write and workshop a variety of pieces of different lengths and styles, spending in-class time on peer critique, presentations, and writing exercises, which they will compile into a writing portfolio. We will discuss and write op-eds, memoirs, long-form book reviews, commentary essays, and satire. Throughout, we will devote considerable class time to critique and discussion of students' writing. Readings will include works by James Baldwin, William F. Buckley, Claudia Rankine, Hunter S. Thompson, Ta-Nehisi Coates, Alexander Chee, Angela Nagle, and Omar el Akkad. We will draw on political commentary from sources ranging from The Washington Post to Jacobin to The Onion, through to Facebook and Twitter. Throughout, we will consider a wide range of topics pertinent to writing about politics, including questions of the make-up of the public sphere and diverse audiences, the use of voice and language, the deployment of facts and rhetoric, the place of fiction and humor in political critique, and the rise of fake news and trolling.
Area: Writing Intensive

AS.192 (International Studies)

AS.192.150. States, Regimes & Contentious Politics. 3 Credits.
This course, which satisfies the gateway requirement for the major in International Studies, introduces students to the study of politics and political life in the world, with a particular focus on the Middle East, Latin America, and Africa. Throughout the course, we will analyze the sources of order and disorder in modern states, addressing a series of questions, such as: why did nation-states form? What makes a state a nation? Why are some states democracies while others are not? How do people organize to fight oppression? Why does conflict sometimes turn violent? What are the causes of ethnic war? Drawing on a mix of classic works and contemporary scholarship, we will discuss the answers that scholars have formulated to address these and other questions, paying special attention to research design and the quality of argumentation. This course also counts as a 100-level course in comparative politics required for political science majors.

AS.192.210. Library Research Seminar for International Studies and Social Sciences. 1 Credit.
Are you planning to do a research project for your independent study class, or preparing for a grant application, or working on a big research project for a research intensive class or graduation thesis, or just wishing to improve your research skills? If so, this course is for you! Through weekly two hour sessions over ten weeks, you will receive systematic training on major research tools, resources and techniques useful for any research project in international studies, political science, and other social science subjects. By the end of the course, you will be able to come up with a viable research topic, and complete a research statement that includes an abstract, problem statement and literature review based on in-depth research utilizing tools and techniques covered in the course. The skills you learn through the course will prepare you for any future research projects and advanced studies.

AS.192.225. Economic Growth and Development in East Asia. 3 Credits.
The course offers an overview of the complexities of East Asia's development experience from a variety of perspectives. It is divided into three parts to allow students to develop expertise in one or more countries and/or policy arenas, while cultivating a broad grasp of the challenges of "East Asia's fast-paced economic growth." Part I considers the origins of East Asian economic development, analyses the common economic variables behind the region's success, looks at the 1997-1998 East Asian financial crisis, its lessons and the economic renaissance that followed. Part II focuses on the development experiences of individual countries, with an emphasis on the ASEAN economies, NIEs, Japan and China. Part III considers topics of special interest to East Asia, including trends toward greater regional economic cooperation, trade integration, and issues related to poverty, migration, and inclusiveness.

AS.192.265. Introduction to Contemporary African Politics. 3 Credits.
This class provides an introduction to contemporary African politics. Africa is diverse, and its political landscape is rapidly changing. Dramatic events that have occurred in just over half a century in Africa, including but not limited to decolonization, the end of the Cold War, rapid democratization, urbanization, the youth bulge, conflicts, and most recently, the COVID-19 pandemic, etc. has significantly shaped the nature of state and society with implications for political outcomes in present-day Africa. This course unfolds in four parts. In part one, we examine Africa's recent political history focusing on how pre-colonial politics, slave trade, colonialism, and decolonization politics impact modern African states. Part two then examines the social forces that shape contemporary politics across the continent. These include ethnic groups, religion, gender, and civil society. With an understanding of these social forces, we then move on to part three, which will explore dynamics and structures that mediates these social forces, including democracy, development, social movements, and international relations. The final part examines Africa's critical issues and opportunities, including conflict, the youth bulge, regionalism/AfCFTA, climate change, gender (in)equality and women's empowerment, and the COVID-19 pandemic.

AS.192.270. International Migration, Diasporas and Development. 3 Credits.
International migration has emerged as one of most politically salient and contentious issues in the politics of advanced democracies. However, while the economic, political, and social impact of large immigrant inflows has prompted much debate and analysis in developed countries, the effects of emigration and diasporas on the source country are poorly understood. This seminar examines the economic and political challenges and opportunities of international migration and diasporas on countries of origin and policy options to address them.The seminar will examine a range of issues. Is the phenomenon of greater import in the current (and future) context than it has historically been and if so, why? How do selection characteristics of international migrants and reasons for leaving affect the country of origin? Why do diasporas differ in the forms of engagement with the country of origin? What explains the massive increases in financial remittances sent by immigrants to their countries of origin and what are their effects? The seminar will also examine non-pecuniary or "social" remittances, which reshape individual preferences and social norms and thereby influence economic, political, and social change. What are the human capital effects of international migration, ranging from the "brain-drain" of limited human capital to "brain-gain" effects arising from diasporic networks? How does the "long-distance" nationalism of diasporas that support more polarizing political parties and groups engaged in conflict affect international security? Finally, we will examine policies in both receiving and sending countries and how they affect outcomes in their countries as well as of migrants themselves. Are international agreements on migration feasible or will rising nationalism ensure that unilateral policies and bilateral arrangements prevail?
Area: Writing Intensive

AS.192.290. Informational World Orders. 3 Credits.
We are on the cusp of a new era of contention in global politics. For decades, politicians and experts assumed that global information networks like the Internet had an inherently liberal bias, and would weaken autocratic regimes like China and Russia. Now, we are discovering that authoritarian countries can use technology too. The result is increased clashes over information technology between democratic countries and non-democratic countries, and among democratic countries too. All of them find themselves sharing the same global networks, and fighting over how these networks ought to work. In this course, we'll debate the conflict between different informational world orders promoted by the US, Europe and China. We will examine when information technology helps strengthen democracy, and when it benefits autocracies instead. We'll explore how information markets work, and work through the logic of political fights over artificial intelligence and surveillance.

AS.192.305. Global Energy and Environment: A Political Economy Approach. 3 Credits.
Global environmental deterioration is a major threat to human wellbeing. How do governments cooperate to address international environmental problems? Why is the global environmental regime structured as it is? Can international agreements and organizations solve global environmental problems? These are the primary questions addressed in this seminar. Among other topics, we cover research on global climate cooperation, the relationship between trade liberalization and the environment, North South negotiations on environmental agreements, environmental activism, and the problem of energy poverty in non-OECD countries.The seminar also provides students with an opportunity to conduct original research. In addition to weekly readings and discussion, the students write a final paper for the class based on empirical research on global environmental governance. Students also participate in a simulation of global climate negotiations under the 2015 Paris Agreement on Climate Change.
Area: Writing Intensive

AS.192.315. Politics of India. 3 Credits.
India is the world's largest democracy and its second most populous country. This course introduces core issues in the study of modern Indian politics. The class is organized around the following topics: we trace India's journey to Independence; the consolidation of democracy in the early decades; the relationship between the state and the economy; the state's institutional architecture; how political parties and electoral campaigns operate; the threats posed by corruption, criminality and dynastic politics; the role of caste and religion in shaping politics; the political and economic consequences of economic liberalization; elections; and the recent rise of right-wing hindutva in the country. The focus is on building knowledge and understanding of the Indian case. But we will also consider to what extent India's experience is reflective of more general theories of politics, and how they might change because of what India can teach us. Class sessions will be interactive, with plenty of opportunity for group discussion. The reading list is diverse and draws from political science, sociology, history, and anthropology.
Area: Writing Intensive

AS.192.325. International Political Economy of Emerging Markets. 3 Credits.
This course examines the relationship between politics and international economics in emerging market and developing economies. Throughout the course, we critically evaluate different political science theories of foreign economic policymaking in emerging markets. The course begins with an overview of theories of international political economy. The second section of the course focuses on developing countries' embrace of economic globalization over the past thirty years. We examine different political explanations for why emerging market and developing countries have removed barriers to foreign trade and foreign investment since the 1980s. The final section of the course explores how globalization has impacted emerging market economies, focusing on the challenge of maintaining economic and financial stability in this era of economic globalization.

AS.192.360. Modern Warfare. 3 Credits.
This course examines modern warfare from the Second World War to the present. It takes a broad historical perspective. Strategic decision-making, technological change, experiences of the soldier, different concepts of warfare, and the effect of war on societies and the effect of societies upon war will be examined. Students will be introduced to critical texts and key primary source documents. The course will start with the Second World War. It will then go on to the nuclear revolution, the Korean War, and the early Cold War. From there, the subject matter will turn to examine people's war, focusing on Mao and the Chinese Civil War and then Vietnam. Next, the Arab-Israeli conflicts will be discussed before moving on to the strategic environment of the post-Cold War world and the long war against "terrorism" in Afghanistan, Iraq, Syria, and elsewhere. Finally, the course will look at recent technological change, clashes, and new players. Throughout, special attention will be paid to non-Western views and experience of war. The five main questions of the class will be: • How has the nature of warfare changed between 1939 and today? What is the nature of war today? What kind of war is possible today?• How has technology changed warfare?• What are the experiences of people, both soldiers and civilians, in war?• How has warfare affected societies and culture? How have societies and culture affected war?• How has warfare affected domestic and international political change?

AS.192.404. Democracy, Autocracy and Economic Development: Korea, Indonesia, and Myanmar. 3 Credits.
East Asia's "miracle growth" has not gone hand in hand with a decisive move toward democracy. The course explores the reasons why democratization proceeds slowly in East Asia, and seems to be essentially decoupled from the region's fast-paced economic growth. The course is divided into three parts. Part I introduces the specifics of East Asia's economic development strategies as well as key concepts of democracy, authoritarianism and military rule and the tensions between these theories and the East Asian experience. Part II will focus on the economic and political development experiences of Korea, Indonesia and Myanmar in light of what discussed in Part I. Finally, Part III presents lessons emerging from the comparison of Korea's, Indonesia's and Myanmar's economic and political developmental trajectories.

AS.192.410. Kissinger Seminar on American Grand Strategy. 3 Credits.
Enrollment is at the discretion of the instructor and space in the course is limited. To apply, email a one-page resume, one-page personal statement on why you want to take the class including how it contributes to your professional interests, and a writing sample of less than ten pages to KissingerCenter@jhu.edu by the end of the day on Sunday, October 24, 2021. This course is an initiative of the Henry A. Kissinger Center for Global Affairs at Johns Hopkins SAIS. It will expose exceptional undergraduate students to the study of grand strategy and the history of U.S. foreign policy. The course will explore critical moments, themes, and people in the history of American grand strategy, from Washington's Farewell Address to the statecraft of Donald Trump. The seminar will also consider key issues in U.S. grand strategy today, from climate change to the challenge of an assertive China. Students will also have the opportunity to meet with current and former policymakers who have worked on these issues in real time. The course will meet 9 times at Homewood and 4 times at the SAIS campus in Washington, D.C.; transportation between Homewood campus and SAIS will be provided.

AS.192.412. Politics of Inequality. 3 Credits.
At the heart of the study of politics is a question about who gets what and when. Consequently, inequality features as a central theme in the discipline. Scholars have studied how inequality shapes democratization, redistribution, voting behavior, and how the institutions of welfare and taxation in turn shape inequality. More recently, scholars have started to pay attention to how inequality across and within ethnicities, races, and gender may matter to political outcomes. The centrality of inequality is reflected in the significant increase in quantity and quality of research on this subject over the past two decades. This seminar is designed to provide you with a critical overview of the field, both theoretically and empirically. We will briefly review the normative foundations and conceptual complexities involved in the study of inequality. Measures of inequality vary in their analytical properties, and it is important to choose the right one. We will review the main issues when measuring inequality. We will then proceed thematically. We will examine the political, and institutional foundations of income inequality and also its effects on institutional development, political participation and voting choice. Next, we examine the individual-level determinants of economic and political preferences, and how inequality intersects with race and gender. We end with a discussion of the social effects of inequality and what constraints exist to addressing inequality.
Area: Writing Intensive

AS.192.415. The Battle of Ideas for the World Economy. 3 Credits.
This seminar is intended as a capstone intellectual experience for seniors and advanced juniors majoring in international studies. The course presumes some background in economics, comparative politics, and international relations. This course will hone your analytical and writing skills by exposing you to theoretically advanced forms of political economy argument in a "proposition-opposition" format. The seminar is organized around a series of thematic pairings, covering such political economy themes like free trade vs. protectionism, free market capitalism vs. socialism, democratic erosion vs. autocratic strength, hegemonic stability vs. US abdication of power, or whether the current populist wave has mainly economic or mostly cultural roots. Each segment will deal with a specific topic area. Our discussions will involve in-depth interrogations of the arguments of these 'pro-con' authors.
Area: Writing Intensive

AS.192.420. Global Health Policy. 3 Credits.
The world's countries—low, middle and high-income alike—face numerous health challenges, many shaped by processes connected to globalization. We are presently amidst one of the greatest global health challenges of the past century—the COVID-19 pandemic. But there are others that persist, including combating the HIV/AIDS pandemic, addressing non-communicable diseases, expanding health coverage and ensuring effective global governance for health. This course will examine these and other issues with an emphasis on facilitating your understanding and critical analysis of central issues in global health policy, and examining the role you can play to address health conditions—particularly those that affect disadvantaged populations.
Area: Writing Intensive

AS.192.425. The Politics and International Relations of Iran. 3 Credits.
This course provides a basis for understanding the political, economic and security dimensions of Iran's politics and the country's role in World politics. It will discuss the Islamic Republic of Iran's complicated political system and its international politics. A significant and geostrategically situated country, Iran is where Islamic ideology first attained power in form a major social revolution. The unfolding of that revolution has shaped the Middle East, and has posed one of the most important challenges to American foreign policy. As a revolutionary Islamic State Iran experienced a unique path to development and state-building. This course will introduce the students to the main ideological currents and political trends in Iranian politics. It will discuss the structure of its theocracy, and the working of its politics and economy. The course will also examine Iran's foreign policy posture, with focus on U.S.-Iran relations, quest for nuclear power, and Iran's regional policy.

AS.192.501. Internship- International Studies. 1 Credit.

You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.194 (Islamic Studies)

AS.194.102. Islamic Pasts in the Contemporary World. 3 Credits.
This course will focus on the intellectual and cultural legacies of "Islamic pasts." It has been argued by scholars that Islam is not only a religion but a "civilization" with identifiable sensibilities, overlapping histories, and temporalities. This civilization once spread from the Atlantic coast of Africa to the Indian subcontinent and beyond, but regimes and dynasties have changed hands in many of these places, while remaining in place in others. What remains of Islamic pasts in places where Islam once reigned supreme but has either vanished, been reduced to minority status, or repressed in ongoing political projects? This course examines lost Islamic pasts in the contemporary world, using readings from anthropology, history, literature, and poetry. As the basis of this course, we will read four texts in their entirety focusing on four different geographic points of interest—Spain, India, the Balkans, and Palestine.

AS.194.105. Islam and its Cultural and Religious Diversity, 600-1600. 3 Credits.
While media often present Islam as a fairly univocal and compact cultural and religious system, news reports about tensions, hostility and at times open conflict within the Islamic world itself are frequent. Unity and internal diversity characterize Islam nowadays and have historical roots that have deeply shaped Islam since its very inception.This course will explore the historical origins of the dynamics of unity and diversity in Islam from the predication of Muhammad and the expansion of the first caliphate, to the formation of the Ottoman, Safavid and Mughal empires. By focusing on the historical events and the cultural production of the first millennium of Islam, this course will offer a thorough historical introduction to its cultural and religious complexity.

AS.194.201. Jews, Muslims, and Christians in the Medieval World. 3 Credits.
The three most widespread monotheisms have much more in common than is generally portrayed: a common founding figure, a partly shared succession of prophets, closely comparable ethical concerns and religious practices, a history of coexistence and of cultural, religious, social and economic interaction. This course will focus on a number of key texts and historical events that have shaped the relationships between Jews, Muslims, and Christians during the Middle Ages and contributed to their reciprocal construction of the image of the "other." The geographical center of the course will be the Mediterranean and the Near and Middle East, a true cradle of civilizations, religions, and exchange.

AS.194.202. Never Forget: Muslims, Islamophobia, and Dissent after 9/11. 3 Credits.
In partnership with the social justice organization Justice for Muslims Collective, this community-engaged course and oral history project will explore how diverse Muslim communities navigated and contested belonging and political and cultural agency amidst state-sponsored violence and national debates on race, gender, citizenship and national security after 9/11 and during the ongoing War on Terror. Through history, ethnography, first-person narratives, film, fiction, and online resources, students will learn about the impact of 9/11 on American Muslim communities. This includes cultural and political resistance to imperialism, racism, and Islamophobia as well as to intersectional inequities within Muslim communities that were intensified in the context of Islamophobia. Students will learn about community activism and organizing from JMC, and complete a participatory action research project with the organization. This project is an oral history archive that will address gaps in the documentation of movement histories when it comes to early organizing against War on Terror policies by Muslim communities and communities racialized or perceived as Muslim. Students will be trained to record stories of resistance among leaders who organized and responded at the local and national-level in the Greater Washington region, to support the building of an archive that will shape a wide variety of future organizing and advocacy efforts.

AS.194.205. Islamic Mysticism: Traditions, Legacies, Politics. 3 Credits.
For over a thousand years, the Sufi tradition has been a dynamic force in Islamic social, political and spiritual life. The tradition offers a treasure trove of devotional literature and music, philosophical treatises, contemplative practices, and institutions of social and political organization. After unpacking the politics of the term “Sufi,” we will trace the historical development of the tradition from the early ascetics in Iraq and Syria to the age of trans-national Sufi orders, with case studies from South Asia, Turkey, and the United States. We will then move into some of the key constructs of the tradition of spiritual growth and character formation: the divine-human relationship, the stages of the spiritual path, contemplative and practical disciplines, ideas of sainthood, discipleship and ethical perfection, and the psychology of love. Throughout the class, we will explore the nature of experiential language and interrogate the tradition through the lens of gender. We will also experience Sufism through ritual and music.

AS.194.210. Race, Gender, Citizenship: Being Muslim in America. 3 Credits.
This course explores how American Muslims navigate and contest complex notions of belonging in the context of national conversations on race, gender, citizenship, and national security. With a focus on specific case studies that range from Black Muslim movements of the early twentieth century to the ongoing War on Terror, the course adds complexity to the public conversation on what it means to be Muslim - and what it means to be American. We will draw on history, ethnography, first-person narratives, films, blogs, documentaries and fiction. As a Community Engaged course, the class will include site visits and learning with and from Muslim communities in Baltimore.

AS.194.220. The Qur’an: Text and Context. 3 Credits.
For 1400 years, the Qur’an has played a central role in Muslim intellectual, spiritual, artistic and ritual life. This course will explore the sacred scripture of Islam through its foundational ideas, history of the text and thematic development, literary style, history and methods of interpretation, and role in Muslim spiritual and ritual life. We will also explore how the Qur’an weaves through literature, music and the visual arts.

AS.194.230. African-Americans and the Development of Islam in America. 3 Credits.
Muslims have been a part of the American fabric since its inception. A key thread in that fabric has been the experiences of enslaved Africans and their descendants, some of whom were Muslims, and who not only added to the dynamism of the American environment, but eventually helped shape American culture, religion, and politics. The history of Islam in America is intertwined with the creation and evolution of African American identity. Contemporary Islam in America cannot be understood without this framing. This course will provide a historical lens for understanding Islam, not as an external faith to the country, but as an internal development of American religion. This course will explicate the history of early Islamic movements in the United States and the subsequent experiences of African-Americans who converted to Islam during the first half of the twentieth century. We will cover the spiritual growth of African American Muslims, their institutional presence, and their enduring impact on American culture writ large and African-American religion and culture more specifically.

AS.194.305. Cultures of Pilgrimage in Islam. 3 Credits.
The hajj pilgrimage to Mecca is one of the pillars of Islam. But Muslims around the world also take part in many other pilgrimages, from the massive annual Shi’a pilgrimage to Karbala to the smaller ziyarat “visits” to Sufi saint shrines, to travel to centers of Islamic learning, to pilgrimage to isolated natural features like mountains, trees, valleys. What are the theologies that propel the act of travel in Islam? How are cities, architectures, economies shaped by these cultures? And how are these traditions affected by the wars and colonial projects that plague many Muslim-majority countries in the contemporary world? Readings in this course will draw from anthropology, philosophy, Islamic interpretive texts (tafsir), and travelogues.
Area: Writing Intensive

AS.194.401. Themes in Medieval Islamic Thought. 3 Credits.
This seminar examines medieval Muslim thinkers who addressed themes at the intersection of theology, philosophy, science, and ethics: the definition of the nature of God’s attributes, His uniqueness, transcendence and omnipotence; human freewill and the limits of human knowledge; the nature of the world; and the relationship among reason, religion, and science. The course will look at how these and other crucial themes were addressed by major medieval philosophers and philosophical schools not only in Islam, but also in Judaism and Christianity, and highlight similarities and differences among the three major monotheistic faiths.

AS.194.502. Independent Study. 3 Credits.
Approval Required
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.196 (Agora Institute)

AS.196.300. Getting to Truth: How to Navigate Today's Media Jungle. 3 Credits.
Our democratic system depends on an informed public, but media today are polarized along ideological lines, undercut by economic and technological change and sometimes polluted with bogus stories written for profit or spin. In this course, taught by a veteran journalist, we will discuss the evolution of news, examine the current challenges and assess what citizens can do to get a fair understanding of what's going on. We'll use many concrete examples and students will have multiple writing assignments.
Area: Writing Intensive

AS.196.301. Social Entrepreneurship, Policy, and Systems Change: The Future of Democracy. 3 Credits.
This course will explore the dynamics and interplay between social entrepreneurship, social change, and policy. Students will explore frameworks for social transformation and systems change, and explore whether stable governance and effective policies are necessary for sustainable change. The course will examine the intersection between social change and policy change, examining how the two concepts intersect while focusing on the end goal of systems change. Students will examine different case studies of social transformation (or proposed social transformation) from across the United States and world. Guest speakers will include diverse practitioners of social entrepreneurship who think about long-term pathways to transformative social change, and dynamic policymakers.While the course will include case studies on broader domestic and international challenges and models of social transformation, a larger focus will be on specific local social problems and solutions. This will manifest through class discussions and a final project based on the surrounding community.
Area: Writing Intensive

AS.196.302. Science and Democracy. 3 Credits.
What role does scientific expertise play (or not play) in American democracy? What role should scientific expertise play (or not play) in American democracy? These are the key questions we'll address in this class, focusing on a wide range of examples such as government responses to public health crises, environmental crises, and war. We'll tackle these questions from multiple angles, drawing on ideas from across the social sciences, including political science, psychology, sociology, economics, history, and communication. We'll focus largely on the United States, though in some cases compare the US experience with other democracies to understand how unique aspects of our democratic institutions influence the link between science and democracy.

AS.196.304. Democratic Challenges. 3 Credits.
Modern democracies like the U.S. are undergoing severe challenges from within and elsewhere. Internally, many of their citizens are newly skeptical of democracy, believing for example that elections are rigged. Outside, they face new competition from authoritarian systems such as China's government, which show no signs of converging towards democracy, and offer a possible alternative system of rule. Finally, democracies also have to engage with new policy challenges, such as racial justice and climate change. In this course, we will draw upon the collective wisdom of faculty at Johns Hopkins' new SNF Agora Institute, to understand better the political challenges that democracy faces, and the policy challenges that it has to respond to. We will put modern democratic challenges in their appropriate historical context. Has America really been a democracy in the past? We will ask about the social and political conditions under which democracy does well, and under which it fails. Finally, we will look at the new agenda of questions that democracy faces, and the means that it can draw on to confront them.
Area: Writing Intensive

AS.196.305. Democratic Erosion. 3 Credits.
It is often assumed that once a country achieves a certain level of economic andpolitical development, democratic consolidation is permanent. Recent trends in American and European politics have led some commentators to question this assumption. In this course, students will explore the causes and consequences of democratic erosion in comparative and historical perspective, with a focus on better understanding our own unique political moment.This course is not intended as a partisan critique of any particular American politician or political party. Rather, it is designed to provide an opportunity for students to engage, critically and carefully the state of democracy in the US and elsewhere; to evaluate whether those claims are valid; and, if they are, to consider strategies for mitigating the risk of democratic erosion here and abroad. Readings will address both empirical and normative questions and will be gleaned from a combination of academic and media sources.
Area: Writing Intensive

AS.196.306. Democracy by the Numbers. 3 Credits.
How is democracy doing around the world? This course will help students to answer this question and ask their own questions about political systems by examining a variety of quantitative measures of facets of democracy in the U.S. and internationally. We consider general indices as well as those that focus on specific normatively-appealing aspects —the absence of fraud in and broader integrity of the electoral process itself, the guarantees of fundamental human rights to all, governments' effectiveness and accountability to the public, the equity of both representation and policy outcomes for minority groups and those historically disadvantaged or excluded, and the possibility and extent of civic engagement in non-government institutions. Wherever possible, the course will present evidence about the kinds of institutions and policies that seem to bolster democracy. Students can expect to gain hands-on experience with publicly-available subnational and national indicators of electoral and democratic quality.

AS.196.311. Democracy. 3 Credits.
Democracies around the world are under threat. This course introduces students to the philosophical foundations of democracy as well as the history of democratic revolutions, institutions, and principles. How can we defeat the most important contemporary challenges to democracy, including populism, authoritarianism and disinformation? And how can we revive the "democratic spirit" - in America and around the world?

AS.196.364. This is Not Propaganda. 3 Credits.
We live in an era of disinformation' mass persuasion and media manipulation run amok. More information was meant to improve democracy and undermine authoritarian regimes- instead the opposite seems to be happening. This course will take you from Russia to South Asia, Europe to the US, to analyze how our information environment has been transformed, why our old formulae for resisting manipulation are failing, and what needs to be done to create a model where deliberative democracy can flourish.
Area: Writing Intensive

AS.196.500. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.196.505. Internship - Disinformation. 1 Credit.
This course requires instructor approval. There will be administrative work to complete with some hands-on field research.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.196.506. Research - Disinformation. 2 Credits.
This is a research opportunity around disinformation for undergraduate students. This course requires instructor approval.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.]

AS.196.600. Data-analysis for Social Science & Public Policy I.
We will gain experience with data-analysis geared towards understanding the social world. Our scope ranges from simple descriptions and predictions under strong assumptions to intervention analyses that provide a more trustworthy foundation for quantifying causal effects. The course will be offered in a hybrid modality and will have a heavy focus on computation. We will alternate between discussion sessions devoted to fundamental concepts, and lab sessions devoted to a combination of web- and instructor-led data-analyses. Whenever possible, examples using both R and Stata and using a range of national and cross-national data-sources relevant to the study of democracy will be provided.

AS.196.601. Data-analysis for Social Science & Public Policy II.
We will gain experience with data-analysis geared towards understanding the social world. Our scope ranges from simple descriptions and predictions under strong assumptions to intervention analyses that provide a more trustworthy foundation for quantifying causal effects. The course will be offered in a hybrid modality and will have a heavy focus on computation. We will alternate between discussion sessions devoted to fundamental concepts, and lab sessions devoted to a combination of web- and instructor-led data-analyses. Whenever possible, examples using both R and Stata and using a range of national and cross-national data-sources relevant to the study of democracy will be provided.

AS.196.801. Independent Study.

AS.196.802. Field Research on Civic Engagement.
This is a graduate-level course that will focus on the field research of civic engagement.

AS.196.805. Graduate Internship - Disinformation.
This course requires instructor approval. There will be administrative work to complete with some hands-on field research.

AS.200 (Psychological & Brain Sciences)

AS.200.101. Introduction To Psychology. 3 Credits.
Do we all see colors the same way? How did so many 'good' people support the Nazi party? Do crossword puzzles really stave off Alzheimer's Disease? This course tries to answer these questions and many others, providing a comprehensive overview of the scientific study of the mind. We'll explore topics such as perception, language, memory, decision-making, creativity, love, sex, art, politics, religion, dreams, drugs, brain damage and mental illness, grappling with deep and long-standing controversies along the way: differences between the sexes, the relationship between mind and brain, causes and consequences of racism, human uniqueness (or not) within the animal kingdom, nature vs. nurture, good and evil, consciousness. Appropriate for anyone wanting to know who and what we are as human beings (or who noticed that psychology is now on the MCAT).

AS.200.110. Introduction to Cognitive Psychology. 3 Credits.
Introductory survey of current research and theory on topics in cognitive psychology. The course will cover a range of topics in perception, attention, learning, reasoning, and memory, emphasizing relationships among mind, brain, and behavior.

AS.200.132. Introduction to Developmental Psychology. 3 Credits.
An introductory survey of human development from the prenatal period through adolescence. The developing child is examined in terms of cognitive, social, emotional, motor, and language development.

AS.200.133. Introduction to Social Psychology. 3 Credits.
An introductory survey of social psychology. Topics include social perception, social cognition, attitudes, prejudice, attraction, social influence, altruism, aggression, and group behavior.

AS.200.141. Foundations of Brain, Behavior and Cognition. 3 Credits.
A survey of neuropsychology relating the organization of behavior to the integrative action of the nervous system. Cross-listed with Behavioral Biology and Neuroscience.

AS.200.162. Childhood Disorders & Treatments. 3 Credits.
This course examines the psychological disorders that are usually first diagnosed prior to adulthood. Some of the specific disorders that will be discussed are Attention-Deficit and Disruptive Behavior Disorders, Neurodevelopmental Disorders, Learning Disorders and Intellectual Disability.Students will become familiar with various diagnoses, etiologies, and methods of treatment. Note: This course does not count toward the Psychology Major

AS.200.199. Psychopathology and Its Development. 1 Credit.
Examine an overview of abnormal psychology (i.e., psychopathology), including its development, etiological/theoretical perspectives, diagnosis, and treatment. Broadly cover the DSM categories, with a focus on understanding the major features of the common disorders and the evidence-based treatment of these conditions.

AS.200.200. Research Methods in Psychology. 4 Credits.
The goal of this course is to introduce how psychological scientists develop and test research questions about the mind and behavior. We will explore how empirical investigation differs from other ways of making discoveries and learning about the world, and how psychologists employ various methodologies to tackle their phenomena of interest. We will examine the relationships between research questions and research designs, the benefits and drawbacks of differing measurement and sampling approaches, the ethical implications of various research paradigms, and best practices in communicating research findings clearly and engagingly. You will have the opportunity to engage “hands-on” with the research process through interactive labs and demonstrations. Over the course of the semester, you will develop and receive feedback on a research proposal, which will serve as a foundation for the spring course “Design and Analysis for Experimental Psychology”.
Area: Writing Intensive

AS.200.201. Design & Statistical Analysis for Psychology. 4 Credits.
The goal of this course is to expose you to the processes of data collection, analysis, and dissemination in psychology. This course is the follow-up to “Research Methods in Experimental Psychology,” and therefore will draw on the methodological principles and practices covered in the Fall semester. This course will cover a wide array of analytical techniques (i.e., statistics) that you will apply to data collected as part of a semester-long group research project. The course will also include extensive coverage of the R programming language for use in data management, analysis, and visualization. With your group members, you will collect primary research data, carry out appropriate statistical tests, compose individual research manuscripts, and collectively present a poster at an on-campus research symposium. In combination with the Fall course, this class will serve as strong preparation for those considering honors theses, joining research labs at Homewood and/or JHMI, conducting independent research projects, and ultimately pursuing careers/graduate work in experimental psychology.
Area: Writing Intensive
AS.200.200 (was AS.200.207)

AS.200.202. Forensic Psychology. 3 Credits.
The field of forensic psychology is focused on answering legal questions about the causes of human behavior. This survey course will explore the work that forensic psychologists do; their research, assessment, and clinical methods; and how their work influences lawyers, judges, and other legal practitioners. Specific topics will include mental capacity assessment, psychopathy, claims of mental distress, child custody evaluations, juvenile delinquency, forensic treatment, and forensic neuropsychological assessments.
Students can only receive credit for AS.200.202 or AS.200.325, not both.

AS.200.205. Psychological Profiling. 1 Credit.
“Psychological Profiling” focuses on strengths and limitations of psychological methods employed by forensic professionals who assist police in criminal investigations. Clinical cases of serial offenders, spree killers, disgruntled employees, police profiling, and terrorists will be studied. Legal and ethical issues will be explored, especially racial profiling controversies. We anticipate visits to the FBI Behavioral Sciences Unit at Quantico, Virginia; Baltimore County Forensic Crime Lab (with emphasis on crime scene analysis), and the Baltimore Police Profiling Program.This course does not count towards the psychology major.

AS.200.208. Animal Behavior. 3 Credits.
This course examines how and why animal behaviors are produced across the animal kingdom. Neurobiological, hormonal and developmental mechanisms and adaptive function of behaviors are examined in an evolutionary context. Behaviors include survival, acquiring food, reproduction, communication, parental care, and cooperation. Students will also learn how to develop hypotheses and predictions for scientific questions and interpret graphical results.
AS.200.141 OR Permission of Instructor.

AS.200.209. Personality. 3 Credits.
This is a survey course focused on theory and research on human personality. Topics include personality traits, motivation, unconscious processes, self-regulation, cognitive and behavioral aspects of personality, biological and evolutionary influences on personality, and dysfunctional manifestations of personality.

AS.200.211. Sensation & Perception. 3 Credits.
This course surveys how stimuli from the environment are transformed into neural signals, and how the brain processes those signals to interpret the objects and events in the world. A primary focus will be on the visual system, with additional coverage of hearing, touch, taste, and smell.

AS.200.212. Abnormal Psychology. 3 Credits.
A survey of the major syndromes of psychological disorders. Research and theory about the mechanisms, development, and diagnosis of psychopathology are emphasized.

AS.200.222. Positive Psychology. 3 Credits.
The course will review the growing field of positive psychology and will review the research on positive human attributes such as optimism, happiness, hope, resiliency, self-esteem, altruism, empathy, and forgiveness. This course will explore the research on how such positive attributes are developed and how they relate to psychological and physical well-being.

AS.200.240. Industrial and Organizational Psychology. 3 Credits.
This course provides a survey of the field of Industrial and Organizational Psychology, a scientific discipline that studies human behavior in the workplace. The course focuses on understanding the psychological bases of work behaviors, cognitions, and emotions and practices that can be implemented to create a good fit between employees’ characteristics and work demands. A number of topics are addressed in the scientist-practitioner model, including the structure/characteristics of jobs, techniques for assessing and supporting employee performance, selecting and training a workforce, and the various mechanisms that influence employee motivation and attitudes, among other topics. Real-world applications and research are emphasized throughout the course.

AS.200.250. Behavioral Neuroscience. 3 Credits.
Behavioral neuroscience is the study of the neural basis of behavior of animals, including humans. This course will introduce the student to this field using a traditional lecture format. We will cover fundamental properties of brain structure and function, mechanisms of psychoactive drug action, and brain mechanisms of perception, homeostatic drives, learning and memory, and cognition. Along the way, we will touch on the biological bases for social interactions, as well as for behavioral and mental illnesses, such as addiction, depression and schizophrenia. A key focus will be understanding how behavioral neuroscientific research, past and present, leads to knowledge in this area.

AS.200.301. History Of Psychology. 3 Credits.
A survey of leading figures, schools, and systems in the history of psychology. The course will emphasize the development of experimental psychology in late 19th century Germany and its establishment in America at Johns Hopkins, Harvard, Chicago, and Columbia. Special topics will include the development of clinical and applied psychology and psychological testing. Enrollment limited to Juniors and Seniors only. Sophomores with instructor approval. Recommended Course Background: two prior Psychology courses.

AS.200.304. Neuroscience of Decision Making. 3 Credits.
This course will survey the neural mechanisms of decision-making. Current experimental research and theory concerning selection, control, and evaluation of actions are examined in humans and animals. Topics will range from simple perceptual judgements to complex social behavior. The course involves a weekly lecture about a specific topic followed by a student presentation of a current research paper. Cross-listed with Neuroscience.
AS.080.305 AND AS.080.306 or instructor permission

AS.200.305. Advanced Seminar in Forensic Psychology. 3 Credits.
Forensic psychologists determine clinical diagnoses and offer expert opinions to assist court decision makers who must employ legal tests to make case determinations. This course will explore how forensic psychologists communicate with the courts via consultation, report writing, and expert testimony. Students will write forensic analyses on a variety of controversial, cutting edge forensic topics (e.g., for competence to stand trial, child abuse, civil commitment, compensation for mental injuries, sex offender commitment, insanity, fitness for duty, child custody). Prerequisites: AS.200.202 OR AS.200.212
Area: Writing Intensive
AS.200.202 OR AS.200.212

AS.200.307. Medical Psychology. 3 Credits.
Medical Psychology is a specialization within clinical psychology that focuses on the application of psychological theories, research, and techniques to physical health problems and health promotion. Students will learn about the consultation process and interventions used in medical psychology practice to improve the physical and psychological health of medical patients, including those with chronic conditions (e.g., chronic pain, heart disease) and those with acute illnesses and injuries. Enrollment limited to Junior & Senior Psychology Majors & Minors or with instructor approval. Prerequisite: AS.200.212
AS.200.212

AS.200.311. Sensory Representations in the Brain: Maps, Modules, & Distributed Coding. 3 Credits.
In this course we will explore the ways in which information from vision, hearing, touch, smell, and taste is encoded in the brain. We will compare and contrast different representation schemes and their computational advantages in order to uncover some overarching organizing principles of sensory processing in the brain. Class meetings will consist of lectures plus group discussions of classic papers in cognitive neuroscience, computational modeling, and neurophysiology. Enrollment limited to Juniors & Seniors.
AS.200.211 OR AS.080.203 OR AS.050.203 OR AS.200.141 OR AS.020.312

AS.200.312. Substance Use and Mental Health. 3 Credits.
This course focuses on the intersection of substance use and mental health. Topics will include substance use disorders, the co-morbidity of substance use disorders and other mental health diagnoses, and substance use as a form of self-medication for mental health symptoms. We will explore abuse of substances including synthetic drugs, "street" drugs, and commonly abused prescription medications. We will review etiological factors, including psychological, neurobiological, genetic, and trauma-related factors, as well as evidenced-based treatments. We will also explore controversies about the diagnosis and conceptual models of substance use disorders and addiction and controversial treatments, such as methadone and suboxone. Psychology majors & minors or by permission of the instructor. Pre-requisite: AS.200.212 Abnormal Psychology, or by instructor permission.
AS.200.212

AS.200.313. Models of Mind and Brain. 3 Credits.
This is a seminar surveying computational approaches to understanding mental and neural processes, including sensory and conceptual representation, categorization, learning and memory. The course will also develop familiarity with computational tools such as numerical simulation, linear transformation and data visualization. Recommended Course Background: AS.110.106 / Calculus I OR AS.110.108 Calculus I, AS.050.101 / Cognition OR AS.200.211 / Sensation & Perception OR AS.080.105 / Introduction to Neuroscience OR other introductory coursework in cognitive & neural sciences. Experience with at least one programming language is strongly recommended.

AS.200.317. Interpersonal Relations. 3 Credits.
This course will investigate interpersonal processes ranging from attraction and courtship to relationship functioning and distress. Enrollment limited to Psychology majors and Psychology minors.
AS.200.133

AS.200.321. Child and Adolescent Psychopathology. 3 Credits.
This course focuses on mental disorders in children and adolescents. The course begins with an exploration of the general models and theories for why psychopathology occurs in childhood. The second portion of the course provides a systematic review of the symptoms, course, risk factors, theories, and treatments for specific disorders, including mood disorders, anxiety disorders, autism, ADHD, feeding disorders, and behavioral disorders. Restricted to Junior & Senior Psychology Majors & Minors, or permission of the instructor.
AS.200.212

AS.200.322. Clinical Neuropsychology. 3 Credits.
Clinical Neuropsychology is a clinical psychology specialty focused on assessment and treatment of acquired or developmental disorders of the nervous system, including dementia, neurodegenerative disorders, traumatic brain injury, learning disabilities, and neurodevelopment disorders. This course will focus on research findings and techniques used by psychologists in the assessment, treatment, and rehabilitation processes. Recommended Course Background: AS.200.141 / Foundations of Brain Behavior Cognition.
AS.200.141

AS.200.323. Psychology and Social Media. 3 Credits.
This course explores modern-day social media use (e.g., Facebook, Match.com) through multiple theoretical lenses within psychology. Through weekly student-led discussions and readings, it will accomplish 3 aims: 1) applying psychology of identity, motivation, and communication to social media (e.g., self-presentation, intergroup dynamics), 2) investigating clinical/health implications of social media use (e.g., addiction, loneliness), and 3) exploring social media as data-gathering environments (e.g., user experience research from already committed guest-speakers who work in social media industries). Recommended Course Background: at least 1 course in introductory psychology, developmental psychology, social psychology and/or clinical psychology.

AS.200.326. Law, Psychology and Public Policy. 3 Credits.
An introduction to applications of psychological research in policy analysis. Special emphasis is given to the use and misuse of psychology in Supreme Court advocacy and decision making in the areas of children's rights, adult sexuality, and educational and employment opportunity. Recommended Course Background: Statistics & Regression Analysis

AS.200.329. Real World Human Data: Analysis & Visualization. 3 Credits.
Experiments in human cognition typically involve careful manipulation and control of variables in order to answer specific questions about the mind or brain. However, digital devices now provide an ocean of incidental human data: information collected continuously about our behavior and physiological states as we go about our lives. These incidental datasets are often large and noisy, and pose different analysis and visualization challenges from more traditional manipulated experiments. In this course students will learn computational tools and qualitative approaches for exploring, visualizing and interpreting large human data. The course emphasizes computer-based analysis of open-source human behavioral and neuroimaging datasets. Analyses will be conducted in MATLAB. Instructor will grant approval as long as you have previous programming experience (roughly equivalent to material covered in an introductory-level programming course). Self-taught or real-world experience can be applicable in lieu of previous formal classroom instruction.

AS.200.330. Human and Machine Intelligence. 3 Credits.
Description: The class will discuss original papers in a variety of papers and book chapters on the following topics.1. What is intelligence?2. Origin and evolution of intelligence?3. Human brain and intelligence4. Machine intelligence5. Neural networkRecommended course background: neurobiology.

AS.200.332. Seminar in Theoretical Neuroscience. 3 Credits.
This course develops a theoretical understanding of the large-scale anatomical and functional organization of the cerebral cortex. We will discuss, present, and write about primary literature in the area of theoretical neuroscience. The principles to be explored will include: hierarchy; normalization; pattern completion; prediction; gradient-based learning; and conjunctive representation. We will consider the broader motivation for each of these computational principles, and we will ask how successfully they organize the empirical data about our brains. Specific questions include: What are the functional benefits of a hierarchical anatomical organization of the cerebral cortex? Do neocortical circuits generically implement a normalization operation? How and why is pattern completion implemented in the neocortex and the hippocampus? Can gradient-based representational learning occur in the cerebral cortex without supervision or reinforcement signals? How is the flow of information between brain regions regulated? How can distinct cortical representations be "bound" into joint representations? Calculus 1 or equivalent is required. Higher-level mathematics and programming experience are not required, but students should be willing to engage with computational concepts. Recommended Course Background: AS.200.110 OR AS.050.203 OR AS.200.211 OR AS.080.105 OR other introductory coursework in cognitive & neural sciences.
AS.110.106 OR AS.110.108

AS.200.333. Advanced Social Psychology. 3 Credits.
The class is designed as a seminar including discussion of primary readings of social psychology articles ranging in topics from interpersonal relationship to behavior in large groups. Rising junior & senior Psychology majors only.
AS.200.133

AS.200.334. Human Memory Psychology. 3 Credits.
This class will survey the behavioral and biological science of human memory. Historical perspectives as well as modern controversies will be discussed. Intersections with other fields such as law, education, medicine, and technology will be highlighted. The course will be a mixture of lectures and group discussions.

AS.200.337. Origins of the Social Mind. 3 Credits.
Humans possess remarkable capacities for morality, politics, and culture. But where do these capacities come from and what cognitive mechanisms support them? In this seminar, we will take comparative and developmental perspectives to understand the origins of the social mind. We'll explore how nonhuman animals, especially primates, represent and navigate their social worlds, and what makes the human mind unique. We'll also explore the earliest manifestations of social intelligence that are present in human infancy, allowing babies to richly experience the social world long before they develop language. We'll cover a range of topics, such as the abilities to remember other individuals and keep track of their social relationships and social groups, theory of mind, self-awareness, precursors of politics and morality, and the question of whether animals have culture. Enrollment limited to Junior & Senior Psychology, Neuroscience or Behavioral Biology majors/minors. Prerequisite: 200.132 Intro to Dev. Psych OR 200.133 Intro Social Psych OR 200.110 Intro Cog. Psych OR 200.141 Foundations of BBC OR instructor approval
AS.200.132 OR AS.200.133 OR AS.200.110 OR AS.200.141

AS.200.340. Diversity in Psychology. 3 Credits.
This course presents an overview of the nature of human diversity in psychology and fosters the critical examination of major diversity issues in psychology. Conceptual, historical, philosophical, and theoretical issues and empirical research are reviewed. Students develop sensitivity and critical thinking regarding issues in psychology research and professional practice that may be influenced by factors such as age, generational influence, ethnicity, race, religion and spirituality, gender, socioeconomic class, sexual orientation, national origin, disability and other cultural diversity topics. Current issues will be highlighted. Students will also be introduced to public health paradigms regarding the changing roles of psychology researchers and practitioners. This course is limited to Senior Psychology Majors and Minors. Junior Psychology Majors and Minors can request to enroll by instructor permission.

AS.200.344. Behavioral Endocrinology. 3 Credits.
This course examines both the evolution and mechanisms of hormonal effects on behavior across animals, including humans. Topics will include the effects of hormones on sexual differentiation, reproductive behavior, parental behavior, stress and social behavior. Additionally, this course emphasizes developing skills in hypothesis testing and critically assessing the scientific literature. Cross-listed with Behvioral Biology and Neuroscience.
(AS.200.141 OR AS.080.306) OR (AS.020.151 AND AS.020.152) or instructor's permission

AS.200.350. Why is thinking hard?. 3 Credits.
In what ways and why is human cognition limited? This seminar will focus on understanding and explaining the limitations and capabilities of human cognition through deep dives into a number of subtopics. Possible topics include: What is 'intelligence,' does it have quantifiable units and/or a substance-like underpinning. Why does thinking feel hard, why and how do we experience mental effort? What limits visual attention and working memory? Where does insight come from? Why do we forget things? What is creativity? What makes some concepts hard to learn? Why do we misunderstand science? How do we evaluate our own knowledge and understanding?
AS.200.110

AS.200.357. Advanced Statistical Methods. 3 Credits.
Topics in applied probability and statistical inference; analysis of variance; experimental design. Recommended Course Background: one statistics course.

AS.200.358. Advanced Research Design and Analysis. 3 Credits.
Second half of statistics sequence, covering complex research design and analysis. Recommended Course Background: AS.200.357. Enrollment limited to seniors by instructor approval.
AS.200.357

AS.200.361. Tests & Measurements. 3 Credits.
Psychological tests and measures are used in several settings including research, clinical, business, forensic, school and other applied settings. This course will consider the methodological and practical issues involved in test construction, the evaluation of instruments, and the uses of psychological tests across settings and for different purposes. Examples of assessments that may be discussed are aptitude and achievement tests; personality and behavioral inventories; neuropsychological tests, observations and interviews; and tests for employment and forensic use. Enrollment limited to Junior & Senior Cognitive Science & Psychology Majors, or instructor approval.
AS.200.201

AS.200.369. Neuroscience of Motivation & Reward. 3 Credits.
This course will explore the neurobiological bases of motivated behavior, including eating, drinking, and reproduction, tracing the history of our understanding from early neuroscientific studies to the modern day, with a focus on mammalian model systems. We will discuss innate motivated behaviors, and well as how learning can guide the expression of these behaviors. Neural mediation of processes such as reward and aversion will be considered in depth, as will applications of these findings to the understanding of addiction and other behavioral disorders. The course will be a mixed lecture/seminar format; we will read original research articles and scholarly reviews.
Students may not have taken AS.200.366.;AS.080.305;AS.080.306 (students may enroll concurrently)

AS.200.370. Functional Human Neuroanatomy. 3 Credits.
This course examines the general organizing principles of the anatomy of the human central nervous system and how this anatomical organization relates to function, from the level of neural circuits, to systems, to behavior. Students will learn to identify neuroanatomical structures and pathways in dissections and MRI images through computerized exercises. Readings and lectures will emphasize general structure-function relationships and an understanding of the functional roles of particular structures in sensory, motor, and cognitive systems. Recommended Course Background in addition to pre-requisite AS.080.305: AS.080.306 OR AS.050.203 OR AS.080.250
AS.080.305

AS.200.374. Happiness and Psychological Well-Being. 3 Credits.
This course will cover advances in the field of research on positive psychology, happiness, and well-being, including perspectives on motivational and emotional wellness, cognitive processes, social-interpersonal dynamics, and sociocultural variables. We will explore topics including hobbies and leisure, mindfulness and meditation, money/income, ethics and religion, social media, marriage, friendship, economic institutions, school, the workplace, and more. Coursework includes reflection exercises, discussions, research proposals, fact-checking analyses, and presentations. Restricted to Senior & Junior Psychology majors & minors. Prerequisite: (AS.200.133 OR AS.200.101) AND (AS.200.212 OR 200.382) AND 200.222 or by instructor permission.
(AS.200.133 OR AS.200.101) AND (AS.200.212 OR AS.200.382) AND AS.200.222

AS.200.376. Neuropsychopharmacology. 3 Credits.
Designed to provide information about how drugs affect the brain and behavior. The course focuses on biological concepts underlying structures and functions of the brain that relate to mental disorders. An introduction to neurobiology and brain function is presented as it applies to the interaction of various classes of drugs with the individual neurotransmitter systems in the brain. A brief historic review is followed by a discussion of clinical relevance. Cross-listed with Behavioral Biology and Neuroscience. Enrollment limited to juniors and seniors.
(AS.080.305 AND AS.080.306) OR AS.020.306 AND AS.020.312) OR (AS.200.141 AND AS.020.306)

AS.200.377. Neuroethology. 3 Credits.
A comparative and evolutionary approach to understanding the neural underpinnings of biologically relevant behaviors in vertebrate and invertebrate animals. Enrollment limited to Sophomores, Juniors, Seniors or by instructor approval. Recommended Course Background: AS.200.141

AS.200.380. Neurobiology of Human Cognition. 3 Credits.
The complexity of human behavior surpasses even our closest primate relatives. Only humans communicate through language, build complex technology, devise legal system and wage war. What neurobiological capacities set humans apart from other animals? This course will explore the neurobiology of cognition, focusing on cognitive domains that are particularly developed in the human species: language, social cognition, number, executive function and concepts. The course format will consist of lectures and in class workshops.
AS.200.141 OR AS.200.312 OR AS.080.105 OR AS.080.203 OR AS.050.203 OR AS.050.312

AS.200.382. Models of Psychotherapy. 3 Credits.
This course reviews the major models of psychotherapy, including psychodynamic, cognitive, behavioral, interpersonal, and family therapy, with a focus on modern and empirically supported treatments. The application of the models through the analysis of clinical case studies is emphasized. Restricted to Junior & Senior Psychology Majors. Instructor permission required to enroll.
Area: Writing Intensive
AS.200.212

AS.200.385. Mind, Brain & Experience. 3 Credits.
How do nature and nurture shape the human mind? How does experience contribute to the development of visual perception, language and social reasoning? This course explores insights into these age-old questions from neuroscience and psychology. Studies of infant behavior reveal rich knowledge about objects and people in the first months of life. At the same time, experience has profound effects on behavior and neurobiology. For example, temporary absence of vision (i.e. blindness) during development permanently alters visual perception and the visual cortex. Key evidence also comes from studies of naturally occurring variation in human experience (e.g. blindness, deafness, socioeconomic and cultural differences). We will discuss what such studies of cognitive and neural function tell us about the origins of human cognition. This is a writing intensive course with weekly lectures and seminar style discussion of primary sources. Students will be required to write weekly responses to readings and a term paper.
Area: Writing Intensive
AS.200.141 OR AS.050.105 OR AS.080.105 OR AS.050.203 OR (AS.080.305 AND AS.080.306) OR AS.080.203

AS.200.388. Occupational Health Psychology. 3 Credits.
Occupational Health Psychology (OHP) concerns the application of psychology to improving the quality of work life, and to protecting and promoting the safety, satisfaction, health, and well-being of workers. This course will consider a broad range of topics in OHP including the role of work on well-being, job stress and burnout, diversity and work, safety climate, work-family balance, conflict, and counterproductive work behaviors. The emphasis will be on drawing connections between OHP theory and OHP practice and at the relationship between individual and organizational health and well-being. This class should be of interest to students interested in industrial/organizational psychology, social psychology, health psychology, clinical psychology, human factors, public health, preventive medicine, and industrial engineering.
AS.200.240 or instructor permission

AS.200.401. Careers in Psychology - Freshmen. 1 Credit.
An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.

AS.200.402. Careers in Psychology - Sophomore. 1 Credit.
An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.

AS.200.403. Careers in Psychology - Juniors & Seniors. 1 Credit.
An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.

AS.200.404. Careers in Psychology - Seniors. 1 Credit.
An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.

AS.200.431. Neural Systems & Behavior. 1 Credit.
Discussion of research activities in the Neural Systems and Behavior Lab. Discussion of research activities in the Neural Systems and Behavior Lab. This course is only available for undergraduate students currently working on research projects in the Moss Lab.

AS.200.450. Undergraduate Teaching Assistant in Psychology. 1 - 3 Credits.
Qualified students can serve as undergraduate Teaching Assistants for psychology courses they have already taken at Hopkins (by faculty instructor invitation only). Each individual faculty instructor will determine TA responsibilities based upon departmental policy. Upon invitation, potential Teaching Assistants should forward the instructor invitation to the co-Director of Undergraduate Studies (Dr. Drigotas) and make a request in SIS to add the course using the instructor's section number (e.g., 200.450 section 2). Dr. Drigotas will be approving requests in SIS.

AS.200.515. Psychological Research. 1 - 3 Credits.
The student chooses a research problem with the advice and approval of a faculty member. S/U grading only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.200.525. Psychology Internship. 1 - 3 Credits.
S/U grading only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.200.530. Independent Study in Psychology. 1 - 3 Credits.
S/U grading only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.200.545. Psychological Readings. 1 - 3 Credits.
Psychological Readings represents an in-depth analysis of a psychological subject area not typically covered in departmental course offerings. Students must have the support of a full time faculty sponsor and work with them to plan a curated set of readings and activities for the semester.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.200.613. Fundamentals of Biopsychology.
This is a required course for all first year PhD students in the Department of Psychological and Brain Sciences. The course covers foundational concepts and methods in neurobiology and cognitive neuroscience.

AS.200.617. Fundamentals of Cognitive Psychology.
This is a required course for all first year PhD students in the Department of Psychological and Brain Sciences. The course covers foundational concepts and methods in cognition.

AS.200.650. Why is thinking hard?.
In what ways and why is human cognition limited? This seminar will focus on understanding and explaining the limitations and capabilities of human cognition through deep dives into a number of subtopics. Possible topics include: What is 'intelligence,' does it have quantifiable units and/or a substance-like underpinning. Why does thinking feel hard, why and how do we experience mental effort? What limits visual attention and working memory? Where does insight come from? Why do we forget things? What is creativity? What makes some concepts hard to learn? Why do we misunderstand science? How do we evaluate our own knowledge and understanding?

AS.200.654. Psychological & Brain Sciences Core Topics A.
This course is designed to introduce students to core topics in psychological and brain sciences. Students will read seminal and contemporary papers in topics that cover the breadth of the field. Graduate students in Psychological and Brain Sciences.

AS.200.655. Psychological & Brain Sciences Core Topics B.
This course is designed to introduce students to core topics in psychological and brain sciences. Students will read seminal and contemporary papers in topics that cover the breadth of the field. Graduate Students in Psychological & Brain Sciences.

AS.200.657. Advanced Statistical Methods.
Topics in applied probability and statistical inference; analysis of variance; experimental design. Intended for graduate students.
Recommended Course Background: one statistics course.
Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.211 OR EN.550.230 OR AS.280.345 OR EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430 OR EN.560.348

AS.200.658. Advanced Research Design and Analysis.
Second half of graduate statistics sequence, covering complex research design and analysis. Recommended Course Background: AS.200.657. Enrollment limited to seniors by instructor approval and graduate students.

AS.200.659. Quantitative Methods for Brain Sciences.
Focuses on frequently used quantitative methods in the study of brain sciences. Course goals include gaining conceptual understanding of analysis techniques, application of techniques to datasets, and learning the use of MATLAB. Topics will include dimensionality reduction, information theory, clustering and classification, optimization and model selection, and frequency domain methods. Enrollment is limited to graduate students and undergraduate seniors; seniors must receive permission from the instructor to enroll. Recommended (but not required) Course Background: Probability & Statistics, Linear Algebra, MATLAB programming.

AS.200.661. Topics in Psychological & Brain Sciences.
An introduction to postdoctoral activities (e.g., grant applications, journal article submission, meeting presentations, the politics of psychology and American science) for Ph.D. candidates in psychology.

AS.200.662. Psychological and Brain Sciences: Career Development.

AS.200.670. Advanced Seminar in Vision.
This seminar will cover advanced topics in vision from the perspectives of several disciplines.Topics include human visual psychophysics, perception and cognition, and computational vision. Graduate students only.

AS.200.680. Psychological & Brain Sciences Seminar.

AS.200.800. Psychology Research - Summer.

AS.200.808. Readings: Current Research in Cognitive Aging.
Guided independent readings. The class is designed as a seminar including discussion of primary research articles of cognitive aging. Specific topics include human imaging and animal models of memory, aging, and neurodegenerative disease.

AS.200.810. Research In Psychology.
Students plan and execute original research under guidance of advisers. Results are usually prepared in a form suitable for publication. Graduate students only.

AS.200.817. Cognitive Seminar.

AS.200.825. Biopsychology Seminar.
Graduate students only.

AS.200.830. Research Seminar in Psychological & Brain Sciences.
TBA

AS.200.848. Current Advances in Psychological and Brain Sciences.
Introduces advanced research topics to graduate students (as well as faculty) through a series of speakers and discussions.

AS.200.849. Teaching Practicum.
All candidates are required to obtain special experience in various aspects of undergraduate teaching. Graduate students only.

AS.200.850. Advanced Teaching Practicum.

AS.200.860. Dissertation Preparation.
TBA

AS.210 Modern Languages & Literature

AS.210.101. French Elements I. 4 Credits.
Provides a multi-faceted approach to teaching language and culture to the novice French student. The first semester emphasizes listening and speaking, while laying the foundation in grammar structures, reading, and writing. This course is designed for true beginners: Students with any previous background must take the placement test (https://advising.jhu.edu/student-roadmap/freshmen/placement-exams/french/). May not be taken on a Satisfactory/Unsatisfactory basis. Contact: Claude Guillemard (cguille1@jhu.edu)

AS.210.102. French Elements II. 4 Credits.
The second semester of this intensive course for beginners provides students with the linguistic tools to read excerpts from a play (Antigone by Jean Anouilh), to polish a written autobiography, and to perform short oral skits. A variety of cultural materials help students acquire grammatical structures and expand their vocabulary.May not be taken on a Satisfactory/Unsatisfactory basis.
AS.210.101 or AS.210.103 or appropriate score on the placement exam (https://advising.jhu.edu/student-roadmap/freshmen/placement-exams/french/). Contact: Claude Guillemard cguille1@jhu.edu)

AS.210.103. Learner Managed French Elements I. 3 Credits.
This beginner course is specifically designed for students who have had some exposure to French. They must take the mandatory placement test: http://www.advising.jhu.edu/placement_french.php, and receive between 30 and 49. They will cover the first semester of French Elements at a pace suited for "false beginners" with major online components to supplement class instruction. Must complete the year with 210.102 to obtain credit. May not be taken on a Satisfactory/Unsatisfactory basis.

AS.210.105. Fast-Track Beginning French. 4 Credits.
This beginning French course is a fast-paced, intensive introduction to the French language and the culture of France and the French-speaking world, covering the content of French Elements 1 and 2 (AS 210.101-102) but in one semester. As such, it is meant for students who have some previous classroom or independent study of French (as assessed by a placement exam), or who are native or bilingual speakers of another Romance language. Classroom activities will emphasize spoken communication on a variety of topics, using relevant vocabulary and grammar. Extensive use of online resources outside of class will build skills in listening, reading, and writing. Completion of this class will allow students to enroll in Intermediate French 1 (AS 210.201).

AS.210.106. Italian through Food. 3 Credits.
This beginner's course will help you develop foundational linguistic skills in Italian while offering an overview of Italian food cultures, both past and present. By the end of this course, you will be able to navigate everyday situations (e.g. ordering a meal at a restaurant, describing your favorite dishes, talking about likes and dislikes) entirely in Italian, and will develop an appreciation for the history of Italian cuisine. Upon completion of this course, students are encouraged to enroll in AS210.152 (Italian Elements II) in the Spring term. Advanced speakers of other Romance languages (e.g. French, Spanish, Portuguese) are encouraged to enroll in AS.210.175 (Accelerated Italian for Speakers of Other Romance Languages I). Open to first-year students only.
Students who are taking/who took AS.210.151 or higher Italian language course are not allowed to register.

AS.210.111. Spanish Elements I. 4 Credits.
This is an introductory Spanish language course. On completion of this course, the students will have acquired the basic communication and grammatical skills necessary for speaking, writing, listening and reading in Spanish. Students will demonstrate these skills through their performance in class, by completing several online assignments, and by taking part in three group presentations in addition to two comprehensive exams which focus on the following thematic topics: Greetings, University Life, Family and Leisure. Students will also be introduced to the culture, history and geography of various Spanish and Latin American countries. The content covered in Spanish Elements 1 is the foundation for all consecutive Spanish courses. A placement exam is required to ensure the appropriate level. Your enrollment in Spanish Elements I will not be considered for approval until you have emailed the Spanish Language Director.

AS.210.112. Spanish Elements II. 4 Credits.
This introductory Spanish language course is a continuation of the content covered in Spanish Elements I. On completion of this course, the students will have further developed the communication and grammatical skills necessary for speaking, writing, listening and reading in Spanish. Students will demonstrate these skills through their performance in class, by completing several online assignments, and by taking part in three group presentations in addition to two comprehensive exams which focus on the following thematic topics: Food, Sports, Shopping, Travel, and Health. Students will also be introduced to the culture, history and geography of various Spanish and Latin American countries. The content covered in Spanish Elements II prepares the students for Intermediate Spanish.May not be taken satisfactory/unsatisfactory. No new enrollments permitted after 4th class session.Prerequisite: AS.210.111 or appropriate placement exam score.
AS.210.111 or Spanish placement exam score.

AS.210.120. Elementary Modern Hebrew. 3 Credits.
Elementary Modern Hebrew is the first exposure to the language as currently used in Israel in all its functional contexts. All components of the language are discussed: reading, writing, listening, and speaking. Simple idiomatic sentences and short texts in Hebrew are used. Students learn the Hebrew alphabet, words and short sentences. Cultural aspects of Israel will be intertwined throughout the course curriculum.

AS.210.121. Modern Hebrew for Beginners II. 3 Credits.
Hebrew for Beginners 106 is a continuation of Hebrew 105 and as such, students are required to have a foundation in Hebrew. The course will enhance and continue to expose students to Hebrew grammar, vocabulary, and syntax. All components of the Hebrew language will be emphasized in this course; we will highlight verbs, adjectives, and the ability to read longer texts. Speaking in Hebrew will also be highlighted to promote students' engagement and communication. Cultural aspects of the language will be incorporated into lessons as well.
AS.384.115 OR AS.210.120

AS.210.151. Italian Elements I. 4 Credits.
This course sequence (AS.210.151 and AS.210.152) is an introduction to Italian for students with no previous exposure to the language. By the end of the academic year, you will be able to meet basic needs in an Italian-only environment. Examples include introducing yourself, asking for and giving directions, ordering a meal at a restaurant, describing and asking information about places and people, and engaging in a simple phone conversation. Advanced speakers of other Romance languages (e.g. French, Spanish, Portuguese) are encouraged to enroll in AS.210.175 (Accelerated Italian for Speakers of Other Romance Languages I)

AS.210.152. Italian Elements II. 4 Credits.
Course helps students develop basic listening, reading, writing, speaking, and interactional skills in Italian. The content of the course is highly communicative, and students are constantly presented with real-life, task-based activities. Course adopts a continuous assessment system (no mid-term and no final). May not be taken Satisfactory/ Unsatisfactory. No previous knowledge of Italian is required.
AS.210.151 OR AS.210.106 or Placement Exam Part I.

AS.210.161. German Elements I. 4 Credits.
Four-skills introduction to the German language and culture. Develops proficiency in speaking, writing, reading and listening skills through the use of basic texts, multi-media and communicative language activities. Online tools required. May not be taken on a satisfactory/unsatisfactory basis. Tuesday section is a mandatory hour.

AS.210.162. German Elements II. 4 Credits.
Continuation to the introduction to the German language and a development of reading, speaking, writing & listening through the use of basic texts and communicative activities. The culture of the German-language countries is also incorporated into the curriculum. May not be taken on a S/U basis. Prerequisites: AS.210.161 or Placement Exam. Tuesday hour is mandatory.
AS.210.161 or appropriate score on placement exam.

AS.210.163. Elementary Yiddish I. 3 Credits.
Year-long course. Includes the four language skills, reading,writing, listening, and speaking, and introduces students to Yiddish culture through text, song, and film. Emphasis is placed both on the acquisition of Yiddish as a tool for the study of Yiddish literature and Ashkenazic history and culture, and on the active use of the language in oral and written communication. This class will be using In Eynem, the brand new Yiddish language program from the Yiddish Book Center.Cannot be taken Satisfactory/Unsatisfactory.

AS.210.164. Elementary Yiddish II. 3 Credits.
Year-long course that includes the four language skills--reading, writing, listening, and speaking--and introduces students to Yiddish culture through text, song, and film. Emphasis is placed both on the acquisition of Yiddish as a tool for the study of Yiddish literature and Ashkenazic history and culture, and on the active use of the language in oral and written communication. Both semesters must be taken with a passing grade to receive credit. Recommended Course Background: AS.210.163 or instructor permission.

AS.210.171. Accelerated Italian Elements I for Advanced Spanish Speakers. 4 Credits.
This course sequence is designed for advanced speakers of other romance languages (e.g. French, Spanish, Portuguese), and will cover the same material as the regular-track Italian Elements I and II and Intermediate Italian I and II courses. Upon completion of both semesters, students will be allowed to register for AS210.351 (Advanced Italian I).

AS.210.172. Accelerated Italian Elements II for Advanced Spanish Speakers. 4 Credits.
Course draws on the many similarities between Spanish and Italian to help students develop basic listening, reading, writing, speaking, and interactional skills in Italian in an accelerated fashion. The content of the course is highly communicative, and students are constantly presented with real-life, task-based activities. Course is taught in Spanish and Italian. Students successfully completing the course with a grade of A- or higher will be allowed to place into Advanced Italian I (AS210.351)
AS.210.171 with a grade of A- or higher.

AS.210.175. Accelerated Italian for Advanced Speakers of other Romance Languages. 3 Credits.
This course sequence (AS210.175 and AS210.176) is designed for advanced speakers of other Romance languages (e.g. French, Spanish, Portuguese), and will cover the same material as the regular-track Italian Elements I and II (AS.210.151 and AS.210.152) and Intermediate Italian I and II (AS.210.251 and AS.210.252) courses. Upon successful completion of both semesters, students will be allowed to register for AS.210.351 (Advanced Italian I).

AS.210.176. Accelerated Italian for Advanced Speakers of other Romance Languages II. 4 Credits.
This is the second part of an elementary Italian language course sequence designed for advanced speakers of other romance languages (e.g. French, Spanish, Portuguese). This course will cover the same material as the regular-track Intermediate Italian I and II courses. Students completing this course with a grade of B or higher will be allowed to register for AS210.351 (Advanced Italian I) in the Fall term. Pre-requisite: Completion of AS.210.175 with a grade of B or higher, or Italian Language Program Director permission.
AS.210.175 with a B or higher

AS.210.177. Portuguese Elements I. 4 Credits.
This one-year course introduces students to the basic skills in reading, writing, and speaking the language. Emphasis is placed on oral communication with extensive training in written and listening skills. Class participation is encouraged from the very beginning. All classes are conducted in Portuguese. Students must complete both semesters with passing grades to receive credit. May not be taken on a Satisfactory / Unsatisfactory basis. No previous knowledge of Portuguese is required.

AS.210.178. Portuguese Elements II. 4 Credits.
This course expands students knowledge of the basic language skills: reading, writing, listening, speaking. It uses a multifaceted approach to immerse students in the cultures of Brazil, Portugal, and Portuguese-speaking Africa. The focus of the course is on oral communication with, however, extensive training in grammar. The course is conducted entirely in Portuguese. Lab work required. Students must complete both semesters with passing grades to receive credit.
AS.210.177 or equivalent score on placement test or instructor approval.

AS.210.201. Intermediate French I. 3 Credits.
This course develops skills in speaking, listening comprehension, reading, and writing.Systematic review of language structures with strong focus on oral communication and acquisition of vocabulary; extensive practice in writing and speaking; readings and films from French-speaking countries. Recommended Course Background: AS.210.102 or AS.210.104 or appropriate score on Placement test I.

AS.210.202. Intermediate French II. 3 Credits.
This course develops skills in speaking, listening comprehension, reading, and writing. Systematic review of language structures with strong focus on oral communication and acquisition of vocabulary; extensive practice in writing and speaking; readings and films from French-speaking countries. Recommended Course Background: AS.210.201 or permission of instructor (sroos@jhu.edu).

AS.210.211. Intermediate Spanish I. 3 Credits.
Intermediate Spanish I is a comprehensive study of Spanish designed for students who have attained an advanced elementary level in the language. The course is organized around a thematic approach to topics relevant to contemporary Hispanic culture. Students will practice the four language skills in the classroom through guided grammatical and creative conversational activities and through the completion of three comprehensive exams. Outside of class, students will complete extensive online assignments and write three major compositions (as part of the three exams). In addition, students will broaden their knowledge of Hispanic culture by viewing a Spanish-language film and by reading several literary selections. Successful completion of Intermediate Spanish I will prepare students for the next level of Spanish (Intermediate Spanish II).There is no final exam. May not be taken satisfactory/unsatisfactory. No new enrollments permitted after the third class session.
AS.210.112 or appropriate Spanish placement exam score.

AS.210.212. Intermediate Spanish II. 3 Credits.
Intermediate Spanish II is a comprehensive study of Spanish designed for students who have attained a mid-intermediate level in the language or who have completed Spanish 212. The course is organized around a thematic approach to topics relevant to contemporary Hispanic culture. Students will practice the four language skills in the classroom through guided grammatical and creative conversational activities and through the completion of three comprehensive exams. Outside of class, students will complete extensive online assignments and write three major compositions (as part of the three exams). In addition, students will broaden their knowledge of Hispanic culture by viewing a Spanish-language film and by reading several literary selections. Successful completion of Intermediate Spanish II will prepare students for the next level of Spanish (Advanced Spanish I).There is no final exam. May not be taken satisfactory/unsatisfactory. No new enrollments permitted after September 13th.
AS.210.211 or appropriate Spanish placement exam score.

AS.210.220. Intermediate Modern Hebrew I. 3 Credits.
Intermediate Modern Hebrew enhances and enforces previous knowledge of Hebrew as acquired from previous foundational coursework and/or experience. Grammatical aspects of the language such as past and present tenses as well as combined and complex sentence syntax and construction would be applied. Reading comprehension and writing skills will be emphasized. Modern Israeli cultural links and facets of the Hebrew language will also be introduced to inform the holistic understanding of the modern language.
AS.384.116 OR AS.210.121 or equivalent

AS.210.221. Intermediate Modern Hebrew II. 3 Credits.
Intermediate Hebrew level II is a continuation of the course Hebrew 205 and as such is a requirement for entry. In the course, grammatical aspects of the language will be introduced in the focus of past and future tenses. Combined and complex sentences with proper syntax and reading comprehension and writing skills will be required. Modern Israeli cultural aspects of the Hebrew language will be introduced as well and will be part of the holistic understanding of the modern language.
AS.384.215 OR AS.210.220

AS.210.251. Intermediate Italian I. 3 Credits.
This course sequence (AS.210.251 and AS.210.252) will reinforce your ability to engage in complex daily tasks in Italian, and will introduce you to more formal academic and real-world topics. By the end of the academic year, you will be able to write a strong résumé and cover letter in the European format, sit a job interview in Italian, and participate in debates on simple topics. You will also read five engaging short stories, watch several Italian films, and discuss topics such as emigration and immigration from/to Italy, the protection of the environment, and the history of the Italian South.
AS.210.152 or placement exam.

AS.210.252. Intermediate Italian II. 3 Credits.
Taught in Italian. Course continues building on the four essential skills for communication presented in Intermediate Italian I (listening, speaking, reading, writing) on topics of increasing complexity. Course adopts a continuous assessment system. May not be taken Satisfactory/Unsatisfactory.
AS.210.251 OR appropriate placement exam scores (Parts I II).

AS.210.261. Intermediate German I. 3 Credits.
Taught in German. This course continues the same four-skills approach (speaking, writing, reading and listening) from the first-year sequence, introducing and practicing more advanced topics and structures. Expansion and extension through topical readings and discussion and multi-media materials. Online tools required. Prereq: 210.162 or placement exam. May not be taken on an S/U basis.
AS.210.162 or placement by exam.

AS.210.262. Intermediate German II. 3 Credits.
Taught in German. This course is designed to continue the four skills (reading, writing, speaking and listening) approach to learning German. Readings and discussions are topically based and include fairy tales, poems, art and film, as well as readings on contemporary themes such as Germany's green movement. Students will also review and deepen their understanding of the grammatical concepts of German. Prereq: 210.261 or placement exam May not be taken on an S/U basis.
AS.210.261 or placement by exam.

AS.210.263. Intermediate Yiddish I. 3 Credits.
For students who have completed one year of Yiddish language study or equivalent, this course will provide the opportunity to broaden and deepen their knowledge of Yiddish culture while continuing to improve their skills in reading, writing, listening and speaking Yiddish. Alongside textbook-based language work, students will read, listen to and interact with a variety of texts, for example literature, journalism and oral history.

AS.210.264. Intermediate Yiddish II. 3 Credits.
Continuation of Intermediate Yiddish I: this course will focus on the Yiddish language as a key to understanding the culture of Yiddish-speaking Jews. Topics in Yiddish literature, cultural history and contemporary culture will be explored through written and aural texts, and these primary sources will be used as a springboard for work on all the language skills: reading, writing, listening, and speaking.

AS.210.265. Individualized Yiddish Practicum. 3 Credits.
This course will allow students at any stage of Yiddish language acquisition to hone their skills in reading, writing, listening and speaking. The program will be individualized for each student according to his or her needs while at the same time providing joint activities in which all can participate.

AS.210.266. German Conversation. 1.5 Credits.
Taught in German. This course is designed for intermediate and above students who wish to improve their conversational and oral presentational language skills. The syllabus aims to provide useful, relevant language and necessary discourse structures to hold conversations and presentation on varied topics of an everyday, as well as academic nature. Students will practice German to build confidence, develop fluency and improve pronunciation and accuracy. Short texts, audio and films will provide the basis for discussion. Students fields of study and interests will be incorporated into the syllabus and tasks will be matched to the ability level of the students enrolled. Recommended course background: 210.262 or at least 3 semesters of college instruction or the equivalent. May be taken concurrently with other courses in German. May be taken S/U. Not for major or minor credit.

AS.210.267. German Across the Curriculum. 1 Credit.
Students in courses in History, CTL, Art History, Classics, Near Eastern Studies, WGS, and Philosophy augment their studies in those disciplines by reading short excerpts from the material assigned in the original German. The selected excerpts rotate among the disciplines, exposing students to a variety of texts and giving students the opportunity to collaborate across disciplines and acquaint themselves with the scholarly language in their respective majors and minors.

AS.210.275. Fast Portuguese for Spanish Speakers and speakers of other Romance Languages I. 4 Credits.
NO PREVIOUS KNOWLEDGE OF PORTUGUESE IS REQUIRED. This fast-paced one-semester course covers all content for Portuguese Elementary. This course is designed as an accelerated introductory course for speakers with a sound knowledge of Spanish OR other romance languages (e.g. French and Italian). The course will cover introductory aspects of Portuguese grammar and present relevant points of the cultures of the Portuguese speaking countries. Upon the successful completion of this course with a grade of C or higher, students may enroll in 210.277 Portuguese Intermediate. May not be taken on a Satisfactory / Unsatisfactory basis. No Prereq. THERE IS NO FINAL EXAM.

AS.210.277. Intermediate Portuguese I. 3 Credits.
Intermediate Portuguese I is designed for students who have attained an advanced elementary level in the language. The course offers training in the skills of the language with emphasis on expanding grammatical knowledge and vocabulary, while developing ease and fluency in the language through the use of a multifaceted approach. Course materials immerse students in the cultures of Brazil, Portugal, and Portuguese-speaking Africa, and reflect the mix of cultures at work in the contemporary Lusophone world. Upon the successful completion of Intermediate Portuguese I, students may enroll in the next level, Intermediate Portuguese II – AS.210.278. May not be taken on a satisfactory/unsatisfactory basis. Prereq: AS.210.275 or placement test. THERE IS NO FINAL EXAM.
AS.210.178 or AS.210.275 or equivalent score on placement test or instructor approval.

AS.210.278. Intermediate Portuguese II. 3 Credits.
Intermediate Portuguese II is designed for students who have attained a mid-intermediate level in the language or completed Intermediate Portuguese I AS.210.277. The course offers training in the skills of the language with emphasis on advancing grammatical knowledge, expanding vocabulary, and developing fluency in the language through the use of a multifaceted approach. Course materials immerse students in the cultures of Brazil, Portugal, and Portuguese-speaking Africa, and reflect the mix of cultures at work in the contemporary Lusophone world. Successful completion of Intermediate Portuguese II will prepare students for the next level Advanced Portuguese I – AS.210.391. May not be taken on a satisfactory/unsatisfactory basis. Prereq: AS.210.277 or placement test. THERE IS NO FINAL EXAM.
AS.210.277 or equivalent score on placement test or instructor approval.

AS.210.288. Portuguese: Conversation through Film & Music. 3 Credits.
Improve your Portuguese conversational and speaking skills through colorful Brazilian media. This course is designed for highly motivated undergraduate and graduate students who want to SPEAK Portuguese. Conversation sessions provide intensive work on communication skills through discussion on issues raised in films, news media & music. Grammar will be reviewed as needed outside of class with tutors or TA, freeing class time for more communicative activities. May not be taken on a Satisfactory / Unsatisfactory basis. Prereq: one semester of Portuguese (AS.210.177), two semesters of Spanish or Placement test.

AS.210.290. Accelerated Portuguese. 4 Credits.
NO PREVIOUS KNOWLEDGE OF PORTUGUESE IS REQUIRED. This accelerated one-semester course covers all content for Elementary Portuguese. Upon the successful completion of this course with a grade of C or higher, students may enroll in 210.277 Intermediate Portuguese. Encourages rapid acquisition by intensive exposure to the language through immersion activities, videos and culture. The course will cover relevant aspects of the Portuguese language grammar. Students will be encouraged to use the language through communicative activities, listening and writing activities. THERE IS NO FINAL EXAM. May not be taken on a Satisfactory/ Unsatisfactory basis.

AS.210.301. Advanced French for Writing. 3 Credits.
Students in AS.210.301 will focus primarily on written expression, learning to 'decipher' classic and contemporary French texts, in order to expand their vocabulary and communicate their ideas in writing with clarity and accuracy. (A primary focus on oral expression is provided in AS.210.302; the two advanced-level courses may be taken in either order or simultaneously.)
Area: Writing Intensive

AS.210.302. Advanced French for Speaking. 3 Credits.
Students in 210.302 will focus primarily on oral expression through individual and group work on contemporary media (music, film, current events) in order to expand their vocabulary and become fluent in conversation across social-cultural contexts. (A primary focus on written expression is provided in 210.301; the two advanced-level courses may be taken in either order or simultaneously.)

AS.210.306. Medical French : Santé et Société. 3 Credits.
In this interactive language course (not exclusively designed for pre-meds), students learn how to communicate in the fields of public health, medicine, and humanitarian aid in a French-speaking environment. While acquiring new lexical and syntactic tools weekly, students examine and debate the current structures and issues of the French health system, through a variety of media (governmental websites, mainstream and specialized newspapers, movies, blogs, first-account books, etc.). A final project is tailored to each student's own area of interest. Please note that this course is taught by a language instructor, not a medical expert. Students may elect to take the exam for the French For Health Diploma: https://www.lefrancaisdesaffaires.fr/testsdiplomes/diplomes-francaisprofessionnel-dfp/sante/
AS.210.301 OR AS.210.302

AS.210.308. Acting French: learning about French language and culture through theater. 3 Credits.
This course proposes to enhance students' verbal (pronunciation, intonation, syntax, vocabulary) and nonverbal skills (body language, vocal projection, spatial awareness) by performing excerpts from French and Francophone plays ranging from the Middle Ages to the 21st century. A closer analysis of these excerpts will lead us to consider how theater uses the physicality and immediacy of human experience to create a more universal form of connectivity with the world.Recommended course background: AS.210.301.

AS.210.309. The Sounds of French. 3 Credits.
This course introduces students to the sound system of French: its development over centuries, its standardized Parisian form versus regional and international dialects and accents, and the popularity of "word games" (abbreviations, acronyms, and verlan). The course will include extensive practice in perceiving, articulating, and transcribing sounds, words, and intonation groups through viewing film clips, listening to songs, and completing in class lab assignments. Recorded speech samples obtained at the beginning, middle, and end of the semester will allow students to track their progress in moving toward more native pronunciation and intonation. Recommended Course Background: AS.210.202 or equivalent

AS.210.311. Advanced Spanish I. 3 Credits.
This course is a comprehensive study of the Spanish language focused on the continuing development of students' communicative abilities and their knowledge of Hispanic cultures. Students will expand their use of basic structures of Spanish with a special emphasis on more difficult grammatical and vocabulary aspects, and further improve both their oral and written skills. Students will sharper their critical thinking skills and listening abilities utilizing movies and written texts. This course combines an extensive use of an online component with class participation and three exams. Upon successful completion of this course, students will have acquired extended complex language tools that facilitate proficiency in Spanish and its use in various professional contexts. There is no final exam. May not be taken satisfactory/unsatisfactory. No new enrollments permitted after the third class session.
AS.210.212 OR AS.210.213 or appropriate Spanish placement exam score.

AS.210.312. Advanced Spanish II. 3 Credits.
This course is thorough review of the Spanish language focused on the development of students' communicative abilities and their knowledge of Hispanic cultures. Students will both expand their knowledge of the basic structures of Spanish, with special emphasis on more difficult grammatical and vocabulary aspects, and further improve on oral and written skills. Students will increase their critical thinking skills and listening abilities utilizing movies and written texts. This course combines an extensive use of an online component, class participation and three exams. Upon successful completion of this course, students will have acquired more complex language tools to become proficient in Spanish and its use in various professional contexts. There is no final exam. May not be taken satisfactory/unsatisfactory. No new enrollments permitted after the third class session.
AS.210.311 or appropriate Spanish placement exam score.

AS.210.313. Medical Spanish. 3 Credits.
Medical Spanish is a comprehensive examination of vocabulary and grammar for students who either work or intend to work in medicine and health-related fields in Spanish-speaking environments. The student will be able to participate in conversations on topics such as contrasting health systems, body structures, disorders and conditions, consulting your doctor, physical and mental health, first-aid, hospitalization and surgery on completion of this course. In completing the course's final project students will apply, synthesize, and reflect on what has been learned in the class by creating a professional dossier individualized to their professional interests. There is no final exam. May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after the third class session.
AS.210.311 OR AS.210.312 or appropriate Spanish placement exam score.

AS.210.314. Spanish for International Commerce. 3 Credits.
Spanish for international business is an overview of business topics in an international Spanish-speaking context with an emphasis on deep review of grammar and vocabulary acquisition. On completion of this course the student will have developed the ability to read and critically discuss business and government relations in Latin America and will have examine entrepreneurship, finance, marketing, business ethics, human resources and commerce in the Spanish speaking world. In completing the course's final project students will apply, synthesize, and reflect on what has been covered in the class by creating a professional dossier individualized to their own professional interests. Concepts learned in this course will be directly applicable to careers linked to international relations and will apply to various careers in business. There is no final exam. May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after the third class session. Language Program Director: Loreto Sanchez-Serrano
AS.210.311 or or appropriate Spanish placement exam score.

AS.210.315. Spanish for International Relations. 3 Credits.
Spanish for international relations is an advanced examination of grammar and an analysis of international relations' topics in Spanish. By completion of this course the student will have developed the ability to read, critically discuss and demonstrate mastery of political and socio-economic issues in Spanish-speaking environments. Potential topics include a survey of the professions in international relations, NGOs in Latin America, intellectual property, cultural diplomacy, remesas, regional coalitions and treaties, and the environment. Class presentations and final projects will allow students to apply, synthesize, and reflect on what has been learned in the class by participating in a global simulation that will include a written exercise individualized to their professional interests. May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after the 4th class session.
AS.210.311 or appropriate webcape score

AS.210.316. Advanced Spanish Conversation. 3 Credits.
Conversational Spanish surveys high-interest themes, discusses short films by contemporary Hispanic filmmakers and offers a thorough review of grammar. The student will be able to participate in conversations on topics such as personality traits, social media, political power, art and lifestyles on completion of this course. Conversational skills mastered during the course apply to all careers interconnected by Spanish. There is no final exam. May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after the third class session.
AS.210.311 or appropriate Spanish placement exam score.

AS.210.317. Adv Spanish Composition. 3 Credits.
This third-year course is a hands-on and process-oriented introduction to discussion and compositional analysis. On completion of this course, students will have improved their Spanish writing skills in various types of compositions they might be expected to write in academic settings and in real-life formats such as film reviews, letters to the editor, cover letters, etc. The course also focuses on refinement of grammar and vocabulary use.May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after September 13th.
Area: Writing Intensive
AS.210.312 or appropriate Spanish placement exam score.

AS.210.318. Spanish for Engineering. 3 Credits.
Spanish for engineering is a comprehensive examination of vocabulary and grammar for students who either work or intend to work in the engineering field to develop their communicative strategies in the field of engineering. On completion of this course, students will be able to participate in conversations on topics such as applications of biomedical engineering in the diagnosis and treatment of different medical conditions, efficient use of energy and materials, design and construction of public works, development of electrical systems and development of solutions to environmental problems. In completing the course's final project students will apply, synthesize, and reflect on what has been learned in the class by creating a professional dossier individualized to their professional interests.There is no final exam. May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after the third-class session.
AS.210.311

AS.210.319. Spanish for Public Health. 3 Credits.
Spanish for Public Health is a comprehensive examination of vocabulary and grammar for students who either work or intend to work in the Public Health field such as government agencies, health care organizations, nonprofits, or health insurer companies, in Spanish-speaking environments. On completion of this course, the student will be able to participate in conversations on topics including health systems, reproductive biology, nutrition, epidemiology, mental health, and environmental health. In completing the course's final project students will apply, synthesize, and reflect on what has been learned in the class by creating a professional dossier individualized to their professional interests.
AS.210.311

AS.210.320. Advanced Modern Hebrew I. 3 Credits.
Advanced Modern Hebrew I will focus on conversational and interactive language skills to expose learners to attributes of different genres and layers of the language. Students will be introduced to various original texts and lingual patterns to better understand and formulate proper syntax. The course will include contemporary readings from Israeli journalism and essays, along with other relevant Hebrew resources to inform class discussions and students' reflective writings. Israeli cultural aspects will be integral to the course curriculum.
AS.384.216 OR AS.210.221 or equivalent

AS.210.321. Modern Hebrew via the Lens of Israeli Cinema. 3 Credits.
This course will expand students' fluencies in Modern Hebrew through Hebrew-dialogic Israeli and Palestinian cinema, examining and comparing several layers of a contemporary Hebrew-speaking society. For this class, students will view, discuss, and write about films with Hebrew as the primary spoken language. Through aural interpretation and subtitles, students will understand, analyze, and reflectively discuss the diversity of Hebrew-speaking cultures within society and the provenance and intentionalities of the dialects exhibited throughout a given film. Linguistic nuance, slang, and interpretive aspects of Hebrew as shown in the chosen films will prompt students to examine this modality of the expression of contemporary Hebrew. The course will be taught primarily in Hebrew and will be open to students who have matriculated to at least 200-level coursework of Modern Hebrew.
AS.384.315 OR AS.210.320 or instructor permission

AS.210.351. Advanced Italian I. 3 Credits.
This highly interactive course focuses on complex historical and contemporary themes, and is ideal, among others, for students who are specializing in international studies, medicine, psychology, and cognitive science. Students will analyze authentic texts and audiovisual materials on topics including the history of the Sicilian mafia, mental health and the deinstitutionalization movement in Italy, Europe and Italy in the 1960s-1980s, the role of curiosity and amazement in scientific discovery and art, and intercultural differences around hilarity. Taught in Italian.
Area: Writing Intensive
AS.210.252 or placement exam

AS.210.352. Advanced Italian II. 3 Credits.
Course presents a systematic introduction to a variety of complex cultural and historical topics related to present-day Italy, emphasizing intercultural comparisons, interdisciplinarity, and encouraging a personal exploration of such topics. Course adopts a continuous assessment system (no mid-term and no final).
Area: Writing Intensive
AS.210.351 OR appropriate placement exam scores (Parts I, II and III).

AS.210.361. Advanced German I: Cultural Topics of the Modern German-speaking World. 3 Credits.
Taught in German. Topically, this course focuses on defining moments in cultural history in German speaking countries in the 2nd half of the 20th century. Films, texts, including a full-length novel, and other media provide a basis for discussing events in post-war Germany from 1945 to 2000. A review and expansion of advanced grammatical concepts and vocabulary underlies the course. Focus on improving expression in writing and speaking. May not be taken on an S/U basis.
Area: Writing Intensive
AS.210.262 or placement exam.

AS.210.362. Advanced German II: Contemporary Issues in the German Speaking World. 3 Credits.
Taught in German. Topically, this course focuses on contemporary issues such as national identity, multiculturalism and the lingering social consequences of major 20th century historical events. Readings include literary and journalistic texts, as well as radio broadcasts, internet sites, music and film. Students read a full-length novel. Emphasis is placed on improving mastery of German grammar, development of self-editing skills and practice in spoken German for academic use. Introduction/Review of advanced grammar.
Area: Writing Intensive
AS.210.361 or equivalent score on placement test.

AS.210.363. Business German. 3 Credits.
Taught in German. Course is designed to familiarize students with the vocabulary and standards for doing business in Germany. Taking a cultural approach, students read texts and engage in discussion that elucidate the works of business, commerce & industry in Germany, the world's third largest economy. Emphasis is placed on vocabulary expansion and writing as it relates to business and business cases. May not be taken S/U. Recommended background: at least 4 semesters of college German (210.262) or equivalent.

AS.210.364. German for Medical & Public Health Professions. 3 Credits.
Taught in German. An introduction to the concepts and linguistic tools necessary for understanding the German health care system and public health fields. Designed for students with B1 or above language skills in German. Readings, role plays, videos and research projects will form the basis for learning. Linguistic focus on expanding vocabulary, increasing reading and listening comprehension while also honing grammatical control to increase accuracy in speaking and writing. Topics include the German health-care system, the body, typical interactions between patients and health care professionals, as well as the history of iconic institutions such as Berlin's Charite. Prerequisite: 4 semesters of college German or equivalent or permission of German LPD.
AS.210.262 OR AS.210.361 OR AS.210.362

AS.210.365. German for Science and Engineering. 3 Credits.
Taught in German. This course is designed to provide language training in German tailored to students of science & engineering. Germany has long been a world leader in engineering, most notably in chemical and mechanical engineering. Over the past decades, Germany also has taken a lead in environmental sciences and information technology. In addition, Germany is now becoming an increasingly attractive place to pursue degrees in the technical fields. This course will provide practice and expansion in all language skill areas: analysis of texts, hands-on-activities, preparation of presentations, and discussion of topics. Specific areas of interest to the course members will be taken into consideration for the selection of materials. [Does not replace 210.362 as prerequisite for upper level courses or as major requirement.]
AS.210.262 OR AS.210.361 OR AS.210.362 or equivalent or placement exam.

AS.210.367. Advanced Yiddish I. 3 Credits.
This course will provide students who have completed at least two years of Yiddish with the opportunity to hone their skills in all four language areas: reading, writing, listening, and speaking. In addition to advanced grammar study and readings in Yiddish literature, the course will take into account the interests of each individual student, allowing time for students to read Yiddish texts pertinent to their own research and writing.

AS.210.368. Advanced Yiddish II. 3 Credits.
Continuation of Advanced Yiddish I (AS.210.367). Students will continue to hone their skills in all four language areas: reading, writing, listening, and speaking. In addition to advanced grammar study and readings in Yiddish literature, the course will take into account the interests of each individual student, allowing time for students to read Yiddish texts pertinent to their own research and writing.

AS.210.391. Advanced Portuguese I: Language and Literature. 3 Credits.
This third-year course focuses on reading, writing, and oral expression. Students will read two complete works by major Brazilian, Portuguese, and/or Afro-Portuguese writers each semester, followed by intense writing and oral discussion on the topics covered. Grammar will be reviewed as necessary. All classes are conducted in Portuguese. Prereq: 210.278, placement test or instructor approval.
Area: Writing Intensive
AS.210.278 or equivalent score on placement test or instructor approval.

AS.210.392. Advanced Portuguese II. 3 Credits.
Advanced Portuguese II offers a systematic review of the Portuguese language focused on the development of students' communicative skills and their knowledge of the Lusophone culture. This course fosters the development of complex language skills that enhance fluency, accuracy and general proficiency in Portuguese and its appropriate use in professional and informal contexts. Students will concentrate on complex grammar concepts and the use of appropriate written and oral registers. Using a variety of cultural items such as current news, short stories, plays, films, videos, newspaper articles, and popular music, students discuss diverse topics followed by intense writing and oral discussion with the aim of developing critical thinking and solid communication skills. May not be taken on a satisfactory/unsatisfactory basis. Prereq: AS.210.391 or placement test.
Area: Writing Intensive
AS.210.391 or equivalent score on placement test or instructor approval.

AS.210.409. Le monde francophone. 3 Credits.
This course examines both sociolinguistic and cultural aspects of the French-speaking world and the relationship between la francophonie and France itself. We focus on five regions—Sub-Saharan Africa (Cameroun and Senegal), Northern Africa (Morocco and Algeria), the Caribbean (Martinique and Haiti), North America (Quebec), and Europe (Belgium) —and consider language features unique to those regional varieties, the status of French as opposed to other indigenous languages and creoles, the demographics of their speakers, and the representation of their culture in media (particularly in short stories, poetry, song, and film). A semester-long research project on one of these main areas will allow students to combine their study of the French-speaking world with other disciplines of interest to them.

AS.210.411. Translation for the Professions. 3 Credits.
Spanish Translation for the Professions surveys the field of contemporary translation theory and provides practice of translation from English to Spanish. Translation exercises may include comparing and contrasting texts of literature, medicine, health, law, technology, politics, and journalism. Students will identify and differentiate terminology specific to these various fields and will focus on practicing correct uses of the grammatical structures relevant to the translation of both English and Spanish. In the course's final projects students will apply, synthesize, and reflect on what has been learned in the class by completing a translation exercise individualized to their professional interests. Strategies of communication mastered in this course will help students of Spanish throughout their careers, in that achievement of the course objectives will help students discern, translate, and evaluate the usefulness of translations in different professional settings. There is no final exam. May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after the third class session.
Area: Writing Intensive
AS.210.313 OR AS.210.314 OR AS.210.315 OR AS.210.318 OR AS.210.319

AS.210.412. Community Based Learning - Spanish Language Practicum. 3 Credits.
This fourth-year course involves a specially designed project related to the student's minor concentration. On completion of this course, the student will be able to use the Spanish language in real world contexts. The student-designed project may be related to each student´s current employment context or developed in agencies or organizations that complement student's research and experimental background while contributing to the improvement of his/her language proficiency. There is no final exam. May not be taken satisfactory/unsatisfactory. No new enrollments permitted after first week of class.
Area: Writing Intensive
AS.210.411

AS.210.413. Curso de Perfeccionamiento. 3 Credits.
This forth-year course is an in-depth examination of the Spanish grammar, including a wider range of idiomatic expressions and usages than students might have previously encountered. On completion of this course, students will be able to achieve the ACTFL Advanced-Mid to high level in oral and written expression as well as in reading and listening skills. The course will also help to prepare students for the DELE Intermediate or Superior levels, offered by the Instituto Cervantes. May not be taken satisfactory/unsatisfactory. Not open to native speakers of Spanish. No new enrollments permitted after the 4th class session.
Area: Writing Intensive
(AS.210.312 OR AS.210.317) AND (AS.210.313 OR AS.210.314 OR AS.210.315)

AS.210.417. Eloquent French. 3 Credits.
This highly interactive, writing intensive course intends to 1) provide tools to help students reach linguistic proficiency in French (advanced lexical and idiomatic expressions, rhetorical devices used in complex argumentation; 2) sharpen analytical skills by applying the French method of Explication de textes to a variety of fictional and non-fictional discourses (film, literary excerpts, articles, social media); 3) help students develop their own voice in creative writing.
Area: Writing Intensive

AS.210.426. French for Reading and Translation. 3 Credits.
This course aims to provide proficiency in reading and translating? a variety of French texts from the humanities and social sciences. It is designed for undergraduate and graduate students with little or no background in French who wish to acquire a knowledge of French for research purposes 2) for Ph.D. candidates preparing to fulfill their a Foreign Language Proficiency requirement. Please note that this course does not provide speaking and listening skills, and can therefore not be taken as a substitute for other classes in the French Language curriculum (AS.210.xxx).

AS.210.501. French Independent Study/Language. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.210.551. Portuguese Independent Study. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.210.596. German Internship - Summer. 1 Credit.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.210.661. Reading and Translating German for Academic Purposes.
Graduate students only. Seniors may enroll with permission from LPD and instructor.Taught in English. This is the first semester of a year-long course designed for graduate students in other fields who wish to gain a reading knowledge of the German language. Seniors who intend to do graduate study in other disciplines are also welcome. Instruction includes an introduction to German vocabulary and grammatical structures as well as discussion of relevant translation practices. The goal of the course is for students to gain confidence in reading a variety of texts, including those in their own fields of study. No knowledge of German is assumed.

AS.210.662. Reading & Translating German for Academic Purposes II.
Taught in English. Seniors by permission & Graduate students only. This course is designed for graduate students in other departments who wish to gain reading knowledge of the German language and translation practice from German to English. This course is a continuation of the Fall semester. Focus on advanced grammatical structures and vocabulary. For certification or credit.
AS.210.661 or permission of instructor.

AS.211.103. The missing “A”. Seminar participant immere on torie and iue affecting Hipanic in the US, pecifically quetioning if ocial media and information created by artificial intelligence perpetuate ubordination and micommunication. By invetigating platform uch a TikTok, Youtube and Twitter thi coure hone foundational critical thinking kill in the art and humanitie. STEM to STEAM for Hispanics
Area: Humanities

AS.211.203. Propaganda: From Blut und Boden to Post-Fact. 3 Credits.
This course taught by Writing Seminars professor Wayne Biddle and Media Studies professor Bernadette Wegenstein covers the 20th-century history of propaganda with special focus on its visual techniques, on censorship, and how media serve as sites of both control and resistance to power. We will pay particular attention to the influence of misinformation abetted by the new media revolution, and both the rise of the political rhetoric of “fake news” and the massive dissemination of actual fake news since the 2016 election. Students will write papers pegged to current issues and events using the critical framework developed in class. Cap 30 students. Reader: Jason Stanley: How Propaganda Works, Princeton University Press, 2015.
Area: Writing Intensive

AS.211.222. Italian Cinema: The classics, the Forgotten and the Emergent.. 3 Credits.
This course traces the history of Italian cinema from the silent era to the new millennium, highlighting its main trends and genres, and reflecting on the major transformations modern and contemporary Italian society experienced over the twentieth and twentieth-first centuries. We shall examine iconic films such as Vittorio De Sica's Bicycle Thieves, Federico Fellini's La Dolce Vita, Michelangelo Antonioni's L'Avventura, and Pier Paolo Pasolini's Mamma Roma, that received international recognition and influenced other national, cinematic productions. We shall also look at the work of less famous, or independent filmmakers who received less critical attention. While this class takes an historical approach, it also includes a theoretical component and introduces students to the specificity of the cinematic language, examining films in relation to the mise-en-scène, frame composition, camera movements, editing, and sound. This class is taught in English.

AS.211.224. Made in Italy: Italian style in context. 3 Credits.
Italy and the “Italian style” have become synonym of exquisite taste, class, and elegance thanks to the quality of Italian craftsmanship. This course will explore some of the major factors that contributed to the rise of Italian fashion and Italian industrial design as iconic all around the world. The classes will focus on the main protagonists and art movements that influenced the development of Italian style. We will analyze trends, clothing, and style not only in a historical context, but also through a critical apparatus that will include themes related to gender, culture, power, and politics.The course is taught in English. No knowledge of Italian is required, but those who can read in Italian will have an opportunity to do so. Everyone will learn some Italian words and expressions.

AS.211.231. Planet Amazonia: Culture, History, and the Environment. 3 Credits.
Without Amazonia, global warming could reach levels that threaten life on the planet. Yet, in an era of deforestation and climate change, Amazonia itself might be on the verge of disappearance, with disastrous consequences for the world. This course proposes interdisciplinary perspectives on Amazonia through a range of works drawn from history, anthropology, archeology, environmental studies, literature, and the arts. We’ll look at texts by European travelers and missionaries who contributed to the paradoxical image of Amazonia as a “virgin paradise” or a “green hell”; scientific studies and artists’ depictions of the region’s flora and fauna; the often-overlooked history of human occupation of the region; and projects to colonize, develop, or conserve the world’s largest tropical forest. What importance does Amazonia hold for Latin American and global geopolitics? How do art and literature, including indigenous writings, create, reinforce, or deconstruct clichés about the region? What alternative futures for our planet can Amazonia help us to imagine?

AS.211.240. Italian Culture and Civilization I. 3 Credits.
This class aims to introduce students to some major traits of Italian culture. This analysis explores topics that span from Art History, Fashion, including Film, to Food Culture, Pop Culture, and Politics. This first module will focus mostly on its aesthetic traditions, and their impact outside national boundaries. The course will be taught mostly in English with the opportunity to be introduced to elements of Italian language. No knowledge of Italian is required. This three-credit course counts toward the major and Minor in Italian, and the International Studies Global Italy concentration.

AS.211.251. The New Media Revolution and its Effects on Storytelling and Media Aesthetics. 3 Credits.
This course will highlight the change from a culture of mass media to social media in the recent media history. As examples of how story telling is affected throughout this paradigm shift, we will be taking into account such phenomena as AI storytelling, Video Vines, and News Feeds. In the age of Mass Media, spanning the rise of TV culture in the 1950s to the end of the 20th century, media had a unifying effect on American culture. With the rise of Cable TV in the 1990s to the ubiquity of internet entertainment sources to the invention of the iPhone and the rise of social media, this cultural unanimity had been shattered. In some ways this has caused a positive effect, as the forms of storytelling have proliferated and diversified, and there is more room for different voices and perspectives today than every before. In other ways the effects have been more insidious, with some critics pointing to social media as one of the main factors in the rise of our post-truth age. The age of social media has also certainly increased a sense of insecurity (FOMO) and attention deficit disorder in the millennials.

AS.211.259. Introduction to Medical and Mental Health Interpreting. 3 Credits.
This course is a broad introduction to the fields of medical and mental health interpreting. Modules will include: (1) Three-way communication: managing role expectations and interpersonal dynamics; (2) Basic interpreting skills and techniques in a healthcare setting; (3) Ethical principles, dilemmas, and confidentiality; (4) Elements of medical interpreting; (5) Elements of mental health interpreting; (6) Trauma-informed interpreting: serving the refugee population. The course is taught in English, and has no foreign language pre-requisites.

AS.211.265. Panorama of German Thought. 3 Credits.
This course introduces students to major figures and trends in German literature and thought from the sixteenth to the twentieth century. We will pay particular attention to the evolution of German political thought from the Protestant Reformation to the foundation of the German Federal Republic after WWII. How did the Protestant Reformation affect the understanding of the state, rights, civic institutions, and temporal authority in Germany? How did German Enlightenment thinkers conceive of ethics and politics or morality and rights? How do German writers define the nation, community, and the people or das Volk? What is the link between romanticism and nationalism? To what degree is political economy, as developed by Marx, a critical response to romanticism? How did German thinkers conceive of power and force in the wake of World Wars I and II? What are the ties that bind as well as divide a community in this tradition? We will consider these and related questions in this course through careful readings of selected works.
Area: Writing Intensive

AS.211.278. Eataly: An Exploration of Italian Food Cultures. 3 Credits.
Italian cuisine is often recognized as one of the finest in the world. This Freshman Seminar will offer an exploration of Italian food cultures past and present. Discussion topics will include the Slow Food Movement, the tension between local and global, food and social justice, and the representation of food in literature, film, and other media. The course is taught in English. No knowledge of Italian is required, and everyone will learn some Italian words and expressions.

AS.211.300. Niccolò Machiavelli's "The Prince": Understanding the Meaning and Legacy of a Masterpiece. 3 Credits.
Who was Niccolò Machiavelli? We often hear the term “Machiavellian” in reference to actors in business or politics, but what does it really mean? What does Machiavelli teach us about the nature and the dynamics of political power? Can Machiavelli’s thought offer insights into today’s politics and fast-changing world? The course aims to answer these questions by addressing three topics. First, we will study Machiavelli’s life and times, particularly the events connected to his production and the context in which he wrote his main writings. We will see how the fifteenth-century Florentine humanism and the massive political changes affecting early modern Europe shaped Machiavelli’s mindset. Second, we will familiarize ourselves with Machiavelli’s thought by reading The Prince and excerpts from Discourses on Livy. Third, we will get acquainted with some of the main trends in the reception of Machiavelli in the 20th and 21st centuries. Special attention will be paid to interpretations of Machiavelli by Antonio Gramsci, Leo Strauss, Isaiah Berlin, John Greville Agard Pocock, Quentin Skinner, and John P. McCormick. We will also pay attention to modern television programs and films that show the width and depth of Machiavelli’s legacy.

AS.211.301. Nietzsche and Literature. 3 Credits.
Nietzsche and Literature is devoted to exploring the philosophy and literary works of the German philosopher Friedrich Nietzsche, and studying his impact on literature and literary modernism. Readings will include works by Nietzsche and by the literary writers he influenced, including Rainer Maria Rilke, Stefan George, Thomas Mann, Stefan Zweig, Hugo von Hofmannsthal, Franz Kafka, Jorge Luis Borges, Hermann Hesse, James Joyce, Wallace Stevens, and William Butler Yeats, and Else Lasker-Schüler.

AS.211.307. Labor in Theory, Literature, and Art. 3 Credits.
This seminar examines some of the ways we define, represent, and think about the concept of labor in capitalism. We will analyze and compare a wide variety of texts (literary, visual, and theoretical) that embody different, often contradictory, notions of the work we do, why we do it, and how it affects us. As we investigate different types of work—productive and unproductive, physical & intellectual, factory & office—a few of the questions we will ask are: What methods have writers and artists used to depict labor in the 20th and 21st centuries? How is labor stratified along racial and gender lines? Is it possible to imagine a post-work society? The course curates a range of cultural artifacts (short stories, manifestos, novel excerpts, visual art, and film) that employ aesthetic strategies like irony, humor, absurdity, and duration to represent the dynamics of labor in capitalism. Theoretical texts then provide varied conceptual viewpoints from which to compare, contrast, and synthesize our impressions and interpretations of art and literary works. By the end of the semester, we will have traced a trajectory of labor in capitalism from the early 20th century to our own strange and precarious present.
Area: Writing Intensive

AS.211.311. Introduction to Romance Linguistics. 3 Credits.
If the modern-day Romance languages all evolved from Latin, how and why do they differ in so many important ways? What drives language change in the first place and why should this be the case? We approach these questions not only from a linguistic perspective (analyzing Romance sound systems, vocabulary, morphosyntax, and semantics), but from a cognitive-psychological and a socio-political perspective as well. Recommended Course Background: At least intermediate-level proficiency in a Romance language as assessed by coursework or placement exam; some previous coursework in linguistics is desirable but not necessary.

AS.211.316. Brazilian Cinema and Topics in Contemporary Brazilian Society. 3 Credits.
Course is taught in ENGLISH - This course is an introduction to the academic study of cinema as a communicative art and to Brazilian film. The films selected focuses on films from the late 1950s to the present and highlight import episodes and challenges in the advancement of the Brazilian society as well as its cinematic production with a special view to the film aesthetics through analysis from a number of critical perspectives, including class, race, gender as well as ethnicity, nationalism or national identity, colonialism, social changes, and the politics of representation. In this sense, the films and documentaries that we will be watching and studying encompass the period from the rise of New Cinema (Cinema Novo) up to films exploring the most recent trends, including movies launched up to 2016. Students wishing to do the course work in English, for 3 credits should register for section 01. Those wishing to earn 4 credits by doing the course work in Portuguese should register for section 02. THERE IS NO FINAL EXAM. May not be taken on a Satisfactory / Unsatisfactory basis.
Area: Writing Intensive

AS.211.325. Representing Otherness in Literature and Film. 3 Credits.
The term 'Otherness' is known to be rooted in the Self-Other opposition as it emerged in German Idealism, adopted by psychoanalysis and transformed to Post-Colonial and Feminist theories. This theoretical framework will allow us to explore the role of the Other in literature and cinema. Students will become familiar with the historical development of the notion of the “stranger” through reading and analyzing various contemporary works of prose, poetry and cinema from various countries. We will analyze the ways in which these works depict Otherness and will investigate questions regarding their social, political and philosophical framework as well as the literary and cinematographic devices they employ. The course will have a comparative nature with the aim of learning more about the differences between the literary and cinematic representations.

AS.211.327. Ecocinema: Framing Italy's Environmental Crises. 3 Credits.
Over the past decade, growing numbers of filmmakers in Italy have addressed ecological crises in their work. This class takes an eco-critical approach to contemporary Italian cinema, examining a body of compelling place-centered stories that deal with local and global issues. Defining the scope of eco-cinema and the ways we can interrogate films as ecological texts, we shall screen earth-centered films that raise consciousness about the consequences of human manipulation of the natural world; the complicity of industry, government, and organized crime in creating environmental crises; and the effects of economic and social malaise. Screenings include iconic films such as Michelangelo Antonioni’s Red Desert (1963), more recent, critically acclaimed films such as Matteo Garrone’s Gomorrah (2008), Alice Rohrwacher’s Happy as Lazzaro (2018), and many others.

AS.211.328. Berlin Between the Wars: Literature, Art, Music, Film. 3 Credits.
Explore the diverse culture of Berlin during the heyday of modernism. During the Weimar Republic, Berlin became a center for theater, visual arts, film, music, and literature that would have an outsize impact on culture throughout the world and the twentieth century. The thinkers, artists, and writers drawn to interwar Berlin produced a body of work that encapsulates many of the issues of the period: the effect of the modern city on society; “the New Woman”; socialist revolutionary politics; the rise of the Nazis; and economic turmoil. While learning about interwar Berlin’s cultural diversity, we will take a special look at works by Jewish writers and artists that engage with the question of ethnic, religious, and national identity in the modern world, specifically in the context of Berlin’s rich Jewish history and the rise of anti-Semitism in the interwar period. All readings will be in translation.

AS.211.329. Museums and Identity. 3 Credits.
The museum boom of the last half-century has centered largely around museums dedicated to the culture and history of identity groups, including national, ethnic, religious, and minority groups. In this course we will examine such museums and consider their long history through a comparison of the theory and practice of Jewish museums with other identity museums. We will study the various museological traditions that engage identity, including the collection of art and antiquities, ethnographic exhibitions, history museums, heritage museums, art museums, and other museums of culture. Some of the questions we will ask include: what are museums for and who are they for? how do museums shape identity? and how do the various types of museums relate to one another? Our primary work will be to examine a variety of contemporary examples around the world with visits to local museums including the Jewish Museum of Maryland, the National Museum of African American History and Culture and the National Museum of the American Indian.

AS.211.332. Heidegger's Being and Time and the Examined Life. 3 Credits.
This course will explore Heidegger's Being and Time with attention to such central concepts as Dasein's unique relation to Being, worldliness, care, authentic and inauthentic existence, attunement, understanding, projection, and being unto death. The first eight weeks will be devoted to a thorough reading of Being and Time and selected critical texts. The last five will consider works of art that expand our understanding of Heidegger's magnum opus.

AS.211.333. Representing the Holocaust. 3 Credits.
How has the Holocaust been represented in literature and film? Are there special challenges posed by genocide to the traditions of visual and literary representation? Where does the Holocaust fit in to the array of concerns that the visual arts and literature express? And where do art and literature fit in to the commemoration of communal tragedy and the working through of individual trauma entailed by thinking about and representing the Holocaust? These questions will guide our consideration of a range of texts — nonfiction, novels, poetry — in Yiddish, German, English, French and other languages (including works by Primo Levi and Isaac Bashevis Singer), as well as films from French documentaries to Hollywood blockbusters (including films by Alain Resnais, Claude Lanzmann, and Steven Spielberg). All readings in English.
Cannot be taken by anyone who previously took AS.213.361

AS.211.342. Emerging Latin American Cinema. 3 Credits.
This survey of emerging cinema in Latin America focuses on thematic clusters such as gender identity, violence against women, the struggle for indigenous rights and recognition of their history, the politics of ecological crises, and the plight of youth who don't see a viable future. We will focus on films from Brazil, Mexico, Argentina, and Colombia, among other cultures.

AS.211.347. Monsters, Ghosts, and Golems. 3 Credits.
Modern Jewish culture is full of monsters, ghosts, golems, dybbuks, and other occult creatures. We will study the rich religious and folkloric traditions that these works draw on in order to better understand why Yiddish, German, Hebrew, and English literature from the 19th century to the present and why film from its beginnings are so full of the occult and the supernatural. We will pay special attention to the ways that monsters, spirits, and the like were deployed in modernist literature and film, in order to ask and answer major questions about modernity: what are the social and aesthetic consequences of technology and automation? what aspects of human nature are revealed by new insights into the psyche? All readings in English.

AS.211.349. JHU Bologna Program: Food for Thought: Gastronomy, Politics & Identity. 3 Credits.
Italian Culture course offered on the JHU Summer Program in Bologna. Permission required. Must be taken for a letter grade. Open to students admitted to the JHU Summer Program in Bologna only.

AS.211.354. The Art, Craft, and Science of Translation. 3 Credits.
This course is an introduction to the growing field of Translation Studies. Broadly speaking, the translation process involves three major phases: (1) 'understanding' what someone else has written; (2) exploring the linguistic/cultural tools available (or not) in another language to convey the original meaning; and (3) taking responsibility for one's translation choices. What does it mean to 'understand' a text? Is it ever possible to find an 'equivalent' in another language? Can the translation process ever be objective, and what role, if any, does the translator's voice play? What practical tools are available to facilitate the translation process? Drawing from interdisciplinary theories and approaches to translation, this course will attempt to reflect on these questions, and provide an opportunity for some hands-on translation practice. Language pre-requisite: Completion of Advanced French I (AS210.301), Advanced Italian I (AS210.351), Advanced Spanish I (AS210.311), or instructor permission.
Area: Writing Intensive
AS.210.301 OR AS.210.351 OR AS.210.311 OR Instructor Permission

AS.211.356. Short Forms in German Literature. 3 Credits.
Taught in English. Before Twitter, there were the diverse short forms that evolved in the accelerating world of modernity to capture fleeting experiences, fragmentary perceptions, and flash-like insights: epigrams, aphorisms, fragments, feuilletons, parables, thought images, and mini-essays. The course offers an alternative history of German modernity by surveying masters of short forms from the 17th century to the present, such as Angelus Silesius, Lichtenberg, Novalis, Fr. Schlegel, Schopenhauer, Nietzsche, Kafka, Roth, Walser, Kracauer, Benjamin, Adorno, Blumenberg, and Kluge. Readings will be made available both in English translation and in the original German.

AS.211.361. Narratives of Dissent in Israeli Society and Culture. 3 Credits.
In this course we will study and analyze the notion of dissent in Israeli society and culture on its various literary and artistic forms. We will examine the emergence and the formation of various political and social protest movements, such as the Israeli Black Panthers, Israeli feminism and the 2011 Social Justice protest. We will discuss at length the history and the nature of dissent in the military and in relation to Israeli wars and will track changes in these relation. Significant portion of the course will be dedicated to the literary, cinematic and artistic aspects of Israeli protest and their influence on Israeli discourse. We will explore the nature and role of specific genres and media such as the Israeli satire, Israeli television, newspaper op-ed and the recent emergence of social media. Students wishing to work in English exclusively for 3 credits should enroll in section one. Students who are fluent in Hebrew and are wishing to attend an additional hour-long Hebrew discussion session per week with Professor Cohen (time TBD in consultation with enrolled students) for 4 credits should enroll in section 2.

AS.211.369. We Conduct: Editing a Documentary. 3 Credits.
This course will provide a hands-on opportunity to work with film director and professor of media studies Bernadette Wegenstein in the editing process of We Conduct, a documentary about the magic of orchestral conducting and the changing face of those who are called to this vocation. The film follows famed conductor Marin Alsop as she breaks new ground in her already distinguished career. The film was shot predominantly in Baltimore, but also in New York, São Paulo, Vienna, Lucerne, and London, with Shana Hagan (Los Angeles) as Director of Photography, additional cinematography by Judith Benedikt (Vienna), and John Benam (Baltimore). During the semester we will be looking at the various narratives in their rough format, and see the film take shape from treatment to full-fledged documentary narrative. Editor Victor Livingston based in Los Angeles will come to work with the class twice during the semester.

AS.211.374. Gendered Voices. 3 Credits.
The course will explore the notion of 'voice' in order to show how poetry, literature, philosophy, and music have been dealing with it throughout the ages. In particular, by focusing on classical figures such as the Sirens, Circe and Echo, as well as by considering the seminal discussions of the 'voice' in Plato and Aristotle, the course will address the gendered nature of the voice as a tool to seduce and manipulate the human mind. More specifically, the course will discuss the ways in which male, female, queer, gendered and un-gendered voices embody different functions. Course materials include classical, medieval and early modern sources as well as later rewritings of myths concerned with the voice by authors such as Jules Verne, Karen Blixen, Giuseppe Tomasi di Lampedusa, and Italo Calvino. A selection of theoretical works (e.g. Cavarero, Silverman, Dollar, Butler) will also be discussed. The course is taught in English and all materials will be available in English translation; Italian majors and minors should enroll in section 2.
Area: Writing Intensive

AS.211.386. Italian Cinema. 3 Credits.
Italian Cinema: The Classics, The Forgotten, The Emergent. This course traces the history of Italian cinema from the silent era to the contemporary period, highlighting its main trends and genres, and reflecting on the major transformations modern and contemporary Italian society experienced over the twentieth and twentieth-first centuries. We shall discuss iconic films such as Vittorio De Sica's Bicycle Thieves, Federico Fellini's La Dolce Vita, Michelangelo Antonioni's L'Avventura, and Pier Paolo Pasolini's Mamma Roma, (the classics) that received international recognition and had a global impact on film history, and also rare archival films by pioneer women filmmakers from the silent era (the forgotten). Finally, we'll discuss films released in the last decade (the emergent) that address issues such as migration and the ecological crisis. (Zoom Q&As with filmmakers will be part of curriculum). While this class takes an historical approach, it also includes a theoretical component and introduces students to the specificity of the cinematic language, examining films in relation to frame composition, camera movements, editing, and sound. This is an intensive writing class taught in English.
Area: Writing Intensive

AS.211.394. Brazilian Culture & Civilization. 3 Credits.
Did you know that Brazil is very similar to the United States? This course is intended as an introduction to the culture and civilization of Brazil. It is designed to provide students with basic information about Brazilian history, politics, economy, art, literature, popular culture, theater, cinema, and music. The course will focus on how Indigenous, Asian, African, and European cultural influences have interacted to create the new and unique civilization that is Brazil today. The course is taught in English, but ONE extra credit will be given to students who wish to do the course work in Portuguese. Those wishing to do the course work in English for 3 credits should register for section 01. Those wishing to earn 4 credits by doing the course work in Portuguese should register for section 02. The sections will be taught simultaneously. Section 01: 3 credits Section 02: 4 credits (instructor's permission required). No Prereq. THERE IS NO FINAL EXAM.
Area: Writing Intensive

AS.211.400. Topics in Romance Literatures. 3 Credits.
The Romance Avant-Garde: The course will examine the revolutionary contributions of literary artists from the French, Italian, Spanish, and Latin American traditions to the Avantgarde movements of the 20th century.
Area: Writing Intensive

AS.211.415. Thomas Mann's "The Magic Mountain". 3 Credits.
Taught in English. Stranded for seven years in an Alpine sanatorium, a young engineer is granted a highly unusual education, one that is at turns hilarious and stirring. He gains initiation into the mysteries of life, death, and love, and finds himself caught in the middle of dazzling arguments animated by the ideological conflicts of a continent on the brink of world war. A unique blend of comic portrayal, essayistic reflection, and ironic narration allows Mann to develop an absorbing panorama and an acute diagnosis of cultural crisis, making his novel from 1924 a key work of modernism. We will discuss the novel against the backdrop of the cultural currents and political developments to which it responds.

AS.211.423. Black Italy. 3 Credits.
Over the last three decades Italy, historically a country of emigrants—many of whom suffered from discrimination in the societies they joined—became a destination for hundreds of thousands of migrants and refugees from various countries, and particularly from Africa. Significant numbers of these immigrants came to Italy as a result of the country's limited, though violent colonial history; others arrive because Italy is the closest entry-point to Europe. How have these migratory flows challenged Italian society's sense of itself? How have they transformed the notion of Italian national identity? In recent years, growing numbers of Afro- and Afro-descendant writers, filmmakers, artists and Black activists are responding through their work to pervasive xenophobia and racism while challenging Italy's self-representation as a 'White' country. How are they forcing it to broaden the idea of 'Italianess'? How do their counternarratives compel Italy to confront its ignored colonial past? And, in what way have Black youth in Italy embraced the #Blacklivesmatter movement? This multimedia course examines representation of blackness and racialized otherness, whiteness, and national identity through literary, film, and visual archival material in an intersectional framework. Examining Italy's internal, 'Southern question,' retracing Italy's colonial history, and recognizing the experiences of Italians of immigrant origins and those of immigrants themselves, we'll explore compelling works by writers and filmmakers such as Igiaba Scego, Gagriella Ghermandi, Maza Megniste, Dagmawi Yimer, and others.

AS.211.424. Climate Change Narratives: Human and Non-Human Transformative Storytelling. 3 Credits.
In The Great Derangement Indian novelist Amitav Ghosh writes that "the climate crisis is also a crisis of culture, and thus of imagination." Worldwide, climate and environmental change is stirring the imaginary of novelists, filmmakers, and artists who are finding ways to frame, emplot, or even perform, an unmanageable phenomenon like climate change. How is climate change shaping new modes of storytelling and aesthetics? How do film, literature, and environmentally conscious art transform our perception of the world we inhabit and its unpredictable changes? Can climate change narratives help us to imagine futures of possibilities, maybe dystopian, uncertain, or even happy, but futures nonetheless? This multimedia course explores, through a transnational perspective, a variety of contemporary novels, films, and other media that attempt answer these questions.

AS.211.444. The Apocalypse in Literature and Film. 3 Credits.
"Everything which we loved is lost! We are in a desert" – this emotional assertion was the reaction to Kazimir Malevich's 1915 painting The Black Square, as the artist himself recalled it. This sentiment of fearing, warning and even witnessing the end of the world as we know it, will stand at the center of the course. We will study the literary and cinematic representations of this apocalyptic notion and investigate its theoretical, theological, physiological and aesthetic aspects. We will seek to trace the narrative dynamics as well as literary and cinematic means of apocalyptic representations in works from various periods, languages, cultures and religions. Among the issues to be discussed: what is the apocalypse, biblical apocalypse, dystopia and nostalgia, trauma and post trauma, war and the apocalypse, the Holocaust as the end of civilization, the atomic bomb, realism and anti-realism, political changes and the apocalypse in popular culture.
Area: Writing Intensive

AS.211.477. Renaissance Witches and Demonology. 3 Credits.
Who were the witches? Why were they persecuted for hundreds of years? Why were women identified as the witches par excellence? How many witches were put to death between 1400 and 1800? What traits did European witch-mythologies share with other societies? After the witch-hunts ended, how did "The Witch" go from being "monstrous" to being "admirable" and even "sexy"? Answers are found in history and anthropology, but also in medicine, theology, literature, folklore, music, and the visual arts, including cinema.
Area: Writing Intensive
Students who have already taken AS.214.171 cannot take AS.211.477.

AS.211.478. Power and Resistance in French Political Thought. 3 Credits.
Today France is a multicultural, multi-ethnic society fractured by the memories of colonialism. Throughout the country's history, French thinkers – classical and contemporary – have questioned the foundations of power and focused critically not only on the claims of authority issuing from the top, but also on the compliance of the governed. What it is, they ask, that makes people stick together and recognize each other as citizens of one country? Is there such a thing as a shared history, and is Fraternité something more than a slogan? Works by La Boétie, Montaigne, Diderot, Robespierre, Tocqueville, Gobineau, Camus, Sartre, Memmi, Foucault and others.
Students may not have previously completed AS.212.341.

AS.211.479. Dante's Journey through the Afterlife. 3 Credits.
Dante's Divine Comedy presents a complete picture of the medieval world-view in all its aspects: physical (the structure of the cosmos), historical (the major actors from Adam to Dante himself) and moral (a complete system of right and wrong). Dante shows how the Christian religion portrayed itself, other religions, the nature of God, humans, angels and devils, and human society. We will explore these topics both from the viewpoint of Dante's own time, and in terms of its relevance to our own societal and cultural concerns.
Area: Writing Intensive
AS.214.479

AS.211.480. Religious Themes in Film and Literature. 3 Credits.
This course would be of interest to anyone who would like to learn about the intersection of religion and modern culture. At the center of the course will stand a close study of the representation of religious themes and their role in modern literature and cinema. The works which we will deal with are not considered religious and yet they include religious themes as part of their narrative, images, language or symbolic meaning. We will trace in various works from various countries and genre, themes such as: divine justice, providence, creation, revelation, the apocalypse, prophecy, sacrifice and religious devotion. We will also study the ways in which Biblical and New Testament stories and figures are represented in these works. The course will have a comparative nature with the aim of learning more about the differences between the literary and cinematic representations.

AS.211.566. Independent Study - CAMS/undergraduate. 1 - 3 Credits.
requires permission of instructor
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.211.606. Literature and Truth: Forgery and Fakes.
Forgery is an eternal problem. It is a literary tradition in its own right, with connections to politics, Classics, religion, philosophy, and literary theory. Spurious writings impinge on social and political realities to a degree rarely confronted by criticism. This course offers a reading of the sort traditionally reserved for canonical works of poetry and prose fiction, spotlighting forgery's imaginative vitality and its sinister impact on scholarship. Students will study manuscripts and incunabula drawn from JHU's Bibliotheca Fictiva, the world's premier collection of literary forgeries.
Area: Writing Intensive
Students cannot have taken AS.214.606.

AS.211.612. Monuments and Monumentality.
As is clear from current events and debates surrounding monuments to the Confederacy, monuments play an outsize role in the public negotiation of history and identity and the creation of communal forms of memory. But monumentality is not restricted to statues or buildings. In this course we will study alternative forms of monumentality, especially in the 20th and 21st centuries. These alternative monumentalities — primarily literary, but including various material- and object-based expressions, and elaborations on institutional modes of monumentality — have assumed significance especially in minority and diaspora communities, and for other people and peoples outside the economic and political systems that endow and erect traditional public monuments. The primary case studies in this course will be forms of Holocaust commemoration, including the post-Holocaust large-scale Yiddish literary projects meant to serve Jewish communities in search of new forms of memorialization; and counter-monuments like Germany's Stolpersteine (stumbling stones). We will also consider contemporary debates around monuments in America and global manifestations of alternative monumentalities. All readings in English.

AS.211.616. Caribbean Fiction: Race, History, & Exoticism.
The Caribbean is often described as enigmatic, uncommon and supernatural. While foreigners assume that the Caribbean is exotic, this course will explore this assumption from a Caribbean perspective. We will examine the links between Caribbean and Old World imagination, the relationship between exoticism and Caribbean notions of superstition, and the way in which the Caribbean fictional universe derives from a variety of cultural myths. The course will be taught in English and all required texts are in English and English translations from French. A weekly session in French will be held for undergraduates wishing to count the course towards the French major and for interested graduate students. Open to all grad students and to undergraduates with permission of the instructor."
Area: Writing Intensive

AS.211.623. Reading Modern Hebrew Literature.
"And Jesus was a Jew with ear-locks and prayer shawl" claimed Uri Zvi Greenberg, the ultra-nationalist giant of modern Jewish poetry. A flesh-and-blood Jew, a demon, a spoiled student, an idol, a suffering brother, a (failed) Messiah, a nationalist rebel, a Greek god in a Jewish garb – these images of Jesus accompanied Jewish thought and literature for almost two thousand years. This course will study these images through a close reading of major Jewish texts from the Talmud to modern times.

AS.211.640. The Literature of Existence.
This seminar will explore some key expressions of what could loosely be called existentialist writing from the early twentieth century to the present day, to the end of coming to terms with an emerging "new politics of existence." While there will be some emphasis on Spanish language materials, including writings by José Ortega Y Gasset, Miguel de Unamuno, María Zambrano, and Jorge Luis Borges, we will also be reading important works by Martin Heidegger, Jean-Paul Sartre, Simone de Beauvoir, Albert Camus, and Martin Hägglund.
Area: Writing Intensive

AS.211.641. Women Filmmakers from the Margins.
Filmmaking remains an overwhelmingly male-dominated profession, but women are making significant inroads, and in so doing are leaving their distinctive mark on the medium. In this seminar we will examine the films of a group of women auteurs (those who write and direct their own films) who have endeavored to speak from the margins—be they social, geographical, or sexual—and whose work has challenged mainstream cinematic norms. The filmmakers whose work we will analyze may include Jane Campion, Australia; Aurora Guerrero, Mexico-USA; Claudia Llosa, Peru; Mira Nair, India-USA; Marialy Rivas, Chile; So Yong Kim, Korea.
Area: Writing Intensive

AS.211.658. Nomadic Narratives: Italian Women's Literature and Cinema.
This interdisciplinary graduate seminar examines the work of women writers, directors, and photographers in modern and contemporary Italy. We shall explore the question of female authorship and themes such as female subjectivity and mobility, women's participation in, or exclusion from, history. We shall read foundational texts such as Elsa Morante's La storia (1974), Anna Maria Ortese's collection of short stories Il mare non bagna Napoli (1953), and more contemporary novels such as Goliarda Sapienza's L'arte della gioia, and Elena Ferrante's L'amore molesto (1995). In the second part of the semester, we will study the work of female directors from different generations, from pioneer Elvira Notari, to mid-century Cecilia Mangini, and contemporary Alice Rohrwacher, as well as the work of photographers such as Carla Cerati and Letizia Battaglia.

AS.211.666. Graduate practicum: Mapping the Scholarly Landscape I (Research Skills).
From online resources to core printed reference works, this course acquaints students with the range of scholarly apparatus in the field of literary and cultural studies, with attention to issues of access, retrieval, and research. The course, which is required for all first-year graduate students in MLL, will be conducted in six (6) two-hour sessions.

AS.211.667. Graduate practicum: Mapping the Scholarly Landscape II (Tools for Professional development).
Spring Semester (coordinated by GRLL faculty with the participation of advanced grad students)1. Preparing a syllabus, marketing your classes (DTF, Summer, Intersession) [with the participation of successful DTF/Intersession instructors]Options for online teaching2. Writing a conference paper abstract; conference presentations 3. Organizing a conference/symposium [led by advanced grad students]4. How to get published (what, when, where)5. Academic review writing6. Options for fellowships/grants/career development

AS.211.713. The Culture of Algorithms.
This course proposes a study of the culture of algorithms for students of the literate space. True (deep) literacy is the ability to interpret a text or an object in its cultural, historical, conceptual, material or political contexts. With the evolution of digital cultures, literate practices have changed to incorporate the emerging cultural paradigms born out of the encounter of algorithms and computability with social practices embedded in the earlier literate traditions. Indeed, modern computation environments invite a new algorithmic hermeneutics grounded in both literate and scientific traditions. We will consider, among others, texts such as Bernard Chazelle's inaugural lesson at the Collège de France, "L'algorithmique et les sciences"; Leibniz on ordered problem solving; Condorcet on "social arithmetic"; Norbert Wiener, God and Golem, Inc.; Herbert Simon, "Bounded Rationality…"; Alan Turing, "Computing Machinery and Intelligence"; Steven Wolfram: Computation and the Future of the Human Condition; Leslie Valiant, Probably, Approximately Correct; Ed Finn, What Algorithms Want. Imagination in the Age of Computing; Daniel Cardon, À Quoi rêvent les algorithmes?; and of course Donald Knuth's classics, Literate Programming and "Computing Science and its Relation to Mathematics". Various modern novels also attempt to engage with the algorithmic, and these can form a counterpoint to the more technical or philosophical texts. For more information and a provisional syllabus, please go to http://www.wilda.org/Courses/CourseVault/Grad/Algorithms/Syllabus.html.This course will be taught in English. A few (short) texts are in French, so the ability to read French will be useful although not required.

AS.211.714. Ariadne's Threads: Metamorphosing Mythologies.
Abandoned by Theseus, Ariadne lamenting on the shore of Naxos embodies one of the most powerful tropes in literature and the arts. The fate of the heroine who helped Theseus out of the labyrinth became herself a thread (indeed, an inexhaustible series of threads) running across the ages and populating the imagination of poets, painters, composers. After exploring in detail the classical sources that canonized Ariadne's myth (Catullus, Carmina, 64; Ovid, Heroides, 10) as well as references to the myth found in other classical authors (Homer, Hesiod, Pausanias, Plutarch, Propertius), we will turn to the reception of Ariadne in literature and music (Ariosto, Rinuccini-Monteverdi, Haydn, Nietzsche, Strauss-Von Hofmannsthal). The analysis of the various case studies will focus on the rhetorical and poetical devices used by poets and composers to reenact the vocal features of Ariadne's lament.

AS.211.722. Global Feminist Filmmaking: a Theory in Practice Seminar.
This seminar examines recent emerging narrative and documentary global feminist filmmakers, applying feminist theory, intersectional theory, cine´ma ve´rite´, theory of nonviolence, and intersubjectivity to understand their work. Each week, we will examine one filmmaker's approach to their own personal practice of feminist filmmaking, and either interview them during our class or screen a pre-recorded zoom interview. In this seminar students will go beyond a theoretical feminist film criticism to one introduced into a lived and living feminist film practice. The filmmakers in question are Marialy Rivas (Chile), Elisabeth Scharang (Austria), Habiba Djahine (Algeria), Patricia Ortega (Venezuela and Argentina), Wanuri Kahiu (Kenya), Naomi Kawase (Japan), Sandra Kogut (Brazil), Kirsten Johnson (USA), TT the Artist (USA), Patricia Ramos (Cuba), Susana de Sousa Dias (Portugal), Claudia Llosa (Peru), Alina Marazzi (Italy), Rosine Mfetko Mbakam (Cameroun and Belgium).

AS.211.724. Media Artist in Residence Jane Jin Kaisen.
Media Artist in Residence Jane Jin Kaisen is a team-taught class between Bernadette Wegenstein (MLL) and Clara Han (Anthropology). In this class we will prepare the artist residency of Jane Jin Kaisen, a visual artist born in Jeju Island, South Korea and raised in Denmark. In the first part of the semester, we will cover theoretical questions raised in Jane Jin Kaisen's work such as cross-cultural adoption, diaspora, migration, war, gender and sexuality, and translation. In the second part we will involve students practically in questions of media arts curation for the artist's exhibit planned for April 2-9, 2022, at the Parkway Theatre, featuring three of her recent and acclaimed installations and films: The Woman, the Orphan, and the Tiger (2010), Apertures/ Rifts (2016), and Community of Parting (2019. In this class students will be closely involved with JHU's Center for Advanced Media Studies (CAMS), and the Baltimore Stavros Niarchos Parkway Theatre's artistic director Christy LeMaster. They will also meet the artist Jane Jin Kaisen during her residency.

AS.211.727. Humanity in Question.
Although it is often assumed that any inquiry into the human inevitably leads to pernicious forms of anthropocentrism, current debates about the Anthropocene suggest that we avoid such reflection at our own peril. Drawing on philosophy, biology, and sociology, Helmuth Plessner's Levels of Organic Life and the Human: An Introduction to Philosophical Anthropology (1928) offers a powerful account of humans' "excentric positionality," whose key ideas Plessner would further flesh out in his Political Anthropology (1931). Plessner's 1928 book was overshadowed, however, by the near-simultaneous appearance of Being and Time and Heidegger's imperious dismissals of philosophical anthropology. Disturbed by Heidegger's blindspot and its political consequences, during the World War II Hans Jonas, one of Heidegger's most original students, began to outline a conception of organic life as "an experiment with mounting stakes," with the highest stakes reached in human freedom. That conception, fully elaborated in The Phenomenon of Life: Toward a Philosophical Biology (1966), would serve as the basis for Jonas's influential theory of bioethical and ecological responsibility. Now that Plessner's key works are finally available in English translation, a joint examination of his, Heidegger's, and Jonas's conceptions is in order. We will ask what these three thinkers have to tell us about our current situation.

AS.211.732. The Literature of Speculative Genres: Science Fiction, Bandes dessinées, MMOGs, Mangas….
The francophone and anglophone worlds have longstanding distinct if complementary traditions for staging the primordial literary gesture, the imagining of the "What if". This course will confront the two cultures in early works like Cyrano de Bergerac's Histoire comique des états et empires du soleil, C. N. Ledoux's utopian workers' paradise, or Jules Verne's novels. It will then address the modern literate spaces in which the two traditions cross-fertilize each other— for example the French reception of Philip K Dick's oeuvre, Korogodski's Pink Noise-A Posthuman Tale, Catherine Dufour's Le Goût de l'immortalité, cyberpunk, mangas co-authored by francophone artists and writers, the "9e art" of the high graphic novels, especially the Cités obscures of Schuitten and Peeters, or hybrid French/anglophone MMOG communities like Ubisoft's Assassin's Creed. The materials will be in French or English, so the ability to understand French is necessary, with class discussion in English. Undergraduates are welcome with permission of the instructor, and this course may count for the French major or minor.

AS.211.748. Media Theory in the Age of Big Data.
This seminar will explore some key themes in contemporary media theory in an age when five tech giants have succeeded in infiltrating the daily lives of global citizens to an unprecedented degree in history. We will study the impact of this saturation on socioeconomic inequality as well as the implications of an almost total loss of privacy.Among the strategies of resistance to the capacity for surveillance these companies have developed we will focus in particular on current examples of feminist media art and voices from the global and cultural periphery as well as tendencies in these practices to emphasize a return to interpersonal connections and the embodied here and now. As case studies we nay include #metoo, slo-film movements from Southern Bahia in Brazil, and the financing and distribution of art films by mega media companies like Netflix.

AS.211.753. The Renaissance Comic Romance.
In the fifteenth and sixteenth centuries, Italian and French humanists transformed the medieval adventure stories of Charlemagne's and Arthur's knights. The course concentrates on Luigi Pulci's earthy, bourgeois Morgante, Teofilo Folengo's Macaronic (Latin/Italian dialect) Baldus, and Rabelais's encyclopedic Gargantua and Pantagruel, combining close analysis of their linguistic and narrative fabric with examples of their influence on later comic narrative masterpieces.
Area: Writing Intensive

AS.211.754. Modernist Primitivism.
This course will explore the aesthetics and politics of primitivism in European modernity, focusing on the visual arts and literature in German and Yiddish, but looking at the wider European context, including France and Russia. We will begin with the backgrounds of primitivism in Romanticism, looking especially at its ethnographic and colonial sources. We will then focus on the presence of anthropological and ethnographic discourses within various registers of modernist thought, literature, and visual culture, with special attention to visual and literary primitivism. Our central concerns will include: the attempt to create a modernist aesthetics grounded in ethnography; the primitivist critique of modernity; the place of primitivism in the historical avant-garde; the development of the notion of "culture" in modernity; and the aesthetics of modern ethnic and national identity. Key thinkers, artists, and writers to be considered include Herder; Gauguin; Picasso; Wilhelm Worringer; Carl Einstein; Hannah Höch; and Emil Nolde.

AS.211.777. The Critical Unconscious.
Criticism in the 21st century has tended to relegate psychoanalysis to a dustbin of fads that proliferated at the end of the prior century but that today are of interest only to balkanized cliques of devotees. Bucking this trend, this seminar will examine the intellectual history and abiding influence of psychoanalysis's key critical concept: the unconscious. Basing our discussions on in-depth readings from key thinkers in the analytic tradition such as Freud, Lacan, and Klein, as well as the post-analytic philosophical tradition, including Zizek, Butler, Laclau and Mouffe, Deleuze and Guattari, and Jameson, we will work to distill an understanding of the unconscious as essential to the practice of criticism tout court, and as inhering even in those discourses that have sought most stridently to distance themselves from it. Seminar discussions will take place in English; readings will be available in the original as well as in translation.
Area: Writing Intensive

AS.211.866. Independent Study - CAMS/graduate.
requires permission of instructor

AS.212.318. Women in French Literature of the 17th and 18th Centuries. 3 Credits.
This course will examine the changes in the relationship of women to literature in France before the French Revolution from several points of view: (1) What were the social and intellectual contexts of gender distinctions? (2) How did men writing about women differ from women writing about women? (3) How were these questions affected by the changing norms of literary productions? Texts by Mme. de Sévigné, Molière, Mme. de Lafayette, Prévost, Diderot, Rousseau, Laclos, and Beaumarchais.
Area: Writing Intensive

AS.212.333. Introduction à la littérature française I. 3 Credits.
Readings and discussion of texts of various genres from the Middle Ages to the 20th century. The two semesters (212.333 and 212.334) may be taken in either order. Students may co-register with an upper level course during this course. 212.333 covers the time period from the Middle Ages to the Revolution.
Area: Writing Intensive
AS.210.30] AND AS.210.302

AS.212.334. Introduction à la littérature française II. 3 Credits.
Readings and discussion of texts of various genres covering the time period from the Revolution to the 20th century. This sequence is a pre-requisite to all further literature courses. Students may co-register with an upper-level course during their second semester.
Area: Writing Intensive
AS.210.301 OR AS.210.302 or at least one semester of AS.210.301 or AS.210.302 with a grade of A and written permission of the instructor.

AS.212.340. Topics in French Cinema: Immigration, identité, différence culturelle. 3 Credits.
An exploration of immigration, identity, and cultural differences through the lens of recent French and Francophone films. Focus on discussion and analyses of film sequences in class and on oral presentations. Students will have the opportunity to progress in vocabulary, oral expression, and in critical analysis. Films studied include works of Kassowitz, the Dardennes, Kechiche, Sciamma, Haneke, and Audiard. Conducted in French. Recommended course background: completion of AS. 210.301 or equivalent score on Placement test.

AS.212.353. La France Contemporaine. 3 Credits.
Students will explore contemporary French society and culture through a wide variety of media: fiction and non-fiction readings (graphic novels, news periodicals, popular magazines), films, music, art, websites, and podcasts. A diverse range of hands-on activities in addition to guided readings will help students develop cultural awareness as we discuss topics such as education, politics, humor, sports, cuisine, immigration, slang, and national identity, as well as the historical factors that have influenced these facets of French and francophone culture.
Recommended Course Background: AS.210.301 or AS.210.302 or permission of instructor.
Students may not have taken AS.211.401.

AS.212.402. The Count of Monte Cristo and its Avatars. 3 Credits.
Alexandre Dumas's Le Comte de Monte Cristo (1844-46) is widely regarded as one of the most popular novels of all time and as one of the best adventure novels ever written. Perhaps no other masterpiece of French literature has been subjected around the world to such countless film adaptations, including animation, television series, and serials. This course aims to study and contextualize the reasons behind this sustained transnational and transcultural interest. Close reading and analysis of Dumas' novel will provide a good point of departure to explore problems that cut across nineteenth-century French society: politics, social class, revolution, family, love and desire, revenge, justice, science, and religion. Course conducted in French; most films in English or with English subtitles.

AS.212.403. Voodoo and Literature. 3 Credits.
This course will examine the various ways voodoo, as the Unknown, has been represented, misrepresented, recuperated, and interpreted in the aftermath of the Haitian Revolution from the early nineteenth century to the present day. While historians have debunked the role of voodoo in the aftermath of the Haitian Revolution, the literary representation of the slaves in captivity is often associated with the will to liberation enacted in the secret practice of voodoo on the plantation. The history of voodoo in Saint-Domingue (Haiti) is intertwined with the history of colonial subversion, ancestral medicine, and the physical resistance of the enslaved people. Yet the most defining event in the armed uprising by the enslaved, the ceremony of Bois Caiman (August 14, 1791) still divides historians, novelists, and anthropologists. Where history and anthropology seem to flounder in trying to capture the mystery of such ceremony, literature soars majestically, maintaining the mystery by using the freedom of the imagination as its sole support. Might the transmission of voodoo during the colonial period, be understood as the historical mode of preservation of an ancestral secret practice that can only be transmitted through oral tradition and rituals, which may have been lost in the attempt to produce written translations ? Readings in French and English may include works by Alejo Carpentier, Aimé Césaire, Patrick Chamoiseau, Marie Chauvet, Edwidge Danticat, René Depestre, Zora Neale Hurston, Frédéric Marcelin, Alfred Métraux, Toni Morisson, Jacques Roumain, Simone Schwarz-Bart, William Seabrook, Derek Walcott, Richard Wright, to be supplemented by films, an art exhibit, music, and cultural demonstrations of voodoo. Course taught in French. Discussion in French and EnglishCross-listed with Humanities Center
Area: Writing Intensive

AS.212.406. The City in French Literature. 3 Credits.
The city is an integral theme, even a privileged character, in the literary and speculative texts of the 17th and 18th century. It is often understood to stand in opposition to the royal court and embodies the spirit of the people in a way related to the modern notion of "solidarity". This course will look at a number of examples of the peculiar status of the French city (especially Paris) from the late Renaissance through the First Empire. Selections from Marguerite de Valois, Mme de Sévigné, Montesquieu, Diderot, Rousseau, Turgot, Ruault, Rétif de la Bretonne, Mercier, Saint-Just, Robespierre, Napoléon Bonaparte, with a coda from Balzac and Michelet. Please note: taught in French
AS.212.333 OR AS.212.334

AS.212.413. For the Record: Jazz Cultures of Modern France. 3 Credits.
Across the 20th century, mainstream and avant-garde French culture was deeply impacted by the presence of African American musicians and performing artists hailing from the jazz tradition. From the Josephine Baker craze of the 1920s to the second post-war which welcomed the innovations of bebop and sixties-era free improvisation, metropolitan France proved a space where expatriate and exiled Black Americans could both perpetuate the tradition and innovate by turns. At the same time, French tastemakers, critics, and musicians eager to adopt new forms and styles debated the extent to which American jazz music in its various strains could be "made French." This course in transcultural French studies will feature readings in music criticism, history, and literature, as well as frequent close listening. It will culminate in a local concert reflecting France's continued connection to and support of jazz and related improvised musics. Though some background in French language and in musical notation is desirable (students are encouraged to engage in original-source research), all core course readings will be provided in English. Discussion in English.

AS.212.419. Romans africains d'expression française [French-Language Novels of Sub-Saharan Africa]. 3 Credits.
Across the 20th century, mainstream and avant-garde French culture was deeply impacted by the presence of African American musicians and performing artists hailing from the jazz tradition. From the Josephine Baker craze of the 1920s to the second post-war which welcomed the innovations of bebop and sixties-era free improvisation, metropolitan France proved a space where expatriate and exiled Black Americans could both perpetuate the tradition and innovate by turns. At the same time, French tastemakers, critics, and musicians eager to adopt new forms and styles debated the extent to which American jazz music in its various strains could be "made French." This course in transcultural French studies will feature readings in musiccriticism, history, and literature, as well as frequent close listening. Though some background in French language and in musical notation is desirable (students are encouraged to engage in original-source research), all core course readings will be provided in English. Discussion in English.
AS.212.334

AS.212.429. Honors Thesis Prep. 1 Credit.
This course will meet three times during the Fall semester to enable all French majors to prepare their thesis subject, thesis bibliography, and abstract prior to the writing of the Senior Thesis (AS.212.430) in the Spring semester of their senior year. This course is required of all French majors and must be taken during the Fall semester of their senior year. Schedule TBA upon consultation with the class list, as there are only three group meetings. The rest of the meetings are in individual appointments with the DUS or another chosen French professor.Prerequisites: AS.212.333-334 and either prior enrollment or concurrent enrollment in AS.210.417 Eloquent French.
AS.210.417;AS.212.333 AND AS.212.334

AS.212.430. French Honors Thesis. 3 Credits.
An in-depth and closely supervised initiation to research and thinking, oral and written expression, which leads to the composition of a senior thesis in French.Recommended Course Background: AS.212.429
Area: Writing Intensive

AS.212.431. Style, Gender and Politics from Marie-Antoinette to the Burqini. 3 Credits.
From effeminate kings, to slutty queens, to post-revolutionary dandies, to the manifest invisibility adopted by some French citizens today, debates on the gendering and styling of political bodies have always been central to power struggles in France. Students will read from sociology, history and literature in order to understand the complex interplay among fashion, gender and political identity.Taught in English, but French minor/major credit possible by completing written work in French and by attending a weekly discussion section conducted in French. Students interested in the 4-credit French option should enroll in section 2. All others should enroll in section 1.Special Notes: This course is meant to be a small class experience. Enrollment limits will be strictly enforced.

AS.212.433. Reason and Revolution. 3 Credits.
The French Revolution in relation to the literature and political thought of the Enlightenment: Montesquieu, Rousseau, Beaumarchais, Condorcet, Robespierre, Mme de Stael and the revolutionary theater. Recommended Course Background: AS.212.333 or AS.212.334. http://www.wilda.org/Courses/CourseVault/Undergrad/ReasonRev/syllabus.html
Area: Writing Intensive

AS.212.436. Cultures of Love. 3 Credits.
From the time of its invention, as a kind of counterfeit religion, in the Hispano-Arabic world, love has been an unsettling, paradoxical, transgressive phenomenon: mystical, adulterous, con game, parlor game, poison, illness. Taking a literary, sociological and anthropological approach, this course will try to grasp some of the challenges posed by love's protean discourse: from the fin'amor born in women-ruled Medieval courts, to the language of 17th-century women mystics, to libertinage, to the cold intimacies of today's emotional capitalism. Taught in French.
Area: Writing Intensive
AS.210.301

AS.212.437. Diderot and the French Enlightenment. 3 Credits.
Denis Diderot's early work was dominated by his work on the natural sciences and the Encyclopédie. In later years, his literature addressed the social applications of knowledge: economic, anthropological, political, and moral issues structured his aesthetic concerns. As an author in continual conversation with his contemporaries and who was instrumental in the creation of an engaged intellectual community, his fiction, philosophical texts and critical works serve as the ideal lens to bring into focus the peculiarities of the French Enlightenment. Among the texts to be considered will be articles from the Encyclopédie, the Supplément au voyage de Bougainville, Le Rêve de d'Alembert, the Salon de 1767, Le Neveu de Rameau, extracts from his Essai sur les règnes de Claude et de Néron… This class will be taught in French.Recommended Course Background - AS.212.333
Area: Writing Intensive

AS.212.439. Aimer Son Prochain? Sympathie, Différence, Hostilité. 3 Credits.
Une exploration des diverses manières de produire et réguler l'amour de l'autre au sein d'une société hiérarchique et compétitive: que cet autre soit un concitoyen ou un étranger, un inférieur ou un supérieur, qu'il nous ressemble ou non. Du roman, à l'anthropologie, à la sociologie, au débats sur le vivre-ensemble à l'Assemblée Nationale, nous examinerons les rêves pacificateurs de la politesse aristocratique, l'institution de la solidarité républicaine, les blessures de la socialité coloniale. Cours et textes à lire en français.
Area: Writing Intensive

AS.212.440. Pandemic and Vaccination as Cultural Watershed in the Ancien Régime. 3 Credits.
What is a plague? What does it mean to protect your society from such diseases? This was a fraught, even violently debated political, social and moral, more than a medical question in the French Enlightenment, and it marked the literate culture of the Age of Enlightenment. Early on, pandemics and vaccination were understood in radically different ways in England (especially by the Princess of Wales) and in France, still dominated by a view of plagues as divine punishment. In Enlightenment literature, both fiction and nonfiction, the disease is secondary to the experience of the conscious sufferer, or to its sociopolitical consequences. We will approach these issues first via a quick overview of explanations of the plague, then discuss the 18th-century smallpox vaccination debates (one of Princess Caroline's letters, Voltaire on vaccination in two of his Lettres anglaises, extracts of Rousseau's novel La Nouvelle Héloïse). We will then consider the hugely influential mid-century debate space within the magisterial Encyclopédie of Diderot and d'Alembert. Finally, we will pass to late-18th-century texts that inflect culturally, politically and socially the consequences and metaphors of pandemics on the cusp of the Revolution. Texts to be read include Laclos' Liaisons dangereuses and a short essay by Guillotin (the inventor of the guillotine) on the citizen's experience of illness and contagion in a post-aristocratic, Revolutionary state. This will be a writing-intensive course, focused on close readings of texts in 2 explications de texte (written close analyses of a selected passage). The second paper may be a more extensive study, still based on textual analysis, but which may address a historical context or set of texts that particularly interest the student. This course will be taught in French.
Area: Writing Intensive
AS.212.333

AS.212.449. France, terre des migrations [French Histories of Migration]. 3 Credits.
Comme le Canada ou les Etats-Unis, la France est une grande terre d'immigration qui depuis le 19e siècle a accueilli sur son sol des populations du monde entier. En examinant témoignages, textes de fiction et films documentaires, nous suivrons les expériences contrastées de diverses vagues de migrants chassés par la faim, le chômage ou les persécutions. Quels mécanismes ont favorisé ou freiné l'intégration économique, sociale et civique de ces migrants qui ont rejoint la République française? Que veut dire "être immigré" aujourd'hui? Recommended Course Background: AS.212.333 OR AS.212.334
AS.211.401

AS.212.452. The Character Function. 3 Credits.
What do we really mean when we talk about a "character" in a discursive work? What are the structuring, esthetic and heuristic functions of such forms of agency? How has the concept of the character evolved from the early modern period to the present day? A sampling of the cases to be considered: Descartes, Racine, Marivaux, Diderot, Rousseau, Napoleon, Michelet, Zola, avatars and "digital angels". This course will be taught in French.Recommended Course Background - AS.212.333

AS.212.454. French Theater: Reading and Practice. 3 Credits.
Reading modern theater in French can be exciting: a battle waged with words instead of swords, a battle of wit and of style. The literature of the nineteenth century was marked by major literary battles opposing young Romantic writers against an old school of Academicians. This battle was fought largely in and through the theatre. In this course the classroom space itself becomes a stage in which to reenact or rehearse some of these battles, through careful readings of texts and by exploring all possible literary contexts. Participants will read together a number of plays as well as take part in collaborative learning and creative activities. Readings to include texts by Césaire, Dumas, Hugo, Marivaux, Musset, Scribe, Sartre, and Vigny. Readings and discussion in French.
Area: Writing Intensive

AS.212.651. Romantisme et Indigénisme.
Le romantisme littéraire, en tout temps et en tout lieu, est contagieux. Ce qui a fait la force pérenne du romantisme français au XIXe siècle, c'est sa capacité de susciter de nouveaux modèles en France et de miroiter son élan esthétique au-delà des frontières nationales. Ce séminaire abordera principalement la question du romantisme français et la manière dont ses prolégomènes ont été appropriées par une ancienne culture coloniale.
Area: Writing Intensive

AS.212.679. Romantique et Romanesque: Desire, History, and Politics in 19th Century French Novel.
Literary critics from René Girard to Jacques Rancière assert that French literature of the 19th century— itself arguably the century of the novel— is fundamentally romantic. What does that mean? Is the French novel intrinsically romantic? Our discussion could well start with Girard's Vérité romanesque et mensonge romantique, which presents a new conception of the novel in correlation with human philosophy, and concludes that the "roman romanesque" is not "romantique," because romanesque adhered to the truthfulness of its subject while the romantic scenario is linked to its deceit. However, the real theoretical focal point is not the position of contemporary critics on romantic and non-romantic narrative scenarios, but the following characterization from 1903 of the "roman romanesque" by Academician Émile Faguet (1847-1916): "Ce n'est point du tout le roman à aventures extraordinaires et tumultueuses. Celui-là, je l'appellerais plutôt le roman mélodramatique. J'entends par roman romanesque celui qui, très délibérément, s'attache à nous présenter des caractères exceptionnels qui ne cessent pas d'être vrais." The course will introduce the socio-cultural complexity of novelistic forms and techniques of the literary movement familiarly known among the critics as "le romanesque français" from the Restoration to the early Third Republic. Readings by Balzac, Constant, Dumas, Flaubert, Hugo, Sand, Staël, and Stendhal. Taught in French.

AS.212.684. Fabrique de la banlieue parisienne [The Making of the Paris Suburbs].
Parler de "la banlieue parisienne", qu'est-ce à dire? Et si ce singulier induisait en erreur? Selon les époques, la banlieue fut tour à tour verte, grise, rouge ou néon vif. Appréhendée à la croisée des discours sur l'urbain et des productions culturelles, elle est le lieu de conflits idéologiques entre le capital et le salariat, entre "le Français" et "l'étranger", entre progressisme et nostalgie, entre droit et non-droit. La dialectique qui se tisse entre représentations artistiques (romans, photographies, films), pratiques sociales (arts de faire, modes d'habitation et de déplacement) et représentations idéales (urbanisme, architecture) formera l'objet de ce parcours critique embrassant un siècle de banlieue parisienne. Textes de Céline, Simenon, Queneau, Fallet, Rochefort, Daeninckx, Charef, Djaïdani; films de Duvivier, Dhéry, Godard, Rohmer, Cabrera, Ly. *Open to undergraduate French majors with permission of instructor.

AS.212.696. Literature Confronts Science: Zola.
Zola worked with the theories of heredity of his time in the Rougon-Macquart novels. But he also attempted to use his understanding of biology and thermodynamics to reform the theory of the novel in general. This course will examine these two different effects of science on literature and try to see what leads an author to undertake such a project. For a more extended description, please see http://www.wilda.org/Courses/CourseVault/Grad/Zola/Syllabus.html. Advanced undergraduates with sufficient background may register for this course with permission of the instructor.

AS.212.702. Une Littérature révolutionnaire.
The 1st half of the semester will consider some of the theoretical underpinnings (Montesquieu, Rousseau, Condorcet) and a few examples of Revolutionary rhetoric, especially the trial of Louis XVI and the late speeches of Robespierre. The 2nd half of the semester will study memoirs and literary works produced during the Revolution's aftermath and 19th-century attempts to culturally digest the Revolution. Please note: taught in French

AS.212.711. Baudelaire and Flaubert: Literary Life in the Year 1857.
Charles Baudelaire (1821-1867) and Gustave Flaubert (1821-1880): two young men from wealthy families, two opponents of bourgeois education, two aborted social callings, two terminal illnesses, two resounding failures before literary institutions, two adventures in love, two satanic fascinations, two notorious literary trials, two conceptions of the craft of writing, two approaches to realism, two criticisms of romantic art, two models of poetic inspiration, two aesthetics of language, two cults of Beauty, all for one and a unique literature. This seminar will be devoted to the literary life of two writers whose canon for more than a century has occupied a central place of importance in contemporary literary criticism. It will be our task to place their work in perspective within the context of the rise of modernism, which is to say, the new status of literature as of the year 1857. We shall endeavor, thus, to discern the authenticity of the creative relationship of each artist with himself and subsequently with others. The point will be to foreground three fundamental principles that will aid in grasping the evolution of the literary world under the Second Empire and under the Third Republic: literary history, writing and the elevation of the writer (Bénichou). Our work will be based on three or four texts by Baudelaire and Flaubert, it being understood that additional works of criticism will illuminate the discussion of these texts.
Area: Writing Intensive

AS.212.720. Le Livre Antillais: Culture/Écriture.
On s'arrête trop souvent pour souligner l'inexistence d'une véritable sphère du livre lorsqu'on aborde la littérature haïtienne, mais assez rarement pour s'interroger sur la place de cet objet dans la fiction. Il semble que la représentation du Livre et ses avatars sont partout dans les œuvres des écrivains antillais depuis le 19esiècle. Car lire et écrire jouent un rôle non négligeable dans la représentation culturelle, esthétique et politique qu'ils se font de leur société qui subit une quelconque tyrannie. Ce séminaire sera consacré essentiellement à la question du livre dans un contexte antillais. Aussi s'interrogera-t-on sur la personne de l'auteur antillais, sa présence dans l'œuvre fictionnelle, sa conception fétichisée du livre et de l'écriture au travers de l'esthétique, du social et du politique, en prenant pour exemples quelques romans de Marie Chauvet, René Depestre, Frankétienne, Fernand Hibbert, Dany Laferrière, Émile Ollivier, René Philoctète.
Area: Writing Intensive

AS.212.726. Approches géopoétiques: théâtre, poésie, roman.
Chaque genre littéraire développe un rapport particulier à l'espace, tout autant qu'au temps. Au théâtre, l'espace est à la fois abstrait, dans la mesure où le texte théâtral fait subir au monde une réduction à l'extrême, et concret, en ce que la mise-en-scène actualise un ensemble de possibles devant le public. Dans le domaine de la poésie, l'espace fait l'objet d'évocations diverses et changeantes ; il peut être intensément présent ou être renvoyé à l'arrière-plan au profit de la seule voix, siège de la "conscience" poétique. Le récit de fiction, lui, fort de sa visée mimétique, semble engendrer un imaginaire spatial plus marqué, que celui-ci se crée à partir de topoï communément admis ou qu'il intègre des précisions géographiques ou architecturales, comme le veut l'esthétique réaliste. Le but de ce séminaire sera de confronter ces trois imaginaires de l'espace en littérature, afin d'en arriver à une meilleure compréhension des ressources propres aux textes littéraires et de leur possible théorisation. Ouvrages et articles critiques d'Ubersfeld, Collot, Westphal, Moretti, Bouvet et Camus; œuvres d'expression française, à lire in extenso ou sous forme d'extraits, de Corneille à Koltès, de Lamartine à Glissant, de Voltaire à Volodine...
Area: Writing Intensive

AS.212.741. Rousseau: Citizenship and Exile.
Throughout his life Rousseau presented himself by turns as the citizen of a Republic, a stateless outcast, the resident of a vanishing homeland of the heart, and the focal point of an international conspiracy. He invented new foundations for political communities that could never be implemented or were misunderstood during the revolutionary Terror. The families he portrayed were both patriarchal and defiantly anti-normative. He affirmed his desire to belong and insisted on his irreducible difference; he extolled friendship and engineered breakups. Through readings of Rousseau's major political, autobiographical and fictional works we shall examine how and why communities, personal identity and citizenship are alternately built and destroyed. Taught in French. Course open to undergraduates with permission of the instructor.

AS.212.751. Franco-Algerian Screens: Exoticism, Revolution, Independence.
From exoticist features of the 1920s and 1930s and political works of the 1960s, to family sagas and personal essays looking back on a conflicted past from the standpoint of the new century, Algeria has featured prominently in the French cinematographic imaginary. The independent North African nation has likewise produced compelling narratives that address the colonial legacy, the armed struggle for independence and its aftermath. Addressing from both sides of the Mediterranean an entangled political and cultural history, this course places in critical context conflicting screen representations as well as the institutions, individuals, and publics associated with them. The course will be taught in English, however most course materials will be in French. Undergraduates may take with permssion of the instructor and completion of AS.212.333 and AS.212.334. Graduate students need not have completed the prererquisite courses.

AS.212.757. Romans Africains D'expression Française [French-language Novels of Sub-saharan Africa].
Depuis la période coloniale finissante, le roman africain d'expression française a porté les espoirs et les déceptions d'un continent tiraillé entre panafricanisme et nationalisme, patrimoine traditionnel et modernité, courants séculiers et religieux. Que signifie le choix d'écrire des romans en une langue de colonisation qui est aussi, dans les sociétés multiethniques du Mali, du Sénégal ou encore du Congo, une langue fédératrice auréolée de prestige? Quels publics les romanciers visent-ils à atteindre, et à quel point la forme romanesque permet-elle d'exposer des griefs ou de dénoncer des états de fait tout en faisant apparaître des alternatives? Nous éclairerons, en étudiant des auteur.e.s francophones d'Afrique noire, trois temps forts: l'éveil politico-culturel menant aux indépendances d'abord (Kane, Oyono, Ouologuem, Kourouma); la construction de nouvelles identités africaines ensuite (Sembene, M. Bâ, Sony Labou Tansi); et enfin, les violences génocidaires au Rwanda qui laissent, sur les consciences et les corps, des marques indélébiles (Tadjo, B. Diop, Mukasanga).

AS.212.778. Les écritures contemporaines aux confins des genres [Contemporary French Writing Beyond the Genres.
Le système des genres littéraires consacré par la vieille trinité "roman, poésie, théâtre" ne fait plus la loi. Depuis les années 1980 ont émergé en France des formes d'écriture hybrides s'appuyant sur le montage, le recyclage, le catalogue ou encore la traduction intermédiale. Notre objet sera d'interroger le statut de l'objet littéraire et de la figure de l'écrivain dans un paysage artistico-médiatique que caractérisent la surproduction de textes et d'images et une certaine déréalisation du lien social.

AS.212.781. L'entre-deux-guerres en toutes lettres [French Literature Between the Wars].
French literary culture between the wars (1919-1939) promoted the novel as a forum for social comment and formal experimentation alike. Questioning the psychological biases of the 'roman d'analyse' and reacting to the collective tragedy of the Great War, interwar writers updated the French language as well as narrative 'technique' in light of emergent theories (psychoanalysis, Marxism, phenomenology). Readings from Aragon, Breton, Céline, Cocteau, Colette, Dabit, Malraux, Némirovsky, Queneau, and Simenon.

AS.212.785. The Enlightenment and its Critics.
Are imperialism, universalism, soulless rationalism, reckless exploitation of nature, and social engineering the legacy of a so-called "Enlightenment project," as many have argued in the wake of World War II? This course explores some core aspects of that critique, from Rousseau to Foucault, while testing them against examples of the plurality of discursive practices that we call Enlightenment. Readings and discussion in French. Course open to undergraduates with the instructor's permission.
Area: Writing Intensive

AS.212.791. Film Theory and Critical Methods.
Film Theory and Critical Methods surveys critical approaches to the study of film. Each week we examine a different theoretical approach to filmic representation, with emphasis variously placed on a style, genre, region of production, or period. We will be examining global film traditions from East Asia to Latin America, Western Africa, Europe, and North America. Seminar discussions will incorporate examples from films that students both view on their own as well as during the Wednesday evening screenings, which are mandatory for all seminar participants.

AS.212.801. French Independent Study.

AS.212.802. French Dissertation Research.

AS.212.803. French Proposal Preparation.
1st semester: Develop list of already-read works in your chosen field to develop a thesis subject. Identify 2 co-advisors of the ABD project; the expectation is that 1 will direct the thesis following the ABD defense. Register in this advisor's section (01: Desormeaux; 02: Anderson; 03: Russo; 04: Schilling). 1st month: Discuss with co-advisors your understanding of the core research question(s) and prepare a provisional abstract (an ongoing working tool). The abstract includes 1) well-articulated thesis statement; 2) description of proposed methodology; 3) list of proposed primary works to be studied; 4) justification of the project's relevance to the field and its interdisciplinary reach. It should be accompanied by a report on your literature search: situate your project within the existing scholarly corpus. 2nd month: prepare an annotated bibliography of primary and secondary works. Expect it to expand significantly during ABD prep as well as after the ABD defense. 3rd month: review and modify the abstract with the co-advisors; develop a provisional outline of your ABD text. Present a reading list for the period between the 1st and 2nd semesters of proposal prep. 2nd semester: Meet with the co-advisors to report on the interim research and revisit if necessary the proposed outline and abstract. Submit proposal for the sample chapter. 1st month: begin writing the sample chapter. 2nd month: in the light of how the sample chapter is progressing, review the outline with the co-advisors, then begin writing a narrative of potential thesis chapters. 3rd month: once the foregoing are drafted, write up the methodological introduction and finalize the annotated bibliography. Finally, review the abstract for completeness and revise the ABD for language and formatting. The ABD must be approved by the ABD co-advisors before it is distributed for defense. Goal: ~25 pages of supporting material; ~30-page writing sample; an annotated bibliography. ABD is not to exceed 75 pp.

AS.212.804. French Summer Research.

AS.213.205. Outsiders, outlaws, outcasts. 3 Credits.
Introduction to the close reading of German-language literature in the original. We read and discuss literary works in which experiences of crisis give rise to novel forms of selfhood. Authors may include Tieck, Kleist, Büchner, Droste-Hülshoff, Heine, Keller, Storm, Kafka, and others. We will ask how narrative form can represent breakdowns in established ways of sense-making. Attention will be paid to writers' divergent responses to the challenges of modernity. Readings, discussion, and writing assignments in German.

AS.213.311. Wege aus der Krise: politisches Theater heute. 3 Credits.
Course taught in German. Klimakrise, sogenannte Flüchtlingskrise, Gesundheitskrise, Krise der Demokratie: Eine Krise nach der anderen stellt sich ein oder wird zumindest ausgerufen. Das Resultat ist jedes Mal Weltverlust, wenn auch auf sehr unterschiedliche Weise. Es gibt also grundsätzliche Probleme, mit denen sich politisches Theater heute auseinanderzusetzen hat. In Deutschland und Österreich hat das Theater traditionell und aktuell einen hohen gesellschaftlichen Stellenwert. Allerdings ist auch die Welt des Theaters seit Frühjahr 2020 aufgrund des Gebots, soziale Kontakte einzuschränken, weitgehend zusammengebrochen. Dennoch arbeiten Theatermacher*innen weiter daran, den großen Problemen unserer Zeit zu begegnen. Welche Entwürfe bieten zeitgenössische Stücke, um uns als Gesellschaft Wege aus der Krise zu weisen.
AS.210.362

AS.213.313. Utopia: Idyllic Pasts, New Frontiers. 3 Credits.
Taught in German. This course will explore the vision in German romantic and modern literature of ideal communities. We will examine the relation of past and to future in these works as well as the way they conceive humans and nature, earth and heavens, bodies and machines. To what extent is a utopia something crafted? To what degree is it presented as a fashioned setting like a work of art? What does the image of utopia tell us about the act of imagining at the heart of literature? To what extent does envisioning a utopia amount to inhabiting one? Why is a utopia at once every place and no place (u-topos)? Reading to include works by Klopstock, Novalis, Hoffmann, Kleist, Nietzsche, Scheerbart, Walser and Jünger.
AS.210.361 AND AS.210.362

AS.213.314. Texte sehen, Bilder lesen. 3 Credits.
Taught in German. This course examines the intersections of literature and the visual arts. We will read texts by writers influenced by artists and explore art that mobilizes text; and we will examine the relationships between text and image in both illustrated books and artworks. We will also consider the visual dimensions of texts themselves, asking how texts sometimes come to function imagistically or even as images in their own right. We will work across different periods of literary and visual production, and specific topics will include: theories of text and image; manuscript illumination and early printing; typography; concrete poetry; artists' books; text art; and graphic novels. The course will include visits to the Baltimore Museum of Art, the Walters Art Museum, Special Collections at the Sheridan Library, and a letterpress shop.
Area: Writing Intensive
AS.210.362 or Instructor Permission

AS.213.315. Playtime…auf deutsch. 3 Credits.
Taught in German. German discussions of theater have largely focused on Greek tragedy and how this classical genre can be adapted for the modern stage. Yet comedies (or Lustspiele) have played an equally important role in German cultural productions and discourse from the early modern figure of the buffoon (Hanswurst) to reflections on puppet theater and to larger philosophical and anthropological inquiries into play. In this course we will read several theoretical texts on comedy and play by Aristotle, Huizinga, Kant, Schiller, and Kleist before turning to various comedies by Lessing, Kotzebue, Kleist, Brentano, Droste-Hülshoff, Büchner and Brecht. The culmination of the class will be a theatrical production.
AS.210.362 or Instructor approval

AS.213.321. Bodies and Pleasures. 3 Credits.
This course traces a literary history of sexuality from the Middle Ages to contemporary women's writing. We will analyze how sexual pleasure changed over time. In particular, we will discuss what role literature plays in the reproduction and transformation of bodily pleasures. The course explores how the pleasures of bodies are imagined in and through literature, but also whether words are bodies that give pleasure and perhaps even have their own pleasures.

AS.213.328. German Literary Modernism. 3 Credits.
Taught in English. German Literary Modernism focuses on modernist works of literature between 1900-1930, considering central modernist authors against the backdrop of dramatic changes and events in European culture and society, including urbanization, technological change, the First World War, and social and artistic movements. Students will engage literary works--by such authors as Kafka, Rilke, Hofmannsthal and Thomas Mann--that express a sense of crisis about modern life, or provoke questions about the nature of reality, the human self, the reliability of perception, and the possibilities of language and art. ? Students have the option of an additional hour of German discussion and doing all the assignments in German for German-language credit (3+1) towards the major or minor. Students interested in that option should register for section 2.

AS.213.340. Flucht und Migration: Literarische Erkundungen. 3 Credits.
We will study how contemporary German literature reflects the experiences of migrants and refugees. Jenny Erpenbeck's novel Gehen, ging, gegangen (2017) and Sasha Marianna Salzmann's novel Außer sich (2018) will serve as our main examples, complemented with shorter texts and other material on the historical and political contexts.

AS.213.354. Introduction to German Poetry. 3 Credits.
This class will introduce students to German poetry from the eighteenth to the twentieth century. We will read selected poems by Goethe, Eichendorff, Mörike, George, Hofmannsthal, Rilke, Trakl, Celan, and Bachmann. In addition we will read several theoretical reflections on poetry by literary critics and philosophers which examine the lyric form and the curious world that poetry constructs. Readings and discussion in German.

AS.213.360. Animals and Animality in Literature and Philosophy. 3 Credits.
(300-level, taught in English) critically engages the presentation and imagination of animals and other non-human life in modern literature, philosophy, and thought. We will examine the figure of the animal and the means of conceptual differentiation between the animal and the human, considering animals' relation to or perceived exclusion from language, pain, embodiment, sexuality, and the visual gaze. The course is ideal for students interested in fascinating themes in literature and how they reflect philosophical concerns. No prior courses in philosophy are required. Students will read philosophical texts alongside literary works in learning the conceptual history of animals and of humanity as a distinct species. Expect fascinating readings and engaging, lively discussions. Readings may include works by Marx, Nietzsche, Freud, Heidegger Derrida, Agamben, Poe, Kleist, Hofmannsthal, Rilke, Kafka, Mann, Pirandello, and Coetzee.
Area: Writing Intensive

AS.213.373. Sex und Macht. 3 Credits.
We will discuss postwar and contemporary literature and films that grapple with the effect of unequal power structures on sexual relations. Taught in German.

AS.213.374. Existentialism in Literature and Philosophy. 3 Credits.
What does it mean to exist, and to be able to reflect on this fact? What is it mean to be a self? This course explores the themes of existentialism in literature and philosophy, including the meaning of existence, the nature of the self, authenticity and inauthenticity, the inescapability of death, the experience of time, anxiety, absurdity, freedom and responsibility to others. It will be examined why these philosophical ideas often seem to demand literary expression or bear a close relation to literary works. Readings may include writings by Kierkegaard, Nietzsche, Dostoevsky, Heidegger, Rilke, Kafka, Simmel, Jaspers, Buber, Sartre, de Beauvoir, Camus, and Daoud.
Area: Writing Intensive

AS.213.377. Wassermänner Und Meerjungfrauen. 3 Credits.
Schriftsteller*innen haben immer wieder Geschichten von Wassermenschen erzählt. Was für eine Faszination birgt das Leben im Wasser? Was ist an diesen Zwitterwesen— Männer mit Schwimmhäuten, Frauen mit Fischschwänzen—so interessant? Was geht verloren, wenn solche Amphibien sich für immerauf dem Land einrichten? Tatsächlich sind alle Menschen Wasserwesen— zu einem Großteil aus Wasser bestehend. Aber dieses Lebenselement wird zunehmend gefährdet und gefährlich. Was nun? Wir werden literarische Texte aus der Romantik, Moderne und Gegenwart sowie ein paar Filme analysieren, um diesen Fragen nachzugehen

AS.213.378. Seeing the World by Foot. 3 Credits.
TAUGHT IN GERMAN. Few traditions have placed more emphasis than German literature on the importance of walking for finding one's way on earth and in the cosmos. From Schiller and Novalis to Thomas Bernhard and Werner Herzog, walking has been conceived not only as a journey outwards but also inwards into uncharted terrain of memory, the unconscious, and the imagination. In this course we will read short texts on wandering by Schiller, Chamisso, Goethe, Novalis, Tieck, Stifter, Walser, Bernhard, Herzog and Sebald with an eye toward the relationships that walking establishes between past and present, reality and imagination, time and space and inner and outer experience.
AS.210.361 AND AS.210.362

AS.213.380. Ghost Stories, Haunted House and Other Occult Phenomena. 3 Credits.
From the eighteenth century to the modern period, German authors have been obsessed with uncanny phenomena that blur the line between the natural world and the supernatural world of ghosts, spirits, and magic. We will explore the encounter with otherworldly phenomena in this course with a special emphasis on the status of literature as a play of semblance or collection of shadows. Why have ghost stories been so persistent in the modern era when science and reason are said to dominate our understanding of the world? Is the occult the dark side of science? What kind of knowledge does literature yield? What can literature tell us about what is random, obscure, or inexplicable?

AS.213.407. German Media Theory. 3 Credits.
German Media Theory is an advanced course for upper-level undergraduates and graduate students, giving an introduction and overview of the specifically German version of Media Studies that first gained traction in the 1980s. The term media refers not just to mass media but more broadly to devices that process, transfer and store information, reaching from the alphabet that changed the culture of writing, or the printing press made famous as the foundation of the ‘Gutenberg galaxy’ to computers and smart phones dominating our current lives. In this course we will cut across disciplinary boundaries to explore the multifaceted roots and formations of German media theory which combine literary poststructuralism, histories of science and technology, psychoanalysis, cybernetics, art history, and philosophy among other fields. Readings include works by Friedrich Kittler, Bernhard Siegert, Cornelia Vismann, Wolfgang Ernst, Walter Benjamin, Niklas Luhmann, Michel Foucault, Marshall McLuhan and many others. The course will be taught in English and all readings will be available in English.

AS.213.423. Reflections on Modernity. 3 Credits.
Taught in English. Reflections on Modernity takes up the problems conflicts, and possibilities of modernity in aesthetic, literary, and philosophical texts. Questions about the modern self, our relationship to nature, to urban experience, to history and language, and the role of the artist and writer in reflecting on modern life. Texts include works by such authors as Kant, Nietzsche, Baudelaire, Weber, Rilke, Hofmannsthal, Simmel, Heidegger, Habermas, Foucault.

AS.213.437. Phenomenology and Literature. 3 Credits.
Phenomenology and Literature engages the most fertile interchanges between literature and philosophy in the 20th century, focusing on the roots of phenomenology in German philosophy and its connections with and expansion to literary writing. Themes include: the nature of literary experience, including the experience of reading and writing, literary and phenomenological descriptions of reality, the literary construction of the self, and the understanding of literary imagination from a phenomenological perspective. We will read philosophers and literary theorists such as Nietzsche, Husserl, Heidegger, Sartre, Camus, Merleau-Ponty, Blanchot, Beauvoir, Hamburger, Ingarden and Iser in connection with the works of many modernist writers, including Rainer Maria Rilke, Franz Kafka, Hugo von Hofmannsthal, Thomas Mann, Thomas Bernhard, Virginia Woolf, Marcel Proust, and Wallace Stevens.
Area: Writing Intensive

AS.213.446. Nature and Ecology in German Literature and Thought. 3 Credits.
Nature and Ecology in German Literature and Thought considers the understanding and representation of the natural world in literary works and aesthetic theory from the 18th to the 20th centuries. We will consider such topics as poetic reverence for nature, anthropocentric representations of nature in literature, the thematization of landscape, the representation of animal life, the distinction between the human and animal as explored by literary writers, and ecologically-oriented critique of human consciousness. Readings may include works by such writers and thinkers as Goethe, Kant, Hölderlin, Nietzsche, Heidegger, Rilke, and Kafka, and more recent works of literary ecocriticism.

AS.213.509. German Honors Program. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.213.510. German Honors Program. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.213.607. Critical Ecologies of Literary Modernism.
Critical Ecologies of Literary Modernism will trace the origins of ecocritical literary modernism. Beginning with Hölderlin and Nietzsche, who most radically identified the source of estrangement from nature in human cognition itself, we will explore how innovations in conceiving human cognition and practice play out ecologically in the work of German modernists Hugo von Hofmannsthal, Rainer Maria Rilke, Franz Kafka, Else Lasker-Schu¨ler, Robert Musil, and Bertoldt Brecht, as well as in the modernist works of Virginia Woolf, D.H. Lawrence, William Carlos Williams, T.S. Eliot, Wallace Stevens, Elizabeth Bishop, Françis Ponge and Albert Camus. Grounded in modern German thought and extending across multiple literary modernisms, we will see that what have been taken as the subjective or aestheticized concerns of modernist writing can be recognized as critical ecologies of human cognition and practice, while exposingmodernist anxiety about the technological advances of human habitats, the expanse ofurbanization, the reach of human intervention in nature, and the underlying animality within human thinking and perception. These works may also initiate forms of imagined intimacy with nature and non-human life in modernist works.
Area: Writing Intensive

AS.213.618. Nietzsche.
The first premise of this seminar is that Nietzsche’s works are not simply expositions of ideas. Rather, they testify to an effort to overcome nihilism, that is, to make a life of writing worth living by turning it into an enthralling experiment in which basic tenets of Western culture are pitted against themselves. Our second premise is that this project cannot be adequately understood without attention paid to the peculiarly German form of cultural crisis that confronted the young Nietzsche, the characteristically German turn to Greek antiquity that defined his beginnings, and the grand project of national renewal to which he dedicated his energies during his early alliance with Wagner–the encounter with whom Nietzsche continued to view as the most important event of his life even after he repudiated Wagner. The selection of works we discuss will therefore be bookended on one end by The Birth of Tragedy and a few other early writings, and on the other end by Nietzsche’s final settling of scores with Wagner. A recurrent theme will be the shifting relation between aesthetic delight and the will to truth in Nietzsche’s writings.

AS.213.620. Robert Walser, Literary Miracles and Virgin Births.
One of the most remarkable features of Robert Walser’s writing is that the narrator consistently orchestrates or engineers his birth. He crafts a narrative that enables him to pass from the page into life in a form of literary transubstantiation in which the word is made flesh. This is the miracle of Walser’s writing. It is also a perversion of the Platonic and mystical ideal of a virgin birth. This seminar will explore Walser’s work against this historical and theological backdrop with special emphasis on the nexus of religion and psychosis, as evidenced in Daniel Paul Schreber’s memoir and Freud’s analysis thereof. We will consider the perversion at the heart of Walser’s work that makes literature the sphere of wonders and miracles in an otherwise disenchanted world. Reading knowledge of German is required for this course, as many of Walser’s works have not been translated into English. In addition to Walser’ work, we will also read Plato, Meister Eckhart, Mechthild of Magdeburg, Schreber, Freud, and Beierwaltes on neo-Platonism.

AS.213.622. Possible Worlds: Fiction and Contingency from Leibniz to Tieck.
In 1689, as Leibniz began to understand that contingent phenomena exist, he declared that they pulled him out of an "abyss." What contributed decisively to this insight was not only infinitesimal calculus but also the novel, whose fictive worlds could be given the status of the possible, even if they had no place in the existing "series of the universe." The result of the convergence of literature and mathematics prompted by Leibniz's epistemic breakthrough included new practices of writing and of inventing possible worlds. We will take up these questions in the seminar beginning with Leibniz's Theodicy and Blanckenburg's Essay on the Novel (1774), followed by readings of selected novels from Wieland's Agathon to Dorothea Schlegel's Florentin as well as (more or less) fantastical shorter narratives from Goethe to Tieck. We will also consider theories of fiction and possible worlds from Doležel to Lamarque. Course taught by the Max Kade Visiting Professor Christiane Frey.

AS.213.623. Poetry and Philosophy.
This course will trace the tensions, antagonisms, and collaborations between poetry and philosophy as distinctive but fundamental expressions of human thought and experience. We will engage poetry as a form of artistic expression that compliments, completes, or challenges other forms of knowledge, and consider the range of philosophy's responses to poetry and poetics. Readings will include works by philosophical poets and poetic philosophers including Hölderlin, Schlegel, Rilke, Bachmann, Celan, Stevens, Heidegger, Gadamer, Adorno, Benjamin, Merleau-Ponty, Valéry, Wittgenstein, and Agamben.

AS.213.624. Reading Sand.
Why is there "a world in a grain of sand"? And why in German literature is it a "sandman" who brings dreams? The specific materiality of sand allows for a broad range of metaphorical uses with strong epistemological implications. With its small discrete grains of the same size, sand is barely limited in its potential to coalesce into formations that can be counted yet remain innumerable and to dissolve. Exploring sand in literary texts means to deal with issues like the history of the microscope, the problem(s) of infinity, "sandy" or "grainy" mediality and loose grounds as well as the subjects of remembrance, dream and the historicity of the human being. In this seminar we will read texts by Barthold Heinrich Brockes, Theodor Kornfeld, Jorge Luis Borges, Italo Calvino, Ingeborg Bachmann, Stefan Heym, Paul Celan, E. T. A. Hoffmann and Bodo Kirchhoff. The discussion will be in English, but reading knowledge of German is required for the course material. This course will be taught by Max Kade Visiting Professor, Annina Klappert

AS.213.626. Husserl's Ideas: An Introduction to Phenomenology.
The first volume of Husserl's Ideas I (1913) provides an overarching picture of the phenomenological method that came to define much twentieth-century German and French thought. This course will consider the foundational concepts introduced in this volume (eidetic analysis, intentionality, bracketing, correlationism, time consciousness, the natural attitude and the phenomenological reduction) as well as responses to them by Merleau-Ponty, Derrida, Heidegger and others. We will also consider Husserl's later efforts to incorporate history, other minds, and even that which is other-than-mind into his idealist system.

AS.213.630. Modern Orpheus: Rilke and Celan.
In the Sonnets to Orpheus Rilke proclaims, "Singing is being" [Gesang ist Dasein], in an affirmation of the life attained through art that Nietzsche spoke of in The Birth of Tragedy. This is not an individual life but the whole of being, in which poet and reader share, provided they surrender to the movement of the song, the rhythm of its words. Celan's halting rhythm could not be more different than Rilke's, and yet his poetry also invites the reader to surrender to the work, albeit not to the words but to the wounds it opens within them, to the silence it exposes in speech. This course will consider the Orphic tradition and its aftermath as seen in Rilke's and Celan's work. Special attention will be paid to the status of the unsayable (das Unsägliche for Rilke, das Unsagbare for Celan) in both writer's poetry, prose and translations, especially from the French.

AS.213.636. Hölderlin and His Readers.
Hölderlin's works develop vast intellectual constructions in a poetic language of striking rhythmical power, while remaining anxiously concerned with the conditions of lyric utterance. Although his work responded to the literary and philosophically currents as well as the revolutionary politics and Philhellenism of his time, it proved untimely. Yet the same severe features that alienated contemporaries would lead such 20th-century poets as George, Rilke, and Celan to celebrate and emulate Hölderlin. We will examine how Hölderlin's early contributions to post-Kantian idealism paved the way for his poetic project, as well as his odes and elegies, and some of the poetological writings. The late hymns will be discussed in detail against the backdrop of Hölderlin's engagement with ancient tragedy and his Empedocles project. Since Hölderlin's works have elicited literary criticism of the highest order as well as influential reflections on the aims and challenges of literary interpretation, our readings of Hölderlin will proceed in dialogue with such critical responses.
Area: Writing Intensive

AS.213.639. On the Difficulty of Saying I.
This course takes as its point of departure the position that language carries within it the traces of something that exceeds the cognitive grasp of the subject and to this extent undoes any claim to knowledge the subject might make. This position has been central to twentieth and twenty-first century thought from psychoanalysis and poststructuralism to media theory and new materialism. This course will not take issue with this position. It will examine instead how this position evolved from the Idealism of Fichte to the eerily inhuman, if not mechanical, talking figures in texts by Novalis ("Monolog"), Poe ("Maelzel's Chess Player"), Hoffmann ("Die Automate"), Büchner (Leonce und Lena), and Kafka ("Ein Bericht für eine Akademie"). We will explore the literature of the personal and impersonal in romantic and modernist texts in order to ask what moves and motivates works in which the first-person narrator would seem to be nothing more than a fiction—a staged phenomenon or a mechanical device.

AS.213.643. Franz Kafka in Philosophical and Literary Perspective.
This course is devoted to close study of the writings of Franz Kafka from both philosophical and literary perspectives. Writings will include Kafka's short prose works and novels along with philosophical and literary critical interpretations thereof. Readings may include commentaries by Walter Benjamin, Theodor Adorno, Hannah Arendt, Albert Camus, Giles Deleuze, and Giorgio Agamben. Primary texts for students from the German section will be in original; any other students may read Kafka in translation.

AS.213.668. Kleist im Kontext.
This seminar will explore the narrative, dramatic, and quasi-journalistic work of Heinrich von Kleist in its philosophical and literary environment. We will examine how Kleist comments on and parodies the positions of the enlightenment, German Idealism, Weimar classicism, and the theater establishment. We will pay particular attention to the way he combines the verbal and the visual in his performative, narrative, and syntactic strategies, and analyze how this contributes to a specifically Kleistian sense of humor.Grading: P/F

AS.213.679. Haitian Revolution: German Responses.
We will explore how contemporary German thinkers and writers reacted to the Haitian Revolution, what their interests were, and how later generations of writers responded to earlier reactions, perhaps tried to do better and used the historical material for their own purposes. Possible authors: Hegel, Humboldt, Kleist, Zschokke, Seghers, Müller, Fichte, Buch, Öziri and others.

AS.213.687. Imagination in Philosophy and Literary Theory.
Imagination in Philosophy and Literary Theory is devoted to studying theories of imagination in the history of philosophy and literary theory, from the ancient Greeks to the present day. We will study philosophical conceptions of the role of imagination in memory, cognition, perception, and creativity, and assess traditional philosophical oppositions between imagination and reason, the imaginary and the real. Readings may include selections from Aristotle, Kant, Coleridge, Nietzsche, Husserl, Heidegger, Merleau-Ponty, Sartre, Dufrenne, Stevens, Iser, Ricoeur, Ryle, Wittgenstein, and Nussbaum.

AS.213.742. New Objectivity: Program and Projects.
The course will focus on the aesthetics and discourse of “New Objectivity” in Weimar German literature. The ideals of sobriety and coldness called for a direct and unadorned view of the routines of modern work and love and found proponents not only among writers of the avant-garde but also, and with less fanfare, among authors who worked in popular genres like adventure novels. In this course, we will investigate how the desire for objectivity responded to a cultural crisis in the aftermath of World War I and how it guided the choice of genres (biography, reportage, non-fiction, modernist novel) as well as encouraged factographic styles of writing. Authors to be discussed include Egon Erwin Kisch, Joseph Roth, Siegfried Kracauer, Ilja Ehrenburg, B. Traven, Irmgard Keun, Gabriele Tergit, and Marieluise Fleißer. Class discussion will be in English or German depending students’ preferences. Reading will be in German.

AS.213.761. Literary Aesthetics.
This course explores literature in the context of the aesthetic tradition in philosophy. Themes include literature as mimesis, or the representation of reality, its relation to truth, untruth, and possibility, literature as the revealing of being, literary imagination, the distinctiveness of literary language and expression, the role of the literary author. Readings may include background selections from Plato and Aristotle, but the course will focus on philosophical interest in literature since the late 18th century, and may include Kant, Hölderlin, Nietzsche, Heidegger, Sartre, Blanchot, Bachelard, among other readings. Course will be taught by the Kurrelmeyer Chair in German. Taught in English.

AS.213.763. Contemporary Theater: Gender/Violence.
The course explores 21st-century German theater in its diverse aesthetic and textual forms. Due to comparatively generous funding, German non-commercial theater has over the last decades been able to develop, adapt, and maintain a great variety of at one point “experimental” artistic styles, including frequently stark depiction of gender and violence. We will focus on the ways in which the productions take up, amplify, displace, disrupt, and/or reinforce cultural codes and images of gender and violence both in their symbolic and physical dimension. Topics include the “directors’ theater,” political theater, “pop-theater,” “discourse-theater,” “new documentary theater,” “post-migratory theater,” postcolonial theater and live art. The readings may include Nobel laureate Elfriede Jelinek, Dea Loher, René Pollesch, Milo Rau, Falk Richter, Sasha Marianna Salzmann and various works of shared authorship such as She She Pop, Rimini Protokoll, Gintersdorfer/Klaßen, and Yael Ronen. The Tuesday sessions will be used for the joint viewing of production recordings. Taught in English. Course material in German. No sessions after March 27th.

AS.213.800. Independent Study-German.

AS.213.804. German Summer Research.

AS.213.812. Directed Dissertation Research.

AS.213.813. German Qualifying Paper Preparation.

AS.214.304. Founding Mothers: Female Genealogies in Medieval and Renaissance Italian Literature. 3 Credits.
In this course we will explore the problem of the relationship of women to dynastic power in the literature and culture of late medieval and Renaissance in Italy. Beginning from Giovanni Boccaccio’s famously ambivalent portraits of women in the Decameron and his treatise On Famous Women, we will locate women within an early modern system of inherited power and literary representations. We will then move to study a series of genealogically motivated chivalric poems (such as Orlando innamorato, Orlando furioso, Floridoro, Gerusalemme liberata) which propose a number of roles for women: warriors, queens, saints, monsters, saviors, poets, founders. These texts return again and again to the key role of women in establishing and maintaining dynastic continuity within noble families, but also to the dangers they pose to dynastic stability. We will try to understand how these literary texts work within the social and political context of the Italian city- states of this period. We will also study the involvement of women in the production and circulation of literary texts, focussing on notable patrons of the arts like Isabella d’Este and Lucrezia Borgia, and on important poets like Vittoria Colonna.

AS.214.362. Italian Journeys: Medieval and Early Modern. 3 Credits.
The Truth behind the Courtly Façade: «Of ladies, knights, of passions and of cutthroat competition»: the truth behind the romantic façade. What did life actually look like at Italian courts of the 1400 ‘s and 1500’s? We will reconstruct life at a Renaissance court through Italian history, literature, music and art of this period. Who were the stars of these scenes? We will explore the complex and intricate world of the Italian courts, including Florence and Ferrara, through the works of art they produced. The course will concentrate on historical, literary and visual representations including modern media such as film and television.
Area: Writing Intensive

AS.214.363. Italian Journeys: An Other Story. 3 Credits.
What does it mean to be "other," and how can reading about experiences of otherness affect our understanding of historical moments? In this interdisciplinary survey of contemporary Italian literature, students will read through the lens of "the other" in order to highlight both the milieu of lived experiences (often lived by the authors themselves) outside of sociocultural ideals, and the role they play within modern Italian canon. Combining gender studies, animal studies, posthumanism, and other theoretical frameworks, students will examine works from authors such as Sibilla Aleramo, Carlo Levi, Elena Ferrante, Igiaba Scego, and directors Vittorio De Sica, and Alice Rohrwacher. Taught in English—students wishing to do coursework in Italian should register for AS.214.363 (02).

AS.214.422. Ugly Beasts, Talking Monkeys: The Medieval Animal. 3 Credits.
This seminar explores the boundaries between humans and animals in the medieval world and beyond. Reading literary texts such as Giovanni Boccaccio's Decameron, Moderata Fonte's Floridoro, Luigi Pulci's Morgante and medical texts such as Girolamo Fracastoro's On Contagion, we will trace the formation of distinctions between species.The categories we will use to investigate the distinctions between animals and humans include metamorphosis, contagion, education, taxonomy, subjugation, hunting, representation, anthropomorphism and zoomorphism, wilderness, misogyny, and promiscuity. To probe these categories and distinctions, we will make use of a series of critical approaches, from critical animal studies to posthumanism, within the disciplinary specificity of Medieval Studies.

AS.214.434. Elena Ferrante and her Brilliant Friends: Contemporary Italian Women Writers. 3 Credits.
Elena Ferrante is Italy's most acclaimed contemporary novelist, although her true identity remains unconfirmed. Having been translated into and published in 45 languages, with over 15 million copies sold worldwide, her 'Neapolitan Quartet' triggered what has been called 'Ferrante Fever.' Through reading and discussion of Ferrante's works (novels, letters, and a fairytale) and their screen adaptations— the HBO TV series My Brilliant Friend and Maggie Gyllenhaal's The Lost Daughter (2022) —we shall discover the reasons behind this global, literary phenomenon while exploring themes such as gender, memory, trauma, women's participation in, or exclusion from, history, and the internal violence of a rapidly changing society. In addition to Ferrante's works, we shall also read Anna Maria Ortese, Elsa Morante, and Fabrizia Ramondino to understand the influence of women writers from previous generations on Ferrante's work. This class is taught in English. Additional discussion sessions in Italian will be offered.

AS.214.466. Utopias and Dystopias in Renaissance Culture. 3 Credits.
We will trace the dream of designing an ideal society and the danger of creating its opposite in the sixteenth and seventeenth century Italian and European thought.

AS.214.479. Dante Visits the Afterlife. 3 Credits.
One of the greatest works of literature of all times, the Divine Comedy leads us down into the torture-pits of Hell, up the steep mountain terrain of Purgatory, through the "virtual" space of Paradise, and then back to where we began: our own earthly lives. We accompany Dante on his journey, building along the way knowledge of medieval Italian history, literature, philosophy, politics, and religion. The course also focuses on the arts of reading deeply, asking questions of a text, and interpreting literary and scholarly works through discussion and critical writing. Conducted in English.
Area: Writing Intensive

AS.214.561. Italian Independent Study. 0 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.214.562. Italian Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.214.607. Teoria e Prassi della Glottodidattica dell'Italiano.
The goal of this course is to familiarize Graduate Student Instructors in Italian with foundational elements of Second Language Acquisition and foreign language teaching. The course will (1) acquaint students with historical and current theories of foreign language pedagogy; (2) demonstrate strategies to integrate theoretical knowledge into everyday practice, both in terms of instructional delivery, and materials development; (3) introduce participants to basic evaluation tools to critically assess teaching practices and tools in terms of quality, relevance, validity, reliability and other theory-based criteria; (4) help participants to articulate their own pedagogical training and philosophy of teaching in preparation for the academic job market. Taught in Italian.

AS.214.608. Vico: Mythology, Philology, and Forgery.
In this course we will examine Giambattista Vico's innovative effect on intellectual history, in light of recent discoveries regarding Vico's publication history. Extensive work in Special Collections will be featured.

AS.214.610. The Nonhumans of Renaissance Humanism.
This course is an exploration of the notions of the human that emerge when interrogating pre-modern Italian literary constructions of nonhuman entities (water, earth, flora, fauna, objects, buildings, cities, automata, demons, angels, gods, and God). We will read work by authors such as Dante, Petrarch, Boccaccio, Pico, Alberti, Leonardo, Sannazaro, Baldi, and Della Porta, as well as parts of the Hypnerotomachia Poliphili, and selections from bestiaries, herbaria, and books of emblems. Accompanying these readings are recent studies in critical theory on posthumanism and transhumanism, animal studies, ecocriticism, and phenomenology.

AS.214.685. Donne e scrittura tra '500 e '600.
While women's contributions to Italian Renaissance literature have long been acknowledged, their creative output continued well into the 17th century. This course focuses on some of the protagonists of this extraordinary season, from Lucrezia Marinella and Arcangela Tarabotti to Elena Lucrezia Cornaro Piscopia, who in 1678 became the first woman in the world to receive a university degree. Taught in Italian

AS.214.747. Umberto Eco: Medievalist, Postmodernist, Narratologist.
Umberto Eco was one of the most prolific and flamboyant authors of the 20th and early 21st centuries. Trained as a medievalist, he became one of the central figures in literary theory as well as a best-selling novelist, essayist, and public intellectual. We will explore his long career as both narratologist and narrator and its foundations in intellectual history. Works will include Il nome della rosa, Il pendolo di Foucault, Opera aperta, and The Limits of Interpretation.
Area: Writing Intensive

AS.214.748. Giambattista Vico and the Old Science.
Giambattista Vico's Principi di scienza nuova (1725, 1730, 1744) was intended to found an "ideal" and "eternal" model of human development. Vico emphasizes the importance of both philology and philosophy to his project, and attempts to break the mold of thinking about the history of humanity by exposing the preconceptions and misconceptions that arose from attempts to square "sacred history" with "profane" or non Judaeo-Christian history, creating a philosophy (or even a science) of mythology.
Area: Writing Intensive

AS.214.757. Tasso, Poet of Doubt.
A reading of Tasso's Gerusalemme liberata along with relevant poetic, literary-theoretical, philosophical, and theological texts.
Area: Writing Intensive

AS.214.766. Italy and Environmental Humanities.
This seminar examines a variety of literary texts and films, produced in Italy from the post-war period to the contemporary era, from material eco-critical perspectives. While maintaining a focus on Italy, this course addresses broad questions within the field of environmental humanities: what is the Anthropocene and how it has been conceptualized? How is has been framed chronologically? How do we interrogate a text from an ecocritical perspective? What is a non-anthropocentric narrative? What is the task of the eco-scholar? What is the goal of environmentally concerned scholarship? What does it mean to teach 'ecocritally'? Literary texts include works by Italo Calvino, Carlo Cassola, Paolo Volponi, Anna Maria Ortese, and films by directors Roberto Rossellini, Pier Paolo Pasolini, Pietro Marcello, and Alice Rohrwacher. Critical and theoretical readings will include Marco Armiero and Marcus Hall's Nature and History in Modern Italy, Timothy Morton's Humankind, Serenella Iovino Ecocriticsm and Italy, and Rosi Braidotti's The Posthuman.

AS.214.804. Italian Summer Research.

AS.214.861. Italian Independent Study.

AS.214.862. Italian Dissertation Research.

AS.214.863. Italian Proposal Preparation.

AS.215.231. Introduction to Literature in Spanish. 3 Credits.
The main objective of this course is to examine and discuss specific authors and topics in literature in Spanish from the Middle Ages to the 20th century. The course is designed to cover a selection of Hispanic texts from Spain and Latin America. Literary genres to be studied will include narratives, poetry, and drama. The bulk of each class session will be dedicated to the discussion of the assigned readings. This course is taught in Spanish. This course is required for the major in Spanish.

AS.215.290. Latin American Critical Perspectives on Colonialism: From the 'World Upside Down' to the 'Coloniality of Power'. 3 Credits.
This course, taught in English, examines how indigenous and local (postcolonial) intellectuals in Latin America responded to the ideology and practices of Spanish Colonialism in the earliest post-conquest years (1532), continued to battle colonialism during the period of the wars of independence, and finally arrived at the production of an analysis that shows how modernity is but the other face of colonialism. Among key works to be discussed are Guaman Poma's illustrated sixteenth-century chronicles, D.F. Sarramiento's _Civilization and Barbarism_ (1845), and Anibal Quijano's "Coloniality of Power" (2000).
Area: Writing Intensive

AS.215.309. An Interdisciplinary Introduction to the Study of Latin America. 3 Credits.
The course is an interdisciplinary introduction to the study of Latin America. It brings together archeology, ethno-history, art history, literature and environmental studies.
Area: Writing Intensive

AS.215.336. Don Quijote. 3 Credits.
A close reading and discussion primarily in Spanish of Cervantes' masterpiece, with concentration on its major themes and contributions to the formation of the modern novel. We will use A. Murillo's edition of the novel, Editorial Castalia.
AS.210.311 AND AS.210.312

AS.215.380. Modern Latin American Culture. 3 Credits.
Taught in Spanish. This course will explore the fundamental aspects of Latin- America culture from the formation of independent states through the present—in light of the social, political, and economic histories of the region. The course will offer a general survey of history of Latin-America, and will discuss texts, movies, songs, pictures, and paintings, in relation to their social, political, and cultural contexts. May not be taken satisfactory/unsatisfactory.
AS.210.312;Students may earn credit for AS.211.380 or AS.215.380, but not both.

AS.215.390. Modern Spanish Culture. 3 Credits.
This course will explore the fundamental aspects of Spanish culture from the nineteenth to the twenty-first centuries. The course will offer a general survey of the history of Spain and will discuss texts, movies, songs, pictures, and paintings in relation to their social, political, and cultural contexts. This course will be of particular interest for students planning on spending a semester abroad in Spain—specially for those students going to the JHU Fall Semester in Madrid, at Carlos III University. Taught in Spanish. Recommended Course Background: AS.210.311 or appropriate Webcape score.AS.215.390 was formerly numbered AS.211.390
Students may not have previously completed AS.211.390.

AS.215.406. Novelist Intellectuals. 3 Credits.
What does a novelist's op-ed about economics have to do with her literary writing? In what ways does a fiction writer's essays on the environment inform how we read her novels? What happens when we find the political opinions of a writer objectionable? This undergraduate seminar will consider what the Spanish writer Francisco Ayala termed "novelist intellectuals," that is, literary writers who actively participate in a society's public sphere. Considering writers from Madrid to New York, from London to Buenos Aires, we will ask how one should hold a novelist's fictional and non-fictional writings in the balance and explore ways of reading that allow us to consider the public intellectual side and the aesthetic side of a novelist together.

AS.215.407. Power And Gender In Hispanic American Novels And Films. 3 Credits.
We will analyze and discuss four novels and three films impacted by gender violence and political idolatry under shattering stress. Oficio de tinieblas or The Book of Lamentations (1962) by Rosario Castellanos (Mexico). Zama (1956) by Antonio di Benedetto (Argentina). Delirio or Delirium (2004) by Laura Restrepo (Colombia). El ruido de las cosas al caer or The Noise of Things Falling (2011) by Juan Gabriel Vásquez (Colombia). In addition, we will examine in depth films by Lucrecia Martel (Argentina): the short Rey muerto (1995), La ciénaga (2001), and her own version of Zama (2017). Course taught in Spanish.
AS.210.312

AS.215.409. Catalonia and Independence. 3 Credits.
What is the Catalan independence movement? Where did it come from? What, exactly, does it advocate? This seminar will examine the history, politics, and culture of Catalonia in an attempt to understand why the push for independence has grown over the past decade. We will focus especially on the impact of nationalism, ideology, social history, economics, law, and language on the construction of Catalan identity. But we will also compare Catalonia to other regions in the Iberian Peninsula (the Basque Country, Galicia) as well as across Europe (Scotland, Northern Italy) and North America (Québec) in order to better understand how movements for regional autonomy and independence emerge today. Taught in English.

AS.215.412. Populism. 3 Credits.
What do Hugo Chávez, Marine Le Pen, and Donald Trump have in common? According to many from across the political spectrum, they are all populists. But what is populism, exactly, and how can it describe such disparate phenomena as left-wing social movements, xenophobic anti-immigrant policies, and economic redistribution? This advanced seminar will examine the history, culture, and political theory of populism. We will pay special attention to the resurgence of populism after the Great Recession and examine a number of cases from Latin America, Europe, and the United States.

AS.215.413. Cuba y España. 3 Credits.
La frase “más se perdió en Cuba” alude al singular rango de la antigua Provincia de Ultramar en el mapa geopolítico del colonialismo hispánico. Hemos de estudiar la prolongada relación entre España y Cuba, desde 1492 al presente, a través de materiales literarios, crónicas, artes plásticas, música y medios sociales al corriente. Enseñado íntegramente en español.
AS.210.311

AS.215.414. Blood Cinema in films by Pedro Almodóvar, Julio Medem, and Alejandro Amenábar. 3 Credits.
Films by three leading Spanish male directors from different generational backgrounds and sexual and political orientations. We will study their respective filming and mythmaking of kinship and regional passions in mixing love with hate, attraction with rejection. Our dialogue will revive and debate the polemical psycho-analytic theses in Marsha Kinder's Blood Cinema: The Reconstruction of National Identity in Spain.
AS.210.311 OR AS.210.312

AS.215.416. Mexican Empire: the Problem of Territory from Aztec Philosophy to Trump's Wall. 3 Credits.
This course with seminar option is devoted to Mexico, its past and present paths into a remote inside-out pre-imperial epoch inalienable from North-against-South histories across the American Narcoland from Honduras to Alaska. Our nonfictional materials combine detailed summaries and readings of Stuart Elden's The Birth of Territory and James Maffie's Aztec Philosophy: Understanding a World in Motion. The fictional matter concerns Roberto Bolaño's 1998 novel, Los detectives salvajes (The Savage Detectives), Corman McCarthy's apocalypse Western, 1985 Blood Meridian, and Carlos Reygadas' films, Post Tenebras lux (2012) and Nuestro tiempo (2018).

AS.215.417. Literature of the Great Recession. 3 Credits.
The Great Recession—sometimes called the financial crisis or the economic crisis of 2008—brought financial markets to a halt and created significant political turmoil across the North Atlantic. But its impact on culture, and literature especially, has often been ignored. This seminar will travel across Europe, from Dublin to Madrid, from London to Reykjavík in order to examine how literature has registered this most recent economic crisis. We will focus on how crisis is narrated and the ways in which literary works have managed to provide a voice for marginalized social, economic, and political demands.

AS.215.419. Colombia: Territory Against Nation. 3 Credits.
The nation of Colombia amounts to a large country partly made immense and hard to govern and corruptible by its territorial nexus and porous frontier with Venezuela. Starting from such polemic claim, leaning on misgovernance vs. excessive governmentality, we will study two novels, Laura Restrepo's Delirio/Delirium (2004) and Juan Gabriel Vásquez's The Noise of Things Falling (2011); both winners of the prestigious Planeta Prize. To what extent can literary fictions of such scope and ambitions, invested in deeply rooted family politics, help or harm the reader's political trust in nations as novels and fictions as nations?

AS.215.421. Blood and Honor in the Spanish Golden Age. 3 Credits.
In this class we will study a selection of the often violent and suspenseful literature that served to entertain both the masses and the nobility during the height and rapid decline of the Spanish Empire. We will delve into how the literary establishment, in particular the theater, disseminated and sometimes questioned social and gender norms, all while wrestling with the at times deadly code of honor that permeated Spanish society. (Course taught in Spanish)

AS.215.442. Whose Caribbean and the Epic of Race. 3 Credits.
We will study literary claims of epic colonial possession and aesthetic dispossession through close readings of five works in reverse chronological order: V.S. Naipaul's late historical novel, A Way in the World (1994); Derek Walcott's transoceanic poem, Omeros (1990); Alejo Carpentier's short anti-Enlightenment moral tale, El reino de este mundo (1949) and his short tale in celebration of Afro Cuban wizardry, Viaje a la semilla (1944); Aimé Césaire's prose poetry, mixed chronicle, Cahier d'un retour au pays natal, or Notebook of a Return to the Native Land (1939-1947). We will address questions of temporality and historicity (Heidegger) and a base-materialist political blocking of wild dreams as attainable through translation (Bataille). Such formal and epistemic problems will draw us into issues of race across the colonial spectrum of Caribbean histories.

AS.215.448. The Politics of Spanish Painting. 3 Credits.
How is painting political? What would it mean for a painting to make a political intervention? Can a painting, through its subject, composition, and style, make political arguments and claims? Understanding painting as a repository for social, economic, and political relations, this course will examine the works of major Spanish painters from El Greco to Picasso. We will pay special attention to the ways in which painters developed a particular “political vision” of Iberia and the world. Paintings will be paired with texts ranging from art history and criticism to literature, history, and political philosophy. Taught in Spanish.

AS.215.460. Modern Mexico and the Culture of Death. 3 Credits.
Drawing from sources in popular culture, literature, folk religion, and the media, we will explore the myths and daily practices of death-related representations of Mexico's survival against enemies, from within the state apparatus, and the insertion into it of drug traffickers, on both sides of the so-called Crystal Frontier with the US.

AS.215.463. Borges: His Fiction and Critical Essays. 3 Credits.
This course will deal with close readings of Borges ficciones and critical essays in order to determine how his thinking on the problem of writing and thinking is fictionalized in his stories.
Area: Writing Intensive

AS.215.465. Wild Surrealism: Lorca, Dalí, Buñuel. 3 Credits.
Spanish surrealism emerged unevenly. Some writers and artists sought out the surrealist label while others rejected or ignored it altogether. Some attempted to adhere to André Breton's "Surrealist Manifesto" while others went decidedly against its principles. Yet surrealism, in one way or another, took over the Spanish artistic scene during the 1920s and '30s. Today, it is associated with Federico García Lorca, Salvador Dalí, and Luis Buñuel. Friends, roommates, and even lovers, Lorca, Dalí, and Buñuel came to define surrealism's acceptance, rejection, and indifference in Spain. This seminar will examine the moment of Spanish surrealism through these three figures. The course will include the study of film, art, drama, poetry, and nonfiction. Taught in Spanish.Recommended Course Background: AS.215.390 or AS.215.231

AS.215.469. Mapping Identity in Modern Spain. 3 Credits.
What social, political, and economic forces make groups of people appear out of place in a given society? How have literary works contributed to counteracting the marginalization of certain groups? This course will look at how modern Spanish artists, writers, and intellectuals wrestled with questions of identity and marginalization. We will critically examine how the modern Spanish state was forged from restrictions on cultural difference and consider the various marginalized groups that were left in its wake. These groups include various peoples (e.g. the Romani), ideologies (e.g. anarchism, socialism, communism), social and economic classes (e.g. peasants, the working class), and regional identities (e.g. Catalonia, the Basque Country). Key texts in modern Spanish literature will prompt our investigation into how writers and artists reflected on, contested, and expressed the marginality of the country's various internal others. Taught in Spanish.

AS.215.477. La Habana Miami: One World and Two Cities. 3 Credits.
Havana and Miami make up the oldest US enclave city linked to a foreign one under US Embargo access. We will study a unique counterpoint Hispanic Exiled culture which considers itself protected by American Exceptionalism

AS.215.525. Spanish Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.215.526. Spanish Independent Study. 1 - 3 Credits.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.215.603. Napoleon's Haitian Cosmos from Boukman to Bolívar.
A seminar on middle-modern to late-modern fictions by Alejo Carpentier (1949-1962 El reino de este mundo and El siglo de las luces), Carlos Fuentes (1980 Una familia Lejana), and Gabriel García Márquez (1989 El general en su laberinto). Reread as defunct belles-lettres. Main critical and theoretical points of in-depth reference: Derek Walcott's rogue Robinson-Crusoe Caribbean poetics and Jared Hickman's exorbitant Black Prometheus. Taught in English.

AS.215.604. To Die in Mexico.
The seminar adopts and translates recent ideological revisions of Mexico's alternate modernities; impacted by postcolonial, subaltern, and decolonial theories of Latin American exceptionality. The plural character of these combined exceptions and exemptions and refusals to reincorporate Mexicanness into modernizing Occidentalism will be foregrounded in two historical moments: modernismo-to-modernism, in convulsed Mexico (1900-1927) and criollista Nueva España "Baroque" hybridized and myth-invested ethics of nationhood (1604/1690): Bernardo de Balbuena's Grandeza Mexicana (1604)/Carlos Sigüenza y Góngora's Infortunios de Alonso Ramírez (1690). These materials will be framed in Europe's modernist, re-mythologized "Waste Land" (T.S. Eliot), as "brought home" to America in Hart Crane's The Bridge (a poem largely conceived and reborn in Cuba's Isla de Pinos.)(Fluent reading knowledge of Spanish)

AS.215.606. Engaging with the Global Hispanophone.
This course is envisioned as an invitation to branch out beyond the traditional archives of Hispanism, as we engage with the cultural production of 'peripheral' territories in the so-called Hispanic world, including regions that have recently been grouped within the category of the "Global Hispanophone." This rubric aspires to incorporate the cultures and historical experiences of territories once bound by the Spanish Empire in North Africa, the Gulf of Guinea, and the Philippines. In this reconfiguration of our intellectual and geographic maps of Hispanic studies, we will place these regions' pasts and presents in dialogue with other areas traditionally more central to our disciplines, while giving particular centrality to Africa. The course is thus informed by a determination to break away from the overarching Iberian/Latin American binary, an even some configurations of Atlantic Studies, and to embrace other communities, histories, experiences, and repertoires. We will ask: what might an engagement with this new archive of the Global Hispanophone entail for the broader fields, and for the scholarly practices, of Latin American, Caribbean, Latinx, Iberian, or Atlantic studies today? How might engaging with one or more of the geographical areas involved –Western Sahara, Ceuta, Melilla, Morocco, Algeria, the Philippines, Equatorial Guinea and perhaps others not fully covered in this course– alter, or transform, our approach to the respective fields?

AS.215.607. Utopia, Text, Torture.
We will examine and stress-test writings that graphically breach and exploit established literary discourses in direct or indirect reference to unbound self-consciousness. This mode of textual introspection struggles against false consciousness as a form of self-absorbed torture (matching routine practices by the dictorships that rule over any sense of actuality in these novels). Textual imprisonment (often hyper-sexualized) escapes and humiliates these otherwise triumphantly gendered writers. Diamela Eltit, Lumpérica (1983); José Donoso, La desesperanza (1986); Néstor Perlongher, O negocio do miché. Prostitução viril em Sao Paulo (1987), La prostitución masculina (1993) or El negocio del deseo (1999); Mario Vargas Llosa, El paraíso en la otra esquina (2003); Laura Restrepo, Delirio (2004). In each case, aspects of dictatorship as specific South American despotism should loudly impact our discussions.

AS.215.613. Ricardo Piglia, Borges, Derrida and Argentina's Eighteenth Century.
A voice in Piglia's Artificial Respiration claims that Argentina did not have an eighteenth century or the Eighteenth Century. Besides Piglia's palimpsest novel, we'll study a handful of texts by Borges. Passages from Leopoldo Marechal's Adan Buenosayres, and Derrida's The Beast and the Sovereign Volume Two, in reference to Heidegger's The Fundamental Concepts of Metaphysics and Defoe's Robinson Crusoe. Taught in English.

AS.215.631. Contemporary Latin American Cinema: History, Theory, and Practice.
This seminar presents a transnational history of Latina American cinema from the 1960s to the present, with a special regard to its global influence. Starting with the Cuban Revolution and the subsequent founding of the ICAIC, we'll examine how politics and aesthetics shape each other. We'll discuss the manifestos and films of the so-called New Latin American Cinema, including Tercer Cine, Cine Imperfecto, and Cinema Novo; the filmography made during the continent's various dictatorships; and post-dictatorship debates on memory. We'll also engage with a recent theoretical and cinematic production on gender, sexuality, the non-human, and new cinematic postcolonial approaches. In December, we will visit the International Festival of New Latin American Cinema of Havana to continue discussions in the setting of Latin America's largest film festival. Some knowledge of Spanish will be necessary to take this class.

AS.215.633. Spectacle, Subjectification, and Reality Literacy in Early Modern Society.
In this seminar we will examine the widespread deployment of cultural production in the early modern period in the service of generating social cohesion around an emerging national project, primarily in the case of Spain. At stake will be how cultural practices can determine a shared sense of reality, often at odds with the interests of marginal groups, as well as the strategies that emerge to counteract and question those practices. While reading knowledge of Spanish is desirable, graduate students from other disciplines who wish to explore these theoretical questions with regard to a different cultural corpus are welcome. Graded Pass/Fail.

AS.215.640. Borges, Derrida, Heidegger and the Paradoxes of Perception.
In this seminar we will the examine the ways in which Jorge Luis Borges's narratives intersect with lines of inquiry pursued by Martin Heidegger and Jacques Derrida around perception, knowledge, language, time, and space.
Area: Writing Intensive

AS.215.641. Guaman Poma, his 12 theses for an new understanding of the World Upside Down.
As of today, due to the work of Walter Mignolo, Ossio, Lamana and other scholars in Colonial Studies, the 1000 page letter of Guaman Poma to the King of Spain has become the pre-eminent text written on the question of coloniality of power as theorized by Anibal Quijano. Given that the concept is now central to colonial and modern studies, familiarity with the work of Guaman Poma is essential in the formation of all Latin Americanists and scholars interested in coloniality and imperial studies.
Area: Writing Intensive

AS.215.651. The idea of "Latin America": current debates on the fundamentals of the field.
The course will explore the history of the Idea of Latin America as a discursive and political entity. Students will read the work of Walter Mignolo, Maurico Tenorio Trillo and Fernando Digiovanni among other theorist and cultural historians.
Area: Writing Intensive

AS.215.718. Contemporaneity and Crisis.
How should one study contemporary literature and culture? Is "the contemporary" a period in and of itself? Does it require a distinct conceptual approach? This graduate seminar will examine various approaches that have emerged since Michel Foucault called his genealogies a "history of the present." We will pay special attention to contemporary literature and culture's most distinguishing feature today: crisis. Considering theories of crisis and "the contemporary" together, the course will explore how living in a time of overlapping crises—economic, political, social, cultural, environmental, and others—affects the way we interpret the world.

AS.215.747. Borges in Theory.
The course engages close readings of Borges critical essays and some of his fiction in order to establish the points of interpellation that Post-modern theory takes from or shares with Borges's meditation on the problem of writing.

AS.215.748. Public Humanities Writing Workshop.
Humanists possess a reservoir of scholarly abilities that prime them for contributing to debates well beyond the academy. This semester-long workshop will introduce graduate students to the basics of writing for such broad audience. Each session will be organized around particular topics in public humanities writing, including the pitching, writing, editing, and publishing processes of newspapers, magazines, and online outlets. We will also consider the forms of writing that most allow scholars to draw from their academic training and research: reviews, personal essays, op-eds, interviews, and profiles. Throughout the course we will see how the interdisciplinarity, comparativism, and multilingualism of fields from across the humanities can be helpful for reaching wide audiences. Beyond the nuts and bolts of getting started in so-called "public" writing, this course aspires to teach graduate students how to combine quality writing with academic knowledge, scholarly analysis with a general intellectual readership—and, ultimately, make academic knowledge a public good. Taught in English.

AS.215.791. Film Theory and Critical Methods.
Placed at the crossroads of aethestics and politics, psychology and economics, the history of technology and popular culture, film has emerged as the interdisciplinary object of study par excellence. Based on intensive weekly viewing and on classic and contemporary statements in film theory, this seminar—required for the Graduate Certificate in Film and Media—opens up questions of film language, authorship, genre, spectatorship, gender, technology, and the status of national and transnational cinemas.

AS.215.804. Spanish Summer Research.

AS.215.826. Spanish Independent Study.

AS.215.827. Spanish Dissertation.

AS.215.828. Spanish Proposal Preparation.

AS.216.300. Contemporary Israeli Poetry. 3 Credits.
This course examines the works of major Israeli poets such as Yehuda Amichai, Nathan Zach, Dalia Rabikovitch, Erez Biton, Roni Somek, Dan Pagis, Yona Wollach, Yair Horwitz, Maya Bejerano, and Yitzhak Laor. Against the background of the poetry of these famous poets we will study recent developments and trends in Israeli poetry, including less known figures such as Mois Benarroch, Shva Salhoov and Almog Behar. Through close reading of the poems, the course will trace the unique style and aesthetic of each poet, and will aim at presenting a wide picture of contemporary Hebrew poetry.

AS.216.305. Representations of the Other(s) in Israeli Culture. 3 Credits.
This course will use the concept of the Other to study the ways in which various marginal groups in Israel are represented in contemporary Israeli films, TV drama, prose-fiction, poetry and visual art. As a nation-state which was founded on the premise of a utopian vision of a just and fair society and as a promise for a safe haven for Jews escaping their status as Others, contemporary Israeli culture offers a unique case study. The course will run as a research seminar in which students will be encouraged to actively engage in analyzing the ways in which cultural productions depict the Other/s and Otherness as well as the social, political and psychological motivations and implications of these depictions. We will ask questions such as: who is considered as Other and by whom? What roles do the cultural representations play in shaping national collective identity, stereotypes and the perception of the self as Other? And how collective memory shapes Otherness?
Area: Writing Intensive

AS.216.342. The Holocaust in Israeli Society and Culture. 3 Credits.
This course examines the role of the Holocaust in Israeli society and culture. We will study the emergence of the discourse on the Holocaust in Israel and its development throughout the years. Through focusing on scholarly, literary, artistic, and cinematic responses to the Holocaust, we will analyze the impact of its memory on the nation, its society, politics, and collective self. The course is divided to three general categories: Historical and Sociological Perspective, Literary Perspective, and Cinematic Perspective. However, we will study the crossroad between these three categories, and will explore them in relation to one another.

AS.216.373. War in Israeli Arts and Culture. 3 Credits.
In this course we will study the various representations of what functions as one of Israel's most unifying and yet dividing forces: war. By analyzing literary and cinematic works as well as visual art and popular culture we will attempt to understand the role of war in shaping Israeli society, culture and politics. Topics such as commemoration and mourning, heroism, dissent and protest, trauma and memory and the changing image of the soldier will stand at the center of the course.

AS.216.500. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.216.601. Eastern European Literature.
Twentieth-century and contemporary Eastern European Literature is the locus of poetry and the essay. In this course we shall examine classic authors, such as Bruno Schulz, Zbigniew Herbert, and Adam Zagajewski, as well as those less known in the English-speaking world: Zuzanna Ginczanka, Ota Pavel, Henryk Grynberg, Oksana Lutsyshyna. We will consider verse, poetic prose and lyrical essays. The issues that will inform our readings will be internal and actual emigration, translingualism, and the persistence of war. Polish, Ukrainian, Hungarian, Czech, Serbo-Croatian, but also French and American English are the languages in which these authors speak to us. Eastern European literature resonates with voices that have, time and again, brushed against catastrophe.

AS.216.611. Modern Hebrew Literature and Its Quest for the Sacred.
Modern Hebrew literature emerged during the nineteenth century as part of the Haskalah movement, which attempted to break from the traditional modes of Jewish intellectual and social life while also offering a new understanding of Judaism. The Hebrew literature that arose in this period embraced the rebellious nature of the Haskalah and is therefore commonly characterized as secular in nature, defying Orthodoxy and rejecting the old Hebrew God. Against this clear-cut distinction between religious and secular literature, this seminar will study the ways in which modern Hebrew literature has maintained a vital dialogue with the divine and the sacred. We will read and analyze prosefiction, poetry and publicist essays in order to track the various theological trends that were part of this self- declared secular national literature. The reading will include texts by Ahad Haam, Bialik, Shlonsky, Brenner, Agnon, Grinberg and Goldberg, as well as more contemporary writers like Amichai, Ravikovitch, Wallach, Behar and Pedaya.This course will be taught in Hebrew.

AS.216.615. Exilic Chronotope.
The concept of exile relies on the existence of differentiated space and of borders. It also presupposes affective attachment: to be exiled is to be forcibly removed from the space of belonging. And yet time cannot be excluded from a consideration of exile. Hence exilic chronotope, the timespace of forcible displacement. Beginning with the canonical banishment from the Garden of Eden, the seminar will trace the implications of exile in its historical and metaphysical sense: social alienation caused by displacement, creative fulfillment of the distance from home, phenomenological aspects of exilic topology. The readings and visual works will include Georg Simmel, Alfred Schuetz, Kurt Zadek Lewin, Charles Baudelaire, Walter Benjamin, Siegfried Kracauer, Aby Warburg, Mascha Kaleko, Zuzanna Ginczanka, Charlotte Salomon, and Daniel Mendelson.

AS.216.620. Jesus in Modern Hebrew Literature.
This seminar will track the changes in the representations of Jesus in modern Hebrew literature. Reading will include prose-fiction, poetry, drama, and intellectual essays from the late 19th century to the beginning of the 21st century. We will study the mutual influences of the scholarship on Jesus, national Zionist ideology, changes in cultural and theological perceptions of Jesus and the literary representations of his figure.

AS.216.643. Realism and Anti-Realism in Modern Hebrew Literature.
This seminar seeks to trace the narrative dynamics and literary means of modern Hebrew Literature through a close examination of the tension between its realistic and anti-realistic trends. It begins with theoretical questions regarding the definition of realism as a literary genre. After this introductory section, the seminar is divided to three different periods in modern Hebrew literature, each is analyzed within the framework of its relation to realism. The first period is the turn of the 20th century and its first decades, reading works by writers such as Yosef Haim Brenner, Shmuel Yosef Agnon and Devora Baron. In the second period we study the post Israeli statehood period through reading works by A.B. Yehoshua, Amos Oz, Amalia Khanana Carmon and Yehoshua Knaz. The third part of the course deals with prose-fiction that is considered post-modernistic and includes writers such as David Grossman, Orly Castel-Bloom Yoel Hofmann, and Ronit Matalon.
Area: Writing Intensive

AS.216.707. Modern Hebrew Women's Prose-Fiction.
In this graduate seminar we will read and discuss modern Hebrew women's prose-fiction and novels in the Hebrew original. We will study the historical background in which they emerged and their various literary means of expressing a feminine voice. We will read works by writers such as Amalia Kahanna- Carmon, Savyon Liebrecht, Ronit Matalon, Orly Castel-Bloom, Michal Govrin, Yehudit Hendel, Nurit Zarchi, Ester Peled and Maya Arad.Required Course Background: Knowledge of Hebrew
Area: Writing Intensive

AS.216.800. Independent Study.

AS.216.802. Yiddish Independent Study.
Yiddish Independent Study

AS.216.804. Hebrew/Yiddish Summer Research.

AS.217.301. Literary Readings in Portuguese. 3 Credits.
This discussion-based course for continuing students of Portuguese focuses on a wide range of Lusophone literary sources from the modern and contemporary periods. We'll read seminal texts from Europe, the Americas, and Africa, paying close attention to language and context. How do forms, ideas, and genres travel across the Atlantic? What shape do they take according to different geographies, cultures, and histories? Topics include the legacies of empire and slavery, theoretical debates about the formation of Brazilian Literature, national identity, (post)colonialism, representations of nature, and indigeneity. Students will read in the original Portuguese innovative prose works by Machado de Assis and Clarice Lispector; the poetry of Fernando Pessoa; concrete poetry, and modernist manifestos, among other things. Recommended Course Background: AS.210.278

AS.217.307. Cultura e Ditadura [Culture and Dictatorship]. 3 Credits.
In the 20th century, the Lusophone world saw the rise and fall of such authoritarian governments as the Estado Novo in Portugal (1933–74) and the military dictatorship in Brazil (1964–85). During this period, a series of revolutionary political movements sprung up, as well as innovative cultural production. How does culture respond to censorship? How do art and politics comment on and ultimately transform each other? In this course we will discuss novels, poetry, film, songs, and artworks from Brazil, Portugal, and Lusophone Africa that engage critically with dictatorships and their aftermaths. Topics include violence, trauma and memory, colonialism, post-colonialism, and decoloniality, race and the legacies of slavery, counterculture, and popular cultures. Readings and discussion in Portuguese. Interested students who have not completed course prerequisites should contact the instructor for permission to enroll.

AS.217.425. Latin American Ecocriticism. 3 Credits.
Increased awareness of climate change has led to a shift in the way we address and intervene in environmental issues in the new millennium. Yet the interest in making sense of the environment has a long history in literature and the arts. How have Latin American writers and artists understood and depicted their environments and environmental questions? How do the form and content of texts and cultural artifacts influence our understanding of the non-human world? Can works of fiction shape ecological transformations? In this course we will discuss texts from the early colonial period to the present, including the literary works of Graciliano Ramos, Horacio Quiroga, and Clarice Lispector; political ecology; film; Ana Mendieta's earth-body art; contemporary experiments in bio-art; postcolonial theory; and the intersection of environmental justice with such topics as nationalism and human rights. Going beyond ecocriticism's original focus on the Anglo-American world, we will engage recent scholarship on Latin America that sheds light on the region's cultural and geopolitical importance to the global climate, with particular attention to Brazil. This course aims to introduce students to current debates in Latin American Ecocriticism and the Anthropocene and thus contribute to an incipient but expanding field.

AS.217.427. Radical Women: Brazilian Literature, Art, and Culture. 3 Credits.
The vast body of work produced women artists and writers in Brazil has been marginalized by canonical cultural narratives, which are now being contested by a spate of scholarly and artistic projects. This course spotlights the production of women from the early twentieth century to the present, including renowned and lesser-known works. We'll discuss art, literature, and film alongside feminist theory, exploring radicality as it relates to aesthetics and politics. How do women's art, literature, and thought engage with and transform Brazilian cultural production? What are their contributions to global discussions about gender and sexuality? How do these works respond to historical events? Among the topics addressed are the body, feminism, race, indigeneity, and politics. We'll study Clarice Lispector's acclaimed stories, the first Brazilian proletarian novel written by modernist icon Patricia Galvão, known as Pagu, the diaries of Carolina Maria de Jesus, the emblematic paintings of Tarsila do Amaral, and Lygia Clark's artwork, as well as the booming scene of contemporary cinema and poetry. The course is taught in English, but those interested in doing the coursework in Portuguese (4 credits) should register for section 02.

AS.220 (Writing Seminars)

AS.220.105. Introduction to Fiction & Poetry I. 3 Credits.
An introduction to basic strategies in the writing of poetry and fiction, with readings by Joyce, Woolf, Baldwin, Munro, Garcia Marquez, Donne, Bishop, Yeats, Komunyakaa, Tretheway, and others. Students will learn the elements of the short story and try their hand at a variety of forms: realist, fantastical, experimental. They'll also study the basic poetic forms and meters, from the ballad to the sonnet, iambic pentameter to free verse. Students will compose short stories and poems and workshop them in class. This course is a prerequisite for most upper level courses. This course is part one of the year-long Introduction to Fiction and Poetry, and must be taken before AS.220.106.
Area: Writing Intensive

AS.220.106. Introduction to Fiction & Poetry II. 3 Credits.
The second half of IFP, this course delves deeper into the finer points of fiction writing, including tone, description, and point of view; students will also enrich their knowledge of poetic forms and devices, such as figurative language, verse rhythm, and the poetic line. Readings include work by Paley, Mahfouz, Calvino, Lessing, Richard Wright, Plath, Rich, Auden, Li-Young Lee, and others. Students will write and workshop their own stories and poems, and complete a final portfolio. This course is a prerequisite for most upper level courses.
Area: Writing Intensive
AS.220.105 or AS.220.108

AS.220.108. Introduction to Fiction & Nonfiction. 3 Credits.
A course in realist fiction and nonfiction, with readings by Eudora Welty, Vladimir Nabokov, Henry James; George Orwell, Beryl Markham and Truman Capote. Students compose short stories and essays with attention to literary models. AS.220.108 can be substituted for AS.220.105.
Area: Writing Intensive

AS.220.138. Creative Writing. 1 Credit.
Enjoy the opportunity to develop your creative writing skills. You will work in both fiction and poetry. Through a combination of robust discussion, writing exercises, and substantial feedback, you will learn about imagery, voice, narrative structure, and other aspects of the writer's craft. The reading list will include a diverse range of contemporary authors. There will be a strong emphasis on collaborative workshopping, during which you will discuss one another's works in progress.

AS.220.200. The Craft of Fiction. 3 Credits.
Area: Writing Intensive
(AS.220.105 OR AS.220.108) AND AS.220.106

AS.220.201. The Craft of Poetry. 3 Credits.
A study of the fundamentals and strategies of poetry writing. This course combines analysis and discussion of traditional models of poetry with workshop critiques of student poems and student conferences with the instructor.
Area: Writing Intensive
(AS.220.105 OR AS.220.108) AND AS.220.106.

AS.220.206. Writing about Science I: Daily News Journalism. 3 Credits.
This course is designed to teach students the skills of daily news reporting, with a focus on covering science news. Students will learn how turn scientific discoveries into lively and engaging prose for the general public, interview sources, and pitch stories to news organizations. The skills taught are applicable to all areas of journalism, not just science journalism.
Area: Writing Intensive

AS.220.207. Writing the Unreal. 3 Credits.
"We left what we felt at what we saw," the poet Wallace Stevens once wrote, suggesting writing involves a direct response to our experiences of reality. In this class, we'll look exclusively at writing which takes on what hasn't been seen, and hasn't been felt. Through reading works of science fiction, magical realism, gothic literature, and speculative fiction, students will investigate how the unreal can still speak to our experiences and perceptions of the real. Additionally, students will get the chance to craft their own fantastical worlds through regular writing assignments. Tales of time travelers, haunted houses, unreal languages, and reimagined cities will be covered. Readings will include selections from Paul Beatty, Octavia Butler, Italo Calvino, Ursula K. Le Guin, Yoko Ogawa, and Mary Shelley.
Area: Writing Intensive

AS.220.212. Line and Lineage: A Survey of Poetry Writing. 3 Credits.
This course will be a chronological exploration of English-language poetry, beginning in the medieval era and continuing to the present day. We will examine not only the literature of the past, but also the ways in which a diverse range of contemporary writers have extended, challenged, and reimagined literary tradition. Throughout the semester we will pay especially close attention to the question of how a writer's management of the poetic line can shape a poem's structure, context, and meaning. Although this is a lecture-based class, not a workshop, participants will have many opportunities to respond artistically to the course readings.
Area: Writing Intensive
(AS.220.105 OR AS.220.108) AND AS.220.106

AS.220.213. Fiction Survey: Once Upon a Time. 3 Credits.
A review of the origins and development of the realist short story from fable, fairy tale, saint's life, Bible story, through versions created in the Renaissance and classic (19th and 20th century) periods, to modern narratives. Writing Seminars majors only.
AS.220.105 AND AS.220.106

AS.220.218. Writers on Film. 3 Credits.
An interdisciplinary course focusing on the film writings of poets, novelists, critics, and essayists such as Virginia Woolf, H.D., James Agee, James Baldwin, and Pauline Kael; and films showing the intertitle and screenplay work of writers such as Anita Loos, F. Scott Fitzgerald, William Faulkner, and Jean Cocteau. Participants will write weekly assignments on film from a critical perspective.
Area: Writing Intensive

AS.220.219. Readings in Fiction and Literary Nonfiction. 3 Credits.
This course offers an in-depth exploration of content, style, and crossover literary techniques among authors who write both fiction and nonfiction, including Jamaica Kincaid's memoir My Brother and "Girl." Students will evaluate why each genre was chosen to narrate, for example, such quandaries as ethics in surgery: Abraham Verghese's novel Cutting for Stone and Richard Selzer's essay, "The Knife," as well as the reportage and novels of Ernest Hemingway and others. Also explored: topics of social import and questions of identity in James Baldwin's essays ("Notes of a Native Son") and stories ("Sonny's Blues"), and other works; The course builds on literary writing and reading techniques established in Intro to Fiction & Nonfiction (IFN) and Intro to Fiction & Poetry (IFP). Either course is a prerequisite, with IFN preferred.
Area: Writing Intensive
AS.220.105 OR AS.220.108

AS.220.220. Reading Korean Literature in Translation: A Survey. 3 Credits.
An introduction for students unfamiliar with the Korean language but interested in Korean culture / literature. Students will read a variety of translated texts, especially of works written in the 20th and early 21st centuries by authors including Kim Tong-in, Hwang Sun-won, Pak Wanso, Hwang Sok-yong and Han Kang; there will also be classes on traditional sijo poetry. Students will become familiar with Korean literary genres and formal features, and develop a broad understanding of the historical and sociocultural context of Korean literature.
Area: Writing Intensive

AS.220.221. Modernist Literature and Film. 3 Credits.
This course explores the exchange of ideas and techniques between modernist literature and cinema in response to the social and technological changes of the twentieth century. Prominent figures include Charlie Chaplin, Ezra Pound, T. S. Eliot, Virginia Woolf, Franz Kafka, Sergei Eisenstein, Jean Epstein, John Dos Passos, Zora Neale Hurston, Paul Strand, and Gertrude Stein. Participants will write weekly assignments on films and readings from a critical perspective.
Area: Writing Intensive

AS.220.230. Reading Contemporary Korean Fiction in Translation. 3 Credits.
This course examines a range of contemporary Korean fiction produced since political liberalization of Korea in the 1990s. Students will see the many different ways in which individual selves relate to the world, question the value systems of a globalized society, and celebrate the instinct to survive and thrive. While exploring these things, students will develop their analytical skills and identify the central components of new Korean narratives.

AS.220.231. Art of the Personal Essay. 3 Credits.
This course explores the art and craft of the personal essay from Seneca to Soyinka, Montaigne to Adichie. Deriving from the French essai, to attempt, students bring a sense of investigation, as natural philosophers proposed, to the characteristics, presence, or quality of an idea. Through personal narrative exploration, essayists write on universal themes -- family, loss, social justice -- through various nonfiction essay forms, such as the braided essay, lyric essay, science essay, or humor essay. Students will employ research, convey personal experience, and develop their own voice and style. Course builds on material covered in Introduction to Fiction & Poetry courses and/or Introduction to Fiction & Nonfiction, and will prepare students for Advanced study. This readings-based course is also writing-intensive, including exercises, essay drafts, and revisions. Course features additional diverse authors such as Sei Shonagon, Sara Suleri, James Baldwin, Richard Rodriguez, Brian Doyle, and Ta-Nehisi Coates.
Area: Writing Intensive
AS.220.105 OR AS.220.108

AS.220.311. Intermediate Fiction: Point of View. 3 Credits.
This intermediate workshop will focus on rendering point of view. In addition to exploring questions of psychic distance and reliability, we will examine how point of view comes to bear on voice, character, the management of sympathy, and narrative structure. Students will write and workshop stories and discuss published fiction. Diverse and contemporary readings to include work by Yiyun Li, Carmen Maria Machado, Lorrie Moore, and Alice Munro.
Area: Writing Intensive
AS.220.200

AS.220.312. Intermediate Fiction: Detail and Description. 3 Credits.
An intermediate workshop focusing on the question of how to make fictional worlds feel real. We'll read 19th, 20th, and 21st century short fiction by authors such as Anton Chekhov, Jhumpa Lahiri, Junot Diaz, and Alice Munro, focusing particularly on how authors make the lives on the page feel three-dimensional. Students will write stories and exercises, including exercises that involve exploring Baltimore in order to observe and write about the city in which we live. Recommend Course Background: Students need to have completed a 200-level Writing Seminars course.
AS.220.105 AND AS.220.106

AS.220.317. Writing about Science II: Feature Writing Journalism. 3 Credits.
This course is designed to teach students the skills of long-form narrative journalism, with a focus on covering science news. Skills taught will include how to compose scenes, create three-dimensional characters, create narrative tension, and conduct on-site reporting. Class speakers will include award-winning science journalists from New York to DC, who will share the secrets of their craft. The primary writing assignment will be a 3,000-word feature piece that is pitched, reported, and workshopped throughout the course of the class. "Writing About Science I" is recommended as a prerequisite for this course. If you have not taken this, please contact instructor (dgrimm5@jhu.edu) to enroll.
Area: Writing Intensive

AS.220.319. Intermediate Fiction: Crafting Memorable Voices. 3 Credits.
When we recall our favorite works of fiction, it is often their voice that first comes to mind. This course will explore how narrators enchant us with their voice, focusing on such matters as perspective, syntax, word choice and how even deceptively impartial omniscience takes on a unique and memorable voice. Fiction readings to include: Paul Bowles, Toni Cade Bambara and Ismail Kadare. Craft readings to include: Christopher Castellani and John Gardner. Writing assignments will be both expository and creative.
Area: Writing Intensive
AS.220.200

AS.220.321. Intermediate Fiction: Finishing Touches: How Stories End. 3 Credits.
Typically, stories are easy to start and difficult to conclude. This course will look at various ways in which stories end rewardingly. Close attention will be paid to final paragraphs. We will ask questions like: Do satisfying endings fall into categories? Can we generalize about how stories ought to end? Do some writers have a gift for endings? Readings to include: Sylvia Townsend Warner, Muriel Spark, Alice Munro. Assignments will include both expository and creative writing.
Area: Writing Intensive
AS.220.200

AS.220.327. Intermediate Fiction: Characters. 3 Credits.
How do fiction writers create believable people? A study of Characters. Readings to include E. M. Forster's Aspects of the Novel and A Room with a View, James Baldwin's Giovanni's Room, and various short stories.
Area: Writing Intensive
AS.220.200

AS.220.331. Intermediate Fiction: Forms of Fiction. 3 Credits.
A workshop in the formative genres of fiction: romance, confession, anatomy, and novel. Readings include Flaubert, Stevenson, Camus, and Stephen Dixon. Frequent sketches and two stories.
AS.220.200[C]

AS.220.332. Intermediate Fiction and Poetry: Poet-Novelists. 3 Credits.
We will look at writers in English who excelled at both fiction and poetry. We will ask: How does a talent in one genre show itself in another? Novels will include: Thomas Hardy's Return of the Native, Sylvia Townsend Warner's Lolly Willowes, Vladimir Nabokov's Lolita, John Updike's, Rabbit, Run. Other writers who may be included: Rudyard Kipling, D. H. Lawrence, Malcolm Lowry, Richard Wright, Muriel Spark.
AS.220.200 AND AS.220.201

AS.220.333. Intermediate Fiction: Plot and Narrative Structure. 3 Credits.
This class is primarily a workshop. Students will write two 10-20 page short stories to present for discussion and critique. The craft focus of the class is plot and narrative structure. Through the assigned reading and a few short writing exercises, we will think about storytelling and the elements (character, conflict, desire, causality, consequence) that make a question a plot or narrative question, and how stories are shaped and structured by these questions. The course reading will begin with a variety of short stories. Later in the semester, we will discuss braided narratives and read novels by Virginia Woolf, Rebecca Makkai and Valeria Luiselli.
AS.220.200

AS.220.338. Intermediate Fiction: Developing Subtext. 3 Credits.
In this course, students will write and workshop two original stories. Additional generative writing exercises will explore the ways a writer can develop subtext in their work. How can character details work in parallel with elements of setting? How can a setting be instrumental in advancing a plot? How can finely tuned, sentence-level details, parallel images, foreshadowing, and figurative language give a story a cohesive sensibility and rich subtext? We'll read stories by writers including Stephanie Vaughn, Laura van den Berg, Rickey Fayne, Haruki Murakami, and craft essays by Matthew Salesses, Charles Baxter, and more.
Area: Writing Intensive
AS.220.200

AS.220.346. Line and Lineage: Poems in Time. 3 Credits.
A poem exists in time—both in the historical moment in which it is written, and in its movement from line to line. In this seminar, students will build their knowledge of the history of the poetic line in English, up to the present day. Assignments will include both short critical essays and creative exercises.
Area: Writing Intensive

AS.220.348. Creative Nonfiction Workshop: The Personal and the Public. 3 Credits.
In this workshop, students will study a variety of creative nonfiction essays and articles by a diverse group of writers including Ta-Nehisi Coates, Maggie Nelson, Roxane Gay, Alice Wong, D. Watkins, and Esmé Weijun Wang. Using the expository methods and research practices of journalists and the narrative strategies of memoirists, students will write and workshop their own creative nonfiction as we attempt to understand how the subject of an essay can be meaningfully augmented by acknowledging and even centering the author's identity and experience.
Area: Writing Intensive

AS.220.356. Intermediate Fiction: A Story's Beginnings. 3 Credits.
Where does a story best begin? How does it successfully launch itself? We will look closely at a great many opening paragraphs and pages, analyzing the various strategies by which writers grab and hold a reader's interest. Most of the reading will be short fiction, drawn from various countries and languages.
Area: Writing Intensive

AS.220.363. Intermediate Fiction: Writing about Adolescence. 3 Credits.
Only fairly recently has adolescence been recognized as a developmental period distinct from childhood or adulthood. In this course, we'll read a range of classic and contemporary literature that takes on the challenge of writing about this complicated and fraught stage of life. Readings may include work by Shakespeare, Louisa May Alcott, Colson Whitehead, Louise Erdrich, and others. Students will write and workshop their own stories or novel chapters.
Area: Writing Intensive
AS.220.200

AS.220.372. Intermediate Fiction: Style and Voice. 3 Credits.
In this course, we'll focus on the writing and workshopping of student fiction, with special attention to style and voice. What distinguishes a good sentence from a bad one? How does one develop a style that feels both natural and distinctive at the same time? What do we even mean by "voice," and how on earth is a writer supposed to find one? In addition to each other's work, we'll read stories by authors with particularly unique voices, focusing on what makes their sentences sing.

AS.220.377. Intermediate Poetry: Poetic Forms. 3 Credits.
Poetic Forms I fulfills one of the Intermediate requirements for The Writing Seminars Major. It deals with rhyme, meter, traditional forms, and ad hoc forms of students' own making. Whether you are a poet, novelist, song writer, science writer, or dramatist, this course will help you master lines and sentences even better.
Area: Writing Intensive
AS.220.201

AS.220.378. Contemporary Poetic Forms. 3 Credits.
In Contemporary Poetic Forms, we will look at exciting, mostly younger poets writing in a wide array of metrical forms. From Anthony Hecht to Erica Dawson, you will read a book a week and write eleven poems, and the assignments will be keyed but not beholden to those challenging authors.
Area: Writing Intensive
AS.220.201[C]

AS.220.391. Performing Poetry & Fiction: An Acting Workshop for Writers. 3 Credits.
This hands-on performance workshop, combining literary and theatrical practice, will look closely at what makes a performance or reading compelling, clear, and resonant. Through textual analysis, vocal technique, and group discussion, students will create a pliant and powerful reading style to best serve their work. The course includes regular writing assignments in poetry and fiction and weekly performance and group discussion.
Area: Writing Intensive

AS.220.394. Intermediate Fiction: Place, Setting, and Landscape. 3 Credits.
This course is primarily a workshop; students will each write and workshop two short stories. Additional shorter writing assignments will focus on writing about places, both real and imagined. We will think about the work of description at the sentence level, but also about the relationship between place, character and memory. We'll read work by writers who are known for their ability to evoke or capture in detail a particular setting, potentially including work by Edward P. Jones, Zadie Smith, Eudora Welty, Annie Dillard, Grace Paley, Victor Lavalle, Viet Than Nguyen, and Joan Didion.
Area: Writing Intensive

AS.220.395. Intermediate Fiction: Plots and Subplots. 3 Credits.
How can a subplot inform a reader's understanding of a story's protagonist? How can a story with multiple protagonists and plotlines reveal theme? This intermediate fiction writing class will focus on student writing and on published stories that are interestingly or intricately plotted. Parallel texts by Andrea Barrett, Edward P. Jones, Alice Munro, Amy Hempel, Barret Swanson, Dantiel W. Moniz, and others will give students the opportunity to examine concrete examples of intricately plotted stories while also putting some plotting techniques to the test in their own short fiction.
Area: Writing Intensive
AS.220.200

AS.220.398. Intermediate Fiction: Fictional Frames. 3 Credits.
In this course, we'll focus on writing and workshopping student fiction while reading contemporary parallel texts representing a variety of styles, subgenres, and forms. We'll look at exceptionally short works, stories of intermediate lengths, and longer, novella-length works in an effort to understand what kinds of stories lend themselves to particular lengths and styles. How do you know whether your story should be a work of flash fiction or a novel? What kinds of stories can you tell in each form? We'll read work by Lydia Davis, Kirstin Valdez Quade, Jenny Zhang, Bret Anthony Johnston, Paul Yoon, Lauren Groff, Bryan Washington, and more.
AS.220.200

AS.220.400. Advanced Poetry Workshop. 3 Credits.
In this course we'll explore poetic responses to myth and legend, looking at how poets from different cultures and eras have responded imaginatively to established stories about gods, heroes, and the supernatural, whether for the sake of aligning themselves with tradition, or for the sake of challenging it. Our discussions will take place in the context of a rigorous poetry workshop, where students will experiment with figurative language, management of the line, narrative organization, and the control of rhythm in both form and free verse. At the end of the semester students will turn in a final portfolio of revised poems, accompanied by a reflective letter that demonstrates a mature understanding of verse technique.
Area: Writing Intensive
AS.220.201

AS.220.401. Advanced Fiction Workshop. 3 Credits.
Topics in Advanced Fiction
Area: Writing Intensive
AS.220.200

AS.220.403. Readings In Poetry: Dramatic Verse. 3 Credits.
Why and how do playwrights make their characters speak in verse? What can we learn about writing—and speaking—"naturally" but with artifice? Blank verse is the most important model we have in English dramatic poetry, but not the only one. Readings in this course will range from Shakespeare's King Lear to modern verse plays by Caryll Churchill, Derek Walcott, and David Hirson. Students will write their own one-act verse play.
Area: Writing Intensive
AS.220.201

AS.220.406. Readings in Fiction: Italian war-time and post-war fiction: Italo Calvino, Primo Levi, and Natalia Ginzburg. 3 Credits.
We'll read these three masterly fiction writers who found new ways to write about hard times.
Area: Writing Intensive
AS.220.200

AS.220.408. Readings in Poetry: War Poetry From Troy to Afghanistan. 3 Credits.
The course will follow a chronological line from Homer through to American and British poets of the current war in Afghanistan. This means we will be looking at (among other things) Beowulf, poems of the English Civil War, poems of the American Civil War, poems of the First and Second World Wars, and poems about the conflicts in Iraq and Syria as well as Afghanistan. Each class will be divided into two sections of equal length. In the first half we will study poems written by our predecessors - poems by women as well as men, poems written in the front line as well as behind the lines in hospitals and 'at home', and poems written in a variety of forms - ranging from pure lyric to prose-poetry; in the second half we will discuss poems written by members of the class in response to conflict, and/or in response to the poems we are discussing in any given week.
AS.220.201

AS.220.411. Community-Based Learning: Nonfiction and Social Engagement. 3 Credits.
In this Community-Based Learning course, students will read and write memoir and discuss issues of social concern with high-school age writers from Baltimore public schools in partnership with the organization Writers in Baltimore Schools Please note that this class is not a traditional workshop focusing on critique, but will instead explore how writing can build connection and foster conversation. Participation in some events outside of class time may be required.
Area: Writing Intensive

AS.220.415. Community-Based Learning: Teaching Creative Writing in Baltimore Schools. 3 Credits.
In this course, students will work alongside writing teachers from the non-profit organization Writers in Baltimore Schools (WBS) to lead creative writing workshops in local public elementary and middle schools. Students and WBS teachers will also meet as a group once a week to plan classes, discuss pedagogy, and share ideas. Students will write weekly responses to reading assignments, write reflections on the volunteer experience, and help to assemble a final project at their worksite. Upon completion of the class, students will have the opportunity to apply to become instructors with Writers in Baltimore Schools. Please note that the weekly writing group you will co-lead will occur outside of class. Groups meet either during the school day or after school. We will work with you to find a group that fits your schedule.
Area: Writing Intensive

AS.220.420. Readings in Fiction: Optimistic Apocalypse. 3 Credits.
Contemporary literary depictions of apocalypse often offer up a world that's been transformed (rather than annihilated) by climate change, disease, and war. In this course, students will explore comparatively optimistic literary dystopias with an eye toward understanding how writers observe and extrapolate real dangers to inform their novels and stories. We'll read one classic dystopian work alongside newer stories and novels by Kazuo Ishiguro, Lauren Groff, Colson Whitehead, Rumaan Alam, Emily St. John Mandel, Ted Chiang, Ling Ma, Laura van den Berg, and more. Students will write short creative and critical responses to our readings as well as a final comparative paper.
Area: Writing Intensive
AS.220.200

AS.220.422. Readings in Fiction: Race, Passing, and Performance. 3 Credits.
This course will explore the context and craft of racial passing texts in the U.S, asking students to think critically about literal passing narratives and their persistence over time, and more broadly about how we write about cultural passing, codeswitching, and identity as conscious performance. We'll start with texts that ground us in the genre—Chopin, Larsen, Fauset, Ellison, and Morrison—and read our way into contemporary texts, potentially including work by Danzy Senna, Mat Johnson, Brit Bennett, Min Jin Lee, and Marcelo Hernandez Castillo. Students will write a critical paper, a craft paper, and a short story or novella.
Area: Writing Intensive
AS.220.200

AS.220.424. Science as Narrative. 3 Credits.
Class reads the writings of scientists to explore what their words would have meant to them and their readers. Discussion will focus on the shifting scientific/cultural context throughout history. Authors include Aristotle, Copernicus, Galileo, Descartes, Newton, Darwin, Freud, Einstein, Heisenberg, Bohr, Crick and Watson.
Area: Writing Intensive

AS.220.427. Readings in Fiction: The Novella. 3 Credits.
A study of the novella as a literary form. Authors may include Melville, Turgenev, Tolstoy, Chekhov, Kafka, James, Wharton, Baldwin, Porter, Rulfo, Smiley, and others.
Area: Writing Intensive
AS.220.200

AS.220.437. Creating the Poetry Chapbook. 3 Credits.
Students will build on previous work in the major by completing a project of sustained length, depth, and cohesion (15 - 25 pages) in their final semester. Application only; Advanced Poetry prerequisite.
Area: Writing Intensive

AS.220.441. Readings in Poetry: Shakespeare and Company. 3 Credits.
A study of three of Shakespeare's plays, and of some of the most important creative responses to these plays by modern writers, such as Auden and Stoppard. Students will familiarize themselves with Shakespeare's continuing place in contemporary culture, and write short critical responses; they will also write a longer creative work that in some way transforms one of Shakespeare's plays.
AS.220.201[C]

AS.220.443. Readings in Poetry: International Voices. 3 Credits.
International voices will combine the workshopping of poems by students with a study of contemporary poems written by black British writers and British writers in dialect, African-American writers, Caribbean writers, and Indian and South African poets who are writing in English. The study of broad themes and subjects will be combined with a particular appreciation of linguistic and acoustic matters - which means among other things that time will be spent listening to and evaluating recordings of the poets concerned.Writing Seminars Majors Only
Area: Writing Intensive
AS.220.201

AS.220.452. Reading Proust. 3 Credits.
An excursion through the 3,000 page, seven-volume masterpiece, *In Search of Lost Time.* We will closely read *Swann's Way* and *Within a Budding Grove*; we will cover, in a less intensive way, *Guermantes Way*, and *Time Regained*.
AS.220.200

AS.220.453. Border Crossings: Contemporary Writing from Canada. 3 Credits.
A survey of contemporary Canadian poetry and fiction. Course readings will include work by Margaret Atwood, Christian Bök, Anne Carson, Anne Michaels, Alice Munro, Michael Ondaatje, Madeleine Thien, and others. Students will have the opportunity to respond artistically as well as analytically to the course readings.
AS.220.105 AND AS.220.106 AND AS.220.201

AS.220.454. Community-Based Learning. 3 Credits.
In this Community-Based Learning course, students will explore poetry of social and political concern in partnership with high-school age writers from Baltimore public schools. Students will put learning into practice by engaging in community conversation and collaboration. Participation in some events outside of class time will be required.
Area: Writing Intensive

AS.220.455. Readings in Fiction: Low, High, and Back Again: Experiments in Genre. 3 Credits.
In this course, we'll take a look at the increasingly obsolete notion of "genre fiction" and the way that many contemporary writers are borrowing the conventions of once-frowned-upon genres, from sci-fi to horror to crime, and imbuing them with the concerns of the "literary novel" (character, language, social critique, etc.). The course will pair classics of genre fiction with more contemporary works that take the genre in surprising directions. We'll also do a fair bit of writing ourselves, experimenting with various genres. Authors might include Mary Shelley, Colson Whitehead, Philip K. Dick, Kazuo Ishiguro, Edgar Allen Poe, Carmen Machado, Raymond Chandler, Joan Didion, Zane Grey, and Charles Portis.
Area: Writing Intensive

AS.220.456. The Long Work. 3 Credits.
A course in the composition of a novella or short-story collection. Students will write and revise a thesis of 50 to 60 pages of fiction.Open to seniors by invitation.
Area: Writing Intensive

AS.220.457. Readings in Fiction: 21st Century Fiction: The American Short Story in the Last Twenty Years. 3 Credits.
With the 21st century 22 years old, it seems like a good time to ask ourselves what's going on with the American short story. What can it tell us about our various identities, individual and collective? Is it reflecting our current reality, transforming it, or both? Is it undergoing formal changes to better engage with our transformative times, and if not, should it be? Is contemporary fiction as diverse as our nation itself, and if not, what might account for such shortfalls in representation, and what might be the effects? Our reading list is likely to include such authors as Carmen Maria Machado, Yoon Choi, Bennett Sims, Charles Yu, Jamel Brinkley, ZZ Packer, Kali Fajardo-Anstine, Nana Kwame Adjei-Brenyeh, Dantiel W. Moniz, Claire Vaye Watkins, Kimberly King Parsons, Kirsten Valdez Quade, Ted Chiang, Danielle Evans, Karen Russell, George Saunders, and Bryan Washington. Students will write short critical and creative responses throughout the term, as well as a final longer creative piece.
Area: Writing Intensive
AS.220.200

AS.220.458. Readings in Poetry: Divergencies: British Poetry Since 1945. 3 Credits.
The course will workshop the original work of participants, while also looking at the major figures of immediately post-war British Poetry (Philip Larkin, Ted Hughes) and the diversification of writing that has appeared in more recent years. Among the writers to be discussed are : Simon Armitage, Mary Jean Chan, Imtiaz Dharker, Carol Ann Duffy, Sarah Howe, Linton Kwesi Johnson, Jackie Kay, Grace Nichols, Alice Oswald, Hannah Sullivan and Roger Robinson.
Area: Writing Intensive

AS.220.459. Readings in Poetry: Dramatic Poetry, Poetic Drama. 3 Credits.
This course will explore the intersection of poetry and drama, from Euripides, Shakespeare, and Moliere to modern verse plays by Derek Walcott and Caryl Churchill. We'll also look at some modern plays about poets and poetry—such as Tom Stoppard's Arcadia and The Invention of Love and Sarah Ruhl's Euridice. Finally, we'll examine the poetry of prose speech in such playwrights as David Mamet and August Wilson. Students will write their own scenes in poetic drama.
Area: Writing Intensive

AS.220.460. Community-Based Learning: Nonfiction and Social Engagement. 3 Credits.
In this Community-Based Learning course, students will read and write memoir and discuss issues of social concern with high-school age writers from Baltimore public schools in partnership with the organization Writers in Baltimore Schools Please note that this class is not a traditional workshop focusing on critique, but will instead explore how writing can build connection, foster conversation, and bring together writers from diverse communities.
Area: Writing Intensive

AS.220.501. Independent Study. 3 Credits.
Ordinarily no more than one independent study course may be counted among the eight Writing Seminars courses presented for graduation.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.220.502. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.220.509. Professional Internship. 1 Credit.
The Professional Internship is a one-credit independent course created to document internships in journalism, publishing, the arts, or other writing-related fields. Internships require a minimum of 120 work hours and a short final paper. Permission required. Satisfactory/ Unsatisfactory only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.220.510. The Hopkins Review Professional Internship. 1 Credit.
The Professional Internship is a one-credit independent course created to document internships in journalism, publishing, the arts, or other writing-related fields. Internships require a minimum of 120 work hours and a short final paper. Permission required. Satisfactory/ Unsatisfactory only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.220.513. Teaching Writing. 3 Credits.
Permission Required.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.220.594. Professional Internship. 1 Credit.
The Professional Internship is a one-credit independent course created to document internships in journalism, publishing, the arts, or other writing-related fields. Internships require a minimum of 120 work hours and a short final paper. Permission required. Satisfactory/ Unsatisfactory only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.220.598. Independent Study. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.220.604. Readings in Fiction: Personal Touchstones.
The course explores the notion of one's own personal anthology--the books that mean the most to one over the decades, the books one keeps returning to. In addition to the assigned reading, each student will be asked to come up with a list of books (not read in this class) of great personal significance and to analyze in class the things one's personal touchstones have in common. Assigned readings will be drawn from two genres: the epic (Derek Walcott's Omeros, Halldor Laxness's Independent People) and the comic or light novel (Jane Austen's Persuasion, E. M. Forster's Room with a View, Laxness's The Fish Can Sing, Evelyn Waugh's A Handful of Dust, Muriel Spark's The Prime of Miss Jean Brodie, Kingsley Amis's Ending Up, Mark O'Donnell's Getting Over Homer).

AS.220.607. Readings in Fiction: The Laws, License, and Liability of First-Person Narration.
Study of classic/modernist novels written by the "I": Christopher Isherwood, Gertrude Stein, Albert Camus, Ford Madox Ford, and other practitioners. Mostly close study of texts, but some writing practice, too.

AS.220.608. Readings in Poetry: Sonnet and Sequence.
This course will use the sonnet form as a through line to consider both aesthetic shifts and the enduring lyric impulse across centuries of poetry in English, with a particular focus on how contemporary poets are working with the form through individual poems, sequences, and book-length works. Coursework will include reading, critical writing and presentation, discussion, and completion of an original lyric sequence.

AS.220.609. Readings in Fiction: The Novelist as Poet.
An examination of some half-dozen English-language novelists who were also significant poets. Readings will include both novels and poems. The course seeks to bridge the gap between the two genres.

AS.220.611. Readings in Fiction: Shape, Story, and Experiments in Structure.
How is our experience of a novel's story affected by its form? We'll discuss some traditional structures, including mystery plots and the three-act structure, before moving on to works whose forms bend or break various storytelling conventions. Authors may include Vladimir Nabokov, Susan Choi, Zadie Smith, Tommy Orange, Lorrie Moore, Edward P. Jones, Carol Shields and others.

AS.220.612. Readings in Poetry: The Long Poem.
This course will be an artistic exploration of the long poem. Throughout the semester we'll read a diverse range of work by both contemporary and non-contemporary writers, paying particular attention to the question of how a poem's dramatic intensity or lyric charge can be maintained when a poet is writing at length. Instead of submitting individual poems to a weekly workshop, students in this class will submit successive drafts of a long poem, which they will continue developing over the course of the entire semester.

AS.220.619. Graduate Poetic Forms I.
We will read and write a variety of traditional and less traditional poetic forms with a keen ear toward meter, rhyme, and other prosodic curiosities.

AS.220.623. Fiction Workshop.
Discussion and critique of fiction manuscripts by students enrolled in the M.F.A. program.

AS.220.624. Fiction Workshop.
Discussion and critique of fiction manuscripts by students enrolled in the MFA program. Some assignments possible.

AS.220.625. Poetry Workshop.
Discussion and critique of poetry manuscripts by students enrolled in the M.F.A. program. Some assignments possible.

AS.220.626. Poetry Workshop.
Discussion and critique of poetry manuscripts by students enrolled in the MFA program. Some assignments possible.

AS.220.633. Readings in Poetry: Walcott, Heaney, and Brodsky.
A study of three major poets--Caribbean, Irish, and Russian--who self-identified with at least two cultures. We'll examine these poets' literary friendship and their shared engagement with subjects such as tyranny, empire, home, exile, and the English language. Exploration of these poets' shared debt to a predecessor, Robert Frost, and the debt owed to them by younger poets, will lead to students' own original projects in poetry and prose.

AS.220.646. Readings in Pedagogy: Teaching Fiction and Poetry.
A graduate course designed to develop both close reading and genre study, and to support the teaching of Introduction to Fiction and Poetry (IFP) I and II. Readings in selected works of American, English, and European poetry and short fiction. Course required by all graduate students in fiction and poetry.

AS.220.653. Readings in Fiction: The Writer's Bookshelf: Unsung Novels That Writers Love.
Which books do writers often foist on other writers, telling them "You have to read this"? In this course, we'll look at books that have yet to find much popular appeal, but which writers often speak about in reverential tones. Authors may include James Salter, Paula Fox, Dezso Kosztolanyi, J.L. Carr, Juan Rulfo, Tom Drury, Christina Stead, Evan S. Connell, Leonard Gardner, Joy Williams, and Penelope Fitzgerald.

AS.220.654. Readings in Fiction: Rediscovered Masters.
Readings from modern novels and collections of short fiction which, however well received at time of publication, fell into subsequent eclipse before undergoing something of a revival. Many of the titles will be drawn from the series of New York Review of Books Classics.

AS.220.655. Readings in Poetry: Line, Sentence, Syntax.
A study of the interplay of the line and the sentence in poetry, with an emphasis on syntax. Some prose works will also be used for context. Poets employing syntax with great verve and precision, whether they obey or disrupt the rules, will be read in order to inform students' own stylistic choices.

AS.220.659. Readings in Fiction: The Short Novel.
Class will read nine short novels and begin to write one.

AS.220.660. Readings in Poetry: Performing Poetry.
This hands-on performance workshop, combining literary and theatrical practice, looks closely at what makes poetry performance compelling, clear, and resonant. Through textual analysis, vocal technique, and group discussion and critique, students will create a pliant and powerful reading style, as an integral part of their work.

AS.220.662. Readings in Poetry: Poetry in Translation: From the Iliad to the Present Day.
The course will begin by looking at theories of translation, and thereafter spend half of each class looking at examples of poems in translation before moving on in the second half to look at poems by members of the group - translated poems where people have been able to write them, otherwise at original pieces. I'll be providing texts for study each week.

AS.220.664. Readings in Fiction: Point of View: Collage, Polyphony, Shapeshifting, and Omniscience.
Some of the most interesting moments in fiction are those when characters experience the same event or situation in profoundly different ways. In this course we will look at writing that explores those moments of intersection and collision and think about how point of view can work to achieve both strong characterization and an illuminating sense of larger context. We'll consider what makes a story where the narrative lens or voice can shift feel cohesive and intentional. The reading list will include work by Colson Whitehead, Theodore Dreiser, Virginia Woolf, Gwendolyn Brooks, E.L Doctorow, Mieko Kawakami, Caitlin Horrocks, Dawnie Walton, Zadie Smith, and Rebecca Makkai.

AS.220.665. Readings in Poetry: Personal Anthologies.
Who are the poets who made us who we are? Over years of practice, poets become increasingly aware of their special debts to predecessors whose music compels them and whose themes seem both urgent and enduring. Readings will include some of the instructor's own touchstones, including Herbert, Milton, Dickinson, Auden, Larkin, Bishop, Walcott. Students will write poems inspired by certain models, and also present orally and in a final written project a personal anthology of poets who mean the most to them.

AS.225 (Theatre Arts & Studies)

AS.225.100. Introduction to Theatre. 3 Credits.
An introduction to the drama: how and why the theatre came into being; its role in human history; and how changing social structures in different regions and epochs have shaped different kinds of theatre, plays and performance. Also: how theatre “works” for us and on us, and the major plays of world drama.

AS.225.101. Acting I. 3 Credits.
An introduction to the fundamentals of acting through exercises and improvisations based on the teachings of Stanislavsky and Sanford Meisner. This course also includes a brief survey of major modern American playwrights. Plays will be read and employed in scene work.

AS.225.201. Acting II. 3 Credits.
As in Workshop I, the principal classroom activities will consist of scene work, exercises, lectures, and discussion. Some rehearsal will also take place during school hours. It is expected that substantial out-of- class time be spent on rehearsals and exercises. Recommended Course Background: AS.225.301

AS.225.212. Voice and Speech for the Actor. 3 Credits.
It has been said that 90% of what an actor does onstage is dependent on being effortlessly heard and understood by their audiences. This course is designed to establish the tools for the actor to begin to create this foundation. Using a combination of both the benchmark texts by Edith Skinner and Kristin Linklater, along with in-class exercises and monologues, we will begin the process of exploring both vocal power through breathing and breath control, and the fundamental tools of clarity in the speaking of a dramatic text onstage.

AS.225.215. Performing Musical Theatre. 3 Credits.
Effective performance in musical theatre demands a committed analysis of the musical and dramatic values of the song and the libretto from which it springs, in order to develop a fresh, organic interpretation. This course will provide you with the training to both analyze and interpret musical theatre scenes and songs and to make the most of them in performance.Instructor Permission Only.

AS.225.218. ANGELS IN AMERICA (The Play) The Millennium Shift in American Culture and Politics. 3 Credits.
Tony Kushner's epoch-making play weaves together astonishingly diverse sides of America in a broad tapestry; a modern work that emerged at the end of the 20th Century, now being revived world wide: it provides keys to understanding the American zeitgeist and the coming transformations of the culture. In one pivotal work we find the emergence of LGBT rights, the Mormon Church, the AIDS epidemic, the new "spirituality," the Reagan-era transformation of both government and business, and the looming figure of Roy Cohn whose influence in American politics "behind the scenes" ranged from the Rosenberg trial to his work as counsel for the McCarthy Committee in the 1950s: and even his legacy in the 2016 as primary political and business mentor of the current President of the United States.

AS.225.300. Contemporary Theatre & Film. 3 Credits.
An introduction to the performing arts, including an overview of theatre history, acting styles and the interaction of art and society. A personal view from inside.

AS.225.303. Acting III. 3 Credits.
Special attention is given to the development of spontaneity and emotional freedom using the principles of Workshops I and II. Hands on work with John Astin's "The Process" and the second Silverberg workbook are employed, along with the Uta Hagen text. Boleslavsky and Michael Chekhov are introduced. The Clurman, Meisner, Stanislavsky and Strasberg approaches are included. Substantial out of class time is required. Recommended Course Background: Two acting courses.

AS.225.305. A History of Black Performance and Drama. 3 Credits.
A survey of the history of the Black Performer and Performance. In exploring the art of storytelling from ancient African civilizations, students will critically engage and discuss the origins, aesthetics, characteristics, and practices of Black performers, and their often-unacknowledged contributions and influence upon mainstream performance throughout the history of the world.

AS.225.308. Shakespeare in Performance. 3 Credits.
Students will work with a selection of Shakespeare's plays --- CYMBELINE, RICHARD III, CORIOLANUS--- in exploring specific ways in which the power of the lines can be translated dynamically and immediately into vocal and physical performance. This course can be repeated for credit, because it covers different topics. (Some background in the acting sequence is encouraged).

AS.225.310. Stagecraft. 3 Credits.
A hands-on approach to the technical and theoretical elements of production. Meets in the Merrick Barn Scene Shop. Permission Required.

AS.225.311. Scene Study. 3 Credits.
An introduction to the principles of analyzing text in a playscript and using the intrinsic demands of language to create character in a scene. Gradually, the student learns to define an ACTION through given circumstances and develop the arc of performance in a particular setting.

AS.225.314. Theatre: Tech Direction. 3 Credits.
An introduction to Technical Direction including pre-production and production with an overview of materials, tools, rigging and safety, together with design and its implementation.

AS.225.315. Scene Study 2. 3 Credits.
Classes and scenes tailored to the needs of the actors. Some rehearsal will take place during school hours. It is expected that substantial out-of-class time be spent on rehearsals and exercises.

AS.225.318. 21st Century Female Playwrights. 3 Credits.
This is a writing intensive class exploring the current wealth of women playwrights, including Pulitzer Prize winners: Wendy Wasserstein, Paula Vogel, Lynn Nottage, and Jackie Sibblies Drury (2019 Prize for FAIRVIEW). We will discuss Script Analysis and read (and see) plays by numerous writers including Claire Barron, Kia Corthron, Theresa Rebeck, Sarah Ruhl, Danai Gurira, Caleen Sinnette Jennings, and Hansol Jung. This class will include a mid-term and a Final Paper.
Area: Writing Intensive

AS.225.320. Performance. 3 Credits.
The student is given specific acting assignments, and develops them as special projects for public performance under the direct supervision of the instructor. A professional level performance is the goal. Audition Required. Out of class rehearsal time required. Permission only, signature required.

AS.225.321. The Lab - The Actor/Director/Playwright Lab. 3 Credits.
Student actors, directors, and playwrights will explore their respective crafts with emphasis on process and individual artistic growth. Participants in the class will also collaborate on the creation of new material for the stage. Recommended Course Background: one course in Acting, Directing, or Playwriting.

AS.225.323. Design for the Stage. 3 Credits.
The fundamentals of stage design, with an emphasis on process, including script analysis, research, conceptualization, and implementation, from the first reading of the play to opening night, along with an overview of theatre architecture from the Greeks to the current day and into our imagined future.

AS.225.324. Adaptation for the Stage. 3 Credits.
For aspiring playwrights, dramaturgs, and literary translators, this course is a workshop opportunity in learning to adapt both dramatic and non-dramatic works into fresh versions for the stage. Students with ability in foreign languages and literatures are encouraged to explore translation of drama as well as adaptation of foreign language fiction in English. Fiction, classical dramas, folk and fairy tales, independent interviews, or versions of plays from foreign languages are covered.
Area: Writing Intensive

AS.225.328. The Existential Drama: Philosophy and Theatre of the Absurd. 3 Credits.
Existentialism, a powerful movement in modern drama and theatre, has had a profound influence on contemporary political thought, ethics, and psychology, and has transformed our very notion of how to stage a play. Selected readings and lectures on the philosophy of Kierkegaard, Nietszche, Camus and Sartre -- and discussion of works for the stage by Sartre, Ionesco, Genet, Beckett, Albee, Pinter, Athol Fugard (with Nkani & Nshone), Heiner Müller and the late plays of Caryl Churchill. Opportunities for projects on Dürrenmatt, Frisch, Havel, Witkiewicz, and Mrozek.
Area: Writing Intensive

AS.225.330. Playwriting Strategies. 3 Credits.
A seminar and workshop in playwriting with Dr. Joe Martin, playwright and dramaturge. Student writers, developing their plays, will learn how to open up to the creative process, "brainstorm," refine their work, and shape it toward an act of artistic communication. Writer's techniques, such as attending to plot or "story," delineation of character, creating effective "dialog," even overcoming "writer's block," will be addressed. This course is designed to be complementary to – not a replacement for – playwriting classes in the Writing Seminars.
Area: Writing Intensive

AS.225.333. Scene Study 3. 3 Credits.
Classes and scenes tailored to the needs of the actors. Some rehearsal will take place during school hours. It is expected that substantial out-of-class time be spent on rehearsals and exercises.

AS.225.345. History of Modern Theatre & Drama. 3 Credits.
Designed to impart a deepened appreciation and understanding of today's theatre by surveying the major playwrights, historical movements, and theatre practices of the 20th century. The course also seeks to help students understand theatre's relationship to the societal and political power structure of each era and to introduce students to great dynamic literature in its intended form, which is performance.
Area: Writing Intensive

AS.225.346. Creative Improvisation: For Theatre and for Life. 3 Credits.
An exploration of the imagination and the senses using basic techniques of improvisation: exercises, conflict resolution, ensemble building, and theatre games. Texts: Spolin, Johnstone, LaBan and Feldencreis. Open to all students.

AS.225.374. Acting IV. 3 Credits.
Work is tailored to individual students, using the principles of Workshops I and II and other previous experience. Students work with John Astin's "The Process", along with the texts of Uta Hagen, Boleslavsky and Michael Chekhov. The Clurman, Meisner, Stanislavsky and Strasberg approaches are further explored. Substantial out of class time is required.
Recommended Course Background: Two acting courses. Permission Required.

AS.225.501. Independent Study. 1 - 3 Credits.
Permission only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.225.502. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.230 (Sociology)

AS.230.101. Introduction to Sociology. 3 Credits.
Introduces students to basic sociological concepts and perspectives, and applies them to a variety of topics including family, work, and the dynamics of class, gender, and racial/ethnic inequalities in the United States and globally.

AS.230.150. Issues in International Development. 3 Credits.
Why do billions of people continue to live in poverty? What obstacles stand in the way of secure and dignified lives for all? Who is most likely to bring about change, what strategies should they follow, and what kinds of institutions should they put in place? This course will introduce the main theoretical perspectives, debates, and themes in the field of international development since the mid-20th century. It has three sections. The first section focuses on debates over the optimal conditions and strategies for generating economic growth and on the relationship between growth, human welfare, and inequality. The second section presents critical assessments of development interventions from various perspectives. The third section considers the role of social movements in shaping development and social change in the 21st century.

AS.230.175. Chinese Revolutions. 3 Credits.
This course introduces the origins, operation and impacts of five major revolutions in modern China between 1850 and 1950. These include the Taiping Rebellion, the republican revolutions, federalist and southern automatic movements, labor strikes as well as peasant rebellions. It draws on the existing historiography that examines China's transition from an empire to a republic, impacts of western and Japanese influences to China, as well as the continuity and change of Chinese social organizations. Cross list with International Studies and East Asian Studies. Fulfills IS History requirement.
Area: Writing Intensive

AS.230.195. Exploring Baltimore: An Introduction to Urban Studies. 3 Credits.
This course will introduce students to the field of urban studies and Baltimore itself. Students will learn data collection and analysis methods used in the social sciences. Students will discuss relevant research published in urban studies by Johns Hopkins faculty and other experts in the field. Students will also gain an introduction to their adopted home, Baltimore, by collecting data and conducting field observations in different neighborhoods.
Area: Writing Intensive

AS.230.202. Research Methods for the Social Sciences. 3 Credits.
The purpose of this course is to provide a sound introduction to the overall process of research and the specific research methods most frequently used by sociologists and other social scientists. Required for Sociology majors and IS GSCD track students.

AS.230.205. Introduction to Social Statistics. 4 Credits.
This course will introduce students to the application of statistical techniques commonly used in sociological analysis. Topics include measures of central tendency and dispersion, probability theory, confidence intervals, chi-square, anova, and regression analysis. Hands-on computer experience with statistical software and analysis of data from various fields of social research. Special Note: Required for IS GSCD track students.
Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.211 OR EN.550.230 OR EN.550.310 OR EN.550.311 OR EN.550.413 OR EN.550.420 OR EN.550.420 OR EN.550.420 OR EN.560.435 OR AS.280.345 OR AS.200.314 OR AS.200.315 OR EN.560.348;Statistics Sequence Restriction: Students who have completed EN.550.111 OR EN.550.113 may not enroll.

AS.230.213. Social Theory. 3 Credits.
This course will focus on four classical social theorists whose ideas have greatly influenced how we study and understand society: Karl Marx, Emile Durkheim, Max Weber and W.E.B. DuBois. Students will gain an in-depth understanding of how each theorist answered three major questions: 1) what is the origin, structure and historical dynamic of modern society?; 2) how do we gain an accurate knowledge of society?; 3) what are the conditions of possibility for freedom in modern society? In comparing, applying and critiquing their respective theories, students will advance their own theory of society.
Area: Writing Intensive

AS.230.216. Disability and Society. 3 Credits.
Objectives of this course are to achieve an understanding of the social context of disability from the population level to the individual disability experience. Topics will include social versus medical models of disability; the spectrum of ability; the history of disability; civil rights perspectives; life course and aging aspects of disability; and the role of the environment. Attention will be paid both to theoretical understandings of disability and the role of policies.

AS.230.219. Land, Labor and Environmental Movements in Contemporary Africa. 3 Credits.
The course examines the new wave of social protest and popular uprisings in contemporary Africa through the interconnected themes of land, labor, and environmental movements.Attention will be placed on the early 21st century.

AS.230.221. Global Social Change. 3 Credits.
This course introduces students to issues of global social change, with a particular focus on the challenges of international development and the contemporary globalization process. Specific themes include world income inequality and global poverty, the rise of supranational organizations (e.g. WTO and EU) and their relations with sovereign states, anti-globalization activism, the rise of China and India in the global economy, and the origins as well as consequences of the current global economic crisis and global pandemics, among others. Lectures will be aided by documentary films and other multi-media materials. Special Note: Fulfills Economics requirement for IS GSCD track students only. Formerly offered as AS 230.353. Students who took AS.230.353 cannot take AS.230.221.
Area: Writing Intensive

AS.230.228. Colonialism in Asia and Its Contested Legacies. 3 Credits.
This course surveys the impacts of colonialism in East and Southeast Asia. Special attention will be paid to the social and economic development in British Singapore and Hong Kong as well as Japanese Korea and Taiwan. Topics include free-trade imperialism, colonial modernity, anticolonial movements, pan-Asianism, and post-war U.S. hegemony.

AS.230.233. Inequality and Social Change in Contemporary China. 3 Credits.
This course examines the trajectory of economic development in China since the beginning of market reforms in the late 1970s, with a special focus on social inequality and forms of resistance that have emerged in response to the expansion of the market economy. The first part of the course focuses on understanding the academic debates around China's economic miracle and introduces students to theories about the relationship between market expansion and social resistance. The second part focuses on key thematic topics including the rural/urban divide, rural protest, urban inequality and labor unrest, gender and sexuality in social movements, environmental protests, and the politics of ethnic relations.

AS.230.236. The Sociology of Intimate Partnerships: Dating, Mating, Marriage, and Divorce. 3 Credits.
How do we define an intimate partnership and what role does it play in society? At the turn of the 20th Century socially sanctioned intimate partnerships existed primarily in the context of marriage between a man and a woman. These partnerships formed the center of family units and provided a foundation of social stability for the individuals that entered them. Since then, additional forms of intimate partnerships have become more widely accepted through dating and cohabitation, while marriage has become less stable. In this course, we will explore the evolution of marriage as the dominant type of intimate partnership in society and the concurrent rise of dating, cohabitation, and divorce. Using the context of how these intimate partnerships have changed in recent decades, students will explore and define the role these different types of partnerships serve in society today.
Area: Writing Intensive

AS.230.238. Beyond the Wall: The Political Economy of the US and Mexico. 3 Credits.
Examining the exchange of culture, people, and commodities between the United States and Mexico since the 19th century, this course asks not just how US practices and policies have shaped Mexican society, but how, in turn, Mexico has shaped the United States. We will examine the social, political, and economic forces that have long pulled these two societies together – and pushed them apart.

AS.230.239. Coffee, Tea and Empires. 3 Credits.
The course introduces the transformation of the coffee and tea industries in the long nineteenth century against the backdrop of European and Japanese colonial expansion. It surveys the social changes in the colonial world under the development of the cash crop economy. It also analyzes how the consumption of such caffeinated beverages became sources of heritage makings both in the metropoles and colonies and the latter's postcolonial reconstructions.

AS.230.242. Race and Racism. 3 Credits.
Race has been important in social classifications and producing inequalities. This course is designed to provide you with a global understanding of how racial categories are created and maintained, how they change over time, and how they vary from place to place. It is organized in four parts. The first part introduces the concepts and analytical tools used by social scientists to study race. Of particular concern is power and the social construction rather than “natural” categories of race, as well as the general social processes involved in the maintenance and reproduction of these boundaries. In the second part, we will study the theories and dynamics racial category formation in the United States with attention to forms and processes of racial exclusion and oppression, and evidence of socio-economic inequalities based on race. In the third part of the course, we will compare these processes in the U.S. to those occurring in other countries. The fourth and final part of the course examines how race and racism shape political struggles and resistance movements.

AS.230.244. Race and Ethnicity in American Society. 3 Credits.
Race and ethnicity have played a prominent role in American society and continue to do so, as demonstrated by interracial and interethnic gaps in economic and educational achievement, residence, political power, family structure, crime, and health. Using a sociological framework, we will explore the historical significance of race and its development as a social construction, assess the causes and consequences of intergroup inequalities and explore potential solutions.

AS.230.250. Knowledge, Evidence, and Democracy. 3 Credits.
Fake news. Alternative facts. Follow the science. Misinformation. Disinformation. How can we understand the role of information, evidence, and scientific inquiry in politics? Where does information come from? How is it used? How can evidence, argument, and listening improve public conversations? This seminar will examine the connections between information, knowledge, evidence, and democracy, focusing mostly on the United States but with global examples as well.
Area: Writing Intensive

AS.230.265. Research Tools for Global Sociology and Development. 3 Credits.
This course will introduce students to a range of software programs that are critical for conducting social scientific research in the 21st century. Students will develop competency in the use of computer programs for statistical analysis, database management, the creation of maps and timelines, and the presentation of research reports. The course uses examples from ongoing social science faculty research projects at Johns Hopkins on global inequality and international development. Required for GSCD track students.Course previously titled "Research Tools and Technologies for the Social Sciences"

AS.230.304. (Making Space For) Black Thought. 3 Credits.
How do we think about the power relations at work in the scholarship we read and in the important texts we consider essential to our educational experience? This course will critically investigate the role that concepts of race and racism have played in formulating dominant perceptions of who can be the producers of knowledge and what constitutes authoritative knowledge itself. We will consider how and why thinkers and scholarship produced outside of Europe and North America are too often ignored for their scholarly contributions and the dynamics that lead to this situation. We will also explore how and why new and important perspectives emerge from engaging and centering voices from beyond traditional canonical works. With a particular focus on the forms of knowledge arising from European Enlightenment approaches to concepts of thought reason and objective knowledge, this course will critically engage students with a wide range of thinkers such asGWF Hegel, W.E.B. Du Bois, Angela Davis, Ralph Trouillot, Sadiya Hartman, Walter Rodney, Derek Walcott, Sylvia Wynter and Frantz Fanon. This course will focus largely on thinkers engaging within the Black Atlantic and black diaspora traditions to question how we might consider voices and thought from beyond Eurocentric positions in our own scholarly practice.

AS.230.306. Plagues, Power, and Social Control. 3 Credits.
While developments in biomedicine and health care have led to the eradication, cure and management of many human health problems, disease, illness and health have also been the focus for aggressive social controls and population management. The technologies and practices of disease control and health management have been foundational to some of the most aggressive structures of oppression in recent history such as the Jewish Ghetto, the Concentration Camp, the South African Township and techniques of segregation. This course seeks to explore how epidemics and disease control are linked to larger questions of power, state craft and international dynamics. This course asks how have outbreaks of infectious disease shaped social and political action? How do societies respond to outbreaks and why? What do epidemic moments tell us about global structures of power and the dynamics of control? Drawing on historical cases including plague during the European Renaissance and before, the HIV/AIDS Pandemic and the West African Ebola Outbreak of 2013-2016, this course will introduce students to the history and practices of disease control as well as important theoretical perspectives by which to understand the sociological and historical effects of disease and the responses to them. Students will engage sociological concepts such as biopolitics, social construction of disease and illness and biosecurity and produce a final research paper examining the outcomes and responses to an epidemic event to show mastery of the topics covered in the course.
Area: Writing Intensive

AS.230.312. Education & Society. 3 Credits.
This course analyzes educational systems as social institutions and organizations. It gives particular attention to the often taken-for-granted ways that we structure learning in schools and their consequences for social inequality. To these ends, the course will examine classical institutional and organizational theory in sociology and evaluate these theories in their application to historical process of educational formation and the contemporary organization of K-12 schooling in the US.
Area: Writing Intensive

AS.230.313. Space, Place, Poverty & Race: Sociological Perspectives on Neighborhoods & Public Housing. 3 Credits.
Recent national conversations about racial segregation, inequality and the affordable housing crisis raise many important questions—this course focuses on several of these questions, through the lens of urban sociology and housing policy. There are three main areas we will focus on in the course: 1) Understanding the role of racial segregation, neighborhood and housing effects on children and family life; 2) Research methods for studying urban poverty and neighborhoods; and 3) Programs, policies and initiatives designed to house the poor, alleviate concentrated spatial poverty, and increase residential choice. We will primarily focus on issues related to urban poverty in large cities, comparing the patterns of residential mobility and neighborhood characteristics for white and Black Americans. We will utilize archival data, qualitative interviews, census data, and quasi/experimental data to gather evidence about neighborhoods, housing, and policies, as well as their impacts. We will also explore interactive online applications that facilitate the study of neighborhoods (e.g. American Community Survey, GIS with Social Explorer). A statistics/public policy background is helpful, but not required.
Area: Writing Intensive

AS.230.315. Advanced Topics in International Development. 3 Credits.
This class offers an advanced engagement of various topics in international development. The course begins with an historical examination of the actors and global events, as well as the intellectual debates, that birthed the field of international development as a discrete area of study and practice. We will then analyze the evolving theories that dominated the first five decades of the international development effort. The final part of the course will examine more recent perspectives that have attempted to fill the intellectual void left by the demise of the traditional development paradigm. Here we will cover topics that span the global North and South, including issues of race/caste/ethnicity, migration, gender, and right-wing nationalism. Some prior knowledge of international development is recommended
Area: Writing Intensive

AS.230.316. African American Family. 3 Credits.
This course is an examination of sociological theories and studies of African-American families and an overview of the major issues confronting African-American family life. The contemporary conditions of black families are explored, as well as the historical events that have influenced the family patterns we currently observe. Special attention will be given to social policies that have evolved as a result of the prominence of any one perspective at a given point in time.

AS.230.317. Sociology of Immigration. 3 Credits.
This course surveys sociological theories and research on immigration to the U.S. Theoretical approaches include theories of international migration, economic sociology, immigration, and assimilation. Research topics include the impact of U.S. immigration laws and policies on immigrant inflows and stocks, self-selection of immigrants, the impact of immigration on the native-born population and the U.S. labor market and economy, and the adaptation of the first and second generations.
Area: Writing Intensive

AS.230.318. The Political Economy of Modern India. 3 Credits.
This course examines the complex, at times conflicting, relationship that has emerged between Indian seats of power from above and Indian expressions of society from below. Attention will be placed on the period between 1947 to the present.
Area: Writing Intensive

AS.230.320. Education & Inequality: Individual, Contextual, and Policy Perspectives. 3 Credits.
Area: Writing Intensive

AS.230.322. Quantitative Research Practicum. 3 Credits.
This course provides “hands on” research experience applying sociological research tools and a sociological perspective to problems of substance. Quantitative methods will be emphasized, including how to access publicly available survey data, data management, and the presentation of results. Each student will design and carry out a research project and write a research report. Juniors and seniors only. Sophomores require instructor’s permission.
Area: Writing Intensive

AS.230.323. Qualitative Research Practicum. 3 Credits.
This course provides "hands on" research experience applying sociological research tools and a sociological perspective to problems of substance. Qualitative observational and/or interviewing methods will be emphasized. Students will design and carry out a research project and write a research report. This course fulfills the "research practicum" requirement for the Sociology major.
Area: Writing Intensive

AS.230.324. Gender and International Development. 3 Credits.
This course employs a comparative perspective to examine the gendered impact of international development experiences and policies. Students will discuss the historical evolution of how the concept of gender has been constructed, conceptualized, and integrated into international development theory and practice. The course will also examine how greater international development. In particular, we will examine structural theories of poverty reduction, individual theories of power and processes of stratification at the household and family level. Specific issue areas will include the globalization, class and work political participation and social movements. Cross-listed with International Studies (CP, IR). Fulfills Economics requirement for IS GSCD track students only.
Area: Writing Intensive

AS.230.325. Global Social Change and Development Practicum. 3 Credits.
This course provides "hands on" research experience in the field of global social change and development. The course fulfills the "research practicum" requirement for Sociology majors and is required for the GSCD track.

AS.230.327. Sociology of Revolution and Counterrevolution. 3 Credits.
In this course, students will learn about analyzing revolutionary and counterrevolutionary movements, with a focus on their strategic dimensions. Contributions from the military, counterinsurgency, sociology of revolution, historical materialist, world-system, and critical realist literature will provide different visions of strategy and tactics. The cases of Guatemala and Chile in the early 1980s and 1970s, respectively, will provide historical and empirical roots to class discussions about these different approaches and the possibilities of synthesizing them.
Area: Writing Intensive

AS.230.335. Medical Humanitarianism. 3 Credits.
Humanitarian organizations play life-preserving roles in global conflicts, and have front-row views of disasters ranging from the 2010 Haiti earthquake to the 2011 Fukushima tsunami in Japan. Yet even while they provide vital assistance to millions of people in crisis, such organizations are beset by important paradoxes that hinder their capacity to create sustainable interventions. They work to fill long-lasting needs, but are prone to moving quickly from one site to the next in search of the latest emergency. They strive to be apolitical, yet are invariably influenced by the geopolitical agendas of global powers. How do such contradictions arise, and what is their impact upon millions of aid recipients around the world? Drawing on case studies from South Sudan to Haiti, this course addresses these contradictions by exploring how and why medical aid organizations attempt, and sometimes fail, to reconcile short-term goals, such as immediate life-saving, with long-term missions, such as public health programs and conflict resolution initiatives.

AS.230.337. Global Crises: Past and Present. 3 Credits.
This course will compare the current global crisis with previous major crises of historical capitalism through a combination of theoretical and historical readings. Throughout, we will ask: What can a study of past crises tell us about the nature and future trajectory of the current global crisis? Special emphasis will be placed on (1) “the late-nineteenth century great depression”, (2) the Great Depression of the 1930s, and (3) the period of crisis and stagflation in the 1970s. We will be particularly concerned to understand the differential social and geopolitical impact of the crises. Which social classes bore the brunt of the disruptions in economic activity in each crisis? Which geographical areas or geopolitical groupings lost out (or benefited) from the crisis? How have environmental and ecological challenges resurfaced in each crisis including today?

AS.230.339. The Geography of Opportunity. 3 Credits.
The schools that children attend and the neighborhoods in which they live are critically important sites of mental and physical development, socialization, and academic achievement. These contexts in which children live and learn are also highly segregated by race and class, resulting in spatially stratified opportunities for social mobility – what social scientists call “the geography of opportunity.” This course explores social inequality through the lens of space, place, and geography, with a particular focus on how these dynamics shape educational inequality in the United States. Drawing on readings from sociology, demography, psychology, history, economics, urban planning, and public health, this course will teach students to think critically about how individual choices and public policies interact with dynamics of space and place to create and maintain social inequality.
Area: Writing Intensive

AS.230.341. Sociology of Health and Illness. 3 Credits.
This course introduces students to core concepts that define the sociological approach to health, illness and health care. Topics include: health disparities, social context of health and illness, and the Sociology of Medicine.

AS.230.342. Resistance, Rebellion, and Revolution in Latin America. 3 Credits.
This course will examine the dynamics of transformative social change in Latin America and the Caribbean through analyses of resistance, rebellion, and revolution. Because revolutionary change is at once the most transformative and the most rare, this course will cover the exemplary cases of the Haitian, Mexican, and Cuban revolutions, but then also ask how theorists have understood the dynamics of both open rebellion and of everyday resistance in societies deeply structured by racial, gender, and class power, situated within an unequal world system. Attending to both local and global dynamics, this course will ask how Latin American dynamics have both conformed to and challenged universalist theories of social change.

AS.230.348. Climate Change and Society. 3 Credits.
This course will focus on the social dimensions of climate change. Drawing on global and multi-disciplinary scholarship, we will address such issues as: the history of fossil capitalism; the relationship between social inequality and “vulnerability” to climate change (including heat waves, drought, rising seas, and extreme weather); climate migration and the political economy of “adaptation”; the merits of various mitigation strategies, including the Green New Deal, conservation offsets, and geo-engineering; the roots of climate denialism; and climate justice movements. Students will write a final research paper on a sociological aspect of climate change.
Area: Writing Intensive

AS.230.349. Class, Race, and Political Struggle in Capitalist Societies. 3 Credits.
Does capitalism promote democracy and stability, or repression, racial conflict, and social unrest? Following the 2008 financial crisis, countries around the world have experienced severe economic and political crises, giving rise to explosive movements that have challenged the viability of capitalism and democracy as durable systems. By considering these developments, this course examines the core political dimensions of capitalist societies. We will define and discuss key terms, like capitalism, racial capitalism, the capitalist state, democracy, social movements, and more. We will pay special attention to the ways in which the economic, political, and ideological structures of capitalist societies shape and are shaped by social movements and political parties. The course is global in perspective, drawing on developments in many countries, with a special focus on the United States.
Area: Writing Intensive

AS.230.350. Capitalism, Dependency, and Development in Latin America. 3 Credits.
This course examines Latin American insertion into the global capitalist economy from the colonial period to the present. Examining various historical, sociological, and political-economic theories, this course will ask not only how Latin American economies and societies have developed their particular characteristics, but also how theorists within and outside the region have understood Latin American development over time.development over time.

AS.230.352. Chinese Diaspora: Networks and Identity. 3 Credits.
This course combines lecture and class discussion. It examines the history and historiography of Chinese overseas migration. Major issues include overseas Chinese as “merchants without empire,” Chinese exclusion acts in the age of mass migration, the “Chinese question” in postcolonial Southeast Asia, as well as the making and unmaking of Chinese identity in the current wave of globalization.
Students may not have completed AS.230.217 previously.

AS.230.354. The City After Civil Rights. 3 Credits.
This course examines how American cities have evolved since the United States ratified the radically new vision of race promoted by the Civil Rights Movement in the 1960s. We will study the changing geography of race and class in American cities and their surrounding suburbs and what that evolution has meant for inequality. We will also consider how this shifting geography of race and class affects current debates in metropolitan policies like gentrification and tax policy. We will look to the future to examine what issues might come about in the coming decades and how we might avoid similar problems to those in history.

AS.230.356. Power, Privilege, and Inequality. 3 Credits.
Race, class and gender are among key factors in systematic patterns of inequality in the United States (and globally). In this course, we examine the manner in which social inequality comes about and is maintained through a range of social institutions and daily social interactions. This class will examine how social institutions and daily social interactions structure the decisions individuals make and, in turn, how the decisions that individuals make serve to perpetuate or challenge existing social institutions and interactions. We will explore how the intersection of different forms of inequality, for example race and class or class and gender challenge traditional conceptions of inequality and provide insight into the processes that perpetuate inequality. We will use these sociological tools to develop what sociologist C. Wright Mills calls the "sociological imagination" and apply this imagination to contemporary debates in American society. We will discuss how the sociological imagination differs from the approach other disciplines in social science might take to study inequality.

AS.230.357. Baltimore and Beyond. 3 Credits.
This course uses the city of Baltimore as a lens through which to explore issues of urban inequality. We will focus on Baltimore's history of racial segregation and concentrated poverty, and its effect on the social and economic well-being of the city and its residents, with attention to education, employment, health and crime. Students will learn how to employ Census data, GIS approaches, and sociological research to inform questions about population change, inequality and the distribution of resources across the city and metropolitan region. Students will also work on one or more policy relevant studies based in Baltimore, including: a project on abandoned and vacant housing, a desegregation intervention, and a longitudinal study of inner city youth. Finally, students will become familiar with Baltimore City's programs and policy approaches to addressing the city's most pressing problems, and will design innovative and effective and innovative solutions as part of their course assignments. Enrollment restricted to Social Policy minors only.
Area: Writing Intensive
Students that took AS.360.357 may not take AS.230.357

AS.230.358. The Politics of Mental Health. 3 Credits.
This course examines how the psy disciplines – psychology, psychiatry, psychotherapy and related fields – create knowledge about the mind, and how these fields have in turn shaped political and social life since early 20th century. We will explore how the psy disciplines have proven useful to projects of state building by reconstructing the human mind as a calculable, quantifiable entity, one that can be measured and governed across diverse educational, military, and healthcare settings. We will then ask how psychiatric categories such as bipolar disorder and PTSD (post-traumatic stress disorder) were created, and consider their impact on both the legal/medical management of illness and on lay and expert notions of sanity and normality. Finally, we will examine the rising influence of humanitarian mental health interventions, and immerse ourselves in the debates they have engendered concerning the use of psychotherapy to alleviate suffering in war and disaster zones.
Area: Writing Intensive

AS.230.363. Sociology of Dispossession. 3 Credits.
The "grabbing" of land and natural resources has, in recent years, generated widespread political conflict across the world and put dispossession on the agenda of academics and policy-makers. Nevertheless, compared to other social relations of power, land dispossession has not been central to scholarly or public understandings of capitalism, the state, development, or politics. In this class, we will collectively explore the nascent field that we might call the sociology of dispossession. We will examine existing theories of dispossession, and proceed to challenge, reconstruct or supplant those theories as we consider a wide range of historical examples of dispossession from the English Enclosures and colonial plunder to contemporary urban redevelopment and rural land grabs. This is a reading- and writing-intensive seminar.
Area: Writing Intensive

AS.230.366. Black Social Thought and Social Movements. 3 Credits.
This course will examine the reciprocal relationship between Black social thought and social movements. How have social movements informed thinkers who grapple with questions of freedom and liberation in racially and economically stratified societies, and how have their ideas affected movement tactics? This course will look at 20th century movements and investigate connections between theory and practice through concepts like civil disobedience, internal colonialism, Black feminism, Black internationalism, and others.
Area: Writing Intensive

AS.230.367. Islamic Finance. 3 Credits.
Today, Islamic finance is a global industry comprising nearly $3 trillion in assets, with hubs from Kuala Lumpur to Dubai to London. But half a century ago, nothing called "Islamic finance" existed. So where did Islamic finance come from? Why is it growing so fast? And what does it mean for finance to be Islamic? We discuss the ban on usury in Islam and other religious and philosophical traditions, finance in early and medieval Islamic societies, petrodollars and the birth of Islamic banking in the 1970s, the rise of Islamic capital markets since 2000, contemporary shariah-compliant financial structures, and the constitution of piety through financial practice.

AS.230.369. Sociology in Economic Life. 3 Credits.
This course discusses how geopolitics, technology as well as social differentiation (such as race, class and gender) shape the structure of economic actions. Special attention will be paid to patterns of state-business relationship, labor processes, migrant economy, globalization and international division of labor.

AS.230.370. Housing and Homelessness in the United States. 3 Credits.
This course will examine the role of housing, or the absence thereof, in shaping quality of life. It will explore the consequences of the places in which we live and how we are housed. Consideration will be given to overcrowding, affordability, accessibility, and past and existing housing policies and their influence on society. Special attention will be given to the problem of homelessness.
Students may not have previously taken AS.230.223.

AS.230.378. Refugees, Human Rights, and Sovereignty. 3 Credits.
What is a refugee? Since World War II, states that have pledged to offer protection to refugees have frequently been drawn instead to the dictates of nationalism and communitarianism, which prioritize concern for their own citizens, rather than to the needs of forced migrants. As a result, even those migrants that have been formally recognized as refugees according to the 1951 UN Refugee Convention have not been assured of protection, and other migrants have been even less assured. In this course, we will locate the reasons for this reality in the legal, political, and historical underpinnings of political asylum. What is the difference between an asylum seeker and a refugee? How has the refugee category been redefined and contested by international bodies since 1951? How are the ambiguities of real-life violence and persecution simplified in asylum adjudication interviews that require clear, factual narratives? What kinds of protections are offered to asylum seekers, whether by UN bodies, NGOs, or host governments, and how have such protections varied geographically and historically? Finally, what protections, if any, are afforded to those migrants who are fleeing not persecution but rather “merely” endemic poverty or climate-induced displacement? The course draws on literature from sociology, history, anthropology, and international refugee law in order to understand the capacity (or lack thereof) of human rights discourses and declarations to contravene state sovereignty in the name of protecting the rightless.

AS.230.385. Schooling, Racial Inequality and Public Policy in America. 3 Credits.
After examining alternative explanations for why individuals obtain different amounts and types of educational training, the course focuses on how an individual’s family background and race affect his or her trajectory through the educational system. The course covers the specific challenges that have confronted urban schooling in America since the 1960s, including the classic literature on the effects of school and community resources on student achievement as well as the development and later evaluation of school desegregation policies.
The course also considers case studies of current policy debates in the US, such as housing segregation and school resegregation, voucher programs for school choice, and the motivation for and consequences of the establishment of state-mandated testing requirements. Throughout the course, emphasis is placed upon the alternative modes of inquiry and writing which opposing scholars, policymakers, and journalists use to address these contentious topics.
Area: Writing Intensive

AS.230.386. The Making of the Asian Races Across the Pacific in the Long 20th Century. 3 Credits.
Focusing on the race-makings of the Asians across the Pacific in the long twentieth century, the course employs the reading materials that elucidate the constructions about the demographic categories of the Asian "races." We use prewar Japanese materials and Chinese nationalist thoughts to elaborate on the following themes: the internal distinction among the peoples grouped under the racial category of the Asians; the overall presentation about the generic category of the "Asian" peoplehood, as well as their alleged shared civilization and interests. The theoretical framework include concepts of capitalist reconfiguration of social boundaries through racism and the question of power behind the reproduction of racial hierarchy.

AS.230.388. Sociology of the Family. 3 Credits.
Sociological perspectives on contemporary family life, including marriage and divorce, cohabitation, single parenthood, same sex partnerships, children’s wellbeing, balancing work and family responsibilities, domestic violence, and government policy toward families.

AS.230.389. The Value of Life: Racism, Capitalism and Health. 3 Credits.
We are generally told that you can’t put a price on life or a price on our health but lives are quantified, valued and priced every day. In this class we will explore the ways in which life is valued in the modern world, its effects and the outcomes from it. We will also examine how forms of quantification and valuation have been employed to dehumanize and subjugate peoples, especially those racialized as different. Beginning with an exploration of human pricing during the trans-Atlantic Slave trade and continuing through to contemporary health care and health insurance practices, this course will examine how we value (monetarily) human existence in modernity. This course will introduce students to ideas emerging out of the Black Marxist Tradition, postcolonial thought, and critical feminist approaches to historical research. From the examination of insurance under slavery to the use of race corrections in medical algorithms, this class will confront students with the question- "how can we put a price on life?" and most importantly "Should we?".
Area: Writing Intensive

AS.230.393. Global Health and Human Rights. 3 Credits.
Is access to healthcare a fundamental human right? If so, then which global actors are obligated to provide healthcare to whom, and for how long? How do meanings of health and illness vary across time and place? And finally, how are human rights principles translated into frontline practice in order to promote well-being? This course takes a critical interdisciplinary approach to these questions through a series of global case studies ranging from humanitarian aid in post-tsunami Sri Lanka to anti-FGM (female genital mutilation) campaigns in Ghana. How do international NGOs, UN bodies, and governments collaborate (or compete) to distribute healthcare in places beset by dire resource shortages? Do human rights principles carry legal weight across borders, and if so, could access to healthcare services and essential medicines be litigated in order to compel governments to provide it? And finally, what cultural assumptions do human rights discourses carry with them, and what happens if rights-based approaches are poorly received by recipient populations? Moving beyond the basic principle of healthcare as a human right, this course aims to bring this idea’s history and politics into focus by offering an in-depth exploration of its ethics and implementation.
Area: Writing Intensive

AS.230.394. Social Statistics. 4 Credits.
The application of statistical techniques commonly used in sociological analysis. Topics include measures of central tendency and dispersion, probability theory, confidence intervals, chi-square, anova, and regression analysis. Hands-on computer experience with statistical software and analysis of data from various fields of social research.

AS.230.395. Contemporary Social Theory. 3 Credits.
What is the structure of society, how does it change, and how is it reproduced? What is the relation between social structures and our ideas about them? What are the conditions of possibility for human freedom? This course will examine how major social theorists of the 20th century advanced novel answers to these questions as they grappled with the historical events and social concerns of the 20thcentury—the Russian revolution and its degeneration into Stalinism, the failure of communist movements in the West, the rise and fall of fascism and Nazism, the consolidation of capitalist democracies and welfare states, the emergence of anti-colonial movements in the "Third World," and the persistence of race, gender and sexuality as forms of domination. In addition to understanding and comparing theories, we will assess their usefulness for understanding the present. This is a reading and writing-intensive seminar.
Area: Writing Intensive

AS.230.396. Politics and Society. 3 Credits.
This seminar surveys key problems of political sociology including the rise of the modern state, the origins and nature of liberal democracy, sources of authority, the relationship between political and economic power, the nation-state and nationalism, states and war, ideology and political contention, collective identity, social movements, and social revolutions. Fulfills Comparative Politics for International Studies.
Area: Writing Intensive

AS.230.397. The Political Economy of Drugs and Drug Wars. 3 Credits.
In the United States, we spend more than $100 billion annually on illegal drugs—and the government spends more than $50 billion a year to combat their sale and use. These statistics raise important and complicated social questions. This course will examine the production, sale, use, and control of illegal drugs from a historical and sociological perspective. We will have three objectives: to understand the social construction of drug use and illegality in the United States and other rich countries; to uncover the political and economic consequences of drug trafficking in those countries that produce drugs, particularly in Latin America; and to examine the political economy of drug control through the so-called War on Drugs, both domestically and internationally.

AS.230.405. Neoliberalism. 3 Credits.
Neoliberalism, a political project that seeks to subject all aspects of social life to free market force, has ascended to orthodoxy in developed and developing countries alike over the last four decades. This course is a reading seminar focused on some of the key classic and cutting-edge original texts that critically examine and debate the origins, socio-political impacts, and crisis of the neoliberal project. It will cover such topics as the genealogy of the neoliberal idea, neoliberal state, informalization of works, neoliberal cities, rise of the one percent, and global governance. Class will be a mix of lecture and seminar-style discussions. Requirements include reading memo, class presentation, and a term paper.
Area: Writing Intensive

AS.230.415. Social Problems in Contemporary China. 3 Credits.
In this course we will examine contemporary Chinese society, looking at economic development, rural transformation, urbanization and migration, labor relations, changes in class structure and family organization, health care, environmental problems, governance, and popular protest. The course is designed for both graduate and undergraduate students. Undergraduates must have already completed a course about China at Hopkins. Cross-listed with East Asian Studies.
Area: Writing Intensive

AS.230.418. Racial Capitalism: A Sociological Perspective. 3 Credits.
This course provides theoretical and historical approaches to examining the centrality of racism, imperialism, and colonialism to the origins and ongoing functioning of capitalism and the global political economy. We begin with the dominant theoretical frameworks used to study capitalism and carefully juxtapose these with theory and empirical analyses foregrounding capitalism's connections to racial slavery/racialized labor exploitation, imperialism, colonialism, and gendered exploitation. Following this, we examine the unfolding of capitalism in the post-emancipation, post-independence, and neoliberal periods, paying close attention to inequalities produced within and between nations. We end by examining resistance to racial capitalism, as well as imagining alternative futures.
Area: Writing Intensive

AS.230.420. Class, Capitalism, Colonialism: Evaluating the work of Walter Rodney. 1 Credit.
This course will focus on key writings of Guyanese scholar and intellectual, Walter Rodney (1942-1980) with an emphasis on evaluating his legacy and the relevance of his work for the 21st century, globally and locally. The main course readings are Rodney's three major books—(1) How Europe Underdeveloped Africa; (2) History of the Guyanese Working People; and (3) Groundings with my Brothers. The course will provide students with the background necessary to participate in the January 31, 2020 workshop on the legacy of Walter Rodney organized by the JHU Arrighi Center for Global Studies.

AS.230.430. Sociology of Policing and Resistance in Race-Class Subjugated Communities. 3 Credits.
Policing has become a primary way that many Americans see and experience government, particularly those from race-class subjugated communities, and has been a site of resistance and freedom struggles since the first Reconstruction. In this undergraduate seminar, we will survey key debates around policing and social movements, with a particular focus on research that takes institutional development, history, and racial orders seriously. A core preoccupation of this course will be to understand the ways in which policing "makes race" and how debates about crime, surveillance, and safety were often debates about black inclusion and equality. We will explore changes in the racial logics of policing over time, debates over how policing helped construct the racial order, and the consequences of several shifts in policing for communities. From broken windows policing in New York to the emergence of the new vagrancy-style banishment laws in urban Seattle to the men who live under constant surveillance in Philadelphia and to the large share of blacks in Ferguson with outstanding warrants for 'failure to appear", these policies and policing regimes have helped remake the government in the eyes of the urban poor. How does exposure to criminal justice interventions shape political learning, racial lifeworlds, and community social capital? The course will include a range of methods (ethnography, historical analysis, quantitative and qualitative).
Area: Writing Intensive

AS.230.440. Port Cities and Historical Capitalism in Maritime Asia. 3 Credits.
The goal of the seminar is to examine the prospects and limits of understanding the incorporation of Asia in the capitalist world-system from the prism of oceanic connections. The theoretical thrust of this course is to develop but also to adapt Janet Abu-Lughod emphasis on the connections across port cities and littoral in the Afro-Eurasian continents before the long sixteenth century in her Before European Hegemony. But instead of looking at a port city as its adjacent hinterland polity's gateway to global trade in the premodern era, the course examines the multifarious coast-hinterland relationships. The readings are organized by a chronological order, which begins with the historical maritime silk road between the third and thirteenth centuries, and will be followed by Asian port cities in the European age of empire and postwar American-led Cold War Structure, as well as the present-day Chinese New Silk Road Diplomacy. Students are expected to select an issue of regional tensions and to analyze its historical root.

AS.230.445. Sociology of Religion. 3 Credits.
This seminar tackles major issues in the classical and contemporary sociology of religion. We begin with Ibn Khaldun, Friedrich Nietzsche, Karl Marx, Max Weber, Émile Durkheim, and Mary Douglas, asking basic questions: What are religion and the sacred? Why do they exist? What is the relationship between religion and social structure? And what role does religion play in morality, solidarity, boundaries, exploitation, patriarchy, and macrohistorical transformations such as the rise of capitalism? Keeping this theoretical grounding (and its flaws and biases) in mind, we continue to probe the problem of religion in modernity through more-recent writings. Topics include the secularization debate (Are modernity and religion antithetical?); "religious markets" and rational-choice theories of religion; religious revivalism, evangelicalism, fundamentalism, and proselytizing movements; feminist and queer sociologies of religion; civil religion (Is standing for the national anthem a religious act?); embodiment and prayer; Orientalism and postcolonial interrogations of the secular; religious violence and nationalism; the intersectionality of religion with race, class, and caste; and religion and neoliberalism. Although dominant sociologies of religion have focused on Christianity in Western Europe and North America, this course applies a global lens, training significant focus on non-Western and non-Christian contexts.
Area: Writing Intensive

AS.230.465. Labor in the World System. 3 Credits.
This is an intensive reading seminar on working class formation from a comparative, historical and global perspective, including theoretical and empirical (case study) readings on changes over time in labor process, labor markets, and labor movements. We will build on a range of local case studies to establish spatial and temporal patterns, and discuss the connections between these global patterns and the dynamics of historical capitalism.
Area: Writing Intensive

AS.230.500. Independent Study. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.230.501. Research Assistantship. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.230.507. Internship. 1 Credit.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.230.511. Honors Research Seminar. 3 Credits.
This seminar is a workshop for Sociology majors writing senior honor theses. It is part of the two-semester Senior Honors Program. Students must complete an application to enroll in the Honors Program [https://soc.jhu.edu/wp-content/uploads/sites/28/2021/04/Sociology-Honors-ThesisApplication.pdf] before registering for this seminar. Typically, students first take the seminar and then enroll for the Honors Independent Study (230.512) with their thesis advisor in the second semester of the Program. The seminar is designed to assist students in the early phase of their honors thesis research and to provide a community of peers who are writing theses.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.230.512. Honors Independent Study. 3 Credits.
TBA
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.230.598. Summer Internship. 1 Credit.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.230.600. Introduction to Social Statistics.
This course will introduce students to the application of statistical techniques commonly used in sociological analysis. Topics include measures of central tendency and dispersion, probability theory, confidence intervals, chi-square, anova, and regression analysis. Hands-on computer experience with statistical software and analysis of data from various fields of social research.

AS.230.602. Theories of Society.
This course will examine how important schools of social theory challenged and reconstructed the "classical" theories of Marx, Weber, and Durkheim as they grappled with the historical developments and social concerns of the 20th century.

AS.230.603. Contemporary Social Theory.
This course will examine how important schools of social theory challenged and reconstructed the "classical" theories of Marx, Weber, and Durkheim as they grappled with the historical developments and social concerns of the 20th century.

AS.230.604. Linear Models for the Social Sciences.
This course provides an accessible but in-depth coverage of multiple regression with a focus on sociological problems and software applications. We begin with the basics of linear regression, including estimation, statistical inference, and model assumptions. We then review several tools for diagnosing violations of statistical assumptions and what to do when things go wrong, including dealing with outliers, missing data, omitted variables, and weights. Graduate students should have completed AS.230.600 or equivalent. Undergraduates admitted with instructor's permission and AS.230.205 or equivalent.

AS.230.605. Categorical Data Analysis.
This course provides the students with a set of statistical tools to understand and interpret social science research dealing with categorical dependent variables and to prepare students to apply these models in their own research. The models covered in the course include logit, probit, Poisson, and log-linear models, as well as multi-level models of categorical dependent variables.

AS.230.608. Proseminar In Sociology.
Individual one-hour presentations by faculty members will introduce students to the faculty's substantive interests and research styles.

AS.230.609. Dissertation Seminar.
Advanced seminar for PhD students who are preparing their dissertation proposals or writing their dissertations. Sociology graduate students only.

AS.230.611. Seminar on Comparative & World-Historical Sociology.
In this seminar we will read key texts in comparative sociology. The topics covered are cross-national sociology, comparative national development, comparing world-systems, the modern world-system, globalization, and social movements.

AS.230.612. Seminar on Social Inequality.
This course covers the sources of inequality in contemporary metropolitan areas. It will investigate traditional and contemporary theories that explain the sociological processes that lead to inequality and the methods used to provide empirical evidence.

AS.230.614. Seminar On The Family.
A discussion-oriented seminar focused on major recent writings on the family, in both the developed and developing nations.

AS.230.615. Sem:Panel Data Analysis.

AS.230.617. Seminar on Immigration.
In-depth reading and discussion of theories and research on immigration to the U.S. theoretical issues include international migration, immigration, and assimilation. Research topics include: the impact of U.S. immigration laws on immigrant inflows and stocks, self-selection of immigrants, the impact of immigration on the native-born population, and the adaptation of the first and second generations. The course focuses on immigration since 1965 and its related controversies and debates.

AS.230.618. Introduction to Computational Social Science.
Computational social science is an interdisciplinary field combining social science and data science. Today's digital age presents both opportunities and risks to social scientists with the availability of increasingly big and complex data that depart from traditional data in remarkable ways. This course offers a foundational basis for social science students to embark upon the field. The weekly 2-hour seminar introduces the topics of big data ethics; research designs for the collection and use of digital trace data, automated texts, government administrative data, and large-scale social network data; new forms of surveys and experiments; and mass data collaborations. Research publications are used to illustrate each topic. The weekly 1-hour labs are for group activities on the weekly topic. There are no social science or data science prerequisites.

AS.230.643. Sociological Analysis.
An intensive analysis of a wide range of sociological studies, designed to acquaint the student with how sociologists deal with important theoretical issues, using a variety of methods and sources of data. Particular attention will be paid to the logical coherence of the studies and to the fit between data and interpretation.

AS.230.646. Race and Ethnicity in American Society.
Race and ethnicity have played a prominent role in American society and continue to do so, as demonstrated by interracial and interethnic gaps in economic and educational achievement, residence, political power, family structure, crime, and health. Using a sociological framework, we will explore the historical significance of race and its development as a social construction, assess the causes and consequences of intergroup inequalities and explore potential solutions.

AS.230.649. Qualitative Research Methods: Domestic and International Fieldwork.
The emphasis of this course will be on participant observation and interviews in a fieldwork context (that is, research that takes place in the space and time of "subjects" rather than the observer). While the best way to learn a method is by doing, the pandemic is likely to make a practicum impossible this semester. Therefore, the course will be structured around reading classic or illustrative monographs and articles based on qualitative fieldwork, in both a US and global context. This will be supplemented with a smaller number of methodological texts to introduce different conceptions of science used or assumed by qualitative sociologists. We will also address practical skills like taking ethnographic fieldnotes.

AS.230.650. Macro-Comparative Research.
The course examines methods of studying long-term, large-scale social change. Both qualitative and quantitative methods are covered.

AS.230.651. Political Sociology.
This seminar surveys key problems of political sociology including the rise of the modern state, the relationship between political and economic power, the origins and nature of liberal democracy, the nation-state and nationalism, states and war, sources of authority, identity and political contention, social movements, and social revolutions. This is a graduate level class that will meet together with "Politics and Society", an advanced undergraduate class.

AS.230.675. Arrighi General Seminar.

AS.230.680. Confronting Epistemological Silences in Social Theory.
How do we think about the power relations at work in the scholarship we read and in the important texts we consider essential to our educational experience? This course will critically investigate the role that concepts of race and racism have played in formulating dominant perceptions of who can be the producers of knowledge and what constitutes authoritative knowledge itself. We will consider how and why thinkers and scholarship produced outside of Europe and North America are too often ignored for their scholarly contributions and the dynamics that lead to this situation. We will also explore how and why new and important perspectives emerge from engaging and centering voices from beyond traditional canonical works. With a particular focus on the forms of knowledge arising from European Enlightenment approaches to concepts of thought reason and objective knowledge, this course will critically engage students with a wide range of thinkers such asGWF Hegel, W.E.B. Du Bois, Angela Davis, Ralph Trouillot, bell hooks, Walter Rodney, Gayatri Spivak, Sylvia Wynter and Frantz Fanon. This course will focus largely on thinkers engaging within the Black Atlantic and black diaspora traditions to question how we might consider voices and thought from beyond Eurocentric positions in our own scholarly practice.

AS.230.685. TRP Seminar I.
This seminar includes all members of the second year cohort of sociology graduate students. Class meetings will provide feedback and guidance as students develop proposals for their Trial Research Papers. The course will also include a series of professional developments seminars. For Sociology PhD students only.

AS.230.690. TRP Seminar II.
This seminar includes all members of the third year cohort of sociology graduate students. Class meetings will provide feedback and guidance as students revise the final drafts of their Trial Research Papers. For Sociology PhD students only.

AS.230.800. Independent Study.

AS.230.801. Research Assistantship.

AS.230.802. Dissertation Research.

AS.230.804. Research Apprenticeship.

AS.230.810. Dissertation Fellowship Semester.

AS.230.811. Teaching Assistantship.

AS.230.815. Trial Research Paper I.

AS.230.816. Trial Research Paper II.

AS.230.817. Trial Research Paper III.

AS.230.825. Summer Research.

AS.250 (Biophysics)

AS.250.105. Science and Film. 2 Credits.
From the origins of cinema to the present, science and technology have remained the most reliably popular subjects for filmmakers and audiences alike. This course will address that enduring fascination, exploring the meanings and uses of science and technology in film through guest lectures and discussion of cinematic examples both recent and historic. Lectures and discussion will focus on a range of questions: How does film both reflect and shape our understanding of scientific concepts and technologies, from artificial intelligence to genetic engineering? How does science fiction reveal contemporary cultural anxieties and address ethical questions? How “fictional” is the science in science fiction film, and how have science fiction films inspired science and technology? What can we learn about “real” science from the movies? In addition to exploring science through film, students will learn the tools of film analysis through lecture, close viewing, and completion of a series of short written responses. In lieu of a short written response, student may choose to work in a team to create a short (1-3 minute) video response. Possible scientific topics: Genetics and Bioethics, Psychological and Brain Sciences, Artificial Intelligence and Robotics, Climate Change and Public Health and Astrophysical and Planetary Sciences. Possible films to be discussed: 2001: A Space Odyssey, Eternal Sunshine of the Spotless Mind, Blade Runner, GATTACA, The Martian, Interstellar, WALL-E, Children of Men and more. Attendance at weekly screenings at the Parkway Theater is required.

AS.250.205. Introduction to Computing. 3 Credits.
This course is useful for many disciplines not only the life sciences. It will introduce students to basic computing concepts and tools useful in many applications. Students will learn to work in the Unix environment, and write bash shells scripts. They will learn to program using the Python programming language, including Python libraries for graphing, fitting and for numerical and statistical computing, such as NumPy, SciPy, and Matplotlib. At the end of the semester, students will complete a project coupling all components of the semester together. Brief lectures followed by extensive hands-on computer laboratories with examples from many disciplines. No prerequisites. Course offered every semester.
You cannot take AS.250.205 if you have already taken AS.250.206.

AS.250.253. Protein Engineering and Biochemistry Lab. 3 Credits.
This laboratory examines the relationship between genes and proteins in the context of disease and evolution. It is a research project lab in which the structural and functional consequences of mutations are determined for a model protein. Students will learn basic protein science and standard biochemical techniques and methods in protein engineering. They will perform experiments in site-directed mutagenesis, protein purification, and structural, functional and physical characterization of proteins. No prerequisites. Courses offered in Fall and Spring semesters.
Area: Writing Intensive
You cannot take AS.250.253 if you have already taken AS.250.254.;Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.254. Protein Biochemistry and Engineering Laboratory. 4 Credits.
A project laboratory where students will use the techniques of protein engineering to attempt to modify existing proteins to endow them with new structural or physical properties. This course will provide an introduction to standard biochemistry laboratory practice and to protein science, including experiments in site-directed mutagenesis, protein purification and characterization of proteins in regard to structure, function and stability.
You cannot take AS.250.254 if you have already taken AS.250.253.

AS.250.302. Modeling the Living Cell. 4 Credits.
Previously titled "Models and Algorithms in Biophysics." Introduction to physical and mathematical models used to represent biophysical systems and phenomena. Students will learnalgorithms for implementing models computationally and perform basic implementations. We will discuss the types of approximations made to develop useful models of complex biological systems, and the comparison of model predictions with experiment.
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.310. Exploring Protein Biophysics using Nuclear Magnetic Resonance (NMR) Spectroscopy. 3 Credits.
NMR is a spectroscopic technique which provides unique, atomic level insights into the inner workings of biomolecules in aqueous solution and solid state. A wide variety of biophysical properties can be studied by solution state NMR, such as the three dimensional structures of biological macromolecules, their dynamical properties in solution, interactions with other molecules and their physical and chemical properties which modulate structure-function relationships (such electrostatics and redox chemistry). NMR exploits the exquisite sensitivity of magnetic properties of atomic nuclei to their local electronic (and therefore, chemical) environment. As a result, biophysical properties can be studied at atomic resolution, and the global properties of a molecule can be deconstructed in terms of detailed, atomic level information. In addition, interactions between nuclei can be exploited to enhance the information content of NMR spectra via multidimensional (2D and 3D) spectroscopy. Since these properties can be studied in solution, NMR methods serve as an effective complement to X-Ray crystallography and electron microscopy. In this course, we will learn about the basics of NMR spectroscopy, acquire 1D and 2D NMR spectra and use various NMR experiments to characterize and probe biophysical properties of proteins at an atomic level.
((AS.030.101 AND AS.030.105) OR (AS.030.103 OR AS.030.204)) AND (AS.030.370 OR AS.250.372) AND (AS.020.305 OR AS.030.315 OR AS.250.315) AND AS.030.205 or permission of the instructor.;Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.315. Biochemistry I. 3 Credits.
Foundation for advanced classes in Biophysics and other quantitative biological disciplines. This class is the first semester of a two semester course in biochemistry. Topics in Biochemistry I include chemical and physical properties of biomolecules and energetic principles of catabolic pathways. Co-listed with AS.030.315
If you have completed AS.250.307 you may not register for AS.250.315.;(AS.030.206 OR AS.030.212) AND (AS.250.372 OR AS.030.301)

AS.250.316. Biochemistry II. 3 Credits.
Biochemical anabolism, nucleic acid structure, molecular basis of transcription, translation and regulation, signal transduction with an emphasis on physical concepts and chemical mechanisms. Format will include lectures and class discussion of readings from the literature.
(AS.250.315 OR AS.030.315 OR AS.020.305) AND (AS.030.206 OR AS.030.212) or permission of the instructor.

AS.250.320. Macromolecular Binding. 3 Credits.
All biological processes require the interactions of macromolecules with each other or with ligands that activate or inhibit their activities in a controlled manner. This course will discuss theoretical principles, logic, approaches and practical considerations used to study these binding processes from a quantitative perspective. Topics will include thermodynamics, single and multiple binding equilibria, linkage relationships, cooperativity, allostery, and macromolecular assembly. Some biophysical methods used in the study of binding reactions will be discussed. Computer simulation and analysis of binding curves will be used to analyze binding data, and binding schemes and examples from the scientific literature will be reviewed and discussed.Recommended Course Background: AS.250.372 Biophysical Chemistry
Area: Writing Intensive
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.335. Single Molecule & Cell Biophysics. 3 Credits.
This (elective) course offers an introduction to the field of single molecule and single cell biophysics to second and third year undergraduate students in biophysics. We will examine technologies such as single molecule fluorescence, force measurements and single cell fluorescence detections that enable high precision molecular visualizations in vitro and in cells. In addition, we will cover topics of genome engineering, cell mechanics and optogenetics toward the end of the semester. Each student is expected to read two articles assigned for each week and submit a written summary. All students will take turns presenting the assigned articles to class.

AS.250.351. Reproductive Physiology. 2 Credits.
Focuses on reproductive physiology and biochemical and molecular regulation of the female and male reproductive tracts. Topics include the hypothalamus and pituitary, peptide and steroid hormone action, epididymis and male accessory sex organs, female reproductive tract, menstrual cycle, ovulation and gamete transport, fertilization and fertility enhancement, sexually transmitted diseases, and male and female contraceptive methods. Introductory lectures on each topic followed by research-oriented lectures and readings from current literature.

AS.250.372. Biophysical Chemistry. 4 Credits.
Course covers classical and statistical thermodynamics, spanning from simple to complex systems. Major topics include the first and second law, gases, liquids, chemical mixtures and reactions, partition functions, conformational transitions in peptides and proteins, ligand binding, and allostery. Methods for thermodynamic analysis will be discussed, including calorimetry and spectroscopy. Students will develop and apply different thermodynamic potentials, learn about different types of ensembles and partition functions. Students will learn to use Pythonand will use it for data fitting and for statistical and mathematical analysis. Background: Calculus, Introductory Organic Chemistry, and Introductory Physics.
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.381. Spectroscopy and Its Application in Biophysical Reactions. 3 Credits.
Continues Biophysical Chemistry (AS.250.372). Fundamentals of quantum mechanics underlying various spectroscopies (absorbance, circular dichroism, fluorescence, NMR); application to characterization of enzymes and nucleic acids.
AS.250.372

AS.250.383. Molecular Biophysics Laboratory. 3 Credits.
An advanced inquiry based laboratory course covering experimental biophysical techniques to introduce fundamental physical principles governing the structure/function relationship of biological macromolecules. Students will investigate a “model protein”, staphylococcal nuclease, the “hydrogen atom” of biophysics. Using a vast library of variants, the effect of small changes in protein sequence will be explored. A variety of techniques will be used to probe the equilibrium thermodynamics and kinetic properties of this system; chromatography, spectroscopy (UV-Vis, fluorescence, circular dichroism, nuclear magnetic resonance), calorimetry, analytical centrifugation, X-ray crystallography, mass spectroscopy, and computational methods as needed for analysis. These methods coupled with perturbations to the molecular environment (ligands, co-solvents, and temperature) will help to elucidate protein function. Prerequisite: Introduction to Scientific Computing (250.205) or equivalent. Biophysical Chemistry (250.372 or 020.370) or equivalent. Course taught in Fall and Spring.
Area: Writing Intensive
(AS.250.372 OR AS.030.370) AND AS.250.205;Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.403. Advanced Seminar in Bioenergetics. 3 Credits.
The trait shared by all living systems is the capacity to perform energy transduction. This biophysics/biochemistry course examines the physico-chemical and structural basis of biological energy transduction. Emphasis is on understanding the molecular and cellular logic of the flow of energy in living systems. The course explores the connection between fundamental physical requirements for energy transduction and the organization, evolution and possibly even the origins of biological molecules, cells, and organisms. Implications for planet earth¹s energy balance and for the design of synthetic organisms and of artificial energy transducing machines will be discussed, time permitting. Recommended Course Background: One semester of Biochemistry. Recommended Course Background: One semester of Biochemistry
Area: Writing Intensive

AS.250.410. Genome Maintenance and Genome Engineering. 3 Credits.
Advanced seminar for biophysics undergraduates. We focus on topics of genome maintenance via telomere regulation and genome engineering by CRISPR-Cas systems. The course will have lecture, scientific article reading, small and large group discussion.

AS.250.411. Advanced Seminar in Structural Biology of Chromatin. 3 Credits.
Focus is on structural and physical aspects of DNA processes in cells, such as nucleosomal packaging, DNA helicases, RNA polymerase, and RNA inhibition machinery. Topics are meant to illustrate how the structural and chemical aspects of how proteins and nucleic acids are studied to understand current biological questions. Recommended Course Background: Biochemistry I (AS.250.315) and Biochemistry II (AS.250.316) or Biochemistry (AS.020.305) and Intro to Biophys Chem (AS.250.372)
Area: Writing Intensive

AS.250.420. Advanced Seminar in Macromolecular Binding. 3 Credits.
All biological processes require the interactions of macromolecules with each other or with ligands that activate or inhibit their activities in a controlled manner. This is a literature and skills-based course that will discuss theoretical principles, logic, approaches and practical considerations used to study these binding processes from a quantitative perspective. Topics will include thermodynamics, single and multiple binding equilibria, linkage relationships, cooperativity, allostery, and macromolecular assembly. Some biophysical methods used in the study of binding reactions will be discussed. Simulation and analysis of binding scenarios will be used to analyze illustrate binding schemes, and examples from the scientific literature will be reviewed and discussed. Basic working knowledge of Python is helpful. The writing component will be in one of the common formats employed in the professional biophysics field.Recommended Course Background: AS.250.372 Biophysical Chemistry
Area: Writing Intensive

AS.250.421. Advanced Seminar in Membrane Protein Structure, Function & Pharmacology. 3 Credits.
Topics are meant to illustrate the physical basis of membranes and membrane proteins towards understanding their functions and pharmacological importance including aspects of drug design as it relates to membranes. Contemporary issues in the field will be covered using primary literature articles, structural manipulations in pymol, and computational binding simulations.Recommended Course Background: AS.030.205, AS.250.307, and AS.250.372
Area: Writing Intensive

AS.250.514. Research in Protein Design and Evolution. 3 Credits.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.250.520. Introduction to Biophysics Research. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.250.521. Research in Biophysics. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.;AS.250.520

AS.250.601. Biophysics Seminar.
Graduate students only. Students and invited speakers present current topics in the field.

AS.250.602. Biophysics Seminar.
Graduate students only. Students and invited speakers present current topics in the field.

AS.250.610. Savvy Science Seminars.
Oral presentations are one of the main forms by which scientists communicate their results. Whether in the context of the classroom, the relatively informal lab meeting or as an invited speaker at an international colloquium, the ability to effectively present scientific results is an important skill to master. This course will cover the planning and execution steps necessary to produce an engaging oral presentation. Students will learn to articulate the big biological questions, tell a story that stimulates interest in their chosen subject, and effectively convey their experimental findings. Key methodological steps in planning will guide students on how to create slides with compelling visuals, and how to use technology to their advantage. Students will each prepare, present, and receive feedback on a 15-minute talk on their thesis project in the style of the Biophysical Society short talks. In addition, each student will receive and evaluate a video of their presentation so they can see themselves through the eyes of others.

AS.250.615. Biophysics Writing Workshop.
A series of writing workshops designed to help Biophysics Graduate Students develop a proposal of thesis work. Each student will write a specific aims page and a full (6 page) proposal.

AS.250.620. Optical Spectroscopy.
Basics of absorbance, CD, and fluorescence spectroscopy; calorimetric methods.

AS.250.621. X-ray Diffraction.
Basics of X-ray diffraction methods

AS.250.622. Statistics and Data Analysis.
Basics of statistics and data analysis

AS.250.623. Macromolecular Simulation.
Basics of molecular dynamics

AS.250.624. NMR Spectroscopy.
Basics of NMR spectroscopy

AS.250.625. Single Molecule Measurements.
Basic Principles of Single Molecule Measurements
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.648. Physics of Cell Biology: From Mechanics to Information.
Cells are actively-driven soft materials but also efficient sensors and information processors. This course will cover the physics of those cellular functions, from the mechanics of DNA to the sensing of chemical signals. Questions answered include: How does polymer physics limit how quickly chromosomes move? Why do cells use long, thin flagella to swim? What limits the accuracy of a cell's chemotaxis?Some experience with partial differential equations required. No biology knowledge beyond the high school level necessary. Some problem sets will require minimal programming.
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.250.649. Introduction to Computing in Biology.
In this four week, intensive introductory course, students will gain a practical working knowledge of UNIX and Python programming languages and packages for analyzing data from biochemical and biophysical experiments. Brief daily lectures are followed by extensive hands-on experience in the computer laboratory.

AS.250.685. Proteins & Nucleic Acids.
The structure of proteins, DNA and RNA, and their functions in living systems. Students are required to participate in class discussions based on readings from the primary scientific literature. Co-requisite: AS 250.649 Introduction to Computing in Biology. Instructor permission for undergraduates.
Prerequisite: AS.250.649,may be taken concurrently.

AS.250.689. Physical Chemistry of Biological Macromolecules.
Introduction to the principles of thermodynamics and kinetics as applied to the study of the relationship between structure, energy dynamics, and biological function of proteins and nucleic acids. Topics include of classical, chemical, and statistical thermodynamics, kinetics, theory of ligand binding, and conformational equilibria.

AS.250.801. Dissertation Research.

AS.250.802. Dissertation Research.

AS.250.803. Summer Dissertation Research.
Graduate Independent Academic Work

AS.270 (Earth & Planetary Sciences)

AS.270.103. Introduction to Global Environmental Change. 3 Credits.
A broad survey of the Earth as a planet, with emphasis on the processes that control global changes. Topics include: the structure, formation, and evolution of the Earth, the atmosphere, oceans, continents, and biosphere. Special attention is given to present-day issues, such as global climate change, natural hazards, air pollution, resource depletion, human population growth, habitat destruction, and loss of biodiversity. Open to all undergraduates.

AS.270.111. The Story of Earth. 1 Credit.
The four and a half billion year story of Earth's global changes focusing on the co-evolution of Earth and Life.

AS.270.114. Guided Tour: The Planets. 3 Credits.
An introduction to planetary science and planetary exploration primarily for non-science majors. A survey of concepts from astronomy, chemistry, geology, and physics applied to the study of the solar system.

AS.270.129. The Grandeur of You & The Universe. 3 Credits.
A common question that the scientific community is confronted with is “Why do I care?” or “How does this relate to and affect me?”. We will address these questions by inquiring and exploring where each one of us fit in the grand scheme of the cosmos and its exploration, centered around themes and concepts fundamental in Earth, planetary, and space sciences (EPSS). Using various creative mediums, you will learn to understand and narrate how you, all parts of your identity relate to the story of the universe. This class will allow you to master the fundamentals in EPSS, appreciate and relate to scientific discoveries, understand how to be responsible future scientists and citizens cognizant of broad scientific impacts, and develop and enhance various skills to be able to understand and communicate science.
Area: Writing Intensive

AS.270.202. Introduction to Ecology. 3 Credits.
Ecology is the study of organisms and their environment. This course focuses on the patterns of distribution and abundance of organisms. Topics include population dynamics and regulation, competition, predation, host-parasite interactions, patterns of species diversity, community succession, the flow of energy and matter through ecosystems. We will also discuss the role of natural and human disturbances in shaping communities.
AS.270.103 OR AS.020.151

AS.270.205. Introduction to Geographic Information Systems and Geospatial Analysis. 3 Credits.
The course provides a broad introduction to the principles and practice of Geographic Information Systems (GIS) and related tools of Geospatial Analysis. Topics will include history of GIS, GIS data structures, data acquisition and merging, database management, spatial analysis, and GIS applications. In addition, students will get hands-on experience working with GIS software.

AS.270.220. The Dynamic Earth: An Introduction to Geology. 3 Credits.
Basic concepts in geology, including plate tectonics; Earth's internal structure; geologic time; minerals; formation of igneous, sedimentary, and metamorphic rocks; development of faults, folds and earthquakes; geomagnetism. Corequisite (for EPS Majors): AS.270.221; optional for others. The course is introductory and open to undergraduates at all levels; freshmen are encouraged to enroll.

AS.270.221. The Dynamic Earth Laboratory. 2 Credits.
This course is a hands-on learning experience for introductory geological concepts and techniques using geological tools, such as mineral/rock samples, microscopes, and maps. Field trips are its essential part. The course is open to undergraduates at all levels; freshmen who wish to get their hands (and boots) dirty are encouraged to enroll.
AS.270.220, credit earned or concurrent enrollment

AS.270.222. Mineralogy. 4 Credits.
Introduction to the classification, crystallography, and physical properties of minerals. Weekly lab topics include field identification, crystal morphology and symmetry, optical microscopy and Raman spectroscopy. One field trip to the Smithsonian National Museum of History and Research Archives is planned.
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.270.224. Oceans & Atmospheres. 3 Credits.
A broad survey of the Earth's oceans and atmospheres, and their role in the environment and climate. Topics covered include waves, tides, ocean and atmosphere circulation, weather systems, tornadoes and hurricanes, El Niño, and climate change. For science and engineering majors

AS.270.302. Aqueous Geochemistry. 3 Credits.
Modeling the chemistry of water-rock interactions from weathering and riverine development at Earth's surface to hot springs at depth, fluids in subduction zones in Earth's interior, and the ancient fluids preserved in fluid inclusions. Thermodynamic basis for the calculation of equilibria and irreversible chemical mass transfer involving minerals and aqueous species at low and high temperatures and pressures. The course culminates with practical examples of research interest to individual participants.
(AS.030.101 AND AS.030.102) AND (AS.270.220 AND AS.270.221) or equivalents.

AS.270.303. Earth History. 3 Credits.
This course will explore the evolution of life in the context of environmental, ecological, and geological changes to the Earth surface system. The goal of the class is to provide students with an understanding of how geological and paleontological records provide insight into the origin(s) of life, oxygenation of the atmosphere, the evolution of multicellularity, evolutionary radiations and extinctions, and modern global change.
AS.270.103 OR AS.270.220 OR AS.270.224; or permission of the instructor.

AS.270.305. Energy Resources in the Modern World. 3 Credits.
This in-depth survey will inform students on the non-renewable and renewable energy resources of the world and the future prospects. Topics include petroleum, natural gas, coal, nuclear, hydroelectric, geothermal, solar, wind, biomass, and ocean energy. Global production, distribution, usage, and impacts of these resources will be discussed.

AS.270.306. Urban Ecology. 3 Credits.
Urban ecology has been called the ecology in, of, and for cities. In this course, we will explore how ecological concepts are applied to urban ecosystems and the different approaches to urban ecological research. Topics will include: Biodiversity, water dynamics, energy and heat island effects, and nutrient cycling, urban metabolism, design of greenspace, and sustainability of cities. We will use Baltimore as a case study for studying cities.
AS.270.308 OR EN.570.205 OR EN.570.403

AS.270.307. Geoscience Modeling. 4 Credits.
An introduction to modern ways to interpret observations in the context of a conceptual model. Topics include model building, hypothesis testing, and inverse methods. Practical examples from geophysics, engineering, and medical physics will be featured.

AS.270.310. Evolution and Development of the Vertebrates. 3 Credits.
Modern vertebrates (animals with backbones) are the products of a more than 500-million-year evolutionary history. This course surveys that history and uses it to explore such core evolutionary concepts as adaptive radiation, convergence, extinction, homology, phylogenetic taxonomy, and tree thinking. Emphasis will be placed on the origins of the modern vertebrate fauna and how fossils are being integrated with developmental biology to better understand major transitions in the vertebrate body plan.

AS.270.312. Mammalian Evolution. 3 Credits.
An introduction to the evolutionary history and diversity of mammals, with emphasis on the first half of the Cenozoic - the beginning of the Age of Mammals. The course will focus primarily on the adaptive radiation of mammals (including our own order primates) that followed the extinction of the dinosaurs, exploring the origins and relationships of the major groups of mammals as well as the anatomical and ecological reasons for their success. Lectures will be supplemented with relevant fossils and recent specimens.

AS.270.316. Agroecology: A Global Perspective. 3 Credits.
How can we balance the increasing global food demand with sustainable ecological practices?How are the agricultural, ecological, and socio-economic aspects of food productionintertwined? This course addresses these questions and enables students to critically evaluateexisting agroecosystems around the world, with special attention paid to the challenges of globalenvironmental change. Students will be introduced to the principles of agroecology, and theywill examine interactions between biodiversity, soil, and people through case studies, peerreviewed scientific papers, and a field trip to a local agroecosystem

AS.270.317. Conservation Biology. 3 Credits.
In this course, students examine the meaning and implications of biodiversity with a focus on disciplines associated with conservation biology, wildlife conservation and wildlife management, including taxonomy, genetics, small population biology, chemical and restoration ecology, and marine biology. This includes exploring how conservation biology differs from other natural sciences in theory and in application. Students learn the major threats to biodiversity and what natural and social science methods and alternatives are used to mitigate, stop, or reverse these threats. The course also includes the economic and cultural tradeoffs associated with each conservation measure at the global, national, regional, and local levels. One required field trip.

AS.270.318. Remote Sensing of the Environment. 3 Credits.
This course is an introduction to the use of remote sensing technology to study Earth's physical and biochemical processes. Topics covered include remote sensing of the atmosphere, land and oceans, as well as remote sensing as a tool for policy makers.Also offered as 270.618

AS.270.319. Geochronology. 3 Credits.
Introduction to radioisotope geo/thermochronology and mantle stable and radioisotope geochemistry. Course covers: (1) methods for dating of rocks and geologic processes using long-half-life radioisotope systems, including the various isotope systems available and their applicability; (2) radioisotope techniques for investigation of the geochemical evolution of the crust and mantle; (3) isotope fractionation and utility of traditional and novel stable isotope geochemistry for interrogating high-temperature processes, and (4) thermochronology and methods for interrogating upper-crustal processes. Recommended course background: AS.270.220 and AS.270.221, or instructor permission.

AS.270.323. Ocean Biogeochemical Cycles. 3 Credits.
This course will examine the cycling of trace chemicals in the ocean, consider what we can learn from the distributions of these chemicals about the ocean circulation, and ocean ecosystems. Topics covered will include oceanic biological productivity, open water cycling of nutrients and oxygen, ocean acidification and sediment cycling.

AS.270.325. Introductory Oceanography. 3 Credits.
This class is an introduction to a wide range of physical, chemical, and biological phenomena in the world's oceans. Underlying basic principles are exposed wherever possible. Topics covered include: seawater, waves, tides, ocean circulation, chemical oceanography, biogeochemical ocean processes, and remote sensing of the oceans. Recommended Course Background: freshman Physics, Chemistry, Calculus through ordinary differential equations.

AS.270.326. Cosmochemistry. 4 Credits.
Students in this course will gain an understanding of the origin of various forms of matter in our Solar System and beyond, along with its evolution through geologic processes. Beginning with the concepts of nucleosynthesis and stellar evolution, this course will then cover the condensation of matter, meteoritics, and petrogenetic evolution of differentiated, rocky bodies (i.e. asteroids, the Moon, Mars). Evolution of matter in extra-Solar planetary systems (i.e. exoplanets) will also be broached. In lab we will examine thin sections of meteorites, lunar material, and terrestrial analogs - a field trip to the Smithsonian Meteorite Collection is planned. Graduate and advanced undergraduate-level students are encouraged, as are interdisciplinary students with an interest in planetary science.
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.270.331. Isotope Geochemistry. 4 Credits.
Introduction to stable isotope and radioisotope geochemistry. Isotope measurements are used to probe fundamental questions in the Earth and environmental sciences because they can be used to extract information about the timing of and/or chemical, physical, and biological processes associated with the formation of geomaterials. The first half of the course focuses on light isotope systems (O, C, S, etc.) and low-temperature applications, including: (1) tracing sources and sinks of fluids, sediments, biological materials, and contaminants, (2) studying rates and mechanisms of biochemical reactions, and (3) paleoenvironmental reconstructions. The second half of the course focuses on heavier isotope systems and high-temperature applications, including: (1) methods for dating of rocks and geologic processes using long-half-life radioisotopes, including the various isotope systems available and their applicability, and (2) isotope fractionation at high temperatures and the utility of radioisotope and novel stable isotope geochemistry for interrogating processes influencing the crust and mantle. Biweekly lab classes (scheduled in first week) will allow students to become familiar with principles of isotope measurements and interpretations. Mid-term and final exams. Recommended course background: AS.270.220 and AS.270.221, or instructor permission.
AS.270.220 AND AS.270.221

AS.270.332. Soil Ecology. 3 Credits.
The course introduces basic aspects of cycles and flows in the soil ecosystem, and provides students with an overview of the higher groups of soil organisms. Laboratory and field surveying methods are also covered.
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.270.333. Mineral Physics Recitation. 2 Credits.
This course is designed for undergraduate students interested in pursuing geophysics research in the topics of solid state physics or inorganic chemistry. It will consist of a weekly seminar paired with a separate paper reading+discussion group, covering a range of topics on the frontiers of mineral physics. Themes rotate each semester, and Fall 2018 will be paired with the Mineralogy Lecture Series on Modeling and Experimental challenges in Cosmochemistry. Recommended Course Background: Relevant coursework such as Mineralogy or equivalent in other department, and instructor permission.

AS.270.336. Freshwater Systems. 3 Credits.
A study of streams, lakes, and groundwater with a focus on aspects of water quality, hydrology, geomorphology, and aquatic ecology that are relevant to human impacts on freshwater systems. US environmental policies and water resource management agencies will also be examined in the context of issues such as dams, cattle grazing, climate change, and water allocation.
AS.270.103 OR AS.271.107 or permission of the instructor.

AS.270.337. Freshwater Systems Lab. 1 Credit.
A hands-on investigation of the water quality, hydrology, geomorphology, and aquatic ecology of streams and other freshwater bodies. Includes field trips to water-related facilities such as drinking water and wastewater treatment plants.
Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.270.338. Field Methods in Ecology. 3 Credits.
This course will introduce student to methods used in field-based ecological research addressing population, community and ecosystem-level questions. Outdoor fieldwork is an essential part of the course. Field activities will center around the riparian ecosystem adjacent to the Homewood campus and on the urban ecology of the greater Baltimore region. Students will build skills in data collection, analysis, synthesis, and presentation. Basic statistical instruction in R will be taught to aid data analysis.
AS.270.202;Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

AS.270.339. Topics in Mineralogy. 3 Credits.
This semester, join HEMI's Designer in residence, and MICA professor Jenna Frye, in a modified version of her popular experimental fabrication course, EPIC FAIL. Discover how thinking with your hands, embracing risk and failure and playful exploration with educational toys, can invigorate your research in mineralogy and deepen your understanding of crystallography visualization. This course is designed as a hands-on, deeply collaborative workshop, where we will investigate the role of creative fabrication technology and invention as it relates to communicating scientific research to outside audiences. Together we will make, tinker and fail our way to improved visualization and presentation strategies so that others may more fully access the complexities in our work.Topics in Mineralogy is a special topics course that rotates in subject and may be taken multiple times for credit. This course is designed for those interested in mineralogy, and we recommend concurrent enrollment in Planetary Interiors, Space Weathering, and/or Advanced Mineralogy seminar.

AS.270.345. Metamorphic Petrology. 3 Credits.
Introduction to metamorphic geology and the concepts on which it is built. Ideas and techniques that underpin metamorphic petrology are introduced. Focus is on utility of metamorphic geology in understanding petrogenesis crustal processes and plate tectonics. Local field trip(s) to explore the metamorphic geology of the Baltimore region. Recommended course background: AS.270.220 and AS.270.221, or instructor permission
AS.270.220 AND AS.270.221

AS.270.346. Structural Geology Seminar. 1 Credit.
Seminar class on fundamentals of structural geology. Involves weekly readings/practical exercises on: (1) rock mechanics and deformation processes; (2) commonly-encountered deformation products/structures; (3) deformation style and associated fabrics/textures/structure; (4) metamorphism and deformation; (5) techniques for describing and measuring structures; (6) interpretation of structural data on maps and cross-sections; (7) approaches for inferring large-scale structure from limited data, and (8) methods for visualizing and analyzing structure. Recommended course background: AS.270.220, or instructor permission.
AS.270.220

AS.270.347. Foundations of Ecology. 3 Credits.
In this seminar students will read seminal pieces in ecology. Assigned readings will span early 1900s to present. Students will pair a foundational paper with a more current paper on a similar topic to explore the evolution of ecological concepts and approaches over time. This course is aimed at upper level undergraduates and graduate students.
AS.270.202

AS.270.350. Sedimentary Geology. 4 Credits.
Sedimentary rocks are the historical records of the Earth, documenting climate change, mass extinctions, and the evolution of life. This course will provide an introduction to sedimentary processes and sedimentary rocks. Focus is placed on linking physical observations to the ancient environments in which sedimentary rocks once formed. Fundamental tools for interpreting the sedimentary rock record, such as depositional models, geochronology, and chemostratigraphy will be reviewed. Two 1-day weekend field trips will occur over the course of the semester. There will also be weekly 1-hour labs. Lab and field trip times will be determined in the first week of class. Graduate and advanced undergraduate level. Recommended Course Background: AS.270.220 or instructor permission.

AS.270.354. Stable Isotope Geochemistry. 3 Credits.
Stable isotope measurements are used to probe fundamental questions in the Earth and environmental sciences because they can be used to extract information about chemical, physical, and biological processes associated with the formation of geomaterials. Stable isotope patterns have been used for applications ranging from tracking the rise of oxygen on the early Earth to studying human diet. The majority of the course will focus on light isotope systems (O, C, S, etc.) and low-temperature applications, including: (1) tracing sources and sinks of fluids, sediments, biological materials, and contaminants, (2) studying rates and mechanisms of biochemical reactions, and (3) paleoenvironmental reconstructions. We will also review novel stable isotope applications including heavy isotope systems and mass independent fractionations. At the end of the course, students will be able to make interpretations about how stable isotope patterns inform our knowledge of how geomaterials are formed and provide information about the Earth system.
AS.270.220 OR AS.270.224

AS.270.361. Geodynamics Seminar. 1 Credit.
Seminar class on the dynamics of subduction and accretionary orogenesis. Weekly readings discussed in class. Focus will be broad and process-based. Topics in subduction may include: (1) modes of global subduction through Earth history; (2) models of forced/triggered v. spontaneous subduction initiation; (3) arc development and implications for growth of continents; (4) subduction zone rollback and arc migration, and (5) subducted slab breakoff and tearing. Topics in accretionary orogenesis may include: (1) stress state of the overriding plate; (2) tectonic mode switches (shortening to extension and vice versa), and (3) length and time scales of the thermal manifestations of accretionary orogenesis.
AS.270.220 AND AS.270.221 or instructor permission.

AS.270.362. Lunar Exploration and Analog Geology. 3 Credits.
This course involves readings, discussion, and lectures about astronaut-enabled geological exploration of the Moon and analogous terrains on Earth. Topics include: volcanism, impact geology (cratering, ejecta, ballistic sedimentation), faulting, field methods (video and voice descriptions, sampling protocol), and field equipment (spacesuits, rovers, landers, cores, etc.), Apollo history and Artemis plans/current events. Assessment will involve participation, ~5 assignments related to the course objectives, and a presentation or short paper (student's discretion) synthesizing a small range of covered topics of interest to the student at the conclusion.

AS.270.378. Present and Future Climate. 3 Credits.
Intended for majors who are interested in the science that underlies the current debate on global warming, the focus is on recent observations one can glean from model simulations. Meets with AS.270.641.
Recommended Course Background: AS.110.108-AS.110.109 and AS.171.101-AS.171.102
Student may not receive credit for both AS.270.378 and AS.270.641.

AS.270.379. Atmospheric Science. 3 Credits.
A survey of core topics in atmospheric science, including dynamics, thermodynamics, radiative transfer, and chemistry. The course addresses both basic principles and applications to weather and climate. Recommended pre-requisites: General Calculus and Physics I and/or Oceans and Atmospheres.

AS.270.380. Seminar in Regional Field Geology. 3 Credits.
Introduction to the regional geology and geological history of the Appalachian system (from Alabama to Newfoundland). Key papers on regional bedrock geology and Mesoproterozoic through Phanerozoic tectonics are reviewed in weekly seminar classes. Two three-day field trips are made on weekends negotiated at the beginning of the semester. Fieldwork will be designed with student input to test ideas and models from the literature. Techniques in sedimentary, metamorphic, igneous and structural field geology are introduced and developed in the field. Recommended course background: AS.270.220 and AS.270.221, or instructor permission.

AS.270.381. Seminar in Field Geology. 3 Credits.
Field experience is an integral part of a geology student's education. During this course, students will spend over a week outdoors, learning to make observations that can be used to interpret the geologic history and structure of natural environments. This course is a spring break field course that will focus on different topics each year. For Spring 2019, the focus of the trip will be on applying concepts and techniques covered in Dynamic Earth (AS.270.220/1), Sedimentary Geology (AS.270.350), and Earth History (AS.270.303). Students will also learn about the different tectonic events that have shaped the landscape that we see today in the western United States. The class is designed for upper level E&PS majors and first or second year E&PS graduate students. For logistical reasons, this class is capped at 10 students. Preference will be given to E&PS majors. Students will be camping during the field course and should be prepared to be hiking outside all day. In the case that obtaining personal field supplies (e.g., hiking boots, sleeping bags) is not possible through Homewood student affairs gear rentals and/or is a financial hardship, please contact the instructor. Any communication about this will be kept confidential.Mandatory class field trip: 9-day field trip to Esmeralda County, NV over spring break (3/16/18-3/24/18).
(AS.270.220 AND AS.270.221) OR AS.270.350 OR AS.270.303

AS.270.396. Special Topics in Planetary Exploration. 3 Credits.
Geology in the Outer Solar System: This course will focus on the solid bodies of the outer solar system, addressing their formation, surfaces, interiors, evolution, and how we study them via remote sensing and spacecraft investigation. We will use data from the various missions that have investigated the outer system and cover aspects of instrumentation and remote sensing of outer system bodies from the Voyager missions, Galileo, Cassini, and New Horizons. The course includes lecture, discussion, and hands-on lab work. Recommended pre-requisites: Dynamic Earth and/or Introductory planetary science and/or remote sensing, or instructor approval.

AS.270.400. The Carbon Cycle: Past, Present and Future. 3 Credits.
This course will explore how the carbon cycle shapes environmental conditions and influences other biogeochemical cycles through an investigation of the modern carbon cycle, major carbon cycle perturabtions in the geological record, and projections of future global change. The majority of the class will be structured as a reading seminar, but students will also develop an understanding of how to use quantitative models to evaluate patterns of change associated with both modern and ancient carbon cycle perturbations with implications for predicting future environmental changes.Recommended Prerequisites: AS.270.103 or AS.270.220 or AS.270.224

AS.270.404. Planetary Interiors. 3 Credits.
This course investigates the physical processes occurring in planetary interiors. Topics include formation and differentiation of planetary bodies, planetary structure, thermal evolution, convection, and dynamo generation of magnetic fields. Standard remote sensing methods used to investigate planetary interiors and results from recent planetary satellite missions will also be discussed.Recommended: Knowledge of vector calculus, PDEs and introductory physics.

AS.270.406. Space Weathering. 1 Credit.
This course will introduce and explore multiple topics of Space Weathering - the interaction of solar system bodies with the space environment. Through a combination of lecture, reading, research, and discussion the course will explore physical and chemical processes of solar and cosmic radiation and particles, micrometeorites, etc., on the surfaces of planets. We will also explore interaction of the space environment with planetary magnetic fields and atmospheres, and with non-planetary materials (such as spacecraft, and astronauts).
AS.270.222

AS.270.408. Petrology Seminar. 1 Credit.
Seminar class on recent developments in igneous and metamorphic petrology. Involves weekly readings on modern methods/understanding in petrogenesis and processes leading to mineral (re)crystallization; rock deformation; fluid transport in rocks; pressure and temperature estimates of rock formation, and rates/durations of thermotectonic processes in the lithosphere. Topics covered will cater to interests and learning goals of those who register in the class.
AS.270.220

AS.270.410. Planetary Surface Processes. 3 Credits.
This course explores processes that influence the evolution of planetary surfaces, including impact cratering, tectonics, volcanism, weathering, and sediment transport. These processes manifest themselves as structural deformation of planetary crusts due to loading by volcanoes, formation of craters by asteroid impacts, modification of surfaces by flowing landslides, rivers and glaciers, and the accumulation and transport of sand in dune fields on various planets. Emphasis is on the relationship to similar Earth processes, and the integrated geologic histories of the terrestrial planets, satellites, and asteroids. The focus will be on developing a physical understanding of these processes to interpret the surface characteristics and evolution of planets, satellites, asteroids, and comets from both qualitative assessments and quantitative measurements obtained from spacecraft data. A key component of the class will be the interpretation of these observations from recent and current planetary missions to the Moon, Mars, and other terrestrial bodies.Recommended Course Background: A sound knowledge of Calculus and Introductory Physics, and some prior knowledge of Earth and/or Planetary Science.

AS.270.412. Spring seminar: Geological Field Studies in California. 2 Credits.
Field experience is an integral part of a geology student's education. During this course, students will learn to digitize, synthesize, and interpret the observations they made during the January field-based class to interpret the geologic history and structure of southern California.
Study USA: Geological Field Studies in California is a co-requisite for this course.For Spring 2020, the focus of the field work and course will be on applying concepts and techniques covered in Dynamic Earth (AS.270.220/1), Sedimentary Geology (AS.270.350), Earth History (AS.270.303), Planets, Life and the Universe (AS.020.334), and Isotope Geochemistry (AS.270.331). Sedimentary rocks are spectacularly exposed in this region and record over a billion years of key events in Earth history. Students will learn how these rocks have shaped our understanding of major evolutionary and environmental shifts in Earth's past, while also learning how to map these units' regional geographic distribution. Finally, students will also learn about the different tectonic events that have shaped the landscape that we see today in the western United States. The class is designed for upper level E&PS majors and E&PS graduate students.

AS.270.423. Planetary Atmospheres. 3 Credits.
Fundamental concepts and basic principles of chemistry and physics applied to the study of planetary atmospheres. Vertical structure of planetary atmospheres. Atmospheric radiation, thermodynamics, and transport. Principles of photochemistry. Planetary spectroscopy and remote sensing. Upper atmospheres and ionospheres. Evolution and stability of planetary atmospheres. Recommended Course Background: basic physics, chemistry and calculus

AS.270.425. Earth and Planetary Fluids. 3 Credits.
An introductory course on the properties, flow, and transport characteristics of fluids throughout the Earth and planets. Topics covered include: constitutive relationships, fluid rheology, hydrostatics, dimensional analysis, low Reynolds number flow, porous media, waves, stratified and rotating fluids, plus heat, mass, and tracer transport. Illustrative examples and problems are drawn from the atmosphere, ocean, crust, mantle, and core of the Earth and other Planets. Open to graduate and advanced undergraduate students. Recommended Course Background: Basic Physics, Calculus, and familiarity with ordinary differential equations.

AS.270.426. Mineral Physics. 3 Credits.
Mineral Physics is the study of mineralogical problems through the application of condensed matter physics and solid-state chemistry. Investigations of the thermodynamic and transport properties of minerals at the atomic scale are used to interpret observational data from seismology, geodynamics, geochemistry, and planetary science, an important step toward solving many geologic and geophysical problems. Students in this course will also be introduced to the high pressure and high temperature experiments that measure the physical and mechanical properties of minerals, which is crucial to understanding planetary interiors. Recommended prerequisites: introductory chemistry, physics, mineralogy, or structure of materials.

AS.270.501. Independent Study. 1 - 3 Credits.
Exploration of topic(s) in earth, planetary, and/or environmental science under the direction of an instructor.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.270.504. Independent Research. 1 - 3 Credits.
Research in earth, planetary, and/or environmental science conducted under the direction of a faculty advisor.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.270.510. Senior Thesis. 1 - 3 Credits.
Senior thesis research in earth sciences conducted under the direction of a faculty advisor.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.270.603. Geochemistry Seminar.
A variety of topics of current interest involving mineral-fluid interactions will be reviewed.

AS.270.605. EPS Colloquium.
A weekly seminar series in which graduate students present their latest research results and attend Departmental seminars. This course is required for all graduate students in the Department of Earth and Planetary Sciences.

AS.270.606. EPS Colloquium.
A weekly seminar series in which graduate students present their latest research results and attend Departmental seminars. This course is required for all graduate students in the Department of Earth and Planetary Sciences.

AS.270.612. Tropical Meteorology.
The tropics are a region where climate variability has large impacts yet many aspects of the structure are poorly understood. This course will cover the dynamics of tropical circulation and variability. Topics covered will include equatorial planetary waves, Matsuno-Gill models of tropical circulation, tropical air-sea interaction, the Madden-Julian Oscillation, tropical cyclones, dynamics of the El Nino-Southern Oscillation and monsoonal circulation and flow.

AS.270.614. Atmosphere and Oceanic Vortices.
Vortices are observed in the Earth's atmosphere and oceans and in the atmospheres of other planets. Examples are polar vortices in Earth, Mars and Titan's atmospheres, Spots on Jupiter, Saturn, and Neptune, Gulf Stream rings, and eddies throughout the oceans. These vortices are often the most dominant feature of the regional circulation, and understanding their structure and evolution dynamics is necessary to understand the dynamics and transport of atmospheres and oceans. In this course we focus on the structure and dynamics of long-lived vortices, i.e., vortices that exist for longer than typical wave periods. The first section of the course will consist of lectures examining the fundamental dynamics of vortices in rapidly rotating, stratified fluids, while the second section will be seminars discussing more detailed aspects of specific vortices occurring in nature. It is suggested that you have taken 270.425 Earth and Planetary Fluids or another similar introductory fluids class.

AS.270.615. Inversion Modeling & Data Assimilation.
This graduate class will introduce modern inverse modeling and data assimilation techniques. These powerful methods are used in atmospheric science, oceanography, and geophysics and are growing more widespread. Topics will include: singular value decomposition, Green's function inversions, Kalman filtering, and variational data assimilation. The class will include lectures on concepts and theory, and practical experience in the computer laboratory.Permission of Instructor Required

AS.270.618. Remote Sensing of the Environment.
Also offered as 270.318

AS.270.626. Ocean General Circulation.
The aim of this course is to achieve conceptual understanding of the large scale low frequency ocean general circulation. The role of the ocean circulation in earth's climate is emphasized throughout.

AS.270.628. Seminar in regional field geology.
Weekend field trip to explore regional geology. Students are required to prepare short presentations on field trip topics in advance of weekend trip. Attendance at two organizational meetings (to be scheduled) is required. Open to E&PS graduate students and upper level E&PS undergraduate majors and minors. Trip date is 11/9/2019. Consult instructors for details.

AS.270.630. Physics and Chemistry of Aerosols.
This course will cover fundamentals of aerosol physics and chemistry. Topics covered will include aerodynamics and diffusion of aerosol particles, condensation and evaporation, particle size distributions, optics of small particles, characterization of particle composition, and the diversity of aerosols found in planetary atmospheres.Recommended Course Background: Basic Physics and Chemistry. Calculus.

AS.270.633. Seminar on the IPCC Sixth Assessment.
This course will discuss the contents of the Working Group I contribution to the sixth assessment report (AR6) of the Intergovernmental Panel on Climate Change (IPCC).

AS.270.641. Present and Future Climate.
Meets with AS.270.378.
Student may not receive credit for both AS.270.378 and AS.270.641.

AS.270.653. Earth and Planetary Fluids II.
A sequel to AS.270.425 concentrating on planetary-scale atmospheric and oceanic circulation. Physical understanding of the underlying fluid dynamics will be emphasized.

AS.270.656. Geochemical modeling of water-rock interactions in the deep Earth.
Thermodynamic basis for the modeling of irreversible chemical mass transfer involving minerals and aqueous species at elevated temperatures and pressures. Reading will start with classic papers by Helgeson and co-workers and proceed to applications in the literature involving hydrothermal ore deposits, subduction zones, and diamond formation in the upper mantle. The course focusses on developing specific projects of research interest to individual participants.Recommended Course Background: AS.030.101 and AS.030.102 or equivalent, AND AS.270.220 AND AS.270.221 or equivalent, AND AS.270.302 or equivalent.

AS.270.662. Seminar in Planetary Science.

AS.270.667. Seminar in Soil Ecology.

AS.270.668. Geobiology Seminar.
Geobiology is the study of interactions between life and rocks. In this class we will explore how organisms impact sedimentary records both directly, by leaving behind biosignatures, or indirectly, by affecting their surroundings in a way that promotes formation of certain types of minerals. This will serve as a guide for interpreting geological records during the early evolution of life on Earth, the rise of animals, and major mass extinctions.

AS.270.675. Communication for Scientists.
Communication for Scientists" and the description is "This course will cover the various ways in which scientists are expected to communicate throughout the life of a project. Topics will include writing proposals, preparing impactful figures, writing press releases, interacting with the press (press conferences, radio/TV, interviews, etc.), writing for and speaking to the public, social media, and interacting with policy makers."

AS.270.679. Atmospheric Science.
A survey of core topics in atmospheric science, including dynamics, thermodynamics, radiative transfer, and chemistry. The course addresses both basic principles and applications to weather and climate. Recommended pre-requisites: General Calculus and Physics I and/or Oceans and Atmospheres.

AS.270.680. Seminar in Regional Field Geology.
Introduction to the regional geology and geological history of the Appalachian system (from Alabama to Newfoundland). Key papers on regional bedrock geology and Mesoproterozoic through Phanerozoic tectonics are reviewed in weekly seminar classes. Two three-day field trips are made on weekends negotiated at the beginning of the semester. Fieldwork will be designed with student input to test ideas and models from the literature. Techniques in sedimentary, metamorphic, igneous and structural field geology are introduced and developed in the field. Recommended course background: AS.270.220 and AS.270.221, or instructor permission.

AS.270.681. Seminar in Field Geology.
Field experience is an integral part of a geology student's education. During this course, students will spend over a week outdoors, learning to make observations that can be used to interpret the geologic history and structure of natural environments. This course is a spring break field course that will focus on different topics each year. For Spring 2019, the focus of the trip will be on applying concepts and techniques covered in Dynamic Earth (AS.270.220/1), Sedimentary Geology (AS.270.350), and Earth History (AS.270.303). Students will also learn about the different tectonic events that have shaped the landscape that we see today in the western United States. The class is designed for upper level E&PS majors and first or second year E&PS graduate students. For logistical reasons, this class is capped at 10 students. Preference will be given to E&PS majors. Students will be camping during the field course and should be prepared to be hiking outside all day. In the case that obtaining personal field supplies (e.g., hiking boots, sleeping bags) is not possible through Homewood student affairs gear rentals and/or is a financial hardship, please contact the instructor. Any communication about this will be kept confidential.Mandatory class field trip: 9-day field trip to Esmeralda County, NV over spring break (3/16/18-3/24/18).

AS.270.683. Topics in Mineral Physics.
Mineral Physics is the study of mineralogical problems through the application of condensed matter physics and solid-state chemistry. In this course, students will learn about the foundational and developing research capabilities in Mineral Physics, with an emphasis this year on shock compression and experiments at High Energy Density. Topics will include experimental investigation of equation of states, phase transitions, changes in optical and transport properties and other strain-rate dependent phenomena. Topics in Mineral Physics is a special topics course that rotates in subject and may be taken multiple times for credit . (EN.510.311 OR EN.510.601) OR AS.270.222 or instructor permission.

AS.270.684. Mathematical Methods in Earth and Planetary Sciences.
A range of standard mathematical methods used in earth and planetary science applications will be studied. A core set of topics will include back-of-the-envelope estimates, differential equations, linear algebra, special functions, and transforms. In addition, students will tailor the course to their needs by choosing from a range of extended topics to explore further. Potential topics include perturbation theory, tensors, probability theory and complex analysis. Open to graduate students and senior undergraduate EPS majors with permission of instructor. Recommended preparation includes knowledge of single and multivariable calculus and linear algebra.

AS.270.685. Seminar in Virtual Field Experiences: Accessibility, Exploration, and Development.
The Earth Sciences traditionally rely heavily on outdoor field education – the purposeful use of an outdoor environment to achieve educational objectives – in higher education. Observations made at the surface of the Earth are fundamental to understanding the processes that have shaped it, and outdoor field education is often considered an essential way to connect classroom theory with actual data and observations. However, despite the demonstrated benefits of outdoor field education, there are persistent, deep-rooted problems with it in higher education, two of which include accessibility issues and financial barriers. There is overwhelming and demonstrated need to make outdoor field education and research more accepting of all who want to participate. This course aims to explore some of these accessibility issues by: 1) reading and discussing peer-reviewed literature on this topic, 2) participating in and learning about already established virtual field trips and tools, and 3) developing our own virtual educational tools and experiences.

AS.270.686. Cordilleran Controversies.
The origins of the American Cordillera – the mountain ranges forming the backbone of North America, Central America, and South America – remain contentious. It is one of the few global orogens in which there was an active margin whose formation mechanisms remain unresolved. This seminar class will begin by reading seminal papers on the application of “new global tectonics” to the Cordillera shortly following the plate tectonic revolution in the late 1960s. Progressing forward in time, the class will continue to read and discuss papers that develop the classic, broadly accepted model that western North America was gradually assembled from the late Paleozoic into the Miocene through east-dipping subduction. The class will then turn to a drastically different model that was first published in a divisive paper in 2009 that turned the classic tectonic interpretation of the Cordillera on its head by proposing that much of western North America was a separate ribbon continent. The final part of the course will focus on papers published during the last 10 years that try to reconcile differences between the two models. Throughout the course, we will evaluate the range of observations and datasets – both geological and geophysical – that are used to support aspects of the two competing models.

AS.270.688. Exoplanets and their Atmospheres.
This course covers the basic theory of planetary atmospheres as applied to extrasolar planets. The fundamental physical processes related to the structure, composition, radiative transfer, chemistry and dynamics of planetary atmospheres are covered, with an emphasis on those related to observable exoplanet properties. We also provide an overview of the observational techniques of exoplanetary atmospheres and discuss the habitability of exoplanets.

AS.270.693. Special Topics in Dynamo Theory.
Current research literature in planetary magnetic fields and dynamo theory will be studied. Topics will vary year-to-year. Students will be responsible for leading discussions on relevant papers from the literature. Open to graduate students and senior undergraduate EPS majors with permission of instructor. Recommended preparation includes knowledge of fluid dynamics, electromagnetism and planetary science.

AS.270.695. Graduate Skills in Earth and Planetary Sciences.
This seminar-style course will enable graduate students in Earth and Planetary Sciences to discuss issues and develop skills relevant to working in earth and planetary science fields. Topics will vary each iteration and may include graduate school expectations, research and communication methods, grant and funding procedures, stress management, organization and management methods, critical conversations, work-life balance, career paths, and JEDI issues and resources in the geosciences. Course open to EPS Graduate Students or by Instructor Permission

AS.270.807. Research.

AS.270.808. Research.

AS.271.107. Introduction to Sustainability. 3 Credits.
Humans are having such a massive impact on Earth systems that some call this the Anthropocene epoch. Should we consider this state of affairs progress or catastrophe? How to we find a sustainable path to the future? This course provides an interdisciplinary introduction to the principles and practice of sustainability, exploring such issues as population, pollution, energy and natural resources, biodiversity, food, justice, and climate change through the lens of systems thinking. Course open to freshmen, sophomores, and juniors. Seniors by instructor permission only.

AS.271.302. Exploring Nature. 3 Credits.
This course integrates the analysis and production of environmental media with weekly outdoor excursions. Students will survey a range of authors, adventurers, journalists, scientists, photographers, acoustic ecologists and filmmakers that have explored the natural world and chronicled the history of human-environmental relations and environmental problems. Field trips to regional parks and green spaces will encourage students to discover their own sense of place, foster a deeper level of ecological awareness and construct personal environmental narratives through careful exploration, observation, documentation and reflection.
Area: Writing Intensive

AS.271.304. Sustainable Food Systems. 3 Credits.
Where does your food come from? What impact does food production have on the environment and human societies? How can food systems become more sustainable as the human population increases? This seminar-style course examines the past, present, and future of agriculture, including topics such as the foodways of indigenous people, modern "factory farming" versus organic agriculture, genetically modified foods, and the interplay among science, economics, policy, and agriculture. Involves hands-on experiences.

AS.271.305. Special Topics in Environmental Studies. 3 Credits.
Environmental Policy in the Age of Trump. This course will analyze the effects of the current administration's actions on environmental issues by assessing the policies in question and estimating the potential impacts on climate change, human health, and ecology. Policies that have been overturned or are under review represent a number of environmental issues, including climate change and greenhouse gas emissions, offshore drilling, national monuments, mining pollution, toxic discharge into public waterways, the development of oil pipelines, public land use planning, coal leases, a harmful insecticide, hunting in wildlife refuges, airborne mercury emissions, protection of tributaries and wetlands under the Clean Water Act, energy and fuel-efficiency standards, and resource extraction from federal lands. Students will examine the historical roles environmental organizations and government agencies have played in advocating for, creating and enforcing U.S. environmental policy and will discuss the future roles of these actors and other stakeholders in implementing effective environmental policy

AS.271.311. Climate and Health. 3 Credits.
This course will examine the impact of climate variability and change on human health and disease, including the adverse health effects related to extreme heat, air quality, nutrition, waterborne infections, insect-borne diseases, and exposure to storms and floods. Adaptation and mitigation strategies, including the health "co-benefits", will also be examined
AS.270.103 OR AS.271.107

AS.271.315. Environmental Films and Literature. 1 Credit.
This "book club" style seminar focuses on the exploration, discussion and critical analysis of a range of contemporary environmental films and literature.

AS.271.320. Environmental Photojournalism. 3 Credits.
Environmental cognition, consciousness and communication are produced, reproduced, interpreted and remembered with the support of visual representations and, in particular, photography. Images increasingly structure our experience of nature, environmental problems, human-environmental relations, and ecological awareness. Students will review critical literature focusing on visual representation theory, the relationship between images and social change, the practice of journalism and the history and typology of environmental photography. An understanding of environmental issues is required. Students will engage with the local community, identify and investigate environmental issues facing Baltimore, participate in photographic critiques, and develop a documentary project. This studio/seminar course is designed with an emphasis on independent research and practice.
Area: Writing Intensive

AS.271.345. Society and Nature Conflicts: Interdisciplinary Approaches to Studying Environmental Problems Over Time. 3 Credits.
In this seminar students will read seminal pieces in the field of socio-environmental research. Socio-environmental research recognizes that society and nature inherently interact in such a way that they affect and change one-another - it is not only that society affects the nature or that nature only affects society. Solving environmental problems necessitates understanding this duality and thus an interdisciplinary background. Assigned readings will span early from thinkers on environmental problems (Before 1900) to current approaches to studying and solving environmental problems.It is aimed at upper level undergraduates and graduate students.

AS.271.360. Climate Change: Science & Policy. 3 Credits.
Prereq: 270.103 or permission of instructor.This course will investigate the policy and scientific debate over global warming. It will review the current state of scientific knowledge about climate change, examine the potential impacts and implications of climate change, explore our options for responding to climate change, and discuss the present political debate over global warming.

AS.271.399. Research Design. 1 Credit.
This course supports students in the design of their senior capstone project, including crafting a suitable research question, identifying appropriate methodologies, and writing a formal project proposal.

AS.271.401. Environmental Ethics. 3 Credits.
Environmental Ethics is a philosophical discipline that examines the moral relationship between humans and the natural environment. For individuals and societies, it can help structure our experience of nature, environmental problems, human-environmental relations, and ecological awareness. Beginning with a comprehensive analysis of their own values, students will explore complex ethical questions, philosophical paradigms and real-life case studies through readings, films and seminar discussions. Traditional ethical theories, including consequentialism, deontology, and virtue ethics will be examined and applied. Environmental moral worldviews, ranging from anthropocentric to ecocentric perspectives, will be critically evaluated. Organized debates will help students strengthen their ability to deconstruct and assess ethical arguments and to communicate viewpoints rooted in ethical principles. Students will apply ethical reasoning skills to an examination of contemporary environmental issues including, among others, biodiversity conservation, environmental justice, climate change, and overpopulation. Students will also develop, defend and apply their own personal environmental ethical framework. A basic understanding of modern environmental history and contemporary environmental issues is required. Prior experience with philosophy and ethics is not required.
Area: Writing Intensive

AS.271.402. Water, Energy, and Food. 3 Credits.
The water, energy and food (WEF) nexus is a topic of growing interest in the research and policy communities. This course will survey WEF concepts and principles, introduce tools of analysis, and engage students in case studies of critical WEF issues in the United States and internationally.

AS.271.403. Environmental Policymaking and Policy Analysis. 3 Credits.
This course provides students with a broad introduction to US environmental policymaking and policy analysis. Included are a historical perspective as well as an analysis of future policymaking strategies. Students examine the political and legal framework, become familiar with precedent-setting statutes such as NEPA, RCRA, and the Clean Air and Clean Water Acts, and study models for environmental policy analysis. Cost benefit studies, the limits of science in policymaking, and the impact of environmental policies on society are important aspects of this course. A comparison of national and international policymaking is designed to provide students with the proper perspective. This course is taught in conjunction with an identical graduate course. All students will be expected to perform at a graduate level.

AS.271.496. Senior Capstone. 3 Credits.
This seminar will provide the academic space, time, and mentoring for students to integrate, synthesize and apply the knowledge and skills obtained through the ENVS curriculum. The course focuses on the development of critical thinking and oral communication skills through intellectual engagement with complex and challenging environmental problems.

AS.271.499. Senior Seminar. 1 Credit.
This seminar explores topics related to career development and current events to support senior environmental majors as they transition to post-graduate life and work.

AS.271.502. Independent Study. 1 - 3 Credits.
Exploration of topic(s) in environmental studies under the direction of an instructor.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.271.506. Independent Research. 1 - 3 Credits.
Research in environmental studies conducted under the direction of a faculty advisor.

AS.271.507. Internship. 1 Credit.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.271.509. Applied Experience. 1 Credit.
This course is designed to accompany a supervised, hands-on experience working on an environmental or sustainability-related internship. In addition to completing 80 hours of applied work, students will prepare a reflective journal, paper, and poster presentation about their experience.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.271.511. Senior Thesis. 1 - 3 Credits.
Senior thesis research project in environmental science or environmental studies conducted under the direction of a faculty advisor.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280 (Public Health Studies)

AS.280.101. Introduction to Public Health. 3 Credits.
This course provides an overview of the field of public health. Topics include the major causes of morbidity and mortality; the socioeconomic, behavioral, and environmental factors that affect health; the analytical methods used in the field; the role of government in protecting the public's health; key features of the U.S. health care system; and current challenges in the field. The course also introduces students to the basic conceptual models and approaches that are central to public health practice. This course is restricted to freshmen. Your enrollment may be withdrawn at the discretion of the instructor if you don't meet one of those criteria.

AS.280.120. Lectures on Public Health and Wellbeing in Baltimore. 1 Credit.
An introduction to Urban Health with Baltimore as a case study: wellbeing, nutrition, education, violence and city-wide geographic variation. Lectures by JH Faculty, local government/service providers and advocates.

AS.280.161. Applications of Biological Concepts in Public Health. 3 Credits.
This course explores the basic biology concepts relevant to public health. Case studies will be used to examine key scientific principles and their application. This course is designed for public health students who are not intending to pursue a career in natural sciences or medicine. This course satisfies the Public Health Studies Biology requirement, but does not satisfy Pre-Med requirement.All freshman must have taken or be currently enrolled in AS.280.101 to register.Department Approval Required.
Area: Writing Intensive
AS.020.151

AS.280.225. Population, Health and Development. 3 Credits.
This course will cover the major world population changes in the past century as well as the contemporary situation and projections for this century. Topics include rapid population growth, the historical and continuing decline of death and birth rates, contraceptive methods as well as family planning and child survival programs, population aging, urbanization, population and the environment and the demographic effects of HIV/AIDS and Covid.

AS.280.240. Research Methods in Public Health. 4 Credits.
This course examines the research process, with an emphasis on formulating research questions, critically evaluating published research, and drawing objective conclusions from a body of scientific literature. Students conduct a systematic review of the scientific literature related to a public health issue. Labs focus on developing and documenting a sound review methodology and communicating the review findings effectively in writing.
Area: Writing Intensive
AS.280.101 AND (AS.280.345 OR AS.200.314 OR EN.553.230 OR EN.553.310 OR EN.553.311 OR EN.553.420 OR EN.553.430 OR EN.560.348 OR EN.553.211 OR AS.200.201) OR (EN.550.111 AND EN.550.112)

AS.280.312. Media, Politics, and Evidence in the History of Public Health. 3 Credits.
This writing intensive course will encourage students to consider what counts as evidence among public health professionals as well as popular audiences. Using case studies from the field of epidemiology, now emblematic of the field, students will learn about historical changes in theories of population health and disease. Through a series of writing assignments, students will interrogate the formal structure of scientific arguments and gain practice in synthesizing and communicating complex ideas to a lay audience. Juniors/Seniors Only
Area: Writing Intensive
AS.280.350

AS.280.320. Seminar on Public Health and Well-being in Baltimore. 3 Credits.
Seminar combines lectures from AS.280.120 with additional readings and discussion to more deeply address urban health issues. The course will revolve around student projects that can impact health and wellbeing in Baltimore. If you are accepted for this course do NOT register for AS.280.120. Course registration is by instructor permission only. You will be asked to provide a brief description of a project in order to determine your potential linkage with this course.This course is utilizing the online active approval process. Permission requests should be submitted via SIS Self-Service upon the opening of your registration period. The instructor will review requests and approve registrations using SIS Self-Service for Faculty. Please note, a request does not guarantee registration into the course. Status inquiries should be address to the instructor or departmental administrator.

AS.280.330. Mind-Body Practices and Public Health. 3 Credits.
This course will focus on mind-body practices and their place in public health. We will learn about different mind-body practices and talk about if/how mind-body practices can help amerliorate the national burden of disease. We will also learn how to identify evidence based practices (EBPs) in public health and learn the core components of designing EBPs. We will then combine what we learned about mind-body practices and designing EBPs to create programs that lessen the burden of disease. The mind-body portion of this course is experiential and will include the practice of meditation, yoga, other mindfulness exercises. You will also be asked to reflect on these practices through journaling.
AS.280.101

AS.280.335. The Environment and Your Health. 3 Credits.
This course surveys the basic concepts underlying environmental health sciences (toxicology, exposure assessment, risk assessment), current public health issues (air, water- and food-borne diseases) and global health threats (climate change, designing healthy communities, and environmental justice).
AS.280.101 OR AS.270.103

AS.280.340. Fundamentals of Health Policy & Management. 3 Credits.
Through lectures and small group discussions, students will develop a framework for analyzing health care policy problems and gain familiarity with current issues including managed care, Medicare and the uninsured.Public Health Studies majors have 1st priority for enrollment. Your enrollment may be withdrawn at the discretion of the PHS program if you are not a PHS major.
AS.280.101

AS.280.345. Public Health Biostatistics. 4 Credits.
Using problem-based learning focusing on public health topics, students learn to describe & summarize data, make inferences regarding population parameters, & test hypotheses. Recommended Course Background: Four years of high school math.
Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.211 OR EN.550.230 OR AS.200.314 OR AS.200.315 OR EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430 OR EN.560.348

AS.280.346. Introduction to R Programming for Public Health. 1 Credit.
Formerly known as Advanced Biostatistics Laboratory, a complementary course to 280.345, Public Health Biostatistics, this course teaches R programming skills necessary for conducting independent data analyses, beyond those presented in the main course. No programming experience is necessary, but a willingness to learn independently and work with other students is indispensable.
AS.280.345

AS.280.347. Health Data Analysis Practicum. 3 Credits.
Students will learn to formulate precise scientific and policy questions, design exploratory and confirmatory statistical analyses to address the questions, conduct appropriate analyses using the statistical package R, and communicate their findings through graphical and tabular displays that are presented in writing and in person. The course will be run seminar style in which students conduct data analysis to present to one another in one meeting per week. Evaluation will be through class participation and a final project in which students will analyze their own data set to address a question of their choice. Students need to have taken an introductory statistics course at the level of AS.280.345 (Public Health Biostatistics) and must have some experience using the statistical software R to perform basic analyses.

AS.280.349. Making Work Safer. 3 Credits.
This course explores major health and safety issues that affect workers in the United States, with an emphasis on developing and selecting interventions to prevent occupational injuries. In this course, students will examine the morbidity, mortality, and economic costs associated with work-related injuries; interact with key surveillance systems and other data sources used for tracking such injuries; and apply principles of injury prevention and decision-making through a basic policy analysis process.
AS.280.340

AS.280.350. Fundamentals of Epidemiology. 4 Credits.
A practical introduction to epidemiology focusing on the principles and methods of examining the distribution and determinants of disease morbidity and mortality in human populations. This course is restricted to Public Health Studies only. Any remaining open seats at the start of the semester will open up to all other majors.

AS.280.355. Introduction to Social and Behavioral Determinants of Health. 3 Credits.
Introduces students to a social ecological perspective of population health; Explains key theories and models of health behavior; Describes social and behavioral factors affecting health outcomes; Illustrates the role of factors such as racism, income inequality, social norms, culture, communication and psychological constructs in health outcomes; Demonstrates applications of these theories and models in health behavior research and intervention.
Area: Writing Intensive
AS.280.101

AS.280.360. Clinical & Public Health Behavior Change. 3 Credits.
This course explores the theory and practice of changing the health behaviors of individuals, and the public health and medical impact of doing so. Theoretical concepts are integrated with practical clinical applications, especially in the areas of diet and fitness. Skill building in persuasive, health-related communication will be included in smaller group discussions.

AS.280.365. Public Policy, Politics and Public Health. 3 Credits.
This course is composed of lectures on public policy and political issues that impact the arena of public health. With real-life examples of public health practice in Baltimore and around the country, this course will also expose students to the wide array of opportunities available to those pursuing a career in public health. Throughout the course a major effort will be made to expose students to the wide array of opportunities that are available to those pursuing a career in public health.
AS.280.101

AS.280.380. Global Health Principles and Practices. 3 Credits.
Global health addresses the staggering global disparities in health status, drawing on epidemiology, demography, anthropology, economics, international relations and other disciplines. We review patterns of mortality, morbidity and disability in low and middle income countries, starting with malnutrition, infectious diseases and reproductive health, and continuing to an emerging agenda including mental health, injury prevention, surgical care, chronic diseases, and health impacts of climate change. Gender, health systems and health workforce challenges, and career trajectories in global health are also discussed. Recommended course background: Minimum of one prior course in Public Health.

AS.280.399. Community Based Learning - Practicum Community Health Care. 3 Credits.
This course introduces students to a social structural, justice orientation to public health, with an emphasis on service learning in Baltimore City. Through lectures, class discussions, reflection practices and experiential learning, students will gain an understanding of education, healthcare, housing and other sectors as social determinants of health. The course draws on a social ecological framework and highlights the role of relationships and policies in impacting community resources foundational to health and well-being. Students will choose a community-based organization according to their interests and schedule and, working in teams, complete 45 hours of service-based learning. Grades are based on class participation, completion of a service learning project, group presentation, and papers. Open to Junior Public Health Studies majors and, space permitting, to others upon permission of instructor. This course qualifies as a PHS upper elective; however, it does not satisfy the PHS Applied Experience requirement.

AS.280.438. Reproductive Health in Crisis: Issues in Meeting the Needs of Vulnerable Populations. 3 Credits.
Introduces students to the reproductive health needs of over 65 million people affected by humanitarian, economic, and environmental crises globally. Presents an overview of health care delivery systems in a variety of contexts, and examines the reproductive health consequences of disruptions in service provision during times of crisis. Examines the impact of policies and programs targeting affected groups. Discusses international standards in humanitarian response. Includes discussion of maternal and newborn health, family planning, abortion, and gender based violence. Students develop competency to conduct reproductive health service needs assessments and design an emergency preparedness plan that ensures provision of essential care. For the final project, students apply their skills to plan a response program to meet the reproductive health needs of a specific crisis-affected population. This is a Gordis Teaching Fellowship course.
Area: Writing Intensive

AS.280.439. Ecological Change and Infectious Disease. 3 Credits.
This course will introduce students to key concepts in infectious disease ecology and epidemiology. Students will also learn how key ecological changes are influencing infectious disease dynamics. Ecological changes explored in the course include climate change, water management, deforestation, agriculture, and urbanization. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.335;AS.280.350 can be taken concurrently

AS.280.440. Introduction to Harm Reduction: Principles and Examples in Public Health. 3 Credits.
Harm reduction is an increasingly popular paradigm in public health research and practice. This course introduces students to the principles of and current research in harm reduction. The class will focus on a) history and principles of harm reduction, and appropriate research methods; b) harm reduction & substance abuse and policy; c) harm reduction & sexual health and sex work; d) ethical considerations in harm reduction. This seminar-format course uses journal clubs, small group discussions, and interactive debates. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.345 OR EN.553.112 OR EN.550.112 OR EN.553.211 OR EN.550.211

AS.280.441. Social Media and Public Health. 3 Credits.
This upper-level undergraduate research methods design course explores the growing role of social media in public health research. The course first introduces the current social media landscape, tying in different public health and health communication theories of importance to social media research. This is followed by a discussion of qualitative and quantitative research methods that have been used to conduct social media research, as well as the unique ethical considerations presented by this novel field. The course will then delve into each type of social media platform in depth, discussing how public health research has been conducted and how this ever-changing field continues to move forward. By the end of the course, students will have given explicit consideration to the strengths and challenges posed by conducting social media research in public health, and will be able to apply social media research methods to a public health issue of their interest. Some background in research methods is preferred but not required. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.

AS.280.442. Genetics and Public Health. 3 Credits.
DNA is the code of life and variability in this code can be critical in determining human health outcomes. In a post-genomic era with increasingly advanced genetic tools and data it is critical for future public health professionals to understand the role that genetics plays in disease on the individual and population level. More and more, genetics is instructing public health interventions by informing individuals of their risk of acquiring certain diseases, explaining disease etiology, guiding treatment options in the wake of personalized medicine, and may dictate the future of genetic-based disease treatment in the form of gene therapy. The goal of this semester long course is to expand upon basic genetic concepts and apply them to understanding how variation in the human genome can impact health outcomes and inform treatment. We will look at how genetic diseases are inherited, the various ways in which they can manifest as pathology, and how they are discovered and diagnosed. We will also learn how to interpret genome wide association studies and genetic test results and explore the field of genetic counseling. We will finish by looking at the future of genetic medicine by looking at personalized medicine, gene therapy, and gene drive technologies and the potential ethical implications of these interventions. Prior genetics coursework is useful, but not required. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.020.151 AND AS.020.152

AS.280.443. Health-Related Stigma: Concepts, Considerations, and Interventions. 3 Credits.
Health-related stigma plays an important role in health and social outcomes, however its impact on individuals and populations varies according to context. Through readings, discussions, and assignments, students acquire the framework and skills to conceptualize and assess stigma across a range of health domains. To develop their understanding and analytical approach, students examine examples of HIV/AIDS, smoking, obesity, addiction, and mental health stigma. In each case, students consider key questions including: What are the forms and consequences of stigma? What theories apply? What ethical issues exist? How might interventions minimize or leverage stigma for health promotion? Throughout the semester, students also consider broader questions including: When should interventions target stigma? What are the ethical considerations in health-related stigma research? Is stigma always a threat to health? As the course places a strong emphasis on reading, critiquing, and applying health and social scientific literature, knowledge of or experience with psychology, sociology, ethics, and/or statistics is recommended but not required. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted registration as space allows.

AS.280.445. Mental Health and the Gut. 3 Credits.
Explores the strong, bidirectional communication between the gastrointestinal tract and the brain. Reviews the role of the microbiome in shaping brain health, the link between gastrointestinal symptoms and mental health, and new and seminal research on the brain-gut connection in specific psychiatric disorders, including neurodevelopmental disorders, sleep disorders, depression and anxiety, bipolar disorder, schizophrenia and other psychotic disorders, dementia, and Parkinson's/other movement disorders. Develops students' skills in reading and critiquing literature as well as designing and analyzing studies on the microbiome and mental health. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.345 OR (EN.553.211 (EN.550.211) OR EN.553.112);Students who have taken AS.280.236 are not permitted to take AS.280.445.

AS.280.446. Quality of Life: Concepts and Challenges in Assessing Wellbeing. 3 Credits.
Quality of life means something different to nearly everyone. While public health and regulatory professionals agree that quality of life matters, developing tools that appropriately conceptualize and evaluate quality of life across varying populations remains a challenge. This course will explore the role of quality of life and other health status and functional outcomes in public health. The course is structured in three segments: 1) Conceptualizing quality of life, 2) Measuring quality of life, 3) Valuing quality of life. The class challenges students to assess the existing landscape in qualityof life research and critically evaluate how diverse literature bases (including psychology, medicine, economics, & regulatory science) have influenced public health research, policy,and practice. Students will also gain experience in analyzing and drawing meaningful research and regulatory conclusions from experience data such as patient reported outcomes and patient preference information. This course will be structured as a seminar featuring lectures, in-class journal clubs, guest speakers, and small-group lab activities. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.345 OR (EN.553.211 (EN.550.211) OR EN.553.112)

AS.280.447. Ethical Considerations When Working With Marginalized Populations- A Public Health Perspective. 3 Credits.
Interested in developing best practices to work with marginalized people in public health? This course is for you! We will use a combination of lectures and discussions to critically analyze public health research methodologies at the intersection of ethics, justice, and human rights when working with marginalized populations. The first part of the course is an introduction to theory to equip students with a shared language to understand how marginalization, justice, and ethics are conceptualized in public health. In the second part of the course, students will delve deeper into various public health research methodologies and apply ethical guidelines to a variety of public health cases in the U.S. and internationally. The course will culminate with students designing case studies to present and provide feedback on based on ethical considerations. Gordis Teaching Fellowship course. Priority registration given to Public Health Studies majors. Other students will be permitted to register as space allows.

AS.280.448. Vaccine Development, Epidemiology, and Hesitancy in the Modern World. 3 Credits.
Immunization is one of the most cost-effective and successful public health measures available, but loss of public confidence in vaccines has resulted in the resurgence of vaccine-preventable diseases. This course will review the process of vaccine development and students will understand the use and utility of immunizations for disease prevention. Students will gain an in-depth understanding of the vaccines that have been successfully introduced into routine immunization schedules. This course will discuss post-licensure vaccine surveillance as well as current domestic and international policy issues in vaccine development, supply, delivery and utilization. We will also examine the origins of vaccine hesitancy and discuss the impact of "anti-vaxxers" on immunization coverage and the subsequent return of vaccine-preventable diseases. Students will have the opportunity to work in teams to critically evaluate multi-level interventions to target vaccine hesitancy and improve immunization coverage, and propose a recommendation that will reduce the morbidity and mortality of a specified vaccine-preventable disease. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.350

AS.280.449. Corporate Influence on Public Health. 3 Credits.
Corporate practices are an often under-recognized social determinant of health. Corporate-induced disease contributes to morbidity and mortality worldwide, and a better understanding of the mechanisms underlying corporate-induced diseases illuminates pathways by which social and environmental factors influence health. This course will investigate the influence of industry using tobacco, alcohol, sugar-sweetened beverage, food, and pharmaceutical industries as examples, emphasizing ecological models. Students will evaluate the historical and current role of each industry as they effect health outcomes, research, public health policy, and public perceptions and behaviors. Students will use case studies from around the globe that exemplify instances of influence and interference and critically consider the power and activity of multibillion-dollar multinational companies. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.

AS.280.450. The Dreaded R-Word: The Ethics of Rationing and Resource Allocation in Health Care. 3 Credits.
Uwe Reinhardt, the renowned Princeton health economist, once labeled rationing as “the dreaded ‘R-word.’” Sarah Palin infamously criticized the Affordable Care Act for, in her view, setting up rationing “death panels.” Many others recoil from the idea of rationing, considering it a “heartless, mechanistic withholding of desirable goods or services by faceless bureaucrats.” In contrast, “resource allocation” does not typically inspire the same response. Why does the idea of rationing in health care generate such a negative emotional response? Is this response justified? Does rationing differ from resource allocation as a means of setting priorities for health care? Who has the authority to set priorities for health care? On what basis should priorities be set? Why must priorities be set at all? This class addresses questions like these and offers a broad introduction to the ethics of priority-setting in health care. The class will devote significant time to understanding both the conceptual and normative foundations of priority-setting as well as specific proposals for how to set priorities. We will explore priority-setting in health care at both the individual and population level through various case studies including organ transplants and flu pandemic preparation. We will discuss priority-setting in the context of public health and universal health coverage and explore the role of global organizations like the World Health Organization and World Bank in setting priorities for health care. We will also consider whether priority-setting is compatible with the pursuit of social justice. Gordis Teaching Fellowship course.

AS.280.451. Born a Girl: Issues in Women's Health From a Life Course Perspective. 3 Credits.
The discussion surrounding women’s health has often remained limited to understanding women’s reproductive health needs. This course seeks to move beyond this topic to explore the key issues affecting women’s health, utilizing a life course perspective. This undergraduate course will focus on a select number of themes including: a) understanding the history of women’s health; b) sexual and reproductive health; c) maternal health; d) violence against women and girls; e) the needs of younger girls and aging women; and f) how mental health and stigma affect women. The course brings both U.S. and global perspectives to enhance the understanding of how the field of women’s health has evolved over time. It will also address some of the challenges public health professionals continue to face in addressing the health and wellbeing of women today. This seminar-style course combines class presentations with journal clubs and small group discussions. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.350

AS.280.452. Policy, Politics, and Power in Health Equity. 3 Credits.
Health disparities are avoidable, unjust differences in health opportunities and outcomes related to factors such as race and ethnicity, education, class, citizenship, disability, sex and gender identity, and sexual orientation. These disparities reflect the systems that distribute resources, privileges, and power across society and mediate exposure to physical and mental health hazards such as economic deprivation, discrimination, violence, unhealthy environments, uninsurance, and inadequate medical care. Health equity, which is often referred to as social justice in health, is an ethical value that drives efforts to eliminate these disparities. As the National Academy of Medicine asserts in each of its reports, “Knowing is not enough; we must apply. Willing is not enough; we must do.” The purpose of this course is to introduce students to essential concepts, literature, and policy issues related to health disparities and to prepare them to use their knowledge to build effective policy strategies in support of health equity. Gordis Teaching Fellowship course. Completion of AS.280.340/ Fundamental of Health Policy Management is recommended, but not required.Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.

AS.280.453. Contemporary Social Movements in Public Health. 3 Credits.
Health social movements attempt to alter power structures in order to achieve greater health equity, promote access to resources, and change perceptions of disease. But what distinguishes a moment from a movement? Under what conditions can health social movements lead to lasting policy and social change? Together we will explore a wide range of contemporary health social movements such as Black Lives Matter, MeToo, gun reform, US healthcare reform, environmental movements, and others. We will analyze the types of goals, resources, and tactics used in these movements and consider their contributions to the shaping of health-related policies and practices. Students will demonstrate their understanding of course themes through quizzes, written assignments, class discussions, and brief presentations. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.

AS.280.454. What is the Link Between Oppression and Mental Health? Combining Theory, Concepts, and Empirical Science to Explain Minority Mental Health. 3 Credits.
In this three-module course, students will first gain knowledge on the theoretical orientations that inform the social determinants of health, in combination with conceptual approaches in the field of trauma and violence research, in order to formulate a theoretical, conceptual, and empirical understanding of minority mental health. In the final module, students will study select mental health concerns (e.g., trauma, depression, anxiety, suicide) that affect specific minority populations, including discussions around the lived experiences of minority mental health. This culminates in a final group presentation on empirical research from an approved minority mental health topic of their choice that will be delivered as a TED-style talk. The course will run with graduate-level expectations. Students should anticipate weekly reading assignments to inform group lab presentations and discussions. There will be three brief individual writing assignments of 5 pages or less that critically analyze current minority mental health research. Upon completion of the course, students will be able to discuss minority mental health research with the necessary contexts of theory, research, and life stories that inform current public mental health approaches. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
Students cannot take this course is they are taking AS.194.301.

AS.280.455. Understanding and Engaging Adolescents in Public Health Context. 3 Credits.

Adolescent health is an increasingly important component of the public health agenda. As adolescence is a unique and pivotal stage of life, a rich understanding of this population is important for successful public health engagement. This seminar-style course seeks to provide a foundation for those interested in adolescent health and support effective engagement with adolescent populations. The first half of the course offers theoretical and contextual insights on adolescents—ranging from discussing public health significance, to developmental and life course perspectives, to influences across socioecological levels. The course then delves into practical and methodological considerations for working with this population including ethical matters, insights on reaching adolescents, and approaches to collecting information. This course culminates with deliberations of successful examples of engaging adolescents in public health as well as the future of the adolescent health field. This is a Gordis Teaching Fellowship course open to juniors and seniors. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.

AS.280.456. Introduction to Vaccinology. 3 Credits.

Over the past century, vaccines have a made a tremendous impact on human health, averting an estimated 2-3 million deaths each year. This course aims to introduce students to the interdisciplinary field of vaccinology by building the vocabulary and skills necessary to critically evaluate existing and future vaccines and vaccine programs. Topics include the parameters used to characterize vaccines, the vaccine development pathway, vaccine policy and emerging topics in vaccinology. Although the primary focus of the course will be on the public health aspects of vaccinology, we will also cover key biological principles. At least one semester of biology is strongly recommended as a pre-requisite for this course. Gordis Teaching Fellowship course. Priority registration will be give to Public Health Studies majors.
AS.280.101 AND AS.280.240

AS.280.457. Cohorts and Trials: Interpreting Evidence in Epidemiology. 3 Credits.

How do we know smoking is a risk factor for heart attacks? Why did the NIH invest millions of dollars into the Atherosclerosis Risk in Communities (ARIC) Study or the Systolic Blood Pressure Intervention Trial (SPRINT)? When does the FDA accept a vaccine or drug as safe for use? Why do studies disagree about whether coffee is good or bad for health? This course delves into how two major study designs—cohorts and clinical trials—are used to build and interpret a body of epidemiologic evidence, including the practical context of how cohorts and trials are devised, proceduralized, and funded within the larger scientific enterprise. This is a discussion-based class; active sessions modeled after research journal clubs and consortium workgroups drives peer-to- peer learning along with literature-based lecture. Gordis Teaching Fellowship course. Priority registration will be give to Public Health Studies majors.
AS.280.350

AS.280.458. Monitoring, Evaluating, and Learning to Improve Public Health Programs. 3 Credits.

This course introduces basic principles and methods for monitoring and evaluating public health programs. The course will familiarize students with different types of program evaluation, including formative and summative evaluations, and with approaches to monitor and improve program performance. Students will apply their knowledge to design a logic model, formulate evaluation questions, and identify appropriate quantitative and qualitative methods to answer those questions.Additionally, students will reflect on the importance of conducting evaluations that meet the needs of stakeholders and strategies for integrating an equity focus into the design of evaluations. The goal of the course is to help students to think critically and provide them with the practical skills to monitor, evaluate, and learn from data to improve program implementation and public health impact. Gordis Teaching Fellowship course. Priority registration will be given to Public Health Studies majors.
AS.280.350

AS.280.459. Statistics for Humans: Failures, Values, and Conflicts in Data Science. 3 Credits.

Data does not speak for itself, and the way we use data is a matter of choice. This course will explore the human element of statistics: how statistics drive decision-making, how people can be deceived by statistics, what problems data science poses for the 21st century, and other topics. Case studies in public health will be emphasized. A previous course is statistics is recommended. This is a Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.

AS.280.460. Urban Health: Global Perspectives for Sustainable Development. 3 Credits.

Urban health is a growing area of public health focus around the world. The interdisciplinary nature of this field of study presents a unique challenge for researchers and policy makers, but also a critical opportunity to share and integrate knowledge using a systems thinking framework.The seminar style course will consist of a brief introduction to the goals and frameworks of urban health planning, followed by four urban case studies represented by four cities around the world at varying stages of industrialization. Material will be guided by discussions and debates about pressing urban health topics. This is a Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.101 AND AS.280.335

AS.280.461. Exploring Food Insecurity Through a Racial Equity Lens. 3 Credits.

This course will apply a racial equity lens to explore the issue of food insecurity in the US, including the history, measurement, and current strategies to reduce food insecurity at the national, regional, and local levels. Students in the course will explore how they can take individual action to contribute to dismantling racism and fighting against the root causes of food insecurity. This course will require students to critically reflect on readings and discussions that explore the connection between systems of oppression and food insecurity. This is a Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.350

AS.280.462. Practicing Equity in the American Healthcare System. 3 Credits.
This course provides a broad orientation to key structures within the American healthcare system and their role in promoting health equity. These structures include providers, payers, local health departments, evidence development, health information technology and innovative policy. This course will emphasize practical experience with these structures in the context of health equity through case studies within the class and an integrative project in which students will plan and execute their own project. This is a Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.340

AS.280.463. International Nutrition in the Time of the COVID-19 Pandemic. 3 Credits.
Malnutrition remains one of the largest public health issues in low and middle income countries (LMICs); it has been estimated that 1 in 9 individuals globally remain hungry, and malnutrition related factors contribute to 45% of deaths in children under 5 years old. While global progress has reduced the burden of malnutrition in the past two decades, much of the progress could be undone by the impacts of COVID-19. This course will review the causes and the burden of malnutrition in LMICs and will provide students with the understanding of the various types of malnutrition. This course will discuss the multi-sectoral nature of malnutrition and the role each sector has in addressing malnutrition. In light of recent events, many of these sector's normal operations have been disrupted by the COVID-19 pandemic and disease transmission mitigation strategies. We will examine how the COVID-19 pandemic has influenced these sectors and the anticipated effects on malnutrition. This is a Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.350

AS.280.464. Risk, Resilience, and Public Health Engagement with Marginalized Communities. 3 Credits.
In public health research and practice, marginalized populations are frequently labeled as “at risk” for negative health outcomes and as being more likely to engage in “high risk” behaviors. All too often, risk assessments and behavior change efforts target individuals without adequate consideration of social and environmental factors contributing to risk and vulnerability. The concepts of resilience and protective factors have gained attention in public health for their focus on supporting positive mental and behavioral health in the face of adversity. This seminar-style course will explore the core concepts of risk and resilience from the perspective of multiple disciplines (e.g. anthropology, epidemiology, and more), delving into each construct's underlying conceptual frameworks, methods of assessment, contributing factors on multiple levels, and evidence-based interventions to support resilience and mitigate risk. Students will then use these core concepts to reflect on meaningful engagement with marginalized populations when assessing and addressing risk and resilience, explore the meaning and consequence of categorizing people based on their risk behavior, and become familiar with cross cultural perspectives on these topics. The course will conclude with a deliberation of future directions risk and resilience examined through a public health equity lens. Students are expected to actively engage with assigned readings and in-class discussions, and will have the opportunity to pursue topics of interest through individual assignments. This is a Gordis Teaching Fellowship course open to juniors and seniors. Priority registration will be given to Public Health Studies majors; other students will be permitted as space allows.
AS.280.101 AND AS.280.240

AS.280.465. Beyond the Peer-Reviewed Article: Embodying Public Health Data for Human Consumption. 3 Credits.
As public health researchers and practitioners, one of the most important and in-demand skills is the ability to communicate data to effect population-level change. This course will explore concepts and case studies in data visualization, ethical data dissemination, and evidence-based advocacy. This course will cover strategies for presenting data that are approachable for lay audiences. Students will gain familiarity with key tools, media, and software to support data visualization and dissemination through lectures, case studies and course assignments. The course will culminate with an applied assignment which calls upon students to collaborate with Bloomberg School of Public Health faculty to utilize data from current research to effectively communicate key messages to non-specialist audiences. This is a Gordis Teaching Fellowship course open to juniors and seniors. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.350;AS.280.345 OR EN.553.211 OR EN.553.230 OR AS.200.314 OR AS.200.315 OR EN.553.310 OR EN.553.311 OR EN.560.435 OR EN.553.420 OR EN.553.430 OR EN.560.348 OR AS.200.201

AS.280.466. Rethinking Prevention: Emerging and Novel Approaches to Addressing Adolescent Drug Use. 3 Credits.
Students in this upper-level course will be introduced to the unique needs and public health considerations when working with adolescent populations, specifically in preventing substance use and substance use disorders. Students will explore the etiology and epidemiology of substance use and substance use disorders in young people, as well as the history of substance use prevention while tackling topics of racism, stigma and oppression of those who use drugs. Progressing through the course, students will be introduced to novel and emerging ways the field is rethinking drug prevention, including the use of social media platforms, mindfulness in schools and phone apps. New tools for epidemiologic surveillance of populations will also be considered, such as machine learning and ecological momentary assessment. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.101;AS.280.355 OR AS.230.341

AS.280.467. Adverse Childhood Experiences: A Public Health Perspective. 3 Credits.
This seminar explores the scientific evidence underlying the impact of Adverse Childhood Experiences (ACEs) on various health outcomes. It first describes the prevalence of ACEs, which include abuse, neglect, and household challenges such as parental substance abuse, mental illness, separation or divorce, and incarceration. The course will then discuss mechanisms and risk and protective factors of negative health outcomes following ACE exposure across levels of a socioecological model. These discussions will directly inform the next part of the seminar, which presents evidence-based interventions for ACEs. Throughout the seminar, students will be active participants and will have the opportunity to explore their topics of interest. Gordis Teaching Fellowship course. Priority registration is given to Public Health Studies majors. Other students will be permitted to register as space allows.
AS.280.240

AS.280.468. Food Security in America. 3 Credits.
As of July 2021, 1 in 6 households reported experiencing food insecurity in the United States, with Black, Indigenous, and People of Color (BIPOC) populations disproportionally affected. Food insecurity has been a public health issue in America for decades, with COVID-19 exacerbating existing hardships and disparities resulting from inequitable policies and distribution of resources in communities. This course seeks to provide a critical understanding of the issue of food insecurity in America through describing and evaluating the existing policies, programs, and practices in the United States that aim to promote food security. This is a Gordis Teaching Fellowship course open to juniors and seniors. Priority registration will be given to Public Health Studies majors; other students will be permitted as space allows.
AS.280.101 AND AS.280.340

AS.280.469. How Inequity Persists in Statistics: Lessons Learned and Future Challenges. 3 Credits.
The course will examine the past, present, and future of statistics’ impact on equity. We will discuss how early statistical thinking was used to defend racist narratives and how inequitypersists in statistics to this day. We will explore current and future challenges using examples from artificial intelligence. Students will learn how to implement common artificial intelligencemethods and communicate their results. This is a Gordis Teaching Fellowship course open to juniors and seniors. Priority registration will be given to Public Health Studies majors; other students will be permitted as space allows.
AS.280.101 AND (AS.280.345 OR (EN.553.211 OR AS.200.314 OR EN.553.310 OR EN.553.311 OR EN.553.420 OR EN.553.430 OR EN.560.348 OR AS.200.201))

AS.280.495. Honors In Public Health - Seminar. 3 Credits.
Using lectures, oral presentations, and writing assignments, this seminar is designed to assist Public Health Studies majors in writing a senior thesis. Students will formulate their topics, develop research skills, and address issues of professional ethics. Participating in this seminar is required for students pursuing honors in Public Health Studies. Permission Required. Classes will be held at Bloomberg School of Public Health.
Area: Writing Intensive

AS.280.499. Honors in Public Health. 3 Credits.
A research methods seminar to prepare students doing honors in Public Health Studies. Permission Required.
Area: Writing Intensive

AS.280.500. Applied Experience-Public Health. 1 Credit.
Perm. Req’d, Public Health Majors Only. This is a supervised, hands-on experience working with public health professionals. Students will complete 80 hours of applied work and will submit a synthesizing assignment at the end of the term. Students completing their AE in the current semester will be enrolled in Section 2. Students whose time will roll over to an additional grading period will be enrolled in Section 1. Please contact your PHS Advisor for complete details.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.501. Internship-Public Health. 1 Credit.
Permission Required. Public Health majors only
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.502. Internship-Public Health. 1 Credit.
Permission Required. S/U only.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.505. Research in Public Health. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.506. Research in Public Health. 1 - 3 Credits.
Permission Required.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.511. Research for Juniors/Seniors in Public Health. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.512. Research for Juniors/Seniors in Public Health. 0 - 3 Credits.
Restricted to public health studies majors. Consult the public health studies adviser for procedure. Permission Required.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.590. Internship - Summer. 1 Credit.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.595. Special Studies in Public Health. 1 Credit.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.280.597. Research in Public Health. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290 (Behavioral Biology)

AS.290.101. Human Origins. 3 Credits.
This course examines the origins of human structure, function and behavior from an evolutionary perspective. It includes study of the evolution, behavior and behavioral ecology of nonhuman primates, hominid evolution (including the paleontological and archaeological records), and the origins of human cognition, social behavior and culture.

AS.290.303. Animal Communication Lab. 3 Credits.
This course examines animal communication in all modalities (especially sound, sight, and scent) across taxa. Students will learn how to design experiments, analyze results and write scientific papers in publication form. The course is held in a computer laboratory and on some occasions at “field” locations on or adjacent to campus.
AS.200.208 OR AS.200.344

AS.290.304. Comparative Neuroanatomy. 3 Credits.
This course examines the phylogenetic and developmental history of the central nervous system across the vertebrate tree of life, with emphasis on the deep history of those features that characterize the human brain. We will study how our understanding of non-human vertebrates (both model and non-model organisms) can provide important insights into the structure and function of the modern human brain.
(AS.080.305 AND AS.080.306) OR AS.200.141

AS.290.400. Comparative Neural Systems and Behavior Research Discussions. 0.5 Credits.
This course is required concurrently with research in the Comparative Neural Systems Research and Behavior lab. During the scheduled meetings we will discuss scientific papers, policies and procedures, research ethics and other information related to activities in the lab. At the end of the semester, students will present their research in groups. This course is only open to students doing research in the Neural Systems and Behavior Lab.

AS.290.420. Human Sexual Orientation. 3 Credits.
This course will examine the historical and current theories of sexual orientation and sexual variation development by examining the biological, psychological and social contributing factors that influence the development of sexual orientations and variations along with treatment and modification of problematic sexual behaviors. Students may enroll in both AS.200.204 and AS.290.420, but cannot do so in the same semester. Priority given to Behavioral Biology majors. Note: For credit towards a Psychology major, students should register for AS.200.204 Human Sexuality, rather than this course.
Prerequisite(s): Students may enroll in both AS.200.204 and AS.290.420, but cannot do so in the same semester.
Students may receive credit for either AS.200.204 or AS.290.420, but not both.

AS.290.490. Senior Seminar: Behavioral Biology. 1 Credit.
Great ideas in Behavioral Biology. Discussion of classic and cutting edge articles in the original literature. Student presentations and reaction papers. Capstone course for senior Behavioral Biology majors.
AS.290.101 AND AS.200.208 AND AS.200.208 AND AS.200.208, or Instructor permission.;(AS.290.101 AND AS.200.208 AND AS.200.141) or Instructor permission.

AS.290.500. Connections in Behavioral Biology. 0.5 Credits.
In this seminar, students discuss the intellectual merit of current or potential future research, internship and outreach activities in Behavioral Biology. This course is designed to 1) expose Behavioral Biology majors to new knowledge in the field, 2) provide the opportunity to develop oral and written communication skills, and 3) build community among students in the major. Students will make oral presentations and write a short paper/news piece or prepare a webpage.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.501. Behavioral Biology Research - Freshmen. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.502. Research-Freshmen. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.503. Behavioral Biology Research-Behavioral Biology Majors. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.504. Behavioral Biology Research-Behavioral Biology Majors. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.505. Behavioral Biology DUS Approved Research. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.519. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.520. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.590. Behavioral Biology Internship. 1 - 3 Credits.
TBA
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.594. Behavioral Biology Internship. 1 Credit.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.595. Behavioral Biology Research - Freshmen. 1 - 3 Credits.
TBA
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.596. Behavioral Biology Internship. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.290.597. Behavioral Biology Research-Behavioral Biology Majors. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.300 (Comparative Thought and Literature)

AS.300.102. Great Minds. 3 Credits.
Introductory survey of foundational texts of modern philosophy, social and political thought, and literature. This semester will include works by Plato, René Descartes, Immanuel Kant, Karl Marx, Virginia Woolf, Ludwig Wittgenstein, Iris Murdoch, Cora Diamond, Judith Butler, Kwame A. Appiah, Jacques Derrida, and others. The course is taught in lectures and in seminar discussions.

AS.300.145. Humanities Collaboratory. 3 Credits.
The Humanities Collaboratory is designed for new researchers from across the humanities as they gain the applied skills and experience to conduct their own independent research projects in the humanities. The Humanities Collaboratory model uses a high-tech classroom to allow students and instructors to work, learn, and research together. Three sections of this course will share a core list of materials focused on humanities research techniques, but your primary course materials will be individually selected. Students will have the unique opportunity to participate in a humanities lab section where all three course sections merge for discussion. You will choose your own topic to research with no limits of time period, subject, or genre, and through constant collaborative and independent research, each student will develop the expertise in that topic to both write a research paper and create a final oral presentation.
Area: Writing Intensive

AS.300.207. The American Literature of the Movies. 3 Credits.
This course brings the question of film's status as art into historical focus by approaching it through the various forms of writing that cinema inspired. Following a brief historical and philosophical preamble, each of the three sections will present a literary vantage point on the movies: "inside," "outside," and "alongside." The "alongside" section centers on poets who incorporated film into an adjacent art form, the "inside" section centers on those within the moviemaking industry who wrote about it in their fiction, and "outside" on those who criticized and theorized it. Films that exemplify the issues at hand will accompany each section. Relevant scholarly and theoretical texts elucidate the topics, texts, and films of concern. Students will have the opportunity to read works by H.D., Hart Crane, F. Scott Fitzgerald, James Agee, and other notable writers from the first half of the 20th century.
Area: Writing Intensive

AS.300.227. Business Fictions. 3 Credits.
When you are working for a company, how do you distinguish your ideas, actions, and responsibilities from the firms'—if that is even possible? What is corporate culture or a corporate person, and how is it similar or different from any other kind of culture or person? These and related questions inspired and fascinated writers from the nineteenth century through the present. By reading and thinking about short stories, novels, film, a television series, and a play, we will explore these issues and potential resolutions to them. The course especially considers how problems of action, agency, and responsibility become an intriguing challenge for writers of a variety of modern and contemporary fictions of the business world. Texts will include short stories by Herman Melville, Alice Munro, Ann Petry, and John Cheever; novels by Willa Cather, F. Scott Fitzgerald, and Lydia Millet; films, plays, and television by Charlie Chaplin, David Mamet, and Dan Harmon (Community).

AS.300.300. Honors Seminar. 3 Credits.
The Honors Seminar is a mandatory component of the Honors Program in Humanities, which offers qualified undergraduates the possibility of pursuing an independent research project in their Junior and Senior years in any humanistic discipline or combination of disciplines: intellectual history, comparative literature, philosophy, critical theory, psychoanalysis, religion, film, etc., as well as points of intersection between the arts and the sciences. Sophomores who plan to study abroad in their Junior year should also consider applying to the Program. In the 2021-2022 academic year, the Seminar will focus on a close reading of Tolstoy's The Death of Ivan Ilych and associated texts by Plato, Montaigne, Heidegger, Beauvoir, Levi, Gawande, and others on death and dying.

AS.300.301. Women and Work in the US. 3 Credits.
This course offers an introduction to the political forces, cultural values, and social factors which have shaped the history of women's labor in the US. This course will ask question such as: Why do we place a higher value on work which takes place in the public sphere than work in the home? How do representations of work in literature and popular movies reinforce or subvert gender roles? How have women negotiated gendered and racial boundaries through political action or writing? Focusing on racialized labor, domestic labor, sex work, and factory work, the course will provide an interdisciplinary cultural study of women's work relevant to our current historical moment. Authors discussed include Saidiya Hartman, Harriet Beecher Stowe, Emma Goldman, and Kathi Weeks.
Area: Writing Intensive

AS.300.311. Introduction to Intellectual History. 3 Credits.
This course offers a conceptual and historical introduction to Intellectual History. What makes the “history of ideas” different from the history of other objects? What, if anything, distinguishes the history of ideas from the history of philosophy? What is it exactly that we call “ideas”? In what sense do they have a history? These are examples of the kind of questions addressed in the course.

AS.300.312. Imagining Revolution and Utopia. 3 Credits.
What form should revolution take, and what should society look like after the revolution? What would happen to the state, family, home, status of women, human interrelations, and everyday life? These questions consumed radicals in 19th century Russia and Europe, and their answers helped to shape the political culture of the 20th century. This course examines theories of revolution and utopia and responses to them in literature, art and film. Primary case study is Russia and the Soviet Union, with a comparative look at influential European works.
Area: Writing Intensive

AS.300.317. The Russian Novel. 3 Credits.
This course introduces students to the nineteenth century Russian novel and considers its lasting impact on world culture. We will read classic masterpieces of the psychological and philosophical novel, and their experimental forerunners. Short lectures on historical and cultural context and on methods of literary analysis will be combined with intensive group discussion. Novels include Anna Karenina, Crime and Punishment, Eugene Onegin, Dead Souls, and Hero of our Time.
Area: Writing Intensive

AS.300.319. The Modernist Novel: Mann, Woolf, and Joyce. 3 Credits.
In this course, we will survey the major works of three of the greatest, most relentless innovators of the twentieth century – Thomas Mann, Virginia Woolf, and James Joyce – who explored and exploded narrative techniques for depicting what Woolf called the “luminous halo” of life.
Area: Writing Intensive

AS.300.322. Lu Xun And His Times: China’s Long 20th Century And Beyond. 3 Credits.
The “founding father of modern Chinese literature,” Lu Xun (1881-1936) saw himself as a contemporary of writers like Gogol, Ibsen, and Nietzsche in creating his seminal short stories and essays, and likewise, he has been seen by numerous Chinese, Sinophone, and East Asian writers as their contemporary since his lifetime until today. In this course, we will survey Lu Xun’s canonical works and their legacies through a comparative approach. What echoes do Lu Xun’s works have with the European and Russian texts he engaged with? Why did his works manage to mark a “new origin” of Chinese literature? How were his works repeated, adapted, and appropriated by Chinese writers from the Republican period through the Maoist era to the post-socialist present, even during the Covid-19 pandemic? How do we assess his cross-cultural reception? Are his times obsolete now that China is on the rise? Or, have his times come yet? Through our comparative survey, Lu Xun’s works and their afterlives will offer us a window onto China’s long twentieth century and beyond in a transnational context. All materials are provided in English translation.

AS.300.323. Shakespeare and Ibsen. 3 Credits.
William Shakespeare and Henrik Ibsen are the two most frequently performed playwrights in history, and both have been credited with reinventing drama: Shakespeare for the Elizabethan stage and Ibsen for the modern. In this course we will pair together plays by each author – those that stand in an explicit relation of influence as well as those that share a significant set of concerns – in order to investigate how each takes up and transform key problems in the literary, political, and philosophical tradition for their own historical moment. Plays to be studied: by Shakespeare, A Midsummer Night’s Dream, Hamlet, Othello, King Lear, The Tempest, A Winter’s Tale; by Ibsen, St. John’s Night, Hedda Gabler, Rosmersholm, The Wild Duck, The Master Builder, When We Dead Awaken.

AS.300.324. Cinema of the 1930s: Communist and Capitalist Fantasies. 3 Credits.
Comedy and musical comedy film flourished in the USA during the Great Depression as well as in the USSR during the Stalinist Great Terror. This course will compare films of the era in a variety of genres (musical, epic, Western, drama), examining the intersections between politics and aesthetics as well as the lasting implications of the films themselves in light of theoretical works on film as a medium, ethics and gender.

AS.300.328. Contemporary Sinophone Literature and Film. 3 Credits.
A survey of contemporary literature and film from the peripheries of the Chinese-speaking world, with a special focus on Hong Kong, Taiwan, and overseas Chinese communities in Southeast Asia, the Americas, and Europe. We will not only examine literary and filmic works in the contexts of the layered histories and contested politics of these locations, but will also reexamine, in light of those works, critical concepts in literary and cultural studies including, but not limited to, form, ideology, hegemony, identity, history, agency, translation, and (post)colonialism. All readings are in English; all films subtitled in English.

AS.300.330. Modern East Asian Literatures Across Boundaries. 3 Credits.
Modern literature in East Asia is as much defined by creation of national boundaries as by their transgressions, negotiations, and reimaginations. This course examines literature originally written in Chinese, Japanese, and Korean in light of contemporary understandings of political, social, and cultural boundary demarcation and crossings. How do experiences of border-crossing create and/or alter literary forms? How, in turn, does literature inscribe, displace, and/or dismantle boundaries? Our readings will include, but not limited to, writings by intra- and trans-regional travelers, exiles, migrants, and settlers; stories from and on contested borderlands and islands (e.g. Manchuria, Okinawa, Jeju); and works and translations by bilingual authors. All readings are provided in English translation.

AS.300.331. The Authoritarian Image: Russian Cinema from Stalin to Putin. 3 Credits.
Vladimir Putin’s charismatic authority has a deep history in Russian culture. We’ll investigate that history through cinema, which Lenin called “the most important of the arts.” While Soviet cinema often served as immersive propaganda, directors also found ways to question authority and power. Films to be screened range from Sergei Eisenstein’s Ivan the Terrible (1944) to the 2013 documentary Pussy Riot: A Punk Prayer. This course will combine study of Russian and Soviet culture from the end of World War II to the present with study of film history, style, and technique.
Area: Writing Intensive

AS.300.332. From Chekhov to Chernobyl: Russian Literature of Environmental Catastrophe. 3 Credits.
Environmental degradation and disaster offer a steady backdrop to the 20th century in Russia and the Soviet Union. While the Soviet regime promised mastery over the environment and Russian culture valorized the harmonization of humans with the natural world, environmental catastrophe proved the folly of those dreams. We will read works by authors who havegrappled with this ongoing catastrophe and its implications for relations between human beings and the world. Texts range from short stories and novellas to modernist experimental fiction and documentary prose. We will also engage with materials in special collections and screen selected films. Authors include: Chekhov, Bulgakov, Platonov, Solzhenitsyn, Rasputin,Petrushevskaya, and the Nobel laureate Svetlana Alexievich.
Area: Writing Intensive

AS.300.334. Love and its maladies. 3 Credits.
Much of what we know about love and desire we owe to fiction's ability to evoke these experiences. Consider for example that the publication, in Germany, of The Sorrows of Young Werther inspired young men across Europe to dress and behave just like this lover. Just as nowadays film and television represent, as well as mold our conceptions of love, love-stories from the eighteenth-century onwards have given shape to gendered subjectivities in ways that still matter now. As, intriguingly, illness is a recurrent theme in many modern love stories, we will be prompted to decipher signs and symptoms in the bodies of mind of our protagonists. Why is it that in Western cultures, passion is tightly interwoven with a landscape of pain, suffering, and disease? In studying texts that represent major aspects of a romantic sensibility, we are indeed invited to trace the steps of a history of the body increasingly defined by gender and by medical knowledge. The readings for this class (all available in English) include: Austen, Persuasion; Balzac, The Unknown Masterpiece; Barthes, Lover's Discourse; Goethe; The Sorrows of Young Werther; Mann, Death in Venice; Winterson, Written on the Body.

AS.300.336. Forms of Moral Community: The Contemporary World Novel. 3 Credits.
Literary and philosophical imaginations of moral community in the post-WWII period. Texts include: Coetzee, Disgrace; McEwan, Atonement; Achebe,Things Fall Apart; Ishiguro, An Artist of the Floating World; Roy, The God of Small Things; Lessing, The Grass is Singing; Mistry, A Fine Balance; Morrison, Beloved; and essays by Levi, Strawson, Adorno, Murdoch, and Beauvoir on the deep uncertainty over moral community after the crisis of World War II. Close attention to novelistic style and narrative will inform our study of the philosophical questions that animate these works. What does it mean to acknowledge another person's humanity? Who are the members of a moral community? Why do we hold one another responsible for our actions? How do fundamental moral emotions such as contempt, humiliation, compassion, gratitude, forgiveness, and regret reveal the limits of a moral community?

AS.300.337. The Tragic Tradition. 3 Credits.
This course offers a broad survey of tragic drama in the Western tradition, from its origins in ancient Greece to the twentieth century. In weekly lectures and discussion sections, we will study the specific literary features and historical contexts of a range of different works, and trace the continuities and transformations that shape them into a unified tradition. Key questions and themes throughout the semester will include what counts as tragic, the tragedy of social and political conflict, the bearing of tragedy on the meaning and value of life, the antagonistic relation between world and humans, the promises and dangers of tragedy for contemporary culture. Authors to be studied: Sophocles, Euripides, Seneca, Shakespeare, Racine, Goethe, Ibsen, Strindberg, Chekov, Brecht, Pirandello, and Beckett.

AS.300.339. Introduction to Comparative Literature. 3 Credits.
This course offers an introduction to the history, theory, and praxis of comparative literature. We will read texts from some of the founding figures of the discipline and look at the most recent debates in the field, including translation studies, literary theory, and world literature, among others. Particular attention will be given to the methodologies and problems of studying literatures in different linguistic traditions and the relation between literature and other areas of thought and culture, such as philosophy, art history, and psychoanalysis. Case studies in comparative approaches to literature will provide concrete examples to our discussions.

AS.300.340. Literature and Film of Unintended Consequences. 3 Credits.
Sometimes brilliant ideas and plans don't work as anticipated, or go very badly—for example, empowering the "invisible hand" of the market, building a huge hydroelectric dam, or plotting a double murder by two strangers. This course explores these and other fascinating literary instances of unintended consequences—the unanticipated results of actions that people planned ending up a very different way. Reading or watching mainly twentieth-century American literature and movies, as well as some essays and poetry, we will follow a range of different creators as they think about unplanned effects and why they matter. What can these works tell us about how we intend, act, or make meaning at the limits of our control? Texts will include films by Charlie Chaplin, Billy Wilder, and Alfred Hitchcock, poetry or fiction by Wallace Stevens, Patricia Highsmith, and Zadie Smith.
Area: Writing Intensive

AS.300.341. Transwar Japanese and Japanophone Literatures. 3 Credits.
A survey of Japanese and Japanese- language literatures produced in Japan and its (former)colonies during the "transwar" period, or the several years before and after the end of WWII. This periodization enables us to take into account the shifting boundaries, sovereignties, and identities amid the intensification of Japanese imperialism and in the aftermath of its eventual demise. We aim to pay particular attention to voices marginalized in this political watershed, such as those of Japanese-language writers from colonial Korea and Taiwan, intra-imperial migrants, and radical critics of Japan's "postwar" regime. Underlying our investigation is the question of whether literature can be an agent of justice when politics fails to deliver it. We will introduce secondary readings by Adorno, Arendt, Levinas, Derrida, and Scarry, among others, to help us interrogate this question. All readings are in English.

AS.300.343. The Cinema of Revolution. 3 Credits.
This course examines global political revolutions through cinema and the ways in which cinema helped to make political revolutions. Early cinema was intimately intertwined with the Russian revolution, and Russian revolutionary cinema had a profound impact on the ways in which media was used for revolutionary purposes through the 20th century and around the world. Students will be introduced to films from a number of different countries, and the history and context of their production and reception. They will also learn methods of film analysis and produce their own video essay.

AS.300.344. Literature and the World. 3 Credits.
This course interrogates how modern literature not simply reflects the world but functions as world-making power. What is a world? How do we conceive of, live in, and change it? What if there are multiple worlds? How are literature and other aesthetic forms crucial to tackling these questions? We will survey literary and philosophical texts in a comparative setting, engaging examples from both Europe and East Asia. All readings are in English. Open to graduate students.
Area: Writing Intensive

AS.300.345. Narrative Imagination in Philosophy and Literature. 3 Credits.
We are constantly immersed in narratives or, as Roland Barthes said, narrative "is simply there like life itself. . . international, transhistorical, transcultural." As a bridge between experience and language, narrative informs the way we understand history, gender, politics, emotion, cognition and much more. Through reading a series of philosophical and literary texts, this course will provide a systematic understanding of how narratives are composed, how they are experienced, and eventually, how they evolve. The first part of this course will focus on building a foundation in the formal study of narrative, focusing on elements such as genre, plot, character, narrator and reader. We will start with a brief consideration of ancient approaches to literary narrative in Aristotle's Poetics and Plato's Republic. From there, we will engage with a wide range of readings in narrative theory. The second part of the course will focus on critical approaches to narrative, such as gender and narrative, social and political critique of narrative, narratives in the age of artificial intelligence, and conclude with the evolving concept of narrative in the Anthropocene.

AS.300.347. Imagining Climate Change. 3 Credits.
Climate change poses an existential threat to human civilization. Yet the attention and concern it receives in ordinary life and culture is nowhere near what science tells us is required. What are the causes of this mismatch between crisis and response? What accounts for our collective inability to imagine and grasp this new reality, and how can it be overcome? In pursuit of these questions, we will pair literary works and films with texts from politics, philosophy, literary theory, and religion, that frame climate change as a fundamental challenge to our ways of making sense of the human condition.

AS.300.348. Modern Drama. 3 Credits.
This course offers a survey of modern drama, from the mid nineteenth century to the present. We will sample a broad range of dramatic styles and movements in order to uncover the variety of ways theatre has made sense of the human experience over the past two hundred years.

AS.300.349. Capitalism and Tragedy: from the 18th Century to Climate Change. 3 Credits.
In contemporary discussions of climate change, it is an increasingly prevalent view that capitalism will lead to the destruction of civilization as we know it. The notion that capitalism is hostile to what makes human life worth living, however, is one that stretches back at least to the early eighteenth century. In this class, we will examine key moments in the history of this idea in works of literature, philosophy, and politics, from the birth of bourgeois tragedy in the 1720s, through topics such as imperialism and economic exploitation, to the prospects of our ecological future today. Authors to be studied: George Lillo, Balzac, Dickens, Marx and Engels, Ibsen, Weber, Brecht, Arthur Miller, Steinbeck, Pope Francis, and contemporary fiction, politics and philosophy on climate change.

AS.300.366. Russian Avant-Garde Cinema. 3 Credits.
Russian cinema was born out of the intense artistic experimentation of the fin-de-siècle avant-garde and developed in a climate of dramatic political and cultural change in the twenties and thirties. While subject to draconian censorship in the Soviet period, it nonetheless engaged in active dialogue with the film industries of Western Europe and America and had a lasting impact on world cinema. This course examines the extraordinary flourishing of avant-garde cinema in the Soviet Union in the 1920s and 30s including films by Eisenstein, Vertov, Pudovkin, and Dovzhenko, their theoretical writings, and their far-reaching influence on film and film theory. All readings in English, films subtitled in English.
Area: Writing Intensive

AS.300.367. Seeing Like a Woman. 3 Credits.
What does it mean to "see," think, desire, feel, speak, act, or write "like a woman"? Gendered notions of seeing have had an impact on politics and society long before the #metoo movement and far beyond debates about women's rights in isolation. This seminar examines the issues of female desire, subjectivity, spectatorship and performance in fiction, poetry, memoir and film from a variety of cultures and theoretical perspectives. This is not a course on "the image of the woman" in literature, film or politics, but a course in which we examine the ways in which both male and female theorists, novelists, poets, and filmmakers have imagined how women "see," feel, think and behave.
Area: Writing Intensive

AS.300.399. Cinema and Philosophy. 3 Credits.
What do films and philosophy have in common? Do films express, with their own means, philosophical problems that are relevant to our experience of ourselves and the world we live in? This term we will study such issues with a particular focus on questions of justice, truth, revenge, forgiveness, hope, hate, and fear.

AS.300.402. What is a Person? Humans, Corporations, Robots, Trees. 3 Credits.
Knowing who or what counts as a person seems straightforward, until we consider the many kinds of creatures, objects, and artificial beings that have been granted—or demanded or denied—that status. This course explores recent debates on being a person in culture, law, and philosophy. Questions examined will include: Should trees have standing? Can corporations have religious beliefs? Could a robot sign a contract? Materials examined will be wide-ranging, including essays, philosophy, novels, science fiction, television, film. No special background is required.

AS.300.410. China in Imagination. 3 Credits.
What is China? This question has gained new relevance amid the nation's recent rise as a global power. We survey how China was imagined, represented, and conceptualized in literature, film, and philosophical writings from mainland China, overseas Chinese communities, East Asia, and the West from the late nineteenth century to the present. Through exploring this complex history, we aim to understand China and the contemporary world in a diversified, historically self-reflective way. Topics of discussion include, but not limited to, representation, identity, form, allegory, exile, diaspora, modernism, translation, world history, and universality. All readings are in English; all films subtitled in English.

AS.300.418. The Modernist Novel: James, Woolf, and Joyce. 3 Credits.
In this course, we will survey the major works of three of the greatest, most relentless innovators of the twentieth century – Henry James, Virginia Woolf, and James Joyce – who explored and exploded narrative techniques for depicting what Woolf called the "luminous halo" of life.
Area: Writing Intensive

AS.300.421. Introduction to Concepts and Problems of Modern Philosophy, Aesthtics, and Critical Theory. 3 Credits.
This seminar is addressed to first and second year graduate students as well as to advanced undergraduates. It aims at providing a survey of some fundamental concepts and problems that shape modern and contemporary debates in philosophy, literary studies, and the humanities at large. This term we will study in particular notions of existence, language, truth, power, otherness, race, gender, and reality.
Area: Writing Intensive

AS.300.425. Modernities and Comparison. 3 Credits.
Comparative survey of literary modernities in Europe and East Asia (China, Japan, and Korea). We will study works of modern literature as well as critical and philosophical texts from these civilizations in each other's light. We will, as a working hypothesis, begin our examination by bracketing off the conventional center-periphery (Europe-Asia) scheme and considering literary modernities to be singular and contested, yet mutually resonating attempts at reconstruction, restoration, and revolution vis-à-vis the deconstructive forces of capitalist modernity. Ultimately, we will interrogate how we should understand literary modernities in the plural, as they emerged in distant civilizations. Topics of discussion include decadence, repetition, the trope of the human, ideology, the sublime, ritual, and translation. Readings in Hegel, Nietzsche, Mann, Benjamin, Baudelaire, Proust, Breton, Soseki, Kobayashi, Wang Guowei, Lu Xun, and Yi Kwangsu. All readings are in English.

AS.300.437. Literature and Philosophy of the Everyday. 3 Credits.
The ordinary, the common, the everyday: why does literary realism consider the experiences of the average individual to be worthy of serious contemplation? In this course, we will read closely a set of novels by Flaubert, Mann, Dickens, Eliot, Zola,Tolstoy, and Woolf from the period between 1850 and 1950 in which the development of realism reaches it climax. These novels transform the conventions for the representation of lives of lower and middle class subjects, revealing such lives as capable of prompting reflection upon deep and serious questions of human existence. Theoretical and philosophical texts on the everyday by Auerbach, Kierkegaard, Heidegger, Sartre, Beauvoir, Lefebvre, Certeau, and Wittgenstein will accompany our discussions.

AS.300.439. Stories of hysteria. 3 Credits.
Many are the stories that recount episodes of hysteria, and we owe them not only to medicine. To the modern observer, they are a puzzle, involving strange beliefs about wandering wombs, demonic possession, and female virtue (or lack thereof). Closer to our time, contemporary media, as well as accounts in the social and clinical sciences have evoked cases of "mass hysteria" in America and across the globe. Marriage, it was thought for a long time, might be the best cure, which might be the reason case-studies of this illness can be as intriguing and troubling as novels. Against a backdrop of medical and historical materials, we will examine a selection of stories, from the 17th century onward, that evoke aspects of hysteria. They serve as our case-studies and as prompts to study an illness born at the convergence of histories and myths, of medical science, and of cultural and gender assumptions. Among the notions we will explore: The birth of psychoanalysis, trauma and PTSD, the concept of repression, the visual aspects of an illness and its spread in the arts, including cinema.

AS.300.501. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.300.508. Honors Seminar. 3 Credits.
The Honors Seminar is a mandatory component of the Honors Program in Humanities, which offers qualified undergraduates the possibility of pursuing an independent research project in their Junior and Senior years in any humanistic discipline or combination of disciplines: intellectual history, comparative literature, philosophy, critical theory, psychoanalysis, religion, film, etc., as well as points of intersection between the arts and the sciences. Sophomores who plan to study abroad in their Junior year should also consider applying to the Program. In the 2021-2022 academic year, the Seminar will focus on a close reading of Tolstoy's The Death of Ivan Ilych and associated texts by Plato, Montaigne, Heidegger, Beauvoir, Levi, Gawande, and others on death and dying.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.300.601. How to Read Proust?.
Given the difficulty of his prose, closely and patiently would seem the best way to read Proust, but who has time – time to read a book that, ironically, begins with "Longtemps" and ends with "le temps"? This course will offer for critical examination surgically selected passages of A la Recherche du Temps Perdu as a training ground for the (lost?) art of close reading and as entry points into wide-ranging aspects of literary criticism and theory.Open to advanced undergraduates with permission of the instructor.Taught in English. Knowledge of French is desirable, but not required.

AS.300.608. The Physics and Metaphysics of Handwriting.
When word processing machines that can be held in the palm of a hand, why use pen and paper? Handwriting -- and its juxtaposition against digital forms of communication -- offers a unique approach to studying human interactions and the ways in which meaning, truth, intimacy, and agency are shaped by our changing technologies. At a time of exponential growth in machine writing, a study of this older form of communication enables a comparative approach that, perhaps surprisingly, opens up what are contemporary political questions. Centered on a few case-studies involving works by Sand, Chopin, Manet, Giacometti, Mallarmé, and Proust, this course takes a backward glance at a culture of written expression at a great remove from our word processing world and yet explicitly vested in an aesthetics of free expression. This modern graphological culture saw in the tracings of the hand, the uniquely personal marks of an intertwining of mind, body, and of subjectivity. Merleau-Ponty and recent word on embodiment will provide us with critical tools for our investigations into the “physics” of this activity, as will the methods of textual criticism and the new domain of creativity studies. The “metaphysics” of handwriting call, meanwhile, for a return to Heidegger, to Derrida and other major contemporary theorists of writing. They will help us see how hand and digital writing emerge as fundamentally different modes of human expression – philosophically and politically. Knowledge of French is not required for this course. Undergraduates accepted with the permission of the professor.

AS.300.613. Modern Drama.
This course offers a survey of modern drama, from the mid nineteenth century to the present. We will sample a broad range of dramatic styles and movements in order to uncover the variety of ways theatre has made sense of the human experience over the past two hundred years.

AS.300.614. The End of Art.
In this course we will examine Hegel’s seminal claim that art has come to an end in the modern world. In addition to Hegel’s original argument, readings will include important elaborations of the idea by Kierkegaard, Heidegger, and Adorno. In a final section of the course, we will relate these texts to reflections on the function and prospects of art under the unprecedented condition of the Anthropocene.

AS.300.617. Philosophy and Literature in Either/Or.
Celebrated and reviled alike, Kierkegaard’s 1843 Either/Or has been viewed as both the culmination of the Enlightenment project and the birth of existentialism, a playful work of romantic literature and a piece of late-Hegelian philosophy, a vindication of the secular everyday and the articulation of a modern faith in a transcendent God. In this course we read the work closely and in its entirety and pay particular attention to the relation between its philosophical arguments and literary forms of presentation.

AS.300.618. What is a Person? Humans, Corporations, Robots, Trees..
Knowing who or what counts as a person seems straightforward, until we consider the many kinds of creatures, objects, and artificial beings that have been granted—or demanded or denied—that status. This course explores recent debates on being a person in culture, law, and philosophy. Questions examined will include: Should trees have standing? Can corporations have religious beliefs? Could a robot sign a contract? Materials examined will be wide-ranging, including essays, philosophy, novels, science fiction, television, film. No special background is required.
Area: Writing Intensive

AS.300.620. Cosmopolitanism: Conflicted Legacies, Potential Futures.
In its modern version cosmopolitanism is a defining aspect of Enlightenment that bespeaks its emancipatory aspirations as well as the shortcomings of its Eurocentric and gendered presuppositions. In our time of resurgence of violent nationalisms and mass refugees crises, this seminar aims at reassessing the conflicted legacies of cosmopolitanism and its critical value for the present. Authors studied include: Montaigne, Kant, Marx, Derrida, Lévinas, Kwame A. Appiah, Seyla Benhabib, and others.

AS.300.621. Immersive Poetics and Permeable Screens.
Victor Shklovsky claimed that the art exists “to return sensation to life, to make us feel objects, to make a stone feel stony.” This seminar examines various ways of understanding Shklovsky’s concept of ostranenie (“enstrangement”) across media (literature, art, cinema, and beyond) and in comparative perspective, considering the problematics of politics, philosophy, and aesthetic form. Students will be encouraged to present on texts in their own area of expertise over the course of the term.

AS.300.622. The Concept of World: From Descartes to the Apocalypse.
In this course we will examine the idea of the world as it operates in a range of different literary, philosophical, and theoretical contexts. Beginning with the birth of the modern world in texts like Camões’s “The Lusíads,” Descartes’s “Le Monde,” and More’s “Utopia,” we will pursue its evolution through Baumgarten’s invention of aesthetics, Kant’s critique of dialectical reason, Husserl’s phenomenology, and Heidegger’s fundamental ontology, to the rise of world literature and the study of indigenous cosmologies in contemporary anthropology. We conclude with reflections on the end of our world in the Anthropocene and its implication for the humanistic disciplines. This course serves as the proseminar in methods and theory for graduate students in Comparative Thought and Literature but is open to students in all departments.

AS.300.624. Logics of Recognition.
Since the publication of Hegel’s Phenomenology of Spirit, the struggle of consciousness for recognition has played an important role in moral and political philosophy. This seminar aims at studying Hegel’s account of subjectivity and its antagonistic encounter with the other as well as the responses and critiques it has elicited in contemporary philosophy. Readings include Foucault, Butler, Derrida, Lévinas, Cavell, Honneth and others.

AS.300.625. Russian Literary and Critical Theory.
Close reading of major authors from the Russian literary theoretical and critical tradition including Bakhtin, Eikhenbaum, Jakobson, Lotman, Shklovsky and Tynianov. Student will present primary sources or case studies from their own fields and research.

AS.300.628. Introduction to Concepts and Problems of Modern Philosophy, Aesthtics, and Critical Theory.
This seminar is addressed to first and second year graduate students as well as to advanced undergraduates. It aims at providing a survey of some fundamental concepts and problems that shape modern and contemporary debates in philosophy, literary studies, and the humanities at large. This term we will study in particular notions of existence, language, truth, power, otherness, race, gender, and reality.

AS.300.629. Theory, Now and Then: Autonomy, Form, Critique.
This course explores recent developments and disputes in critical theory in relation to their longer philosophical genealogies. The three topics—form, autonomy, and critique—have been the subject of much recent debate, contention, and new analysis, yet each was also a source of critical and philosophical interest in years past. Our aim will be to make sense of today's interventions in conversation with earlier theory. "Historical" theory writing will include Adorno, Lukács, Cavell, and Jameson; contemporary theory will include Nicholas Brown, Rita Felski, Caroline Levine, Mark McGurl, and Toril Moi.

AS.300.631. On Literature and Ethics.
Arguments for the immorality of literature, the morality of literature, and the amorality of literature. Can a literary text be evaluated on ethical grounds, and how? How do literary texts make ethical arguments? What does it mean to read literary texts or do literary criticism in an ethical mode? We will be concerned throughout with the philosophical uses, and abuses, of literary forms.
Area: Writing Intensive

AS.300.635. Foucault's Late Seminars: the Courage of Truth and the Care of the Self.
In his latest seminars Foucault shifts his attention from power relations and historical scientific paradigms to the study of the history and philosophical, ethical, and political implications of the knowledge and care of the self as well as its relation to truth. In our current context, where speaking of a supposed "post-truth" epoch is commonplace, the analysis of the later works of Foucault provides precious insights in the nature of subjectivity, social and power relations, and the enduring significance of the search for truth regardless of any particular epistemological attempt to define what 'truth really is.'

AS.300.638. Happy and Unhappy Words: Austin, Wittgenstein, and Cavell.
This seminar studies how words help shaping the world we inhabit and how the power and limits of language affect the possibility of living in a shared world in the works of Austin, Wittgenstein, Cavell and others.
Area: Writing Intensive

AS.300.639. Literature and Philosophy of the Everyday.
The ordinary, the common, the everyday: why does literary realism consider the experiences of the average individual to be worthy of serious contemplation? In this course, we will read closely a set of novels by Flaubert, Mann, Dickens, Eliot, Zola,Tolstoy, and Woolf from the period between 1850 and 1950 in which the development of realism reaches it climax. These novels transform the conventions for the representation of lives of lower and middle class subjects, revealing such lives as capable of prompting reflection upon deep and serious questions of human existence. Theoretical and philosophical texts on the everyday by Auerbach, Kierkegaard, Heidegger, Sartre, Beauvoir, Lefebvre, Certeau, and Wittgenstein will accompany our discussions.

AS.300.647. Comparative Methods and Theory: Formalism and Materialism (Graduate Pro-Seminar).
This pro-seminar provides a brief overview and map of the theoretical and philosophical positions in the major debate, still ongoing, between formalism and materialism. Its aim is both theoretical and historical: to help graduate students understand the range and depth of these positions as well as their development over time, continuing to this day. We will study fundamental philosophical works (Kant, Hegel, Marx, de Beauvoir), classic theoretical texts (Propp, Lévi-Strauss, Foucault, Derrida, Bourdieu), and contemporary variations on these debates (Fish, McGurl, Moi, Pippin), to name a few. The course fulfills the pro-seminar requirements in comparative methods and theory for CTL but is open to all graduate students.

AS.300.666. Russian Avant-Garde Cinema.
Russian cinema was born out of the intense artistic experimentation of the fin-de-siècle avant-garde and developed in a climate of dramatic political and cultural change in the twenties and thirties. While subject to draconian censorship in the Soviet period, it nonetheless engaged in active dialogue with the film industries of Western Europe and America and had a lasting impact on world cinema. This course examines the extraordinary flourishing of avant-garde cinema in the Soviet Union in the 1920s and 30s including films by Eisenstein, Vertov, Pudovkin, and Dovzhenko, their theoretical writings, and their far-reaching influence on film and film theory. All readings in English, films subtitled in English.

AS.310 (East Asian Studies)

AS.310.106. Introduction to Korean History and Culture. 3 Credits.
This course offers a comprehensive overview of Korean history and culture from ancient times to the modern era. Through primary, secondary, and audio-visual sources, students will become familiar not only with the overall contours of the entirety of Korean history, but also with its cultural and religious legacy. The course combines lectures and class discussions.

AS.310.107. Introduction to Korean Studies. 3 Credits.
This course offers a comprehensive overview of Korean history, politics, and culture encompassing premodern, modern, and contemporary times. Through primary and secondary materials, students will learn about the formation of Korea as a complex interplay of dynastic changes, wars, colonialism, rapid modernization, migrations, and minority and diasporic politics. We will approach the study of Korea through a cultural studies perspective, paying close attention to systems of power, ideology, gender, race, and class.

AS.310.110. Literatures and Films of Korea and the Korean Diaspora. 3 Credits.
This survey course introduces students to major events and themes addressed in Korean literature and film such as: Japanese colonialism, modernity, capitalism, the Korean War, rapid industrialization, postmodernity, immigration, transnational adoption, and more. Students will examine the role of literature and film in the development of the nation and the depiction of the Korean and Korean-diasporic subject as a complex set of intersecting social identities that contend with race, class, and gender.
Area: Writing Intensive

AS.310.210. Documentary Photography in a Changing China. 3 Credits.
This course aims to inspire students to explore the impacts, meanings, and explanations of social transformation in contemporary China, via the lens of documentary photography. The photographic images of selective topics will include the products of photojournalism and documentary photography, and several documentary films, by both Chinese and non-Chinese photographers. While one picture is worth thousand words, one picture may also provoke countless interpretations. Students are strongly encouraged to read broadly about different aspects of social transformations in contemporary China, and to select and curate their own subjects of photo images. The spirit of comparative study of documentary photography of China and other parts of world will be strongly encouraged. Active class participation is imperative. A small exhibition on the campus will be organized by the Spring semester. The course is designed for upper division undergraduates. Cross-listed with Sociology and International Studies (CP).

AS.310.230. Chinese Politics and Society. 3 Credits.
This introductory course will familiarize students with the major dynamics of political and social change in contemporary China since 1949. The course will be divided chronologically into four main topics: 1. The contested processes of nation-state making in modern China before 1949; 2. The making of the socialist system during the Mao Years and its dismantling since 1978; 3. The Reform Era transformation to a market economy with Chinese characteristics; 4. The dynamic relationships among the state, market and society since the new millennium. Students will explore how scholars have explained major political and social changes with reference to individual and collective rationalities, specific organizational and institutional arrangements, and specific strategic and cultural mechanisms of Chinese political and social habits.

AS.310.285. Chinese Leaders: Institutions and Agency. 3 Credits.
This course is a broad survey of what leadership looks like in China. The main through-line of the course is the how China's leaders navigate the often challenging terrain between constraints and incentives, on the one hand, and opportunities to apply their own individual agency. We will explore the state as the arena in which all this takes place over time (to explore continuity and change) and across space (to explore adaptation and innovation). The course does not presume prior knowledge of China or Chinese language, but students new to the study of China are encouraged to pay special attention to the cumulative nature of the course and invest in the readings, particularly in the first four weeks. Although some of the themes of this course may minimally overlap with/reinforce other Chinese politics courses offered at JHU, the approach to this class will be significantly different.

AS.310.302. China, Human Rights, and U.S. Policy Responses. 3 Credits.
This seminar explores select human rights issues in China (e.g., human rights impacts of the management of COVID-19, the Hong Kong protests, mass detentions/forced labor in Xinjiang province) and the extraterritorial reach of China's human rights challenges. As a practice and policy-oriented course, we will also investigate different responses and actions taken by the U.S. government and Congress, including hearings, legislation, reports, statements, etc. Class assignments include advocacy for Chinese prisoners of conscience (each student will "adopt" one currently detained PoC), and written work that mirrors real-world writing. We'll also have several human rights advocates and experts visit the class to share their experiences and insights. This seminar explores select human rights issues in China (e.g., human rights impacts of the management of COVID-19, the Hong Kong protests, mass detentions/forced labor in Xinjiang province) and the extraterritorial reach of China's human rights challenges. As a practice and policy-oriented course, we will also investigate different responses and actions taken by the U.S. government and Congress, including hearings, legislation, reports, statements, etc. Class assignments include advocacy for Chinese prisoners of conscience (each student will "adopt" one currently detained PoC), and written work that mirrors real-world writing. We'll also have several human rights advocates and experts visit the class to share their experiences and insights.

AS.310.305. China, Southeast Asia, and U.S. National Security. 3 Credits.
The global political and security landscape of the 21st century will be shaped by the rivalry between two superpowers -- China and the U.S. For the foreseeable future, the geographic focus of that contest will be Southeast Asia and the surrounding maritime space, particularly the South China Sea. Southeast Asia is a complex, highly differentiated region of ten-plus nations, each with its own unique history and relationship with China. This course will introduce Southeast Asia as a key region -- geographically, economically, and strategically -- often overlooked by policymakers and scholars. It will also focus on the craft of national security strategy as the best tool for understanding the multi-sided competition, already well underway involving China, the U.S., and the Southeast Asian states.

AS.310.316. First Year Classical Chinese: Philosophers, Poets and Fantasists: An Introduction to Chinese Literature in the Original Classical Texts. 3 Credits.
We will read arguments, anecdotes and stories, beginning with the philosophers of the ancient period, including the imaginative paradigms of the Daoist writer Zhuangzi, and continue with the strange writings allied with shamanism and goddess-worship. We will continue with the fantastical writers of the medieval world and finish with anecdotes of the strange from the Ming and Qing. Because this is a language as well as a literature class, in addition to literary content and social history as background, we will emphasize grammar and vocabulary. Class preparation will require language exercises, translations, readings in English and there will be a final translation/research paper.
(AS.373.115 AND AS.373.116) OR (AS.373.111 AND AS.373.112) OR (AS.378.115 OR AS.378.116) or Instructor permission.

AS.310.318. Eurasia's Transformation and the Global Implications. 3 Credits.
Eurasia, stretching from the Western Europe across Russia, Central Asia, and China to the Pacific, is by far the largest continent on earth, with a massive share of global population, economic output, and key natural resources. It has been traditionally Balkanized. Yet since the late 1970s, due to China's modernizations, the collapse of the Soviet Union, and a series of global geo-economic shocks, the nations of this Super Continent have become increasingly interactive, creating fluid new trans-regional political-economic patterns that remain remarkably unexplored. This course explores the critical junctures that made Eurasia the dynamic, growing colossus that it is becoming today, as well as the global implications, from a unique problem-oriented perspective. It looks first at the developmental and political challenges confronting China, Russia, and key European states as the Cold War waned, how the key nations coped, and how they might have evolved differently. It then considers the new challenges of the post-Cold War world, and how national and local leaders are responding today. Particular attention is given, in this problem—centric approach, to the challenges that growing Eurasian continental connectivity, epitomized in China's Belt and Road Initiative, are creating for US foreign policy and for the grand strategy of American allies in NATO, Japan, and Korea. Note: Some familiarity with Eurasian history and/or politics is recommended
Area: Writing Intensive

AS.310.319. Gender & Sexuality in Korea and Asia. 3 Credits.
Utilizing an interdisciplinary approach, this course examines the role that gender and sexuality play within primarily the South Korean polity and in Asia. Drawing on queer studies, feminist studies, and critical Asian studies, the class will offer a foundational framework from which to analyze how social constructs around gender and sexuality play a major part in the marginalization of communities and their access to rights and representation. We will explore questions of kinship, family, love, and intimacy as they pertain to the larger thematics of the course.
Area: Writing Intensive

AS.310.320. Sociology of Urban China. 3 Credits.
Urban China has gone through two major social transformations since 1949: the embrace of a central planning socialist system between early 1950s and late 70s, and the embrace of neo-liberal market economy in the so-call "socialism with Chinese characteristics" since 1980. While the political regime remains the same over time, many profound changes have occurred in economic life, social life, cultural life, spiritual life and civil life. What really happened in the social transformation of urban China? What would explain those changes? How did people in different walk of life deal with those huge and deep social transformation? To address these concerns, we will exam a list of issues. Topics includes changes in population and demographic characteristics, employment structure and job market, workplace and residential communities, income and wealth distributions, segregation impacts of urban household registration systems, urban consumption patterns, courting cultures and dressing codes, spiritual practices, and social mobility and social stratifications. In the realm of public policies, we will pay special attentions to the issues of transportation, housing, medical service, public education, social insurance, and environmental protection. We will also study the characteristics of contentious politics and how social conflicts of power, interest, justice, cultural and belief were processed in urban China.

AS.310.322. Korean History Through Film and Literature. 3 Credits.
In this course, students will engage with select topics in Korean history from premodern and modern times and examine how the past has been represented through various forms of film and literature. This will be combined with readings of academic articles to allow students to gauge the distance between scholarship and cultural expressions of history. Through this, students will be introduced to the highly contested and often polarizing nature of Korean history and the competition surrounding historical memory. Prior coursework in East Asian Studies strongly recommended.
Area: Writing Intensive

AS.310.324. Belonging and Difference in Modern Korea. 3 Credits.
Drawing on critical race theory, and gender and sexuality studies, this course provides the analytical framework necessary to grapple with how belonging and difference are produced, manifested, and challenged within Korea's citizenry. Students will gain knowledge on modern Korea and its diasporas and examine its construction as one rooted in a history of empire, nationalism, militarism, and neoliberalism.
Area: Writing Intensive

AS.310.326. Labor Politics in China. 3 Credits.
This course explores the transformation of labor relations in China over the past century. It will cover the origins of the labor movement, the changes brought about by the 1949 Revolution, the industrial battles of the Cultural Revolution, the traumatic restructuring of state-owned enterprises over the past two decades, the rise of private enterprise and export-oriented industry, the conditions faced by migrant workers today, and recent developments in industrial relations and labor conflict. The course is designed for upper division undergraduates and graduate students. Cross-listed with Sociology and International Studies (CP).
Area: Writing Intensive

AS.310.328. COVID-19 and Human Rights in Asia. 3 Credits.
This seminar explores the impact of the Covid-19 pandemic and government responses on a range of human rights in Asia, with a focus on the cases of China, Japan, Taiwan, India, South Korea, and Myanmar. In the first part of the course, we will investigate the fundamentals of the international human rights system, the foundational Universal Declaration of Human Rights and core human rights treaties, and the role of civil society in protecting, defending , and advancing human rights. We will then explore the United Nations' human rights-based guidance for Covid-19 response and prevention, the right to health, and approaches to the balancing of rights and duties, including freedom of movement, freedoms of association and assembly, individuals' right to health and duties to others, the right to education, rights to privacy, freedom of expression, right to information (and the problem of disinformation) and governments' emergency powers (and their limits) to protect public health. Inequities and discrimination exacerbated by the Covid-19 pandemic will also be discussed, as will the necessity for international cooperation to effectively battle Covid-19 and vaccine inequity.

AS.310.335. Theorizing Race and Mixed-Race in Asia and its Diasporas. 3 Credits.
This class will explore the construction of race and its applications in Asia and its diasporas. Using the notion of "mixed-race" as an analytic, we will examine how the colonial origins of race and the ensuing Cold War have influenced concepts of national identity and belonging. Employing an inter-sectional approach towards race, gender, and sexuality, the course will draw on a variety of media including memoirs, archives, and videos, to contemplate the locus of race and mixed-race and their importance within the larger nexus of identity formation in Asia and its diasporas.
Area: Writing Intensive

AS.310.340. Development and Social Change in Rural China. 3 Credits.
This course will survey the major issues of development and social change in rural China since 1950s. These issues will be addressed in chronological order. They include land ownership and land grabbing, organization of rural economic, political, and social life, rural elections and village governance, development strategies, urban-rural relationship in resource allocation, rural modernization strategies in regard to irrigation, clean drinking water, electricity supply, hard paved road, education and rural medical service, women's rights and family life, rural consumption, and etc. This course will prepare students, both empirically and analytically, to understand what happened in rural China from 1949 to the present, and how we can engage in policy and theoretical discussions based on what we learn.

AS.310.431. Senior Thesis Seminar: East Asian Studies. 3 Credits.
The East Asian Studies Senior Honors Thesis Seminar is a workshop for EAS majors writing an honors thesis. It is a year-long course with meetings scheduled in both the fall and spring semesters. Please note that in order to qualify for honors in the major, the thesis must receive a final grade of A- or better. Students will receive credit for the seminar regardless of whether their thesis qualifies for honors.
Area: Writing Intensive

AS.310.432. Senior Thesis Seminar: East Asian Studies. 3 Credits.
This course is the continuation of Senior Thesis Course AS.360.431 for students completing their thesis in the East Asian Studies program.
Area: Writing Intensive
AS.310.431

AS.310.501. Independent Study - East Asia. 1 - 3 Credits.
Students carry out an independent research project involving East Asia. You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.360 (Interdepartmental)

AS.360.105. Intro to Hopkins: Arrive & Thrive. 1 Credit.
Explore the University. Engage with people. Empower yourself. Chart your expedition at Hopkins. In this freshman-only course, students will explore Hopkins' academic resources and opportunities to integrate their academic, career, and personal goals for college and beyond. Students will be exposed to topics including learning strategies, academic planning, and campus culture. Students will develop a personalized plan for success and make some new friends.

AS.360.111. Special Opportunities in Undergraduate Learning Tutorials. 1 Credit.

AS.360.133. Freshman Seminar: Great Books at Hopkins. 3 Credits.
Students attend lectures by an interdepartmental group of Hopkins faculty and meet for discussion in smaller seminar groups; each of these seminars is led by one of the course faculty. In lectures, panels, multimedia presentations, and curatorial sessions among the University's rare book holdings, we will explore some of the greatest works of the literary and philosophical traditions in Europe and the Americas. Close reading and intensive writing instruction are hallmarks of this course; authors for Fall 2020 include Homer, Plato, Dante, John Donne, George Herbert, Christina Rosetti, Mary Shelley, Friederick Nietzsche, Isaac Bashevis Singer, Frederick Douglass.
Area: Writing Intensive

AS.360.146. Epidemics, Pandemics, & Outbreaks. 1 Credit.
In the midst of a global pandemic that has shifted the ways in which we move, work, and interact with others around the world, it is more important than ever to have a deeper understanding of how outbreaks, epidemics, and pandemics have evolved. You'll review select communicable (COVID-19, Ebola, Zika, and HIV) and non-communicable (diabetes, cancer, cardiovascular disease, injury, and mental health) diseases in public health around the world. Examine the global burden of these diseases and the various forms of prevention efforts undertaken by global and national organizations. This program will use a combination of lecture, discussion, and student presentation format to encourage broad participation.

AS.360.201. The Memoir: Personal Experience in Health Disparity. 3 Credits.
Memoir is an adept genre for expressing the sociological through the personal; this course will use memoirs to examine health care disparities. The course materials will be interwoven with visits from guest speakers who are either practicing clinicians or research scientists grappling with these same inequities. For example, when we address gender and concepts of masculinity and sexuality, we will have a discussion with a gender-reassignment surgeon. Every text will have a corresponding professional speaker. There will be a particular emphasis on medical memories, contemporary debates, and experiences that critically examine how factors such as race, gender identity, and ability impact our humanity and our health outcomes.
Area: Writing Intensive

AS.360.247. Introduction to Social Policy and Inequality: Baltimore and Beyond. 3 Credits.
This course will introduce students to basic concepts in economics, political science and sociology relevant to the study of social problems and the programs designed to remedy them. It will address the many inequalities in access to education and health care, unequal treatment in the criminal justice system, disparities in income and wealth, and differential access to political power. The focus will be on designing effective policies at the national and local level to address these pressing issues. This course is open to all students, but will be required for the new Social Policy Minor. The course is also recommended for students who are interested in law school, medical school, programs in public health, and graduate school in related social science fields. This course does not count as one of the required courses for the Economics major or minor, but it is required for the Social Policy Minor. Cross list with Sociology, Economics and Political Science. Freshman, Sophomore and Juniors only.
Area: Writing Intensive

AS.360.308. Policy and Practice in Human Services. 3 Credits.
This course will focus on the policies that frame human service programs and the methods that are used to deliver them. Course content focuses specifically on child welfare and provides an opportunity for students to study why it is so hard to get good work done by government for vulnerable populations. Students will be given the opportunity to review the challenges of implementing programs and reforms in government and to consider the impact human services have on the population served. This unique course is taught by Professor Tierney, who spent 25 years in the public sector in Chicago, DC and most recently at the helm of the social services agency in Baltimore.

AS.360.331. Methods for Policy Research. 3 Credits.
This course will introduce students to quantitative methods for studying social policy problems. Topics to be covered include descriptive statistics and sampling, correlation and causation, simple and multiple regression, experimental methods, and an introduction to cost-benefit analysis. The emphasis will be on the selection, interpretation and practical application of these methodologies in specific policy settings, rather than with formal proofs. Skills will be reinforced by hands-on exercises using statistical software. Over the course of the semester, students will critically analyze policy reports and empirical research in a range of policy areas and learn how to present this research to a non-specialist audience. Finally, we will discuss the pros and cons of quantitative vs. qualitative methodologies. The course will conclude with group presentations that draw on all these skills. Enrollment restricted to Social Policy minors only.

AS.360.339. Planets, Life and the Universe. 3 Credits.
This multidisciplinary course explores the origins of life, planet formation, Earth's evolution, extrasolar planets, habitable zones, life in extreme environments, the search for life in the Universe, space missions, and planetary protection. Recommended Course Background: Three upper level (300+) courses in sciences (Biophysics, Biology, Chemistry, Physics, Astronomy, Math, or Computer Science)
Students may not register for this class if they have already received credit for AS.020.334 OR AS.020.616 OR AS.171.333 OR AS.171.699 OR AS 270.335 OR AS.360.671

AS.360.366. Public Policy Writing Workshop. 3 Credits.
This workshop is designed to hone the analytical and communications skills necessary for effective formulation and advocacy of public policy. Topics include how to develop op-ed pieces and other forms of advocacy journalism, memoranda, position papers, and grant proposals. The workshop puts special stress on how to make a clear and persuasive exposition of complex or counter-intuitive policy arguments in the market place of ideas, including the challenges of writing for popular journals and communicating to specific audiences both in and out of government. Students receive intensive individual instruction, including close editing of their work and advice on how to publish or promote it in the public sphere. Enrollment restricted to Social Policy minors only.
Area: Writing Intensive

AS.360.401. Social Policy Seminar. 3 Credits.
This course is designed for students who have completed either the Baltimore intensive semester of the Social Policy Minor. The students will make presentations and pursue joint projects based on what they have learned during the intensive semesters concerning key social policy issues.

AS.360.408. Experiential Research Lab: "Holy" Conquest: Religion and Colonization in Sixteenth-Century Mexico. 3 Credits.
"When the Spanish unleashed their regime of colonization of what is present-day Mexico, their primary justification was the religious salvation of Indigenous people. Spaniards, along with other Europeans, arrived by the boatload to impose colonial order, taking up bureaucratic and ecclesiastical positions. The result was far from smooth—the sixteenth-century saw widespread disease, missionary violence on behalf of salvation, crop destruction and the recultivation of land, urban plans that radically altered the environment, the resettlement of entire populations, among other dramatic social and environmental events. This course investigates the complex and dynamic elements of colonial New Spain (as Mexico was called) from an interdisciplinary perspective. It tries to make sense of the chaotic landscape of the first century of Spanish colonial rule in New Spain. It is a research and writing intensive course that serves as an introduction to both the history and art history of this place and moment. Our meetings will act as a springboard for a group trip to Mexico during the January intersession to study objects and spaces in situ. Final projects will relate to materials viewed in person in Mexico. The costs for this trip are included for all students, no fees required. Knowledge of Spanish preferred but not required.
Area: Writing Intensive

AS.360.409. Humanities Research Lab: Documentary Pre-Production. 3 Credits.
This class will be a hands-on experience for students to be involved in the early stages of a documentary's making. Students will be working with the professor on researching, planning, and writing the treatment for a documentary about a forgotten feminist play (1927) from pre-Holocaust Vienna, where diversity and progressive thought were still possible. This romantic comedy centers around a self-determined matriarch, Therese, helping her three daughters navigate the expectations of rigid, societal beliefs – often leading by example – as they find their way into adulthood. Moving back and forth between the archive of its time both through the re-appropriation of Nazi newsreels and propaganda films, as well as ephemeral films of the time and the the new staging of the play, the film will take the audience inside a theater space where a vibrant environment of escapism smashes against the harsh reality of its time, which is as vivid as it was 80 years ago.

AS.360.420. Humanities Research Lab: Making Maps of Mexico. 3 Credits.
Learn the basics of ArcGIS and data management as you help Prof. Lurtz publish an agricultural dataset and maps from 10 years before Mexico erupted in revolution. No experience necessary.

AS.360.528. Problems in Applied Economics. 2 Credits.
This course focuses on a monetary approach to national income determination and the balance of payments. Money and banking, as well as commodity and financial markets, are dealt with under both central banking, as well as alternative monetary regimes. Particular emphasis is placed on currency board systems. Students learn how to properly conduct substantive economic research, utilizing primary data sources, statistical techniques and lessons from economic history. Findings are presented in the form of either memoranda or working papers of publishable quality. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Advanced excel programming skills are required and students are expected to be pre-screened for research at the Library of Congress in Washington, D.C.. Bloomberg certification is a requisite.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.360.551. Arts and Sciences Research Practicum.

AS.360.603. Graduate Orientation and Academic Ethics.

AS.360.612. Media Theory and Modernity.
This course will engage with 20th century critical theory and social inquiry that wrestles with the idea that new mediations have profoundly altered the character of human experience and subjectivity, and it will consider the questions that these theorists pose for our disciplines. How have modern subjectivity, gender, affect, reason, and politics been shaped by the technologies and structures of representation that mediate them? Among figures of interest: Marx, Freud, Eisenstein, Benjamin, Bakhtin, Adorno, Deleuze, Guy Debord, Haraway, Stuart Hall, Teresa de Lauretis, Kitterer, Sobchack, Berlant, Latour, Linda Williams, Ranciere, Orit Halpern.

AS.360.623. Latin America in a Globalizing World.
An interdisciplinary seminar on Latin America's role in global economic processes, from both historical and contemporary perspectives. Participants will engage with scholarly and primary texts as well as share written work. The Fall 2022 seminar will examine the topic of Latin American political thought.

AS.360.624. Responsible Conduct of Research (Online).
You do not need to register for any course in SIS. Within six weeks after course completion, the following entry will appear on your JHU transcript: "AS.360.624 – Responsible Conduct of Research (Online)"

AS.360.625. Responsible Conduct of Research.
Through a discussion-based curriculum, the Responsible Conduct of Research course introduces students to key research issues: academic ethics, animal subjects, conflict of interest, data management and authorship, and human subjects.Attendance to all meetings is required to receive credit for the course.

AS.360.626. Latin America in a Globalizing World II.
The second in a two-semester graduate sequence, this course will be for graduate students and faculty to collaboratively workshop their own research and writing on topics related to Latin American studies.

AS.360.671. Planets, Life and the Universe.
Replace description with the following--"This multidisciplinary course explores the origins of life, planet formation, Earth's evolution, extrasolar planets, habitable zones, life in extreme environments, the search for life in the Universe, space missions, and planetary protection. Recommended Course Background: Three upper level (300+) courses in sciences (Biophysics, Biology, Chemistry, Physics, Astronomy, Math, or Computer Science)
Students may not register for this class if they have already received credit for AS.020.616 OR AS.020.334 OR AS.171.333 OR AS.171.699 OR AS.270.335 OR AS.360.339.

AS.360.781. Preparation for University Teaching.
Full-time A&S Graduate Students only. This course will prepare graduate students to teach at the university level. Topics covered include large and small class teaching, characteristics of student learning, syllabus construction, grading students, and developing a teaching portfolio. Co-listed with EN.500.781

AS.360.800. Dean's Teaching Practicum.

AS.360.851. Arts and Sciences Research Practicum.

AS.361 (Program in Latin American Studies)

Cross-listed courses applicable to the PLAS minor include:

AS.010.205 (01) Art of Mesoamerica

This course provides a basis for the study of Mesoamerican visual cultures and urban settings. We will explore the artistic production of the Olmec, Maya, and Aztec as well as works created by the artists of Teotihuacan, Monte Albán, and West Mexico. With a focus on aesthetics and cultural function, case studies range from stone sculpture, painted ceramics, and screenfold codices, to architectural complexes from Mexico and Central America. Themes to be discussed include: representations of humans and deities, monumentality and rulership, mutilation and destruction of monuments, and ritual and political significance of materials.

AS.010.398 (01) Tombs for the Living

Centering on the tomb as the unit of analysis, this course examines the cultural and material aspects of death and funerary ritual. Case studies are drawn from North America, Mesoamerica, and the Andes. Collections study in museums.

AS.010.350 (01) Body and Soul: Medicine in the Ancient Americas

This course examines curative medicine in the Americas through its visual culture and oral histories. Philosophies about the body, health, and causes of illness are considered, as are representations of practitioners and their pharmacology. Case studies are drawn from cross the Americas (Aztec, Moche, Aymara, Paracas, American SW). Collections study in museums, Special Collections.

AS.100.115 (01) Modern Latin America

A class combining Latin American history since independence and digital humanities (revised with 2021 student feedback). Students will build guided research projects while thinking about questions of republicanism, freedom and unfreedom, migration, and development.

AS.100.379 (01) Brazil History and Cultures: A Glance from Baltimore

Using textual and visual documents (including books from Peabody Library), we will examine the contrasts of Brazilian history and culture, and its connections with 19th and 20th century Baltimore.

AS.140.685 (01) Histories of Reproduction

While there is a vast literature on reproduction in a global context, this course will focus on the arc of what we might call decolonial histories of reproduction—those that center issues of justice, freedom, intimacy, and agency, as well as cultural negotiation, conflict, and change. Students will write critical histories of reproduction, with attention to the ways in which reproductive politics interface with institutions that exert hegemonic, racialized, gendered, and ableist forms of state power and colonial power. We will also appreciate the ways in which reproduction interacts with other—non geographically-bound, non-institutionalized, and non-state mediated—forms of biopolitical power. We will analyze how the historiography has evolved over time and discuss future directions in the field.

AS.190.306 (01) Latin American Politics and Society in Comparative and Historical Perspective

The seminar will introduce students to the political and economic trajectories of Latin America as a whole and of individual countries, including Mexico, Brazil, Argentina, and Chile. Special attention will be paid to the long-term trajectory of the political regime (democracy versus dictatorship) and of economic development (variations in GDP per capita). Competing theories, from economic dependence to historical institutionalism, will be examined for their contribution to our understanding of Latin America's relative economic backwardness and low quality democracies.

AS.211.294 (01) Freshman Seminar: Soccer in Brazil: Opium of the Masses

Futebol offers a unique perspective on politics, race and citizenship in Brazil. This course seeks to understand Brazilian culture through the historic national pastime of futebol. In addition to the main textbooks chosen for the class, by reading a variety of texts from newspapers, academic journals, fiction and film, students will be able to find their own approach to understanding the phenomenon of futebol within the social and political traditions of Brazil. No knowledge of Portuguese is required, but those who can read in Portuguese will have an opportunity to do so. Everyone will learn some Portuguese words and expressions. This class may count toward the Minor in Portuguese.

AS.211.394 (01) Brazilian Culture & Civilization
Did you know that Brazil is very similar to the United States? This course is intended as an introduction to the culture and civilization of Brazil. It is designed to provide students with basic information about Brazilian history, politics, economy, art, literature, popular culture, theater, cinema, and music. The course will focus on how Indigenous, Asian, African, and European cultural influences have interacted to create the new and unique civilization that is Brazil today.

AS.215.407 (01) Power And Gender In Hispanic American Novels And Films

We will analyze and discuss four novels and three films impacted by gender violence and political idolatry under shattering stress. Oficio de tinieblas or The Book of Lamentations (1962) by Rosario Castellanos (Mexico). Zama (1956) by Antonio di Benedetto (Argentina). Delirio or Delirium (2004) by Laura Restrepo (Colombia). El ruido de las cosas al caer or The Noise of Things Falling (2011) by Juan Gabriel Vásquez (Colombia). In addition, we will examine in depth films by Lucrecia Martel (Argentina): the short Rey muerto (1995), La ciénaga (2001), and her own version of Zama (2017). Course taught in Spanish.

AS.217.425 (01) Latin American Ecocriticism

Increased awareness of climate change has led to a shift in the way we address and intervene in environmental issues in the new millennium. Yet the interest in making sense of the environment has a long history in literature and the arts. How have Latin American writers and artists understood and depicted their environments and environmental questions? How do the form and content of texts and cultural artifacts influence our understanding of the non-human world? Can works of fiction shape ecological transformations? In this course we will discuss texts from the early colonial period to the present, including the literary works of Graciliano Ramos, Horacio Quiroga, and Clarice Lispector; political ecology; film; Ana Mendieta's earth-body art; contemporary experiments in bio-art; postcolonial theory; and the intersection of environmental justice with such topics as nationalism and human rights. Going beyond ecocriticism's original focus on the Anglo-American world, we will engage recent scholarship on Latin America that sheds light on the region's cultural and geopolitical importance to the global climate, with particular attention to Brazil. This course aims to introduce students to current debates in Latin American Ecocriticism and the Anthropocene and thus contribute to an incipient but expanding field.

AS.217.427 (01) Radical Women: Brazilian Literature, Art, and Culture

The vast body of work produced women artists and writers in Brazil has been marginalized by canonical cultural narratives, which are now being contested by a spate of scholarly and artistic projects. This course spotlights the production of women from the early twentieth century to the present, including renowned and lesser-known works. We'll discuss art, literature, and film alongside feminist theory, exploring radicality as it relates to aesthetics and politics. How do women's art, literature, and thought engage with and transform Brazilian cultural production? What are their contributions to global discussions about gender and sexuality? How do these works respond to historical events? Among the topics addressed are the body, feminism, race, indigeneity, and politics. We'll study Clarice Lispector's acclaimed stories, the first Brazilian proletarian novel written by modernist icon Patricia Galvão, known as Pagu, the diaries of Carolina Maria de Jesus, the emblematic paintings of Tarsila do Amaral, and Lygia Clark's artwork, as well as the booming scene of contemporary cinema and poetry.

AS.230.342 (01) Resistance, Rebellion, and Revolution in Latin America

This course will examine the dynamics of transformative social change in Latin America and the Caribbean through analyses of resistance, rebellion, and revolution. Because revolutionary change is at once the most transformative and the most rare, this course will cover the exemplary cases of the Haitian, Mexican, and Cuban revolutions, but then also ask how theorists have understood the dynamics of both open rebellion and of everyday resistance in societies deeply structured by racial, gender, and class power, situated within an unequal world system. Attending to both local and global dynamics, this course will ask how Latin American dynamics have both conformed to and challenged universalist theories of social change.

AS.230.397 (01) The Political Economy of Drugs and Drug Wars

In the United States, we spend more than $100 billion annually on illegal drugs—and the government spends more than $50 billion a year to combat their sale and use. These statistics raise important and complicated social questions. This course will examine the production, sale, use, and control of illegal drugs from a historical and sociological perspective. We will have three objectives: to understand the social construction of drug use and illegality in the United States and other rich countries; to uncover the political and economic consequences of drug trafficking in those countries that produce drugs, particularly in Latin America; and to examine the political economy of drug control through the so-called War on Drugs, both domestically and internationally.

AS.360.420 (01) Humanities Research Lab: Making Maps of Mexico

Learn the basics of ArcGIS and data management as you help Prof. Lurtz publish an agricultural dataset and maps from 10 years before Mexico erupted in revolution. No experience necessary.

AS.376.342 (01) Caribbean Music

This course will explore the many genres of traditional and popular music that have emerged among the peoples and cultures of the Caribbean region and its Diaspora. We will examine the social, political, and economic issues that have shaped the region's music and how that music may have intersected with migration, colonization, ethnicity, race and tourism. Using a "participant observation" approach, students will read about, listen to and research a variety of musical experiences within the relevant sociopolitical context. Students should expect to fully participate in discussions about the assigned readings and music, and should be prepared to conduct their own research and share their own or newly acquired knowledge of contemporary and "historical/traditional" musical themes, and local and regional artists. Our collective goal will be to enjoy as well as to think critically about music, culture and performance and within a more informed understanding of the complex, multi-varied and multi-vocal context—know as "The Caribbean".

AS.362 (Center for Africana Studies)

AS.362.102. Anti-Racism 101. 3 Credits.
What is Anti-Racism? How do we identify racism's presence and effects, and how do we direct social and civic resources to end it? In this Freshman Seminar, students will learn from a series of faculty experts and invited guests about the history, workings, and legacies of racism. They'll also study present-day and past approaches – attempted and theorized – to abolish racism in the modern world.

AS.362.109. Introduction to African American Literature- Part II. 3 Credits.
This course will offer students an introduction to the central novels, plays, short stories, essays and poetry that have constituted African American Literature from 1930-1980. By focusing on representative works that span each of the major periods from the Harlem Renaissance to the Black Arts Movement, we will continue to consider the question of race and representation. How does one represent the race? And, for whom should black authors write – a white audience in order to change their minds about black people, or to black people for their pleasure and edification? Over the course of the semester, we will trace the various ways early- to late- 20th century black writers sometimes borrowed from earlier literary traditions and, at other times, developed new ones. In addition, we will hone in on the major debates and central texts that have come to define African American Literature and explore how it has long served as a creative, political, and intellectual enterprise.

AS.362.111. Introduction to African American Studies. 3 Credits.
This course introduces students to the interdisciplinary field of African American Studies, with attention to the literature, film, culture, history, and politics of black life in the United States. Our reading list will likely include texts by David Walker, Frederick Douglass, Frances E.W. Harper, Sutton Griggs, W.E.B. Du Bois, James Baldwin, Amiri Baraka, Toni Morrison, and others.

AS.362.112. Introduction to Africana Studies. 3 Credits.
This course introduces students to the field of Africana Studies. It focuses on the historical experience, intellectual ideas, theories, and cultural production of African-descended people. We will consider how people of the black diaspora remember and encounter Africa. We will explore, too, how such people have lived, spoken, written, and produced art about colonialism and enslavement, gender and mobility, violence and pleasure. This course will be thematically organized and invite you to center your own stories about black people within your understanding of the modern world and its making.

AS.362.115. Introduction to Police and Prisons. 3 Credits.
This introductory course will examine policing and prisons in the United States and beyond, with a focus on racial inequality. It will consist of three parts. First, we will define key concepts in police and prison studies. Then, we will explore the contemporary state of prisons and policing in the United States and look at debates around the rise of "mass incarceration" and aggressive forms of policing in the final third of the 20th century. Third, we will explore policing and prison in other parts of the globe in the contemporary moment, highlighting similarities and differences from the U.S. case. What can studying the instruments of social control in other societies reveal about our own? Students will develop an understanding of major trends, keywords, and debates in the literature on policing and prisons, with particular reference to race and racism.

AS.362.118. Cutting Through the Gaze: An Introduction to Social Justice Cinema. 2 Credits.
This course will introduce students to the fundamentals of community-engaged documentary filmmaking with a focus on both theory and practice. It will examine documentary filmmaking as an educational tool for raising social- and racial- justice issues from an African diasporic and global perspective. The course is taught by award-winning professional documentary filmmakers. Students will produce their own 3-5 minute film or audio podcast. Students will select their documentary film topic, conduct their own research, and move from pre-production into production. No prior experience in filmmaking is required for this course.

AS.362.123. Introduction to African American Literature (Part 1). 3 Credits.
This course will survey African American Literature from the 19th century to the late 20th century. We will turn to prose, poetry, and drama to explore the various ways black writes have engaged U.S. culture, history, and politics.
Area: Writing Intensive

AS.362.160. Land, Labour and Environmental Rights and Struggles in Contemporary Africa. 3 Credits.
‘Africa rising’ has become an influential, albeit contested, narrative used by institutions like the International Monetary Fund and World Economic Forum to describe the rapid economic growth in 21st century Africa. This rapid ‘economic growth has been accompanied by another type of ‘Africa Rising’ – a mushrooming of social protest and popular uprisings across the continent. The course will introduce important theoretical perspectives, debates, and examples to equip students to critically examine contemporary social dynamics through the interconnected themes of land, labor and environmental rights and struggles that have gripped the African continent. What has given rise to these awakenings? Who are the actors involved in these actions? What are their demands and strategies? What lessons does it hold for social movement theory and development more broadly? The first section focuses on land reclamation movements, the new wave of ‘land grabs’ and responses from below. The second section presents the role of labour movements and its intersection with popular uprisings. The third section considers responses from communities and movements to the ecological destruction and climate change.

AS.362.201. African American Poetry and Poetics. 3 Credits.
In this course, we will follow the development of black poetry primarily as it has evolved in the United States. Beginning with the first published African American writers of the eighteenth century and ending with several important poets writing and performing today, we will consider the shape of the African American poetic tradition as commonly anthologized and as defined by our own theoretically-informed readings of the assigned literature. Attention will be given to both canonical and neglected literary movements and groups. Readings will include poetry and essays by Frances E.W. Harper, James Weldon Johnson, Langston Hughes, Gwendolyn Brooks, Amiri Baraka, Harryette Mullen, Tracie Morris, and others.

AS.362.203. Passing in American Culture. 3 Credits.
This course will examine film and literary narratives of “passing” in 20th century America. We will study texts that feature people who cross social boundaries of race, class, sexuality, and gender, and consider what “passing” reveals about American social mobility.
Area: Writing Intensive

AS.362.204. Anti-Black Racism and Black Freedom Struggles: History, Theory, and Culture. 3 Credits.
In Anti-Black Racism and Black Freedom Struggles: History, Theory, and Culture, students will learn about key historical, intellectual, and political aspects of white supremacy as a system or racial domination, and anti-black racism as a central feature of that global system. This class will explore the historical forms that white supremacy has taken—from colonialism and plantation slavery to Jim Crow, gentrification, and mass incarceration—racial ideologies, and how modern political systems have hinged on racial oppression. Most important, we will explore how black people have responded to the structures and ideologies of white supremacy, their thinking about freedom, being, and rights, and their efforts to fit into the worlds in which they found themselves, to improve those societies, and those projects that sought radical alternatives to the an anti-black world.
Area: Writing Intensive

AS.362.216. The politics of contemporary black film. 3 Credits.
Over the past few years films such as Black Panther, Get Out, and Black KKKlansman have been both critical and economic successes, significantly changing how we think of “black films” as a genre. What do these films tell us about what it means to be black at this specific moment in time? How is what these films tell us shaped by how they are produced? How do the circulation of concepts like “Wakanda Forever!” shape political imaginations? When we watch these films how are our own ideas change? As a particularly powerful form of popular culture, film not only entertains, but it educates, and in some instances propagandizes. This is no less true of black films than it is of non-black ones. In this class we will examine a range of recent popular black films with an eye to examining the politics of their production, circulation, and consumption.

AS.362.271. Hip Hop Culture: From the Boogie Down to Black Lives Matter. 3 Credits.
Hip hop has become one of the most influential youth cultural movements of the past 40 years. It has moved from being a geographically-isolated African American and Puerto Rican musical scene to influencing every aspect of American and international youth culture, including music, visual culture, language, and politics. How did hip hop develop? Where did it come from, who made it, and why? What do the images and messages of hip hop culture mean, how has it changed our world, and who cares? We will approach these questions by delving into the historical, aesthetic, socioeconomic, and political dimensions of hip hop culture. Classes will historically explore specific themes, either examining issues that hip hop has dealt with (e.g., police brutality) or employing theoretical frameworks that we can use to help us think more critically about hip hop (e.g., subcultural theory).

AS.362.301. Black Women Writers. 3 Credits.
This course will introduce students to a variety of works written by black women of the Diaspora with a focus on the U.S. We will consider how women have theorized power, engaged history, and creatively imagined both the past and the present.
Area: Writing Intensive

AS.362.305. Black Periodical Studies. 3 Credits.
This course explores the ways in which nineteenth- and twentieth-century black periodical culture fostered (and, at times, hampered) the literary and cultural production of the African diaspora. Authors will likely include Frederick Douglass, “Ethiop (William J. Wilson),” Frances E.W. Harper, Pauline Hopkins, W.E.B. Du Bois, Marcus Garvey, Jean Toomer, Langston Hughes, Richard Bruce Nugent, and others.
Area: Writing Intensive

AS.362.309. Performing the Archive 2022: 200 Years of US-Liberia Migration. 3 Credits.
This seminar will explore some of the pivotal historical and contemporary connections between the US and Liberia since the first Black American settlers arrived in West Africa with the American Colonization Society in 1822. This course asks: What are implications of these stories of migration and reception for how we make sense of global anti-Blackness in the contemporary moment? How does performance provoke new questions about shared histories of those impacted by colonialism and the transatlantic slave trade? Why is a more in-depth understanding of 19th century Black political thought and the precolonial West African indigenous category necessary for developing theory on the political economy of race today? Through the lens of performance studies, students will analyze the documents in the American Colonization Society archive, to reimagine these early encounters as informed by historical documentation including folklore and pan-Africanist theory. Through exploring a range of historical and contemporary materials that center the problematic “indigenous/settler” binary, students will engage in a dramaturgical process which presents powerful possibilities for unlearning historical misrepresentations. In particular, students will develop theater-based projects that interrogate the spatio-temporal connections between the stories of both, free Blacks and those who were enslaved in Maryland and manumitted to go to Liberia, and the contemporary politics of Liberia-US migration.

AS.362.311. Black Utopias. 3 Credits.
In this course, we will read literary and historical texts that present visions of black utopia. Authors include “Ethiop” (William J. Wilson), Marcus Garvey, Octavia Butler, Toni Morrison, and others.
Area: Writing Intensive

AS.362.315. Black Against Empire. 3 Credits.
This course will examine the confrontation of Black social movements with imperialism in the twentieth century. How, we will ask, have key Black internationalist thinkers conceptualized and defined diaspora, capitalism, imperialism, war, and the global? What have been the effects of war and repression, as well as economic growth and globalization, on Black internationalism? Readings may include texts by W.E.B. Du Bois, Angela Y. Davis, Frantz Fanon, Ashley Farmer, Claudia Jones, Robin D.G. Kelley, Claude McKay, Huey P. Newton, Walter Rodney, Malcolm X, etc. Students will complete a research paper on a topic of their own choosing related to Black internationalism in the twentieth century.
Area: Writing Intensive

AS.362.402. Arts and Social Justice Practicum. 3 Credits.
This course provides students with an opportunity to explore art and social justice and its history in Baltimore and the Black Arts Movement through the creation of student-led artistic projects. Students will examine their creative practices and how they can be used to advocate for change. Local artist and scholars will share their expertise providing lived experiences of using art as a call to action. At the end of the semester, students will present their projects in a public showcase of student work through film, poetry, photography, painting and other visual media. (No prior artistic training necessary.)

AS.362.413. African American Representations in the Western. 3 Credits.
The course will investigate American cinematic representations of African Americans, slavery (and more specifically its absence), the Civil War, and racial formation along the United States’ southwestern frontier in films produced from the 1950s through the contemporary period. The course closely examines American cinematic fantasies of the western frontier, frontier violence and the desire to escape or erase the tensions of race and slavery that have deeply permeated the American cultural consciousness, strongly shaping the production of American masculine ideals. The course will also take decided note of the national shift from liberal “Great Society Programs” of the 1960s to the conservative “neoliberal” social and cultural ideals in the 1980s and 1990s. Our purpose is to consider the organization and reformation of hegemonic power by way of the complex morality play the western film evokes, typically considering the interstitial geographies between blackness and whiteness, civilization and savagery, belonging and alienation, and metropolis and colonial outpost. We will privilege in our discussions the contested frontiers of racial dominion. Films include “Buck and the Preacher,” “The Battle of Algiers,” “Sgt. Rutledge,” and “Django Unchained.”
Area: Writing Intensive

AS.362.510. Senior Honors in Africana Studies I. 3 Credits.
The first semester of Senior Honors in Africana Studies, conducted as an Independent Study. Interested students should submit an application to the CAS Director of Undergraduate Studies.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.362.511. Senior Honors in Africana Studies II. 3 Credits.
The second semester of Senior Honors in Africana Studies, conducted as an Independent Study. Only students who have successfully completed AS.362.510 Senior Honors In Africana Studies I will be allowed to register.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.362.590. Independent Study for Africana Studies. 3 Credits.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.363 (Study of Women, Gender, & Sexuality)

AS.363.201. Introduction to the Study of Women, Gender, and Sexuality. 3 Credits.
This course will serve as an intensive introduction to contemporary approaches to theories of gender and sexuality, and their relationship to cultural production and politics. Students will develop a historically situated knowledge of the development of feminist and queer scholarship in the 20th and 21st centuries, and consider the multiply intersecting forces which shape understandings of sexual and gender identity. We will consider both foundational questions (What is gender? Who is the subject of feminism? What defines queerness?) and questions of aesthetic and political strategy, and spend substantial time engaging with feminist and queer scholarship in comparative contexts. Students will be introduced to debates in Black feminism, intersectionality theory, third world feminism, socialist feminism, queer of colour critique, and trans* theory. We will read both canonical texts and recent works of scholarship, and the final weeks of the course will be devoted to thinking with our theoretical and historical readings against a selection of feminist and queer literature and cinema. No prior familiarity with the study of gender and sexuality is necessary.

AS.363.226. Women writers and the sonnet from the European Renaissance to the Harlem Renaissance. 3 Credits.
Shakespeare's description of his lover's eyes as 'nothing like the sun' is both an homage and a sendup of the 300-year-old Petrarchan tradition in which the male poetic persona remains forever enraptured by an unattainable female beloved, who never speaks. Beginning with a review of Shakespeare's sonnet sequence and selections from Petrarch's sonnets to an elusive Laura, we will read a series of fifteenth-and sixteenth-century women writers who inserted their own voices into this evolving tradition by allowing "Laura" to talk back. These include Vittoria Colonna (and her interactive sonnets with Michelangelo), Veronica Gambara, and Gaspara Stampa; dueling personas in sonnets by French poets Pernette du Guillet and Maurice Scéve, and sonnets by more familiar Shakespearean contemporaries Lady Mary Wroth and Sir Philip Sidney (both of whom reflect back on Petrarch but from quite different viewpoints). In the final section of the course we will apply our newly acquired historical perspective to selections from a more recently available corpus of female-authored sonnets from the Harlem Renaissance. All continental works will be read in translation; no previous familiarity with the topic is required.
Area: Writing Intensive

AS.363.301. Feminist and Queer Theory. 3 Credits.
This course will encourage encounters with a number of concepts from a critical gendered perspective, including: sameness/difference, identity politics, race/gender, loyalty, security, queer ethics, and queerness in media.
Area: Writing Intensive

AS.363.302. Feminist and Queer Theory: Women in Western Thought an Introduction. 3 Credits.
Women in Western Thought is an introduction to (the history of) Western thought from the margins of the canon. The class introduces you to some key philosophical question, focusing on some highlights of women's thought in Western thought, most of which are commonly and unjustly neglected. The seminar will be organized around a number of paradigmatic cases, such as the mind/body question in Early Modern Europe, the declaration of the rights of (wo)men during the French revolution, the impact of slavery on philosophical thought, the MeToo debate and others. By doing so, the course will cover a range of issues, such as the nature of God, contract theory, slavery, standpoint epistemology, and queer feminist politics. Students will engage with questions about what a canon is, and who has a say in that. In this sense, Women in Western Thought introduces you to some crucial philosophical and political problems and makes you acquainted with some women in the field. The long term objective of a class on women in Western thought must be to empower, to inspire independence, and to resist the sanctioned ignorance often times masked as universal knowledge and universal history. People of all genders tend to suffer from misinformation regarding the role of women and the gender of thought more generally. By introducing you to women who took it upon themselves to resist the obstacles of their time, I am hoping to provide role models for your individual intellectual and political development. By introducing you to the historical conditions of the exclusion and oppression of women (including trans and queer women as well as black women and women of color), I hope to enable you to generate the sensitivities that are required to navigate the particular social relations of the diverse world you currently inhabit. By introducing philosophical topics in this way, I hope to enable you to have a positive, diversifying influence on you future endeavours.
Area: Writing Intensive

AS.363.306. Feminist and Queer Theory: Race, Class, Gender, Sexuality-Intersectional Feminist Theory. 3 Credits.
In this course, we will get to know intersectional feminist philosophy through the lens of a Black feminist epistemology. What does this mean? That means that we will focus on how the contributions of Black feminist authors can bring out the specific political and philosophical nature of an intersectional theoretical framework.

AS.363.307. Feminist and Queer Theory: Family Matters: Queer and Feminist Responses to Family Life. 3 Credits.
This course examines the historical development of feminist and queer critique, focusing on how the concept of family life has been understood by generations of writers, activists, and theorists. We will read important early works on western forms of kinship and family structure, and investigate how contemporary developments in reproductive technology, queer marriage, and workplace integration have produced new imaginings of familial belonging and its alternatives.

AS.363.329. Gender and Sexuality Beyond the Global West: Gender and Sexuality in Contemporary Art in North Africa and the Middle East. 3 Credits.
This course aims to explore how gender and sexuality is situated in contemporary artistic practices in the geographical Middle East, through concepts of religion, war, revolution, resistance, nation-state, post-colonialism, and neoliberalism, especially as written and observed first-hand by artists, curators and scholars from the Middle East and North Africa region and their diasporas. Every week, under an overarching topic, notions of gender and sexuality will be questioned through works of selected artists across the region, as well as texts that provide the historical, theoretical, sociological and political background.
Area: Writing Intensive

AS.363.330. Ecofeminist Debates: Gender and Sexuality Beyond the Global West. 3 Credits.
This course develops an interdisciplinary and comparative approach to introduce students to ecofeminism through a special focus on its inflections in non-western contexts. Through class discussions and sustained writing engagement, we will develop an understanding of the history of ecofeminism, including theoretical debates linking gender perspectives with political mobilization, as well as ecofeminism's enduring influence on new intellectual and political movements.

AS.363.331. Gender and Sexuality beyond the Global West. 3 Credits.
Gender and Sexuality in the Global West. Topics change each semester. See class search for specific topic being taught each term.

AS.363.333. Poetics and Politics: Eros & Literature. 3 Credits.
What does it mean to love? From Antiquity to now, from Plato to Jeanette Winterson, writers have staged conversations on love and sex. In this way, they provide us with a "science of sex" (to use Foucault's notion) that, though fully attuned to the power differentials that inhabit our most intimate physical experiences, gives free range to the imagination of desires. With Plato, the legend of Tristan and Isolde, and the study a few Renaissance love lyrics as a backdrop, we will delve into stories of desire that chart new configurations and break away from "normative heterosexuality." Readings involve novellas by Balzac, George Sand, Colette; stories by Woolf, by Proust, and selected from Gender Outlaws as well as two films M. Butterfly and Call Me by Your Name. Meshing such stories with fundamental concepts in gender theory will enable us to chart ever changing configurations of desire from the double perspective of queerness and of sexual politics.
Area: Writing Intensive

AS.363.335. Gender Justice: From Conflict to Resolution. 3 Credits.
This course focuses on the potential and limitations of the recent efforts of the international community to introduce a "gendered approach" to conflict resolution, peacebuilding and transitional justice. It examines the fundamental theoretical issues that underlie the "gendered approach" to transitional justice by following the evolution of the gendered approach to peacebuilding in three phases through case studies: The gender-blind phase (Human Rights Trials in Argentina), the gender-neutral phase (Truth and Reconciliation Commission in South Africa) and the gender-sensitive phase (Disarmament, Demobilization and Reintegration of female combatants in Colombia). The limitations of the gendered approach in practice is explored through cases. For example, we examine the identification of gender-based crimes with sexual crimes in ICTY and ICTR. The LGBTI communities' inclusion to transitional justice as well as gender based harms that are not related to sexual violence are examined through the Colombia Peace Process. Ultimately, the course aims to address the prevailing question in the fields of peacebuilding and transitional justice today through the lens of "gender": Should transitional justice simply redress harms or should it aim to be transformative for the post conflict community? Should response mechanisms aim to restore relationships or should they aim to transform gender relations in communities? The final weeks of the class will be dedicated to the discussion of moral and practical implications of these questions for transitional justice.

AS.363.337. The Poetics & Politics of Sex: Struck From the Record: Reclaiming Women's Contribution to the Global March Towards Modernity. 3 Credits.
The course examines claims that present women's historic role as limited to confinement in the home, and bearing children. Students will gain an understanding of the complexity the world's path to modernity and the important, and?until recently, silent?roles that women have played.
Area: Writing Intensive

AS.363.338. The Poetics and Politics of Sex: Feminist Utopia in Theory and Fiction. 3 Credits.
This course examines the historical development of feminist utopia in theory and fiction. Readings will center Indigenous, Black, postcolonial, diasporic, and transnational perspectives that engage the topic of feminist utopia.
Area: Writing Intensive

AS.363.345. Zora Neale Hurston: Ethnography as Method. 3 Credits.
While many recognize Zora Neale Hurston's creative literary work, her methodological innovations are often overshadowed. This course will examine Hurston's contributions to theorizing the African diaspora and creative use of ethnography.Dr. Amarilys Estrella, the 2020-2021 ACLS Emerging Voices Postdoc, will teach this course. For more info on Dr. Estrella, see https://history.jhu.edu/directory/amarilys-estrella/

AS.363.415. WGS Internship Practicum: The Carceral State, Gender, and the Family. 3 Credits.
This class will examine the U.S. government's use of incarceration, parole, and house-arrest as default forms of social management, in lieu of social welfare policy. We will explore the origins of the "carceral state" and its impact on targeted communities. The class will focus on often neglected aspects of the ongoing crisis of mass-incarceration in the U.S., in particular its debilitating effects on single-mother households, children who grow up with incarcerated family members, and the extreme violence and deprivation of basic medical needs faced by incarcerated women and LGBTQI individuals. Topics will include black-feminism and "black matriarchy," the relationship between domestic violence and mass-incarceration in communities of color, women and non-gender conforming prisoners, the "school-to-prison pipeline," the psychological effects of policing on targeted communities, and the fiscal interests served by mass-incarceration. We will engage sociological, historical, and philosophical materials, as well as literature, film, and past and present social movements.
Area: Writing Intensive

AS.363.416. WGS Internship/Practicum: Feminist Animals: Sex, Nature, and Nonhumans. 3 Credits.
Introducing feminist approaches to ecology and nonhumans, this course considers the interconnections between heteropatriarchal domination and the domination of nonhuman animals and ecologies. What different sensibilities and ways of seeing sex and gender open up when attention shifts to nonhumans? What tensions within and between feminism, animal liberation, and ecological concern come to the fore when each approach is alongside the others? How does the study of nonhumans extend the promise of feminism, and vice versa? In responding to these questions, we will see the real breadth of issues that the theory and practice of feminism can address.
Area: Writing Intensive

AS.363.445. Reading Judith Shakespeare: Women and Gender in Elizabethan England. 3 Credits.
If Shakespeare had a sister who went to London to be a writer, what would she write? Virginia Woolf's account of the thwarted career of Shakespeare's hypothetical sister, Judith, in A Room of One's Own frames our reading of plays and poetry by Shakespeare and contemporary women writers, including Isabella Whitney, Elizabeth Cary, Mary Sidney, Aemelia Lanyer, and Mary Wroth. Working within a selected historical context, students will create fictional biographies of "Judith Shakespeare," including her perspective on our identified authors and a sample or description of Judith's own literary accomplishments. Secondary course readings will reflect contemporary economic, political, and religious contexts.
Area: Writing Intensive

AS.363.601. WGS Graduate Colloquium.
Presenting new scholarship and art, the WGS Graduate Colloquium will catalyze intellectual discussions in which gender and sexuality concerns play important roles. The seminar includes lectures by invited speakers and a film series. Graduate students are encouraged to develop critical and comparative approaches to the study of gender and sexuality—often in interaction with related issues such as race, class, violence, law, medicine, art, and emotionality. This seminar can be taken for credit or audit.

AS.370 (Center for Language Education)

AS.370.115. First Year American Sign Language. 3 Credits.
Designed for students who have no previous knowledge of ASL. Students will learn fingerspelling, words, facial expressions, and classifiers to be able to communicate at a basic level with other signers. The curriculum will cover sentence structures such as questions, commands, and other conversational phrases. Mastery will include knowledge of Deaf community and Deaf cultural practices.

AS.370.602. American English Pronunciation.
This course focuses on improving students' perception and pronunciation of American English through learning articulation, phonetics, and phonology. Students learn the basics of anatomy of speech production in order to understand how difficult sounds and sound contrasts are made. Students also learn the International Phonetic Alphabet (IPA) to help them distinguish sound contrasts that are difficult depending on the individual students' native languages. Moving beyond individual sounds, students learn how sounds change depending on what word or phrase they appear in and when they appear in fast or colloquial speech. Finally, students learn and practice intonation appropriate for various types of statements and questions.

AS.370.603. Public Speaking in Academia.
This course is intended for international Teaching Assistants (ITAs) with advanced English skills and satisfactory pronunciation who wish to further improve their communication and public speaking skills, as well as better understand the cultural norms of the American academia. Students refine their pronunciation and intonation, practice designing and giving presentations, learn the basics of conversation and e-mail etiquette in America, as well as the norms of interacting with college students, professors, and colleagues in various academic situations such as classes, office hours, lab meetings, and scientific meetings. This course is appropriate as a follow-up to American English Pronunciation (AS 370.602) or as a stand-alone course for students with satisfactory pronunciation. This course can also be repeated for additional practice or taken concurrently with American English Pronunciation.

AS.370.604. Advanced Grammar and Academic Writing.
In this course, students will read and analyze the content, structure, and style of a wide range of academic and professional writing in order to improve their own essays, articles, reports, theses, critiques, and proposals using those features. They will learn to explain, support, compare and argue their ideas effectively through attention to organization, vocabulary, and style. Grammar will be infused into the course as it applies to revision and editing of written work and consistency within various types of writing. Students will use a variety of strategies to improve skills in idea development, organization, word choice, sentence fluency, voice, grammar and mechanics. Writing tasks will be integrated with content, vocabulary, and grammar from various texts.

AS.373.111. First Year Heritage Chinese. 3 Credits.
This course is designed for students who were raised in an environment in which Chinese is spoken by parents or guardians at home and for those who are familiar with the language and possess native-like abilities in comprehension and speaking. The course therefore focuses on reading and writing (including the correct use of grammar). Cross-listed with East Asian Studies

AS.373.112. First Year Heritage Chinese II. 3 Credits.
For students who have significant previously-acquired ability to understand and speak Modern Standard Chinese. Course focuses on reading and writing. Teaching materials are the same as used in AS.373.115-116; however, both traditional and simplified versions of written Chinese characters are used. Lab required. Continuation of AS.373.111. Recommended Course Background: AS.373.111 or permission required.
AS.373.111 or or instructor permission

AS.373.115. First Year Chinese. 5 Credits.
This course is designed primarily for students who have no prior exposure to Chinese. The objective of the course is to help students build a solid foundation of the four basic skills---listening, speaking, reading, and writing in an interactive and communicative learning environment. The emphasis is on correct pronunciation, accurate tones and mastery of basic grammatical structures. Note: Students with existing demonstrable skills in spoken Chinese should take AS.373.111-112. No Satisfactory/Unsatisfactory. Cross-listed with East Asian Studies

AS.373.116. First Year Chinese II. 5 Credits.
Introductory course in Modern Standard Chinese. Goals: mastery of elements of pronunciation and control of basic vocabulary of 800-900 words and most basic grammatical patterns. Students work first with Pin-Yin system, then with simplified version of written Chinese characters. Continuation of AS.373.115. Note: Student with existing demonstrable skills in spoken Chinese should take AS.373.111-112. Recommended Course Background: AS.373.115 or permission required.
AS.373.115 or instructor permission]

AS.373.211. Second Year Heritage Chinese. 3 Credits.
This course is designed for students who finished AS.373.112 with C+ and above (or equivalent). Students in this course possess native-like abilities in comprehension and speaking. The course focuses on reading and writing. Cross-listed with East Asian Studies
AS.373.112 or equivalent.

AS.373.212. Second Year Heritage Chinese II. 3 Credits.
For students who have significant previously-acquired ability to understand and speak Modern Standard Chinese. Course focuses on reading and writing. Teaching materials are the same as used in AS.373.115-116; however, both traditional and simplified versions of written Chinese characters are used. Continuation of AS.373.211. Recommended Course Background: AS.373.211 or permission required.
AS.373.211 or instructor permission

AS.373.215. Second Year Chinese. 5 Credits.
Consolidation of the foundation that students have laid in their first year of study and continued drill and practice in the spoken language, with continued expansion of reading and writing vocabulary and sentence patterns. Students will work with both simplified and traditional characters. Note: Students who have native-like abilities in comprehension and speaking should take AS.373.211-212. Cross-listed with East Asian Studies
AS.373.116 or equivalent

AS.373.216. Second Year Chinese II. 5 Credits.
Consolidation of the foundation that students have laid in their first year of study and continued drill and practice in the spoken language, with continued expansion of reading and writing vocabulary and sentence patterns. Students will work with both simplified and traditional characters. Note: Students who have native-like abilities in comprehension and speaking should take AS.373.211-212. Recommended Course Background: AS.373.215 or Permission Required.Cross-listed with East Asian Studies
AS.373.215 or instructor permission.

AS.373.313. Third Year Heritage Chinese. 3 Credits.
This course is designed for those who have already taken AS.373.212 or equivalent. Students need to have native-level fluency in speaking and understanding Chinese. The course focuses on reading and writing. In addition to the textbooks, downloaded articles on current affairs may also be introduced on a regular basis.Cross-listed with East Asian Studies
AS.373.211 AND AS.373.212 or instructor's permission

AS.373.314. Third Year Heritage Chinese II. 3 Credits.
This course is a continuation of AS.373.313. Students need to have native-level fluency in speaking and understanding Chinese. The course focuses on reading and writing. In addition to the textbooks, downloaded articles on current affairs may also be included on a regular basis. Recommended Course Background: AS.373.313 or Permission Required. Lab required.
AS.373.313 or equivalent

AS.373.315. Third Year Chinese. 3 Credits.
This two-semester course consolidates and further expands students' knowledge of grammar and vocabulary and further develops reading ability through work with textbook material and selected modern essays and short stories. Class discussions will be in Chinese insofar as feasible and written assignments will be given. Cross-listed with East Asian Studies
AS.373.216 or instructor permission

AS.373.316. Third Year Chinese II. 3 Credits.
This two-semester course consolidates and further expands students' knowledge of grammar and vocabulary and further develops reading ability through work with textbook material and selected modern essays and short stories. Class discussions will be in Chinese insofar as feasible, and written assignments will be given. Continuation of AS.373.315. Recommended Course Background: AS.373.315 or permission required.
AS.373.315 or instructor permission

AS.373.415. Fourth Year Chinese. 3 Credits.
This course is designed for students who finished AS.373.316 with a C + or above (or equivalent). Readings in modern Chinese prose, including outstanding examples of literature, newspaper articles, etc. Students are supposed to be able to understand most of the readings with the aid of a dictionary, so that class discussion is not focused primarily on detailed explanation of grammar. Discussion, to be conducted in Chinese, will concentrate on the cultural significance of the readings' content.Cross-listed with East Asian Studies
AS.373.316 or instructor permission

AS.373.416. Fourth Year Chinese II. 3 Credits.
Continuation of AS.373.415. Readings in modern Chinese prose, including outstanding examples of literature, newspaper articles, etc. Students should understand most of the readings with the aid of a dictionary, so that class discussion need not focus primarily on detailed explanations of grammar. Discussion, to be conducted in Chinese, will concentrate on the cultural significance of the readings' content. Recommended Course Background: AS.373.415 or Permission Required. Cross-listed with East Asian Studies
AS.373.415 or instructor permission

AS.373.491. 5th Year Chinese. 3 Credits.
Fifth Year Chinese is designed for students who finished fourth year regular or third year heritage Chinese course at JHU or its equivalent and wish to achieve a higher advanced proficiency level in Chinese. The goal of the course is to help students further develop their listening, speaking, reading and writing skills cohesively and to enhance students' understanding of Chinese culture and society through language learning.
AS.373.416 OR AS.373.314 or equivalent

AS.373.492. Fifth Year Chinese II. 3 Credits.
Fifth Year Chinese is designed for students who finished fourth year regular or third year heritage Chinese course at JHU or its equivalent and wish to achieve a higher advanced proficiency level in Chinese. The goal of the course is to help students further develop their listening, speaking, reading and writing skills cohesively and to enhance students' understanding of Chinese culture and society through language learning.
AS.373.491 or equivalent

AS.373.493. Fundamentals of Chinese Grammar. 2 Credits.
This course is designed for students who have already studied 1st Year Chinese grammar and wish to develop a thorough knowledge of Chinese grammar in order to advance all aspects of language skills to a higher level. It is also appropriate for graduate students who need to be able to read materials written in Chinese. The goal of the course is to provide students with a thorough knowledge of Chinese grammar; therefore, knowledge of vocabulary in depth is not requisite. In addition, since this is not a language course that places equal focus on all four skills (speaking, listening, writing, and reading), there will be no conversation practice – this is a lecture course on grammar. Pass-fail grade option only. Must have at least 5 students enrolled to run.
AS.373.115

AS.373.501. Independent Study - Chinese. 0 - 4 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.373.503. Chinese Independent Study. 1 Credit.
Chinese independent course work.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.375.115. First Year Arabic. 5 Credits.
Introductory course in speaking, listening, reading, and writing Modern Standard Arabic. Presents basic grammatical structures and a basic vocabulary. Through oral-aural drill in classroom, tapes in Language Laboratory, and reading/writing exercises, students attain a basic level of competence on which they can build in subsequent years of studyNo Satisfactory/ Unsatisfactory

AS.375.116. First Year Arabic II. 4 Credits.
Continuation of AS.375.115. Introductory course in speaking, listening, reading, and writing Modern Standard Arabic. Presents basic grammatical structures and a basic vocabulary. Through oral-aural drill in classroom, tapes in Language Laboratory, and reading/writing exercises, students attain a basic level of competence on which they can build in subsequent years of study. May not be taken Satisfactory/ Unsatisfactory
AS.375.115 or instructor permission

AS.375.215. Second Year Arabic. 4 Credits.
Designed to bring students up to competency level required for third/ fourth year Arabic. Students will consolidate and expand their mastery of the four basic skills acquired in AS.375.115-116. More authentic material--written, audio, and visual--will be used, and culture will be further expanded on as a fifth skill. Recommended Course Background: AS.375.115-116 or equivalent.
AS.375.116 or equivalent

AS.375.216. Second Year Arabic II. 4 Credits.
Continuation of AS.375.215. Designed to bring students up to competency level required for third/fourth year Arabic. Students will consolidate and expand their mastery of the four basic skills acquired in AS.375.115-116. More authentic material--written, audio, and visual--will be used, and culture will be further expanded on as a fifth skill. Recommended Course Background: AS.375.215 or permission required.
AS.375.215 or instructor permission

AS.375.301. Third Year Arabic. 3 Credits.
Designed to enhance students' ability to read, discuss, and write about various topics covered in traditional and contemporary Arabic texts. Recommended Course Background: AS.375.216 or equivalent.
AS.375.116 or instructor permission

AS.375.302. Third Year Arabic II. 3 Credits.
Designed to enhance students' ability to read, discuss, and write about various topics covered in traditional and contemporary Arabic texts. Continuation of AS.375.301. Recommended Course Background: AS.375.301or permission required.
AS.375.301 or instructor permission

AS.375.401. Fourth Year Arabic. 2 Credits.
This is an introductory course to different periods of the Arabic literature. Selections of famous Arabic poetry and short prose works are the substance of the course.
AS.375.302 or equivalent

AS.375.402. Fourth Year Arabic II. 3 Credits.
This is an introductory course to different periods of the Arabic literature. Selections of famous Arabic poetry and short prose works are the substance of the course. Continuation of AS.375.401. Recommended Course Background: AS.375.302 or equivalent.
AS.375.401 or equivalent.

AS.375.802. Independent Study -- Arabic.

AS.377.115. First Year Russian. 4 Credits.
This course is designed for students who have no background in the language and wish to learn the language at an academic level, obtaining knowledge of the linguistic aspects of the language as well as skills needed to communicate in Russian. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of Russian linguistics and culture that are necessary for language competency in survival level. It is expected that, by the end of the spring term, students will have basic speaking and listening comprehension skills, a solid grasp of basic grammar, reading and writing skills. No Satisfactory/Unsatisfactory. Students may not have completed AS.377.131 AND AS.377.132 under the previous JHU/Goucher program.

AS.377.116. First Year Russian II. 4 Credits.
A continuation of AS.377.115. This course is designed for students who have no background in the language and wish to learn the language at an academic level, obtaining knowledge of the linguistic aspects of the language as well as skills needed to communicate in Russian. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of Russian linguistics and culture that are necessary for language competency in survival level. It is expected that, by the end of the spring term, students will have basic speaking and listening comprehension skills, a solid grasp of basic grammar, reading and writing skills. No Satisfactory/Unsatisfactory.
AS.377.115

AS.377.215. Second Year Russian. 3 Credits.
This course is designed for students who have finished AS.377.116 with C+ or above, or by a placement exam. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of Russian linguistics and culture that are necessary for language competency higher than that learned in First Year Russian.

AS.377.216. Second Year Russian II. 3 Credits.
Continuation of AS.377.215. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of Russian linguistics and culture that are necessary for language competency higher than that learned in First Year Russian.
AS.377.215

AS.377.315. Third Year Russian. 3 Credits.
This course offers advanced training in spoken as well as written Russian. It is designed for students who have basic Russian language proficiency acquired through AS.377.216 or equivalent. Advanced level of grammatical structures will be learned and practiced through communicative tasks.

AS.377.316. Third Year Russian II. 3 Credits.
Continuation of AS.377.315. This course offers advanced training in spoken as well as written Russian. Advanced level of grammatical structures will be learned and practiced through communicative tasks.
AS.377.315

AS.377.395. Readings in Russian Studies. 2 Credits.
The course examines aspects of Russian culture through Russian literature. Readings include a wide range of texts. In this particular course, we will read a play by a Soviet writer and watch a video recording of a contemporary stage show by the Moscow Art Theater. Participation in the course would require reading authentic Russian texts, extensive classroom discussions, and frequent writing assignments. (All texts and videos are in Russian.) Pre-req: 377.315-316 or by permission

AS.377.397. Readings in Russian Studies II. 2 Credits.
The course examines aspects of Russian culture through Russian literature. Readings include a wide range of texts. Participation in the course would require reading authentic Russian texts, extensive classroom discussions, and frequent writing assignments. (All texts and videos are in Russian.) Pre-req: 377.315-316 or by permission
AS.377.315 OR AS.377.316 OR AS.377.395 or permission of instructor

AS.378.115. First Year Japanese. 5 Credits.
This course is designed for students who have no background or previous knowledge in Japanese. The course consists of lectures on Tuesday/Thursday and conversation classes on Monday/Wednesdays/Fridays. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of Japanese culture. By the end of the year, students will have basic speaking and listening comprehension skills, a solid grasp of basic grammar items, reading and writing skills, and a recognition and production of approximately 150 kanji in context. Knowledge of grammar will be expanded significantly in AS.373.215. No Satisfactory/Unsatisfactory. Cross-listed with East Asian Studies

AS.378.116. First Year Japanese II. 5 Credits.
This course is designed for students who have no background or previous knowledge in Japanese. The course consists of lectures on Tuesday/Thursday and conversation classes on Monday/Wednesdays/Fridays. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of Japanese culture. By the end of the fall term, students will have basic speaking and listening comprehension skills, a solid grasp of basic grammar items, reading and writing skills, and a recognition and production of approximately 60 kanji in context. Knowledge of grammar will be expanded significantly in 2nd year Japanese. May not be taken Satisfactory/Unsatisfactory. Recommended Course Background: AS.378.115
Prereq: AS.378.115 or instructor permission

AS.378.215. Second Year Japanese. 5 Credits.
Training in spoken and written language, increasing their knowledge of more complex patterns. At completion, students will have a working knowledge of about 250 Kanji. Recommended Course Background: AS.378.115 and AS.378.116 or equivalent.
AS.378.116 or equivalent

AS.378.216. Second Year Japanese II. 5 Credits.
Continuation of Beginning Japanese and Intermediate Japanese I. Training in spoken and written language, increasing students' knowledge of more complex patterns. At completion, students will have a working knowledge of about 250 Kanji. Recommended Course Background: AS.378.215 or equivalent.
AS.378.215 or instructor permission

AS.378.315. Third Year Japanese. 3 Credits.
Emphasis shifts toward reading, while development of oral-aural skills also continues apace. The course presents graded readings in expository prose and requires students to expand their knowledge of Kanji, grammar, and both spoken and written vocabulary. Cross-listed with East Asian Studies
AS.378.215 AND AS.378.216 or instructor permission

AS.378.316. Third Year Japanese II. 3 Credits.
Emphasis shifts toward reading, while development of oral-aural skills also continues apace. The course presents graded readings in expository prose and requires students to expand their knowledge of Kanji, grammar, and both spoken and written vocabulary. Lab required. Continuation of AS.378.315. Recommended Course Background: AS.378.315 or equivalent.
AS.378.315 or equivalent.

AS.378.396. Fundamentals of Japanese Grammar. 2 Credits.
This course is designed for students who have already studied 1st Year Japanese grammar and wish to develop a thorough knowledge of Japanese grammar in order to advance all aspects of language skills to a higher level. It is also appropriate for graduate students who need to be able to read materials written in Japanese. The goal of the course is to provide students with a thorough knowledge of Japanese grammar; therefore, knowledge of vocabulary (including kanji) in depth is not requisite. In addition, since this is not a language course that places equal focus on all four skills (speaking, listening, writing, and reading), there will be no conversation practice – this is a lecture course on grammar. 2 credits. Pass-fail grade option only
AS.378.115 AND AS.378.116 or Instructor Permission

AS.378.415. Fourth Year Japanese. 2 - 3 Credits.
By using four skills in participatory activities (reading, writing, presentation, and discussion), students will develop reading skills in modern Japanese and deepen and enhance their knowledge on Kanji and Japanese culture. Recommended Course Background: AS.378.315 and AS.378.316 or equivalent.
AS.378.316 or equivalent

AS.378.416. Fourth Year Japanese II. 2 - 3 Credits.
By using four skills in participatory activities (reading, writing, presentation, and discussion), students will develop reading skills in modern Japanese and deepen and enhance their knowledge on Kanji and Japanese culture. Lab required. Recommended Course Background: AS.378.415
AS.378.415 or equivalent.

AS.378.493. Grammar and Readings in Japanese Studies. 2 Credits.
This course is designed for graduate students (in East Asian Studies, Public Health, History of Medicine, History,etc.) and undergraduate students with a strong interest in developing a thorough knowledge of Japanese grammar from both linguistic and cultural perspectives in depth well beyond regular language courses in order to advance reading and comprehension of materials written in Japanese without use of a dictionary. We first review the primary components of Japanese grammar, such as tense, aspect, particles, conditionals, passive and causative, etc., followed by readings of articles demonstrating particular grammatical items. Specific strategies and techniques are also introduced, followed by practice. Class materials include a broad spectrum of native materials, including novels, newspapers, scholarly articles, essays, and historical papers. A diverse range of articles and essays are selected by students to introduce and enforce various ways of reading Japanese effectively. 2 credits. Pass-fail grade option only.

AS.379.115. First Year Haitian-Creole. 3 Credits.
This course is designed for students who have no background in the language and wish to learn the language at an academic level, obtaining knowledge of the linguistic aspects of the language as well as skills needed to communicate in Haitian-Creole. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of linguistics and culture that are necessary for language competency in survival level. It is expected that, by the end of the spring term, students will have basic speaking and listening comprehension skills, a solid grasp of basic grammar, reading and writing skills. No Satisfactory/Unsatisfactory.

AS.379.116. First Year Haitian Creole II. 3 Credits.
A continuation of AS.379.115. This course is designed for students who have no background in the language and wish to learn the language at an academic level, obtaining knowledge of the linguistic aspects of the language as well as skills needed to communicate in Haitian-Creole. The goal of the course is the simultaneous progression of four skills (speaking, listening, writing, and reading) as well as familiarity with aspects of linguistics and culture that are necessary for language competency in survival level. It is expected that, by the end of the spring term, students will have basic speaking and listening comprehension skills, a solid grasp of basic grammar, reading and writing skills.
AS.379.115

AS.380.101. First Year Korean. 5 Credits.
Introduces the Korean alphabet, hangeul. Covers basic elements of the Korean language, high-frequency words and phrases, including cultural aspects. Focuses on oral fluency reaching Limited Proficiency where one can handle simple daily conversations. No Satisfactory/ Unsatisfactory.
Cross-listed with East Asian Studies

AS.380.102. First Year Korean II. 5 Credits.
Focuses on improving speaking fluency to Limited Proficiency so that one can handle simple daily conversations with confidence. It provides basic high-frequency structures and covers Korean holidays. Continuation of AS.380.101. Recommended Course Background: AS.380.101 or permission required.
AS.380.101 or instructor permission

AS.380.201. Second Year Korean. 4 Credits.
Aims for improving oral proficiency and confident control of grammar with vocabulary building and correct spelling intended. Reading materials of Korean people, places, and societies will enhance cultural understanding and awareness. Project due on Korean cities. Existing demonstrable skills in spoken Korean preferred.
AS.380.101 AND AS.380.102 or instructor permission

AS.380.202. Second Year Korean II. 4 Credits.
Aims for improving writing skills with correct spelling. Reading materials of Korean people, places, and societies will enhance cultural understanding and awareness, including discussion on family tree. Continuation of AS.380.201. Recommended Course Background: AS.380.201 or equivalent.
AS.380.201 or equivalent

AS.380.301. Third Year Korean. 3 Credits.
Emphasizes reading literacy in classic and modern Korean prose, from easy essays to difficult short stories. Vocabulary refinement and native-like grasp of grammar explored. Project due on Korean culture. Cross-listed with East Asian Studies
AS.380.202 or equivalent

AS.380.302. Third Year Korean II. 3 Credits.
Emphasizes reading literacy in classic and modern Korean prose. By reading Korean newspapers and professional articles in one's major, it enables one to be well-versed and truly literate. Continuation of AS.380.301. Cross-listed with East Asian StudiesPrerequisite: AS.380.301 or equivalent.
AS.380.301 or instructor permission

AS.380.401. Fourth Year Korean. 2 Credits.
This course is designed for those who have finished AS 380.302 or beyond advanced mid level of competency in Korean in four skills. By dealing with various topics on authentic materials including news, articles on websites, short stories, this course aims to help students enhance not only linguistics knowledge and skills, but also current issues in Korea. It is expected that, by the end of the term, students will be able to discuss a variety of topics and express opinions fluently in both spoken and written language.
AS.380.302 or instructor permission

By dealing with various topics on authentic materials including news, articles on websites, short stories, this course aims to help students enhance not only linguistics knowledge and skills, but also current issues in Korea. It is expected that, by the end of the term, students will be able to discuss a variety of topics and express opinions fluently in both spoken and written language.
AS.380.401 or equivalent

AS.381.101. First Year Hindi I. 3 Credits.
Course focuses on acquisition of additional vocabulary and grammatical structures in culturally authentic contexts, listening, speaking, reading, and writing comprehension. No Satisfactory/ Unsatisfactory

AS.381.102. First Year Hindi II. 3 Credits.
This course prepares students to function in everyday situations in the Hindi speaking world. Focuses on the acquisition of basic vocabulary and grammatical structures in culturally authentic contexts through listening, speaking, reading, and writing comprehension. Hindi reading and writing is taught in its original Dayva-nagari script. Oral-aural drills in class and work in the Language Lab is required.
AS.381.101 or instructor permission

AS.381.201. Second Year Hindi I. 3 Credits.
Course provides refinement of basic language skills in cultural context. Emphasis will be on expansion of vocabulary and grammatical structures and further development of communicative skills. Recommended Course Background: AS.381.101, AS.382.102
AS.381.102 or equivalent

AS.381.202. Second Year Hindi II. 3 Credits.
Course provides refinement of basic language skills in cultural context. Emphasis will be on expansion of vocabulary and grammatical structures and further development of communicative skills. Continuation of AS.381.201. Recommended Course Background: AS.381.201 or permission required.
AS.381.201 or instructor permission

AS.381.301. Third Year Hindi I. 3 Credits.
Learn to converse in Hindi through Hindi songs, films, and media. Promotes the active use of Hindi in culturally authentic contexts. Development of fluency in oral and written communication is emphasized. Not offered every semester.
Area: Writing Intensive
AS.381.201 AND AS.381.202 or instructor permission

AS.371 (Art)

AS.371.126. Fiber Art and the String Revolution. 3 Credits.
This course presents students with technical, historical and cultural understanding of the fiber medium. Students learn the basics of textile processes, including dyeing, felting, knitting, weaving, sewing, and lacemaking. Technical demonstrations and samples will be covered in class while students are encouraged to expand upon covered material through long-term personal projects. Technical demonstrations will be supported with slide lectures demonstrating the historical context of fiber processes and their contemporary applications. Attendance in 1st class is mandatory.

AS.371.129. Botanical Painting in Watercolor and Gouache. 3 Credits.
This introductory painting class is an exploration of the ways watercolor and designer gouache are used together to paint organic materials representationally. We'll study the difference between botanical painting and illustration and trace how women specifically have shaped this genre of art through history. Students will learn techniques from both observation and invention and artwork will be assessed in weekly group critiques. Course includes demonstrations, short readings and a research paper about a botanical artist.

AS.371.131. Foundation Drawing. 3 Credits.
This course is designed as an introduction to the tools, techniques and concepts of basic drawing for students with little or no previous experience. Studio assignments focus on developing strong observation and rendering skills while experimenting with traditional and contemporary practices in drawing. Wet and dry media will be used. Attendance at 1st class is mandatory.

AS.371.133. Oil Painting I. 3 Credits.
This course is designed as an introduction to the tools, techniques and concepts of basic painting for the serious student with little or no previous experience. Studio assignments focus on developing strong observation and rendering skills focusing on issues of light, color and composition while experimenting with traditional and contemporary practices in painting. Lectures and a museum trip give students an art historical context in which to place their own discoveries as beginning painters. Oil paint will be used. Attendance at 1st class is mandatory.

AS.371.147. Art of Architecture: Homewood, Baltimore and Beyond. 3 Credits.
In this course, students will learn to design, draw, and see like an architect. A series of progressive design exercises will teach the practical capacities and habits of mind that lead not merely to competence but success and advancement in the field. We will look at what architecture has been, discuss what it is becoming, and explore both formal and narrative methodologies for design. The class will use the built environment of the city - and the Homewood campus - as a classroom and a site for interpretive drawing and creative design work. Essential in the architect's education is the sketchbook, which functions not merely as a place to 'store' what has been witnessed, but a place to interpret and explore implications of design in the world, whether close to home or traveling in exotic locales.

AS.371.151. Photoshop/Digital Darkroom. 3 Credits.
Photoshop is not only the digital darkroom for processing images created with digital cameras;it is also a creative application for making original artwork. In this course, students use Photoshop software as a tool to produce images from a fine art perspective, working on projectsthat demand creative thinking while gaining technical expertise. Students will make archivalprints, have regular critiques, and attend lectures on the history of the manipulated imageand its place in culture. We will look at art movements which inspire digital artists,including 19th-century collage, dada, surrealism, and the zeitgeist of Hollywood films. Studentsmust have a digital SLR camera. Prior knowledge of Photoshop is not required.Attendance at first class is mandatory. Approval for this course will be considered afterenrollment on SIS; no need to email.

AS.371.152. Introduction to Digital Photography. 3 Credits.
In this course students are introduced to the technical and creative study of digital photography. Students will learn the basic operation of the DSLR camera while receiving instruction in Photoshop, Lightroom, Nik software, file handling and color editing processes. Through in class demonstrations and in the field practice, students learn to use the camera's manual settings to make accurate exposures. Lectures and discussions of historical and contemporary photographs will be introduced to give students guidance and inspiration for their own image making. The semester culminates with students creating a final portfolio of prints. Attendance in first class is mandatory.

AS.371.153. Introduction to Visual Communication- Graphic Design. 3 Credits.
The digital design course explores two-dimensional graphics as visual communication. Students will be introduced to basic design principles and elements, learn graphics tools used in the designindustry, and develop and apply creative strategies to solve design problems in their everyday lives. This unique course will address the students' direct needs through real-life design problems they face. Students will be asked to bring design challenges and tackle the issue both independently and collaboratively. Design challenges may include building print and web visual presentations, producing information brochure and posters, developing off and online portfolios, creating a resume to business cards. The course will offer both analog and digital design processes, graphics software tutorials and techniques, and basic introduction to design history, vocabulary and concepts.

AS.371.154. Introduction to Watercolor. 3 Credits.
Watercolor is simultaneously the most accessible of all painting media and the most misunderstood. This course provides experience and instruction in observational and expressive watercolor techniques, materials, concepts, and vocabulary. Topics to be reviewed include line, perspective, value, texture, composition, color, and pictorial space. There will be an introduction to contemporary practices in watercolor, as well as experimental and abstract exercises, collage, and conceptual work.

AS.371.155. Introduction to Sculpture. 2 Credits.
A studio course introducing students to sculptural concepts and methods. Emphasis is on the process of creating. Even the simplest materials can effectively activate space, convey meaning, and elicit emotion when used thoughtfully and imaginatively. Students will learn different methods including additive and reductive techniques, construction, modeling, and mold-making. No prerequisites except a willingness to experiment, make mistakes... and clean up when you are done. Approval in this course will be considered after enrollment in SIS. Attendance in 1st class is mandatory.

AS.371.162. Black and White: Digital Darkroom. 3 Credits.
In this digital photography course, students explore the beauty and drama of the black- and-white aesthetic. Students learn the elements of composition, style and content through discussions of historic and contemporary imagery. They gain proficiency in Photoshop, Lightroom, and NIK software. Projects enhance students' artistic vision and include the Evocative Landscape, Surrealism, and a DADA collage. Students work on a final project of their choice. Digital SLRs are provided. Attendance at 1st class is mandatory. Camera experience is a plus but not a requirement. Approval for this course will be considered after enrollment on SIS.

AS.371.164. Introduction to Printmaking. 2 Credits.
Working with non-toxic/water based inks and both an engraving press and hand tools, students will explore several types of printmaking. Methods will include intaglio, collograph and both simple and multi-plate relief. As they develop their prints, students can then observe and exploit the strengths that each method has to offer. Drawing and Photoshop skills are helpful but not required.

AS.371.165. Location Photography. 3 Credits.
Working in the studio and in various locations, students will learn the fundamentals of lighting interiors and strategies for working in almost any environment. Field trips will include the National Aquarium, Evergreen Museum & Library, a Howard County horse farm, a Tiffany-designed church and a photo studio. Students will also concentrate on the fine art of printing in our digital lab. They will develop a final portfolio of 10 photographs which express a personal vision about a location of their choice. A basic knowledge of digital photography is helpful, but not required. Approval for this course will be considered after enrollment on SIS. First class is mandatory

AS.371.166. Landscape Photography. 3 Credits.
Class begins: Wednesday, July 6th. In this course students will experience the drama and beauty of the urban and rural landscape. On numerous field trips they will hone their camera technique as well as learn elements of composition and develop a personal style. Students will learn the fundamentals of Photoshop and they will also be introduced to the beauty of black and white in Silver Efex software. Digital SLR cameras will be provided.

AS.371.180. Exploring Line. 2 Credits.
This challenging yet creatively playful course presents abstract, perceptual and conceptual concepts in art to understand line, one of the elements of art, from multiple perspectives, materials and practices. Be prepared to collaborate and experiment! Through an intense exploration of line, students will create artworks exploring line as marks on a flat surface (drawing), lines that communicate data (design), lines that build form (sculpture) and lines that embody movement (performance and video). Possible assignments will include projects with drawing, printmaking, fiber, cell phone video, installation, unconventional or recycled materials and collaboration. • This is not a drawing class but a multimedia course on one of the elements of art.Instructor approval and attendance at first class is mandatory.

AS.371.185. Printmaking: Multiples and Variations. 3 Credits.
In this course students learn to create marks, textures and imagery using a variety of printmaking techniques. Students create relief and intaglio printing matrices and practice printing by hand and with a press to reproduce their images. The class culminates with explorations of layered printing, monoprinting, and mixed media approaches to create unique 2-dimensional and 3-dimensional works. Attendance in first class is mandatory. No prior experience is needed.

AS.371.186. Fundamentals of Design Drawing and 3-D Visualization. 2 Credits.
This course introduces the tools, techniques, and technologies of design representation in a project-based setting. Students will build drawing skills, learn the principles of perspective, and explore theories and applications of design media and emerging digital technologies. Designing projects at various scales from the hand-held object to the public realm, we will develop creative problem solving, design thinking, and iterative design methodologies, leaving the course with the ability to apply the foundations of design to any discipline. Special note: This spring our course will be geared toward collaborative and site-based practices. Class meetings will begin with remote instruction and collaboration, and expand to include site visits as the season progresses. This course will satisfy the foundation drawing class for the art minor.

AS.371.187. Intermediate Drawing, A Contemporary Approach. 2 Credits.
This is an intermediate drawing class that builds on the concepts and skills in Studio Drawing 1. Students will explore contemporary and conceptual approaches to drawing while further developing their skills in various graphic mediums. Risk taking and experimentation will be encouraged while learning about comtemporary practices in the medium. The course will conclude with students creating an individual series of drawings of their choice.
AS.371.131 OR AS.371.186

AS.371.210. Drawing: Who's Telling the Story?. 2 Credits.
What makes an image truthful?Students will create drawings utilizing both traditional and unconventional processes through the lens of historical and political illustrations, propaganda graphics and misinformation, and current events. The course is anchored in, but not limited to, the art practices of Kara Walker's slavery narrative, George Grosz's political caricatures of First War Germany, historical war posters, Hugo Crosthwaite's depiction of the US/MX border to Coronavirus "beauty shot." Projects may include revising a historical artwork, manipulating propaganda graphics of the past and the present, redrawing a visual data, and designing a personal narrative drawing project. Field trips, technical demos, discussions, and lectures will provide context and support for students to become image-makers of their own narrative and history. Attendance in first class is mandatory. Recommended but not required: AS.371.131

AS.371.211. Artist Books: Draft, Print, Stitch. 3 Credits.
In this studio art class students will create three artist books taught by three different CVA faculty. The first four weeks will investigate the book as a technological and cultural artifact, exploring historically what the book is and does, and as a cognitive aid and engine for ideation. Students will create a blank book that they use for their creative explorations.The second section will use printmaking techniques such as paper lithography, xerox transfers, and relief printmaking combined with quick and ephemeral folding structures in an effort to understand both printmaking and bookmaking's rich history in dissemination of ideas, democracy, and social change. This section will participate in a class zine exchange. The third section of the course will explore embroidery and weaving to navigate language and mark making. Students will explore the relationship between poetry, storytelling, and fiber processes to create a narrative textile.

AS.371.215. Hybrid Photography; Analog and Digital Experimentation. 3 Credits.
This course will introduce students to the basic use of the digital camera, Adobe photoshop post processing, basic darkroom printing and a variety of techniques for making images using analog and digital techniques. Students will learn a variety of alternative processes such as Photograms in contemporary practices, Chemigrams, and nature printing techniques such as Lumen Prints, Chlorophyll prints and Anthotypes. Through lectures, demos and hands on experimentation, students will learn how to creatively combine two worlds of technology, digital and analog, to make unique images.

AS.371.226. Sculptural Fibers. 3 Credits.
The fabric of the universe, a wrinkle in time and space: our physical universe is frequently described through fiber metaphors. Fiber processes are algorithmic. They grow exponentially, they fold, they tear, they wrinkle. These processes function as a pliable plane that can be bent, stretched, and turned inside out. This course offers students an opportunity to explore fiber processes through this sculptural lens. Topics include knitting, crochet, basketry, and lace as they come together to form sculptural armatures and objects. Together we will explore the physical properties of fiber and textiles, how they take up space and function in our world. Attendance in first class is mandatory. Recommended but not required: AS.371.126 Fiber Art and the String Revolution.

AS.371.228. Investigations in Still Life Photography. 3 Credits.
Students will learn approaches to taking still life photographs and expressing their relationships to the objects surrounding their daily lives. Still life will be defined as the objects we purchase, own, consume, observe and arrange. Investigations into the still life will be focused on table top, food, found objects, and product photography.Technical explorations include the exposure triangle, depth of field, basic lighting control, framing, and visual design. Class will consist of live-demonstrations, independent studio work, discussions, and photography critiques. Students will complete a portfolio of printed images by the end of the class. A digital camera with manual control, tripod, Lightroom, and Adobe Photoshop will be supplied for this course. Students will be approved into the course after enrollment in SIS. Attendance in first class is mandatory.

AS.371.230. Portrait Photography. 3 Credits.
In this course students will gain insight into the art of portraiture with projects such as the self-portrait, collaborative portraiture, portrait of a place, and image and text. In representing people, we'll explore developing an understanding of people in relation to power and representation, the body, environments and society. Lectures on the history of the portrait and its practitioners, new directions in portraiture as well as empathy and the gaze will inspire students to bring greater depth to their image making. Camera experience is a plus but not a requirement. Cameras will be provided for the semester. First class is mandatory.

AS.371.233. Environmental Photography. 3 Credits.
Environmental cognition, consciousness and communication are formed, deciphered and internalized with the support of visual representations and, in particular, photography. Images increasingly structure our experience of nature, environmental problems, human-environmental relations, and ecological awareness. Students will engage with the local community, identify and investigate environmental issues affecting Baltimore, participate in photographic critiques, and develop a final, in-depth environmental photo-documentary project. This studio/seminar course is designed with an emphasis on individual research and practice.Attendance in first class is mandatory.

AS.371.234. Oil Painting II. 3 Credits.
Students who have mastered basic painting skills undertake sustained projects, including portrait and plein air landscape work. Slide lectures and handouts deepen students' appreciation of representational traditions. Advanced techniques, materials, and compositional issues are also investigated. Recommended Course Background: AS.371.133 or equivalent.
AS.371.131 OR AS.371.133 or instructor's permission.

AS.371.240. Intermediate Digital Photography: Photographic Concepts. 3 Credits.
This studio art course will introduce students to conceptual techniques and applications of digital photography. In this course, we will foster creative exploration and uses of technology through advanced digital capture, image construction and manipulation, substrate choices, and methods of digital output. We will have an in-depth look at historic and contemporary photography as it relates to culture, current trends, and classroom assignments. Students will also engage in conversation and classroom critique throughout the semester to aid their dialogue and understanding of contemporary art. Attendance in first class is mandatory. Completion of AS.371.152 is suggested.

AS.371.250. Life Drawing. 3 Credits.
An intermediate drawing course focusing on drawing the human form and studying anatomy for artists. Working from live models, students will draw the clothed and nude figure, portrait drawing, gesture drawing and anatomy tracings of the skeleton and muscles. Students will use drawing skills learned in Drawing I to explore the human form using wet and dry material, collage and color. The class will study the figure drawings and paintings from Renaissance to contemporary artists. Attendance in 1st class is mandatory.
AS.371.131 or AS.371.187 or permission of Instructor.

AS.371.302. Photographic Portfolio. 3 Credits.
In this upper level course, students will work on a semester-long project. They will develop their ideas within a seminar style format that allows for conversation and debate and provides a forum for the evolution their work. Students will learn advanced techniques in Photoshop, Nik software and Lightroom to enhance content and develop a personal style. Through a combination of critique, lecture, and lab, students will complete a portfolio of ten printed images that work together in a series. Approval for this course will be considered after enrollment on SIS. Attendance in 1st class is mandatory.

AS.371.303. Documentary Photography. 3 Credits.
In this course, we will explore different genres and approaches to documentary photography and the questions inherent to this mode of image-making like representation, storytelling, records and archives, journalism, community engagement, research and personal perspective. Baltimore neighborhoods and contemporary issues will provide inspiration for student work. Students will learn camera operation, photo editing and produce a final documentary project on a subject of their choice as the culmination of their semester's work. Digital SLRs are available on loan for the semester. Attendance at first class is mandatory.

AS.371.307. The Photographer's Book. 3 Credits.
Students create a handmade book of photographs that illustrate a favorite piece of text. They may work with poetry, song lyrics, a play, a narrative, a blog, a diary, any writing (including their own). Students may look at historical texts such as medieval manuscripts or even scientific treatises. The possibilities are endless. We will take fieldtrips to book collections at the George Peabody Library, Evergreen Museum and Library and the Betty and Edgar Sweren Collection.This course will be taught by a photographer and an artist book designer. A previous photography class is a plus, but not a requirement. Students who would like to combine their painting and drawing skills with their photographs are welcome to do so. Attendance in first class is mandatory. Students will have an exhibition of their artist books in the Special Collections Rare Books room of the MSE library.Approval for this course will be considered after enrollment in SIS.

AS.371.330. Evergreen as Muse: A Photographic Exploration. 3 Credits.
In this course taught by an historian and a fine art photographer, students are introduced to the delights of the Evergreen Museum and Library of the Johns Hopkins University. The history of Evergreen, its inhabitants including family members and servants, the world-famous library, art collection and grounds, all serve to inspire students to produce a portfolio of photographs. There will be an exhibition showcasing student work at the museum as the culmination of their semester's work.
AS.371.152 OR AS.371.162 OR AS.371.303

AS.371.381. Advanced Projects in Visual Art. 3 Credits.
In this studio course students will create artwork based on their individual research and concerns in art. Through artist presentations, readings, discussions and museum and gallery visits the students will advance their skills and understanding of contemporary art and theory. This class is open to studio and digital photography students who want to engage with other serious art students and advance their art practice and research.
AS.371.131 OR AS.371.133 OR AS.371.152

AS.371.501. Independent Study. 2 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.371.502. Independent Study. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.371.590. Independent Study. 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.374 (Military Science)

AS.374.101. Introduction to the Army. 2 Credits.
The MSL I course produces a Cadet who accepts the Army as a values-based organization and embraces the scholar-athlete-warrior ethos; who is familiar with individual roles and responsibilities in support of team efforts and problem solving processes in military and non-military situations; who demonstrates oral and written communication skills, understands resilience, and demonstrates a commitment to learning. MSL101 introduces Cadets to the Army and the Profession of Arms. Students will examine the Army Profession and what it means to be a professional in the U.S. Army. The overall focus is on developing basic knowledge and comprehension of the Army Leadership Requirements Model while gaining a big picture understanding of the Reserve Officers' Training Corps (ROTC) program, its purpose in the Army, and its advantages for the student. Cadets also learn how resiliency and fitness supports their development as an Army leader. As you become further acquainted with MSL101, you will learn the structure of the ROTC Basic Course program consisting of MSL101, 102, 201, 202, Fall and Spring Leadership Labs, and Basic Camp. The focus is on developing basic knowledge and comprehension of Army leadership dimensions, attributes and core leader competencies while gaining an understanding of the ROTC program, its purpose in the Army, and its advantages for the student.Military Science courses require department permission and are restricted to active or inquiring ROTC members

AS.374.102. Foundations of Agile and Adaptive Leadership. 2 Credits.
The MSL I course produces a Cadet who accepts the Army as a values-based organization and embraces the scholar-athlete-warrior ethos; who is familiar with individual roles and responsibilities in support of team efforts and problem solving processes in military and non-military situations; who demonstrates oral and written communication skills, understands resilience, and demonstrates a commitment to learning. MSL102 introduces Cadets to the Army and the Profession of Arms. Students will examine the Army Profession and what it means to be a professional in the U.S. Army. The overall focus is on developing basic knowledge and comprehension of the Army Leadership Requirements Model while gaining a big picture understanding of the Reserve Officers' Training Corps (ROTC) program, its purpose in the Army, and its advantages for the student. Cadets also learn how resiliency and fitness supports their development as an Army leader. As you become further acquainted with MSL102, you will learn the structure of the ROTC Basic Course program consisting of MSL101, 102, 201, 202, Fall and Spring Leadership Labs, and Basic Camp. The focus is on developing basic knowledge and comprehension of Army leadership dimensions, attributes and core leader competencies while gaining an understanding of the ROTC program, its purpose in the Army, and its advantages for the student.

AS.374.110. Basic Leadership Laboratory, ROTC 101. 1 Credit.
These introductory courses in a laboratory environment are designed to expose students to practical experiences, challenges and individual learning opportunities in a small group. Students learn the fundamentals of an organization and apply principles of leadership and management at the foundation level. Students develop military courtesy, organizational discipline, communication and basic leadership and management skills. Ultimately, students understand how to facilitate and lead a small group of four to five people as an integral part of a larger organization of 75-100 people through situational training opportunities in a variety of conditions. As a leadership practicum, students have the opportunity to serve in leadership positions and receive tactical and technical training. In addition to learning to lead groups of five to 100 people, students will also be exposed to training on first aid, operating Army equipment, Army activities such as rappelling and drill and ceremony. These laboratories are required for enrolled ROTC participants who desire to be considered for a commission in the Army. Corequisite: AS.374.101-AS.374.102.Military Science courses require department permission and are restricted to active or inquiring ROTC members.
Prerequisite(s): AS.374.101 OR AS.374.102

AS.374.120. Basic Leadership Laboratory II. 1 Credit.
Students learn and apply team echelon leadership at an entry level. They continue development of military courtesy, discipline, communication and basic Soldier skills. Ultimately, students understand how to operate in and lead 4-5 persons through a program of training opportunities in a variety of conditions. Freshmen only.

AS.374.201. Leadership and Decision Making. 2 Credits.
The MSL II course produces a cadet grounded in foundational leadership doctrine and skills by following and leading small units to achieve assigned missions; who applies critical thinking and problem solving using Troop Leading Procedures (TLP); who comprehends the value of diversity and understands the officer's role in leading change; understands the fundamentals of the Army as a profession. MSL201 adds depth to the Cadets understanding of the Adaptability Army Learning Area. The outcomes are demonstrated through Critical and Creative Thinking and the ability to apply Troop Leading Procedures (TLP) to apply Innovative Solutions to Problems. The Army Profession is also stressed through leadership forums and a leadership self-assessment. Students are then required to apply their knowledge outside the classroom in a hands-on performance-oriented environment during Leadership LABs team building exercises, and Field Training Exercises.Military Science courses require department permission and are restricted to active or inquiring ROTC members.

AS.374.202. Army Doctrine and Team Development. 2 Credits.
MSL 202 focuses on Army doctrine and team development. The course begins the journey to understand and demonstrate competencies as they relate to Army doctrine. Army Values, Teamwork, and Warrior Ethos and their relationship to the Law of Land Warfare and philosophy of military service are also stressed.The ability to lead and follow is also covered through Team Building exercises in small units up to squad level. Students are then required to apply their knowledge outside the classroom in a hands-on performance-oriented environment during Leadership LABs (team building exercises, LTXs, VBS exercises). Includes a 1-Hour lab per week taught by MS III Cadets.The Army Reserve Officer Training Course (ROTC) Basic Course is an academically rigorous 2-year college program comprised of four semester courses of instruction, Leadership Labs (two sets, Fall/Spring), and the Cadet Basic Camp conducted at Fort Knox, KY.

AS.374.210. Basic Team Leadership. 1 Credit.
Students lead and assist in leading 4-5 person teams through a variety of training opportunities. They learn the troop-leading procedures, basic problem solving, and tactical skills aimed at military leadership. Students will mentor and assist members of their team with improving their own skills and leadership as well. Corequisite: AS.374.201.Military Science courses require department permission and are restricted to active or inquiring ROTC members.
Prerequisite(s): AS.374.201

AS.374.220. Advanced Team Leadership. 1 Credit.
Students perform duties of and develop their leadership, as team leaders during a variety of induced training opportunities. Continued emphasis is placed on troop-leading-procedures and simple problem solving. Students lead physical fitness training and mentor subordinates in military, academic and extra-curricular activities. Successful completion of advanced team leadership allows students to progress into ROTC Advanced Courses. Sophomores only.

AS.374.301. Training Management and the Warfighting Functions. 2 Credits.
MSL301 Training Management and the Warfighting Functions, is an academically challenging course where you will study, practice, and apply the fundamentals of Army Leadership, Officership, Army Values and Ethics, Personal Development, and small unit tactics at the platoon level. At the conclusion of this course, you will be capable of planning, coordinating, navigating, motivating and leading a squad and platoon in the execution of a mission during a classroom PE, a Leadership Lab, or during a Field Training Exercise (FTX). You will be required to write peer evaluations and receive feedback on your abilities as a leader and how to improve those leader skills that can further develop you in to a successful officer. This course includes reading assignments, homework assignments, small group assignments, briefings, case studies, and practical exercises, a mid-term exam, and a final exam. You will receive systematic and specific feedback on your leader attributes, values, and core leader competencies from your instructor, other ROTC cadre, and MSL IV Cadets who will evaluate you using the Cadet Officer Evaluation System (COER). Successful completion of this course will help prepare you for the SROTC Advanced Camp, which you will attend in the summer at Fort Knox, KY.Military Science courses require department permission and are restricted to active or inquiring ROTC members.
Area: Writing Intensive

AS.374.302. Applied Leadership in Small Unit Operations. 2 Credits.
MSL302 Applied Leadership in Small Unit Operations, is an academically challenging course were you will study, practice, and apply the fundamentals of Army Leadership, Army Values and Ethics, Personal Development, and small unit tactics at the platoon level. At the conclusion of this course, you will be capable of planning, coordinating, navigating, motivating and leading a squad and platoon in the execution of a mission during a classroom PE, a Leadership Lab, or during a Field Training Exercise (FTX). You will be required to write peer evaluations and receive feedback on your abilities as a leader and how to improve those leader skills that can further develop you in to a successful officer. This course includes reading assignments, homework assignments, small group assignments, briefings, case studies, and practical exercises, a mid-term exam, and a final exam. You will receive systematic and specific feedback on your leader attributes, values, and core leader competencies from your instructor, other ROTC cadre, and MSL IV Cadets who will evaluate you using the Cadet Officer Evaluation Report (COER). Successful completion of this course will help prepare you for the SROTC Advanced Camp, which you will attend in the summer at Fort Knox, KY.
Area: Writing Intensive

AS.374.307. Leadership in Military History. 2 Credits.
This course provides students with a historical perspective to decisions made by American military leaders: battlefield complexity, resource limitations, and teamwork deficiencies. Students cover major military engagements from the colonial period through the current operating environment. Students examine how leaders motivated their men, devised battle strategies, implemented rules of engagement, and managed supplies, transportation, and logistics for their troops. Requires permission of the Director of Military Science. Registration restricted to contracted ROTC cadets only.
Area: Writing Intensive

AS.374.310. Basic Tactical Leadership Laboratory. 1 Credit.
In Leadership Laboratory, students are given the opportunity to apply what they have learned in the classroom, in a tactical or field environment. Students learn and demonstrate the fundamentals of leadership by planning, coordinating, navigating, motivating, and leading squads in the execution of both garrison and tactical missions. Successful completing of this course will help prepare you for the SROTC Advanced Camp, which you will attend in the summer at Fort Knox, KY. Corequisite: AS.374.301.Military Science courses require department permission and are restricted to active or inquiring ROTC members.
Prerequisite(s): AS.374.301

AS.374.320. Advanced Tactical Leadership. 1 Credit.
Students further develop their leadership skills by directing and coordinating the efforts of 9-60 personnel on offensive, defensive and civil-support tactical-tasks. Develop written plans for garrison and field environments while supervising its execution. Ultimately, prepares students to excel at the four-week National Leadership Development and Assessment Course at Fort Knox, KY. Permission required. Juniors only.

AS.374.401. The Army Officer. 2 Credits.
MSL 401 Focuses on development of the Army Officer. It is an academically challenging course were you will develop knowledge, skills, and abilities to plan, resource, and assess training at the small unit level. You will also learn about Army programs that support counseling subordinates and evaluating performance, values and ethics, career planning, and legal responsibilities. At the conclusion of this course, you will be familiar with how to plan, prepare, execute, and continuously assess the conduct of training at the company or field grade officer level. Includes a lab per week overseeing MSL III lesson facilitation and supervised by ROTC Cadre.Military Science courses require department permission and are restricted to active or inquiring ROTC members.

AS.374.402. Company Grade Leadership. 2 Credits.
This is an academically challenging course were you will study, practice, develop, and apply critical thinking skills pertaining to Army leadership, officer skills, Army Values and ethics, personal development, and small unit tactics at platoon level. This course includes reading assignments, homework assignments, small group assignments, briefings, case studies, practical exercises, mid-term exam, and a Capstone Exercise in place of the final exam. For the Capstone Exercise, you will be required to complete an Oral Practicum that you will be evaluated on your knowledge of the 20 Army Warfighting Challenges (AWFC) covered throughout MSL401 and 402 coursework. In addition, you could be assessed on leadership abilities during classroom PE, Leadership Labs, or during a Field Training Exercise (FTX). You will receive systematic and specific feedback on your leader attributes, values, and core leader competencies from your cadre, PMS and other MSL IV Cadets who will evaluate you using the Cadet Officer Evaluation Report (COER). You will be required to write peer evaluations and receive feedback on your abilities as a leader and how to improve those leader skills. At the conclusion of this course, you will be able to plan, coordinate, navigate, motivate and lead a platoon in future operational environments. Successful completion of this course will assist in preparing you for your BOLC B course and is a mandatory requirement for commissioning.

AS.374.410. Advanced Planning & Decision Making I. 1 Credit.
Students develop a semester-long progression of programmed training activates that support completion of the unit's Mission Essential Task List. The laboratory builds from fall to spring semester as students master advanced problem solving, resource synchronization and executive decision making. Students evaluate, mentor and develop subordinate leaders as part of the Leadership Development Program and FM 6-22, Army Leadership. The course serves as the final evaluation and determination on a student's ability to lead Soldier's as a Second Lieutenant in the US Army. Co-requisite: AS.374.401-AS.374.402. Recommended Course Background: AS.374.301-AS.374.302, AS.374.310-AS.374.320 and Basic Course.Military Science courses require department permission and are restricted to active or inquiring ROTC members.
Prerequisite(s): AS.374.401 OR AS.374.402

AS.374.420. Advanced Organizational Planning. 1 Credit.
Students develop a semester-long progression of training activates that support completion of the unit's Mission Essential Task List. The laboratory builds on the first semester's achievements through advanced problem solving, resource synchronization and executive decision making. Students evaluate and develop subordinate leaders as part of the Leadership Development Program and FM 6-22, Army Leadership. The course serves as the final evaluation and determination on a student's ability to lead Soldier's as a Second Lieutenant in the US Army. Permission required. Seniors only.

AS.374.501. Independent Study. 1 Credit.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.374.512. Internship - Military Science. 1 - 3 Credits.
Students will select a topic relevant to the study of military leadership and will complete a project based on current military doctrine and the contemporary operating environment of current military operations. Permission required.
Area: Writing Intensive
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.376 (Music)

AS.376.111. Rudiments of Music Theory and Musicianship. 3 Credits.
This course introduces written and aural music fundamentals including notation, scales, intervals, chords, rhythm, meter and sight-singing. Students will compose melodies and short pieces and complete listening projects. Course does not count towards the completion of the minor.

AS.376.166. Star Trek Music- The Franchise Frontier. 3 Credits.
Music defines the Star Trek experience. Through their continued reuse and repetition, Star Trek's many musical themes go beyond their original audiovisual frameworks to operate as learned musical-cultural texts. As Star Trek has expanded its content into a myriad of installments and media platforms, this musical symbolism has proved vital in articulating both these differences and “sameness.”This online, asynchronous course uses Star Trek's music as a tool to investigate musical branding and the creation of meaning in the media we consume every day. Through close viewings—and listenings—of film, television episodes, video games, computer games, commercials, and other media, we will explore the meaning(s) these media construct and acquire as they are re-used and re-purposed in audiovisual contexts. Your work will include studying media clips, television episodes, and some feature-length films; short readings in which we interact with both current and classic scholarly literature; regular discussion posts and responses to our content; a weekly reflection journal of short posts; and a final paper/project on a Star Trek music topic of your choice (1500 words). In so doing, we will hone your analytical skills by learning to critically evaluate filmic media and craft arguments about the roles of music/sound in film.

AS.376.190. Learn Music by Writing It. 3 Credits.
This course uses composition and song-writing projects to introduce music fundamentals to students with little or no musical background. Topics will include rhythm and meter, pitch and intervals, scales, chords, and harmony, and how to read and write music in both traditional and popular presentations. We will cover standard classical music notation (score, Roman numerals, traditional theory terminology) as well as popular (lead-sheet notation and performance conventions). This course has no prerequisite.

AS.376.211. Music Theory I. 3 Credits.
Introduction to basic principles of tonal music through listening, analysis and music making. Students study melody, harmony, voice leading, figured bass and dissonance treatment, and will also undertake short composition projects. Must have taken the qualifying examination or AS.376.111. Recommended to be taken concurrently with AS.376.221.

AS.376.212. Music Theory II. 3 Credits.
This course continues the aural and written work of the previous course, but focuses on chromatic harmony while continuing the study of melody, counterpoint, and figured bass. Prerequisite: Music Theory I. AS.376.211

AS.376.221. Musicianship I. 2 Credits.
An introduction to basic musicianship skills. The course is divided into performance skills (sight singing, rhythm reading, basic piano, and improvisation) and aural skills (recognition of pitch, chords, rhythms, melodies, and other musical structures). Topics include major and minor keys and simple time signatures. Emphasis is placed on developing effective practice techniques. Pre-requisite: AS.376.111 (Rudiments of Music Theory and Musicianship) or placement exam.

AS.376.222. Musicianship II. 2 Credits.
A continuation of the skills developed Musicianship I. The course is divided into performance skills (sight singing, rhythm reading, basic piano, and improvisation) and aural skills (recognition of pitch, chords, rhythms, melodies, and other musical structures). Topics include minor keys, chromatic melody and harmony, compound time signatures, and syncopation). As in Musicianship I, emphasis is placed on developing effective practice techniques. Pre-requisite: AS.376.221 (Musicianship I) or placement exam.

AS.376.231. Western Classical Music. 3 Credits.
This course offers an introduction to music of the Western “classical” tradition through the study of a select number of works written over the course of the last four hundred years. In examining these musical works, all of which were remarkable for their time and which many still value today, we will consider their identity both as timeless aesthetic objects and as particular moments in cultural history. We will frame our work within the historical, philosophical, and political contexts of the time, and more recent critical assessments will help us evaluate the circumstances that have shaped reception of this repertoire over the past four centuries. In addition to the works and composers treated in our textbook, we will supplement our study throughout the semester with a consideration of the lives and works of individuals whose stories are less well-known. Ultimately, we will work to understand the particular challenges, opportunities, and responsibilities related to continued engagement with so-called “classical” music in the 21st century. Close attention is given to techniques of musical listening, and to details of first performances, with a consideration of the problems involved in assembling such a picture. No previous knowledge of musical notation or terminology is required. 3 credits.

AS.376.242. Introduction to Popular Music. 3 Credits.
A survey of the stylistic features and social contexts of American popular music since the 1950s.

AS.376.244. Electronic Music Production. 3 Credits.
Students will be introduced to electronic music production techniques and software, and how both can be used to produce a wide range of genre specific results. Skills such as beat matching, intricate use of quantization, virtual instrument editing, automation, sampling, mixing, mastering, effect usage and use of plugins will be explored.

AS.376.245. Introduction to Sound, Audio, and Recording Arts. 3 Credits.
In this course we will undertake a comprehensive survey of sound, audio and the related technology. While covering sound recording from an historical perspective, we'll touch on related material in physics, music, psychology and acoustics. In lab exercises and assignments, students will have the opportunity to learn in a hands-on environment as practical applications of the lecture material are explored. Assignments will include critical listening, in addition to basic recording, editing and mixing of audio. The course will culminate in a comprehensive final project.

AS.376.250. Introduction to Computer Music. 3 Credits.
Introduction to Computer Music is an opportunity for people with no specialized training in music to explore electronic art music as a long-standing, if obscure, body of art, then to participate in creative work in the style. Participants will gain a heuristic understanding of forms of musical composition that operate outside the conventions of regular rhythm and harmony as they record and manipulate sound to sculpt it into original musical works. The lecture portion combines an historical overview of electronic music, rudiments of acoustics and musical perception, and instruction in compositional techniques and in using computers as creative musical tools. The laboratory portion, given at the Digital Media Center, serves as a workshop for creative exploration and for the completion of assigned creative projects including original works of digital sound art.

AS.376.252. Jazz History. 3 Credits.
The primary focus of this course is a survey, investigation, and study of jazz music and how it shaped American history from its origins to current times. Upon completion of this course students will be able to: discuss why jazz is important, both musically and culturally; learn the nuances of a new art form; demonstrate that jazz is a huge part of American heritage; explore parallels between jazz and both American and world history; and become a receptive and knowledgeable audience for jazz.

AS.376.258. Jazz Improvisation and Theory. 3 Credits.
The primary focus of this performance/theory course is designed to help students acquire and develop basic language for improvisation in a collaborative environment. Throughout the semester, the course will develop these skills through songs drawn from standard jazz repertoire, examining improvised solos by master musicians, and understanding the application of fundamental theory concepts in performance situations. Enrolled students should be comfortable with theory rudiments such as note reading, scales, and intervals. No textbook is required, but students should have access to an instrument (singers are welcome).

AS.376.259. Theory of 20th Century Popular Song. 3 Credits.
This class will explore the way harmonic concepts codified in the western classical tradition over the last few centuries are represented and expanded upon in 20th and 21st century popular music. We will examine a number of harmonic techniques using a wide array of genres, ranging from jazz to Broadway to rock to pop to R&B/soul to hip-hop. This course will focus on listening, analysis, and composition techniques.

AS.376.303. Musical Theater from Aristophanes to Leonard Bernstein. 3 Credits.
This course examines the birth of musical theatre from Greek tragedy through the liturgical and secular plays of the middle ages and Renaissance, to the classical and romantic singspiels, operettas, and zarzuelas of the modern era, by such figures as Aristophanes, Adam de la Halle, Hildegard of Bingen, Angelo Poliziano, Juan del Encina, Wolfgang Amadeus Mozart, Gilbert and Sullivan, Ernesto Lecuona, Igor Stravinsky, and Kurt Weill. These will serve as a backdrop for a closer examination of the musicals of Jerome Kern, Cole Porter, George Gershwin, Irving Berlin, Richard Rodgers, Harold Arlen, Frank Loesser, Leonard Bernstein and others. In addition to studying and placing the works of these Broadway giants into a social, political, and economic context, we will study and perform from representative musicals and attend a performance at the Lyric Theatre. Student will be expected to write a capstone project.
Area: Writing Intensive

AS.376.330. History of Opera. 3 Credits.
A basic course in the origin and development of opera and its dissemination throughout the Western world.

AS.376.332. A Cappella Arranging. 1 Credit.
Students will learn how to arrange pre-existing melodies or songs for various vocal ensembles. Music theory I as a prerequisite recommended but not required.

AS.376.334. World Music & Cultures. 3 Credits.
The general purpose of this course is to introduce students to the scholarly study of traditional, popular, and classical music from around the world through reading, discussion, close listening of recordings, and observation of ethnographic and commercial films. We will be primarily concerned with using music as a lens through which to better understand cultural concepts including diaspora, religion, colonialism, creolization, and tradition. Area case studies will include India, East Asia, Sub-Saharan Africa, the Caribbean, and the Middle East.

AS.376.336. Beethoven and the Transformation of Musical Style. 3 Credits.
A survey course focusing on the life and music of Ludwig van Beethoven, whose compositions transformed and revolutionized music of the 19th century. Students will become acquainted with Beethoven's major works, including piano sonatas, string quartets, and symphonies. No previous musical background is necessary. NOTE: The year 2020 marks the 250th anniversary of Beethoven's birth.

AS.376.342. Caribbean Music. 3 Credits.
This course will explore the many genres of traditional and popular music that have emerged among the peoples and cultures of the Caribbean region and its Diaspora. We will examine the social, political, and economic issues that have shaped the region's music and how that music may have intersected with migration, colonization, ethnicity, race and tourism. Using a "participantobservation" approach, students will read about, listen to and research a variety of musical experiences within the relevant sociopolitical context. Students should expect to fully participate in discussions about the assigned readings and music, and should be prepared to conduct their own research and share their own or newly acquired knowledge of contemporary and "historical/traditional" musical themes, and local and regional artists. Our collective goal will be to enjoy as well as to think critically about music, culture and performance and within a moreinformed understanding of the complex, multi-varied and multi-vocal context—know as "The Caribbean".

AS.376.344. Powerful Women in Opera. 3 Credits.
Many opera scholars have noted that opera abuses its female characters. Many operatic heroines die, whether from violent acts or chronic diseases. However, women in opera also wield great power through their voices as ambitious queens, cunning servants, magical beings, and femmes fatales. In this course we will examine how these female characters operate through explorations of the operas' historical context, their texts and scores, and modern performance practice. Spanning from the 17th to 21st centuries, the repertoire studied in this class will provide an introduction to opera history. At the same time, we will delve deeply into different ways to do close analyses of opera through the lens of gender, reading the work of such thinkers as Carolyn Abbate, Naomi Andre, Adriana Caverero, Catherine Clément, and Wayne Koestenbaum.

AS.376.348. The Symphonic Century. 3 Credits.
The symphony occupies a prominent place within the history of Western classical music in the "long" nineteenth century. At once a canvas for daring innovations in style and form and a genre strongly allied with notions of "tradition," the nineteenth-century symphony brings together a complex set of issues that illuminate the broader history of music and musical culture of the past 200 years. This course introduces the iconic works of the symphonic tradition, with a focus on music of Haydn, Mozart, Beethoven, Schubert, Berlioz, Schumann, Mendelssohn, Brahms, Bruckner, and Mahler. As we aim to discover what made this music so remarkable in its time and why so many people still care about it today, we will consider each symphony both as a timeless work of art and as a particular moment in cultural history. Close attention will be given to the techniques of musical listening, and our work will be deeply rooted within the historical, philosophical, and political contexts of the time. There are no pre-requisites for the course apart from a willingness to open one's ears and to engage creatively and critically with some of the most extraordinary music ever written.

AS.376.371. Introduction to Music Cognition. 3 Credits.
What underlies our aesthetic response to music? How and why are we able to identify certain sounds as music? To what extent are music and natural language similar? What is it about music that evokes such powerful emotions such as happiness and sadness? What is unique to musical creativity? Examining such questions from cognitive science, neuroscience, psychology, and philosophical perspectives, this course explores relevant research and theory in the emerging domain of music perception and cognition. Students will complete a final research paper on the topic of their choice that integrates the course material.

AS.376.372. Topics in Music Cognition. 3 Credits.
This course explores the similarities and differences between music and language, the effects of musical training on cognitive development, and the expressive power of music, with an introduction to music and its role in film. We will read relevant research and theory on these topics from cognitive science, neuroscience, psychology, musicology, and philosophical perspectives.

AS.376.404. History of Musical Instruments. 3 Credits.
The history, technology, and performance of Western European musical instruments, their precursors, and their non-western counterparts, addressed by experts and explored on visits to historic collections.Recommended prerequisite: AS.376.231 "Western Classical Music".
Area: Writing Intensive

AS.376.407. Music and Evolution. 3 Credits.
This course will examine the bio-cultural evolution of music in light of recent interdisciplinary research on the social bases of human cognitive evolution, and explore its implications for current debates in musicology, ethno- musicology, psychology of music, and human cognitive evolution.
Area: Writing Intensive

AS.376.428. Mozart Operas. 3 Credits.
Wolfgang Amadeus Mozart wrote his first opera in 1767 at the age of 11. By the time of his death at age 35, he had written 22 full-length operas. Many of these operas are still performed today in opera houses around the world. In this course, we will discuss the enduring popularity of these works. We will discover how these operas were created, delving into the many important collaborations Mozart had with singers, librettists, impresarios, and patrons. We will analyze the words and music of the operas and how they combine to create three-dimensional characters for which his operas are known, such as the melancholy but determined Countess in The Marriage of Figaro, or the cowardly but loyal Papageno in The Magic Flute. Cultural norms have shifted dramatically between Mozart's time and ours, and we will examine how Mozart's operas have been received from their premieres through to today. We will think about how the operas have been translated, adapted, and circulated to different audiences in different eras and locations. Finally, we will reflect on our position as modern audience members, watching recent productions of the operas which reinterpret the works in alternative settings or times and studying the ways in which opera companies promote Mozart's works.
Area: Writing Intensive

AS.389 (Program in Museums and Society)

AS.389.155. The History of Fake News from The Flood to The Apocalypse. 3 Credits.
"Fake News" is everywhere in both past and present. Explore that history first-hand throughJHU's rare book collection of literary and historical forgeries spanning millennia of human history.Students learn how to examine and investigate rare books.
Area: Writing Intensive

AS.389.165. Hands on History: Material Cultures of Knowledge from Antiquity to the Digital Age. 3 Credits.
This hands-on course deals entirely with JHU's collections of rare books and manuscripts as a springboard to build skills in the close visual and physical examination of rare books and manuscripts. You will investigate the technological and aesthetic transformation of textual artifacts from ancient papyri to Gutenberg imprints to digital surrogates, and contribute to the accumulation of historical clues about their meaning and significance as material cultural objects. You will learn what goes into curating and conserving book and manuscript collections today, and how to evaluate the quality and significance of collections. Materials/topics will include ancient Babylonian cuneiform and Egyptian papyri; medieval illuminated manuscripts; incunabula; Renaissance illustrated books of the Scientific Revolution and Spanish Golden Age; cheap print and unique ephemera; early books by and about women; forgeries; and "digital humanities" initiatives at JHU. Students will make regular visits to the Special Collections Reading Room in the BLC throughout the semester.
Area: Writing Intensive

AS.389.201. Introduction to the Museum: Past and Present. 3 Credits.
This course surveys museums, from their origins to their most contemporary forms, in the context of broader historical, intellectual, and cultural trends including the social movements of the 20th century. Anthropology, art, history, and science museums are considered. Crosslisted with Archaeology, History, History of Art, International Studies and Medicine, Science & Humanities.

AS.389.202. Introduction to the Museum: Issues and Ideas. 3 Credits.
Museums face practical, political and ethical challenges, including economic difficulties, debates over interpretation of culture and pressure to demonstrate social value. This course considers how museums are answering these challenges.

AS.389.220. Queer Sixties. 3 Credits.
Introduction to queer & trans politics and culture in the period immediately preceding the gay liberation movement, from the early to late 1960s, focusing on intersections of race, sexuality, and gender. Course examines how we have come to narrate queer & trans history and investigates the ways archival practices shape conceptions of queer & trans life. Students learn research methods as they draw on and contribute to the university's digitized archival collections.

AS.389.230. Queer & Trans Public History. 3 Credits.
This course introduces students to a blend of public history, queer studies and transgender studies. Students learn oral history and archival research methods as they draw on and contribute to the university's archival, museum, and library collections.

AS.389.240. Archaeological Museum Practicum: Collections Management. 3 Credits.
Students will learn current procedures for surveying, cataloguing, documenting and rehousing collections using objects from the Archaeological Museum. This is a hands-on practicum course working closely with museum staff.

AS.389.242. Museum Education: From Contested Knowledge to Reflective Narrative. 3 Credits.
This practicum course critically considers current art and history museum education practices and explores social justice discourses through museum visits, visitor studies, and museum learning strategies.

AS.389.250. Conservation of Material Culture: Art, Artifacts and Heritage Sites. 3 Credits.
This course will introduce students to the field of art conservation through the study of paintings, paper, books, objects, contemporary sculpture and historic preservation. Topics covered will include: methods of manufacture, agents of deterioration, preservation initiatives, conservation treatment and ethics, and conservation science. Cross-listed with History of Art.Class usually meets at 1:30 - 3:50 PM, except for days with field trips.

AS.389.260. Cultural Heritage in Crisis. 3 Credits.
We explore the possible futures of cultural heritage and museums in times of accelerating climate change, pandemics, armed conflict and political and social turmoil by examining past and contemporary events.

AS.389.275. Interpreting Hopkins as Historic Site. 3 Credits.
This hands-on course explores interpretive strategies for historic sites and culminates in the production of original, research-based, outdoor interpretive exhibits on the Homewood Campus.

AS.389.280. Of and For Everyone: Diversity, Equity, Inclusion and Access in the Museum. 3 Credits.
How are museums responding to the pressures to be more equitable, inclusive, and accessible towards public audiences and their staff? Students go behind the scenes of the Smithsonian, Baltimore Museum of Industry and Baltimore Museum of Art to meet with working groups and staff charged with transforming their institutions. Includes site visits, hands-on experiences and research on best practices.

AS.389.303. World of Things. 3 Credits.
The course introduces and applies new concepts about materials, and materiality to museum objects. It treats the museum as a site for investigating the relationship between people and things.

AS.389.311. From Treasure House to Production House: Exploring New Roles for the Museum in the 21st Century. 3 Credits.
Students work with the Director of, the Peale Center for Baltimore History and Architecture as it reinvents itself as a museum for the twenty-first century. Involves working with community story-tellers in residence. Extra time is to allow for field trip travel - most days class runs 1:30-3:50.

AS.389.314. Commemoration, Mourning, and Race: The Stories of Mount Auburn Cemetery. 3 Credits.
In partnership with Mount Auburn Cemetery in Baltimore, owned and operated by the Sharp Street Memorial United Methodist Church, this community-engaged course will address the African American cemetery in general, and the Mount Auburn Cemetery in particular, as a place of multiple meanings: a sacred site of private mourning, a public place of commemoration, a representation of racism, an historic accomplishment. This course will require on-site research that contributes to the cemetery's interests.

AS.389.315. Ancient Color: The Technologies and Meanings of Color in Antiquity. 3 Credits.
What role did the colorful surfaces of sculptures, vessels and textiles play in the ancient world? We examine historical texts and recent scholarly and scientific publications on the technologies and meanings of color in antiquity, and use imaging and analytical techniques to study polychromed objects from the Johns Hopkins Archaeological Museum

AS.389.322. Tigers to Teapots: Collecting, Cataloging, and Hoarding in America. 3 Credits.
Course will examine the collecting behavior of Americans. Students will explore how collectors have defined the holdings of the nation's museums, galleries, and libraries and used objects to shape taste and status in the U.S.

AS.389.324. The BMA Seminar: Digital Interpretation. 3 Credits.
When museums shut their galleries in response to the global pandemic they saw a surge in digital audiences and engagement, athough not everyone can access digital content equally. Continued public health risks bring new challenges to digital interpretation, while universal access as well as embedded racial and gender bias remain significant issues. Students research what works and what doesn't in digital interpretation for art museums, centering social equity and accessibility in their assessment, and develop principles and guidelines for the museum's digital interpretation strategy.

AS.389.325. Women of the Book: Female Miracle Workers, Mystics, and Material Culture, 1450-1800. 3 Credits.
From psycho-spiritual autobiographers to mystical bi-locating nuns, convent crèche-keepers to choristers of sacred music, from rock-star-status mystics to the hidden careers of women printers, engravers, and miracle-makers, this course will explore the remarkable intellectual, cultural, and imaginative contributions of women who found refuge, agency, and power within alternative lives.
Area: Writing Intensive

AS.389.329. Author/Canon/Archive. 3 Credits.
Why are some literary works from the past reprinted, anthologized, and considered worthy of study, but not others? Why are some works "lost" and some "rediscovered," while others simply fall out of favor? Focusing on nineteenth- and early twentieth-century American literary culture, we will use rare books and archival materials from JHU collections to examine Edgar Allan Poe, Walt Whitman, Emily Dickinson, Stephen Crane, Charles Chesnutt, and Zora Neale Hurston, along with a few authors you've never heard of, in terms of the relationship between authorship, stewardship, and status.

AS.389.340. Critical Issues in Art Conservation. 3 Credits.
The course examines recent controversies in the conservation of major global art works and sites, raising questions concerning the basic theoretical assumptions, practical methods and ethical implications of art conservation. Cross-Listed with History of Art and Anthropology

AS.389.346. Scribbling Women in the Literary Archive. 3 Credits.
Students examine select texts and archival materials related to Emily Dickinson, Frances Ellen Watkins Harper, Edith Wharton, Ida B. Wells, Charlotte Perkins Gilman, Sui Sin Far, Alice Duer Miller, and Zora Neale Hurston. Students interrogate how these writers navigated the constraints of gender, as informed by race and class, in the decades before and after the 19th Amendment and consider literary collecting in relation to gendered cultural politics.

AS.389.347. Landscaping Baltimore: Designing and Interpreting JHU's Neighborhood. 3 Credits.
This course will explore the landscape history and current arrangement of the area around JHU's Homewood campus, including Evergreen Museum, coinciding with the bi-centennial of the birth of Frederick Law Olmsted whose design firm played a central role in developing plans for and around JHU. The course will culminate in a student-produced exhibit for a public audience.

AS.389.348. Queer Oral History. 3 Credits.
Students learn to conduct, analyze, and interpret their own oral histories as they contribute to a wide-ranging project documenting queer worldmaking in the Baltimore-Washington D.C. region. We engage with scholarship from performance studies, queer of color critique, LGBTQ history, and public humanities to consider the politics of storytelling and the promises of public-facing oral history projects. Students have the option of developing podcasts, multimedia projects, and public humanities proposals as their final assignment.

AS.389.357. Heaven on Earth: Art, Power, and Wonder in the Vatican from Antiquity to the Enlightenment. 3 Credits.
A material cultural exploration of the Vatican from the founding of St. Peter's basilica in antiquity to the establishment of the Vatican Library and Museums in the Renaissance and Enlightenment.
Area: Writing Intensive

AS.389.373. Encountering American Art. 4 Credits.
Students investigate the Baltimore Museum of Art's American art collection and its presentation to the public alongside current scholarship on American art to develop strategies for a new permanent collection display that aligns with the museum's commitment to artistic excellence and social equity. M&S Practicum. Co-taught with BMA curator Virginia Anderson.

AS.389.379. Interpreting Historic Sites for the 21st Century. 3 Credits.
Students go behind the scenes at JHU's own Evergreen Museum and Library to investigate how historic sites design spaces for learning, community engagement, leisure, as well as for exhibitions and special events. Students consider the history of Evergreen and its inhabitants and create concepts for how to engage communities in that history and story. Multiple class meetings take place at the Evergreen Museum.

AS.389.384. Object Encounters at the Baltimore Museum of Art. 3 Credits.
Using the Baltimore Museum of Art as a laboratory, students examine canonical narratives in art museums and iterate new approaches to objects in museums that build equity, interrogate privilege, decolonise, revisualise and offer alternative stories. Class meets at the museum every other week.

AS.389.405. Visualizing Africa. 3 Credits.
Examines the history of African art in the Euro-American world, focusing on the ways that Western institutions have used African artworks to construct narratives about Africa and its billion residents.
Area: Writing Intensive

AS.389.410. Sharing Knowledge: Participatory Archives, Collaborative Storytelling, and Social Justice. 3 Credits.
This course introduces students to collaborative humanities projects that encourage democraticparticipation among publics more broadly conceived than the academy. We investigate indigenous research methods; collaborative oral history and ethnography; interactive theater;and community archives. Final projects draw on the university's archival, museum, and librarycollections.

AS.389.420. Curatorial Seminar. 4 Credits.
In collaboration with a local museum, conceptualize and develop an exhibition, potentially including but not limited to: checklists, exhibition texts, interpretive strategies, and programming. Exhibition theme varies year to year. Concepts, ethics and practicalities of curation are key concerns. Research visits to regional museums and private collections as relevant.
Area: Writing Intensive

AS.389.502. Independent Study- Museum and Society. 1 - 3 Credits.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.389.521. Capstone in Museums and Society. 1 - 3 Credits.
The Capstone allows students to develop and carry out their own, hands-on research project in a museum, collection, archive, or other living resource. Final projects must involve some form of public presentation (exhibition, lecture, poster, web-based, etc.) and a work of self-reflection (journal, brief paper, blog, or other). Projects must be approved and overseen by a supervising faculty member and approved by the Program's Director, in keeping with the University's Independent Work Policy. Instructor permission required.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.389.522. Capstone in Museum and Society. 1 - 3 Credits.
The Capstone allows students to develop and carry out their own, hands-on research project in a museum, collection, archive, or other living resource. Final projects must involve some form of public presentation (exhibition, poster, web-based, etc.) and a work of self-reflection (journal, brief paper, blog, or other). Projects must be approved and overseen by a supervising faculty member and approved by the Program's Director, in keeping with the University's Independent Work Policy.
AS.389.201;AS.389.202;You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

AS.410 (Biotechnology)

AS.410.302. Bio-Organic Chemistry. 4 Credits.
This course provides a foundation in structural organic chemistry, acid-base chemistry, chemical thermodynamics, and reaction mechanisms. Subjects include Lewis structures, atomic and hybridized orbitals, stereochemistry, inter- and intramolecular forces of attraction, nucleophilic reaction mechanisms, functional groups, and the organic chemistry of biological molecules. Please note that this course does not count toward requirements for the master's degree in biotechnology. Prerequisite: two semesters of college chemistry.

AS.410.303. Foundations in Bioscience. 4 Credits.
This course examines the fundamental underlying scientific concepts utilized in the creation and development of biomedical products. Topics to be covered include the structure and function of biomolecules, such as proteins, enzymes, carbohydrates, lipids, and DNA, as well as the structure and function of cellular components, such as membranes, vesicles, organelles, and the cytoskeleton. In addition, students will examine the complexities of metabolism, DNA replication, transcription, translation, signal transduction mechanisms, apoptosis, the cell cycle, and cancer. Please note that this course does not count toward requirements for the master's degree in either biotechnology or regulatory science and is required as a prerequisite course for some students entering the Master of Science in Regulatory Science. Pre-requisites: one year of college chemistry and one year of college biology or permission of program director. S

AS.410.601. Biochemistry. 4 Credits.
This course explores the essential roles of key biological molecules: proteins, lipids, and carbohydrates. It provides a systematic and methodical application of general and organic chemistry principles, particularly as applied to protein biochemistry. Students examine the structure, function, and regulation of a wide variety of proteins, and also the techniques and laboratory methods used to purify and characterize proteins. Enzyme mechanisms, kinetics and inhibition are covered in detail. Major pathways for carbohydrate metabolism are examined from thermodynamic and regulatory perspectives. This course illuminates the links between the disciplines of chemistry and biology.

AS.410.602. Molecular Biology. 4 Credits.
This course provides a comprehensive overview of the key concepts in molecular biology. Topics to be covered include nucleic acid structure and function, DNA replication, transcription, translation, chromosome structure, and the remodeling and regulation of gene expression in prokaryotes and eukaryotes. Extended topics to be covered include methods in recombinant DNA technology, microarrays, and microRNA.

AS.410.603. Advanced Cell Biology. 4 Credits.
This course covers cell organization and subcellular structure. Students examine the evolution of the cell, chromosome, and plasma membrane structures and behaviors, as well as the mechanics of cell division, sites of macromolecular synthesis and processing, transport across cell membranes, cell dynamics, organelle biogenesis, and cell specialization. Students are also introduced to the experimental techniques used in cell biology to study cell growth, manipulation, and evaluation.

AS.410.604. Cellular Signal Transduction. 4 Credits.
This course is a continuation of 410.603 Advanced Cell Biology and further explores cell organization and subcellular structure. Students examine cell-to-cell signaling that involves hormones and receptors, signal transduction pathways, second messenger molecules, cell adhesion, extracellular matrix, cell cycle, programmed cell death, methylation of DNA, modification of chromatin structure, and mechanisms of the cell. The roles that defects in signal transduction pathways play in the development of cancer and other disease states will be stressed. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I.

AS.410.607. Proseminar in Biotechnology. 4 Credits.
The Biotechnology Proseminar introduces students to issues and challenges facing leaders of public and private-sector organizations as well as t0 communities seeking to achieve shared goals within the biotechnology industry. The course brings together diverse academic, science, and business disciplines (science, regulatory affairs, marketing, finance, legal, ethics, communications, etc.). It explores how these disciplines can be used as powerful tools to create effective leadership and productive collaborations within the industry while improving managerial decision-making.

AS.410.608. Neurological Disease. 4 Credits.
Knowledge about neuronal structure, function, and circuitry will be applied in order to understand the genetic and molecular bases of a wide variety of diseases that affect the central and/or peripheral nervous systems. This course will incorporate explorations of the recent primary literature, as it relates to specific disease pathologies and treatments, and innovative research tools used in their study. The particular pathologies covered will vary by semester, but will include some of the following: brain/spinal cord injury, epilepsy, stroke, multiple sclerosis, Parkinson's disease, Alzheimer's disease, schizophrenia, depression/bipolar disorder, amyotrophic lateral sclerosis, Huntington's disease, infectious disease, prion-based disease, addiction, autism spectrum disorder, and disorders of neural development. This course is a natural continuation of, and builds upon the foundations provided in, the Neurobiology course. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I, 410.604 Advanced Cell Biology II, 410.628 Neurobiology. SCI

AS.410.609. Developmental Biology. 4 Credits.
This course will explore the cellular and molecular mechanisms involved in the growth and development of complex organisms. In particular, students will be introduced to the mechanisms of fertilization, formation of the early body plan, cell type determination, organogenesis, morphogenesis, and stem cell niches. The course will examine the cellular and morphological changes during development, as well as the molecular signals responsible for development of organisms. SCI

AS.410.610. Epigenetics, Gene Organization & Expression. 4 Credits.
Students use genetic analysis and molecular biology techniques to investigate chromosome organization, chromatin structure, functional genomics, and mechanisms of differential gene expression. Other topics include DNA methylation, silencers, enhancers, genomic imprinting, and microarray analysis. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology. SCI

AS.410.611. Vaccinology. 4 Credits.
This course will cover the biological development of vaccines a well as the immunologic concepts and methods for vaccine delivery. Specific topics include new technologies for vaccine development, such as DNA vaccines, recombinant mucosal vaccines, dendritic cells for antigen delivery, novel adjuvants, and methods to increase vaccine stability. Both time-tested and new vaccine delivery systems, such as lipid-based systems, needle-free injection systems, and the use of genetically modified foods, will be discussed. The underlying biological role of the innate and adaptive immune systems will be explored in light of new types of vaccines and delivery systems. Finally, the process of bringing vaccines to market will be covered, including government oversight and licensure. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I, 410.613 Principles of Immunology, or undergraduate immunology course. SCI

AS.410.612. Human Molecular Genetics. 4 Credits.
In this course, students learn to use the tools of modern genomics to elucidate phenotypic variation within populations. The course uses human disease (from simple Mendelian disorders to common, complex disorders) to exemplify the types of studies and tools that can be used to characterize cellular pathophysiology as well as to provide genetic diagnostics and therapies. Students become facile with linkage analysis, cancer genetics, microarray analysis (oligo and DNA arrays), gene therapy, SNP studies, imprinting, disequilibrium mapping, and ethical dilemmas associated with the Human Genome Project. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology. SCI

AS.410.613. Principles of Immunology. 4 Credits.
This course covers molecular and cellular immunology. Topics include innate immunity, adaptive immunity, the development and function of B cell and T cell antigen receptors, the major histocompatibility complexes, innate effector mechanisms, humoral and cellular immune responses, and regulation of immune responses. Special topics include immunomodulation, immunodeficiency diseases, autoimmunity, evasion and subversion of the immune system by pathogens, immunotherapies, and vaccines. Students are also introduced to the applied aspects of immunology, which include protein and cellular-based immunoassays. Prerequisites: 410.601 Biochemistry; 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.614. Pathogenic Bacteriology. 4 Credits.
Lecture and discussion are augmented by guided readings on pathogenic bacteria, with special attention being given to the microorganisms that cause human disease. The course is designed to impart to the student an appreciation and knowledge of the history, epidemiology, cultivation, morphology, serology, biochemistry, and clinical description of the major disease-producing bacteria. Discussion of therapeutic considerations and vaccination will also be included in this course. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, undergraduate microbiology course, or permission of program committee. SCI

AS.410.615. Microbiology. 4 Credits.
This course is an overview of microorganisms important to clinical diseases and biotechnology. Students are introduced to the general concepts concerning the morphology, genetics, and reproduction of these microbial agents. Lectures focus on individual organisms, with emphasis on infectious diseases, biotechnology applications, molecular and biochemical characteristics, and molecular and serological identification methods. Students will also discuss the impact that biotechnology, particularly genomics, will have on the development of antibiotics and vaccines as treatments and preventive measures. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.616. Virology. 4 Credits.
This course covers the advanced study of viruses with regard to the basic, biochemical, molecular, epidemiological, clinical, and biotechnological aspects of animal viruses primarily, and bacteriophage, plant viruses, viroid's, prions, and unconventional agents secondarily. Specific areas of virology, including viral structure and assembly, viral replication, viral recombination and evolution, virus-host interactions, viral transformation, gene therapy, antiviral drugs, and vaccines, are presented. The major animal virus families are discussed individually with respect to classification, genomic structure, viroid structure, virus cycle, pathogenesis, clinical features, epidemiology, immunity, and control. The viral vectors and their application in biotechnology are discussed. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI
You must enroll in AS.410.601, AS.410.602, and AS.410.603 prior to taking AS.410.616

AS.410.618. Parasitology. 4 Credits.
The field of parasitology is immense. It covers a plethora of organisms and a multitude of disciplines. This course focuses on the parasites of medical importance that causehuman morbidity and mortality throughout the world. It also introduces the student to the general aspects of parasitology. The developmental biology, natural history, and cell and molecular biology of the major eukaryotic parasites will be discussed. Also, the fundamental mechanisms of host-parasite relationships, diagnosis, pathogenesis, epidemiology, and control strategies will be emphasized. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.620. Advanced Topics in Immunology. 4 Credits.
This course integrates and expands concepts learned in an introductory immunology course. Students will be presented with advanced topics in immunology through literature reviews, clinical case studies, and basic science and clinical research papers. Students will also receive support from leading-edge webinars. Topic areas may include, but are not limited to: acellular and cellular innate immunity, adaptive immunity, immune regulation, autoimmunity, immunosuppression, inflammation, neuroimmunology, immunobiology of pregnancy, immunogenomics, tumor immunology, standard and developing therapies for immunopathologies, and immunotherapies. Students will also be introduced to immunological tests used for disease screening and diagnoses. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cellular Biology I, and 410.613 Principles of Immunology or an undergraduate immunology course. SCI

AS.410.621. Agricultural Biotechnology. 4 Credits.
This course is designed to provide an introduction to the application of recombinant DNA technology in agriculture. We will study methods for the introduction of foreign DNA into plant and animal cells and the generation of stably transformed plants and animals. We will discuss specific examples of the use of transgenic plants and animals in biotechnology, which can provide protection against insects, diseases, and tolerance to specific herbicides. We will also investigate how recombinant growth hormones can result in leaner meat, greater milk yield, and better feed utilization, as well as how transgenic plants and animals can serve as bioreactors for the production of medicinals or protein pharmaceuticals. Because recombinant agricultural products are released into the environment or consumed as foods, we will also discuss environmental safety issues. Prerequisites: 410.601 Biochemistry 410.602 Molecular Biology, 410.603 Advanced Cell Biology I.

AS.410.622. Molecular Basis of Pharmacology. 4 Credits.
This course begins by reviewing receptor binding and enzyme kinetics. Various cellular receptors and their physiology are discussed, as are the pharmacological agents used to define and affect the receptor's function. Students study the pharmacology of cell surface receptors and intracellular receptors. Also considered are the drugs that affect enzymes. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I, 410.604 Advanced Cell Biology II. SCI

AS.410.627. Translational Biotechnology: From Intellectual Property to Licensing. 4 Credits.
This course provides an extensive overview of a process for the development of a pharmaceutical by a biotechnology company or pharmaceutical company. The course emphasizes the importance of intellectual property, the basic sciences underpinning the development of a product, and the importance of the interaction between a company and the Food and Drug Administration. Students learn to appreciate the importance of quality control and assurance, good manufacturing practices, preclinical and clinical testing, and the lengthy regulatory processes that govern the development, manufacturing, and eventual sale of biotechnological products. Hands-on solving of practical problems and guest lecturers who are experts in the field familiarize students with the intricacies of the process. Prerequisites: 410.303 Bioscience for Regulatory Affairs, OR 410.601 Biochemistry and 410.603 Advanced Cell Biology I or admission to the MS in Regulatory Science OR Master of Biotechnology Enterprise and Entrepreneurship programs. SCI

AS.410.628. Neurobiology. 4 Credits.
This course provides a framework for understanding the molecular physiology of neuronal structure, signaling, and circuitry, and how this cellular design is ultimately integrated to achieve higher cognitive functions, such as perception, control of movement, learning, and memory. The course introduces the students to various current neuroscience topics, including but not limited to membrane physiology and electrical excitability of neurons, neurotransmitters and synaptic transmission, signaling at the neuromuscular junction, cellular and higher-order aspects of perception and motor control, molecular mechanisms of neural development, and the molecular basis of learning and memory. This course places particular emphasis on the genetic and molecular bases of a wide variety of neurological and neurodegenerative diseases, such as multiple sclerosis, amyotrophic lateral sclerosis, Parkinson's, and Alzheimer's. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I, 410.604 Advanced Cell Biology II. SCI

AS.410.629. Genes & Disease. 4 Credits.
Because of recent advances, powerful diagnostic tests now detect genetic diseases, and there is promise of gene replacement therapy. In this course, students cover general genetic principles, DNA tools for genetic analysis, cytogenetics, gene mapping, the molecular basis of genetic diseases, animal models, immunogenetics, genetics of development, genetics of cancer, and treatment of genetic diseases. Molecular methods of analysis are emphasized. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.630. Gene Therapy. 4 Credits.
In this course, students learn about how gene therapy can be used to treat or prevent genetic disease in the human population. This course is centered around how disease-causing variations in the human genome, including inherited diseases, mutations, epigenetic modifications, and viral infections, can be targeted using molecular technologies. Students will learn about the benefits and limitations of gene therapy as well as about the bioethical concerns involved with this field of research and medicine. Pre-requisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Cell Biology I. SCI

AS.410.631. Infectious Diseases. 4 Credits.
This course focuses on infectious diseases of mankind and is presented in a system-by-system format. Basic principles of host defense and microbial virulence will be discussed. Practical, up-to-date information on the clinical presentation, symptoms, physical findings, laboratory diagnosis, treatment, and prevention of the general array of diseases caused by bacteria and viruses will be presented. The use of antibiotics, prophylactic agents, and vaccines, along with selected aspects pathogenesis and epidemiology, will be covered. More cursory coverage will be given to the fungal and parasitic agents of human disease. The student will develop a broad understanding of the many different kinds of infectious processes to which our bodies are subjected to on an ongoing basis. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.632. Emerging Infectious Diseases. 4 Credits.
This course focuses on emerging infectious diseases from many different perspectives. The maladies addressed range from diseases that have reappeared in altered genetic forms, such as the influenza virus and West Nile virus, to the lethal hemorrhagic fever caused by the Ebola virus. Also discussed is the threat of recombinant and ancient infectious agents, such as Bacillus anthracis, the causative agent of anthrax, which can be used in biological warfare weapons. Opinions from noted scientists and leaders concerning emerging diseases and the prospects for battling them successfully provide scientific and social perspectives. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.633. Introduction to Bioinformatics. 4 Credits.
This course explores the theory and practice of biological database searching and analysis. In particular, students are introduced to integrated systems where a variety of data sources are connected through internet access. Information retrieval and interpretation are discussed, and many practical examples in a computer laboratory setting enable students to improve their data mining skills. Methods included in the course are searching the biomedical literature, sequence homology searching and multiple alignment, phylogeny, gene prediction, protein sequence motif analysis and secondary structure prediction, and several genome browsing methods. Introductory analysis using the R programming language is introduced. Computer access is required. Prerequisites: 410.601 Biochemistry. Corequisite: 410.602 Molecular Biology. SCI

AS.410.634. Practical Computer Concepts for Bioinformatics. 4 Credits.
This course introduces students with a background in the life sciences to the basic computing concepts of the UNIX operating system, relational databases, structured programming, object-oriented programming, and the Internet. Included is an introduction to SQL and the Python scripting language. The course emphasizes relevance to molecular biology and bioinformatics. It is intended for students with no computer programming background but with a solid knowledge of molecular biology. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology. SCI

AS.410.635. Bioinformatics: Tools for Genome Analysis. 4 Credits.
Large-scale DNA sequencing efforts have resulted in increasingly large numbers of DNA sequences being deposited in public databases. Assigning annotations, such as exon boundaries, repeat regions, and other biologically relevant information accurately in the feature tables of these sequences requires a significant amount of human intervention. This course instructs students on computer analytical methods for gene identification, promoter analysis, and introductory gene expression analysis using software methods. Additionally, students are introduced to comparative genomics and proteomic analysis methods. Students will become proficient in annotating large genomic DNA sequences. This course covers customizing genome browsers with novel data. Next-generation sequence analysis is covered through sequence quality control and assembly and analysis of ChIP-seq and RNA-seq data. Students complete two large sequence analysis projects during the course. Prerequisites: 410.601 Biochemistry; 410.602 Molecular Biology; 410.633 Introduction to Bioinformatics or equivalent. SCI

AS.410.637. Bioethics. 4 Credits.
Students in this course analyze and discuss traditional philosophical theories regarding the nature of the moral good. They then apply these theories to critical issues and selected cases involving experiments with human subjects, organ transplantation, in vitro fertilization, the use of animals in research, the collection and publication of research data, peer review, conflicts of interest, and other topics of current concern.

AS.410.638. Cancer Biology. 4 Credits.
This course provides students with knowledge of the fundamental principles of the molecular and cellular biology of cancer cells. The course explores the role of growth factors and signal transduction mechanisms, oncogenes, tumor suppressor genes, tumor viruses, and angiogenesis in tumorigenesis and metastasis. Special topics include cancer prevention and the array of cancer therapies, which include surgery, chemotherapy, radiation therapy, hormonal therapy, stem cell transplant, and immunotherapies. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cellular Biology I , 410.604 Advanced Cell Biology II. SCI

AS.410.639. Protein Bioinformatics. 4 Credits.
Because the gap between the number of protein sequences and the number of protein crystal structures continues to expand, protein structural predictions are increasingly important. This course provides a working knowledge of various computer-based tools available for predicting the structure and function of proteins. Topics include protein database searching, protein physicochemical properties, secondary structure prediction, and statistical verification. Also covered are graphic visualization of the different types of three-dimensional folds and predicting 3-D structures by homology. Computer laboratories complement material presented in lectures. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.633 Introduction to Bioinformatics. SCI

AS.410.640. Molecular Phylogenetic Techniques. 4 Credits.
This course will provide a practical, hands-on introduction to the study of phylogenetics and comparative genomics. Theoretical background on molecular evolution will be provided only as needed to inform the comparative analysis of genomic data. The emphasis of the course will be placed squarely on the understanding and use of a variety of computational tools designed to extract meaningful biological information from molecular sequences. Lectures will provide information on the conceptual essence of the algorithms that underlie various sequence analysis tools and the rationale behind their use. Only programs that are freely available as either downloadable executables or as Web servers will be used in this course. Students will be encouraged to use the programs and approaches introduced in the course to address questions relevant to their own work. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.633 Introduction to Bioinformatics. SCI

AS.410.641. Clinical & Molecular Diagnostics. 4 Credits.
This course covers basic concepts and practical applications of modern laboratory diagnostic techniques. Topics include the principles of testing methodology, quality assurance, and the application of molecular methods to the clinical and research laboratory. The test methods to be covered include nucleic acid-based methods, such as hybridization, amplification, and sequencing, non-nucleic acid methods, such as HPLC, GLC, and protein analysis, and technologies such as PFGE, ribotyping, RFLP, and serological testing methodologies. In addition to the test procedures, students are exposed to aspects of statistics, quality control, and regulatory issues, as well as applications of these methods to the diagnosis and prognosis of human disease. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology. SCI

AS.410.642. Economic Dynamics of Change in Biotechnology. 4 Credits.
Governments around the world are beginning a long-term process that reviews and redesigns their health care systems, addressing concerns of innovation, cost, equitable access, and sustained quality of health care. As a result, health care is undergoing significant changes globally in R&D, marketing, pricing, sales, and distribution. This course helps students to understand these processes and the new business opportunities and new business models they will create. It provides some of the basics of macro and microeconomics to clarify how economic and social forces drive changes in the pharmaceutical, biotech, and genetic industry. Emphasis will be placed on the application of economics.

AS.410.643. Managing and Leading Biotechnology Professionals. 4 Credits.
The roles of managers and leaders within biotechnology companies undergo constant change. Biotechnology managers and leaders must engage in new and innovative problem-solving strategies, lead a diverse and global workforce, develop partnerships with other businesses, customers, and competitors, manage horizontally and across teams, and utilize technology to a competitive advantage. The student is able to address and cure challenges in his/her own organization and learn methods of implementing change, such as negotiation techniques and motivation. The course includes in-depth discussions of leadership skills, communication, conflict resolution, and goal integration. Students research a biotechnology organization, analyze what is working and not working within its management systems, and suggest alternatives.

AS.410.644. Marketing Aspects of Biotechnology. 4 Credits.
This course introduces students to the strategic and tactical approaches used in the marketing of biotechnological produce and services. Students gain a thorough understanding of the research and planning necessary to develop a marketing plan, the relationship between the marketing and sales functions, the difference between marketing a scientific product and a scientific service, pricing strategies, distribution alternatives, communications, promotion, and the importance of perception. Knowledge of marketing terminology and techniques proves helpful to anyone in the industry.

AS.410.645. Biostatistics. 4 Credits.
This course introduces statistical concepts and analytical methods as applied to data encountered in biotechnology and biomedical sciences. It emphasizes the basic concepts of experimental design, quantitative analysis of data, and statistical inferences. Topics include probability theory and distributions; population parameters and their sample estimates; descriptive statistics for central tendency and dispersion; hypothesis testing and confidence intervals for means, variances, and proportions; categorical data analysis; linear correlation and regression model; logistic regression; analysis of variance; and nonparametric methods. The course provides students a foundation with which to evaluate information critically to support research objectives and product claims and a better understanding of statistical design of experimental trials for biological products/devices. Prerequisites: Basic mathematics (algebra). SCI

AS.410.646. Creating a Biotechnology Enterprise. 4 Credits.
This course provides a foundation to start or help guide a young biotechnology company from inception through early growth. Topics include market assessment of innovative technology, patents and licensing, corporate law, preparing a business plan, raising money from angels and venture capitalists, government grants, strategic alliances, sales and marketing, real estate, human resources, and regulatory affairs. The course provides a survey and overview of the key tasks and challenges typically faced by biotech entrepreneurs, their management team, and directors. Students will prepare a business plan for a biotech startup and present the plan to a panel of industry experts and financiers. Leaders from our local bioscience community will be guest lecturers for many of the classes.

AS.410.647. Research Ethics. 4 Credits.
This course covers the basic ethical issues associated with the responsible conduct of biomedical research using animals and human subjects. Students explore ethical dilemmas and decisions central to these issues, such as the appropriate use of animals in research, misconduct in science, informed consent for human subjects, the role of institutional review boards (IRBs), authorship, data integrity, peer review, intellectual property, and biosecurity.

AS.410.648. Clinical Trial Design and Conduct. 4 Credits.
Through a case study approach, this course will cover the basic design issues of clinical trials, specifically targeting protocol, case report forms, analysis plans, and informed consent. The design of a specific trial will be studied to illustrate the major issues in the design of a study, such as endpoint definition, control group selection, and eligibility criteria. The course will also cover the analysis plan for a study, including approaches that are central to clinical trials, such as stratified analysis, adjustment factors, and “intention-to-treat” analysis. The planned analytical techniques will include the analysis of correlated data (i.e., clustered data and longitudinal data), survival analysis using the proportional hazards (Cox) Regression model, and linear models. A semester-long project will include the creation of a protocol, case report forms, and informed consent. Prerequisites: 410.645 Biostatistics or equivalent (recommended), 410.651 Clinical Development of Drugs and Biologics (recommended). SCI

AS.410.649. Introduction to Regulatory Affairs. 4 Credits.
Regulatory affairs are comprised of the rules and regulations that govern product development and post-approval marketing. In the U.S., the FDA establishes and oversees the applicable regulations under several statutes, many regulations, and partnerships with legislators, patients, and customers. Biotechnology products may be classified as drugs, biologics, or medical devices. Each type is regulated by a different center within the FDA. This course provides an overview of RA and its effect on product development. Topics include RA history, regulatory agencies, how to access regulatory information, drug submissions, biologics submissions, medical device submissions, GLP, GCP, GMP, and FDA inspections.

AS.410.650. Legal Aspects of Biotechnology. 4 Credits.
This course is a survey of legal topics relevant to a biotech enterprise as it is established, conducts research, and brings innovative products to market. These include property, contracts, regulatory compliance, and patents. Students will be able to analyze common business situations and understand how associated legal risks are managed. Students who have taken 410.687 Ethical, Legal and Regulatory Aspects of the Biotechnology Enterprise will also benefit from this course, as they will analyze contracts, patents, and various statutes and court decisions that impact the biotechnology sector.

AS.410.651. Clinical Development of Drugs and Biologics. 4 Credits.
This course introduces students to the planning and work required to develop potential new drugs and biologics efficiently. Students gain a thorough appreciation of FDA and International Council for Harmonisation regulations and guidelines. Because the course emphasizes the importance of planning before the execution of any of the necessary steps, lectures use a “backward” approach, discussing the final analysis and report before developing protocols. Topics also include an overview of preclinical investigations, NDA/BLA format and content, clinical development plans, product and assay development, the IND, and trial design, implementation, and management. Prerequisites: 410.303 Foundations of Bioscience OR 410.601 Biochemistry and 410.603 Advanced Cell Biology OR admission to the MS in Regulatory Science Program OR Master of Biotechnology Enterprise and Entrepreneurship programs. SCI

AS.410.652. Cell Culture Techniques. 4 Credits.
This laboratory course illustrates the use of basic cell culture techniques for bioscience research and commercial applications. Students are introduced to cell cultivation methods, including proper use of a biological safety cabinet, sterile technique, cell enumeration and media preparation, cultivation of cell lines, detection of contamination, cryopreservation, transfection, cell culture scale-up, and bioassays. This course is designed for students with no prior knowledge or with limited knowledge of cell culture methods. Prerequisites: 410.601 Biochemistry, 410.603 Advanced Cell Biology I. SCI

AS.410.653. Regenerative Medicine: from Bench to Bedside. 4 Credits.
Regenerative Medicine is a multidisciplinary field developing next-generation therapies that aim to augment, repair, replace or regenerate tissues and organs. This field can be broadly defined by three overlapping technology domains: cell therapy, gene therapy, and tissue engineering. In this course, we will explore these regenerative medicines from bench to bedside. We will discuss relevant biological, engineering, clinical, legal, regulatory, and ethical principles and perspectives to understand the emerging field of regenerative medicine. Specific topics will include induced pluripotent stem cells, bioartificial organs, cell-based immunotherapy, and gene editing techniques such as a CRISPR/Cas-9. In addition to gaining a scientific foundation, students will become familiar with the current state of the industry and the process of bringing these regenerative medicine products to market, including market trends and opportunities, process development and manufacturing, and commercialization challenges and successes. Readings will be drawn primarily from scientific journals. Prerequisites: 410.601 Biochemistry; 410.602 Molecular Biology; 410.603 Advanced Cell Biology I. SCI

AS.410.655. Radiation Biology. 4 Credits.
This course will review types of ionizing radiation and their differences, physical and chemical interactions of radiation with key biological molecules, and effects on living matter beginning with molecular and cellular interactions and proceeding to tissue, organ, and organism levels, emphasizing the human system. Radiation’s beneficial effects in cancer therapy and medicine, as well as its detrimental and carcinogenic effects, will be discussed. Specific units will consider food irradiation, nuclear power plant accidents, radiation terrorism, everyday sources exposure to the U.S. population, and other practical situations involving radiation. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.656. Recombinant DNA Laboratory. 4 Credits.
This laboratory course introduces students to methods for manipulating and analyzing nucleic acids. Students gain extensive hands-on experience with plasmid purification, restriction mapping, ligations, bacterial transformations, gel electrophoresis, and applications of the polymerase chain reaction. This course is not recommended for students with substantial experience in these methodologies. Prerequisites: 410.602 Molecular Biology. SCI

AS.410.658. Biodefense & Infectious Disease Laboratory Methods. 4 Credits.
This laboratory course introduces students to the methods and techniques used for biothreat detection, surveillance, and identification. Using bio simulants and demonstrations, various bio detection platforms will be discussed and presented, such as point-of-detection devices and methods, laboratory-based screening and identification technologies (culture, quantitative PCR, immunoassays, biosensors), and high-throughput environmental surveillance methods. Statistical methods for determining diagnostic sensitivity and specificity and assay validity will be discussed. Laboratory practices and procedures for working in simulated Biosafety Level 2 and 3 environments will be practiced. Students will be introduced to the current bioinformatics genomic and proteomic databases used for select agent (category A, B, and C) identification and characterization. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I, undergraduate microbiology or 410.615 Microbiology, or approval of program committee. SCI

AS.410.659. Advanced Recombinant DNA Lab. 4 Credits.
This course is a continuation of Recombinant DNA Laboratory (410.656), intended for those who have completed the introductory course or who have extensive molecular biology laboratory experience. This second course consists of a series of integrated laboratory exercises designed to give students hands-on experience with a variety of molecular techniques. Exercises include molecular cloning, PCR optimization, quantitative real-time PCR, control of gene expression by RNA interference (RNAi), CRISPR, and DNA sequencing. Students will be introduced to microarray analysis and utilization of bioinformatics pipelines. Prerequisites: 410.601 Biochemistry; 410.602 Molecular Biology; 410.656 Recombinant DNA Laboratory; or consent of program committee. SCI

AS.410.660. Immunological Techniques in Biotechnology. 4 Credits.
This laboratory course introduces students to methods for analyzing the immune system. Participants gain experience with various immunologic techniques used in research and biotechnology laboratories, such as immunoassays, immunofluorescence, western blot analysis, SDS-PAGE, antibody purification (protein A), and cytokine assays. Additional topics for discussion include hybridism technology phage antibody libraries, therapeutic monoclonal antibodies, and flow cytometry. Prerequisites: 410.601 Biochemistry, 410.6 Molecular Biology, 410.603 Advanced Cell Biology I, 410.613 Principles of Immunology or undergraduate immunology course highly recommended, or consent of program committee. SCI

AS.410.662. Epidemiology: Diseases in Populations. 4 Credits.
Epidemiology is the study of the patterns and determinants of disease in populations. It constitutes a basic science for public health and biomedical sciences, and its influence can be felt daily through the presentation of data by government, academic, and industry sources. The goal of this course is to present an introduction to epidemiological methods and inferences to biotechnology professionals with little prior experience in public health. Issues in epidemiological inference and the assessment of causal relationships from epidemiological studies will be discussed, introducing the issues of bias and confounding. Throughout the course, emphasis will be placed on the practical use of epidemiology, and lectures will be complemented by case studies and published literature. Examples will be drawn from contemporaneous issues in chronic and infectious diseases. At the conclusion of the course, students should have a greater appreciation for the role of the epidemiologic method and be able to evaluate a basic epidemiologic study, including how the study goals and research questions relate to the design, measures, and inferences. Recommended prerequisites: undergraduate statistics course or 410.645 Biostatistics. SCI

AS.410.664. Ethics in Emerging Bioscience Technologies. 4 Credits.

AS.410.665. Bioscience Communication. 4 Credits.
Researchers must communicate effectively so their discoveries can be shared with others. In this course, students learn how to communicate their ideas to other researchers, their scientific peers, and investment communities. Students master both written and verbal communication skills, hone their expertise at making both formal and informal oral presentations, prepare poster presentations, and develop their own public speaking strategies. The course also presents personal strategies for improving daily communications, cross-cultural communications, and nonverbal skills. Students improve their written communication, editing, and informal writing skills.Participants also learn effective email strategies for getting their message across and learn how effective writing can improve their chances of getting grant applications approved. Class assignments include preparation of scientific papers, general science writing, oral presentations, PowerPoint presentations, and scientific posters.

AS.410.666. Next Generation DNA Sequencing and Analysis. 4 Credits.
The recent revolution in DNA sequencing technologies has transformed biology within a few short years, decreasing the cost and difficulty of sequencing dramatically to the point where the “$1,000 human genome” is in sight. Armed with complete genome sequences, biologists need to identify the genes encoded within and the variation in these genes between individuals, assign functions to the genes, and put these into functional and metabolic pathways. This course will provide an overview of next-generation sequencing technologies in the historical context of DNA sequencing, the pros and cons of each technology, and the bioinformatics techniques used with this sequence information, beginning with quality control assessment, genome assembly, and annotation. Prerequisites: 410.602 Molecular Biology, 410.633 Introduction to Bioinformatics, 410.634 Practical Computer Concepts for Bioinformatics. SCI

AS.410.671. Gene Expression Data Analysis and Visualization. 4 Credits.
This course will introduce students to various methods for analyzing and interpreting transcriptomics data generated from technologies such as oligonucleotides or two-channel microarrays, qRT-PCR, and RNA sequencing. Topics will include scaling/normalization, outlier analysis, and missing value imputation. Students will learn how to identify differentially expressed genes and correlate their expression with clinical outcomes such as disease activity or survival with relevant statistical tests; methods to control for multiple testing will also be presented. An introduction to linear and nonlinear dimensionality reduction methods and both supervised and unsupervised clustering and classification approaches will be provided. Open source tools and databases for biological interpretation of results will be introduced. Assignments and concepts will make use of publicly available datasets, and students will compute and visualize results using the statistical software R. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.645 Biostatistics, 410.634 Practical Computer Concepts for Bioinformatics, or an undergraduate computer programming course. SCI

AS.410.673. Biological Processes in Regulatory Affairs. 4 Credits.
This course provides an overview of the biological processes and laboratory techniques utilized for the discovery, development, and evaluation of therapeutic drugs. Students investigate drug development processes, such as gene cloning, culture scale-up, downstream processing, and product purification. Emphasis is placed on the theory and application of laboratory methods used in drug development, such as recombinant DNA techniques, antibody technology, protein purification, immunoassays, high- throughput drug screening, chromatography, electrophoresis cell receptor characterization, pharmacokinetics, drug toxicity testing and evaluation of therapeutic drugs, diagnostics, and vaccines. Prerequisites: 410.303 Bioscience for Regulatory Affairs, OR 410.601 Biochemistry and 410.603 Advanced Cell Biology OR admissions to the MS in Regulatory Science OR Master of Biotechnology Enterprise and Entrepreneurship programs. SCI

AS.410.674. Food Microbiology. 4 Credits.
Food microbiology encompasses the study of microorganisms that have both beneficial and deleterious effects on the quality and safety of raw and processed meat, poultry, and egg products. Food microbiology focuses on the general biology of the microorganisms that are found in foods, including their growth characteristics, identification, and pathogenesis. Specifically, areas of interest that concern food microbiology are food poisoning, food spoilage, food preservation, and food legislation. Pathogens in products, or harmful microorganisms, result in major public health problems in the United States and worldwide, and are the leading causes of illnesses and death. SCI

AS.410.675. International Regulatory Affairs. 4 Credits.
Pharmaceutical/biotechnology product approval and marketing requires a good understanding of international regulatory affairs in order to successfully compete in today's global marketplace. It is important for tomorrow's leaders to understand and follow the regulatory differences to ensure optimum product development strategies, regulatory approvals, and designs for exports conforming to the foreign regulatory bodies. There are various product development strategies that industry is using to shorten the product development time by conducting preclinical programs outside the U.S., but the strategies require careful planning and interaction with the U.S. and foreign regulatory agencies. With the increased globalization of economy and exports, international regulations will have a bigger impact on the biotechnology business in the future. The course provides a review and analysis of the pharmaceutical/ biotechnology product approval processes within the world's major markets. The key strategies required in phases from preclinical product development to marketing approval of the products in Europe, Japan, and the U.S. will be compared and discussed. Students will explore the European Union regulations and their overall importance to international markets. The course will cover the salient features of common technical and regulatory documents required for submission and approval to the leading regulatory bodies in the world, general guidance documents, international harmonization, and the General Agreement on Tariffs and Trade.

AS.410.676. Food And Drug Law. 4 Credits.
The Food, Drug, and Cosmetic Act governs the regulatory approval process for bringing a drug, biologic, medical device, food, or cosmetic to market. The class will discuss administrative procedures followed by the FDA. The course includes an overview of the drug, biologic, and medical device approval processes and the regulation of food and dietary supplements. Students then will be exposed to the enforcement activities of the FDA, including searches, seizure actions, injunctions, criminal prosecutions, and civil penalties authorized under the FD&C Act as well as other statutes, like the Public Health Service Act, which regulates the development and approval of biologics.

AS.410.679. Practicum in Regulatory Science. 4 Credits.
This integrative, case-based course will focus on applying knowledge gained from previous courses in the Master of Science in Regulatory Science program to actual cases from the FDA. For each case, students will assume the role of a regulatory specialist, an FDA reviewer or senior-level policy-maker, or other involved stakeholders, such as a consumer group or an advocacy group. Students will be expected to research, evaluate, and present scientifically and legally justifiable positions on case studies from the perspective of their assigned roles. Students will present their perspectives to the class and be asked to debate the issues with the other students from the perspective of their assigned roles. The major responsibility of the students in this course will be to make scientifically and legally defensible recommendations and to justify them through oral and written communication.

AS.410.680. Finance for Biotechnology. 4 Credits.
Students will build an understanding of the basics of contemporary global monetary systems and the essentials of financial management. This course will include the means to develop a working knowledge of the critical financial factors for decision-makers from the perspectives of key stakeholders. The syllabus is designed to provide students with limited or no background in finance an opportunity to establish an understanding of financial basics and communicate clearly in financial terms when conducting business. This course is uniquely designed to meet the current needs of those leading the global life science industry. SCI

AS.410.682. Validation in Biotechnology. 4 Credits.
Understanding validation and applying a comprehensive validation philosophy are essential in today's biotechnology industry. First and foremost, validation allows a company to operate in compliance with the regulations and guidance set forth by the FDA. Perhaps more importantly, it results in equipment assays and processes that are well-understood and robust, less prone to failure, and more cost-effective. This course will introduce the fundamentals of validation, validation master planning, resource management, types of validation and the associated documentation, departmental roles and interactions, and the differences between commissioning and validation. Students will have the opportunity to solve real-world problems, generate actual validation documents, and develop validation program elements that balance regulatory requirements, operational needs, and business expectations.

AS.410.683. Introduction to cGMP Compliance. 4 Credits.
Current Good Manufacturing Practice regulations are the minimum standards for the design, production, and distribution of drugs, biologics, and medical devices in the U.S. and internationally. In the U.S., they are codified at the federal level in the FD&C Act and the Code of Federal Regulations and are actively enforced by the FDA. These regulations, however, only begin to describe the practices used in the pharmaceutic and biotech industries. Additional sources of insight and guidance include the FDA's guidance documents and training manuals, industry trade publications, international compendia, and standards-setting organizations. Students will learn the scope and history of the regulations, industry-standard implementation strategies and "best-practices" approaches, and the FDA's current expectations. Students will also learn to apply practical solutions to the regulatory issues faced in the pharmaceutical and biotech industries today.

AS.410.684. Technology Transfer & Commercialization. 4 Credits.
This course is an introduction to the multidisciplinary aspect involved in the process of translating innovations in technology into commercial use, particularly research discoveries emanating from universities and other nonprofit organizations.

AS.410.685. Emerging Issues in Biotechnology. 4 Credits.
Biotechnology impacts the world and our social, political, and physical environment in ways that many both inside and outside the industry may not fully understand or appreciate. It is critical to ensure that advances in biotechnology be accompanied by important public, political, and social considerations and discussions. This course will cover issues including domestic and global public perception of biotechnology, its benefits and risks, advances in bio-agriculture and genetically modified food, the impact of recombinant therapeutics on the pharmaceutic and health care industry, ways in which advances in biotechnology have and will continue to change our views of what life is, and how the political climate impacts advances in biotechnology discoveries. This highly interactive course will include thought-provoking debate and discussion with industry leaders, both proponents and opponents of biotechnology.

AS.410.686. Regulation of Good Food Production Practices. 4 Credits.
Good Food Production Practices are production and farm level approaches to ensure the safety of food for human consumption. Good food production and post-harvest guidelines are designed to reduce the risk of foodborne disease contamination. These good food production procedures can be tailored to any production system and are directed toward the primary sources of contamination: soil, water, hands, and surfaces. Good food production protocols were developed in response to the increase in the number of outbreaks of foodborne diseases resulting from contaminated food. Students will learn to develop good food production regulatory protocols using case studies.

AS.410.687. Ethical,Legal & Regulatory Aspects of the Biotechnology Enterprise. 4 Credits.
This course provides an overview of the important ethical, legal, and regulatory issues that are critical to the biotechnology industry. The course shares current trends and essential elements of ethics, legal issues, and regulations in a way that allows for an appreciation of how each influences the others. Students will examine core ethical values that guide the practice of science in the biotechnology industry. The course will provide an overview of legal issues, such as protecting inventions, intellectual property, licensing, and the range of regulatory oversight mechanisms with which the biotech industry must comply. This course will review the implications of strategic ethical, legal, and regulatory choices that add value to the biotechnology firm, customers, and society.

AS.410.688. Project Management in Biotechnology. 4 Credits.
Today, many organizations use the approach called project management to handle activities that have a limited life span as opposed to routine, ongoing operations. This course will answer the question, "What do I do to be successful?" The units will provide guidance for project management success by considering each phase in the life of a typical project, from concept to closeout. We will discuss the nature of project management, the structure of projects, working with teams of technical experts, and all the other activities that make project management different from any other discipline. The course will rely heavily on group discussions. Topics will include deciding making decisions, developing a project plan, risk management, team leadership, monitoring and controlling during the project, scope change control, and traditional and modern approaches to project closeout. Concepts presented will be consistent with the Project Management Institute's "Guide to the Project Management Body of Knowledge," the U.S. standard for project management.

AS.410.689. Leading Change in Biotechnology. 4 Credits.
As bioscience companies grow and mature, leadership needs to evolve. Students will learn how to identify their company's position in the "Leadership Life Cycle" and learn how to select the right leadership capabilities based on their current organizational needs. Research shows that the right leaders at the right time dramatically improve organizational success. Discussions will address the leadership needs of organizations from early-stage, research-based companies through fully integrated biopharmaceuticals. General leadership practices and strategies, moving ideas from the research bench to the consumer, and strategies to prevent failure will all be discussed.

AS.410.690. International Food Regulations. 4 Credits.
As the U.S. food industry expands into international markets, the same companies hoping to sell their products abroad find themselves forced to source ingredients and finished products from foreign suppliers to reduce costs and remain competitive, and to do so, they must comply with a myriad of rules and regulations in both the United States and elsewhere. The most visible enforcement agency at any U.S. border is Customs and Border Protection. However, food importers must also comply with regulations enacted by a host of other government agencies, most notably the FDA, USDA Food Safety and Inspection Service, USDA Animal and Plant Health Inspection Service, and U.S. Fish & Wildlife Service. Food exporters have an even tougher burden, as they need to comply with Customs and food safety, quality, and labeling regulations and certification requirements in both the U.S. and the country that is receiving the goods; this is to mention nothing of the international regulatory infrastructure to which manufacturers must adhere when shipping food internationally. This course will cover each step of the importing and exporting process in detail and explain where to go for key information and guidance.

AS.410.692. Biological & Chemical Threat Response & Forensics. 4 Credits.
This course introduces the methods and techniques used for biological and chemical threat agent characterization; methods of detection, identification, medical intervention, and forensic attribution are also discussed. Lectures cover a broad variety of topics pertaining to the use of biological and chemical agents, including the historical background of biological and chemical agents in classic and discretionary warfare, the introduction of scientific evidence in criminal proceedings and chain of custody for evidentiary materials in crimes and terrorism, quality assurance in laboratory operations, threat containment, decontamination and remediation, health and safety of responders and analysts, and risk assessments. Laboratory methods employed in the characterization and forensic analysis of biological (bacterial, viral, biological toxins, agricultural threats) and chemical agents (classic military chemical agents, toxic industrial chemicals, and materials) will also be discussed. The course will also provide general overviews of techniques and sample collection for classic biological and chemical agents (PCR, DNA sequencing methods, immunological analyses) and for chemical agents (gas chromatography and mass spectrometry). Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I, undergraduate microbiology, or 410.615 Microbiology. SCI

AS.410.693. Science, Medicine & Policy in Biodefense. 4 Credits.
This course provides a comprehensive introduction to the Concentration in Biodefense. Biological warfare is introduced in its historical context, followed by the properties of the most important biological threat agents, their medical consequences and treatment, diagnostics, and forensics. Relevant international and domestic policy issues are explored, along with defense strategies and the nature of existing dangers to national security. Students should leave the class with a deep understanding of biological warfare and terror agents, the consequences of their potential use, and the available means of protection. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I, undergraduate microbiology, or 410.615 Microbiology. SCI

AS.410.694. FDA Premarket Applications. 4 Credits.
This course provides a comprehensive overview of the U.S. Food and Drug Administration's (FDA's) regulation of the research and development, and marketing of new drugs, biologics, and medical devices. The regulatory requirements for investigational (Investigational New Drug (IND) and Investigational Device Exemption (IDE)) and premarket approval (New Drug Application (NDA), Abbreviated New Drug Application (ANDA), Biologics License Application (BLA), premarket notification (510(k)), Premarket Approval (PMA)) applications will be addressed. The content and format requirements for the preparation, submission, and maintenance of these applications will be covered.

AS.410.696. Bioassay Development. 4 Credits.
This course will cover methodological approaches to bioassay development for high-throughput screening. Both cell-based (cytotoxicity, cytoprotection, high content imaging, and reporter systems) and cell-free assay systems (enzyme, FRET, time-resolved fluorescence, quenching assays, and immunological assays) will be included with discussion of the potential promise and pitfalls associated with each assay system. Various assay formats, visualization techniques, and current developments in assay technology will be discussed. Project management techniques will be utilized to aid in the process of assay development. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.698. Bioperl. 4 Credits.
This course builds on the Perl concepts taught in 410.634 Practical Computer Concepts for Bioinformatics. Perl has emerged as the language of choice for the manipulation of bioinformatics data. Bioperl, a set of object-oriented modules that implements common bioinformatics tasks, has been developed to aid biologists in sequence analysis. The course will include an overview of the principal features of Bioperl and give students extensive opportunity to use Perl and the tools of Bioperl to solve problems in molecular biology sequence analysis. Prerequisites: 410.601 Biochemistry, 410.60 Molecular Biology, 410.634 Practical Computer Concepts for Bioinformatics. SCI

AS.410.699. Nanobiotechnology. 4 Credits.
The emerging field of nanobiotechnology utilizes developments in nanotechnology and molecular biology for applications to biomedical science and clinical practice as well as fundamental cell biology research and industrial biotechnology. Nanobiotechnology is an interdisciplinary field that exploits the unique functional properties of natural and synthetic biomolecular-sized (nanometer-scale) constructs, such as quantum dots, carbon nanotubes, nanostructured surfaces, liposomes, artificial membranes, and molecular machines for biotechnology and medicine. This course is designed for biotechnology majors and will survey the research, development, and applications of nanotechnology to medical diagnostics, imaging, and therapeutics (including drug delivery and anti-cancer treatments), cell biology and single-cell analysis, nanofluidics, bioassays, biosensors, and bio-inspired engineering. Prerequisites: 410.601 Biochemistry; 410.602 Molecular Biology; 410.603 Advanced Cell Biology I. SCI

AS.410.700. Food Labeling and Packaging Regulations. 4 Credits.
The Nutrition Labeling and Education Act of 1990, which amended the FD&C Act, requires most foods to bear nutrition labeling and requires food labels that bear nutrient content claims and certain health messages to comply with specific requirements. The NLEA and the final regulations to implement the NLEA provide for a number of fundamental changes in how food is labeled, including requiring that nutrition labeling be placed on most foods, requiring that terms that characterize the level of nutrients in a food be used in accordance with definitions established by the FDA, and providing for the use of claims about the relationship between nutrients and diseases or health-related conditions. These changes apply to virtually all foods in the food supply, including, in large measure, to foods sold in restaurants. Food labeling is required for most prepared foods, such as breads, cereals, canned and frozen foods, snacks, desserts, drinks, etc. Nutrition labeling for raw produce (fruits and vegetables) and fish is voluntary. SCI

AS.410.701. Intro to Food Safety Regulation. 4 Credits.
This course is designed to help students understand the legal and regulatory complexities of the regulation of food products in the United States. The prone issues, including regulatory compliance in food safety and Hazard Analysis and Critical Control points (HACCP), are among major issues to control the food-supply. The FDA and the U.S. Department of Agriculture (USDA) have primary responsibility for the safety of meat and food products. Based on the principles of HACCP, FDA-issued seafood regulations went into effect in December of 1997. However, the regulation of food additives, labeling, dietary supplements, genetic modifications, and the protection of the food supply account for the majority of the in-depth food regulation in the United States. The FDA and USDA regulate the safe practice of primary and secondary food products to the American public. Depending upon the source and nature of food product, the method of shipment, advertisement of nutritional values, etc., are being governed by FDA and USDA jurisdictions. The Food Safety Modernization Act overhauls the FDA in food surveillance, enforcing regulations on specific targets, inspection records examination, and exemptions. In this course, students will learn the existing food regulations and safety net by examining the product tracing, performance standards, and preventive control plans toward food safety, security, genetic modifications, dietary supplements, and food labeling. Students will have the option to design projects to propose an effective food safety net that can assist in the supply chain of the nation’s food safety and security.

AS.410.702. Biomedical Software Regulation. 4 Credits.
Software continually grows more complex and is becoming relied upon by health care professionals in the treatment of patients. This course describes how the U.S. government regulates software used in delivering health care, including the regulations utilized by the FDA and the Centers for Medicare and Medicaid Services. This course covers a wide range of topics, including FDA regulation of software as a medical device and software validation, medical imaging software regulation, electronic record keeping and software used in clinical trials, laboratory information management systems, and HIPAA privacy rules and security standards.

AS.410.703. Strategic Planning for the Biotechnology Enterprise. 4 Credits.
This course is an overview of the strategic planning process of a biotechnology enterprise. It focuses on creating value through strategy formulation and implementation. Topics covered include leadership and technology competencies, performance indicators, intellectual property, corporate governance, regulatory strategy, and appropriating value. The thesis of the course is that effective strategic planning and implementation is critical to success and provides a valuable, structured process for creating enterprise value and managing business risks. Best practices in strategic planning and managing the planning process are also discussed.

AS.410.704. Social Entrepreneurship in BioScience. 4 Credits.
<p>This course will explore how biotechnology innovators are solving social issues, including developing medical diagnostics, discovering effective and safer medicine, producing cleaner energy, remediating environmental contamination, and improving crop yields. Students will think broadly in terms of the roles required to tackle these social, economic, health, and environmental issues and how these roles can add value to society. </p><p>This course will cover social entrepreneurship principles and practices in a range of sectors, including corporate social responsibility and public value missions in emerging markets. Students will have the opportunity to define their role in advancing biotechnology as it relates to the top global challenges. </p>

AS.410.705. Problem Solving and Innovation. 4 Credits.
Whether tackling business challenges in a clinic or creating global initiatives, being a healthcare provider, scientist, engineer, or entrepreneur means being a problem solver. This course focuses on helping students develop the problem-solving strategies and innovation development models necessary to more effectively tackle challenges in medical, industrial, and environmental areas of biotechnology. Students will develop a working knowledge of design thinking principles, lean startup, storytelling, and human-centered techniques, as well as an understanding of how they can be utilized to create positive change in any context. While evaluating real-world problems, students will consider how these techniques can be utilized to turn an innovative idea into an effective solution. Students will work individually and collaboratively on real-world projects, turn their ideas into practical action, and demonstrate their ability to leverage science, health care, technology, and social innovation to bring change through community-based and global initiatives.

AS.410.706. Building and Leading Teams in Health Care. 4 Credits.
In order to provide the best care possible, health care professionals are working together more now than ever before. As a result, strong leadership and teamwork skills are becoming necessities in joining the health care field. This course will provide hands-on activities to help students develop problem-solving skills, learn basic negotiation and mediation strategies, and understand their own tendencies as leaders and team members. Using real-world examples, students will explore how strong leadership and teamwork can drive innovative solutions to public health issues.

AS.410.707. The Psychosocial Determinants of Health, Implications on Diagnostics. 4 Credits.
In this capstone course, students will learn basic diagnostic techniques and use case studies to explore the relationship between physiological illnesses and diagnostic output. Through discussions and guided interviews, students will explore the role of psychology and sociology in patient care choices as well as physician recommendations to patients. Students will practice cultural sensitivity through group activities and discussion of pressing public health issues. Students will undertake final group projects that identify needs in the local community and attempt to create solutions that could feasibly be completed with limited resources.

AS.410.708. Medical Product Reimbursement. 4 Credits.
Medical products brought to market need to have a sound payment, coding, and coverage strategy. Medicare covers over 100 million Americans and leads the way in all United States insurance policies. This course will provide insight into how medical product reimbursement works and allow students to understand how the Centers for Medicare & Medicaid Services (CMS) considers medical products for coverage, coding, and payment. We’ll review the history of Medicare coverage and the regulations. We’ll focus primarily on strategies used to get reimbursement for medical products—both at the national and local levels.

AS.410.709. Cancer Genomics. 4 Credits.
Alterations to the genome are the basis of cancer development, but not all mutations cause cancer. Cancer genomics is the study of cancer cell genomes to elucidate how changes from the normal host genome drive cancer development and how these changes can be targeted for better prevention, diagnosis, and treatment of cancer. In this course, students learn about the multi-step process of tumorigenesis and the confounding development of passenger mutations that challenge the use of genomics to inform therapies. Students will use bioinformatics tools to analyze human cancer genomic data sets to understand the genetic basis of cancer and how to identify genetic signatures in tumors to guide treatment. Topics also include the development of drug resistance, biological sample acquisition, the technologies used to identify and distinguish pathogenic alleles, and how data is stored, referenced, and shared. Discussions about clinical trials and standards of care based on cancer genomics, and about the ethical challenges raised by the use of genomic information to make personal care decisions, are included in the course. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cellular Biology I. 410.638 Cancer Biology is recommended. SCI

AS.410.712. Advanced Practical Computer Concepts for Bioinformatics. 4 Credits.
This intermediate-to-advanced-level course, intended as a follow-on to 410.634 Practical Computer Concepts for Bioinformatics (a prerequisite for this new class), will integrate and expand on the concepts from that introductory class to allow students to create working, Web-based bioinformatics applications in a project-based course format. After a review of the concepts covered in 410.634, students will learn how to create functional Web applications on a UNIX system, using Python and CGI to create forms that can be acted upon, and using the Perl DBI module to interface with MySQL relational databases that they will create and populate to retrieve and present information. This will be demonstrated by building an in-class, instructor-led project. More advanced SQL concepts and database modeling will also be covered, as well as introductions to HTML5, CSS3, and Javascript/JQuery. Class time in the latter weeks of the class will be devoted to individual assistance on student projects and to short lectures on advanced topics. Once again, whenever possible, this course will emphasize relevance to solving problems in molecular biology and bioinformatics. Prerequisites: 410.601 Biochemistry; 410.602 Molecular Biology; 410.634 Practical Computer Concepts. SCI

AS.410.713. Advanced Genomics and Genetics Analyses. 4 Credits.
The next generation of array and sequencing technologies provides the ability to investigate large quantities of genomics information with higher sensitivity, greater throughput, and lower costs. This also introduces new challenges in data management, novel algorithmic approaches, and general interpretation. This course builds on the topics in 410.671 Gene Expression Data Analysis and Visualization to address analysis of both genetic variation and genomics content, including splice variants, single nucleotide polymorphisms (SNPs) with family-based and case/control genome-wide association, copy number variation, somatic and germline single nucleotide variants, tumor clonality and ploidy estimates, and transcription factor binding sites. Data types will include array, RNA sequencing, and DNA sequencing (targeted and whole exome) with sequence assembly methods presented,?such as de novo and reference-based.?Prerequisites: 410.602 Molecular Biology, 410.633 Introduction to Bioinformatics, 410.671 Gene Expression Data Analysis and Visualization. SCI

AS.410.715. Medical Device Regulation. 4 Credits.
This course provides a comprehensive introduction to medical devices and how they are regulated by the FDA. Topics that will be covered include an overview of the laws and regulations that govern medical devices, the FDA's organizational structure and responsibilities for medical device regulation, and administrative and legal requirements for medical devices throughout the full product life cycle. Particular focus will be placed on the premarket review, post-market programs enforcement (e.g., Quality Systems Regulation, and FDA inspectional programs). Included will be discussions on the responsible offices and major program requirements and resources. Students will be given various case studies to examine the application of regulations and participate in a 510(k)/PMA workshop, mock inspectional audit, and mock enforcement action. Upon completion of this course, the student will have a working knowledge of the requirements and policies of FDA regulation of medical devices.

AS.410.716. Food Toxicology. 4 Credits.
Food toxicology is the study of the nature, properties, effects, and detection of toxic substances in food, and their disease manifestation in humans. This course will provide a general understanding of toxicology related to food and the human food chain. Fundamental concepts will be covered, including dose-response relationships, absorption of toxicants, distribution and storage of toxicants, biotransformation and elimination of toxicants, target organ toxicity, teratogenesis, mutagenesis carcinogenesis, food allergy, and risk assessment. The course will examine chemicals of food interest, such as food additive mycotoxins and pesticides, and how they are tested and regulated. SCI

AS.410.717. Risk Assessment and Management. 4 Credits.
Risk analysis is composed of three separate but integrated elements, namely, risk assessment, risk management, and risk communication. Risk communication is an interactive process of exchange of information and opinion on risk among risk assessors, risk managers, and other interested parties. Risk management is the process of weighing policy alternatives in light of the results of risk assessment and, if required, selecting and implementing appropriate control options, including regulatory measures. Students will learn how to integrate risk assessment, risk management, and risk communication using case studies.

AS.410.718. Food Safety Audits and Surveillance. 4 Credits.
Food safety audits provide a credible verification system to the entire food processing industry, including retail environments, meat, fish, and poultry, vegetable, and produce suppliers. Having a HACCP plan in place is often the first step to a successful food safety program, but is not entirely enough to ensure that food safety standards are being adhered to on a consistent basis. In this course, students will learn how to adequately plan for a food crisis situation.

AS.410.719. Postmarket Surveillance. 4 Credits.
While review of devices prior to marketing plays a significant role in ensuring that patients and providers have access to safe and effective medical devices, continued post-market surveillance of devices after they reach the market is crucial to protecting public health. The Office of Surveillance and Biometrics (OSB) within the FDA's Center for Devices and Radiologic Health (CDRH) is responsible for overseeing the continued post-market surveillance of medical devices. This course covers regulatory requirements for industry once a device reaches the market as well as the post-market surveillance requirements and activities performed by the FDA. Students will discover the multifaceted approach to medical device post-market surveillance through topics including Post-market Surveillance Studies, 522 Studies, Registries, Medical Device Reporting (MDR) & Complaint Handling, the MedSun Program, Medical Device Tracking, Unique Device Identification (UDI), MDEpiNet, and Real-World Data/Evidence & the National Evaluation System for health Technology (NEST). SCI

AS.410.720. American Food Policy and Regulation. 4 Credits.
This course examines American food policy and regulation through the lens of USDA, FSIS. Students will (1) examine federal inspection of food from its birth in the 19th Century to the rise of the Food Safety Inspection Service as a single regulatory agency; (2) examine the use of 'adulterated' and 'misbranded' as the foundational standard for all food safety policy, and (3) apply those standards in a 21st Century federal inspection system. Coursework is built around a project in which students work through the policy and regulatory hurdles to obtaining federal inspection services. Course work concludes with an examination of federal enforcement authority and state inspection programs.

AS.410.721. In Vitro Diagnostic Regulation. 4 Credits.
This course provides a comprehensive overview of in vitro diagnostic (IVD) devices and how they are regulated by the U.S. Food and Drug Administration (FDA) and by international organizations such as the European Union (E.U.). Topics that will be covered include: (1) a summary of the U.S. and international laws, regulations, and policies that govern IVD devices, (2) administrative and legal requirements and resources for IVD devices throughout the full product life-cycle, (3) types of IVD devices, (4) coverage and reimbursement of laboratory tests, and (5) current issues and developments. Upon completion of this course, the student will have a working knowledge of the requirements and policies of the regulation of IVD devices.

AS.410.727. Regulatory Strategies in Biopharmaceuticals. 4 Credits.
Given the costly drug development process and the limited resources of emerging biopharmaceutical companies, developing an early regulatory strategy - starting well before clinical trials are initiated - is extremely important for the success of a company. This course will discuss different regulatory strategies that several players of the U.S. biopharmaceutical industry have employed. Students will learn about interacting with regulatory agencies, the orphan drug development, accelerated approval, fast track, priority review, and other regulatory mechanisms, pharmacogenomics and biomarkers, adaptive clinical trials, animal rule, generic drug development, and biosimilars. Using case studies, the impact of these regulatory strategies on drug development, and how these strategies have helped many biopharmaceutical companies will be discussed. At the end of this course, students will better understand federal regulations and the aspects involved in developing efficient regulatory strategies.

AS.410.728. Managing Innovation in the Life Sciences. 4 Credits.
Innovation is the creation of value from new ideas, concepts, methods, materials, and organizational structures. Life sciences organizations that seek to create value for their stakeholders must do so using available capital resources, including financial capital, human capital, intellectual capital, and physical capital. They should manage those resources to gain leverage and maximize value realized. They then seek to defend and control the value created. Why, then, do most organizations treat innovation (and innovators) in ways similar to the body's immune system (i.e., by identifying the innovators, isolating them, "killing" them, and ejecting them from the organization? This course will explore innovation, invention, and value creation as a driving force in the biotechnology or life sciences enterprise as well as the ways in which managers should plan to take full advantage of innovation as the only true competitive weapon for long-term success. A special emphasis will be placed on innovation as applied to life science applications (biotechnology, medical devices, health care delivery, drug discovery, development and packaging, bioinformatics, etc.). Topics include invention, ROI, disruption, creative destruction, types of innovation, technology brokering, organizational structures that foster innovation, planning, and managing for innovation. Students are required to read extensively, participate actively in discussions, do case studies, and develop a convincing pitch for an innovation project.

AS.410.731. Bioprocessing and Scale-up Laboratory. 4 Credits.
This course will provide students with hands-on experience in the process development of biological products from a cell bank through purification. Students will develop products produced in bacteria, mammalian cells, and insect cells. Students will optimize growth conditions on a small scale and then produce the biologic in a larger-scale vessel. Students will then purify the product after optimizing purification conditions. Topics to be covered include microbial fermentation, cell culture production, bioassays, product purification, and the regulatory, engineering, and business principles associated with the scale-up of a biologic product.

AS.410.732. Funding a New Venture. 4 Credits.
In this course, we study the nuts and bolts of putting together a new company and explore financial markets and the economics of life science companies. The course includes weekly discussions based upon textbook and outside reading materials; the latter are often topical and speak to the issues of the day and how they may affect investor's confidence and funding. Video presentations on the part of all students are required. We will examine the roles of corporate officers and the venture community. The students will learn what makes the startup process both attractive and difficult, and will work through that process in a realistic manner.

AS.410.733. Comparative Animal Physiology. 4 Credits.
This class examines animal physiology from an evolutionary and comparative viewpoint. The goal is to examine the commonalities and unique differences in how various animal organisms address the necessary life functions. Topics will include homeostatic mechanisms as an overarching theme, integrating the following systems: nervous, endocrine, muscle, circulatory, defense, respiratory, excretory, fluid and acid-base balance, digestive, energy balance and thermal, and reproductive. SCI

AS.410.734. Practical Introduction to Metagenomics. 4 Credits.
The emerging field of metagenomics allows for the study of entire communities of microorganisms at once, with far-reaching applications in a wide array of fields, such as medicine, agriculture, and bioremediation. Students will learn the principles of metagenomics through the exploration of published project data and guided readings of recent literature. Using data from the Human Microbiome Project, students will explore practical analysis tasks, including sequence assembly, gene prediction and annotation, metabolic reconstruction, taxonomic community profiling, and more. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.633 Introduction to Bioinformatics, 410.634 Practical Computer Concepts for Bioinformatics. SCI

AS.410.736. Genomic and Personalized Medicine. 4 Credits.
With the advent of rapid, low-cost whole-genome sequencing, the field of personalized medicine is growing from a niche field to becoming the new standard of practice in medicine. Already, oncology makes use of genomic sequencing to inform treatment decisions based on tumor types, and patients are seeking knowledge about their genetic and environmental risk factors to make informed health decisions. This class explores the evolving field of personalized medicine, examining genomics as well as proteomics, metabolomics, epigenetics, and the microbiome. Students will read and discuss new developments in pharmacogenomics, rare and complex diseases, genomics for the healthy person, and the ethical, economic, and social implications of these new technologies. These topics will be approached with a view toward application in clinical practice. Prerequisites: 410.602 Molecular Biology; 410.633 Introduction to Bioinformatics. SCI

AS.410.737. Promotion of Biomedical Products: Regulatory Considerations. 4 Credits.
This course will provide students with knowledge of the basic laws and regulations affecting the advertising and promotion of drugs, biologics, and medical devices. This course is specifically designed to illustrate how the law and regulations are applied on an everyday basis using case study examples as well as to provide historical context on regulations and strategies used in the past. SCI

AS.410.750. Molecular Targets & Cancer. 4 Credits.
This course will investigate current and potential molecular targets in cancer, including kinases, DNA repair pathways, epigenetic modifications, immunotherapy approaches, and hormonal, metastasis, and angiogenesis targets. Discussion will also include topics on what defines a molecular target and the methods by which they are evaluated. Prerequisites: 410.601 Biochemistry, 410.602 Molecule Biology, 410.603 Advanced Cell Biology I. Recommended: 410.604. Advanced Cell Biology II. SCI

AS.410.751. Drug Design and Chemical Libraries. 4 Credits.
The course of Drug Design and Chemical Libraries explores pharmacological space with an emphasis on disciplines related to drug discovery, and an understanding of the properties desirable in a drug. Medicinal chemistry, natural product chemistry, focused synthetic libraries, and combinatorial chemistry will be covered. The application of Lipinski's rules for assessing drug-like molecules will be discussed in detail, as well as methods for chemical analysis, in silico drug design, molecular modeling, and compound storage and handling. Also, techniques used for assessing and harnessing chemical diversity for drug discovery will be discussed. The students will gain a fundamental understanding of small molecules at the atomic level as well as insights into the structure-activity relationship. Both are critical to the design and synthesis of chemical libraries that efficiently explore therapeutically useful chemical space and to drug design.SCI

AS.410.752. High Throughput Screening & Automation Lab. 4 Credits.
This course will use hands-on instruction in automated bioassay systems for high-throughput screening as an entry point to covering pertinent aspects of HTS, such as data manipulation, storage, and analysis; liquid handling robotics, microtiter plate washing, manipulation, and barcoding; HTS assay detectors; and automated devices for assay setup, validation, and visualization. Cost considerations, HTS amenable assay systems, and miniaturization and scale-up will also be discussed. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology, and 410.696 Bioassay Development. SCI

AS.410.753. Stem Cell Biology. 4 Credits.
This course will involve discussion and debate on current topics concerning stem cell biology and the use of stem cells in biotechnology and therapeutics. Topics will include review and discussion of developmental and cell biology, stem cell characteristics, stem cell preparation and therapeutic uses, tissue engineering, global regulatory and ethical issues, and commercialization of stem cell therapy. Current peer-reviewed literature and guest experts in the field will provide up-to-date information for discussion. Prerequisites: 410.601 Biochemistry, 410.602 Molecule Biology, 410.603 Advanced Cell Biology I, 410.604 Advanced Cell Biology II. SCI

AS.410.756. Grants and Federal Funding for Biotechnology Enterprises. 4 Credits.
This course is designed to help students working for life sciences companies understand the fundamentals of obtaining government funding for product/technology research and development. While the emphasis will be on grant funding from the National Institutes of Health, other Federal and state funding mechanisms will also be covered. Students will learn how to search for funding opportunities and receive an overview of the NIH funding mechanisms as well as explore the background and history of the Small Business Innovation Research (SBIR) program. The course will provide insights on preparing an SBIR proposal and submission procedure. Fundamentals of government contracting law will also be covered.

AS.410.777. Next Generation Alternative Energies. 4 Credits.
In this course, students are introduced to the current technologies used in the production of alternative energies. These technologies include first and second-generation biomass biofuels, carbon-neutral synthetic fuels, microbial fuel cells, algae fuel, and biological hydrogen production. The study of biomass biofuels will include technologies using agriculture, cellulosic, and waste feedstocks. Carbon-neutral synthetic fuels will include biobutanol, acetone-butanol-ethanol, methane, and biogas. Students will study the methods used to produce these types of fuels, the by-products produced, and the sustainability of energy production. In addition to studying the techniques used to produce alternative energy, students will also discuss the economic and environmental impacts of producing and using alternative energy sources. Prerequisites: 410.601 Biochemistry, 410.602 Molecular Biology, 410.603 Advanced Cell Biology I. SCI

AS.410.780. Stem Cell Culture Laboratory Methods. 4 Credits.
This laboratory course introduces students to the cultivation and differentiation of stem cells. Students are introduced to cell cultivation methods for three types of stem cells and the basics of tissue engineering. Students will scale-up cells into mini-bioreactors for large scale use. The class will include industry-wide practices in cGMP. Prerequisites: 410.601 Biochemistry; 410.602 Molecular Biology; 410.603 Advanced Cell Biology I; 410.652 Cell Culture Techniques or permission of program committee. SCI

AS.410.799. Current Topics in Regulatory Policy. 4 Credits.
The ability to successfully navigate the intersections of law, regulation, guidance, and policy has never been more critical to the success of entities engaged in medical product development and commercial marketing. The entities that make up this industry are very sophisticated in their abilities to innovate at a blazing speed. In contrast, regulators must use a regulatory model that evolves and adapts much slower than their industry counterparts. As a result, regulators are relying more heavily on policy to drive their strategy, actions, and outcomes. Therefore, a clear understanding of regulatory policy is an essential consideration for individuals engaged in the medical product development industry. This course provides an introduction to several key areas of government regulatory policy (both old and new) and regulatory science. The topics covered in this course will serve as a road map for students who want to successfully navigate within this complex and changing regulatory model.

AS.410.800. Independent Research in Biotechnology. 4 Credits.
Students in the Biotechnology, Bioinformatics, and Individualized Genomics and Health programs have the opportunity to enroll in an independent research course. This elective course is an option after a student has completed at least eight graduate-level courses and has compiled a strong academic record. Prior to proposing a project, interested students must have identified a research topic and a mentor who is familiar with their prospective inquiry and is willing to provide guidance and oversee the project. The research project must be independent of current work-related responsibilities as determined by the project mentor. The mentor may be a faculty member teaching in the biotechnology program, a supervisor from the student's place of work, or any expert with appropriate credentials. Students are required to submit a formal proposal for review and approval by the biotechnology program committee. The proposal must be received by the Advanced Academic Programs office no later than one month prior to the beginning of the term in which the student wants to enroll in the course. Students must meet with a member of the program committee periodically for discussion of the project's progress, and a written document must be completed and approved by the program committee and project mentor for the student to receive graduate credit. Additional guidelines can be obtained from the AAP administrative office. Prerequisite: All core courses for your degree program and four additional courses. SCI

AS.410.801. Biotechnology Thesis. 4 Credits.
Students wishing to complete a thesis may do so by embarking on a two-semester thesis project, which includes the 410.800 Independent Research Project and 410.801 Biotechnology Thesis courses. This project must be a hypothesis-based, original research study. The student must complete 410.800 Independent Research Project and fulfill the requirements of that course, including submission of a project proposal, final paper, and poster presentation, before enrolling in the subsequent thesis course. For the thesis course, students are required to submit a revised proposal (an update of the 410.800 proposal) for review and approval by the faculty adviser and biotechnology program committee one month prior to the beginning of the term. Students must meet with the faculty adviser periodically for discussion of the project's progress. Graduation with a thesis is subject to approval by the thesis committee and program committee and requires the student to present his/her project to a faculty committee both orally and in writing. Prerequisites: Successful completion of 410.800 Independent Research Project and 410.645 Biostatistics. SCI

AS.410.802. Independent Studies in Regulatory Science. 4 Credits.
This course is open only to students in the MS in Regulatory Science program or the MS in Biotechnology with a concentration in Regulatory Affairs and may be taken only after the student has completed 5 courses and has compiled a strong academic record. Prior to proposing a project, interested students must have identified a study topic and a mentor who is familiar with their prospective inquiry and who is willing to provide guidance and oversee the project. The study project must be independent of current work-related responsibilities as determined by the project mentor. The mentor may be a faculty member, a supervisor from the student's place of work, or any expert with appropriate credentials. The goal of the study project should be a "publishable" article. Students are required to submit a formal proposal for review and approval by the regulatory science program committee. The proposal must be received by the Advanced Academic Programs office no later than one month prior to the beginning of the term in which the student wants to enroll in the course. Students must interact with a member of the program committee periodically for discussion of the project's progress, and a written document must be completed and approved by the program committee and project mentor for the student to receive graduate credit. Additional guidelines can be obtained from the AAP administrative office.

AS.410.803. Regulatory Science Thesis. 4 Credits.
Students wishing to complete a thesis may do so by embarking on a two-semester thesis project, which includes the 410.802 Independent Studies in Regulatory Science Project and 410.8 Biotechnology Thesis courses. This project must be either a hypothesis-based or research question-based original research study. The student must complete 410.802 Independent Research Project and fulfill the requirements of that course, including submission of a project proposal, final paper, and poster presentation, before enrolling in the subsequent thesis course. For the thesis course, students are required to submit a revised proposal (an update of the 410.802 proposal) for review and approval by the faculty adviser and biotechnology program committee one month prior to the beginning of the term. Students must meet with the faculty adviser periodically for discussion of the project's progress. Graduation with a thesis is subject to approval by the thesis committee and program committee and requires the student to present his/her project to a faculty committee both orally and in writing. Prerequisites: All required regulatory science courses and three elective courses, which must include 410.802 Independent Studies in Regulatory Science and, if hypothesis-driven, 410.645 Biostatistics.

AS.410.804. Practicum in Biotechnology Enterprise & Entrepreneurship. 4 Credits.
This course synthesizes the knowledge and skills acquired in the Masters of Biotechnology Enterprise and Entrepreneurship program while offering a real-world examination of a bioscience organization and the issues it faces. Students will form interdisciplinary teams and work with faculty and industry professionals on an authentic and current project from a local bioscience public or private company, an entrepreneurial startup, or a nonprofit organization. This course is only open to students completing the Master of Biotechnology Enterprise and Entrepreneurship program.

AS.410.806. Independent Studies in Biotechnology Enterprise and Entrepreneurship. 4 Credits.
This course is open only to students in the MBEE or the MS in Biotechnology with a concentration in Enterprise and may be taken only after the student has completed five courses and has compiled a strong academic record. Prior to proposing a project, interested students must have identified a study topic and a mentor who is familiar with their prospective inquiry and who is willing to provide guidance and oversee the project. The study project must be independent of current work-related responsibilities as determined by the project mentor. The mentor may be a faculty member, a supervisor from the student's place of work, or any expert with appropriate credentials. The goal of the study project should be a "publishable" article. Students are required to submit a formal proposal for review and approval by the enterprise/regulatory program committee. The proposal must be received by the Advanced Academic Programs office no later than one month prior to the beginning of the term in which the student wants to enroll in the course. Students must interact with a member of the program committee periodically for discussion of the project's progress, and a written document must be completed and approved by the program committee and project mentor for the student to receive graduate credit. Additional guidelines can be obtained from the AAP administrative office.

AS.420 (Environmental Sciences)

AS.420.301. Quantitative Methods. 3 Credits.
This prerequisite course provides the necessary background in mathematics for students who do not have sufficient undergraduate course work in calculus and statistics. Students who receive a provisional admission because of math deficiency can opt to take the mathematics assessment test. If the student earns a score of 80% or better, then s/he is not required to take the course. In this course, students acquire quantitative skills and an understanding of mathematical principles fundamental to environmental sciences, and necessary for evaluating the implications of policy measures. Topics include probability and statistics, systems of equations, analytical geometry, and basic concepts of calculus. Problem sets, interpretation of data, and applications to everyday problems help students appreciate the usefulness of quantitative methods. Offered online twice a year.

AS.420.302. Chemistry of Natural Processes. 3 Credits.
This course provides students with a basic understanding of the fundamentals of chemistry, of Earth's interrelated chemical systems, and of how to manipulate and interpret chemical data. Topics include molecules and chemical bonding, states of matter, thermodynamics, and kinetics. Through a series of exercises, students apply chemistry principles to solve real-world environmental problems. Prerequisite: Students are urged to take 420.301 Quantitative Methods for Environmental Sciences before enrolling in this course. Offered online only, one to two times annually.

AS.420.601. Geological Foundations of Environmental Science. 3 Credits.
This course provides an overview of Earth's materials, processes, and resources for environmental scientists and policymakers. Topics include minerals, rocks, sediments, stratigraphy, structure, geomorphology, and geologic environments. Emphasis is placed on understanding geologic principles and methods as applied to environmental science, Earth resources, and public policy. Offered online or onsite, twice per year. Onsite version includes a required field trip.

AS.420.603. Environmental Applications of GIS. 3 Credits.
Geographic information systems technology (GIS) is a powerful data visualization and analysis tool.This course is designed to introduce students to advanced concepts of geographic information science related to the fields of reserve planning, environmental science, natural resources, and ecology for the purpose of spatial analysis and geo-visualization of environmental issues. Topics may include conservation needs using remote sensing, digital image processing, data structures, database design, landscape ecology and metrics, wildlife home range and habitat analysis, suitability modelling, terrain and watershed analysis, and spatial data analysis. This course will only be offered online.

AS.420.604. Hydrology & Water Resources. 3 Credits.
This course provides an introduction to the hydrological cycle and examines the influence of climate, geology, and human activity on this cycle. The components comprising this cycle will be examined and include: precipitation; evapotranspiration; surface and groundwater flow; storage in natural reservoirs; water quality; and water resource management and regulation. Discussion of these topics in threaded discussions using the primary literature as well as problem sets will highlight applications and areas of current hydrological research. Offered online and onsite three times per year. Onsite version includes a required field trip.

AS.420.605. Maritime Law and the Environment. 3 Credits.
The course is designed to introduce students to the process by which environmental policy can be implemented as law in the international sphere. "Law of the Sea" formed the foundation of modern public international law. It also represents the world's first efforts to define and regulate a "global commons" and to grapple with the management of resources as the "common heritage of mankind". Topics explored include freedom of navigation on the high seas, the limits on port-state jurisdiction over foreign vessels, and the scope of coastal nations' power to regulate activities in their respective territorial waters, "contiguous zones", and "exclusive economic zones". The course also examines how the UNCLOS regime functions in tandem with other treaties, customary international law, the role of voluntary standards (such as American Society for Testing and Materials (ASTM) International and International Organization for Standardization (ISO)) and domestic law in addressing specific current issues - including management of living and nonliving resources on the Continental Shelf, deep seabed mining, reduction of pollution, protection of highly migratory fish stocks, aquaculture, "marine dead zones", and the future of ocean policy.

AS.420.606. Climate Justice. 3 Credits.
Climate change impacts and policies effect different groups of people in varying ways. More vulnerable populations will disproportionately experience impacts more severely (drought, flooding, food security, storms, heat islands, changes to resources and livelihoods). Also, policies to mitigate and adapt to climate change will have differential impacts. In this course, we will review both climate impacts and proposed policies through the lens of equity and justice. Topics to cover will include: analysis of differential impacts, equity critique of mitigation policies, and the impact of adaptation policies on the poor and people of color. The course will cover both the US and international topics.

AS.420.608. Oceanic & Atmospheric Processes. 3 Credits.
In this course, students study the oceans and the atmosphere as interrelated systems. The basic concepts of air masses, water masses, winds, currents, fronts, eddies, and storms are linked to permit a fundamental understanding of the similar nature of oceanic and atmospheric processes. Among the course's topics are weather forecasting, global climate change, marine pollution, and an introduction to applied oceanography. A field trip is included for in-person sections. Offered on-site or online two to three times each year.

AS.420.609. Agroecology. 3 Credits.
In this course, Agroecology will be taught as a transdisciplinary study of how agricultural production of plants and animals affects and is affected by the local environment. Students will gain a more in-depth understanding of inputs and outputs in agricultural systems and their relation to primary productivity, nutrient cycling, energy flows, and species interactions on farms. The components of farm management will be studied within the context of a complex ecosystem. Time in this course will be spent in lecture, field studies and field trips that will attempt to integrate concepts in agroecology with actual practices in sustainable agriculture.

AS.420.610. Sustainable Business. 3 Credits.
This course provides an introduction to sustainable business strategies practiced by US companies. Students will examine the evolution of CSR and triple bottom line management in the context of competing stakeholder interests. Given that sustainability practices differ by sector, company and country, specific illustrations will be discussed in relation to deforestation, water and waste. Attention will be placed on evolving regulatory regimes including compliance mechanisms such as certification and auditing as well as voluntary partnering with NGO's and government agencies. The discussion of sustainable business strategies will be approached as a policy debate that continues to be shaped at both the national and global levels.

AS.420.611. Principles & Methods of Ecology. 3 Credits.
This course examines the relationship between organisms and their biotic and abiotic environment at three levels of biological hierarchy: individual organism, population, and community. Population characteristics, models of population dynamics, and the effect of ecological interactions on population regulation are discussed in detail. The structure and function of natural and man-made communities and the impact disturbances have on community structure are also examined. Students are led to appreciate the importance of ecology in solving environmental problems. Offered online or onsite, at least twice per year. Onsite version includes required field trips.

AS.420.612. Sustainability Science: Concepts and Challenges. 3 Credits.
Sustainability Science is an interdisciplinary field engaged with understanding the dynamics between natural and social systems and how those interactions challenge the notion of sustainability. This course will start by reviewing the history of the concept of sustainability and will then consider how it has been applied in the environmental sciences. Specifically the goal of the course is to provide a comprehensive, multidisciplinary perspective on this emerging field, understanding its theory, research horizons, and practical applications. Concepts to be reviewed include socio-environmental systems, complex adaptive systems, cross-scalar impacts, tipping points and regime shifts, vulnerability, resilience and adaptive capacity, equity, sustainable development, political ecology, governance, capital assets and livelihoods. In a seminar context this course will consider these and other concepts from a theoretical perspective but will focus on their application in solving real-world problems.

AS.420.613. Forest Ecosystems. 3 Credits.
Forests are critical global ecosystems that provide not only timber and wood products, but an array of services including habitat for wildlife, water filtration, carbon storage, and recreational opportunities. Forests are also dynamic landscapes produced by complex and interacting social and ecological processes. Yet increasingly they are being impacted by deforestation, climate change, biotic homogenization, the spread of invasive species and a range of other natural and anthropogenic stressors. This graduate discussion based seminar class will explore the distribution, ecology and sustainability of forest ecosystems with an eye on development of forests of North America over time. It will cover aspects of biogeography, climate forcing of vegetation dynamics, effects of invasive species, land use change and creation of urban forests. Prerequisites: Principles and Methods of Ecology or equivalent experience.

AS.420.614. Environmental Policymaking and Policy Analysis. 3 Credits.
This course provides students with a broad introduction to U.S. environmental policymaking and policy analysis. Included are a historical perspective as well as an analysis of future policymaking strategies. Students examine the political and legal framework, become familiar with precedent-setting statutes such as NEPA , RCRA , and the Clean Air and Clean Water Acts, and study models for environmental policy analysis. Cost benefit studies, the limits of science in policymaking, and the impact of environmental policies on society are important aspects of the course. A comparison of national and international policymaking is designed to provide students with the global perspective on environmental policy. Offered online or onsite, at least twice per year.

AS.420.615. Environmental Restoration. 3 Credits.
This field-centered course focuses on river, freshwater tidal wetland, serpentine and deforested grassland environments that have been restored or designed in the southern Pennsylvania, Maryland and DC region. Knowledge of prehistoric and paleoecological conditions and post-settlement impact along with modern ecological studies provide important long-term guidelines for restoration, mitigation and conservation measures. Field trips are an integral component of this course with possible locations to include Gettysburg Battlefield, PA; Soldiers Delight Environmental Area, Little Falls and First Mine Run in northern Baltimore County; Big Spring Run Restoration in Lancaster, PA; Severn River Coastal Plain forest, sweet bay magnolia bog and cedar bog in Anne Arundel County; and the restored Kenilworth Marsh in DC. Weekly classroom sessions include plant identification of grasses, sedges and trees, and background data on vegetation, land use history and paleoecological data. The pros and cons of different restoration and conservation approaches regarding effectiveness and sustainability are reviewed. Prerequisite: 420.611 Principles and Methods of Ecology, equivalent course, or experience.

AS.420.616. Environmental Consequences of Conventional Energy Generation. 3 Credits.
Environmental consequences of conventional energy generation will explore the energy resources that have driven and are projected to be the primary energy sources worldwide for the next several decades. Specifically, this course will focus on the historical and future role of conventional energy sources such as those derived from fossil fuels, focusing on their geologic genesis and the consequences of resource extraction which will invite comparisons to more recent trends in energy generation. Students will be exposed to the nexus of social, technical, engineering and environmental challenges of providing energy supplies to an increasingly urban and technologically connected global population. Topics include petroleum, traditional natural gas, coal, nuclear, hydroelectric, and geothermal supplies as well as recent trends in shale hydrologic fracturing methods of obtaining petroleum resources. Environmental impacts will focus on mining, resource extraction, soil and groundwater contamination as well as particulates, smog, acid rain, and global warming. Global production, distribution, usage and impacts of these resources will be considered. Offered online, annually. Prerequisites: none.

AS.420.617. Managing Responsible Organizations for the Ecosystem. 3 Credits.
Corporations are currently in the forefront of the sustainability debate with business viewed as a primary player in determining the future of the ecosystem. Leading businesses focused on sustainable strategies, implies changes across the conventional management processes of planning, organizing, leading and innovating. This course will examine the existing and emerging managerial approaches and individual competencies for sustainable management.

AS.420.618. Terrestrial and Marine Conservation Biology. 3 Credits.
Both the Maine coast and mountainous, interior Maine provide a stunning and ideal venue for learning about the myriad conservation biology issues, challenges and solutions in dealing with both marine and terrestrial conservation. These habitats provide an ideal “living laboratory” for studying, understanding and implementing conservation biology. Acadia National Park, established in 1919, will provide us opportunities to investigate the only fjord in the Atlantic Northeast, Somes Sound; carefully assess the ocean-land interface, e.g., Otter Cliffs, Thunder Hole, Sand Beach, and the Ocean Path Trail; hike Cadillac Mountain — the first place to see the sunrise from October to early March in the continental U.S.; time permitting visit Long Pond and hike the Ship Harbor Nature Trail; and spend a day “at sea” investigating cutting edge marine conservation issues up close. Additionally, day trips will be scheduled for the Schoodic Peninsula (via ferry from COA’s dock to Winter Harbor) and to the new Katahdin Woods and Waters National Monument, just east of Mt. Katahdin, Maine’s highest mountain — designated by President Obama as our newest National Monument in August 2016. Since this is a brand new Monument, we’ll investigate how to help implement its mission including through a day hike assessing Katahdin Lake off the Loop Road. Prerequisite: 420.611 Principles and Methods of Ecology, equivalent course, or experience.

AS.420.619. Climate Dynamics. 3 Credits.
There is a huge interest in understanding the climate at multiple scales. This course will provide an overview of the chemical and physical climate system, feedbacks, and the basic physical balances governing atmospheric circulations and climate with an eye on understanding the basics of climate models. The course will cover energy transfer in the ocean-atmosphere system, mathematical modelling of the ocean and atmosphere, modeling of these systems and the basics on how to construct a climate model and explore the current state of climate models.

AS.420.621. The Intersections Between Science and Society: Investigating Watershed Ecosystems in the Cascades. 3 Credits.
This field course will synthesize concepts from a variety of disciplines including watershed and resource management, climate change, forestry, freshwater ecology, environmental policy and advocacy, tribal culture, and eco-tourism.? It will examine the sensitive and fragile relationship between water usage practices and observe the effects on the landscape within different watershed levels. Participants will be able to synthesize the interconnective relationships between different water use practices and their impacts on the health of the watershed.? The course will culminate with participants designing and executing their own independent research projects, starting with the initial preliminary studies, and ending with statistical analyses including a write up of their research findings, and deliver a community presentation on their projects.

AS.420.622. Ecotoxicology. 3 Credits.
This course covers fundamental of ecotoxicology, including chemical action on plants, wildlife, and ecosystems. Coursework explores toxic effects of pollutants and other stressors at multiple levels of function ranging from cellular and organ systems to populations, communities, and ecosystem functions. Students will learn essential concepts governing fate, exposure, and toxic mechanisms of chemicals as well as basic mathematical models used to investigate biological uptake, bioaccumulation, and dose-response effects. Course includes lessons on application of ecotoxicology, including standard procedures for toxicity testing, risk assessment, and measuring exposures and impacts in the field. Topics are covered in a framework of basic biology and ecology, including cellular/organismal functions, trophic structure, food-web dynamics, population biology and community ecology. Offered online every two years. Prerequisite: 420.611 Principles and Methods of Ecology, equivalent course, or experience.

AS.420.623. Freshwater Ecology & Restoration of Aquatic Ecosystems. 3 Credits.
This course focuses on the ecology, protection, and restoration of non-tidal waters. Students study the biological, chemical, and physical characteristics of the waters and riparian zones. There is also a focus on ecological responses to anthropogenic activity and approaches to protection and damage mitigation in freshwater ecosystems. Ongoing and planned protection and restoration activities in Maryland and elsewhere are presented. Students develop holistic restoration plans based on existing ecological data. Two weekend field trips are required parts of the course. Offered every two years. Prerequisite: 420.611 Principles and Methods of Ecology.
Must satisfy prerequisite course prior to enrolling in 420.623

AS.420.624. Ocean Stewardship and Sustainability. 3 Credits.
<p> Covering over 70% of our planet, the ocean produces half the planet's oxygen, absorbs a quarter of all carbon dioxide emissions, feeds 3 billion people, and contributes $3 trillion per year to the global economy. Yet, we know more about the moon's surface than we do about the bottom of the ocean. What we do know, however, is that overfishing, pollution, land-use change, and ocean warming and acidification, to name a few, are causing marine biodeterioration and threatening the ability of the ocean to sustain global systems critical for life. This course will provide students with a robust scientific approach to the study of oceans with a focus on environmental issues, governance and social-ecological systems.<o:p></o:p></p><p> This is an interdisciplinary course that examines the history of human interactions with ocean environments, current ocean sustainability issues, and real-world examples of how to advance ocean conservation practices and theories in the future. Students will investigate approaches to protect ocean ecosystems, to promote innovation in ocean governance, and to increase scientific knowledge, research and technology that supports ocean health. This course provides a holistic and systems-based view of how human interactions influence ocean functions and of innovative policies and sustainable management solutions to social and environmental problems stemming from those interactions. <o:p></o:p></p>

AS.420.625. Ecology and Ecosystem Management in Coastal and Estuarine Systems. 3 Credits.
This course examines the physical, chemical, and biological processes affecting coastal and estuarine ecosystems with special emphasis on the Chesapeake Bay as a model system. Human influences on such large and critical ecosystems and the policy decisions made to manage and minimize human impact are explored in lecture and seminar formats. Topics include the hydrodynamics of shallow tidal waters; energy and material flows and transformations; diversity and adaptation of plant, animal, and microbial communities; population and pollution ecology; and ecosystem management. Case histories illustrate problems in fisheries management and the eutrophication of the coastal and estuarine systems. Offered annually, on-site. Required weekend field trips are included. Prerequisite: 420.611 Principles and Methods of Ecology, equivalent course, or experience.

AS.420.627. Great Lakes Ecology and Management. 3 Credits.
This intensive course examines the physical, chemical, and biological aspects of the Great Lakes aquatic ecosystem as well as its governance, policy-making and management. State-of-the-science, socio-economic relationships, human impacts and restoration activities are also explored, often by presentations from regional experts. Daily lecture topics are reinforced with numerous field experiences to an array of sites throughout Michigan. Students will also be exposed to hands-on sampling, learn about long-term monitoring programs and participate in developing alternative management strategies.

AS.420.628. Ecology and Management of Wetlands. 3 Credits.
This course explores the biological, physical, chemical, and ecological aspects of tidal and non-tidal wetland ecosystems. Topics include wetland classification, valuation, function and dynamics. Wetland modification and manipulation are analyzed through case studies of restoration, construction, and mitigation. The effects of federal and state laws, of various regulations, and of human perturbations are explored. In-person sections include field trips that provide hands-on experience and demonstrate the significance of wetland mitigation, restoration and construction projects. Offered onsite every two years. Prerequisite: 420.611 Principles and Methods of Ecology, equivalent course, or experience.

AS.420.629. Drinking Water,Sanitation & Health. 3 Credits.
In this course students examine scientific and public policy dilemmas related to the provision of safe drinking water and related protection of global human health. Course work emphasizes basic understanding of the fundamentals of water supply, treatment, regulation, and sanitation as well as providing a focus on unresolved issues confronting scientists, resource managers, and policymakers. Students work to develop recommendations for solutions to critical issues as controlling pathogens from urban and agricultural runoff, managing harmful by-products of the disinfection process, regulating arsenic in ground water, evaluating the risk posed by exposure to mixtures of contaminants, and confronting the threat of terrorist attacks on water supplies. Offered online, annually. Prerequisite: 420.604 Hydrology and Water Resources, equivalent course, or experience.
Must satisfy prerequisite course (AS.420.604) prior to enrolling in AS.420.629

AS.420.630. Tropical Ecology and Conservation of African Wildlife. 4 Credits.
This is an immersive study abroad field course in Cameroon, Africa with a strong focus in tropical ecology field methods for the purpose of conserving African wildlife. The Congo Basin is the second largest tropical rainforest in the world, storing an estimated 25-30 million tons of carbon stocks, and home to nearly 20% of Earth's species. There is a critical need to better understand the Congo Basin's rainforests because we cannot conserve what we do not understand. The field component of this course takes place at the Dja Nature Reserve in southeast Cameroon at a remote research station operated by the Congo Basin Institute. The Dja rainforest is a diverse and understudied ecosystem. This course will cover basic field methods including but not limited to biodiversity assessments, species population estimates, setting up and checking large mammal camera traps, auditory surveys of primate vocalizations, mist netting for tropical birds, and other field techniques. Couse content will focus on problems such as ecological impacts of biodiversity loss, drivers of wildlife poaching, conservation strategies and best practices. Students will be introduced to local leaders in conservation, members of the community from the ecosystems we'll be working in, as well as indigenous residents from the Baka tribal group. This course will also explore the broader social, political, economic, and climate change impacts to wildlife conservation efforts in Africa. Prerequisite: AS.420.611 – Principles and Methods of Ecology.

AS.420.631. Field Methods in Stream & Water Quality Assessment. 3 Credits.
This course provides an overview of field methods used to sample and assess various biological, physical, and chemical components in streams, rivers, and lakes. It allows students to determine the impact human activity has on aquatic environments. Students gain hands-on experience with standard sampling techniques, and with the detection, identification, and quantification of biological specimens and chemical pollutants in the aquatic environment. Students discuss water quality standards and federal regulations such as the Clean Water Act and Safe Drinking Water Act. Also included are study design, gear selection, sample preservation, and safety. Basic approaches to analyze and report findings are covered, with emphasis on methods currently practiced by government resource agencies. Offered onsite every two years. Prerequisite: 420.611 Principles and Methods of Ecology, equivalent course, or experience.

AS.420.632. Air Quality Management and Policy. 3 Credits.
Understanding and mitigating air pollution, both indoor and outdoor, is of extreme importance to global health. In fact, the World Health Organization released a statement in 2014 that in 2012, approximately 7 million people died - one in eight of total global deaths around the world - as a result of air pollution exposure. Air pollution also has an impact on climate change, in terms of its abilities to both exacerbate and reduce global warming. This course provides an overview of the principles, effects, and policies regarding outdoor air pollution with an emphasis on emerging international air pollution issues, public health and environmental impacts of outdoor air pollution, and evolving ways to monitor air pollution, from low-cost sensors to satellite techniques. Course topics include: history of air pollution events and management; major air pollutants and sources; atmospheric chemistry, transport and dispersion; measurement and monitoring; control technology; effects on human health and climate; and regulatory requirements. The effectiveness of the Clean Air Act, approaches toward air quality management in other countries, international treaties, future air quality projections, and regulatory case studies will also be discussed. Offered online, infrequently. Prerequisite: 420.608 Oceanic and Atmospheric Processes, an equivalent course or experience, or approval of the instructor.
Must satisfy prerequiste course (AS.420.608) prior to enrolling in AS.420.632

AS.420.634. Bioremediation & Biofuels for Environmental Restoration. 3 Credits.
This course presents details of environmental technologies for assessment, remediation, and restoration of contaminated sites. The course includes a brief review of environmental policy related to impacts of hazardous chemicals and endocrine blockers, but focuses on remediation technologies available for reclaiming contaminated resources and reducing health risks. It covers the application of multiple physical, chemical, and biological technologies, but emphasizes use of biological systems for the cleanup of hazardous chemicals. Students are introduced to the nature of hazardous waste, behavior of chemicals in the subsurface, biochemistry of microbial degradation and technology applications. Students also explore the use of biotechnology to maintain biodiversity, to remediate contaminated soils, and to isolate and remove substances. In keeping with the emerging “bio” technology exploration, students take a look at biofuels and their role in combating climate change on a global-scale and their role in restoration of degraded land on a local-scale. Students in this class learn to select appropriate technologies, design a monitoring program for assessing the applicability of bioremediation techniques, develop biological conceptual models for natural attenuation, and understand the key principles for design. Prerequisites: 420.601 Geological Foundations of Environmental Science and 420.604 Hydrology and Water Resources, equivalent courses, or experience.Prerequisites for SIS: AS.420.601 and AS.420.604

AS.420.636. Environmental Anthropology. 3 Credits.
Anthropology, the study of humans and their engagement with the environment, depends on the use of methods and theories to provide insight into human adaptation and resilience to environmental changes. In order to understand the present environmental crisis, we must analyze the sociocultural factors that have led us to this point and consider how they are influenced by various contexts. Applying the theories of cultural materialism, symbolic anthropology, and socioecology, students will explore diverse economic practices, including hunting and gathering, horticulture, aquaculture, agriculture, and pastoralism in a range of geographical settings, both in US and globally. Course activities and assignments will investigate how human belief systems relate to specific environments and are integrated into rituals and arts. Considering current socioecological frameworks, such as deep ecology, ecological feminism, and political ecology, students will explore how Western environmental perspectives overlap with or are disconnected from the local ecological knowledge developed by indigenous societies. To provide training in the application of environmental anthropology frameworks and tools, students will conduct a fieldwork project unique to their interests and regions.

AS.420.637. Conservation Biology. 3 Credits.
In this seminar style course students examine the meaning and implications of biodiversity with a focus on disciplines associated with conservation biology. The course will expound on the following topics: patterns and processes creating biological diversity; estimates of extinction rates; consequences of diversity losses; approaches to conserving diversity, including large-scale conservation planning; conservation biology tools, such as population viability analyses and conservation triage; and causes of diversity loss including habitat loss-fragmentation, invasive species, and climate change. This includes exploring how conservation biology differs from other natural sciences in theory and in application. Students learn the major threats to biodiversity and what natural and social science methods and alternatives are used to mitigate, stop, or reverse these threats. The course also includes the economic and cultural tradeoffs associated with each conservation measure at the global, national, regional, and local levels. Prerequisite: Principles and Methods of Ecology or equivalent experience.

AS.420.638. Coastal Zone Processes and Policy. 3 Credits.
The course is designed to provide the student with knowledge to address modern coastal, environmental, geologic, and policy issues. The course will focus on the coasts, barrier-islands, major estuaries, and inner continental shelf areas of the United States. Fundamental coastal engineering principles will be described in order to address methods used for public works projects including hurricane protection, beach nourishment, and tidal inlet maintenance. The policies pertinent to management and use of coastal environments will be studied. Offered online every other year. Prerequisite: 420.601 Geological Foundations for Environmental Sciences, equivalent course, or experience.

AS.420.639. Landscape Ecology. 3 Credits.
Landscape ecology is a rapidly developing area of study that explicitly examines the effects of spatial pattern and scale on ecological processes that unfold over areas of several square kilometers or larger. Thus, landscape ecology provides many concepts, tools, and approaches that will enhance the effectiveness of endeavors such as watershed management, ecosystem management, design of conservation reserves and green infrastructure, and smart growth. The goal of this course is to give students a firm grasp of the concepts of landscape ecology and of how they can be applied to enhance the effectiveness of environmental policy, management, regulation, and assessment. Offered online at least every other year. Prerequisite: 420.611 Principles and Methods of Ecology, equivalent course, or experience.
Must satisfy prerequisite course (AS.420.611) prior to enrolling in AS.420.639

AS.420.640. Urban Wildlife Ecology. 3 Credits.
An increasing human population, urban sprawl, global travel and commerce are hallmarks of modern society. As a result, human-wildlife interactions are increasingly commonplace, particularly in cities and suburbia, prompting the development of a new discipline known as urban wildlife management. This course will explore the occurrence, adaptations, and management of wildlife in urban and suburban landscapes, focusing on human dimensions, animal damage, zoonoses, control of invasive and introduced species, endangered species recovery, and population dynamics. Students will examine historical and sociopolitical perspectives, review ecological theory, and practical applications for managing wildlife and maintaining biodiversity in increasingly urbanizing environments. Students will also review the current directions in urban wildlife research and explore the use of modern sampling and estimation techniques, such as camera trapping and occupancy estimation, as well as the more traditional methods used on wildlife populations.Prerequisites: 420.611 - Principles and Methods of Ecology, equivalent course, or experience.

AS.420.641. Natural Resources Law and Policy. 3 Credits.
This course introduces students to federal and state legislation and policies of critical importance in natural resource management. Students explore such issues as regulation of ocean fishing, coastal zone management, mineral exploitation and associated environmental impact, water allocation and quality, hazardous waste cleanup programs under the Superfund law, urban industrial infrastructure such as water and sewage systems, land use management, and water and air pollution control. Offered onsite of online every two years. Completing 420.614 Environmental Policymaking and Policy Analysis is recommended. An equivalent course or experience may also suffice.

AS.420.642. Public Lands-Private Interests:The Struggle for Common Ground. 3 Credits.
This course prepares students to participate in the great debate over the use and protection of America 's federally owned forests, rangeland, parks, and sanctuaries. Students consider such questions as how much should be paid for grazing on federal lands; how to balance the demand for timber harvest with the need for watershed and wildlife management; who controls mineral and oil extraction on federal lands; and who has the rights to waters flowing through federal lands and stored behind federally funded dams. These and similar issues of today and tomorrow are studied in the context of history, statute and case law, and administrative regulations. Offered infrequently.Prerequisite: 420.614 Environmental Policymaking and Policy Analysis, equivalent course, or experience.

AS.420.643. U.S. Environmental History. 3 Credits.
Environmentalism is a multifaceted phenomenon infused with many different schools of thought about the nature of environmental problems as well as the most appropriate solutions for those problems. This course will examine the major historical influences on the varied approaches to environmentalism and environmental practice. Students will explore the influence of environmental ideas and actions in the US from the 19th century to the present. The goal is to deepen our understanding of contemporary environmental practice – by others and ourselves – by tracing the influence of these historical trends in current debates and actions. Topics include conservationism, preservationism, transcendentalism and green romanticism, toxic construct, the wilderness construct, and sustainability.

AS.420.644. Sustainable Cities. 3 Credits.
This course examines urbanization and its impacts on the environment. The goal of the course is to better understand how urbanization contributes to ecological damage as well as how cities can be constructed in ecologically healthy ways. Topics include land use planning transportation, waste, management, water quality, open space/greening, green building technology, urban design, and urban ecology. The course takes an international perspective by using case studies of cities in North America, Europe, Asia, Latin America, and Africa. The case studies also include a wide range of cities with different populations, geographic scale, and growth rates. Final projects are an in-depth study of one particular city of the student's choice and its attempts to implement programs for sustainability. Offered online, annually. Prerequisite: 420.614 Environmental Policymaking and Policy Analysis, equivalent course, or experience.

AS.420.645. Environmental and Natural Resource Security. 3 Credits.
<p>Environmental Security concerns the complex relationship between peace, security, and the environment. It addresses the rapidly growing importance of environmental degradation concerns, resource scarcity, food production, unequal distribution of natural resources, and climate events that present ever-increasing challenges for nations and their security and stability. <o:p></o:p></p><p>This course will survey security disruption and conflicts over natural resources from domestic protests to civil wars to major international armed conflicts. From melting sea ice in the Arctic creating vulnerabilities, to mining rare earth minerals necessary in the production of many renewable energy sources, managing the fair use and distribution of natural resources is critical to peace and security across the globe. This course will also address the risks and opportunities that environmental issues present for domestic and global security and stability. <o:p></o:p></p>

AS.420.646. Transportation Policy and Smart Growth. 3 Credits.
This course examines how transportation policy and decisions can alleviate or prevent problems resulting from urban sprawl. How can transportation decisions and planning contribute to more livable urban design and land use patterns that promote smart growth that is environmentally and ecologically sustainable? Students discuss how different environmental media land, water, and air are affected by our transportation systems and resulting development patterns, and how the design of transportation systems the highways, roads, transit systems, and bike and walk paths can more closely harmonize with nature and provide communities with a better quality of life. A wide range of policy options is examined, from altering the structure of road pricing to redesigning neighborhoods and altering urban form. A number of case studies are examined to illuminate the issues and principles raised in the course. Offered online at least every other year. Prerequisite: 420.614 Environmental Policymaking and Policy Analysis, equivalent course, or experience.

AS.420.647. Environmental Racism and Inequality. 3 Credits.
This course will examine the deeply rooted social, psychological, and political backgrounds that have resulted in environmental inequities and injustices. Essentially the course will focus on why, and through what social, political and economic processes, some people are denied access to untainted natural resources and are exposed to direct threats to personhood through environmental degradation and political marginalization. It will examine systemic structural biases in environmental policy-making that discriminates against indigenous peoples and people of color, particularly with respect to the state-sanctioned siting of toxic waste facilities, the distribution of pollutants, the location of food-deserts, and the exclusion Indigenous peoples and people of color from leading positions in the environmental movement.

AS.420.648. Fossil Fuels and the Climate Crisis. 3 Credits.
In this course, we will study the inter-relationship of fossil fuels and the climate crisis, including a particular focus on Louisiana and 'Cancer Alley.' The course will look at the role of fossil fuel companies in the climate crisis and will delve into the issues of climate and environmental justice, indigenous rights, social movement organizing, public policy, and the energy transition. With a particular focus on oil, students will learn about the rise to global dominance of a natural resource on which states and nations have come to depend, but which has also brought great political, environmental, social, and climate strife. The course will explore approaches to solving the seemingly contradictory need to both rapidly transition away from fossil fuels and address this continued dependence. Students will learn about the history and future of fossil fuels, the social movements resisting them, and policy approaches to replacing them.

AS.420.650. International Environmental Policy. 3 Credits.
This course explores the methods and strategies for promoting solutions to global environmental problems. Through consideration of issues such as stratospheric ozone depletion, global climate change, tropical deforestation, loss of biodiversity, transnational pollution, and other threats to the international commons, students examine policymaking from the perspective of developed and developing countries, the United Nations system, international financial entities, and nongovernmental interest groups. By investigating important international agreements, students determine how far the international community has come in solving specific problems, what obstacles prevent effective international solutions, and what needs to be done to overcome barriers. Offered onsite or online, infrequently. Prerequisite: 420.614 Environmental Policymaking and Policy Analysis, equivalent course, or experience.
Must satisfy the prerequisite course (AS.420.614) prior to enrolling in AS.420.614

AS.420.651. Environmental Risk in Decision Making. 3 Credits.
Analysis of risk is one of the most powerful tools and components of regulatory decision making. Based on the premise that risk assessment has no "right" answers, this course explores what risk perception, risk management, and risk communication mean. Students are introduced to terminology and concepts necessary in risk communication. Case studies help to explain the complexities of risk assessment and management. Students learn how to balance the costs and benefits of risk reduction and how to account for the uncertainties in risk estimates. Prerequisite: 420.614 Environmental Policymaking and Policy Analysis, equivalent course, or experience.

AS.420.654. Environmental & Natural Resource Economics. 3 Credits.
This course presents the fundamental concepts and applications of economic theory related to environmental protection and the management of natural resources, including renewable resources (i.e., fisheries) and exhaustible resources (i.e., petroleum). Topics covered include sustainability, the relationship between the environment and the economy as a whole, the role of government in addressing market failures, how economic incentives can be used to protect the environment, concepts and methods for valuing environmental benefits and cost-benefit analysis of environmental regulatory policies. Prerequisite: AS.420.614 - Environmental Policymaking and Policy Analysis, equivalent course, or experience.
Must satisfy prerequisite course (AS.420.614) prior to enrolling in AS.420.654

AS.420.656. Environmental Impact Assessment & Decision Methods. 3 Credits.
This course introduces the process of environmental impact assessment and policy decision making as required under the National Environmental Policy Act (NEPA) and the regulations of the Council of Environmental Quality (CEQ). Topics include identification of purpose and need for any actions affecting the environment, development of objectives and decision criteria, and various techniques for assessing impact and comparing alternatives for a given environmental intervention. The strengths and weaknesses of various approaches are evaluated with techniques that allow analysis of multiple objectives and conflicting uses of environmental resources. The importance of scientific credibility and public acceptance is demonstrated with actual cases. Offered onsite or online annually.Prerequisite: 420.614 Environmental Policymaking and Policy Analysis, equivalent course, or experience.

AS.420.659. Management for Environmental Results with Performance-based Measurement. 3 Credits.
At all levels of government and throughout private industry, performance-based initiatives now place unprecedented demands on environmental managers to achieve measurable environmental results. The goal of the various performance based initiatives is to give environmental managers a systematic understanding of the causes of environmental problems, both natural and anthropogenic, and their human, ecological and economic effects. It is also at the heart of sound environmental impact analysis, risk assessment, and benefit-cost analysis. In this course, students learn the foundations and applications of modern performance-based initiatives. Using case studies taken from a variety of environmental programs, students learn to use available scientific knowledge to uncover the likely keys to program success. Students learn why success has so often eluded environmental managers in the past. The goal of this class is for students to critically assess the design, performance measurement and management of environmental programs on all scales and to recommend effective improvements. Students will develop skills for implementing results oriented environmental management. Offered onsite or online, annually.

AS.420.660. Strategies in Watershed Management. 3 Credits.
Watersheds are often thought of as the basic organizing units for landscapes and the natural resources they support. As water is a fundamental resource that shapes landscapes, nourishes life, provides habitat and recreation, and transports sediments, nutrients, and wastes, prudent management of watersheds is critical for thriving ecosystems and human populations. The course comprises ten on-line modules students, each with topical content, web pages to visit, readings in the required text, and a quiz. Most modules also have discussions, and some have other assignments. The final discussion is a brief essay on a relevant topic of the student's choice. Students are introduced to definitions of 'watershed' and 'watershed management' in the context of natural resources science and policy. There is a brief review of basic hydrology, a look at the history of watershed management, and examination of the institutions and legislation that control activities affect watershed management. We discuss threats to watershed health, sources of information to guide watershed managers, and practices that can ameliorate the threats. Through case histories, the students are exposed to the collaborative process for assessing, protecting, and restoring watersheds. Offered online, annually.

AS.420.665. Climate Change on the Front Lines: The Study of Adaptation in Developing Countries. 3 Credits.
Poor and developing countries are predicted to bear the brunt of climate change. This course will focus on key sectors such as agriculture, forestry, biodiversity, water resources, human health, and tourism and the ways in which poorer and developing counties are impacted by and adapting to climate change. This course may focus on a region or a specific country depending on the instructor. Assessment and evaluation of demographic trends, environmental challenges such as retreating ice, potential flood hazards, ecosystem impacts, as well as health issues will be incorporated. International instruments such as adaptation funds, carbon funds, clean development mechanisms, and reduced deforestation/degradation strategies and policies will be investigated in a comparative analysis of impacts and adaptation responses of countries around the world. Offered online, annually.

AS.420.666. Community Development and Sustainability in developing countries. 3 Credits.
This course introduces community development concepts via discussion of the environmental-social-economic nexus in developing countries. Students will seek answers to key questions such as: (a) How rural communities in developing countries interact with their natural environment (b) What are the drivers, tradeoffs, and feedback loops of such interactions and what lessons can be drawn to seek common ground for sustainability (c) how do interaction between social, environmental, and economic dimensions shape communities to adapt to changes in these dimensions (d) what are some of the successful models of sustainable community development and environmental management (e) what is the fundamental concept of sustainability and factors that influence sustainability and its pathways (f) what are some of the efforts in place through government, nonprofits, and the private sector to assist developing countries in attaining sustainability. Students will discuss topics ranging from energy saving stoves in the Himalayas; to indigenous practices in Africa for mitigating human-wildlife conflict within buffer zones; to community-driven approaches for water management and agriculture; to community forestry and leasehold forestry models. In addition to key problems and challenges, students will be introduced to important tools used to translate ideas into sustainable action, such as project logical frameworks. By the end of the course, students interested in international, community, and sustainable development would be able to engage in related debates and be familiar with approaches and techniques for designing sustainability solutions.

AS.420.667. Analysis of Environmental & Ecological Data. 3 Credits.
This course will teach participants how to develop work flows going from raw data to graphics and statistical analysis, using the programming language and statistical environment R. Topics will focus exclusively on the biological sciences and will cover foundational concepts in statistical modeling (ANOVA, Regression, ANCOVA, PCR, etc); emphasis is on conceptual underpinnings of statistics not methodology, with a focus on defining statistical models and the major inference paradigms in use today.

AS.420.668. Sustainable Food Systems. 3 Credits.
This course considers the environmental and social challenges of providing a sustainable global food system. We will investigate the geographic patterns of agricultural and food production systems, emphasizing contemporary patterns and how these came to be. Attention will be given to agricultural systems from the local to the global scale and we will consider the global distribution of production and consumption of agricultural products. The impacts of global change issues such as climate change, energy crops, population growth, and urbanization on food production will be also be part of the course. Offered online or onsite, annually.

AS.420.669. Applied Sustainability. 3 Credits.
This course examines the history and current trends in the expanding field of sustainability. Students will be exposed to a wide range of case studies, visit many field sites and have discussions with sustainability practitioners in Maryland to determine the current state of the science as well as impediments to progress. Additional work includes practical application through development and implementation of a sustainability-related vision project. Offered only as a compressed field course every other summer. Offered as intensive field course every other summer.

AS.420.670. Sustainability Leadership. 3 Credits.
Using a highly interactive format, this course examines practical, state-of-the-art concepts in leadership, with a focus on the unique challenges of sustainability facing our world. Students will examine the essential components of leadership, including vision, communication, strategy, organization, synergy and strategy. Recognition of barriers and risks and how to work around them will be stressed, and the restricted conditions under which leadership is actually exercised will be revealed. Students will also practice self-reflection/assessment and become familiar with advanced tools to improve their leadership ability. Coursework will include frequent work in small groups, review of leadership case studies and a practical, 'real-world' vision development project. Offered only as a compressed field course every other January intersession.

AS.420.671. Global Land Use Change. 3 Credits.
This course provides a comprehensive examination of global land use change including the current spatial and historical extent of forests and grasslands, methods used to detect forest cover and its current and historical changes. Reviewing these patterns will lead to an understanding of the past and present drivers of land use change. In this course, we will consider the hydrological, and major biogeochemical cycles (i.e., carbon, nitrogen and phosphorus) and the impacts that forests and grasslands (and the loss of these ecosystems) has had on these cycles. The impact of forest loss on biodiversity, long term functioning of ecosystems and climate will also be discussed. After reviewing the effects of a loss of these environmental processes, we will bridge the physical and biological sciences with the social sciences by examining economic impacts and socioeconomic drivers of deforestation. Lastly, current policies and the potential effect of policies that aim to reduce deforestation such as REDD will be discussed.

AS.420.672. Environmental Ethics. 3 Credits.
Environmental Ethics is a philosophical discipline that examines the moral relationship between humans and the natural environment. For individuals and societies, it can help structure our experience of nature, environmental problems, human-environmental relations, and ecological awareness. Beginning with a comprehensive analysis of their own values, students will explore complex ethical questions, philosophical paradigms and real-life case studies through readings, films and seminar discussions. Traditional ethical theories, including consequentialism, deontology, and virtue ethics will be examined and applied. Environmental moral worldviews, ranging from anthropocentric to ecocentric perspectives, will be critically evaluated. Organized debates will help students strengthen their ability to deconstruct and assess ethical arguments and to communicate viewpoints rooted in ethical principles. Students will apply ethical reasoning skills to an examination of contemporary environmental issues including, among others, biodiversity conservation, environmental justice, climate change, and overpopulation. Students will also develop, defend and apply their own personal environmental ethical framework. A basic understanding of modern environmental history and contemporary environmental issues is required. Prior experience with philosophy and ethics is not required.

AS.420.673. Ecology and Evolution of the Galapagos. 3 Credits.
The Galapagos Islands have often been called the laboratory of evolution, where scientists have been able to study in detail many of the processes that have shaped the face of life on our planet. There are few places in the world, where it is possible to find such a variety of species, both animal and plant, which show so many degrees of evolutionary change, in such a restricted area. This course will focus on the tectonic development of the Islands and of the origin, evolution, and ecology of flora and fauna, and the reasons for the concentration of threatened and endangered species in the forests and on the Galapagos Islands. In the marine environment, emphasis will be placed on the ecological processes that maintain biodiversity, community organization, and the impacts of climate change which are threatening such communities.

AS.420.674. Applied Energy Policy in the 21st Century. 3 Credits.
This course provides an overview of clean energy technology and deployment, infrastructure and finance for environmental scientists and policy makers. Topics include civics, climate science, renewable energy, energy efficiency, sustainable transportation, city infrastructure (energy, transportation, water), and public private partnerships. Emphasis is placed on a place-based approach to energy policy, including climate smart resilient cities and how new urban mobility can address social problems.

AS.420.675. Geology and Tropical Ecology of Hawai'i. 3 Credits.
The breathtaking beauty and unfettered access to the soaring Mauna Kea, the highest mountain when measured from the ocean floor, and home to the Big Island's eight major climate zones, from desert to alpine, inspire countless superlatives. The volcanoes of the Big Island of Hawai'i are one of the premier examples of active hotspot volcanism in the world and are by far the most accessible. This location offers an unparalleled opportunity to observe the planetary processes of destruction and creation through Hawai'i's geology and tropical ecology. This field course explores the unique marine, freshwater and terrestrial habitats of the island, interconnections between the geology and the ecology and the integrated management of natural resources from volcanic mountain tops to the biodiversity of the coral reef. The primary goal of this interdisciplinary course will be to provide a solid foundation in field science for both geologic and ecologic methods. Specifically, we will examine the geological development of hot spot generated Hawaiian ocean islands, we will describe the biological development of the ecosystems on the islands, and we will examine the interaction between humans (landscape use and introduction of exotic species) and the island environments (major biomes and anthropomorphic systems). As a field course, natural communities will be a major emphasis. On land, focus will be placed on the tectonic development of the Islands and of the origin, evolution, and ecology of flora and fauna, and the reasons for the concentration of threatened and endangered species in Hawai'i. In the marine environment, emphasis will be placed on the ecological processes that maintain biodiversity, community organization, and the impacts on coral reefs. Prerequisite: AS.420.601 - Geological Foundations of Environmental Science or permission from the instructors.

AS.420.676. Global Scarcity in Freshwater Systems: Crisis and Solutions. 3 Credits.
This graduate-level course explores the dual nature of water scarcity worldwide, including both natural and human causes, and what is being done to help people and ecosystems cope with scarcity. The course covers definitions of water scarcity, the geographic extent of the problem, and trends in factors that contribute to it. It also examines several types of actions that are being taken to deal constructively with water scarcity. These actions fall into the general categories of monitoring, supply enhancement, conservation, re-use, pollution control, lifestyle changes to lower our water footprint, and public policy changes. Many of these actions, especially those related to public policy, are incorporated into seven principles of sustainable water management detailed in the course textbook, “Chasing Water: A guide for moving from scarcity to sustainability”, by Brian Richter of the Nature Conservancy. Examination of the principles helps to end the course on a hopeful note by reminding us that humans collectively use only 5-10 percent of the water that falls as precipitation, and we have the capacity to greatly reduce the human suffering and environmental damage caused by poorly managed use of freshwater resources.

AS.420.677. Spatial Statistics. 3 Credits.
Spatial Statistics is a rapidly developing tool in the discipline of ecology that analyzes both 2-D and 3-D data that contain a spatial component. Many ecologists use continuous data (e.g., vegetation density and height, net aboveground primary production, percent of biomass killed by disturbance, etc…) that violates the assumption of spatial independence; therefore, necessitating the need to analyze the data using spatial statistics. Thus, spatial statistics provides concepts, tools, and approaches that will enhance the analyses of population data, sample data, partitioning of regions (patch and boundary), spatial interpolation, and data that are spatially autocorrelated. The goal of this course is to give students a firm grasp of the concepts of spatial statistics in ecology and of how they can be applied to analyze continuous data for environmental policy, management, and assessment. Uses of case studies, data analysis in the R spatial statistics package, and discussions help to examine and apply the concepts.

AS.420.678. Nature Conservation and Sustainability in Cuba. 3 Credits.
This cultural and scientific emersion program will investigate Cuba's agroecology, tropical marine and terrestrial ecosystems as well as the countries unique geology. As wildlife and habitat have faded from the tropics, Cuba's importance as an ecological bastion has risen. The island has the largest tracts of untouched rain forest, unspoiled reefs and intact wetlands in the Caribbean islands. Cuba also is home to many unique, or endemic, species, including the solenodon, and the bee hummingbird, the world's smallest bird. In this course, students will have the opportunity to learn about the marine ecology through first-hand investigation of the reefs off the shores of Cuba, and learn about rainforest ecology through observations of Cuban forests. The course will also examine the interplay between geology, ecology, evolution and adaptation in areas such as coastal xeromorphic vegetation, swamp ecosystems, and Viñales National Park.

AS.420.679. International Water: Issues and Policies. 3 Credits.
This course is a broad survey of the international water issues facing the 21st century. Topics to be covered include, water security, privatization of water service delivery, conflict and cooperation on trans-boundary rivers, the role of large multi-purpose reservoirs (for hydropower, water supply, irrigation), water as a human right, achieving the Sustainable Development Goals on water supply and sanitation, the role of water in food security, water institutions and policies, and climate change. Any discourse today on sustainable development is not complete without a discussion of the important role of water to society, economic growth, and poverty reduction. Our objective in this course is to gain a broad overview of these issues, primarily from the sustainable development lens, and to critically evaluate these challenges from a multi-disciplinary perspective (e.g. economics, environment, social, engineering, public health). This is important as solutions to water problems will require many different disciplines and expertise working together.

AS.420.681. Climate Change Adaptation and Development in Nepal. 3 Credits.
This is a field course that takes a firsthand look at the reality of climate change adaptation at various scales as it is experienced in in a developing country such as Nepal. Specifically it considers Nepal's vulnerability and resilience to climate change at the national, district and community levels, and will review adaptation instruments and actions at all levels and the political context in which they are executed. Specific topics to be covered include climate change by sector, vulnerability at various scales, institutional and community-based plans for mitigation and adaptation, institutional and legal mechanisms that address climate change, extension efforts, climate change integration into development, and current effort by developing countries such as Nepal in carbon-financing and other topics. The course will also consider how funding to support climate change adaptation intersects and overlaps with development aid and planning. The course will start and end in Kathmandu, the capital city, where students will meet with policy makers, government officials and experts. We will also travel to communities in the three biophysical regions of Nepal, the highlands, the middle hills and the lowlands (Terai). In all locales students will interact with stakeholders all various kinds and be exposed to the great cultural, economic, political, and biophysical diversity of Nepal.Course prerequisite: 420.665.81, Climate Change on the Front Lines: The Study of Adaptation in Developing Countries, or permission of the instructor.

AS.420.687. Science Communication and Policy Engagement. 3 Credits.
This course provides students with an introduction to the theory and practice of communicating science and engaging with different types of audiences including policymakers, the public, and the media. Science is valued by many and sharing our understanding of science and technology is a crucial part of engaging beyond the scientific community. In this course, we will explore current research on the science of science communication, as well as how to create narratives for engagement based on the goals and audience. Students will have the opportunity to discuss engagement strategies and communication methods, design an engagement plan, and practice using their skills for engaging with policymakers, public audiences, the media, and more.

AS.420.690. Environmental Health. 3 Credits.
The environment plays an important role affecting public health. This course will explore major topics in the area of environmental health, examining sources, routes, and health outcomes associated with exposure to microbial, chemical and physical agents in the environment. This course will cover how such agents affect human disease at the individual, community, and population level. Students will also explore how environmental health challenges are addressed through development of policy in a regulatory framework.

AS.420.703. Open Source GIScience for Environmental Research. 3 Credits.

This course on Free and Open Source GIS is targeted at students who already have some experience working with ArcGIS and want to learn about alternative software packages. The course will discuss the advantages and disadvantages? of open source GIS in contrast with more commercial GIS offerings. Geographic Information Science is now embedded in just about everything we do. From Google Maps to geotagging to wearable technology. Depending on your career choice, commercial software may not always be available for use or affordable. However, there are free, Open Source GIS software options available and as these tools become more powerful, more employers are adding knowledge of these software packages as required or desired skills. In this course, students will use free, publicly available environmental geographic data to perform GIS and remote sensing tasks using Open Source Software (e.g. QGIS, Remap, EO Browser). Students will learn how to obtain, create, analyze, assess, generate, and visualize environmental data relevant to environmental science fields like habitat assessment, natural disturbances, conservation, and landscape ecology.

AS.420.704. Practical Engineering Approaches to Climate Adaptation. 3 Credits.

<p> This course will briefly examine what risks recent POLICY actions pose to the environmental, economic and social infrastructure of the US and global community – especially the less developed nations – from the standpoint of climate-related natural disasters [floods, droughts, tsunamis, landslides, hurricanes, typhoons, monsoons, storm surges, forest fires, etc], and what technologies and technical options can be enlisted to mitigate the adverse [and some positive] effects associated with global warming. <o:p></o:p></p> <p> This course will focus on a few technical mitigation [e.g. geo-engineering] options, but will focus mainly on practical adaptation options and strategies related to contemporary [and future innovative] infrastructure solutions and existing ‘best management practices’ for coastal erosion, storm preparedness, flood/drought management and preservation of ecological systems. Real case studies, based on recent disasters, such as Hurricane Katrina [New Orleans] and Superstorm Sandy [New York metropolitan region], as well as international examples from the Great Lakes, Columbia R. basin, Rio Grande basin, Mekong River basin, small island states, and both European and African case studies will be used to highlight each of the major engineering-based adaptation strategies. <o:p></o:p></p>

AS.420.705. Natural Resources Sustainability: Field Study in Alaska. 3 Credits.

This interdisciplinary field-based course examines the natural, cultural history and resource management in the ecosystems of Southeast Alaska. Through class lecture/discussion and field excursions, students obtain an understanding of integrated resource management and sustainability in protected areas while assessing options for addressing impacts and perturbations in habitats where species have and continue to be affected. The course will emphasize a variety of disciplines including: marine science and fisheries, wildlife management, geology, energy resources, forestry, botany, eco-tourism and anthropomorphic impacts to biodiversity, marine and wilderness areas.

AS.420.738. Newfoundland and Labrador: A Journey Through Time. 3 Credits.

The field course will examine the origins of the North American Continent and the Appalachians including the creation and destruction of oceans, human ecology, climate change, tectonics, whaling, and marine fisheries around the Labrador Sea and the Grand Banks. Field locations include four UNESCO World Heritage sites: <o:p></o:p></p><ul style="list-style-type:disc">
Gros Morne National Park, featuring majestic fjords and glacial valleys; L’Anse aux Meadows, North America’s first authenticated Viking settlement; Red Bay, the 16th-century Labrador home to over 1,500 Basque whalers; and
Mistaken Point Ecological Reserve, site representing the oldest multicellular life on Earth.

AS.420.800. Independent Research Project in Environmental Sciences and Policy. 3 Credits.

The independent research project enables students to apply and synthesize the material learned in their courses, develop expertise on a specific environmental topic, work closely with an expert in the field, and improve their professional writing skills. Students who take this elective must identify a project topic and a Mentor who is both familiar with the chosen topic and willing to guide and oversee the project. The Mentor may be a faculty member teaching in the program or elsewhere at JHU, a qualified and appropriate person from the student's place of work, or any expert with appropriate credentials. A preliminary proposal must be approved by the Mentor and the Course Instructor prior to enrollment in the course. In order to enroll in the class, permission of instructor is required. Final proposals for the IRP must be approved by the Mentor and the Course Instructor at least two weeks prior to the start of the semester in which the IRP is to be completed. A Mentor Agreement form must be completed and returned at the beginning of the semester in which the student in take the I.R.P. course. This form is sent to the Mentor by the Course Instructor once the final proposal is approved. For more information please go to the ESP website => The Experience => IRP. Offered every term and scheduled as needed.

AS.420.801. Independent Study. 3 Credits.

AS.420.805. Internship and Capstone Thesis. 3 Credits.

This course is designed to allow students to have a Capstone/Thesis Internship Experience, a Group Research Project as well as the standard Capstone (Independent Research Project) in an internship format. Advanced students in the MS in Environmental Science and Policy program may propose an internship to receive on-the-job experience in science or science policy or a related profession. An approved internship receives one full course credit toward the MS in ESP degree usually an elective. Students may propose to participate in existing internship programs, or they may arrange a unique experience. In most cases, students should have completed four or more courses toward their degree before seeking an internship, and proposals must be submitted in writing to program leadership at least 30 days before the start of the target term. Proposals are evaluated on a competitive basis. Only a limited number will be approved, and priority will be given to students who have completed the most degree-level courses and who submit proposals that demonstrate the best internship experience. Internships may be paid or unpaid. To complete the course, students must write a robust paper designed for peer-review. The adviser for the paper will be the faculty member teaching the course in conjunction with a mentor as part of the internship experience. Because students receive academic course credit for internships, they pay tuition levels equal to one graduate course.

AS.420.888. Capstone or Thesis Continuation.
Noncredit. This course is for students who completed 420.801 Independent Research Project or 420.805 Internship and Thesis but failed to finish an approved paper or thesis. Required for those who have completed all of their coursework and have taken the above course but have not yet completed their paper. Students must register for this course and pay its accompanying fee for every term until a final paper is approved.

AS.425.641. Greenhouse Gas Inventory, Accounting, and Reporting. 3 Credits.

AS.425 (Energy Policy and Climate)

AS.425.601. Principles and Applications of Energy Technology. 3 Credits.
The course examines the major energy technologies underlying energy supply and consumption, their applications, and their integration with the electric grid. Students will gain a solid understanding of science, economics, environmental impacts associated with the design and operation of different energy technologies on a stand-alone and integrated basis. The course coverage includes: an introduction to energy, heat, work, energy conversion and efficiency; solar, wind, hydro and other renewable electric generation technologies, fossil, and nuclear generation; renewable integration issues such as the role of energy storage to balance supply and demand. Energy security and climate change issues are considered throughout the course. Lower carbon transportation will be introduced, with a focus on hybrids and battery energy vehicles. The course will touch on some major policies impacting the development, deployment, and utilization of technologies.

AS.425.602. Science of Climate Change and its Impact. 3 Credits.
The course begins examining the basic processes of the climate system. The course, then, moves to the study of the changing climate. While natural changes will be studied, the emphasis will be on anthropogenic climate change. Various models for predicting future climate change will be presented, including the assumptions and uncertainties embedded in each model. The regional climate impacts and impacts on subsystems will be examined, including changes in rainfall patterns, loss of ice and changes in sea level. The possible ecological effects of these predicted changes will also be examined. Offered online and on twice per year.

AS.425.603. Climate Change Policy Analysis. 3 Credits.
After a study of the historical development of climate change policy, this course analyzes current policy options for mitigating and adapting to long-term climate change. The course will examine various approaches available in the U.S. for national-level policy, including regulatory and market-based approaches, particularly cap and trade and carbon taxation. Various models for designing a cap and trade system will be studied, including the European experience and regional programs in the United States. Special attention will be paid to methods for setting initial prices and accounting for discounting of future benefits. The course will focus primarily on national-level carbon management policies, but international agreements will also be included, as well as equity considerations on a global level.

AS.425.604. Energy & Climate Finance. 3 Credits.
This course introduces students to environmental markets and the policies that create them, focusing mainly on emissions trading systems to mitigate climate change. The course also provides an introduction to attributes of the financial sector through its analysis of markets for environmental commodities Students learn the economic theory behind market-based environmental policy instruments, such as tradable renewable energy credits, carbon offsets, and water rights in a semester of lectures featuring presentations from practitioners, including state and federal government, private companies subject to market-based emissions regulation, commodity brokers, and representatives from international institutions. Offered online on-site twice per year.

AS.425.605. Introduction to Energy Law & Policy. 3 Credits.
This course will provide an overview of the major laws and policies that shape and regulate the complex energy system the United States and, to a lesser degree, the world. The goal is to provide students with a framework for understanding the energy laws and policies of today and those likely to be important in coming years. The course will review laws and policies for all major types of energy, including fossil fuels, nuclear, and renewables, as well as issues related to extraction, conversion, distribution, use, and conservation. Laws and policies ranging from local level to state, federal, and international levels will be included. Laws and policies will be presented again in the context of profound and rate changes occurring in the energy system, climate change and other environmental issues, economics, national security, and population growth. The course will be largely empirical, but attention will be given to major theories. Most aspects of the course will be illustrated by reference to contemporary issues, such as the recently unveiled Clean Power Plan, court decisions, climate change negotiations, and changes in state policies and federal tax policies for renewables. Offered on-site at least once every two years.

AS.425.606. Social Science Research Methods for Energy & Environmental Policy. 3 Credits.
Many energy, climate, and environmental issues are inherently human problems, yet many natural scientists and policymakers attempt to conduct and review social science research without training or experience in the social sciences. This course is designed to teach students the proper protocol of social science methods like case studies, narratives, interviews, focus groups, ethnographies, oral histories, and mixed methods as they apply to energy and environmental issues and policy. Students will also do an in-depth exploration of survey design, validation, deployment, and data collection. Part of the course involves an investigation of examples for each methodology in the energy, climate, and environmental science and policy sphere. The other part of the course is largely hands-on, giving students the opportunity to practice collecting and/or working with qualitative and quantitative social science data within the different methodologies. Weaved throughout the course is a discussion regarding the ethical concerns of human subject research, informed consent, and the Institutional Review Board (IRB) process.
By the end of this course, students planning capstone or independent research in the energy, climate, or environmental sciences will have a working research plan that includes social science methodology or mixed methods to address their problem of practice. Prerequisites: must have taken at least one core course in either the EPC program or the ESP program. Prerequisites: must have taken at least one core course in either the EPC program (425.601, 425.602, 425.603, 425.604, 425.605) or the ESP program (420.601, 420.603, 420.604, 420.608, 420.611, 420.614).
Prerequisites: must have taken at least one core course in either the EPC program (425.601, 425.602, 425.603, 425.604, 425.605) or the ESP program (420.601, 420.603, 420.604, 420.608, 420.611, 420.614).

AS.425.615. Understanding Public Attitudes for the Communication of Climate and Energy Policy. 3 Credits.
Public attitudes influence the political feasibility of passing new legislation on climate change policy, and consumer decisions contribute to as much as 40% of national emissions. As a result, governmental, non-profit, and commercial sectors have become interested in low-cost, non-regulatory “soft policy” approaches based on social science to inform public decision-making and behavior change. Communication—whether in the form of information provision, participatory decision-making, or social marketing—is among the foremost of these strategies. This course aims to expose students to social science research and methodology on human attitudes, behaviors, and decision-making with respect to climate and energy policy so they can directly apply it in their professional organizations. This course will challenge students not only to think about the varied communication factors that influence human decision-making and behavior, but to use that information in designing and evaluating programs. Special attention is given to the application of behavioral economics to climate, energy, and other environmental issues, and students will learn the fundamentals of social science statistical analysis using SPSS software.Prerequisite: AS.420.301 – Quantitative Methods or Statistics

AS.425.617. Energy, Eutrophication, and Inundation in Coastal Louisiana. 3 Credits.
This course will evaluate the many compounding factors of wetlands loss and sea-level rise in coastal Louisiana, will assess the impact of wetlands and habitat loss on wildlife and bird populations in the coastal zone of Louisiana, and will examine the ongoing menace of eutrophication in Gulf of Mexico waters. A portion of the course will be spent analyzing flood control efforts in New Orleans and along the Mississippi River Delta, their advantages and disadvantages, and future risk in the context of global climate change. Vulnerability analysis, environmental impact, and mitigation strategies associated with energy infrastructure, pipelines, and pipeline canals connecting offshore oil and gas to south Louisiana will be considered and assessed. Further contemplation will be given to efforts by oil and gas companies to minimize environmental impact along the Louisiana coast. The impact of the Coastal Wetlands Planning and Restoration Act will be debated and other policy initiatives explored. Students will leave this field experience with a better understanding of the complex cultural, environmental and climate, economic, and political factors at play in southern Louisiana. Prerequisite: any core course in either ESP or EPC programs (AS.420.601, AS.420.603, AS.420.604, AS.420.608, AS.420.611, AS.420.614, AS.425.601, AS.425.602, AS.425.603, AS.425.604, AS.425.605)

AS.425.618. Energy, Policy and Environmental Impact in China. 3 Credits.
Climate change is a direct result of anthropogenic emissions over decades (since the beginnings of the Industrial Revolution). This most populated country (more than 1.3 billion) in the world has experienced considerable economic growth in the past 20 years, and as a result, some of the world’s largest local environmental impacts have been experienced. The impacts are sweeping, and only recently, the country is attempting to address the issues by monitoring, using replacement technologies and implementing nationwide policies (e.g., favoring electric vehicles and limiting car traffic in cities). This field trip will explore some of the impacted sites from environmental pollution and state-of-the-art research to improve energy technologies and policies to improve the situation in China.

AS.425.619. Renewable Energy and Climate Change Projects in California. 3 Credits.
<p>California has abundant natural resources and has long been the center of attention for renewable energy within the USA. The US Department of Energy indicates that California has just over 24% of its energy coming from renewable energy production, one of the highest for a large population state. Traditionally, California has also lead the nation in terms of proactive climate change and sustainability issues.<o:p></o:p></p><p>This field trip will explore very innovative and leading sustainability projects in San Francisco. We will also visit the solar labs in nearby University of California, Berkeley, followed by a visit to nearby energy projects (e.g. Tesla, Google). Part of the trip will include discussing renewable energy projects with city and state officials. <o:p></o:p></p>

AS.425.620. Climate Risk: Society and The Economy. 3 Credits.
This course introduces students to theory and analytics of risk assessment and risk management with respect to climate change, including scenario analysis, stress testing and corporate risk analysis practices. Physical climate risks to be covered include: 1) fire and extreme weather risk and their impact on insurability of assets and infrastructure; 2) heat, drought, food production and their impact on crop yields and population migration; and 3) sea-level rise and its impact on real-estate, corporate and municipal risks. Climate change transition risks to be covered include: 1) the impact of policy risks on individual sectors of the economy; 2) technology transition and the risk associated with stranded assets; and 3) corporate and sovereign liability risk and the role of climate risk disclosure. Students in this course will learn to analyze the impact of climate risk on corporations, cities, and infrastructure and to evaluate the cost and benefits of climate risk mitigation strategies. AS.425.603 is recommended but not required.

AS.425.622. Renewable Energy and Climate Change Projects in Europe. 3 Credits.
The course will highlight current and near-future renewable energy and climate change mitigation and adaptation projects in an on-ground learning experience with national stakeholders in Europe. The intensive field course will be divided roughly into two parts. First, the course will be held in Luxembourg and hosted by the Luxembourg Institute of Science and Technology where students will be presented with an overview of state-of-the-art tools that are used to study energy technologies and their application in urban, industrial, and natural contexts. Several day trips will include visits to nearby bio-plants, wind farms, and solar energy projects. The course will then move to adjacent Rotterdam, Netherlands, and will include additional daily trips to various innovative urban space and energy projects. The second part of the trip will journey to Hamburg, Copenhagen, and Stockholm where the class will stop to talk with subject matter experts in energy and sustainability along the way and to visit foremost wind energy sites. Throughout the trip students will be expected to connect theoretical concepts of renewable energy, climate change, and sustainability with practical applications and policy.

AS.425.623. Transportation Policy in a Carbon-constrained World. 3 Credits.
Transportation systems provide essential services for individuals, business, and every sector of the economy. However, transportation is a major expense, causes significant negative side effects, and is now the largest source of greenhouse gas emissions in the United States. This course examines the complex system-of-systems that is modern transportation as well as the many technologies and policies that can mitigate the negative effects of transportation while maintaining or improving transportation services. These include cleaner vehicles, lower emission fuels, and changes to travel demand. It also explores disruptive innovation in transportation, including the emerging roles of information technology and the potential transition to connected and automated vehicles. Estimates of impacts of these technologies and policies on energy use, infrastructure, emissions, and other metrics are presented and discussed. This course has a U.S. focus with a balance of technology and policy content and a strong interactive component. Course Prerequisite: AS.425.601 – Principles and Applications of Energy Technology.

AS.425.624. Wind Energy: Science, Technology and Policy. 3 Credits.
Topics include the assessment of wind resources, basic principles of wind turbines and power transmission, electric markets and wind power, technological and economic aspect of storage of intermittent wind power, legal issues at state and federal levels, international water issues, and environmental impact assessment processes for wind developments. Offered on-site at least once every two years. Prerequisite: 425.601 Principles and Applications of Energy Technology.

AS.425.625. Solar Energy:Science, Technology & Policy. 3 Credits.
This course focuses on the two primary solar technologies i the contemporary market: photovoltaic cells and concentrate solar power, with a focus on PV. The course will investigate techniques for increasing efficiency, expanding storage, and decreasing price. Solar energy for use as both distributed and grid-independent resources is considered. The course covers science and technologies, as well as the environmental impact on solar technologies. Additionally, the course examines the main structure considerations for solar technology development. Prerequisite: 425.601 Principles and Applications of Energy Technology.

AS.425.626. Climate Anthropology and Changing Communities. 3 Credits.
Coastal, arctic, and arid ecosystems are significantly affected by climate change. This course invites us to think about small rural communities that have been profoundly affected by climate change. By exploring multiple ethnographic case studies and applying multiple theoretical models, the course offers anthropological insights into how the people in these areas interact with their environment over their lives. While examining the inhabitants’ knowledge-based views of climate and local socioecological systems, students in this course will develop more robust, flexible models of anthropological analysis for climate change (in general) and for smaller ecosystems (in particular). By examining the impact of climate devastation on the local scale, the course contributes to a better understanding of how environmental changes impact people, traditions, economies, politics and health on the global scale, and help students develop new ideas for effective climate communication, community engagement, and the development of future climate and energy policy that addresses the needs of communities.

AS.425.628. Renewable Energy Project Development and Finance. 3 Credits.
This course examines the financial, legal and regulatory topics related to the development of renewable energy (RE) projects (wind, solar, geothermal, hydro etc.) in the US. The bulk of the course focuses on utility scale projects, with the latter section on smaller scale renewable distributed energy resources (DER). The course is divided into sections on finance, siting, basic technical features of the electric grid, and regulatory background. The finance section will provide fundamentals of corporate and project finance, then focus on the ownership and financing structures used for developing renewable energy projects. Basic financial terms and conditions such as power purchase agreements, engineering/ construction/ procurement contract, fuel supply arrangements, and operation and maintenance contracts will be reviewed. The project siting and development section will review models for feasibility studies, environmental assessment and permitting at state and Federal levels. The electrical grid section will discuss at a high level how the power system works, including basics of transmission and generation, with a focus on concepts useful for developing projects, including the transmission interconnection process. Multiple case studies will be used throughout the course to highlight successful models and approaches. At the end of the course the students will have critical skills to work on project development and finance components of RE projects in the US. Prerequisite: There are no prerequisites.

AS.425.630. Cities and Climate Change. 3 Credits.
This course examines cities as the primary centers of energy demand; as major sources of greenhouse gases; as places most vulnerable to climate change impacts; and as logical focal points for mitigation and adaptation solutions. Local level government climate policy and financing options are also examined, including alternative energy production, resilient water systems, green buildings, energy efficient transport and sustainable infrastructure generally, local level offsets, and urban-based Clean Development Mechanisms. Analytical methods are introduced to understand current approaches to decision-making. Offered online at least once every two years. Prerequisites: Climate Change Policy Analysis.

AS.425.634. Climate Change and Health. 3 Credits.
This course examines the potential impacts on human health from global climate change and the possible responses to and adaptations for these impacts. Topics include impacts on health of climate extremes, climate change and infectious diseases, health and climate refugees, national assessments of health impacts of climate change, monitoring the health effects of climate change, and public health policies for climate change. Prerequisite: Science of Climate Change and Its Impacts.

AS.425.635. Climate and Earth System Modeling. 3 Credits.
Provides a survey of the history, use, applications, and broader significance of climate and Earth system modeling. Students will gain an understanding of the process of model development; the evolution of model complexity and performance over time; and the usefulness and application of climate, Earth, and other associated models to various problems. In particular, the utility and role of models for mitigation and adaptation policy and planning will be explored. Participants will also engage with model data and code, although experience with coding and advanced statistics are unnecessary, and students from all backgrounds are welcome. The course will result in a deeper understanding of climate models and the crucial policy-relevant information they offer about future Earth system conditions. Prerequisite: 425.602 - Science of Climate Change and its Impacts or permission of instructor.

AS.425.636. Emerging Energy Technologies and Applications. 3 Credits.

This elective course builds on a number of ideas covered in the core Principles and Applications of Energy Technology course (425.601) - and as with the first course uses and integrates a broad range of ideas from science, engineering and economics. The main focus of the course will be to broaden and deepen the coverage of the how some of the emerging energy technologies work, that were either not covered or only lightly covered in the core course. Electricity generation or storage related topics include (1) Fuel cells and batteries, including hydrogen fuel cells, batteries with different lithium-ion chemistries, and flow batteries, including integration with solar and wind (2) ocean wave devices, with an emphasis on the energy in traveling ocean waves, and how some of this wave energy can be absorbed and converted to electricity, through ideas related to natural frequency and forced damped oscillations, (3) new approaches to carbon capture and sequestration (CCS), such as the proposed Allam cycle - which is a type of closed cycle combustion turbine (CT), where the use of super-critical carbon dioxide rather air as the working fluid facilitates CCS (4) nuclear energy, from small modular fission to fusion. The course will also look at some important applications of electricity, including light emitting diodes (LEDs). The 2014 Nobel prize for physics went to inventors of the first blue LEDs using high band-gap semi-conductors, like indium gallium nitride which has made their widespread use for high quality white light applications possible. LEDs - as will be explained - are similar to (the p-n junctions in) PV cells but with higher band gaps, and operated to run backwards using an electrical source, so that electrical power is converted to visible light with much higher efficiency than with traditional incandescent light bulbs. Prerequisite: 425.601 Principles and Applications of Energy Technology, equivalent experience, or permission of instructor. Prerequisite: 425.601 Principles and Applications of Energy Technology, equivalent experience, or permission of instructor.

AS.425.637. International Climate Change Policy. 3 Credits.

This course focuses on the development, analysis, and implementation of international policy frameworks and mechanisms for climate change mitigation and adaptation. It includes a review of the history of international responses to climate change at the multilateral and bilateral levels, including in depth examination of the agreements of the United Nations Framework Convention on Climate Change (UNFCCC) and the Conference of the Parties (COP) as well as important bilateral agreements. The course explores how international climate change policy is affected by the national priorities and capacities of countries, and how these circumstances shape the evolution of both climate change policy and related areas such as trade and energy. It is recommended, but not required, that students take AS.425.602 - Science of Climate Change and its Impacts and/or AS.425.603 - Climate Change Policy Analysis before taking this elective.

AS.425.638. Adaptation to Climate Change. 3 Credits.

Global climate change risks are increasingly complex and may ultimately affect virtually every facet of our economic, energy, community, and environmental systems. At the same time, policy and investment responses to climate resiliency needs are similarly complex, controversial, and high stakes. Perhaps no issue facing leaders of today and tomorrow is more cross- cutting in nature or in greater need of improved understanding and capability than climate change risk. This course will provide a comprehensive framework for understanding, assessing, and applying climate change risk, vulnerability, a hazard assessment for the development of risk reduction an adaptation response. In the process, it will examine the status, limitations, and strengths of current assessment and action planning approaches across varying sectors, scales, and impact areas. The course will also include a review of methods prioritizing actions and addressing feasibility, flexibility, and logistical needs as applied to specific facilities, such as military installations, as well broader communities and multistate regions. Individual and group learning exercises will be involved. Offered on-site at least once every two years.

AS.425.639. Energy Markets and Strategy from Europe to Asia. 3 Credits.

Europe, the Middle East & North Africa (MENA), and Asia are interdependent geoeconomic domains with interlinked energy markets. This course will provide an overview of the main topics that characterize the structure and fundamental dynamics of energy markets in these regions and how energy security and economic development strategies shape the fate of nations. Students will learn the historic, economic, political, structural, and operational aspects of the regions' energy industries, with a particular emphasis on the production and transportation of petroleum and natural gas. The course will also explore how economic development, energy and national security, environmental considerations, and technology evolution shape and disrupt these relationships. Students will learn how the strategies of nations, national and private energy companies, and the role of international and intergovernmental organizations, such as OPEC and the European Commission, interact to shape the future direction of energy markets and the planet. The course will familiarize students with publicly available sources of data on energy in these regions.

AS.425.644. Principles & Applications of Energy Technology II. 3 Credits.

This course builds on a number of ideas covered in the core EPT course, and as the first course uses and integrates a broad range of ideas from science, engineering, and economics. The course has two distinct but overlapping themes that will be often be covered in parallel. First, the course will broaden and deepen the coverage of the how some of the energy technologies discussed in the core course work, with a slight more formal discussion and use of ideas from mechanics and thermodynamics, including the role of entropy; a few newer potential technologies, such as fusion and ocean, will also be covered. Second, the course will extend the coverage of the economics and operation of energy markets to provide a deep understanding of how to value energy generation assets facing an uncertain future on both a stand-alone and integrate basis, and how these considerations play out in real electric markets, including the role of energy, capacity, and ancillary services. The course will include coverage of the potential role of energy storage and/or demand side management in integrating large-scale renewable energy into the grid from both an operational and economic perspective. Offered on-site at least once every two years.

AS.425.645. Global Energy Policy. 3 Credits.
Energy policy is about more than sheer market design. Policy agendas have become increasingly complex, adding sustainability and development to traditional energy security concerns. In response, a patchwork of institutional frameworks has emerged, including clubs (OPEC, IEA), treaties, the Energy Charter Treaty (ECT), agencies, the International Renewable Energy Agency or policy networks, and the Renewable Energy & Energy Efficiency Partnership. The course introduces students to the global dimensions of energy policy, discusses shifting agendas, and assesses the institutional spectrum of global energy governance. Offered online at least once every two years.

AS.425.646. US Offshore Energy: Policy, Science and Technology. 3 Credits.
Offshore energy is progressively becoming a significant part of the U.S. energy mix. Oil from offshore platforms now accounts for roughly one-third of the U.S. domestic production, and significant interest has emerged for developing renewable energy resources in the ocean and the Great Lakes. Large-scale offshore wind projects have been proposed along the East Coast, and there is also interest in developing wave energy off the West Coast and the Pacific islands. Ocean current and tidal energy are the other emerging sources. This course will take a multi-disciplinary approach to offshore energy analysis. We will discuss both renewable resources such as offshore wind, and conventional resources such as offshore oil and gas. Topics covered will include: resource assessment, state and federal regulations, economics of offshore energy, environmental impact and benefits, space-use conflicts, cultural/tribal issues, public perception, offshore energy technology, and energy infrastructure. We will also review case studies on the proposed Cape Wind project and the Deepwater Horizon oil spill. In addition, we will discuss the recently launched National Ocean Policy initiative and how it is influencing offshore energy regulation. Subject-matter experts from federal regulatory agencies will be invited as guest speakers. By the end of the course, students will understand policies and regulations governing offshore energy in the U.S. They will also be conversant with the economics of resource development, technological drivers for harnessing the resources, and the scientific advances in assessing and mitigating environmental impact from energy production in offshore areas. Offered onsite at least once every two years.

AS.425.647. Energy and Water Security in South Asia. 3 Credits.
<p>South Asia (India, Pakistan, Bangladesh, Afghanistan, Nepal, Sri Lanka, Bhutan and Maldives) is home to more than 1.7 billion people (nearly 25% of the global population). It is also a region of rapidly growing economies, rising energy consumption, and increasing environmental stress. Fossil fuels, particularly coal is the major source of electricity in the region, contributing to rising greenhouse gas emissions and worsening air quality. India in particular is promoting the use of indigenous coal to power its economic growth. At the household level, inefficient use of biomass for cooking and heating continues to be a major health and environmental hazard. Moreover, fresh water stress and pollution has reached alarming levels in the region with far reaching impacts on agriculture and human health. <o:p></o:p></p><p> South Asia is uniquely vulnerable to climate change impacts. On the one hand, receding Himalayan glaciers in Nepal, India, Pakistan and Bhutan are exacerbating water stress and threatening food security for more than a 1 billion people. And on the other hand, Bangladesh and Maldives are prone to sea level rise and coastal flooding from powerful tropical storms. <o:p></o:p></p><p> Creating a sustainable energy and freshwater pathway is intrinsically linked to innovative development approaches tailored to local and regional variabilities. In order to curb growing emissions, the region is promoting renewable energy sources such as solar, wind, and micro hydro power. However, the unmet demand for energy, particularly electricity remains so large in South Asia that fossil fuels are expected to be a major part of the future energy mix. Water stress is being managed through a mix of traditional and modern techniques. <o:p></o:p></p><p> Given the demographic size of the region and the pent-up energy demand, it can be argued that the success of global climate change initiatives (such as the 2015 Paris agreement) in large part is contingent on creating a low-carbon energy future in South Asia. The challenges are national and regional, but the implications are clearly global. <o:p></o:p></p><p> The course will provide a broad overview of the energy and freshwater challenges in South Asia. At the end of the course, students will be conversant with the current energy and water issues, future energy mix and water demand projections, and the technical and policy initiatives to balance growing energy demand with a low-carbon energy pathway and freshwater demands through ingenious initiatives. Students will also benefit from a greater understanding of the unique climate change vulnerabilities of the region and the mitigation initiatives to minimize impacts. <o:p></o:p></p>

AS.425.651. The Electric Grid: Technology and Policy. 3 Credits.
This course aims to introduce the students with an overview of electric power industry including the fundamentals of power system generation, transmission, and markets. Various power generation technologies and system network characteristics will be introduced. Key elements of power system operation such as unit commitment, economic dispatch, and optimal power flow will be discussed to provide the background for understanding how the power grid operates and to lay the foundation for understanding the environmental impact from power generation and system operation. An overview of grid planning will be provided. Students will also be exposed to power markets and complex relationship between market and system. Later, students will be exposed to the topics of US energy policy that particularly pertains to power industry. Relevant energy policies of certain countries on global setting for the electricity sector will also be discussed. The latest developments in power industry such as smart grid, microgrid, distributed energy resources and other topics will also be covered.

AS.425.652. Nuclear Energy: Technology, Policy, and Regulations. 3 Credits.
Nuclear energy is a potent energy source that is widely feared and misunderstood, yet continues to play an integral role in the global energy landscape today and in the future. This course will focus on the different forms and use of nuclear energy, the history of nuclear energy and regulation, the fundamentals of fission and fusion nuclear power, the radiological health applications, and the electromagnetic and other radiation in the environment. Students will also learn about federal and international policies and regulations that govern the civilian use of nuclear energy and implications for climate mitigation. Current events related to nuclear power at the international level will also be covered in the course. Prerequisite: AS.425.601 – Principles and Applications of Energy Technology or permission of instructor.
Prerequisite: AS.425.601 – Principles and Applications of Energy Technology or permission of instructor.

AS.425.689. Energy and Environmental Graduate Seminar. 3 Credits.
This graduate seminar course provides exposure to leading topics and vanguard research in environmental science, conservation science, energy and environmental law, and climate change science and adaptation, and offers discussion on practical applications of energy technology and energy/environmental policy. Students will evaluate how each study contributes to the advancement of theory, builds on previous research, and poses questions for future research. Students will also critically analyze professional presentation styles and technical content throughout the semester and will then synthesize best practices for professional communication in their own practice. This course does not meet the Environmental Science and Policy residency requirement.

AS.425.800. Research Design for Capstone Projects in Energy and Environmental Sciences. 3 Credits.
The Capstone Project enables students to apply and synthesize the material learned in other courses, develop expertise on a specific topic related to climate change science or policy, work closely with experts in the field of study, and improve professional writing and presentation skills. In the semester prior to conducting the project, students must identify a proper topic and mentor who is both familiar with the chosen topic and willing to guide and oversee the project. The mentor must be a faculty member teaching in the program, a supervisor from the student's place of work, or any expert with appropriate credentials. Formal proposals must be submitted at least two weeks prior to the start of the semester in which the project be completed. Prior to the enrollment in the course, the proposal must be reviewed and accepted by the course instructor.

AS.425.801. Independent Study. 3 Credits.

AS.425.888. Capstone Continuation Course.
Noncredit

AS.430 (Geographic Information Systems)

AS.430.600. Web GIS. 4 Credits.
Web GIS is an important foundation course in which students will become familiar with the current platforms available for delivering Web GIS and sharing geographic content over the web. Professionals in various industries often have to make information readily available and with current developments this has become easier than ever. The class offers a fundamental understanding of creating and designing web maps and web apps using various approaches and platforms. Capabilities such as editing, geoprocessing, geocoding, image analysis, 3D, mobile and real-time GIS in a web environment will be examined. Cloud-based and on premises infrastructure to deliver Web GIS will be utilized. Offered twice a year.

AS.430.601. Geographic Information Systems (GIS). 4 Credits.
In this introductory course, students become familiar with the concepts and gain the experience necessary to appreciate the utility of Geographic Information Systems in decision-making. Topics covered include the fundamentals of data structures, georeferencing, data classification, querying, cartography, and basic spatial data analysis. The course provides an overview of the capabilities of GIS software and applications of GIS. Class time is divided between lectures and GIS exercises that reinforce critical concepts. Students must complete a term project as part of the course. Offered every semester. Elective option for Govt. Analytics students.

AS.430.602. Remote Sensing: Systems and Applications. 4 Credits.
This course introduces remote sensing as an important technology to further our understanding of Earth's land, atmospheric, and oceanic processes. Students study remote sensing science, techniques, and satellite technologies to become familiar with the types of information that can be obtained and how this information can be applied in the natural and social sciences. Applications include assessment of land cover and land use, mapping and analysis of natural resources, weather and climate studies, pollution detection and monitoring, disaster monitoring, and identification of oceanographic features. Offered once a year in Spring.

AS.430.603. Geospatial Statistics. 4 Credits.
This course introduces theory and practical application of statistical methods in spatial analysis. Statistical fundamentals will be introduced to expose students to descriptive and inferential methods in spatial statistics. Geostatistical fundamentals will also be covered to introduce methods (in particular, kriging) for modelling spatial and spatio-temporal phenomena. This course will provide working knowledge of theory and practice in spatial statistics and Geostatistics, and will serve as a primer to more advanced courses in spatial statistics and machine learning. Theoretical knowledge will be supplemented with real-world use cases through in-class projects and assignments. Throughout the course, students will be exposed to open-source statistics libraries in R, no previous programming knowledge will be assumed. Offered twice a year.

AS.430.604. Spatial Analytics. 4 Credits.
This course introduces students to using various techniques for solving spatial problems. The course teaches a proven process one can utilize to address common inquiries related to understanding spatial relationships and patterns. Traditional analytical methods such as suitability analysis, network analysis, geostatistical analysis, spatial interpolation, etc. are examined, along with recent data science and analytics methodologies that help us extract knowledge and insights from data. Examples and assignments are drawn from many applications, such as business, urban planning, public safety, public health, transportation and natural sciences. Offered twice a year. Elective option for Govt. Analytics students.

AS.430.605. Development and Management of GIS Projects. 4 Credits.
This course introduces students to project, program, and portfolio management standards, which will guide them on how to successfully manage GIS projects. Students will learn how to apply core project management principles and guidelines to real project scenarios. The course will impart knowledge and skills for managing GIS projects throughout their entire lifecycle, while addressing technical, ethical, and institutional problems. Students will explore key issues in organizational management, including earned-value management, resource planning, and communications. During the course, students will learn how to determine the return on investment of a GIS project, create a comprehensive schedule and budget, and determine risk management, quality control, and contract management skills in support of your GIS project. Offered once a year.

AS.430.606. Programming in GIS. 4 Credits.
In this course students will learn how to automate workflows and develop tools using Python as a fundamental language for geospatial technology. The course will first cover introductory python basics, then move into geospatial concepts. It will teach students how to automate simple and complex GIS tasks and functionality, thus simplifying workflows and increasing efficiency. Focus will be placed on following proper coding techniques and patterns. The course will introduce students to Python, ArcPy, Python API, Pandas, Numpy, Jupyter, and Markdown to name a few. Offered twice a year. Prerequisites: 430.600 Web GIS
You must enroll in AS.430.600 prior to enrolling in AS.430.606.

AS.430.607. Spatial Databases and Data Interoperability. 4 Credits.
A well-designed database is necessary to construct relevant spatial data queries. In this course, students learn the different database designs for stand-alone databases and enterprise database systems. This course examines the requirements for a GIS Decision Support System by focusing on the design of the data schema, identifying the necessary data elements and their formats, and exploring data interoperability as a designed constituent of a database. Data management routines for maintaining the spatial integrity will also be introduced. Offered once a year. Prerequisites: 430.600 Web GIS.
You must enroll in AS.430.600 before you enroll in AS.430.607.

AS.430.608. GIS and Spatial Decision Support Systems. 4 Credits.
GIS can be a very effective tool to assist in making decisions for a wide range of applications at the local, regional, and global scale. This course will examine the use of GIS as a spatial decision support system for systematic policy analysis and scenario modeling. Case studies will be used from the areas of agriculture, conservation planning, homeland security, land use planning, natural disasters, transportation, urban planning, and water resources. Offered once. a year. Prerequisites: 430.601 Geographic Information Systems, 430.604 Spatial Analysis with GIS.
You must enroll in AS.430.601 AND AS.430.604 before enrolling in AS.430.608.

AS.430.609. Spatial Data Management: Quality and Control. 4 Credits.
Spatial data quality is a major concern for any GIS. This course examines the nature of errors in spatial data and various aspects of spatial data quality, including positional and thematic accuracy, resolution, precision, completeness and logical consistency. The impacts of errors on the reliability of GIS-based analysis are explored. Various strategies to improve the quality of spatial data are addressed, including the use of standards for spatial data (FGDC, OGC and ISO) and data management tools. Offered once a year. Prerequisite: 430.601 Geographic Information Systems,
You must enroll in AS.430.601 before you can enroll in AS.430.609.

AS.430.610. GIS for Infrastructure Management. 4 Credits.
This course will familiarize students with applications of Geographic Information Systems (GIS) for infrastructure management. Building, utilizing and sharing reliable asset information and integrating enterprise data will be emphasized, in order to help stakeholders make informed decisions and capitalize on efficiencies of using GIS to support various kinds of facilities and infrastructure. Students will have the opportunity to use GIS applications to do project work in support of facility operations, strategic planning, real estate management, architecture design and construction, sustainability, utilities, buildings and interior space management, drones mapping, among others. Samples will be drawn from large university enterprise with multiple campus locations yet applicable to cities and various other settings. Research and spatial analysis will be conducted using recently acquired GIS orthoimagery, LIDAR and planimetric data for the Johns Hopkins' own Homewood campus. Prerequisite: 430.601 Geographic Information Systems.
You must enroll in AS.430.601 before you can enroll in AS.430.610.

AS.430.611. Geospatial Ontologies and Semantics. 4 Credits.
The development of very large databases requires innovative approaches to data handling to efficiently communicate information meaning to users. The Geospatial Semantics and Ontologies course examines the foundations, design, and use of data structured as linked data, geospatial ontology, knowledge graphs, and related technology. Linked data and knowledge graphs are based on the node-edge-node triple data model to form graphs that can represent information networks. Triple graphs formatted as Resource Description Framework (RDF) can address challenges associated with information management such as inconsistencies within GIS applications, data associations within related enterprises, and information exchange over the Internet. The course begins with some general approaches to semantics and ontology, and basics of information interchange on the Internet. Linked Data in the form of Extensible Markup Language (XML), its extension Geography Markup Language (GML), and other standards for formal semantics such as Well Known Text (WKT) for specifying geographic coordinate geometries, SPARQL and GeoSPARQL query language, and Web Ontology Language (OWL) for automated logical reasoning and data inference are discussed. Subsequent lessons examine semantic system architecture, ontology design, and linked data mapping. No programming is required, but some required technical literacies, such as Java Script Object Notation (JSON) and Scalable Vector Graphics (SVG), are reviewed. Students complete a project in the last few weeks of the semester. The introductory skills offered in this course build a foundation for advanced geospatial Linked Data and Knowledge Graph applications in the future. Offered once a year. Prerequisite: 430.600 Web GIS
You must enroll in AS.430.601 before you can enroll in AS.430.611.

AS.430.612. Cartographic Design and Visualization. 4 Credits.
The Cartographic Design and Visualization course focuses on the fundamentals of cartography, spatial statistics, thematic mapping techniques, 3D mapping, and web based mapping. Students will gain an inter-disciplinary understanding of cartographic representation and visualization with hands on applications using cutting edge GIS and graphic design software to create purpose tailored maps. Upon successful completion of this course, students will be able to interpret and appropriately communicate spatial data; will have developed a personalized cartographic style; will have created a professional GIS portfolio for current/potential employers; and most importantly will have developed a keen appreciation for maps and spatial awareness!Offered once a year. Prerequisite: 430.601 Geographic Information Systems.
You must enroll in AS.430.601 before you can enroll in AS.430.612.

AS.430.613. Advanced Topics in Remote Sensing. 4 Credits.
This course explores the various remote sensing platforms, collection systems, processing methods, and classification approaches to remotely sensed data. Course content includes the Electromagnetic Spectrum, Lidar, Interferometric SAR, Sonar, Unmanned Autonomous Vehicles (drone technology), 2D vs. 3D modeling, volumetric analysis, ecological research with remote sensing and applications of technology and datasets in GIS models. Offered once a year. Prerequisite: 430.602 Remote Sensing: Systems and Applications.
You must enroll in AS.430.601 AND AS.430.602 before you can enroll in AS.430.612.

AS.430.615. Big Data Analytics: Tools and Techniques. 4 Credits.
The explosion of data collection methods from a vast array of data sources in volumes previously unimaginable has tested the limits of traditional technology, which are not able to scale to the requirements of massive data. Big Data is the field of data studies where the data is identified by very large volumes, high velocity in data generation, and data format variety. This course explores Big Data technologies while utilizing cloud infrastructures. We will discuss the characteristics and architectural challenges surrounding Big Data, and explore geo-visualization techniques of data processed using Big Data Analytics. Students will work in a cloud computing environment to build Hadoop clusters, NoSQL databases, and work with other open source technologies to process data stores like Census data, and twitter feeds. Offered twice a year. Prerequisites: 430.606 Programming in GIS. Python programming experience is highly recommended.
You must enroll in AS.430.600 and AS.430.606 before you can enroll in AS.430.615.

AS.430.617. Census Data Mining: Visualization and Analytics. 4 Credits.
Census data is the most often used data in geospatial studies. Census data provide information on the demographic composition of households all the way through state and national population trends. Census data also serve the data layers that form the basis of most mapping applications. In this course, students will learn how to work with Census data in GIS by understanding the vast amounts of data collected in support of the decadal Census, how to discover and read the various tables that associate with the raw Census data, and how to create custom data layers for demographic models in economics, housing, and population studies. Offered once a year. Prerequisite: 430.601 Geographic Information Systems, or permission of the instructor.
You must enroll in AS.430.601 before you can enroll in AS.430.617.

AS.430.618. Advanced Python Scripting for GIS. 4 Credits.
This course focuses on advanced uses of Python as a scripting tool to automate workflows in GIS and create customized applications. This includes the development of script tools, utilizing advanced ArcPy modules, working with third-party modules, implementing Python geoprocessing services, customizing GIS applications, and more advanced Python functionality. Offered once a year. Prerequisites: 430.606 Programming in GIS.
You must enroll in AS.430.606 before you can enroll in AS.430.618.

AS.430.619. Web Application Development. 4 Credits.
This course is designed to provide students with experience in web programming and application development. It focuses on uses of Web APIs for developing rich and interactive web mapping applications. HTML, CSS and several popular JavaScript frameworks, such as Dojo, JQuery and AngularJS, will be covered. Interchange languages (JSON, XML) and responsive design will also be explored. Widgets will be examined to quickly develop solutions, and emphasis will be placed on tasks which provide further functionality. Conceptual and technical documentation, and samples, will be greatly utilized. The course will facilitate heavy engagement with the large and growing community of Web API developers. Offered once a year. Prerequisite: 430.600 Web GIS

AS.430.621. GIS for Emergency Management. 4 Credits.
Geographic Information Systems (GIS) have become an integral part of understanding the natural hazards in our world and how emergency management agencies respond to events and mitigate the impact of disasters. Furthermore, the advent of Web GIS has helped agencies overcome many challenges previously associated with GIS in Emergency Management. This course is an opportunity to learn about the use of GIS in studying natural hazards and apply cutting edge GIS technology to help emergency management agencies in the field. In today's device-driven world, maps need to work on mobile devices so there will be an emphasis on enabling GIS in the field. You will use Web GIS to deploy maps that assist agencies with their incident command functions: Planning, Operations, Logistics, Command, and Public Information. While the industry focus will be on Emergency Management, the knowledge, skills and abilities you develop will be widely applicable in both public and private sector industries.Offered once a year. Prerequisite: 430.601 Geographic Information Systems or permission of the instructor.

AS.430.623. Geo Apps. 4 Credits.
The Geo Apps course is designed to reflect current developments in the GIS industry. The course will teach you to extend your reach beyond common desktop GIS workflows, allowing you to present information and tools to a broader audience. You will learn how to create information models for field and crowdsource data collection apps, best practices for publishing geospatial information and configuring a range of web and native applications, and how to create meaningful information products that match specific user needs. You will work with different types of 2D and 3D data in desktop, web, and mobile geo apps to simulate how GIS is being used in modern organizations. Offered once a year. Prerequisite: 430.601 Geographic Information Systems, or permission of the instructor.

AS.430.625. System Architecture for Enterprise GIS. 4 Credits.
This is a project-based course, which allows students to build an Enterprise GIS implementation. Various enterprise architecture components, such as portals, servers, data stores, web adaptors, load balancers, enterprise databases and big data stores, real time servers, geoanalytics servers, etc. will be examined and implemented in a deployment scenario. Students will first design the enterprise architecture, then implement it. Students will have multiple Amazon EC2 instances configuration available to them at least for part of the semester, in order to practice setting up this enterprise implementation. Topics such as high availability and disaster recovery, enterprise authentication, and administration through scripting, will be applied. Offered once a year. Prerequisites: 430.600 Web GIS.

AS.430.627. Artificial Intelligence and Machine Learning in Geospatial Technology. 4 Credits.
The transformational impact of artificial intelligence and machine learning in geospatial data science is profound. This course presents a hands-on approach of applying automated modeling and predictive analytics to solve problems. Smart capabilities are powered by machine learning and GeoAI through the use of correlations of pattern detection to build predictive models and classify outcomes for data never seen before. Use cases from various sectors focusing on prediction and optimization, finding patterns and correlations, advanced object detection and automatic feature extraction, are examined. Offered once a year. Prerequisites: 430.606 Programming in GIS. Python programming experience is required.

AS.430.629. Drones in Geospatial Decision Making. 4 Credits.
This compressed format field course will explore current and future techniques of close-range remote sensing utilizing unmanned aerial vehicles (UAVs or drones) for environmental monitoring, urban cybersensing, and infrastructure assessment related to emergency response, leading to FAA Remote Pilot Certification to operate UAVs for commercial, professional, and research purposes. The course will focus on four basic objectives: (1) demonstrating knowledge and operational skills to successfully execute data acquisition using a variety of UAV remote sensing collection devices; (2) applying different methods of data acquisition and processing to identify, cross-validate and interpret data collected from UAV sensors; (3) discussing existing and emerging trends of UAV applications in various academic and professional situations, and (4) synthesizing and extrapolating data from these novel collection techniques to solve real-world problems. Students will act as flight crewmembers and scientific crew on numerous daily missions during the field portion of the course. Prerequisite: 430.600 Web GIS, or 420.603 Environmental Applications of GIS, or introductory GIS course.

AS.430.630. Special Topics in Land Air Sea Robotics Field Operations. 4 Credits.
This field course will teach participants to design experiments and collect data by employing all modes of Land Air Sea Robotics (LASR) for environmental monitoring and assessment. Students will act as remotely located LASR crewmembers on numerous daily missions during the field portion of the course.Prerequisites: None. Participants who have completed JHU AAP 430.629 Drones in Geospatial Decision Making will be able to act as pilots in command of aircraft. Everyone have the opportunity to fly equipment.

AS.430.631. Spatial Algorithms and Data Structures. 4 Credits.
This course will teach students about the fundamental data structures and algorithms behind GIS and computer science. These data structures and algorithms are what all complex GIS systems are built upon. The topics presented are a mixture of computer science data structures and computational geometry topics. This course will stress code optimization and runtime analysis of code, teaching students how to program efficiently – just because a set of code works, it does not mean it is optimal. The course will use Python to cover such fundamental concepts and help students become better GIS Professionals. Offered once a year.

AS.430.633. Advanced Spatio-Temporal Statistics. 4 Credits.
This course will examine the theory and practical application of statistical methods. Students will examine advanced concepts in descriptive and predictive statistical approaches to spatial, temporal and spatio-temporal data. Students will be exposed to time-series analysis in GIS and its applications. The course will include labs to be completed in Python and R, in addition to theoretical work. Students will work on a comprehensive final project. Offered once a year. Prerequisites: 430.601 Geographic Information Systems

AS.430.635. Urban Analytics. 4 Credits.
This course will leverage geospatial technology to analyze urban spatial problems relevant to contemporary urban planning and design practices. It provides students the opportunity to integrate spatial information and enhance decision making when working with urban environments. Focus is on understanding the business requirements for urban designs, along with use of spatial patterns and big data in smart city planning. Emphasis will also be placed on digital transformation of urban planning to encourage collaboration with community stakeholders and drive efforts towards sustainable cities. Application problems addressed will be within areas of urban planning and design, business decision-making, social, and political and environmental issues, among others. Prerequisites: 430.600 Web GIS
You must enroll in AS.430.600 prior to enrolling in AS.430.635.

AS.430.637. Statistical Computation for Geospatial Sciences. 4 Credits.
This course introduces the fundamentals of computational statistics in spatial sciences, focusing on computational spatial statistics' essentials using the R programming language. The methodological focus of this course is on applications of Bayesian analysis to solve spatial problems. Introductory ideas on working with the R data frame and spatial data representation are covered. The course's thematic focus is on integrating R and GIS for solving problems that pertain to critical zone geoscience. Students will complete projects on computational spatial statistics applications to problems at the intersection of Earth systems and human-driven systems. Offered once a year. Prerequisites: 430.604 Spatial Analytics
You must enroll in AS.430.604 before you can enroll in AS.430.637.

AS.430.800. Capstone for Geographic Information Systems. 4 Credits.
The capstone is the culmination of the instruction and training a student receives in the MS in GIS program. In this course, the student selects a mentor, identifies a topic of interest, acquires the relevant data required for the study, develops a data model and/or analysis method, devises the visualization of the data as part of the data interpretation, and summarizes the study in a final report. Students are encouraged to make their presentations at a GIS conference or publish the results of their study in a peer-reviewed GIS publication. Students are responsible for selecting a mentor who may be a JHU faculty member, a qualified and appropriate person from the student's place of work, or any expert with appropriate credentials. Offered every semester. Prerequisite: core course requirements for MS in GIS, at least eight courses taken in the program.

AS.430.805. Independent Research Project for Geographic Information Systems. 4 Credits.
The independent research project enables students to apply material learned in their courses, extend expertise on a specific GIS topic, work closely with an expert in the field, and improve their professional geospatial technology skills. Students may choose to do this course in lieu of AS.430.800 Capstone for Geographic Information Systems, and must follow same requirements as the Capstone. In this course, the student selects a mentor, identifies a topic of interest, acquires the relevant data required for the study, develops a data model and/or analysis method, devises the visualization of the data as part of the data interpretation, and summarizes the study in a final report.

AS.440 (Applied Economics)

AS.440.011. Forecasting in Organizations.
This course is required to earn the International Institute of Forecasters Certificate in Forecasting Practice, and introduces students to different types of forecasts including those used in government and the private sector. This is a non-credit mini-course, equivalent to a single class meeting, but with more homework. It is offered during Spring Break, as part of the Spring schedule. Prerequisites: 440.614 Macroeconometrics or 440.618 Microeconometrics. Corequisite: 440.615 Macroeconomic Forecasting.
You must enroll in AS.440.615 AND one of the following course: AS.440.614 OR AS.440.618 prior to taking AS.410.011

AS.440.021. Practicum in Applied Economics.
Internships or external projects applicable to the program curriculum qualify for the course. Permission of the student's advisor and of the Program Director is required before adding this non-credit course.

AS.440.304. Math Methods for Economists. 3 Credits.
This is a three undergraduate credit, full-length course at half tuition, required of those students who have had only a single course in Calculus. It covers those parts of Integral Calculus, Multivariable Calculus, Optimization Theory, and Linear Algebra, which are necessary to pursue economics. For those required to take Math Methods, the course is treated academically as part of the Core. Thus, all rules applying to the Core apply to Math Methods. Prerequisite: A course in Calculus.

AS.440.601. Microeconomic Theory. 3 Credits.
Corequisite: AS.440.304, Math Methods for EconomistsThis course offers a systematic presentation of consumer theory, theory of the firm, and market equilibrium. Topics covered include constrained optimization, preferences and utility, exchange, production, pricing, market structures, and welfare economics.

AS.440.602. Macroeconomic Theory. 3 Credits.
Corequisite: AS.440.304, Math Methods for EconomistsThis course provides a systematic overview of the theory of aggregate output and employment, the rate of interest, and price level determination. Coverage includes the theories of consumption and investment, the demand and supply of money, inflation, unemployment, and economic growth. These topics are discussed in the context of contemporary empirical work on aggregative relationships.

AS.440.605. Statistics. 3 Credits.
This course provides a general survey of statistical methodology. Topics include descriptive statistics, probability theory, sampling distributions, interval estimation, hypothesis testing, and Analysis of Variance. It is also designed to provide the requisite background for 440.606 Econometrics. Prerequisite: A course in Calculus.

AS.440.606. Econometrics. 3 Credits.
This course focuses on the application of statistical methods to the testing and estimation of economic relationships. After developing the theoretical constructs of classical least squares, common problems encountered when applying this approach, including serial correlation, heteroscedasticity, and multicollinearity, are discussed. Techniques for dealing with these problems are then examined. Models with lagged variables are considered, as is estimation with instrumental variables and two-stage least squares. Prerequisites: 440.605 Statistics.
You must take AS.440.605 Statistics, prior to enrolling in AS.440.606 unless waived.

AS.440.614. Macroeconometrics [Time-Series Analysis]. 3 Credits.
This course focuses on the practical uses of time-series econometrics in a macroeconomic context. The topics covered include autoregressive-moving average processes, non-stationary time series models, unit root tests, vector autoregression models, and cointegration analysis.Prerequisites: 440.602 Macroeconomic Theory and Policy; 440.606 Econometrics.
You must take AS.440.602 AND AS.440.606 prior to enrolling in AS.440.614.

AS.440.615. Macroeconomic Forecasting [Time Series Analysis]. 3 Credits.
This course examines econometric approaches to forecasting macroeconomic activity. The approaches covered span single equation time series to large, complex, simultaneous equations systems. Different measures to assess the forecasting accuracy of these approaches are addressed. A discussion of these approaches and their relevance for policy recommendations is also covered.Prerequisites: 440.602 Macroeconomic Theory and Policy; 440.606 Econometrics.
You must take AS.440.602 AND AS.440.606 prior to enrolling in AS.440.615

AS.440.616. Bayesian Econometrics. 3 Credits.
The main goal of this course is to provide the students the alternative viewpoint of the Bayesian approach vis-à-vis the classical econometric approach based on the frequentist perspective. The course will present the basic principles of Bayesian inference, Bayesian Analysis of the linear regression model and extensions of the regression model, and the numerical methods used for Bayesian implementation. Modern Bayesian econometrics relies heavily on numerical simulation methods and computational algorithms. With the advancement of computing power and the advent of new simulation methods, simulation based Bayesian methods have become increasingly popular in practice with a large and growing number of applications. A significant part of the course will be devoted to explaining and demonstrating how numerical Bayesian methods, particularly, Markov Chain Monte Carlo (MCMC) methods, such as the Gibbs sampling and the Metropolis-Hastings algorithm, can be applied to estimate various interesting models in economics and finance. Students will develop practical experience with posterior simulation through hands on computer exercises involving computer programming. Prerequisites: 440.601 Microeconomic Theory, 440.606 Econometrics.

AS.440.617. Financial Econometrics [Time-Series Analysis]. 3 Credits.
[formerly 440.647] This course introduces students to the methods most commonly used in empirical finance. Key models and methods are ARCH, GMM, Regime-Switching Models, test of CAPM (Capital Asset Pricing Model), term structure models, and volatility models (implied, stochastic volatility). Students will also learn aspects of time series econometrics for both stationary and non-stationary variables at different time frequencies, with emphasis on financial variables.Prerequisites: 440.601 Microeconomic Theory and Policy; 440.606 Econometrics; 440.614 Macroeconometrics is recommended..
You must take AS.440.601 AND AS.440.606 prior to enrolling in AS.440.617; 440.614 Macroeconometrics is recommended..

AS.440.618. Microeconometrics [Cross-Section and Panel Analysis]. 3 Credits.
[formerly 440.648] This course covers a number of advanced techniques frequently encountered in applied microeconometric analysis. Topics include generalized method of moments estimation, nonlinear regression, estimation with panel data, systems of regression equations and simultaneous equation models, maximum likelihood estimation and likelihood ratio tests, and limited dependent variable analysis (i.e. Logit, Probit, Tobit, etc.).Prerequisites: 440.601 Microeconomic Theory and Policy; 440.606 Econometrics.

AS.440.622. Cost-Benefit Analysis. 3 Credits.
[formerly 440.632] The objective of this course is to develop and apply an analytical framework for evaluating projects with an emphasis on publicly funded projects. Coverage includes the evaluation of benefits and costs over time, including in the presence of uncertainty, in the absence of market prices, and when income distribution objectives need to be incorporated into a project's evaluation.Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 prior to enrolling in AS.440.622.

AS.440.624. Computable General Equilibrium Modeling. 3 Credits.
This course will provide an understanding of how to independently develop, modify, run and interpret Computable General Equilibrium (CGE) models. CGE models are widely used in the analysis of International Trade, Taxation, Environmental Policy, and other subjects. The specific objectives of this course are as follows: Students will (1) gain an understanding of the underlying economic theory behind CGE modeling; (2) learn how to gather data sources from publicly available information to build CGE models; (3) gain an understanding of the software General Algebraic Modeling Software (GAMS) to run the models; (4) learn how use and modify existing CGE programs for research purposes; (5) be able to write simple CGE programs in GAMS; (6) be able to analyze public policy with CGE models; (7) how to interpret results from CGE models; (8) understand possible extensions of CGE models for potential future research purposes. Analytical skills developed through this class will assist you in building your careers as researchers, public managers, and policy analysts.Prerequisites: 440.601 Microeconomic Theory, 440.602 Macroeconomics Theory. Corequisite: 440.606 Econometrics.
You must take AS.440.601 AND AS.440.602 prior to enrolling in AS.440.624.

AS.440.625. Machine Learning in Statistics. 3 Credits.
This course focuses on the use of machine learning methods for in-sample and out-of-sample prediction. The topics include regression, classification, random trees (forests, boosting, and pruning), regularization, Bayesian estimation, neural networks, support vector machines, model selection and ensemble learning. Prerequisite 440.606 Econometrics.

AS.440.629. Survey Research Methods. 3 Credits.
This course introduces students to the theory and practice of conducting surveys. Survey methods combines both social science—economics, sociology, and psychology—and quantitative methods—mathematics, statistics, and computer science—to develop a theory of how surveys can best be used to measure important aspects of the human condition. Key topics include sample design, weighting, data collection modes, administrative operations, questionnaire design, nonresponse, and estimation in surveys. Prerequisites: 440.601 Microeconomic Theory, 440.605 Statistics. Corequisite: 440.606 Econometrics.
You must take AS.440.601 AND AS.440.605 prior to enrolling in AS.440.629

AS.440.630. Monetary Economics. 3 Credits.
<p> This course is designed as a survey of the basic theories in monetary economics for masters level students. The main objective of the course is to help students understand the core aspects of monetary economics: how monetary phenomena and policies are determined, and how they interact with the rest of the macro economy. Several key theoretical frameworks will be constructed, and various monetary economics phenomena, including monetary policy actions, will be analyzed within such frameworks. <o:p></o:p></p><p>Among the topics to be covered include: neutrality and super-neutrality of money, money demand and money supply, consumption CAPM and equity premium puzzle, inflation and the optimal inflation rate, public finance and inflation, (new Keynesian) Phillips curve, monetary policy transmission mechanisms, the term structure of interest rates, strategy of monetary policy and optimal monetary policy, the time inconsistency problem in monetary policy, monetary policy targets and rules, monetary policy at ZLB, and non-conventional monetary policies. <o:p></o:p></p><p>Prerequisites: 440.602 Macroeconomic Theory and Policy; 440.606 Econometrics.<o:p></o:p></p>
You must take AS.440.601 AND AS.440.602 AND AS.440.606 prior to enrolling in AS.440.630

AS.440.631. Finance and the Macroeconomy. 3 Credits.
[formerly 440.621] This course explores the role of the financial sector in the overall macroeconomy. It begins by reviewing various financial instruments and markets, with a focus on their economic function. The course then examines the challenges to monetary and fiscal policy that arise because of macro-financial linkages. Further, a number of analytical tools for assessing financial stability and vulnerabilities to macro shocks are presented. Several case studies are used to illustrate real-world situations facing policymakers. Prerequisites: 440.601 Microeconomic Theory and Policy; 440.602 Macroeconomic Theory and Policy. Corequisites: 440.606 Econometrics; 440.640 Financial Economics, or equivalent.
You must take AS.440.601 AND AS.440.602 prior to enrolling in AS.440.631

AS.440.632. Topics in Macroeconomics and Finance. 3 Credits.
[This course aims to develop a better understanding of the linkages between the banking system and the broader macroeconomy. Particular attention will be paid to the role of banks and the banking system in propagating and perpetuating the recent financial crisis. Specific topics include the functioning of the banking system in a basic general equilibrium macro model, the Diamond-Dybvig model of bank runs; an empirical look into the economic cost of banking crises, central bank intervention in the face of a banking failure, the link between sovereign debt and the banking system, and the European debt crisis and the response of the ECB. Prerequisites: 440.601 Microeconomic Theory, 440.602 Macroeconomic Theory. Corequisites: 440.606 Econometrics; 440.640 Financial Economics
You must take AS.440.601, AS.440.602 AND AS.440.606 prior to enrolling in AS.440.632

AS.440.634. Economic Growth. 3 Credits.
[formerly 440.624] Examines contemporary theories of economic growth and empirically applies them to panels of present day developing and industrialized countries, and to the historical evolution of individual countries and groups of countries. Topics include neoclassical growth models, population and growth, the economics of ideas, endogenous growth models, aid and growth, and policy and growth. Prerequisites: 440.601 Microeconomic Theory and Policy; 440.602 Macroeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 and AS.440.602 prior to enrolling in AS.440.634

AS.440.639. International Finance (Open Economy Macro). 3 Credits.
[formerly 440.619] This course provides an overview of open economy macroeconomics, and international financial markets and policies. The focus is on exchange rate determination, the importance of the balance of payments for both the domestic economy and the economies of other countries, international capital flows, the impact of internal debt on the balance of trade, and the interaction and potential conflicts between domestic and international economic policy objectives.Prerequisite: 440.601 Microeconomic Theory and 440.602 Macroeconomic Theory. Corequisite: 440.606 Econometrics.
You must take AS.440.601 AND AS.440.602 prior to enrolling in AS.440.639

AS.440.640. Financial Economics. 3 Credits.
[formerly 440.642] Finance treats the transfer of resources across time and the transfer of risk among economic entities. The aim of this course is to develop the microeconomic theory relevant to these types of transactions. A set of underlying economic principles is applied to the determination of the value of basic financial instruments such as stocks and bonds, as well as to more complicated derivative securities, such as futures and options. Valuation concepts, in turn, allow for the analysis of various issues of interest to policy makers as well as portfolio managers and investors, such as the term structure of interest rates, portfolio theory, the capital structure of the firm, and risk management.Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 prior to enrolling in AS.440.640

AS.440.641. Financial Intermediation & Financial Markets. 3 Credits.
[formerly 440.620] Examines why financial intermediaries exist, how they co-exist with financial markets, and how they have been forced to switch from accepting deposits and making loans to using derivatives to manage risk. Shows how risk management differs between bank-based and market-based economies. Analyzes the economic consequences of financial market imperfections, especially for credit market equilibrium and rationing. theories of bank runs and systemic risk; and how different financial systems and governments can cope with financial crises, financial fragility, and credit market frictions.Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 and AS.440.602 prior to enrolling in AS.440.641

AS.440.643. Economics of Investments and Financial Management. 3 Credits.
This course develops a deeper understanding of financial markets in the context of portfolio theory. In addition to understanding how financial markets operate and relate to the broader economy, students will develop skills to analyze investment decisions and manage investment portfolios. Students will learn the efficient market hypothesis (EMH), criticisms and implications of EMH for investment strategies, modern portfolio theory and practice, and tools for evaluating performance. Throughout the course, several financial models will be analyzed especially as they relate to real-world asset allocation decisions. Prerequisite: 440.601 Microeconomic Theory and 440.640 Financial Economic. Corequisites: 440.606 Econometrics.
You must take AS.440.601 and 440.640 Financial Economic prior to enrolling in AS.440.643

AS.440.645. Behavioral Economics & Finance. 3 Credits.
This course treats key topics in behavioral economics and finance theoretically and empirically. We analyze the efficient markets hypothesis and its potential weaknesses, the role of noise trading, consumer choice anomalies and perception biases, and serial correlation in stock prices, as well as other topics in behavioral economics and finance. Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must first complete AS.440.601 prior to enrolling in AS.440.645

AS.440.646. Economics of Derivatives. 3 Credits.
This course provides students a thorough introduction to the theoretical and practical aspects of forwards, futures, options, and swaps. Derivatives are important tools in financial markets, and students will learn how to price, value, and use them from a practical perspective. This course is particularly important for students seeking to work in finance. Topics covered include no arbitrage-based pricing, the pricing of forwards and futures, interest rate products and commodities, valuation based on market prices, and option pricing and strategies. Prerequisite: 440.601 Microeconomic Theory. Corequisites: 440.606 Econometrics and 440.640 Financial Economics.
Prerequisite(s): You must take AS.440.606 and AS.440.640 prior to or simultaneously with AS.440.646.
You must take AS.440.601 prior to enrolling in AS.440.646

AS.440.650. Environmental & Resource Economics. 3 Credits.
[formerly 440.640] Beginning with the concept of sustainability, the course develops a framework for an economic assessment of environmental problems including the notion of market failure, valuation of environmental resources, and policy design issues associated with using alternative economic incentives and instruments. The second part of the course examines principles of the economically efficient management of non-depletable and depletable (e.g., fossil fuels, natural ecosystems) resources. Various applied settings are used to demonstrate the principles developed in the course.Prerequisites: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 prior to enrolling in AS.440.650

AS.440.653. Economics of the Labor Market. 3 Credits.
This course develops the theory and empirics of labor markets by focusing on several leading institutional structures of both labor supply and labor demand. This theory is then applied to issues such as wage determination, wage rigidity, training and retraining programs, and the skills and wage distribution, as well as government policies that correct inefficiencies in labor markets. Prerequisites 440.601 Microeconomic Theory and 440.602 Macroeconomic Theory. Corequisite: 440.606 Econometrics.
You must take AS.440.601 and AS.440.602 prior to enrolling in AS.440.653

AS.440.656. Political Economy. 3 Credits.
[formerly 440.616] This course examines how rational choice methodology (including Game Theory and Neoclassical Economics) can be applied to analyze issues related to political economy. Topics include the origin of state, economic origins of political regimes, different models of voting and their outcomes and different aspects of federalism. This course also explores how political economy influences economic development and public debt. Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 Microeconomic Theory prior to enrolling in AS.440.656 Political Economy.

AS.440.658. Industrial Organization. 3 Credits.
[formerly 440.638] In this course, the focus is on the study of markets and the laws and regulations used to ameliorate some of their imperfections, especially the problems caused by market structure and market power. Many economic models used to explain how markets work and what is necessary for market power to exist are investigated. Subsequently, the course explores how regulators and private litigants try to eliminate or control market power, particularly through antitrust law, with respect to price fixing, mergers, and market dominance. Regulatory issues pertaining to such industries as telecommunication, transportation, electrical power, health, safety, and the environment are covered.Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 prior to enrolling in AS.440.658

AS.440.659. Law and Economics. 3 Credits.
[formerly 440.639] Techniques of microeconomic theory and game theory are applied to analyze the effects of various laws on individual decisions and on the allocation of resources. Subject areas covered include the theory of public choice, the economics of property rights, contract law, and tort law. Topics include the efficient breach of contract, the determination of damages, the economics of patents and copyrights, optimal liability rules for environmental and other torts, economics of family law, bankruptcy law, zoning law, antitrust law, and the legal process.Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 prior to enrolling in AS.440.659

AS.440.661. Public Economics. 3 Credits.
This course analyzes the determinants and properties of government expenditures and social regulation. The first part of the course is generic: It addresses efficiency and equity in income redistribution; the provision of public goods; coping with externalities, addiction and risk; and voting and bureaucracy, and taxation. The second part of the course is particular: It examines health policy, education policy, statutory pensions, and welfare policy in a comparative international context.Prerequisites: 440.601 Microeconomic Theory; 440.602 Macroeconomic Theory. Corequisite:; 440.606 Econometrics.
You must take AS.440.601 AND AS.440.602 prior to taking AS.440.661

AS.440.663. Development Microeconomics. 3 Credits.
[formerly 440.623] This course analyzes the constraints on households and policy makers in developing countries using econometric tools. Empirical micro-economic studies of behavior and policy outcomes under different types of market failures are drawn upon. Topics include inter alia inequality, fertility, education, health, poverty, nutrition, and failures in land, labor, credit and insurance markets.Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 prior to enrolling in AS.440.663

AS.440.665. International Trade (Open Economy Micro). 3 Credits.
The first part of the course examines the causes of trade, the sources of the gains from trade, and the domestic and international distribution of those gains. In addition, it introduces the politico-economic causes of trade policy and addresses the theory and empirics of trade and growth. The second part examines in detail the instruments and consequences of trade policy, namely tariffs and quantitative restrictions, and their modern manifestation as anti-dumping and safeguard measures. The causes and consequences of trade policy, too, are linked to contemporary empirical evidence.Prerequisites: 440.601 Microeconomic Theory and Policy; 440.602 Macroeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 and AS.440.602 prior to enrolling in AS.440.665

AS.440.666. Regional Economics. 3 Credits.
Regional economics is a relatively new formal branch of economics which recognizes the crucial importance of geography in the workings of a market economy. By incorporating variables of space and geography into traditional economic models, it has great relevance to real world phenomena and policy questions. We examine the effects of market forces on spatial variables such as the location choices of households and firms; land use policy; labor market agglomeration; urban poverty; the development of transportation infrastructure; and urban and rural housing markets. The roles of natural resources, demographic base, location of industries, and factors determining regional growth and development will also be considered.Prerequisite: 440.601 Microeconomic Theory and Policy. Corequisite: 440.606 Econometrics.
You must take AS.440.601 prior to enrolling in AS.440.666

AS.440.667. Urban Economics. 3 Credits.
This course develops a framework to analyze how cities operate and how to improve them. The first part of the course addresses basic questions about cities: Why do cities exist? What makes some cities more costly than others? What determines housing prices? The second part of the course examines specialized topics including residential segregation, economic development programs, and suburbanization. Prerequisites: 440.601 Microeconomic Theory and 440.606 Econometrics.

AS.440.672. Economics of Health Care. 3 Credits.
[formerly 440.641] This course explores the economics of the health care system in the United States by examining the demand for health care services, the behavior of health care providers, the influence of government policies, and the relationship between health care services and population health levels. Established health care systems and their potential for change in both the United States and other countries are considered in the context of current policy concerns.Prerequisites: 440.601 Microeconomic Theory and Policy; 440.606 Econometrics.
You must take AS.440.601 AND AS.440.606 prior to enrolling in AS.440.672

AS.440.684. Game Theory. 3 Credits.
[formerly 440.644] Game theory is a mathematical tool developed for the purpose of understanding not only the interaction of economic market participants, but overall observed social phenomena as well. This course provides an introduction to game theory with applications to economics. Moreover, the course presents an approach to modeling a social situation as a game and develops techniques for solving the game in order to gain insight into individual behavior. Topics include repeated games, games with incomplete information, and the experimental testing of hypotheses.Prerequisite: 440.601 Microeconomic Theory.
You must take AS.440.601 prior to enrolling in AS.440.684

AS.440.692. Thesis. 3 Credits.
<p> Students may undertake their own research project as an 11th program course for three additional credits at full tuition. Prior to proposing a project, interested students must have clearly identified a research topic, and submit a formal proposal for review and approval to the Thesis Research Committee, to be received no later than two months prior to the beginning of the term in which the student plans to enroll in the course. The proposal must follow the Applied Economics Thesis Guidelines, which can be obtained by contacting the Program Director. <o:p></o:p></p><p>The committee will help identify a mentor who is familiar with their prospective inquiry, and is willing to provide guidance and oversee the project. The mentor must be faculty teaching at the Johns Hopkins University, but the availability of a mentor cannot be guaranteed. Students must meet with the mentor periodically for discussion of the project's progress, on-site or on-line, and must complete a research paper, to be approved by the mentor and the Committee. <o:p></o:p></p><p>Enrollment of the student is undertaken by the Program Director. Candidates must plan on using two semesters to successfully complete Thesis. <o:p></o:p></p><p>Prerequisites: All four Core courses and Microeconometrics or Macroeconometrics, and one or more Applied Economics courses in the substantive area of the proposed research, plus a strong academic record (at least B+ average) in at least eight program courses, are absolute minima.<o:p></o:p></p>

AS.440.801. Independent Study. 3 Credits.
This course focuses on the practical uses of time-series econometrics in a macroeconomic context. The topics covered include autoregressive-moving average processes, non-stationary time series models, unit root tests, vector autoregression models, and cointegration analysis. Prerequisites: 440.602 Macroeconomic Theory and Policy; 440.606 Econometrics.

AS.440.888. Continuation (Applied Economics).
[formerly 440.656] Students not finishing their paper during the term in which they enroll must register for Continuation in every ensuing semester (including Summer) until their papers are accepted, but Continuation does not count as a separate course. Such students must pay a continuation-of-enrollment fee of $500 for each subsequent term until a final grade has been submitted. In Applied Economics, taking Continuation once may be considered the norm.Prerequisite: 440.692 Thesis

AS.450 (Liberal Arts)

AS.450.082. MLA Capstone: Portfolio.
The MLA Portfolio is a zero-credit Capstone option. Students who select the Portfolio option will take 10 courses in the program (one core course and 9 electives), and register for the zero-credit portfolio in their final semester. The portfolio will be completed within the same semester as the 10th course. The portfolio consists of a sampling of the best papers and projects written over the course of the student's graduate career, and it is designed to highlight the intellectual points of convergence in each student's course of study, presenting the student's reflections on knowledge gained and lessons learned.

AS.450.600. MLA Core: Interdisciplinary Graduate Research Methods. 3 Credits.
This seminar will introduce students to current trends in interdisciplinary research in the liberal arts. It is recommended for any students who plan to complete a thesis as their Capstone Graduate Project. This course will lead students through the process of designing original scholarly research for the MLA Program: from developing a research question to identifying primary sources and defining current debates concerning their chosen topic. In each session, in addition to weekly discussions, students will be guided through a writing exercise or a new step in the research process. In this course, students will learn how to critically examine sources, define a theoretical framework, use standards of logical demonstration, and develop a comprehensive thesis project proposal. Starting in Summer 2022, AS.450.600 MLA Core: Interdisciplinary Graduate Research Methods will be a required prerequisite for AS.450.830 MLA Capstone: Graduate Project and for AS.450.850 MLA Capstone: Internship. Once the prerequisite requirement is in place, students must take Interdisciplinary Graduate Research Methods at least one semester prior to enrolling in either of those capstone courses. There will be no prerequisite required for students who enroll in AS.450.820 MLA Capstone: Portfolio.

AS.450.601. Forbidden Knowledge: the "Metaphysical Rebel" in Myth and Literature. 3 Credits.
But from the tree of the knowledge of good and evil you shall not eat" (Gen. 2:17). This interdisciplinary course explores the theme of forbidden knowledge in the various forms it takes in the Bible, the Epic of Gilgamesh, Greek tragedy, folklore and folktale, and in western literary classics ranging from Milton's Paradise Lost through the versions of the Faust story in Marlowe, Goethe, and Thomas Mann, to short stories by Nathaniel Hawthorne, and Mary Shelley's Frankenstein. What do we make of the parallels between the Greek hero Prometheus and the Biblical Satan? How are we to understand the figure of Dr. Frankenstein as "the Modern Prometheus"? Does Faust's pursuit of conventionally forbidden areas of knowledge anticipate 20th and 21st century quests to unveil the secrets of nuclear power, or of artificial intelligence, or of genetic engineering of the human genome? In addition to our literary readings, we will discuss a variety of operas and other relevant musical works; films from Bride of Frankenstein and Dr. Strangelove, to Hannibal; and transgressive visual imagery from Paleolithic cave art to the work of contemporary performance artists ? in a collective quest to find and define the boundaries of "the forbidden."

AS.450.605. Art Since 1960. 3 Credits.
What is contemporary art, and what are the factors that shaped it? This course will attempt to answer those questions through a chronological and thematic investigation of some of the most influential artworks, movements, and theories of the past 60 years. Beginning with a close look at mid-century modernism, we will move into a consideration of Pop, Minimalism, conceptual art, land art, performance art, postmodernism, AIDS activism, and relational aesthetics. Along the way, we will also consider the relevance of feminist and phenomenological theory and of institutional critique and globalization; at the same time, we will explore ways in which art of our own time constitutes both an extension of, and reaction against, some of the historical ideas we encounter. Throughout, students will have a chance to read and discuss both primary and secondary texts, and a range of resources and assignments will offer a variety of analytical angles and interpretive possibilities.

AS.450.606. Ethics for a Multicultural World. 3 Credits.
This is a course in applied philosophy, a practical approach to ethical thinking based principally on the Discourse Ethic of Jurgen Habermas. Using a "Moral GPS," the course works through the basic steps of a discernment and decision process that takes into account the particular ethical challenges of the 21st-century multicultural world. Through the work of this course, Students will: <o:p></o:p></p><ul style="list-style-type:disc">
analyze the principal ethical theories and their relation to each other; evaluate their own ethical assumptions and those of others in relation to those ethical theories; be able to validate ethical claims in ways compatible with cross-cultural dialog; be able to guide ethical dialog toward consensus for effective action

AS.450.607. Through a Glass, Darkly: American Film Noir. 3 Credits.
In Film Noir (French for dark, or black film), the city often provides the backdrop for stories featuring the dark underbelly of society. Morally conflicted, cynical hardboiled investigators, corrupt officials, low- lives, mysterious, double-crossing dames and set in a landscape of trash strewn alleys, dimly lit bars, tenements, and other dark corners. There are no happy endings in Film Noir and the mood is one of paranoia, pessimism, desperation and existential angst. The course will employ an interdisciplinary understanding of the characters, themes, and gritty visual style and mood of the classic Film Noirs of the 1940s and 1950s. Roots of the Film Noir form come through a fusion of German Expressionism and the hard-boiled detective stories and crime novels of the 1920s-1940s upon which some of the greatest noir films were based. The course utilizes a "read and screen" approach beginning with a close textual reading of each story that is followed by a screening of the film through which we will analyze the distinctive visual style (light and shadow, tilted camera angles, mysterious silhouettes) which contributes to the mood and defines the Film Noir formula. Major auteurs of the form such as authors, directors, and actors will also be studied for what they bring to this formula. The course concludes with a look an example of Neo-Noir from the 1970s. Important note: students will need to find the films included in the course to screen on their own.

AS.450.608. Renaissance Women: Portraits, Patrons, and Painters. 3 Credits.
This seminar will explore the artistic experience of women in Renaissance Italy. A large body of recent scholarship has sought to "recover those women...who have been erased from history in modern literature, rendered invisible or obscured by history or scholarship, as well as those who were overshadowed by male relatives, political accident, or spatial location" (Katherine A. McIver, preface to Wives, Widows, Mistresses and Nuns in Early Modern Italy). Drawing upon a consideration of both current research and primary sources, this course will investigate the role women played as the makers, the commissioners, and the subjects of art in Italy during the period from ca. 1250-1600. Among other issues, we will examine the constraints that limited women's contribution to the arts in this period when women's participation in public life were quite circumscribed, as well as the various means they found to overcome them. We will investigate what types of women were able to become artists. We will learn what categories of women were most likely to commission art, and what kinds of art they generally commissioned. Lastly, we will examine portraits of women, to understand what these representations tell us about the view of women in Renaissance society. Students will develop their own critical positions on the issues through a close reading of both texts and works of art, participation in online discussions, and in several substantial writing assignments.

AS.450.609. 1900: The Birth of Modernism in Vienna, Paris, and London. 3 Credits.
<p> The year 1900 was the pivotal fulcrum of the turn of the century, that short but crucial era we call the fin-de-siècle, ranging from 1890 to WW I. This explosively creative period of literary and artistic expression witnessed the dramatic transition from the cultural order of old Europe to the new worlds of modernity: Freud's Vienna, Toulouse Lautrec's Paris, and the London of George Bernard Shaw and Oscar Wilde. It was an exciting new era of steam, speed and electrification, of the exhilarating cultural life of world's fairs, crowded boulevards, cafes, music halls, art galleries, and photographer's studios. <o:p></o:p></p><p> New styles of painting by Viennese Secessionists Gustav Klimt, Egon Schiele, and Oscar Kokoschka, along with Picasso's Cubist experiments, would change people's ideas of what art could do and even of what art was for. Colorful posters featured a new world of travel and consumerism, of daring cabaret performers and uninhibited night-life, and of "new women" shown smoking cigarettes, riding bicycles, and claiming public space. Radical performances by Diaghilev's innovative company, the Ballets Russes, could provoke controversy, and even rioting in the concert halls. The excitement of Belle Époque Paris is legendary, but London may have felt the most vibrant polarizations of all: on the one hand, the sternly patriarchal imperial and colonialist culture celebrated by Rudyard Kipling, with comic relief provided by Gilbert and Sullivan; and on the other, the subterranean currents of aestheticism and gender-bending decadence explored by Oscar Wilde and Aubrey Beardsley, who pushed the boundaries of what Victorian London would tolerate, up to and beyond its limits. <o:p></o:p></p><p> Our interdisciplinary exploration will range from the fine arts and music, through architecture, urban design and city planning, to popular culture and the radical social changes marking this turn of the century epoch. <o:p></o:p></p>

AS.450.611. Social History of Medicine. 3 Credits.
This course focuses on major developments in modern medicine from the scientific revolution and the Enlightenment to the late 20th century and considers those developments within their social, political, cultural, and economic contexts. The focus is on the growth of scientific/bio medicine. However, the parallel growth of lifestyle choices and holistic medicine is also important. Some of the themes of the course are: the development of the medical profession and institutions; changing concepts of insanity; the impact of industrialization and the linking of dirt with disease; drug discoveries and their consequences; the impact of eugenics theories; gender and medicine; war as a catalyst for medical innovation; growing government involvement in health care provision as well as socialized medicine and its relevance today.

AS.450.612. Tough Neighborhood: A History of U.S.-Central American Relations. 3 Credits.
This course examines the tumultuous history of the United States' relationship with Central America, from William Walker's filibustering in the 1850s to the recent wave of migration from the Northern Triangle. We will consider how US policymakers, organizations, and individuals have judged the isthmus in economic and national security terms and intervened accordingly, and we will examine how Central Americans have viewed the United States as a model of modernization, an interloper, and a site of refuge, as well as the ways in which they have shaped the North-South relationship despite the asymmetry of political, economic, and military power. Sources will include works of scholarship such as Confronting the American Dream and The Last Colonial Massacre, as well as texts from Central American authors, including the poetry of Roque Dalton, the personal testimony of Rigoberta Menchu, and the reporting of Óscar Martínez.

AS.450.613. British Victorian Women. 3 Credits.
This course embraces the broad sweep of primarily British Victorian women's experiences. It analyzes the emergence of the Victorian stereotype of middle and upper class women and compares that stereotype to the reality of individual case studies. It also explores the variety of expectations and demands on working class women - focusing on geographical, industrial and rural factors and the resulting lives of women working and living across the British Isles. In addition, there is an emphasis on Victorian women as agents of change in the fields of literature, medicine, teaching and social work both at home and abroad, as well as in local and national politics.

AS.450.617. The Constitution and the Criminal Justice System. 3 Credits.
Examines how the Supreme Court establishes and enforces the constitutional rules that govern law enforcement in the United States, including the 4th Amendment's provisions on searches and arrests, the 5th and 6th Amendment protections for individuals charged with a crime, and the 8th Amendment's requirement for bail and its ban on cruel and unusual punishments. We will also examine what it means to have a fair trial, the process of plea bargaining which resolves most criminal cases, and the continuing controversy over criminal sentencing. And we will continually be exploring the meaning and the reality of "justice."

AS.450.618. Going Underground: Subculture and Social Justice in Self-Publishing. 3 Credits.
This course explores the wide and weird world of self-published zines (pronounced ZEENS). Defined by Stephen Duncombe, zines are "noncommercial, nonprofessional, small-circulation magazines which their creators produce, publish, and distribute by themselves." Zines—along with adjacent formats including alternative comics, fanfiction, and underground newspapers—have been staples of subculture for decades, tracing their history to 1930's science fiction fandom, and encompassing topics from punk rock to critical race studies. By embracing a DIY (do-it-yourself) spirit and subverting traditional publishing, zine creators have amplified voices advocating for social justice by centering topics long considered subversive, forging communities along the fringes, and molding the mainstream. In addition to studying zines through the lens of history, art, critical theory, and cultural studies, students will design and create zines of their own and share them online in a digital format. Whether you're new to the world of zines, an avid reader of them, or a longtime zinester, all are welcome and no prior experience with the format is required.

AS.450.620. Gender and Media. 3 Credits.
This course addresses the intersection of communication, culture, and identity through an examination of gender and the U.S. media system. The course will first introduce students to key approaches to studying gender and media, and will subsequently examine: 1) media representations of gender, sexuality, and intersectionality; 2) diversity in media industries and gendered labor markets; 3) gendered audiences and fan cultures; and 4) gender, power, and identity in a digital era of communication. We will explore these topics through literature from communication and media studies, cultural studies, feminist theory, internet/new media studies, and sociology.

AS.450.621. The Self in Question: Readings in Lit & Psychol. 3 Credits.
What is a “self” and what is its nature? Is the self discovered or invented? Is it synonymous with character, with personality, with soul? Or is the self primarily a storyline? Thinkers throughout the ages have probed the riddle of our human identity and come to distinctly differing conclusions. Buddha considered the self an illusion, while for Plato, the self is a slumbering sage. For Freud, it is an instinctual hunger; for Sartre, a useless passion; for B.F. Skinner, a machine; for Buckminster Fuller, a verb. Modern literature and psychology have further complicated our conceptions of selfhood, challenging traditional notions of the stable ego and expanding our understanding of personal identity to include race, class, gender, and culture. From ‘selves in the making’ to ‘selves under siege,’ from the lonely, existential self to the transpersonal, communal self, in this class we explore questions of selfhood from the perspectives of literature and psychology –two key disciplines devoted to understanding the perplexities of human nature. We consider the approaches of Freudian, Jungian, feminist, Buddhist, Marxist, and existential psychologists, and we read literary selections by Kafka, Thomas Mann, Saul Bellow, Toni Morrison, Milan Kundera, Margaret Atwood, and Z.Z. Packer. Our interdisciplinary focus will enable us to see the ways in which psychology and literature illuminate and enrich each other—and also where they are in conflict, both in their methodologies and in their basic assumptions about the “knowability” of human nature and behavior.

AS.450.622. The Shape of Things: Embodiment and Sexuality in American Culture. 3 Credits.
This course examines theories and experiences of embodiment, sexuality, and bodily difference in contemporary American culture, focusing on understandings, experiences, misconceptions, and marginalizations. <o:p></o:p></p><p> Drawing on feminist-informed gender, fat, disability, and critical race studies, the course introduces phenomenological, poststructuralist, and new materialist perspectives on the body, and interrogates the implications of diverse embodiments for human subjectivity and social life. <o:p></o:p></p><p> Myths and misconceptions of differences that circulate throughout popular and professional cultures, and inform public policies and everyday practices are analyzed. Course readings and audio/visual texts emphasize the problematics of normalcy across the life span and among diverse populations, and reflect on issues of sexual experience, gender, body size, disability and difference, illness and disease, aging and racialized bodies, and sexual variance. <o:p></o:p></p><p> Our bodies and the scrutiny they are under in American culture inform so much of our lived experience. Drawing on a wide range of texts we will examine the scope of sexuality and embodiment in this critical moment. <o:p></o:p></p>

AS.450.627. MLA Core: Critical Theory. 3 Credits.
This course introduces critical theory in the context of struggles for social justice. From Plato to Judith Jack Halberstam, we will trace the history of Critical Theory by analyzing perspectives from psychoanalysis, Marxism, the Frankfurt School, postcolonial theory, poststructuralism, deconstruction, feminism, critical race theory, and queer theory. We will pay particular attention to how critical theory has been intimately and contentiously linked with politics and social justice. Among the authors studied are: Plato, Aristotle, Edmund Burke, Karl Marx, Sigmund Freud, Ferdinand De Saussure, Walter Benjamin, Claude Levi-Strauss, Jacques Lacan, Roland Barthes, Frantz Fanon, Michel Foucault, Monique Wittig, Helene Cixous, Eve Sedgwick, bell hooks, Paul Gilroy, Judith Jack Halberstam.

AS.450.630. Intimacies of East/West: Hegemony, Representation, & Literature. 3 Credits.
This course begins with exploring histories, tensions, and intimacies between East and West through Edward W. Said’s landmark postcolonial text Orientalism, which analyzes dynamics of hegemony, power, knowledge, imagination, and representation in ways that challenge how we think and know about the world. This lens of inquiry will take a political turn by examining issues and conflicts that arise due to imperialism and dominant paradigms of culture, difference, otherness, nationalism, and religion. In the latter portion of the course, close readings of contemporary world literatures will unfold the shared intimate experiences between East and West through the study of transformative novels, memoirs, and short stories that create forms of agency in today’s world. This will bring us beyond the limiting binary of East and West and enable new ways to think intimately and humanistically about religion/secularity, gender, nation, identity, and belonging.

AS.450.631. Western Theatre History: The Dynamic Interplay of Social, Economic and Cultural Forces. 3 Credits.
Theatre offers unique insight into the development of western civilization by depicting people in their relationships to themselves, to each other, and to society. Theatre history provides a distinctive lens through which to explore the social, economic, cultural, geographical and other forces shaping those relationships over the past 2500 years. Beginning with the inception of theatre in religious ritual up to the present postmodern era, Western Theatre History: The Dynamic Interplay of Social, Economic and Cultural Forces will explore the demographics of audiences, the reasons for attending the theatre, who presented theatre, where theatres were located, what theatre space looked like and why they looked that way in order to track the dynamics of western political and social history. Major works of dramatic literature will serve as the entry point into various periods and as reflections of the historical forces at work. The major periods to be studied are: Classical Greek and Rome, Medieval, Renaissance (Italy, England and Spain), 18th and early 19th centuries, the modern era and the postmodern present.

AS.450.634. Italian Renaissance Art and Thought. 3 Credits.
In what sorts of intellectual contexts was Italian Renaissance art produced and received? What, in other words, were the connections among Renaissance art, philosophy, theology, mathematics, rhetoric, and history? This seminar will investigate a number of answers to such questions through a consideration of primary evidence and recent scholarship. Among other things, we will consider Aristotle’s theory of magnificence as it was applied to Renaissance architecture, the development of perspectival systems, the notion of a Renaissance or golden age, and Vasari’s efforts to conceptualize art of the Renaissance in metaphorical terms. Several substantial writing assignments will allow students to develop critical positions of their own, and throughout the term there will be an emphasis upon close reading of both texts and artworks. (Available online)

AS.450.635. How the War was Remembered: The Film and Literature of the Vietnam War. 3 Credits.
The Vietnam War continues to be one of the most controversial and deeply divisive events in U.S. history. The seeds for the war began early in the 20th century, intensified within the Cold War emerging in the years after 1945, and tore the country apart when boots hit the ground in 1965 to fight a war with no clear objectives or enemies. The legacy of Vietnam is difficult to understand but it is clear that the lessons of the war have been most “remembered” through the films and the powerful perspective of the veteran’s voice in the literature of the war. We will ask how writers and film makers presented the experience of those on the battlefield and the home front; how very public and symbolic battles were fought over how the war should be interpreted and remembered; and how these artifacts help to illustrate the construction of a mediated cultural memory of the war. Particular attention will be paid to the "veteran's voice" and the role of autobiography. The course will consider the war from both liberal and conservative perspectives, and we will add an often-missing voice from the story; that of the Vietnamese. Ken Burn’s new documentary series, The Vietnam War will anchor the class. Other films to be considered may include The Quiet American, The Green Berets, Apocalypse Now, Rambo, The Deer Hunter and Platoon, The Little Girl of Hanoi _(_Em bé Hà Noi) as well as other documentaries including Why Vietnam, Peter Davis’ Hearts and Minds, and Four Hours in My Lai. Important literary works by veterans of the war may include those by Michael Herr, Philip Caputo, Bao Ninh, Le Ly Hayslip, Tim O’Brien and Ron Kovic among others. Please note that most of the films are readily available from multiple streaming sources (e.g. Netflix, Amazon Prime, Public Library, etc..). Students will be required to have watched a particular film in advance of class as noted in the syllabus.

AS.450.637. Native American Art History. 3 Credits.
This course examines Native American art as both internal and external communication centered in American Indian households, workshops, studios, and communities. Internal communication has met community and Tribal expectations for thousands of years as art has been engaged in ongoing economic, religious, political, and social activities that have created and maintained ethnic identity. External communication has placed art in the relationship between American Indian communities and non-Indian participants in the process of military conquest and colonization; and in galleries, museums, Powwows, and other public events. From the Colonial period to the present day Native American art has been admired and collected and has, in this way, mediated the relationships between Native communities and dominant American culture. We will use powerpoint slides, readings, and in-person consideration of Native American art at the National Museum of the American Indian to look at stylistic characteristics of various regions and time periods, and the messages and relationships embodied in specific examples of art.

AS.450.638. MLA Core: What is History?. 3 Credits.
What is history? What makes history, as a field of scholarship and a way of knowing, different from any other discipline? This course will introduce students to a vibrant and evolving field of study, and to the tensions, diversity, debates and controversies that shape it. Themes explored will include an examination of the parameters of the field (such as the relationship between popular and academic history; the tension between description and interpretation; the evaluation of sources; the role of the historian as a public intellectual; the craft of historical writing; and digital history as a new field of study) as well as an analysis of the topics and approaches undertaken by contemporary historians (such as the reframing of dominant narratives; the emergence of dominated voices and of new thematic fields such as sexuality, globalism and popular culture; and ongoing critiques of previously established narratives and theoretical frameworks). Students will read historical scholarship in a wide variety of fields, as well as critical theory, popular literature and documentaries.

AS.450.639. The American Southwest:Crossroads of Cultures. 3 Credits.
The course begins at the time when the Southwest was the homeland of the ancient Pueblo people (the “Anasazi”). Our survey moves from the major archaeological sites such as Chaco Canyon and Mesa Verde to the historical communities of the Hopi and Zuni and other Pueblo peoples of New Mexico and Arizona, along with the Navajo and Apache. We then move on to focus on the period of Spanish incursion, when the region became first part of colonial New Spain and then part of independent Mexico. We look at the narratives of the earliest Spanish arrival, and at the long tradition of Spanish colonial art and architecture, culture and religion in the region. We then move on to the incorporation of the region into the U.S. after the Mexican-American war, and with its impact on the Native American and Hispanic populations. The 19th century saw the arrival of the railroads and of an Anglo population of Easterners, and the genesis of the Southwest as a fine art center, sometimes called the Santa Fe-ization of the Southwest. More recently, the area has witnessed the “re-arrival” of a Mexican-American, or Chicano, population along with the retrieval and revival of Mexican cultural traditions such as the Day of the Dead and the cult of Guadalupe. Today the region, for all its cultural conflicts, is the site of an ongoing evolution of a modern ulticultural Southwest.The course includes reading and discussion of literary works by such authors as Willa Cather, Leslie Marmon Silko, Gloria Anzaldúa, Ed Abbey and Tony Hillerman, and an extensive look at the arts of the Pueblo and Navajo peoples, the paintings of the Taos School and the work of Georgia O’Keeffe, and the contemporary revival of Southwest folk art.

AS.450.640. Nature and the American Imagination. 3 Credits.
This course offers an interdisciplinary study of the American landscape and the role it has played in shaping American identity. We anchor our study by looking at the way the idea of land has been constructed throughout our history as a kindred spirit by Native Americans, as a “howling wilderness” by the early colonists, as a school for spirit by the New England Transcendentalists, as a precious inheritance in need of preservation by 19th century conservationists such as John Muir and Teddy Roosevelt, and in keeping with Manifest Destiny, as a rich resource that was "ours for the taking." Philosophically, we explore the influence on early colonists of Biblical and Enlightenment thought, of the European Romantic movement, the moral ambiguities of the slave experience of the American land, the ideas of Romanticism that gave rise to Emersonian Transcendentalism (America’s first homegrown philosophy), the competing theories behind the national park movement, and more recently the revival of Native American holistic values in ecological paradigms. Beginning with Thoreau, who “went to the woods to learn to live deliberately,” we read primary texts of American nature writing, arguably one of America’s finest contributions to world literature, and we experiment with keeping nature journals. Finally, we discuss the bridging of the two cultures, science and art, in the writings of paleontologist Loren Eiseley and conservationists Aldo Leopold, Rachel Carson, and Al Gore.

AS.450.642. Yesterday's Tomorrows: Utopian and Dystopian Futures in Science Fiction Literature. 3 Credits.
Beginning with Thomas More’s seminal work Utopia (1516), this course will engage in an interdisciplinary discussion of the construction of utopian/dystopian-cacotopian worlds in science fiction, or more broadly speculative fiction, and the accompanying philosophical issues and concerns raised in these stories. We’ll draw on novels, history, philosophy, graphic novels, and film to grapple with the meaning and importance of utopian and dystopian thinking and writing across the 20th century. The authors react to and against major historical paradigm shifts caused by, for example, the Industrial Revolution, Modernity, War, the Cyber Revolution, and millennialism, along with the overarching “End of Days” stories. Some of the authors under consideration are H.G. Wells, Edward Bellamy, Yevgeny Zamyatin, Aldous Huxley, Ursula Le Guin, Philip K. Dick, Margaret Atwood, William Gibson, Octavia Butler, Marge Piercy, and Neil Stephenson. Through these stories the authors project both possible futures and offer incisive commentary on contemporary realities.

AS.450.643. Leadership and the Classics. 3 Credits.
This course explores constants and changes in leadership over time through a selection of readings that ranges from ancient philosophy to 20th-century fiction, including works by Confucius, Plato, Sophocles, Shakespeare, Machiavelli, Hannah Arendt, Martin Luther King, Jr., Anne Tyler, and others. Through directed reading and discussion, students gain valuable insights into how leaders can foster creative initiatives and responses to change. A historical perspective enables students to understand and appreciate the challenge of leadership in the 21st-century multicultural world. They can then develop a framework for interpreting and evaluating responses to that challenge. (Available online)

AS.450.644. U.S. Environmental History. 3 Credits.
Environmentalism is a multifaceted phenomenon infused with many different schools of thought about the nature of environmental problems as well as the most appropriate solutions for those problems. This course will examine the major historical influences on the varied approaches to environmentalism and environmental practice. Students will explore the influence of environmental ideas and actions in the US from the 19th century to the present. The goal is to deepen our understanding of contemporary environmental practice – by others and ourselves – by tracing the influence of these historical trends in current debates and actions. Topics include conservationism, preservationism, transcendentalism and green romanticism, toxic construct, the wilderness construct, and sustainability.

AS.450.646. Religion of Politics, Politics of Religion. 3 Credits.
This course examines patterns of authority in religion and politics by exploring the connection between the sacred and the secular. The class will address questions concerning political power and religious influence in order to better understand the complex relationship between the two. Students will consider societies where religion and politics seem inextricable, societies that attempt to separate the two, and societies that attempt to eliminate religion from the equation. The class will recognize the ways in which nations develop their own civil religions. A variety of religious experiences and political ideologies will be considered. Special attention will be given to the role of religion and politics in social change.

AS.450.648. Fakes, Lies, and Forgeries: A History of “Fake News” from The Flood to the Apocalypse. 3 Credits.
In our digital age of hacking, on-line bots, and trolls stealing, faking, and confounding information across the Internet, it is often forgotten that “fake news” has, in fact, always been with us. The history of fakes, lies, and forgeries transcends human history and encompasses nearly every discipline within the liberal Arts, from literature, art, and philosophy, to history, religion, and archaeology. Human civilization has been filling gaps in the historical record and inventing alternative narratives for all sorts of reasons: political, commercial, evangelical, and personal. This course examines this dark undercurrent within human achievement across historical time, exploring specific examples of historical and literary forgeries that date from the biblical Flood to the future Apocalypse. <o:p></o:p></p><p>We will exploring the textual traditions of false archaeological discoveries and fabricated epigraphic fragments from classical antiquity, manufactured time capsules bearing pagan prophecies of the coming of Jesus, fake “illuminations” of Christopher Columbus and Joan of Arc, preposterous accounts of the world’s great “travel liars,” and even look at books from Shakespeare’s own library bearing his personal “annotations.” In the process, we will learn that history’s fakes and forgeries are also, in part, creative and imaginative enterprises that require considerable knowledge, creativity, and even inspiration, to pull them off effectively. At every stage this on-line course will draw upon the riches of JHU’s own Bibliotheca Fictiva, the world’s premier rare book and manuscript research collection dedicated to literary forgeries across the millennia. <o:p></o:p></p>

AS.450.650. Nazi Germany and the Holocaust. 3 Credits.
This course focuses on three major areas: the reasons for the rise to power of Hitler and the Nazi party; the mechanics of the operation of a totalitarian regime as well as various aspects of life in Nazi Germany; and the Holocaust including the fates of Europe's Jewish populations and other groups such as homosexuals targeted by the Nazi regime. These topics will necessitate the study of various sources – histories of this era, documents, memoirs, personal accounts, literature and films. The course looks at perpetrators, bystanders and victims in an attempt to grapple with one of the most written about and mystifying periods of the 20th century. The period still resonates today both in terms of its horror and its revelations about genocide, a new word coined in the late stages of WWII in an attempt to describe such unfathomable acts. By necessity, the study of these topics includes a consideration of political, social, economic and cultural history as well as ethics and the role of memory in shaping and commemorating events and traumas on this scale.

AS.450.651. Western Political Philosophy. 3 Credits.
This is intended as a broad survey of Western political thought, particularly as it developed in the European historical context from the classical era to the 20th century. The thinkers we will discuss can be thought of as engaged in what Robert Hutchins called a "great conversation" across the centuries on the central questions of political philosophy. These questions include: What are the purposes of government? What is the best form of government? How are justice and liberty best realized in a political system? What are rights - and where do they come from? What is sovereignty and in whom does it reside? What principles make political authority legitimate? Is disobedience to political authority ever justified? In many ways these questions are perennial ones, as relevant in our own time as in the distant past. Moreover the divergent systems of thought developed to answer these questions continue to shape much of contemporary political life - e.g. democracy, constitutionalism, liberalism, socialism, and conservatism. Among the political philosophers who will be examined are Plato, Aristotle, Augustine, Thomas Aquinas, Machiavelli, John Locke, Edmund Burke, Thomas Hobbes, Jean Jacques Rousseau, Friedrich Nietzsche, Karl Marx, Hannah Arendt, and Leo Strauss. (Available online)

AS.450.652. Modern Black Political Thought. 3 Credits.
Approaching black politics as a vital source of theoretical innovation and critical analysis, this course introduces students to key themes, trends, and thinkers within the literatures of modern black political thought. Black political thought constitutes not only a practice of theorization and conceptualization undertaken by African-descended peoples in response to experiences of racial domination and exclusion; it can also be understood as a critical practice that produces scholarship and political writings that situate racism and race-making at the core of the projects associated with Western modernity, and thus as formations that have affected many societies and civilizations, not only black people. Focusing primarily on the latter sense of black political thought, this course explores a series of writings that interrogate the intertwined legacies of the emergence of modernity, the elaboration of racial hierarchy, and black emancipatory struggles. Highlighting the central role played by racial domination in the formation of Western modernity, these texts complicate and challenge the underlying epistemic frames and modes of classification through which the Western tradition has made sense of such foundational political experiences and concepts as freedom, justice, liberation, community, and equality. Reading works by W. E. B. Du Bois, Ida B. Wells, James Baldwin, Jamaica Kincaid, Frantz Fanon, Martin Luther King, Jr., Saidiya Hartman, Hortense Spillers, Angela Y. Davis, and others, students will critically engage a diverse range of methods and literary approaches within the literatures of modern black political thought for apprehending the historical and political significance of racial hierarchy in the modern world. They will also learn key conceptual resources provided by these traditions to attain a more sophisticated understanding of contemporary racial politics and its intersections with the politics of class, gender, nationality, and sexuality.

AS.450.654. "When the lamps went out": WWI as history, memory and commemoration. 3 Credits.
The centenary of the conclusion of World War One is a fitting moment to re-examine the cataclysmic impact that war had on world affairs at both a micro and macro level. The war ended the "long nineteenth century" and ushered in an era of questioning and doubt for many who survived. It was the first manifestation of total war, made both necessary and possible because of industrialization and advances in transportation and weaponry. The resulting catastrophic loss of life among the military and civilians led to the assumption of new roles. This course looks at the different theaters of war; the social impact of the war on gender and class; the effect the war had on colonies in Africa and Asia; and the overall global political and economic ramifications of the war. There will be scope for students to pursue research on a specialized topic within this framework and within the following themes: World War One and literature, art, gender, medicine, propaganda, music, independence movements.

AS.450.667. The Bildungsroman as Literary Form-Chronicling Personal Growth in Countries and Cultures. 3 Credits.
The bildungsroman, often referred to as the Novel of Adolescence or Coming of Age novel, is one of the world's most fascinating literary forms because of its manifestations in the literatures of many cultures and countries. The development of the form closely parallels the development of nations, the emergence of philosophical, social, and literary movements which have defined the world from the Eighteenth Century onward. Many major writers of the Romantic, Modern, and Post-modern periods have experimented with the form in compelling works such as Portrait of the Artist as A Young Man, Mrs. Dalloway, Madame Bovary, Great Expectations, Native Son, Catcher in the Rye, and The Famished Road. The illusiveness of the form derives in part from its ubiquitous nature. The classical German bildungsroman differs significantly from its English, French, American, African American, Asian, and African counterparts. This course examines the bildungsroman in several of its manifestations: the rise of the form in Eighteenth Century Germany, its adoption among French and English writers, its adaptation in Joyce's Ireland, its popularity among American and African American writers, and its unique presentation in Asian and African literatures. Students will read several major bildungsromans and discuss the constructs of the form as well as the ways it differs among countries and cultures, races and ethnicities, and between genders. Some attention will be paid to the social and societal contexts associated with the form, as well as the ways in which it has been shaped by prevailing philosophies. Students will be encouraged to participate in The Bildungsroman Project, a Digital Humanities project designed to catalog and explore the form (http://bildungsromanproject.com/). (Available online)

AS.450.669. Family in Cross-Cultural Perspective. 3 Credits.
This course examines the family from various cross-cultural perspectives. Throughout the semester we will examine the family as a social institution through the lenses of race, gender, age, social class, and sexual orientation. First we will explore how the notion of family has changed over time in the United States. Next we will explore the social processes that take place within the context of the family such as dating, courtship, marriage, and parenting. We will also look at other issues that affect families such as immigration policy, work inside and outside the home, poverty, and domestic violence. (Available online)

AS.450.673. Monstrosity & Metamorphosis: Imagining Animals in Early Art & Literature. 3 Credits.
From humankind's earliest artistic expressions on the walls of caves, animals have figured centrally in the human imagination. One can argue, in fact, that much of early art and literature does not differentiate fully between the human and the animal, that human self-awareness evolved, in part, through interactions with animals, and through the imaginative fusion of human and animal forms. This course will study the representation of animals and of human/animal hybrids in the ancient and medieval worlds, weaving together stories presented through visual art and literature. Our journey will take us through East and West, touching on texts including (but not limited to) the Epic of Gilgamesh, the Hebrew Scriptures, the Vedas, and Ovid's Metamorphoses.

AS.450.675. Literary Analysis of the Hebrew Bible. 3 Credits.
This course focuses on narrative criticism of the Hebrew Bible, comparing it to similar methodologies (poetics, rhetorical criticism, etc.) and contrasting it with other forms of exegesis (historical criticism, deconstruction, etc.). Students will study key literary terms and discuss the elements that work together to form a story. The class will consider the narrator's voice in relation to the text and the reader, examining narrative omniscience, key type scenes, and themes in the Hebrew Bible and ancient Near Eastern (ANE) literature. This course attempts to discern narrative criticism's place in the history of Biblical interpretation. Long overshadowed by historical criticism and increasingly seeking to find its place in the midst of a number of reader oriented approaches, narrative criticism can be a valuable partner to both. This class examines narrative criticism's value as a tool for exegesis by studying its roots and the methodologies incorporated by narrative critics of the Hebrew Bible. (Available online)

AS.450.678. Religions of the Emerging World. 3 Credits.
The emerging world of the 21st century is globally interconnected: Al peoples are now neighbors. In this world, competing religious claims to unique truth pose a serious threat. Yet abandoning such claims can reduce religions to quaint cultural relics. How can religious believers maintain the vitality of their spiritual heritage while fully appreciating the faith/wisdom traditions of others? This course explores the insights of one man who has sought that balance of religious consciousness —philosopher Huston Smith—as he reflects on Hinduism, Buddhism, Confucianism, Taoism, Judaism, Christianity, and Islam. Rather than competing, he found, the world's religious traditions can greatly enrich one another. (Available online)

AS.450.687. The American Revolution. 3 Credits.
This course will analyze the roots of the American Revolution, contrasting the perspectives of England with the colonies on the causes, comparing the positions of Loyalists and Patriots within the colonies, evaluating the role of diplomacy during the revolutionary years, assessing the war years, formulating the legacy of the revolutionary experience on the social, religious, economic and political fabric of the new nation, and the creation of the Constitution for the United States. The central question driving this study of the struggle for independence and the creation of a Constitution will be the intense effort to achieve an effective balance of "liberty" and "order,"---an eternal challenge for all governments in all ages.

AS.450.689. Introduction to Digital Humanities in the Liberal Arts. 3 Credits.
This introductory course in the MLA program's digital humanities concentration is designed to familiarize students with digital encoding tools, web platforms, assorted search engines and other methodologies directly relevant to a wide range of research agendas in the liberal arts. In the course of the semester, students will receive a comprehensive introduction to selected tools and methodologies, such as the Text Encoding Initiative (TEI) and text mining software (e.g. Voyant and Collatex). Assigned text encoding projects will guide students in identifying appropriate textual markup strategies, resolving issues generated through digital research, and finally in selecting appropriate tools for edition making. The semester will conclude with group critiques of these assigned projects from the standpoint of both content and user experience. (Available online)

AS.450.694. Philosophy of Beauty. 3 Credits.
Since Plato, "Beauty" has proven to be a crucial topic in Western Philosophy. Philosophers have seen fit to address numerous questions surrounding the topic: what is beauty, what distinguishes and constitutes it, who can create it, who can discern and appreciate it? Is it subjective or objective? We will consider a variety of other critical questions via the prominent thinkers we will read in this class, such as: what is the point in creating art? Who or what is it for? What is its desired or intended impact on the audience? What are the germs of creativity, or what is the critical environment for its emergence? Is creativity and artistic inspiration an individual privilege, or can it be shared broadly in society, or in a community? What is the political role or place of the artist and his/her work? Philosophers read in this class may include Plato, of course, but also Aristotle, Augustin, Aquinas, Hume, Burke, Kant, Hegel, Schopenhauer and Nietzsche, among others. If time permits, we will also look at more recent philosophers writing on the topic--and why beauty might no longer be a concern for art and artists.

AS.450.695. American Political Theory and Practice. 3 Credits.
Our purpose in this course is not to provide an account of the mechanics of American government, but to examine the principles that underlie those mechanics, and the way in which those principles change over time. In other words, we are going to examine the political philosophy that serves as a basis for the American regime (or regimes, if one is so inclined). This means that in addition to questions of justice and right we will examine how the thinkers of the Founding era understood the human being, and the sort of governmental structures that are built on this understanding. We will also consider the revolution in American politics that occurs in the 20th century. The progressive movement of the 20th century builds on a different view of human nature and metaphysics (originating in, but ultimately transcending, Hegelian Idealism), and therefore finds itself in tension with the principles of the Founding. This tension is one of the animating forces of American political partisanship today, so an understanding of the development of American political theory will help us to better understand political disagreements in our own day. (Available online)

AS.450.697. All in the Family: Power, Scandal, and Fall. 3 Credits.
From the Roman Empire through today, ruling families have had a profound effect on the social, political, and cultural lives of their people. It was believed wealth, power, and nobility from birth formed the perfect formula to rule over the lower class. However, the rise of humanistic study, merchants, explorers, revolutions, and colonialism threatened and ultimately destabilized their wealth and power. As a result, the rise of the middle class, emerging political systems, and development of national identities gave way, arguably, to the dissolution of absolute power predominately in the Western world. We will consider the following ruling families: the Julio-Claudian, Ptolemaic, Ming, Hoehnstaufen, Habsburg, Medici, Aragon-Castille, Tutors, Capetian, Romonovs, and current House of Windsor.

AS.450.699. Great Books in Great Contexts. 3 Credits.
What makes a “great book” great? In this course, which emphasizes deep reading and discussion of some of the influential writings that have shaped the intellectual and cultural heritage of our world, we will begin to try to answer that question. Along our journey, we will explore seminal texts including Homer’s Odyssey, The Song of Roland, Shakespeare’s Henry V, Shelley’s Frankenstein, and Conrad’s Heart of Darkness. In studying these great books and their historical contexts, we will employ elements of literary criticism, identify common and enduring narrative themes, and reflect on the inclusion of each of these texts as part of the Western Canon. Students will select one text on which to write an in-depth research paper (in consultation with the instructor).

AS.450.700. "The Souls of Black Folk": Evolving Conceptions of Leadership in African American Literature and Culture. 3 Credits.
Equal parts historical study, sociological investigation, and cultural analysis, W. E. B. Du Bois’ classic work, The Souls of Black Folk, exemplifies the type of interdisciplinary and multidimensional approach employed by political and social theorists in their efforts to make sense of the fundamental conditions, contours, and characteristics of political life in modern societies. Paying particular attention to Du Bois’ account of race, the role political leadership, and the relationship between leaders and the masses, we will put Du Bois’ seminal work in conversation with a number of other prominent Afro-American voices, including Frederick Douglass, Booker T. Washington, Ralph Ellison, Martin Luther King Jr., James Baldwin, Cornel West, Barack Obama, Ta-Nehisi Coates, and Keeanga-Yamahtta Taylor. By attending to Du Bois’ political engagements as well as literary representations of political leadership that have been influenced by him in one way or another, students will have the opportunity to explore the premises and implications of racial politics as well as some of the creative ways in which African Americans have sought to overcome racial domination. What are the appropriate roles and responsibilities of political leaders? What is the nature of their relationship to the community? What are the foundations of legitimate leadership and authority? What form should black politics take in order to overcome white supremacy? How should we understand the relationship between class, gender, race, and sexuality? (Available online)

AS.450.704. Poetry and the Visual Arts. 3 Credits.
This seminar will explore relationships between the languages of poems and those of the visual arts, including painting, drawing, sculpture, and photography. We will begin by discussing theoretical essays contrasting verbal and visual artistic expression, and go on to consider, for example, poems based on paintings (Auden’s Musee des Beaux Arts and Breughel’s Fall of Icarus); poetic images that make use of a pictorial tradition (Chinese ink painting in Li-Young Lee’s Persimmons); reciprocal tensions in the poetry and visual art of a single artist (Derek Wolcott); the use of similar techniques, such as the symbolic coding of color, in poems (Wallace Stevens) and in painting (Marc Chagall); and the individual responses of several poets to the same work. The class will use a blog for the posting of visual images and other class-related materials. Requirements will include short papers/commentaries and one long paper.

AS.450.710. The Mind of Leonardo Da Vinci. 3 Credits.
Leonardo da Vinci (1452–1519) was one of the most fascinating individuals in history. He is the creator of what are arguably the world’s two most famous paintings: the Last Supper and the Mona Lisa. He was also a brilliant scientist and engineer; he made dozens of original anatomical discoveries (for example, he injected hot wax into an ox brain to demonstrate the shape of the ventricles), and he invented hundreds of devices (from ball bearings to a steam cannon). He was well-known as a musician, court entertainer, and even as a practical joker. Who was Leonardo? What do we know of his personal life, including his thoughts on religion, sexuality, or politics? What personal traits shaped his genius? This course explores his thousands of pages of manuscripts; his paintings and other artistic projects; his scientific projects (including anatomy, physiology, botany, and geology); and his civil and military engineering projects. (Available online)

AS.450.717. School and Society: Education Reimagined, Possibilities Disclosed. 3 Credits.
<p>This course will engage in a discussion of the current realities and challenges present within the United States' PK-12 education system. We will examine a range of perspectives on what does (and doesn't) work in our educational policies and practices. While this endeavor will entail a critical examination of the status quo, it also will invite students to recognize what is possible and inspiring in the work many courageous educators accomplish in the midst of challenging times. The course will address the following questions: <o:p></o:p></p><ul style="list-style-type:disc">
What are the aims and purposes of education? What should be the content of the curriculum? What are the implications of structural inequality in schools? What are the roles and responsibilities of teachers and students? What are the issues that impact 21st century schools? <p>Instead of seeking tidy answers to these course questions, you should approach this class as an invitation to enter into an ongoing discussion of: <o:p></o:p></p><ul style="list-style-type:disc">
The factors that characterize the relationship that exists between school and society; The principles that underlie the decisions made by those who have the power or capacity to alter that relationship; and
The challenges faced by those who strive (and usually struggle) to resolve competing demands upon this relationship. <p>Please note: this course does not require a background in the field of education. Although practicing teachers are welcome to join this course, it has been developed for a wider audience. <o:p></o:p></p>

AS.450.723. WWII in Visual and Literary Art. 3 Credits.
The length and massive scope of World War II make it singular in the history of warfare: never before had the entire globe been involved in such a protracted and technologically sophisticated war. Since the end of World War I, the weapons and machinery of war had become increasingly lethal, culminating in the advent of advanced, long-range aircraft and the successful manufacture of the atomic bomb. Fighting took place on land, at sea, and in the air, and casualties were huge: over 60 million people were killed, including c. 50 million civilians. Predictably, the war generated new forms of literature and art and made particular use of photography, which for the first time enabled a detailed and often horrific visual record of events. In this seminar, students will focus on important novels and films that appeared in response to WWII, as well as on the photographic record of the war. An emphasis will be placed on using these sources to understand the major historical and military events of World War II as well as the efforts made by soldiers and civilians to survive it.

AS.450.724. Science Fiction Film in the 20th Century. 3 Credits.
This course provides a survey of Science Fiction Film from the early part of the 20th century, and the very beginnings of film, through 2002. We will look at influential filmmakers and will analyze the basic components of the genre through science fiction origins (A Trip to the Moon, Metropolis), "classics" (The Day the Earth Stood Still, Invasion of the Body Snatchers), cult/fan favorites (Star Wars, Blade Runner) and will conclude with a section focused on the 1990s and the dystopic imagination (The Matrix, Minority Report, 12 Monkeys, Gattaca, and Dark City among others.) The goal is to develop critical analytical skills in understanding the role of science fiction within culture. How is science fiction defined? What is the role of science fiction literature in the creation and development of the formula? What is the "science" that drives the science fiction? What does it mean to be human? What is the view of the future, of technology? How are cultural and social concerns expressed through formula? The films and filmmakers are placed within a larger historical, cultural, and social context as we explore film as an industry, as a technology, as a form of communication, and as an artifact of culture.

AS.450.728. On the Shoulders of Giants. 3 Credits.
<p>Since the year 1865 and the passage of the 13th Amendment, America has struggled with its ability to assure the right of all Americans to achieve full participation in our democracy. There have been short periods of advancement, but they have typically been followed by devastating rollbacks of hard fought gains. The new Jim Crow has a chameleon-like character, disguising its true intent and malevolent designs with code words and strategic policies that erode the rights of all citizens, but are detrimental to African Americans and communities of color more than to others. <o:p></o:p></p><p>This course will focus on a number of social justice giants and critical movements or organizations from the 1940s through the present. Key topics will include an examination of certain critical flashpoints in U.S. history that are strikingly similar to the years immediately leading up to, encompassing and following the Obama presidency, with an eye to identifying the social, economic and cultural forces that are at once the precipitants and undoing of these unique movements in time. We will attempt to understand how these forces shaped and were in turn shaped by powerful women like Anna Julia Cooper, Nancy Cunard, and Audre Lord whose life work inspired and provided the intellectual framework for the activism of later generations, led by Angela Davis, Fannie Lou Hamer, and Kimberle Crenshaw. The poet, novelist, playwright, and columnist Langston Hughes, who, along with WEB Dubois, was one of the most committed artists and intellectuals of the Harlem Renaissance, provides a bridge from that period to a new vanguard of voices like James Baldwin, Ralph Ellison, Lorraine Hansberry, Gwendolyn Brooks, Sonia Sanchez, Nikki Giovanni, Maya Angelou, Toni Morrison, August Wilson and many others. This period of cultural literacy was also responsible for rediscovery of influential writers like Zora Neal Hurston, who shared the stage with Langston Hughes during the Renaissance. Hughes, along with Paul Robeson, a true giant among men, confront head on, the worst of American paranoia and censorship, providing an example of courage and perseverance with enormous relevance to the writers, actors, and filmmakers of today and to the artists of all future generations. <o:p></o:p></p><p>Our hope in this journey is that we might find the paths to elevation of our own spirit and commitment to our fellow man. <o:p></o:p></p>

AS.450.736. Medieval England: From Beowulf to the Battle of Bosworth. 3 Credits.
This course traces this history of England from the Anglo-Saxon invasions of the fifth and sixth centuries to the political unrest and economic crises of the fourteenth and fifteenth centuries. Approaching medieval England through the broad lenses of myth-making, nation-building, and identity-creation, we will focus on some of the larger trends and developments that help explain the distinctive liberalism and individualism of English culture, e.g. the breakdown of feudalism, life in the medieval town and on the manor, the origins and evolution of the common law, and the rise of Parliament. Our exploration will take the shape of a multidisciplinary journey and will include in-depth analysis of art and literature as well as religious and political texts.

AS.450.738. MLA Core: Why Read the Classics?. 3 Credits.
There are three questions that rest at the heart of this course: What is meant by the term “classic” when we refer to works of literature and poetry? Why is it worthwhile to read the classics? and What would you include in your personal library of the classics? We will turn to authors, poets, and philosophers for their wisdom and guidance on the topic, and we will read a number of works to help refine our understanding of what the classics mean to us. In doing so, we will engage in close readings of each text, find ways to bring them into dialogue with one another, contemplate the insights they give into the human experience, and explore their relevance in our everyday lives. Students will be asked to write analytical, creative, and reflective responses to these works and to consider the classics that are meaningful to them.

AS.450.739. Race and Jazz. 3 Credits.
The music known as jazz has been celebrated and performed by peoples throughout the world. This course will examine the music itself as well as the role that race has played in the creation of jazz, the perception of its history, and the perceived authenticity of present-day jazz. We will examine the music from a historical perspective through the study of the music and lives of its creators and practitioners beginning with precursors in ragtime and minstrelsy and continuing into the modern era. Students will learn to make aesthetic judgments, identify various jazz styles, and discuss their relevance to their time and to the present. Classes are planned to include guest artists from the Baltimore jazz scene, examples in various media, and live performances by the instructor. (Available online)

AS.450.741. Apocalyptic in the Bible, Religion, and Popular Culture. 3 Credits.
This course explores primary sources of apocalyptic literature in the Bible, the ancient Near Eastern world, and various religions and cultures. In seeking to define the term “apocalypse,” the class will study the political, social, and economic forces that contribute to the formation of this rich genre of literature. Utilizing this knowledge, students will analyze manifestations of apocalyptic in movies, television shows, comic books, and other media.

AS.450.745. Aristotle and Hobbes: Physics, Psychology, Ethics and Politics. 3 Credits.
<p>This will be a course focused on two goals: clarifying the importance of foundational principles (in this case, the different teachings on physics we find in Aristotle and Hobbes), and clarifying the distinctions between the ancients and the moderns. We will be concerned with questions about nature, matter, motion, the soul, ethics, politics, philosophy, and human life – both as such, and in their complex interrelationships. <o:p></o:p></p><p>To address these questions, we will read the works of two extremely important thinkers – the ancient Greek philosopher Aristotle, and the 17th century English philosopher Thomas Hobbes. Aristotle, writing at the dawn of what becomes the Western tradition of philosophy and science, investigates everything under the sun, writing foundational works in fields as diverse as rhetoric, psychology, biology, logic, physics, and metaphysics. If one understands Aristotle, one can understand much of what comes after. Thomas Hobbes writes after the modern “revolution” – a revolution accomplished in the thought of diverse thinkers, especially Machiavelli, Bacon, and Descartes. One crucial element of this revolution is the rejection of both Aristotle and Scholasticism (Christian Aristotelianism). In this course, we will engage in close readings of Aristotle’s Nicomachean Ethics, as well as parts of his Physics and his On the Soul, and Hobbes’s Leviathan. Reading these two thinkers in dialogue with one another will allow us to see how their fundamental disagreements about physics and causality give rise to subsequent differences in how they conceive humanity, psychology, ethics, and politics. In attending to these differences, we can more clearly identify the debts that we owe to both Aristotle and Hobbes for our understanding of ourselves and our civilization. <o:p></o:p></p>

AS.450.746. Deep Ecology: Environmental Ethic. 3 Credits.
Today, the concerns of Deep Ecology’s movement that started in the so-called Ecological Revolution of the 1960s continue to be debated and addressed as “climate change” with a sense of immediate urgency. Deep Ecology asks deep questions and aims to bring about long-range goals in moving away from anthropocentrism to ecocentrism, calling for a major paradigm shift in perception, values, and lifestyles. Planetary and human survival is at stake due to climate change — this is humanity’s global ultimate concern. Scientists, environmental activists, and representatives of humanities agree that we need a new paradigm shift, that it is unsustainable to treat the living earth organism as an infinite resource of “energy.” Western environmental practices have been based on anthropocentric view of nature where humans occupy the top of the hierarchy in the chain of life. There is an urgent need for a new environmental ethic that will fundamentally reorient humans in their thinking and relating to the natural environment. The course examines cross-cultural perspectives of environmental ethics that are rooted in Western/scientific, Eastern, and Indigenous worldviews and religions. This semester’s readings include current debates concerning climate change, selections from Deep Ecology movement and indigenous perspectives.

AS.450.748. The Black Politics of Michael Jackson. 3 Credits.
Michael Jackson was a global superstar who reached crossover appeal in the late 20th century. More than a mainstream pop performer, Michael Jackson was musician, singer, dancer and visual artist who transformed his artistic heritage, deeply grounded in the African American tradition, to reach a broad audience, in the United States and globally. This course aims at reframing Michael Jackson's cultural and social origins to reveal his anchor in the African American musical, philosophical and political traditions. This course will explore the African American historical context of the 1960s, Black vernacular practices, the Chitlin Circuit, the Great Migration, Black Minstrelsy, the intersection of Blackness, Sexuality and Gender in pop culture, Black Globalism, and 1980s Black Hyper-visibility. In this course, students will closely examine Michael Jackson's music, videos, writing and performances, Jackson's meta-narratives, in addition to theoretical texts on critical race theory, American History, gender studies, performance studies and African American Studies.

AS.450.758. American Literature and the Archive. 3 Credits.
Why are some literary works from the past reprinted, anthologized, and considered worthy of study, but not others? Why are some works "lost" and some "rediscovered," while others simply fall out of favor? What is the relationship between the canon and the archive? Focusing on the relationship between authorship and status in nineteenth- and early twentieth-century American literary history, we will use rare books and archival materials from JHU libraries and digital collections to investigate the writings, publications, archives, and legacies of authors such as Edgar Allan Poe, Walt Whitman, Emily Dickinson, Stephen Crane, Charles Chesnutt, Gertrude Stein, Ezra Pound, Zora Neale Hurston, and Langston Hughes.

AS.450.761. Documenting Baltimore Through the Photographic Image. 3 Credits.
<p> In this course, students will explore and photograph six of Baltimore's historic areas:<o:p></o:p></p><ul style="list-style-type:disc">
Waverly and Greenmount Avenue
The East Side: Milton at Preston
Druid Hill Park
Old Chinatown and Howard Street
The Northern Arts District
Stony Run
<p>In the process they will gain proficiency using digital cameras and learn the fundamentals of image processing in Lightroom and Photoshop. There will be a photography field trip and lab each week as well as lectures that concentrate on the documentary image, its history, theory and practice. As the culmination of the course, students will submit a final paper and portfolio of ten images that work together in a series. <o:p></o:p></p><p>Disclaimer 1: This course requires walking distances of up to two miles. If, for any reason, there may be an issue with this requirement, please contact Student Services Coordinator Manal White at 202-663-5956 or mwhite@jhu.edu. <o:p></o:p></p><p>Disclaimer 2: A limited number of cameras are available to be loaned, and registered students should inform the professor as soon as possible if they would like to request one.<o:p></o:p></p>

AS.450.762. Race and Ethnicity in the United States. 3 Credits.
This course examines the historical, cultural, and structural dimensions of race and ethnicity in the United States. We will examine key theories about the ways race and ethnicity are constructed and influence intergroup dynamics; engage in debates regarding definitions of race and ethnicity and forms of prejudice and discrimination; and review and analyze empirical evidence related to racial and ethnic disparities in economic status, educational attainment, health, employment, and the criminal justice system. The course will examine the racial and ethnic experiences of a range of individuals and communities, including intersections with gender and immigration status. We will begin by reviewing a series of key readings in racial and ethnic studies that establish central concepts, theories, and historical contexts. Using a variety of sources, this course will examine the racial diversity of America and the enduring implications of racial and ethnic pluralism. Throughout the course, students will work to expand their critical thinking and reflection skills, make meaningful connections between ideas and everyday experiences, and better understand how the personal experience of race and ethnicity interacts with larger social and historical forces. We will also discuss the ways people work to mitigate and overcome racial and ethnic disparities. (Available online).

AS.450.766. Deconstructing Capitalism. 3 Credits.
<p>After the fall of the Communist regimes 25 years ago, it was assumed in the West, and throughout much of the world, that the Capitalist economic system is the best possible economic system, indeed, the best by nature, and our destiny as a species. This was of course not always the preponderant view. For most of its history, Capitalism was not supreme, and its supremacy was not self-evident, but rather, it knew significant competition.<o:p></o:p></p><p>In recent years, important criticisms of Capitalism have emerged. It seems the Capitalist system may not be so 'inevitable' after all—there are many unhappy with the way it has been rolled out globally, and how it has progressed (or regressed) in the US and Europe. Some critics argue that we just have not been capitalist enough; the key to more widespread prosperity is to embrace capitalism more fully, and a purer version thereof. Some argue that the economic system is not engineered correctly, at the moment, to share its fruits. As a result, we are mired in ever worse inequality, which may prove to pose major political problems in the near future. And then some critics still argue—in light of the environmental damages due to market expansion, for example—that capitalism is incompatible with our furtherance as a species. In this course, we will visit a number of authors and theorists making such cases.<o:p></o:p></p>

AS.450.767. American Civil War and Reconstruction. 3 Credits.
The American Civil War and Reconstruction will include an analysis of the origins, interpretations and causes of the conflict, a study of the institution of slavery and its legacy, a review of the ante-bellum culture of the Old South, a comparison of the political leadership in the Confederacy and the Union, a study of the war years, a comparison of military leaders and their strategies, an examination of the outcomes of the war, an introduction to the rise of the new south and a review of the legacy of Reconstruction.

AS.450.771. Black Queer History. 3 Credits.
This course explores the history of black queer cultures in America. In continuous dialogues with mainstream black and LGBT cultures, black queer discourses have unceasingly redefined the boundaries of sexuality, class, color and gender through history. Starting from slavery, this course will explore black queer struggles, desires, imaginations and victories to understand present-day discourses on race and sexuality. Topics explored include: cross-gender behaviors in slavery, same-sex sexualities in slave narratives, homoerotic sadism and lynching, sexological categories and scientific racism, intimate friendships, Drag Balls, The Harlem Renaissance, rent parties, black-and-tan clubs, Jazz, black queer religious leaders, black queer DC, black nationalists and sexuality, Disco, House music, HIV/AIDS, trans identities and TV black queer characters.

AS.450.772. MLA Core: Ways of Knowing: Historical and Epistemological Foundations of the Liberal Arts. 3 Credits.
This course addresses the philosophical foundations, historical traditions, and contemporary debates associated with liberal arts education. It will explore the underlying theories and principles of liberal education and it will assist students in understanding the different epistemological principles and assumptions that are present within the disciplines that are associated with the liberal arts. Students will compare the interpretations of knowledge, truth, and validity that exist across quantitative, qualitative, and conceptual ways of knowing and conducting research. By the end of the course, students should have developed a greater understanding of the significance of their MLA degree as well as greater clarity concerning the epistemological foundations of their studies.

AS.450.774. Existentialism: Philosophy and Social Critique. 3 Credits.
Alienation, ambiguity, anxiety, absurdity, authenticity, belief, despair, dread, death, freedom, joy, and responsibility—all of these are concerns associated with existentialism and its pursuit of what it means to exist, to be a self, to be a being. This course is structured around a series of critical engagements with some of the most prominent and profound thinkers who contributed to the formation, development, and extension of existentialism; together we will trace trajectories of existentialist thought from early articulations in the 19th century (Kierkegaard, Nietzsche, Dostoevsky), through prominent European pronouncements in the wake of the First and Second World Wars (Jaspers, Sartre, De Beauvoir), to the works of Afro-diasporic writers (Fanon, Wright, Baldwin) who explore the complex relation between being and being black. Through these engagements we will approach existentialism not just as a series of abstract claims, questions, and concerns, but also as a critical method for interrogating issues related to the embodied, interpersonal, and historical dimensions of human life. What critical resources can we find in existentialism for illuminating questions of identity and difference and for making sense of contemporary struggles regarding race, gender, class, and sexuality?

AS.450.781. The Global Cold War. 3 Credits.
The Cold War was anything but for much of the so-called Third World. Although the United States and Soviet Union did not come to blows, millions of lives were lost throughout Latin America, Africa, and Asia as the superpower struggle fueled local and transnational conflicts over decolonization and modernization. This course will examine the Cold War's effects across the globe and, conversely, the ways in which conflicts and actors in the global South shaped the outcome of the US-Soviet standoff and shaped the contemporary geopolitical landscape. Sources will include works of scholarship such as Conflicting Missions, Hanoi's War, and The Last Colonial Massacre; primary works like Discourse on Colonialism and essays from Jawharlal Nehru, Fidel Castro, and Ché Guevara; and films such as The Battle of Chile and The Act of Killing.

AS.450.790. Six Degrees of Miles Davis. 3 Credits.
Miles Davis is one of the most important and influential figures in modern music. His innovations as a bandleader, composer, and musician have made an enormous impact on our concept of jazz music as well as our perception of a jazz musician. Following his personal life leads to Picasso, Norman Mailer, Jimi Hendrix, Prince, Cecily Tyson, and many more. This course will examine his contributions to jazz in particular and his impact on society in general through his autobiography, biographies, and documentaries with special emphasis on his recorded works. We will also use the popular 'six degrees of separation' theory as a starting point in discussing the nature of innovation. (Available online)

AS.450.801. MLA Independent Study. 3 Credits.

AS.450.820. MLA Capstone: Portfolio. 3 Credits.
The Portfolio should be taken during a student's final semester in the MLA Program. It is a capstone option that is designed to help students reflect on their learning in the MLA program and to identify the connections across their coursework. It consists of a series of newly-composed essays along with a sampling of assignments that serve as evidence of learning and intellectual growth. The goals of this capstone project are for students to articulate what the MLA program has meant to them, exhibit their mastery of the program-level learning outcomes, synthesize lessons learned across a range of different courses and topics, and evaluate how the MLA program has met their goals and expectations. The Portfolio can also have a practical application for students who need to meet professional development requirements, to help them explain how the MLA Program has prepared them for a change in professional direction, and for students who hope to leverage this degree into additional graduate study.

AS.450.830. MLA Capstone: Graduate Project. 3 Credits.
The Graduate Project should be taken during a student's final semester in the MLA Program. This course prepares students for advanced research in the Liberal Arts. Students will engage the resources, methods, and problems of graduate-level research, investigate the scholarly literature of topics in their area of interest, design a research or creative project and develop a plan for sustained research and professional participation in their field of study. Starting in Summer 2022, AS.450.600 MLA Core: Interdisciplinary Graduate Research Methods will be a required prerequisite for AS.450.830 MLA Capstone: Graduate Project and for AS.450.850 MLA Capstone: Internship. Once the prerequisite requirement is in place, students must take Interdisciplinary Graduate Research Methods at least one semester prior to enrolling in either of those capstone courses. There will be no prerequisite required for students who enroll in AS.450.820 MLA Capstone: Portfolio.
You must complete AS.450.600 in order to register for this course.

AS.450.850. MLA Capstone: Internship. 3 Credits.
A third option in the MLA Capstone is the Internship; students who choose this option take one IC course, 8 electives, and register for a particular internship, which will culminate in a detailed research report, as the their tenth course. Please contact the program director for more information on internship options. Starting in Summer 2022, AS.450.600 MLA Core: Interdisciplinary Graduate Research Methods will be a required prerequisite for AS.450.830 MLA Capstone: Graduate Project and for AS.450.850 MLA Capstone: Internship. Once the prerequisite requirement is in place, students must take Interdisciplinary Graduate Research Methods at least one semester prior to enrolling in either of those capstone courses. There will be no prerequisite required for students who enroll in AS.450.820 MLA Capstone: Portfolio.
You must complete AS.450.600 in order to register for this course.

AS.450.888. MLA Capstone Continuation.
This course is open to MLA students who have not completed their capstone projects and who need an additional semester to complete their work. It functions like an independent study.

AS.455 (Film and Media)

AS.455.610. Foundations of Immersive Storytelling: Theory & Practice. 3 Credits.
This introductory course will provide students with the tools and the mind set for making compelling VR/AR experiences. While the industry is nascent, the technological and storytelling innovations move forward at breakneck speed. Students will also, each class, dissect to understand the approaches to the current catalog of immersive experiences, ranging from 360 film, to animation and room scale installation experiences, often with creators who made them to understand challenges and lessons learned. Subsequently, after this overview, students will have the option to build their own prototypes and, also, to support a VR/AR project housed within the program with a leading artist.

AS.455.611. Screenwriting Workshop. 3 Credits.
This will be an intensive writing class that will go from basic film idea through the development of a three act outline to the completion of a full first draft screenplay. Each student is required to come to the first class with one or two ideas for a completely new screenplay. Please do not bring anything for which there is a previous outline, treatment, or draft of a script. The focus of the class will be the structure of the feature screenplay as a function of thematic coherence—the structure of the film is determined by what the story means. We will analyze films by act, sequence, and scene to understand dramatic action as a tension between different possible outcomes. There will be five weekend intensive workshop sessions, divided between Friday evening and Saturday that will include some lecture components, some viewing and discussion of films, and reading and discussion of student work. Between the weekend workshops there will be weekly writing assignments and individual Internet or telephone conferences. Expect a relatively heavy workload. A completed first draft screenplay will be a requirement for completion of the class.

AS.455.613. Stories Matter: How immersive experiences and new technologies create social change. 3 Credits.
This course will explore the ways in which emerging technologies and immersive media—including artificial intelligence, mixed reality, machine learning, spatial computing, and blockchain—can be used to advance the goals of social impact and social justice. Covering the topics of interactivity and storytelling, it will also discuss questions of flow, agency, design thinking and human centered technology. Each session will include case studies, and there will be presentations by leading experts in the field, followed by in-class discussions. Students will be expected to design and prototype original immersive projects, as well as read and write short essays throughout the semester.

AS.455.615. Episodic Writing Workshop 1 – The Pilot. 3 Credits.
This course will expose students to the mechanics and realities of writing an original pilot for a television series, from concept through beat sheet to draft. Each student will finish the semester with a mini-series bible, a detailed outline and the first half the draft of the pilot. Dramatic goals, character arcs, operational themes will be a few of the many subjects covered.

AS.455.616. Episodic Writing Workshop 2 – Comedy. 3 Credits.
This workshop teaches you how to write a television script for your favorite half-hour comedy. In this class students will learn the basics of script writing, from premise lines and beat sheet, to writing pages, punching up dialogue and polishing the draft. The focus here will be on a writing a "spec" script for a current television half-hour comedy, critiquing and workshopping the script as one would in a professional writers' room. Though in this class we will not be developing and writing pilots, we will discuss the process and students will learn the basics of pitching an idea to networks. This course is designed to prepare students for the professional world.

AS.455.618. Episodic Writing Workshop II - The Writers' Room. 3 Credits.
Imagine your one hour dramatic pilot script has just been picked up to series, congratulations. Find out what really happens in the writers room to turn one pilot into many episodes. Learn how to add depth to your original characters, create new ones and develop future storylines. Having already completed or substantially completed a one hour dramatic pilot script is a plus, but not required. Taught by Tammy Ader Green, a writers room veteran and the creator/showrunner of the long-running Sony series “Strong Medicine.”

AS.455.619. Business of Non Fiction Film & TV. 3 Credits.
In an era of record-setting festival acquisitions and a thriving demand for nonfiction content from television, theatrical and streaming platforms, it is evident why our cultural moment has been described as a modern “golden age” of documentary filmmaking. But for an aspiring filmmaker, what is the best way to break through and navigate this terrain from the business perspective? Covering avenues related to storytelling approach (feature-length, series, short form etc.), producing and exhibiting work (pitching, budgeting, fundraising, proposal-writing, festival strategy, distribution, etc), and the organizations and outlets on the forefront of documentary decision-making, this course aims to situate students in the contemporary market of nonfiction filmmaking. Over the course of the semester, students will develop an idea for a nonfiction film or series into a refined pitch and proposal, applying the strategic knowledge gained from a series of lectures, screenings, case studies, and conversations with established industry professionals and filmmakers.

AS.455.620. Fundamentals of Business 1. 3 Credits.
This comprehensive business seminar is centered on presentations and interactive sessions with experts in the field, the study of relevant case studies and the creation of sample plans and strategies by the students. During the first semester we cover such subjects as entertainment law, film finance, production, marketing, public relations and distribution. Emphasis is placed on analyzing and recreating actual and relevant case studies and business situations. Other subjects include sales estimates, comps, tax credits, festivals, release strategies and the art of the pitch.

AS.455.621. A Filmmaker's Guide to Protecting Your Work: Intro to Intellectual Property & Entertainment Law. 3 Credits.
By dynamically using real-life case studies as a basis for discussion and learning, students in this course will explore the legal and business affairs aspect of filmmaking. We will examine the meaning and structure of copyright law, fair use, option & purchase agreements, key crew & talent agreements, distribution agreements, tax credit/rebate statutes, music licensing and product placement deals, among other topics.

AS.455.624. Social Impact Documentary Filmmaking. 3 Credits.
In this hands on course, students will learn the basics of documentary filmmaking from development through post production and social impact. Through a series of screenings, discussions and real-time filmmaking exercises, students will engage in a process of exploration and discovery focused on honing each filmmakers personal voice. There will be a strong focus on telling stories with a clear and provocative point of view. Students will leave the course with a strong bio and personal statement, and having completed 3-5 minute documentary on the subject of their choosing.

AS.455.625. Creative Producing & Line Producing. 3 Credits.
Through in-class projects, interactions with working producers, line producers and AD's and on-going independent productions, students will be exposed to the myriad responsibilities of producers, from the creative and on-the-field perspectives. We will explore the many elements that make up the creation of films and television shows, with a focus on a producer's creative input from development to post production to a producer's understanding of the nuts and bolts fundamentals of how to budget and schedule.

AS.455.626. Mixing Sound for Picture. 3 Credits.
This course is a practical exploration of all aspects of mixing audio for film and tv. The students will prepare to mix during the first half of the semester, topics will include dialog editing, automated dialog replacement (ADR, or "looping"), Foley, music editing and sound effects spotting as well as basic sound design. Recording of ADR and Foley will take place in the studio at the JHU-MICA Film Centre using condenser and dynamic microphones. The class will shift its focus in the second half of the semester to re-recording mixing, exploring both the technical and creative aspects of mixing. Students will learn to mix in the Film Centre's control room using Avid Pro Tools HD software for Apple macOS with proprietary and third-party software plug-ins. Upon completion of the course, students will know how to provide final mix files as well as stems, i.e. mix minus, M&E, dialog, sound effects, and music. Projects will include spotting, prepping, building and mixing a short film or series of scenes.Class will occur during a three-hour weekday evening throughout the semester in the sound studio of The JHU-MICA Film Centre, where students will work as a class to record and edit group projects and, schedule permitting, individual projects.

AS.455.629. Key Business and Legal Considerations for Creators. 3 Credits.
It is an exciting time to be a creator, but with constant and vast changes in the media industry including the ongoing emergence of new technologies and evolution of distribution platforms, threshold business and legal considerations have never been more complicated, or important. This class is structured around a single production project, from conception to exploitation. Students will learn to form a Limited Liability Company, understand and negotiate key agreements, strategically engage cast and crew members, negotiate licensing deals, obtain production insurance, participate in festivals/live events and distribute their project.

AS.455.630. Recording Sound for Film. 3 Credits.
This course serves as an orientation to the recording studio and the craft of capturing sound with microphones. Topics will include sound behavior (i.e., basic acoustics), human perception of sound (i.e., basic psychoacoustics), microphone theory and techniques, signal flow and processing, basic digital audio theory, and the digital audio workstation (Pro Tools and Logic Pro). Projects will include in-studio and location recordings. By the end of the semester students will be able to effectively navigate the studio at the Ten East North facility and capture sound on location for use in subsequent classes. Should be taken prior to or concurrently with AS.445.631 Designing Sound for Film.

AS.455.632. Sound on Film I. 3 Credits.
According to director George Lucas, "sound is half of the picture." Great directors have always known the secret power of sound in filmmaking. While film is certainly a visual art, take out the sound and you have lost "50% of the film," as director David Lynch has said. In this course, we follow the rapid ascent of sound in film, from early talkies to the emergence of sound as an art form of its own. We will trace the technological innovations and study the artists who helped develop the nuanced language of sound in film, surveying a variety of cinematic genres and analyzing different approaches to sound design. By the end of the course, students will have an understanding of the history of sound in film, the tools and techniques used to create soundtracks, and the essential role sound plays in the cinematic experience. The course will include extensive readings as well as viewing films, writing analytical papers and a lively ongoing discussion.

AS.455.634. Designing Sound for Film and Media. 3 Credits.
Explore the use of software and hardware as a means to create, capture, and edit music and sound for picture. Examine the role of music and sound in media and develop the skills to operate software instruments and Digital Audio Workstations. Gain an appreciation for the craft of composing music for picture - including fundamentals of music, 'spotting' a scene, and creating simple music 'cues'. Additionally, learn about editing and recording sound effects and dialogue to create complete soundtracks that incorporate soundscapes and musical compositions.

AS.455.635. Sales, Acquisitions and Marketing. 3 Credits.
This class will explore the ways films reach an audience. We will examine festival strategy and traditional theatrical distribution as well as changing ancillary and online markets. Case studies of successful marketing campaigns across genres and platforms will be used as evidence. Testimonies by guest lecturers who work in the field of distribution will supplement the core syllabus.

AS.455.637. Comedy Writing - TV Spec Script. 3 Credits.
This course will expose students to the mechanics and realities of writing a spec script or pilot script for episodic comedy, from concept through beat sheet to draft. We will study, analyze and break down a specific television show then proceed to sketch out a spec episode based on that show. Each student will finish the semester with a detailed outline and the first pages of the draft. Genre, act structure, dramatic dialogue and cold-opens will be a few of the many subjects covered. In this course, students will be working on a half-hour comedy series.

AS.455.638. Technology and the Future of Humanity. 3 Credits.
Humanity at once refers both to all human beings, in their different forms and manifestations, and to standards of humaneness – including love, benevolence, care, and dignity. This course will examine questions of how are we to be in this world (individually and collectively) with technology; how are we now; and how should we be. It will do so by engaging in a wide-ranging survey – delving into questions of ethics (of information, of privacy, of environment) and complexifying what forms of knowledge we ascribe value to (drawing on indigeneity and indigenous forms of knowledge, for example). The course will then examine specific instances of humane applications of new technology in the fields of peacemaking and peacebuilding, psychiatry and intergroup relations, and storytelling by those on the margins (indigenous communities, victims of climate change, conflict and violence, and the socioeconomically disempowered). From that point, using a speculative design and thinking framework, the course will challenge students to reflect on desirable and undesirable futures, and likely futures. With a backcasting approach, the course will ask students to consider what systems, milestones, decisions, activities, policies and strategies need to be in place to effect desirable futures.

AS.455.640. Graduate Filmmaking Studio I. 3 Credits.
This two-semester course is the centerpiece of the graduate experience. The studio meets for three hours weekly and is co-taught with the MICA MFA Program. This hands-on studio is where good, smart and compelling movies are born. Students will work in groups, particularly during their first semester. While writing and editing are often solitary activities, production is not. Great films are collaborations and students will be expected to work in teams. Group discussions and critiques are balanced with individual meetings with faculty and visits with guest filmmakers. Special emphasis will be placed on ways that filmmakers can build and reach an audience. Students will explore the diverse ways filmmakers are sustaining careers while creating high impact films. Students will have the opportunity to create a wide range of short form work over the course of the 2 semesters.

AS.455.641. Graduate Filmmaking Studio II. 3 Credits.
This two-semester course is the centerpiece of the graduate experience. The studio meets for three hours weekly and is co-taught with the MICA MFA Program. This hands-on studio is where good, smart and compelling movies are born. Students will work in groups, particularly during their first semester. While writing and editing are often solitary activities, production is not. Great films are collaborations and students will be expected to work in teams. Group discussions and critiques are balanced with individual meetings with faculty and visits with guest filmmakers. Special emphasis will be placed on ways that filmmakers can build and reach an audience. Students will explore the diverse ways filmmakers are sustaining careers while creating high impact films. Students will have the opportunity to create a wide range of short form work over the course of the 2 semesters.

AS.455.642. Advanced Cinematography Workshop. 3 Credits.
The Director of Photography has instrumental role in crafting the final look of a film. In the course, the four creative roles of the cinematography department – Camera Operator, Gaffer, Key Grip, and Dolly Grip are examined in-depth. Through a series of screenings, discussions and workshops, the students learn many of the dynamics between these roles. In class, students will mount detailed and intricately lighted shots. Students will work with the Arri Amira, a professional motion picture camera. Camera topics include camera settings & trouble shooting, on-set data management, ALEXA color science, working with LogC, look management, and dailies creation. Prerequisites: AS.455.640 (Graduate Studio I) or a demonstrated basic camera proficiency

AS.455.643. The Future of Cinematic Gaming. 3 Credits.
An introductory course that provides students with an overview of the process to create innovative and meaningful cinematic stories in the evolving field of interactive games. From concept to completion, the class will explore the creative architecture, production process and technical considerations necessary for developing for the new wave of interactive entertainment across platforms. Drawing from theoretical and production frameworks in game design, narrative and documentary filmmaking, art, immersive theatre, and motion capture––critical attention will be given to intuitive and engaging design. The hands on portion of the class will culminate with students developing a prototype for their own original interactive cinematic project.

AS.455.644. Podcasting Fundamentals. 3 Credits.
In this introductory course, students will ultimately create their own short podcasts around stories that are meaningful to them and their intended audiences. Students will enact principles of listener-centered design, they'll work to find stories worth telling, and they'll learn to tell those stories powerfully. This course will build competency in recording and editing techniques, interviewing skills, creating story structure, and understanding the potential social impact of documentary work. Students will also study current monetization strategies in the booming podcast market and learn how to find, keep, and grow an audience.

AS.455.645. Production for Creative Technology. 3 Credits.
This intermediate course takes you through the workflows of producing compelling narratives with emerging technologies like VR, AR and AI. Students will get an opportunity to work collectively on a project with the deadlines, pressures and challenges that come with delivering a quality product for a world class client. Students will also prototype existing ideas and proposals developed in other ISET courses, or new ideas generated from class, to create something that can be showcased in their portfolio, or be utilized long term as a capstone project. Prerequisite: Students must have taken as least one ISET course though some exceptions will be granted on a case by case basis.

AS.455.646. TV Series Development: Pitching, Process, Pilot. 3 Credits.
Do you have an idea for what you believe would make a great TV show? Find out what really happens in the television development process. Over the course of the semester, you will develop and pitch up to three ideas as well as write a series bible and select script scenes for one. Taught by television writer/creator/showrunner and pitching veteran Tammy Ader Green, this course will teach you what it takes to go from dreaming to streaming.

AS.455.647. Virtual Production: A New Era of Filmmaking. 3 Credits.
<p>Lush and realistic virtual worlds that were recently impossible are suddenly commonplace. These synthetic scenes surround us, hidden in sweeping virtual backgrounds on film sets or featured prominently in seemingly endless videogame landscapes. While breakthroughs in computer graphics and game engines make this possible, new tools make it common. The hidden development conjuring up seemingly anything is a new class of reality capture and filmmaking tools that creators to quickly bring the real world into virtual spaces. These are the tools of virtual production and volumetric filmmaking. </p><p>This course starts with personal stories, transforming a vivid memory into a sharable immersive experience with tools and insights from volumetric filmmaking, virtual production and game design. Students learn how to adapt a script for immersion, 3D modeling, photogrammetry scanning, and applying techniques like virtual lighting, virtual cinematography, and the basics of motion capture and volumetric capture to bring their scene to life. The course invites students to create lush and imaginative worlds immediately with common hardware – mobile phones and computers. </p>

AS.455.648. Directing Workshop. 3 Credits.
Students develop and workshop short narrative scripts that they write. The course covers working with actors and understanding the filmmaking process from the actor's point of view. Students visualize their scripts so they are prepared to work with a Producer, Director of Photography and additional crew. The course also explores techniques of blocking and staging action for the camera, with emphasis on the practical problems and aesthetic questions that arise.

AS.455.650. Script to Screen. 3 Credits.
This course de-mystifies the film development process and teaches students the key tools necessary for a successful career as a film executive or producer. This course will chart the key stages of finding and preparing a good project for production. These steps include how to find, evaluate, obtain rights and shape material from the producer's perspective. The course will examine strategies employed by filmmakers who adapt existing IP and literary works to the screen. Detailed comparisons between cinematic adaptations and the novels, plays, and short stories on which they are based. Case studies of literary works that pose a variety of challenges to filmmakers.

AS.455.651. Film Financing. 3 Credits.
Successful producing involves the bridging of the creative with the commercial. Effective producers need the skills to structure and manage fundraising efforts on behalf of their productions and establish a comfort level in defining and promoting their projects as commercial ventures.<o:p></o:p></p><p>At its conclusion, students should have a working command of both the theory and the practice of raising money for film, television and new media productions and the skill-base to embark confidently on their own fundraising efforts. Students will learn of the various mindsets of attorneys, financiers, and other professionals and master the vocabulary of content as investment. Finally, students will understand how to mix- match financing strategies and approaches as is appropriate for each particular project.<o:p></o:p></p>

AS.455.652. Digital Media: Storytelling & Strategy. 3 Credits.
We live in a world where content is queen and more money is being poured into original content than ever before, but what does this deluge of money and distributors mean for creators? In this course we'll take a dual-pronged approach to the digital media landscape—looking at business strategy and creative process in tandem to understand how to take a holistic approach to selling content in a shifting marketplace with an ever-increasing number of buyers. How is digital distribution of video changing the traditional media business models? How does a content developer create a scalable business in this environment?This course will feature a practical element in which all students will pitch, develop and produce digital content, melding business strategy with creativity to create saleable IP with potential for multiple distribution partners and revenue streams. The course will feature industry executives and independent creators as guest lecturers.

AS.455.800. Capstone for Film & Media. 3 Credits.
Guided by meetings with the instructor and other guest speakers from the industry, students research, develop and deliver a final project that demonstrates skill in one or both of their concentrations. Ideally, this project will be completed in collaboration with a student or students from the JHU MA or MICA MFA program who are completing their own capstone projects.

AS.455.801. Independent Study. 3 Credits.

AS.455.803. Capstone Continuation for Film and Media (non-credit).
Capstone Continuation is required for those students who have taken the Capstone Course but not yet finished the required and approved work.

AS.460 (Museum Studies)

AS.460.601. Exploring Museum Professions. 3 Credits.
Managing a 21st-century museum relies upon the coordinated efforts of a wide range of specially skilled staff from directors, curators, and educators to collection managers, conservators, and exhibition designers to event planners, press officers, fundraisers, and administrators to media, IT, membership, security, and facilities management teams. These professionals working behind-the-scenes or out front with the public define the quality of the institution and each visitor's experience. Through readings and interviews with leaders in the field, this course examines the core functions of a museum and explores how the roles and responsibilities of museum professionals assure an organization's daily operation, growth and sustainability. Current issues facing museums, including diversity in the workforce, financial challenges, and the effects of technology will also be addressed. In addition, students will engage in activities to help strategize their own museum career. Note: This course may be taken as an elective, if you have taken 460.602 to meet the requirement.

AS.460.602. Museums in the Digital Age. 3 Credits.
The ever-expanding use of digital technologies in museum practice is more relevant today than ever before. Technology has changed the traditional role and scope of the museum through global communication, interaction with diverse audiences, and promotion of cultural understanding. The use of technology in the museum field is introducing new forms of audience engagement and access, challenging exhibition concepts, and affecting the museum's core operations. This course explores the impact of technology on the museum, including an examination of the current uses and effects of digitization, social media and mobile technologies by these institutions, while considering future possibilities in the digital realm. Students in this course engage in a Twitter project for professional research and networking, as well as apply the basic concepts of strategic planning to a museum technology project.

AS.460.604. Introduction to Museum Education. 3 Credits.
This course introduces students to the critical and fundamental educational function of museums, the core responsibilities of museum educators, and the impact of museum education practices in a pluralistic society. We review theories of how people learn, current teaching practices in museums, and the unique roles that objects play in an informal learning environment. We analyze the wide range of audiences for education programs, approaches to developing museum programs and interpretive projects, and strategies for measuring success. We learn how museum educators advocate for and activate diverse perspectives internally and externally in order to make museums more inclusive, empathetic, and user-centered.

AS.460.606. Exhibition Strategies. 3 Credits.
This course introduces the diverse strategies and approaches used in exhibition planning, development and implementation. It asks students to think critically about exhibitions and the interface between objects, concept and experience. The course focuses on visitor-centered interpretive design and is applicable to a wide range of institutions. Students spend much of the semester working together in small teams, collaboratively producing a comprehensive exhibition project as they walk through the practical steps in exhibition development and design. Note: Because of the high level of online group work, this course is not recommended for first semester students.

AS.460.608. The Business of Museums. 3 Credits.
Museums are stewards of cultural patrimony, disseminators of knowledge, and agents of civic and social awareness. They are community icons, places of respite, economic drivers, and centers of informal education and public engagement. In serving these functions, museums must deal within a hyper-competitive entertainment and commercial environment. While they serve the greater good, they must function as businesses. As nonprofits, they cultivate financial and community support from individuals and donors. They also rely on fees, grants, sponsorships, retail operations and other strategies to survive. This course is a journey through the business side of the museum world. Students will explore the range, fundamentals, and subtleties of the museum world including mission, governance, programming, management, finance, fundraising, public relations, legal and ethical issues, technologies, risk management, audience engagement, leadership, and strategic planning, all in the context of current news stories and events.

AS.460.610. Two-Week Onsite Seminar. 3 Credits.
A two-week or 10-day intensive period of on-ground museum study in a location organized by the MA in Museum Studies program. The seminar includes practicum opportunities in a variety of museum settings, conversations with local museum professionals, and class sessions that integrate the daily experiences. Using the rich diversity of museums in the designated location, this course provides students with the chance to use what they have learned in their prior courses, develop networks with fellow students and museum experts, and explore the latest in museum practice. Seminars may require some assignments prior to arriving onsite. Students work on directed activities during the two-week period, coupled with multiple site visits focused on the academic work being accomplished. Daily journal entries and a post-seminar reflection paper require students to synthesize knowledge gained across courses in the Museum Studies program. Note: As a prerequisite students must have completed a minimum of six courses in the program to register for this course, one of these courses must be 460.601 or 460.602 (students seeking an exception to the pre-requisite requirements can apply to the Program Director). Students are responsible for travel to and from the location, accommodations, and meals, as well as any specified field trip fees. Waiver option: Students who are unable to travel to a seminar location due to accommodation needs, financial hardship, or family challenges may apply to the program director for a waiver to the two-week seminar. If a waiver is granted, the student must enroll in the Virtual Seminar option (460.752) to fulfill related components of the degree requirement. Students may also apply to the Program Director to substitute the Cultural Heritage Management Seminar (465.708) for the Museum Studies Seminar.

AS.460.611. History & Philosophy of Museums. 3 Credits.
From cabinets of curiosities to historical monuments and sites of memory, this course surveys museum history from a global perspective to examine how the museum's function has changed over time. Students create a comprehensive timeline of museum history and philosophy —thinking through and visualizing the way certain concepts and events are related in time and across space. Through case studies and course readings in museum history, theory and methods, students will contextualize the philosophical trends that have impacted organizational structures, outreach, collection strategies, and the museum's role and relationship to its public.

AS.460.615. Museums and Community Engagement. 3 Credits.
This course explores how museums and cultural organizations of all sizes can strengthen their relationships with the communities they serve. No longer are museums measured and judged solely by their internal resources—collections, endowments, facilities, and staff—but rather by the external benefits and value they create for individuals and communities. Growing numbers of museums are learning to make their organizations more meaningful and relevant by involving their communities in ongoing planning and decision-making. They are reframing museum activities to focus on what matters to their communities. By getting involved in community challenges and developing new partnerships, they are identifying underserved audiences and creating memorable visitor experiences. As museums begin this journey towards community engagement, they are initiating and facilitating social change and moving towards social entrepreneurship. This course includes the theory and skills of community engagement, drawing on both research and practice for examples.

AS.460.616. Museums, Law, and Policy. 3 Credits.
Legal issues and concepts are a fundamental part of the day-today management of museums and the policies that shape the nature of museums. This course introduces students to theways in which museums are affected by the law and key legal concepts. Discussions and assignments will address practical concerns as well as policy and conceptual matters, incorporated cases, mock negotiations, and group discussions. Students will be able to identify issues from hypotheticals and relevant legal concerns and resources. The course will help students understand legal matters in museum practice in an applied manner. Legal and policy discussions will include current issues in copyright, freedom of speech and censorship matters, and collections issues including cultural heritage developments.

AS.460.618. Museum Controversies: Ethical Issues in Museums. 3 Credits.
Museum directors, curators, and other staffers have faced an array of political and ethical dilemmas in an increasingly contentious environment. This course explores the historical,political, and cultural backgrounds to controversies surrounding exhibitions such as the Smithsonian's display of the Enola Gay, the Brooklyn Museum of Art's "Sensation," the British Museum's Elgin Marbles, and the showing of illegally acquired antiquities at various art museums. Nationalism, religious beliefs, obscenity, and "edutainment" are among the issues discussed.

AS.460.619. Museums, Race, and Inclusion. 3 Credits.
For over two decades, museums have been grappling with how to increase participation and engagement with community members who are historically under-engaged. By and large, the 2012 Center for the Future of Museum's Report informs us that of the core group of museum visitors, less than 10% represent visitors of color. This course will examine the historical arch of diversity and inclusion initiatives in the field including recent activism as engineered by museum activists and change-makers of the Inclusive Museum Movement. We will explore and define discourses of participation within museum scholarship. This course will use interdisciplinary pedagogies such as Critical Race Theory and Social Inclusion Theory as informative frameworks to help us interrogate our current museum praxis, the museum space, and how invisible social structures such as institutional racism, privilege, and oppression impact our understanding of terms such as diversity, inclusion, equity, and access. In this course, we will explore why race matters in museums and seek to create and identify new discourses on diversity and inclusion for a more vibrant, 21st century museum social ecosystem.

AS.460.620. Accessibility in the Museum. 3 Credits.
Making museums and their information and collections accessible to people with disabilities concerns more than ramps and restrooms. People with disabilities can encounter barriersto every aspect of the museum experience, from finding out about exhibitions and educational offerings before a visit through advertising or the museum's website; to getting to, intoand around the museum galleries and other public spaces; to hearing tours and lectures, reading labels and signs, and using interactive tools; to participating in educational programs. This course will introduce students to the key concepts and issues associated with making museums accessible to and inclusive of people with disabilities.

AS.460.621. Museum Evaluation and Audience Research. 3 Credits.
This course explores audience research and evaluation theory, methodologies, and practical implementation in museums and similar environments. The class explores the three main stages of research and evaluation - front end, formative and summative - and what can be achieved at each stage, with a focus on exhibition and program evaluation. Each semester a museum client presents a real project; in small groups students develop clear research questions, an evaluation plan, an interview tool and an observation tool, all in conjunction with the client. A final presentation ensures the client's evaluation needs are met and workable tools have been created. Students also spend time developing individual projects for their own museums, or museums in their communities. Emphasis is given on evaluating the holistic visitor experience, examining what is working and what is not - educationally, physically, and socially. This course is useful to all museum professionals, in any role within a museum, whether you plan to conduct, oversee, or in any way participate in audience research and evaluation.

AS.460.622. Evaluation Projects and Practice. 3 Credits.
Building on the successful introductory evaluation course, this more advanced course will allow students who have completed the initial course to develop and complete a full evaluation project. It will emphasize hands-on application, including tool development, data collection, data management, and data analysis. Students will begin with a project in their community, they will develop evaluation questions and an overall evaluation plan, collect a rigorous sample size, and then analyze and present their findings in both written and oral final presentations. Prerequisite: Evaluation Theory & Techniques for Museums (460.621)

AS.460.628. Architecture of Museums. 3 Credits.
This course serves as an introduction to museum architecture, including the history of museum buildings, as well as current case studies of renovations, expansions and new facilities. We will discuss the relevant topics in creating a physical museum space, such as developing a museum program, planning the visitor experience, developing wayfinding systems, building a green museum, and incorporating technology in the initial plan. We will analyze museum buildings from multiple perspectives, including visitors, staff and collections. Students will learn how to evaluate an existing museum building and will be guided through a mini-POE (post-occupancy evaluation) of a museum in their community.

AS.460.630. Exhibition Design, Construction, and Documentation. 3 Credits.
Understanding the exhibition design process, from concept to implementation, is valuable not just for exhibition developers, but also for registrars, curators and museum educators. Looking beyond artifacts, storyline and aesthetics, this course examines the rarely explored, but essential, aspects of exhibition design, from drawings and specifications to contracting and installation. Topics will include drawing packages and project documentation, schedules, client and developer responsibilities, project budget, architectural coordination, fabrication techniques, and legal and practical contracting considerations. As with general construction, the exhibition designers and fabricators follow industry standards, and whether a museum is a public or private organization, specific rules must be followed for solicitation and contracting.
Prerequisite: Exhibition Strategies(460.606)
460.606 is a pre-requisite for 460.630

AS.460.632. Practice of Public History. 3 Credits.
Twenty-first-century public history has expanded beyond the simple definition of "history outside the classroom" to include almost any effort to develop and communicate history-related content, from museums and historic houses to movies and social media, to inform, and even influence, audiences. This course provides a comprehensive overview of public history as a modern, engaging field of practice, with a skill-building focus on digital storytelling as the key tool for reaching existing audiences and building new ones. It is now a heavily democratic field in the sense that it can be practiced anywhere, by anyone — and therein lies additional challenges for museum and public history professionals. Consequently, we will cover the fundamental elements of practicing public history — including fundraising, governance, interpretation, and countering false narratives — while also introducing students to the process of digital storytelling, which merges the strength of visual and audio media with the power of narrative storytelling to produce informative and persuasive history-related content. By the end of the course, students will have a working knowledge of the ways that modern public history practitioners understand their roles and leave with a toolkit of new media skills to help them shape their own careers.

AS.460.633. Conservation-Restoration: A 21st Century Approach. 3 Credits.
Conservation-Restoration has existed for hundreds of years, and conservators have been active in museums and the heritage industry since their inception. This course will explore the history of conservation-restoration, how it has changed over time, where it is today and where it might be going tomorrow. Students will become fluent in conservation-restoration research methods and publishing sources, able to identify good sources for information, and to understand the ethical issues in the field. The Getty Art and Archaeological Technical Abstracts (AATA) Online have partnered with this course to provide material for students to review, abstract, and publish on their online bibliographical database. The final project will be the culmination of a semester's worth of research and writing about a conservation-restoration or collections topic and presented as an encyclopedic article in Wikipedia.org. On completion of this course students will be able to call themselves a Wikipedian and a Getty AATA abstractor and they will have a working knowledge of the field of conservation-restoration as it applies to museums and the heritage industry. Prerequisite: Collection Management (460.666).
460.666 is a pre-requisite for 460.633

AS.460.634. Museums, Libraries, and Archives: Issues of Convergence for Collecting Institutions. 3 Credits.
“Convergence” has been a buzzword for archives, museums, and libraries for most of the past decade. This course will look at areas of convergence among the three communities, focusingon issues that relate specifically to collecting institutions. Class work will involve the history of collecting and the development of the three communities (archives, libraries and museums) inthe United States in the late 19th century/ early 20th century, before delving more deeply into ideas and ideals, missions, professional training, conservation, ethics, and services that areshared among these communities. In the final weeks we will focus on how technology can help shape ongoing dialogues.

AS.460.635. Curatorship: Principles and Practices. 3 Credits.
Whether the museum is large or small, public or private, has several curatorial departments or a single director/curator, it must have a way to fulfill its curatorial obligations. Everyone in the museum should understand the institution's curatorial responsibilities, and every museum should have a curatorial strategy suited to its collection and/or its exhibitions. In this course, students will study principles and practices relating to core curatorial functions, learn about the relationship of curatorship to the museum's mission, investigate current challenges facing museums and curatorial staff, and consider how technology is changing the ways museums fulfill their curatorial responsibilities. Students will research, write about, and present objects; draft an acquisition proposal; and work almost exclusively in groups for the second half of the semester to create and present an exhibition proposal.

AS.460.636. Living Collections. 3 Credits.
Zoos, aquaria, botanical gardens, and nature preserves, like many other museums, are collection-based institutions. This course explores the unique character of these institutions in their core functional areas including the special considerations and challenges of caring for, interpreting, and exhibiting living collections. Developed by three museum professionals with specialties in terrestrial, aquatic, and botanic institutions-course topics are explored through the lenses unique to plants, animals, and marine life. In addition to understanding the core functional areas of these museums students will analyze the complex social role of cultural institutions which are devoted to the living world.

AS.460.637. Curating Online Exhibitions and Experiences. 3 Credits.
Today, every museum must have an effective online presence. Increasingly, museum professionals from multiple disciplines – curatorial, collections management, new media, publications, external affairs, etc. – need to collaborate to create online exhibitions and experiences. It is essential that museum professionals have a solid grounding in the theory of online curation, as well as the practical skills to plan, design, and implement online exhibitions and experiences that capture the imagination of online museum visitors. Students will discuss questions such as: What are the unique challenges of curating online? How are the aesthetics of online spaces similar and/or different from traditional bricks and mortar museum galleries and exhibit spaces? What strategies and methodologies can the curator and other museum professionals apply to successfully educate, inform, and engage online exhibition visitors? What are the trends in curating online museum exhibitions, and where does the future lie in this exciting new area of the museum field? Course readings, assignments and discussions will culminate in a research paper on current trends in online curation in museums.

AS.460.638. Preservation of Analog and Digital Photographs. 3 Credits.
This course will explore the main principles in caring for analog and digital photographic collections. It has been designed as a broad approach to the subject, but with enough depth to give the student an approach to the care for photographic collections with both historical and natively born digital photographs. This course will provide this insight from looking at the materials that photographs are composed of, understanding the materials and environment that they are housed in, and the technologies and workflows needed to care for analog and natively born digital photographs for long-term preservation. Students will be required to build and present a case study and a final project discussing a topic related to the course.

AS.460.639. Material Culture and the Modern Museum. 3 Credits.
From the Mona Lisa to Archie Bunker's easy chair, museums play a critical role in the collection, preservation, and interpretation of objects. This course looks closely at the development of material culture studies and its connection to museums in the 21st century. Students will explore collecting as meaningful action, the classification of objects (from academic categorizations to tags and folksonomies) and their access (from collections to archives, to physical and virtual display). Student-developed object biographies will be used throughout the semester to explore the life history of objects, their changing meanings, and their relationship to self, society, and the museum. Note: Students are strongly encouraged to have completed two courses in the program before registering for this course.

AS.460.640. Educational Programming for Museum Audiences. 3 Credits.
Educational programming for today's museums requires more skills than ever before, from defining mission-driven educational goals to conducting summative evaluation, from understanding learning theory and characteristics of a myriad of museum audiences, to designing and implementing technology solutions. Students in this course will learn the steps needed to design sound educational programming in museums, including developmentally appropriate learning theory and strategies for audiences such as children, families, adults, teachers, and students.
Prerequisite: Introduction to Museum Education (460.604)

AS.460.649. Immersive Technologies and the Future of Museums. 3 Credits.
What are immersive technologies and how will they shape the future of museums? This course examines how emerging technologies, such as Augmented Reality (AR), Virtual Reality (VR), 360° technology, spatial computing, and machine learning can be used to support the museum's mission in an ever-evolving landscape of interactive and immersive experiences. Students will learn the fundamentals of a variety of technologies and how they can be used to enhance museum goals such as audience engagement, curatorial and exhibition initiatives, educational programming, and documentation. Students will analyze case studies of how museums are currently using immersive technologies in order to envision future applications.

AS.460.652. The Practice of Museum Publishing. 3 Credits.
As content originators, museum curators, educators, conservators, public relations officers, development staff, and others will hold a stake in the publications process at some point in their careers. This course presents an overview of the range of print and electronic publications typical—and not so typical—of museums and the processes required to make them happen. Students will gain an understanding of schedules and budgets, the editorial process, design concepts, copyright issues and printing, as well as how new technologies have affected both the way museums think about publications and how they get produced.

AS.460.655. Expanding Roles of Museum Marketing and Communications. 3 Credits.
Major changes in technology have dramatically shifted how people consume information. It is critical for museum professionals to understand this and to adapt their marketing and communications strategies in order to compete for attention in an increasingly busy and competitive world. Looking through the lens of audience development, the course explores how museum marketing and communications professionals are empowered to target and engage audiences and the strategies they employ to do this work. From understanding the basics of the marketing mix and the science of public relations to surveying advances in digital advertising and exploring case studies highlighting innovative practices within and beyond the field, this course is a comprehensive primer for museum marketing and communications today.

AS.460.657. Fundamentals of Museum Fundraising. 3 Credits.
Through a combination of current and historical readings, case studies, discussions, and written assignments based on "real-life" scenarios, this course will cover general fundraising strategies and ethics, ePhilanthropy, prospect research, grant writing, annual and capital campaigns, corporate giving and cause marketing, special events and stewardship.

AS.460.662. Developing Effective Digital Engagement Projects for Museums. 3 Credits.
Shifts in audience attention, access, and expectations are forcing museums of all types to grapple with the challenges and opportunities presented by digital transformation. Developing effective digital engagement projects requires museum professionals to be well-versed in the techniques of user-centered design, which enable them to appropriately match technology solutions to the needs and realities of museum audiences. The course will provide an overview of the range of digital engagement opportunities in museums (i.e, web, mobile, social, interactives), with a focus on interpretive uses for education, marketing, fundraising, and scholarship. Students will gain hands-on experience in applying user-centered design techniques to a digital engagement project of their choice. The core project for the course includes conducting user interviews, identifying user problems and motivations, ideating potential solutions based on user needs, building and testing a prototype, crafting a marketing and evaluation plan, and pitching the project idea for approval or funding.

AS.460.663. Social Media Strategies for Museums. 3 Credits.
From #AskACurator to Snapchat selfies, social media has permeated the work of museum staff and the people who visit them. In this course, we will explore social media trends and their relevance for museums, including marketing, fundraising, education, and curatorial functions. Students will explore case studies, talk with leading museum social media practitioners, and develop social media strategies to meet specific museum objectives.

AS.460.665. Introduction to Archives. 3 Credits.
This course provides an introduction to the theory and practice of archives, including an overview relating to the elements of an archival program and the role and work of archivists. Special attention will be paid to the work of archivists in a museum context. The theoretical component of the course will be supplemented with a variety of hands-on exercises, case studies, and informed anecdotes designed to illustrate the relationship between theory and practice. Although American archival tradition will be the focus, international perspectives on archival theory and practice will play an important role in the course of study. Topics include: acquisition; appraisal; arrangement and description; preservation; reference; outreach; archival access systems; legal and ethical issues; and born-digital curation, including digital preservation.

AS.460.666. Collection Management. 3 Credits.
Museums exist to preserve and share their collections with the world. Collection managers, or registrars, are essential to any collecting institution, whether collections are art, history,science, or live specimens. This course focuses on management principles that can be applied broadly to any type of collection. The course covers all aspects of collections care from the acquisition of objects, evaluation, care and storage, through loans and exhibitions. Safe collections care and handling, using the most current methods, are emphasized so objects may be preserved for future generations. Any student who intends to work at a collecting institution will benefit from mastering the practical knowledge and skills underpinning many phases of museum work, which will be taught in this class.

AS.460.667. Collection Management Systems. 3 Credits.
Collections Management Systems, the workhorses of museum information technology, provide staff members and the public alike with access to collections information for a myriad of purposes. In this course, we will look at how these systems have evolved from their traditional role as registration tools to rich repositories of collection information, with the potential to interface with other types of systems, both inside and beyond the museum walls. This course introduces widely used museum Collections Management Systems in a series of developer-led presentations, providing students with the opportunity to evaluate how collections management transactions are performed using various software. Students will learn the basic features of Collections Information Policies and how to apply museum standards to analyze these policies. Data migration planning – from paper to electronic, and electronic to electronic --will be discussed, as well as emerging technologies used in conjunction with traditional Collections Management Systems. This is a must-have course for students with the goal of becoming a registrar, collections manager, or digital curator. Note: Students are strongly encouraged to take Collection Management (460.666) before enrolling in this course.

AS.460.668. Cataloging Museum Collections: History, Standards, and Applications. 3 Credits.
Cultural heritage institutions – including museums, libraries, and archives – have as core responsibilities the safeguarding of the objects in their care and the education of the public about these objects. To support both of these responsibilities, one of the foundational activities of cultural heritage professionals is the cataloging of the objects in their collections. This course will provide both an overview and practicum of cataloging definitions, philosophies, standards, and practices. Recordkeeping methods, numbering systems and data formats will be emphasized, and professionally accepted standards for cataloging various cultural objects will be reviewed. Discussion of the broad application of cataloging data sets, including cross collection aggregation and search, delivery to the public, and Web 2.0 and 3.0 delivery methods will be covered. Note: Students are strongly encouraged to take Collection Management (460.666) before enrolling in this course.

AS.460.669. 2D Digitization of Collections. 3 Credits.
This course will explore the main principles and best practices for planning and implementing two-dimensional digitization projects. The course is designed as a broad approach to this complex subject to give students the capacity to understand the important concepts, from theory to practice, of what is involved in a 2D, primarily textual and image resources, digitization project. This course will prepare students to have the main skills and critical outlook to be able to participate in digitization projects that entail different approaches and budgets.

AS.460.670. Digital Preservation. 3 Credits.
This course introduces students to the current state of digital preservation, preservation challenges, and basic concepts for designing effective digital preservation plans and programs. Topics include the relevance of digital preservation for museums; archival principles that inform preservation practices; standards and policies; considerations in preservation strategies; issues relating to formats, repositories, and processes; and emerging preservation solutions and services. Note: Students are advised to take 460.666 Collection Management before enrolling in this course; consult with the Digital Curation Program Coordinator for approval of exceptions.

AS.460.671. Foundations of Digital Curation. 3 Credits.
This course lays a foundation for managing digital information throughout its life cycle by introducing students to the emerging field of digital curation and by examining the practical issues and tools involved in managing digital collections and repositories over time. Topics include metadata schemas for describing digital assets in different disciplines; sharing digital content beyond the institution to reach wider audiences; requirements for trustworthy repository services; management of research data; policy issues; and user services. Note: Students are advised to take 460.666 Collection Management before enrolling in this course; consult with the Digital Curation Program Coordinator for approval of exceptions.

AS.460.672. Managing Digital Information in Museums and Archives. 3 Credits.
This course addresses technical and practical issues involved in the long-term management and preservation of digital assets, with an emphasis on the unique problems facing museums and archives tasked with preserving digital material of historical or aesthetic value. Subjects will include the fundamental models of digital curation and preservation, practical planning and design of digital curation strategy and associated workflows, a survey of the technologies commonly involved at the institutional level (software, metadata schemas), and a review of best practices for format identification, migration, and potential emulation of digital assets. Practical exercises are included that involve the use of Open Source, and free applications, such as the BitCurator digital forensics suite, and applications for packaging digital objects for submission to repositories. These topics will be presented within the context of analyzing the digital asset management practices (in the broadest sense) of individual institutions investigated by students. Prerequisite: Students must have completed Digital Preservation (460.670) and/or Foundations of Digital Curation (460.671) —preferably both—before enrolling in this course.

AS.460.673. Digital Curation Certificate Internship. 3 Credits.
The internship, including at least 120 hours of field experience, affords students the opportunity to gain hands-on experience working with experts who are leading digital curation activities in museums and related cultural heritage organizations in the U.S. and abroad. The internship is a partnership between the university and the host institution and is customized to meet each student's needs and career goals. The program will assist students in arranging appropriate internships. Student interns will produce evidence of their accomplishments through work products, project reports, or other documentation in an online course component and will participate in online discussion forums with other students enrolled in digital curation internships during the same semester. The internship is usually taken after completing at least two of the following core courses: Digital Preservation (460.670), Foundations of Digital Curation (460.671), or Managing Digital Information in Museums and Archives (460.672). Note: Students should discuss internship plans with the Digital Curation Program Coordinator at least one semester before enrolling in this course.

AS.460.674. Digital Curation Research Paper. 3 Credits.
The supervised research course enables students to investigate a significant problem or issue in digital curation and to develop and demonstrate critical thinking and communication skills. Ideally, the research paper will build on the student's internship experience. The research paper is expected to result in a publishable or presentable paper that makes a contribution to the literature and field of digital curation. As there is currently a significant need for research in digital curation, and relatively little published literature—especially relating to museums —student research in this program can make a major contribution, and graduates will be prepared for careers as leaders in the field. Course work, assignments, and meetings with a faculty member will take place in an online course environment. The research paper is normally completed as the final requirement in the Digital Curation Certificate program.

AS.460.675. Leadership of Museums. 3 Credits.
<p> Every museum career offers opportunities for leadership. Whether you head an internal project, lead a team, department or an entire institution, you draw from the same attributes and skill sets as leaders everywhere. Understanding that skill set and developing individual leadership competence leads to a career hallmarked by intentionality.</p><p>This course introduces students to the nature and practice of leadership through the vocabulary of competencies. It focuses on personal leadership development, beginning with an assessment of a student's leadership strengths and weaknesses while building awareness of challenges, best practices, and practical workplace applications. Through reading, discussion, interviewing current museum leaders, and reflective writing, students deepen their understanding of their personal leadership capacities, grasp the importance of self-awareness to leadership growth, and understand the range of competencies leaders must embrace to be successful in the rapidly evolving world of the 21st-century museum. </p>

AS.460.683. Project Management in Museums. 3 Credits.
Project management is the oversight and process of planning, organizing, and coordinating multiple tasks, resources, and stakeholders. In museum settings it often requires a choreographed juggle of scheduling, budget tracking, content and education considerations, facility and operations issues, and human resources; along with an ability to be flexible and calmly tackle unexpected challenges. This course will present both theoretical and practical concepts for initiating, planning, executing, monitoring, and completing projects in a museum. Using real world scenarios and different types of projects, the course will, provide students with tools and strategies necessary for project scheduling, task supervision, and stakeholder management. Project management is a learned skill, useful not only to those who will ultimately oversee a project, but to everyone who may eventually be part of a project team.

AS.460.684. Museums, Finance, and the Economy. 3 Credits.
This course examines how changes in the economy can affect museum income, expenditures, fundraising, endowments and attendance. It explores how various museum practicescan mitigate the effects of a weak economy and capitalize on a strong economy. Through case studies of large and small museums, students examine information sources thatmanagers use to identify changes in the local, regional, and national economy, which might affect their institutions. Students gain familiarity with economic and museum financialinformation by adopting two museums and tracking how changes in their finances and attendance relate to shifts in the economy. This course is critical for all students interested in the "behind-the-scenes" of museum management, including those with little or no background in finance or economics.

AS.460.685. Private Collectors, Collections, and Museums. 3 Credits.
An increasingly significant amount of our cultural and historical heritage is in private collections and outside the protective sphere of public institutions. Numbering in the tens of thousands in just the U.S., private collections span a great variety of objects reflecting the wide range of enthusiasts who collect them. This course will explore private collectors and trends in their collecting plus the similarities and differences between public and private collections and museums. It will help prepare students for the unique challenges they may face, illustrated by real world examples and interviews with collectors, curators, collections managers, and service providers plus hands-on experience. It will include developing problem solving strategies and project management skills they can use to adapt and implement institutional ethics and best practices, especially as private collections evolve into public museums.
Prerequisite: Collection Management (460.666)

AS.460.686. Culturally Specific Museums. 3 Credits.
Museums have the potential to provide safe spaces for comprehensive cultural inquiry. Culturally specific museums provide strategic platforms for showcasing diverse sets of art, history and culture with the intention of reaching a broad set of visitors. This course examines the significance of culturally specific museums, both individually and in relation to mainstream museums, to better understand how public culture engages issues of art, history, aesthetics, religion, ethnicity, and politics. Through the combination of contemporary reading material, survey of six national culturally specific museums, synchronous and a-synchronous discussion forums and guest speakers, students will discuss some of the ways in which culturally specific museums help make up the fabric of culture represented in museums in the United States of America.

AS.460.687. Provenance Research: Connecting Histories. 3 Credits.
Every object has a story and a history, and the study of objects and their contexts form the basis for provenance research. This course will expose students to the historical context of collecting around the world and will explore the various roles that provenance research plays in museums today, including within the realms of collections management, acquisitions, visitor engagement, publications, legal issues, and more. We will consider not only what provenance research is, but how it can be used as a valuable method for understanding the biography of an object, including its provenience, acquisition, and movement through time and space through a series of events and transactions. By focusing on specific areas of various fields of study, we will examine the overlapping but often distinct ways that provenance research can be utilized and what it can reveal. Through hands-on activities and representative case studies, students will undertake their own provenance research in order to understand the process and methodologies of a discipline that often encompasses many facets of inquiry and avenues of investigation.

AS.460.690. Science, Society, and the Museum. 3 Credits.
Museums have been shaping the public discourse on science for centuries. They serve as a bridge between science and society, a way for general citizens to connect with, engage, and increasingly contribute to scientific understanding. “Science, Society, and the Museum” presents the history of this intimate relationship, detailing the connection and affect that science and society have on one another, and the museum as the documentarian of that relationship. From Darwin and Sputnik to global change and extinction, the course emphasizes the responsibility of museums—past and present—to embrace their role in communicating science and increasing the scientific literacy of an engaged population.

AS.460.691. Innovation and the Modern Museum. 3 Credits.
This course explores how museums of all types (art, archaeology, design, history, natural history, science, etc.) around the world are seeking ways to incorporate innovation in their missions, practices, and displays. The current coronavirus pandemic has made innovative solutions all the more urgent. Topics to be addressed include theory and practice of museum innovation; tension between innovation and tradition; historical roots of museum innovation; nurturing an innovative culture; and the power of play. Guest presenters include experts on exhibit design and museum architecture from both conceptual and practical viewpoints. The course also looks to the future. It explores how “virtual museums” and cutting-edge digital technologies, including 3-D imaging and replication, will transform the presentation of as well as public access to artifact collections. Students will be urged to model innovation in discussion forums and in weekly planning exercises, culminating in a term project in which they develop their own original concept for an innovative museum.

AS.460.695. Museums of the Americas: Facing Challenges in the 21st Century. 3 Credits.
Take a journey inspired by the peoples, ecosystems, and cultures of the Americas and explore how a variety of museums, as well as related natural and cultural heritage sites, are responding to our shared challenges of social and economic disparity, climate change, heritage preservation, and human rights. Through video interviews and live expert sessions, mapping our journey, and sharing what we discover and learn, we will focus on innovation, community and civic engagement, and sustainable practices that we can adapt to museums where we work and live.

AS.460.750. Museum Internship. 3 Credits.
The Museum Studies internship affords students the opportunity to gain experience working withpractitioners in museums, archives, libraries, and related cultural heritage organizations, while also enrolled in an online internship course with other students. The internship is a partnership between the university and the host institution and is customized to meet the student’s needs and career goals. An internship at a museum, approved by the internship coordinator, will be counted as one elective course toward the degree. To fulfill the internship requirement, a student must complete a minimum of 80 hours of work onsite and a project (either a research paper or a practical product) on an approved topic related to their experience, due at the end of the semester. Students are enrolled in an online course, where they participate in discussions with classmates who are also doing internships and submit other associated coursework during the semester. Before registering for the internship option, the student should contact the internship coordinator for approval. At least four to six weeks before the beginning of the semester in which the internship will take place, the student must submit: 1) a description of the internship weekly duties including activities and/or responsibilities; 2) learning objectives and goals; 3) why this experience should be part of the Museum Studies degree; and 4) a signed letter of commitment from the internship supervisor. Note: Students must have completed a minimum of two courses in the program to be eligible to take the internship class.

AS.460.752. Museums in a Changing Time: Virtual Seminar. 3 Credits.
This virtual seminar will investigate, debate, and visualize pathways to successful museum leadership in turbulent times. Not only has the global Covid-19 pandemic upended nearly every museum operation, but the advancement of justice for social, equity, economic, and environmental goals is urgently and rapidly changing institutional missions. Interviews with thought-leaders from the museum sector will assist students as they problem-solve around real-world challenges and create informed action plans that are ready for immediate application. This virtual learning experience will feature topics of inquiry such as: Building resilience; supporting public health; advocating for justice, implementing de-colonization; and understanding digital implications. Each learning module features opportunities for students and instructors (asynchronous and optional synchronous) to discuss and debate issues and document their thinking in individual journals, discussion forums, and team blogs. This seminar includes practicum, collaboration, and networking opportunities and is available as an alternative to the required onsite seminar (with a waiver from the program director) and as an elective. All students complete a post-seminar reflection paper that synthesizes knowledge gained across courses in the Museum Studies program. This course runs for 6 weeks in Summer; 8 weeks in Fall and Spring. Note: As a prerequisite students must have completed a minimum of six courses in the program to register for this course, one of these courses must be 460.601 or 460.602. This course may be taken in lieu of the Two-Week Onsite Seminar (460.610) with a waiver from the Program Director, or it may be taken as an elective course.

AS.460.755. Museum Projects. 3 Credits.
This course expands opportunities for practical experiences beyond the onsite seminar and internship elective. Offered as an online experience, this course will involve students in anactual museum or museum-related project. Students will work in collaborative teams facilitated by a JHU faculty member and engage with museum professionals outside of the program. Thegoal of the course will be to establish a prototype or complete a real-life project of value to the museum field while interacting with current museum professionals. Museum Projects will beoffered on an occasional basis and will vary in topic. Different prerequisites will be set up each time the course is scheduled depending upon the specific project. In addition to weeklyresearch, writing and asynchronous discussions in the course management system, students should expect to participate in five to seven real-time online meetings throughout thesemester, dates of which will be determined by the Museum Project team in tandem with the project requirements and deadlines. Students must submit a Museum Project application form twoweeks before registration begins to be approved for enrollment in the Museum Project course. On this form, students will describe their interest in the specific Museum Project offeredand other applicable topics as requested, as well as confirm their ability to attend five to seven real-time sessions. A selection committee will review the applications and determineenrollment eligibility before the semester's registration begins. Enrollment limits may vary depending upon the project.
You must complete one of the following courses before enrolling in this course: AS.460.604 OR AS.460.606 OR AS.460.602.

AS.460.888. Continuation of Enrollment.
This course is open to any Digital Curation students who have not completed their Research Paper (460.674) and who need an additional semester to complete their work.

AS.465 (Cultural Heritage Management)

AS.465.702. Studies in World Heritage. 3 Credits.
This course offers an in-depth exploration of World Heritage by focusing on the concept of heritage, both tangible and intangible, its historical development, its international conventions, and the role of society and history in its past, present, and future. Students will be asked to engage critically with contemporary heritage concepts such as authenticity, ownership, assessment, value, and preservation that form much of our global understanding of the field of cultural heritage studies. Through case studies, lectures, discussions, and readings, students will explore international heritage policy as structured by the institutional complex, and consider both its local and global impact.

AS.465.704. Cultural Heritage Management/Leadership. 3 Credits.
Cultural heritage management is a complex intersection of theory and practice. This course will explore issues related to cultural sector management and leadership. Through the lens of current practice, we will examine core theoretical concepts and tools, including traditional approaches as well as the incorporation of emergent technology. We will look closely at the roles of the cultural manager and the proficiencies and characteristics needed for effective management and leadership within the cultural sector. We will consider changing definitions of protection and stewardship as they relate to cultural heritage as well as a larger framing of public interest, what publics, which interests.

AS.465.706. Research/Capstone in Heritage Studies. 3 Credits.
<p>The supervised research course enables students to investigate a significant problem or issue in cultural heritage and to develop and demonstrate leadership, critical thinking, and communication skills. The research project is expected to result in a written deliverable that makes a contribution to the field of cultural heritage broadly defined. Coursework, assignments, and meetings with a faculty member will take place in an online course environment. This course is normally completed toward the end of the degree program.<p>Potential students for this course must complete the Turning Your Topic Into A Good Research Question Research Skills Module and submit a Research Proposal/question form prior to registering. On this form, students will describe their topic and research question. Please reach out to your academic advisor in order to complete this step. The course instructor will review the proposals and determine project appropriateness and enrollment eligibility. Students will register for this course through the add/drop form. <p>This course is recommended for students seeking to satisfy 36 CFR 61 federal qualification standards. These are standards used by the National Park Service previously published in the Code of Federal Regulations. <p>The jobs of History, Archaeology and Architectural History include the following minimal professional qualifications (respectively):<ul style="list-style-type:disc"> Substantial contribution through research and publication to the body of scholarly knowledge in the field of history.
Demonstrated ability to carry research to completion.
Substantial contribution through research and publication to the body of scholarly knowledge in the field of American architectural history.

AS.465.707. Reading the Landscape: Cultural Heritage at Scale. 3 Credits.
This course examines the unique challenges faced by academics and practitioners in defining, preserving and managing rural, natural, and urban heritage at a landscape scale. The multiplicity of interests involved add to the complexity and require robust engagement strategies. Students will use a regional, national and international perspective to derive best practices for understanding the breadth of the cultural landscape concept and the opportunities for its sustainable development. Students are strongly encouraged to take this course before enrolling in the Two-Week Onsite Cultural Heritage Management Seminar (465.708).

AS.465.708. Two-Week Onsite Cultural Heritage Management Seminar. 3 Credits.

<p>A two-week intensive period of on-ground heritage management study in a location organized by the MA in Cultural Heritage Management program. The seminar includes practicum opportunities related to site management, heritage tourism, and conservation, alongside classroom sessions that integrate daily experiences. Using the rich diversity of the designated location, the seminar provides students with the chance to use what they have learned in their prior courses, develop networks with fellow students and heritage experts, and explore the latest in cultural heritage practice. </p><p>Seminars may require some assignments prior to arriving onsite. Students work on directed activities during the two-week period, coupled with multiple site visits focused on the academic work being accomplished. Daily journal entries and a post-seminar reflection paper require students to synthesize knowledge gained across courses in the Cultural Heritage Management program. </p><p>Note: As a prerequisite students must have completed a minimum of six courses in the program to register for this course, these must include 465.702 and 465.704 (students seeking an exception to the pre-requisite requirements can apply to the Program Director). Students are responsible for travel to and from the location, accommodations, and meals, as well as any specified field trip fees. </p><p>Waiver option: Students who are unable to travel to a seminar location due to accommodation needs, financial hardship, or family challenges may apply to the program director for an exemption to the two-week seminar. If a waiver is granted, the student must enroll in the internship option (465.780) and complete a synthesis paper to fulfill related components of the degree requirement. </p>

AS.465.710. The Protection of Global Cultural Heritage: Laws, Policies, Politics, and Advocacy. 3 Credits.

This course introduces students to cultural heritage law, as it relates to the interpretation, ownership, management, and protection of both tangible and intangible heritage. Using case studies taken from the court dockets and newspaper headlines, students will develop a solid background in relevant national and international legal concepts, while exploring how the law is implemented through policy and practice. They will also examine the impact of heritage's continuing politicization, including the use (and misuse) of heritage in public commemoration, nation building, armed conflict, and violent extremism. To this end, from a global perspective, and through a legal and policy lens, the course takes an in depth look at key challenges and controversies affecting the field. It considers what can and cannot—and, for that matter, what should and should not—be done to protect heritage, and how these decisions affect politics, economics, and security from the local to the international levels.

AS.465.712. Managing Cultural Heritage Resources. 3 Credits.

This course is a detailed introduction to the recognition, description, evaluation, and management of cultural heritage resources. The focus is on professional practice in the United States (US), but many of the basic activities, policies, and laws have parallels in other countries. Mainly this course is about tangible heritage resources, such as archaeological sites, historic structures, museum collections and archives, traditional cultural properties, and cultural and historical landscapes. However, some attention is given to intangible cultural heritage in assigned readings. Students with a particular interest in intangible heritage may focus on them in the course paper, in consultation with the course instructor. <o:p></o:p></p><p>Students will evaluate the different values that heritage resources have in general and for specific stakeholder communities. Class sessions cover the historical, legal, and regulatory background of heritage management; heritage resource management private and public organizations at local, tribal, state, and federal levels; professional practice in various kinds of heritage resource management organizations; the values that heritage resources may hold; methods for assessing the condition of heritage resources; how conservation, development, stabilization, rehabilitation, restoration, and protection treatments are applied; how modern technology is used in managing heritage resources; the challenges for the long-term, sustainability of heritage resources management; the ways in which heritage resources are interpreted for public audiences; professional ethical guidelines in heritage management; and, likely developments impacting the management of heritage resources in the future. <o:p></o:p></p><p>In the course, students will develop a major individual written project that also can serve as a professional tool for each participant to use in advancing his or her career objectives. <o:p></o:p></p>

AS.465.714. Culture as Catalyst for Sustainable Development. 3 Credits.

The role of cultural heritage in global developmental policy emphasizes a human centered and inclusive approach. The course will introduce students to the current global discourse on sustainable economic development and unpack the role of cultural heritage including the socio-economic impacts of investment. Students will consider the role of cultural heritage in long term development strategies and policy in order to assess impacts and effects. Cultural heritage will be considered as both a means and an end.

AS.465.716. Cultural Heritage Risk Management and Security. 3 Credits.

The 21st century has seen an unprecedented threat to our global heritage — from natural disasters, extreme weather events, and climate change, to military conflicts in some of our most sensitive areas of global heritage alongside the intentional targeting of cultural sites for destruction. In this course students will gain an understanding of the risks facing our global heritage. They will be introduced to a variety of security strategies and technologies implemented to protect and preserve sites from 21st century threats. And they will analyze the pros and cons of various approaches to create their own security and disaster mitigation proposals.

AS.465.720. Issues in Intangible Cultural Heritage. 3 Credits.
Thanks to the efforts of the United Nations Educational, Scientific and Cultural Organization (UNESCO) over several decades, the global heritage enterprise has been expanded to include 'intangible cultural heritage,' the often ephemeral and ever-changing cultural beliefs, practices, and expressions that are embodied and shared by communities, groups, and individuals all over the world. The course, Issues in Intangible Cultural Heritage, explores this relatively new category of heritage, tracing the development of the ICH concept and related policy through pre-cursor concepts, concerns, and activities at the global level, from the 1970s through to today. Grounded in a critical engagement with the heritage and museum studies literature, particularly the thriving international ICH discourse and debates, and through critical analysis of case studies from across the globe, students will explore the challenges that arise with respect to safeguarding and promoting living cultural beliefs, practices, and expressions, as well as engage with key features of conducting community-based ICH work of their own.

AS.465.730. Heritage Interpretation. 3 Credits.
Interpretation is a key component of cultural heritage management and the visible link between heritage and its diverse publics. This course considers current practice and emerging developments in the field as well as a broad range of heritage both tangible and intangible: from museums and sites, to archeological excavations, to urban and rural landscapes, and both the natural and built environment. It asks students to evaluate the role of interpretation in site management and looks critically at interpretation across global landscapes considering both the intended and unintended consequences of chosen narratives. This course looks closely at audience and community, the control of narrative and interpretation, and the short and long-term impact in terms of identity and access. As well as discusses the skills identified across the sector for heritage interpreters and how they are used to create effective experiences.

AS.465.732. Engaging Communities in Heritage. 3 Credits.
Museums and other heritage institutions are increasingly recognizing the value of "bottom-up" heritage programming. This class will explore issues related to community engagement in the heritage sector as well as strategize ways to engage various constituencies in the formulation, collection, and presentation of their heritage. We will use global case studies (as related to memory and memorial, sites of conscience, marginalized histories, indigenous heritage, and eco-museums) to explore the challenges faced by such projects. Examining both the failures and successes will result in a broader understanding of best practices in the field and help us formulate effective strategies for future engagement.

AS.465.734. Heritage Tourism. 3 Credits.
This course explores the practice and theory of heritage tourism and the history of its developments and impacts. Through the lens of sustainable economic development, it will examine the benefits and challenges of tourism and site management in both rural and urban contexts. We will look closely at the relationship between culture, heritage, and tourism by examining a range of topics including the use of natural and cultural heritage resources for tourism development, understanding tourism development and tourist motivations, impacts of heritage tourism, international examples of heritage tourism and the importance of sustainability.

AS.465.736. NAGPRA: Repatriation as Compliance or Ethical Practice. 3 Credits.
In the United States, the Native American Graves Protection and Repatriation Act (NAGPRA) outlines a process by which government agencies (and those who receive government funding) must return human remains and sacred objects to those who claim them. Repatriation is a complicated process because it means something different in almost every case. One of its earliest claims took 20-years to resolve. In 2017, the Ancient One was returned to the tribes of the Columbia River for reburial after DNA tests proved the relationship that tribes had claimed all along. But now reproductions of the Ancient One's skull are being sold by a company that holds the copyright. When those from outside the culture to which he was returned can examine and/or profit from a replica, the distinction between compliance with the law and the ethics of return is clear. Outside of the United States, few repatriation laws exist and many argue that institutions like The British Museum are the best places to protect world heritage. Is providing care of and access to human remains and cultural objects preferable over returning heritage to those from which it was taken? In this course, we examine repatriation claims around the globe in order to critique NAGPRA and establish a compliance toolkit. Where NAGPRA doesn't apply, heritage professionals can use the successes and failures of past repatriations, and a firm grounding in ethics, to make repatriation decisions. Nothing in NAGPRA prohibits practitioners from exceeding its scope and seeking out opportunities to build relationships with descendent communities even when repatriation is not required by law.

AS.465.740. Cultural Heritage in the Digital Age. 3 Credits.
<p>A Neolithic settlement in Scotland, at risk due to coastal erosion, is digitally preserved through precise 3D laser scanning; the construction of the massive towers at Cologne Cathedral is brought to life with digital photogrammetry and augmented reality; multilayered cultural heritage information, images, and damage assessments are catalogued in open source databases. These are just a few examples of how a growing number of scholars, researchers, and practitioners are using the latest technology as a means to document, visualize, interpret, and preserve cultural heritage worldwide. <o:p></o:p></p><p>This course will explore the ways in which cultural heritage professionals are implementing the latest digital technologies to enhance research, conservation, management and preservation of tangible and intangible heritage, as well as methods of education and engagement for visitors. Through lectures, readings, assignments, and social media, students will identify, analyze and debate the use of documentation, visualization and content creation technology currently being used in the cultural heritage engagement, studies and practice, as well as envision its use for the future. <o:p></o:p></p>

AS.465.780. Internship. 3 Credits.
An internship at a cultural heritage organization, approved by the internship coordinator, may be substituted for one elective course. To fulfill the internship requirement, a student must complete a minimum of 80 hours of work on-site and a project, (either a research paper or a practical product) on an approved topic related to his/her experience, due at the end of the semester. Students also participate in online discussion and course work during the semester. Before registering for the internship option, the student should contact the internship coordinator for approval. At least four to six weeks before the beginning of the semester in which the internship will take place, the student must submit: 1) a description of the internship weekly duties including activities and/or responsibilities; 2) learning objectives and goals; 3) why this experience should be part of the Cultural Heritage Management degree; and 4) a signed letter of commitment from the internship supervisor. Students must have completed a minimum of two courses in the program before registering for this internship.

AS.465.800. Independent Study. 3 Credits.

AS.470 (Government)

AS.470.600. Introduction to Graduate Work. 3 Credits.
This course is an introduction to graduate work and will not count toward your degree, but is designed to help students maximize their performance and excel in graduate studies. The course will combine class work with one-on-one advising and tutoring. The course will cover such topics as research, writing, citation, argument, using evidence, study habits, and managing a graduate-level workload. Teacher and student will meet at the beginning of the semester to assess areas of greatest need and tailor the course to meet them.

AS.470.601. Climate Change and National Security. 3 Credits.
This course provides an in-depth examination of how the effects of climate change could impact national security, international relations, and global stability. Students will begin by examining and discussing the current body of academic literature. As the semester progresses, students will learn and practice how to use cross-disciplinary resources and tools to envision potential relationships between climate change effects and security outcomes.

AS.470.602. Government & Politics. 3 Credits.
This course offers an overview of power and politics through the study of the government of the United States. All governments combine coercion and legitimacy. In a stable and legitimate system of government, coercion is hardly noticed. Government comes to be seen as a source of benefits. The purpose of the course is to look behind institutions, practices, and benefits to appreciate how, for what, and for whom we are governed. We shall examine some of the major institutions of American government, some of America's political processes, and some of the key forces competing for power in the U.S. to see how decisions in the areas of economic, social and foreign policy are reached. This is a core course of the Government Program but is open to all students.

AS.470.603. Introduction to Global Security Studies. 3 Credits.
This course introduces students to the basic concepts of global security studies, including theories of international relations, perception and misperception, theories of foreign policy, the varying concepts of security, and the elements of national power. It also includes a brief introduction to social movement theory. It applies these conceptual tools to selected security issues.

AS.470.604. Social Media and The American Presidency. 3 Credits.
This course will investigate the impact that digital technology has had on the institution of the American presidency. The adoption of the internet in the 21st century, both as a tool and as an information distribution mechanism, has had an astonishing impact on the Office of the Presidency. This course is designed to have students operationalize theoretical concepts and apply them to real world situations. Students will engage with scholarly research, analytical arguments, and real-time case studies on the effective use of social media in all aspects of the presidency: campaigning, public debate, electoral processes, and democracy more broadly. In that spirit, we will examine how the first president of the social media age, Taught by a member of the first White House Office of Digital Strategy, the primary objective of this course is to provide students will the tools and skills to be informed consumers of political social media, as well as to equip them to participate in the political digital conversation.

AS.470.605. Global Political Economy. 3 Credits.
In the wake of the financial crisis, bank bailouts, and stimulus plans, the relationship between American economic power and national security is especially salient. In this course, students investigate core topics in international political economy, analyzing the security implications of each. Topics include trade relations, international finance, monetary relations, poverty, and development. (Core course for the MA in Global Security Studies. Recommended elective for MA in Public Management)

AS.470.606. U.S. Security in a Disordered World. 3 Credits.
This course provides an overview of the manifold challenges and opportunities for United States security in the current disordered and changing world. It aims to help students assess why events occur and what policies are developed in response. In that endeavor, the course has three major objectives. First, the course will review the major perspectives on, and debates about, U.S. security and the institutions through which policy is made and executed. Second, the course will review some U.S. security issues through scholarly, policy, political, and historical lenses. Third, the course will help students write for both policy and academic audiences. This course is not open to students who have had 470.606 American National Security.

AS.470.607. Strategy and Leadership for Public Service Innovation. 3 Credits.
The course explores public sector innovation from the perspective of strategic visioning, policy development, and program leadership, employed for successful new venture implementation. Learning modules progress from foundational ideas through the use of practical methods and applied tools. First, students compare and contrast transformational public service governance policy models (e.g. New Public Service) as government leaders who must execute these periodic and/or evolving innovation concepts and agendas. Second, students examine organization program readiness for change adoption with respect to capability, capacity and competencies. Third, students apply their emerging understanding and knowledge of public innovation to their own organizations and scenarios, either inside or outside their workspace, environment or ecosystem. Specific ideation, design and analytic techniques shall be considered critically, in context, enabling course participants to formulate their own professional repertoire for guiding public innovation and transformation. Cases studies are used throughout the course to introduce students to the real-world application of innovation principles, demonstrate best practices, and provide measurable evidence for the innovation value proposition.

AS.470.608. Public Policy Evaluation & the Policy Process. 3 Credits.
This course is designed to introduce students to the public policymaking process, to the basics of policy analysis, and to the substance of some of today's major policy debates. The first half of the course focuses on establishing a framework in which to analyze public policy formulation within the United States. The class also reviews the tools for developing and implementing policy. The second half of the course turns to policy analysis of some critical contemporary issues. Building on earlier readings, we will study current debates in economic/tax policy, education, health care, social security, and national security. (Core requirement for the MA in Public Management. Elective option for Government. Analytics students)

AS.470.609. Leadership Skills in the 21st Century. 3 Credits.
This course will assist leaders in identifying their personal approach to leadership; provide tips on motivating staff by building trusting relationships and shoring up their credibility; suggest influence and persuasion strategies that leaders need to employ when working with bosses, colleagues, direct reports, and critical stakeholders, including funding agencies; develop strategies to build effective work teams; and consider approaches to monitor organizational performance in an ongoing fashion.

AS.470.611. Introduction to Terrorism Studies. 3 Credits.
This course provide an overview of the principal areas important to the study of terrorism. The course offers a variety of academic, policy, and operational models, theories, approaches, and concepts regarding the definitions of terrorism, the nature and functioning of various terrorist groups across the globe, and a variety of domestic and international governmental operational and policy responses. Through this exploration, students will be able to identify patterns of behavior of both terrorist groups and governmental responses, and will also be able to identify gaps, and principal areas of improvements in how we understand, and respond to this important security challenge.

AS.470.612. Bureaucratic Politics. 3 Credits.
This seminar will examine the political support for bureaucracy, how bureaucracy functions in contemporary government and society, and selected current controversies over the purpose and reach of bureaucracy. How does bureaucracy enhance or frustrate liberal democratic ideals? We will take up case studies involving current political issues, such as civil rights enforcement, the war on terror, the role of regulatory agencies, judicial policymaking, relevant student experiences, and the instructor's own experience in various federal and state agencies.

AS.470.615. Speechwriting: Theory and Practice. 3 Credits.
The theory and practice of speechwriting are the focus of our study of the great political speeches of all time and especially those of the American political tradition. We will examine the content, structure, and purpose of high rhetoric ranging from Pericles to Solzhenitsyn, from Abraham Lincoln, Frederick Douglass, and Franklin D. Roosevelt to contemporary politicians. Based on their knowledge of the best models, students will draft and deliver their own speeches.

AS.470.616. Political Ideas, Strategy, and Policy Implementation. 3 Credits.
It is easy, in this age of reactive 24-hour news, to believe that ideas no longer matter in politics. But ideas are the currency of politics, and are central to both campaigning and governing. What candidates stand for matters, and the best policy is the best politics. This class will discuss the critical role ideas play in our American political system. It will examine how ideas define candidates and governments, shape political strategies, and form campaign communications. But, most importantly, it will discuss how campaigning on ideas leads to successful governing. While compromise and negotiation are often derided as weaknesses in today's political system, we will examine how these techniques have been used to implement policy ideas and further political strategy. From the practical perspective of the instructor's own legislative and political experience, the class will take up case studies involving the interplay between politics and ideas in recent history in areas such as budget reform, national security, tax reform, crime prevention, trade, and poverty. Through these case studies, we will look at how and why policy ideas succeeded or failed through the lens of elections, political communications, and their positive impact on the public.

AS.470.617. The Courts and Public Policy. 3 Credits.
Americans traditionally have viewed the courts as—in the words of a constitutional scholar—"the least dangerous branch of government." They are seen as reflectors, not agents, of change. But in an age of government downsizing, the role of the courts bears renewed examination. Students explore the historical and philosophical roots for the notion that American courts, and whether the lawyers who appear before them, can and should make law and policy, and the alternatives to this function. Students consider prominent areas of public policy that have been shaped by the courts, such as civil rights, family and domestic law, environmental and safety regulation, and the regulation of business and commerce.This course counts towards the Legal Studies Concentration.

AS.470.620. Race, Politics, and Policy. 3 Credits.
This course examines the role of race and ethnicity in U.S. national politics focusing on political development, political behavior, and public policy. Treated as both a persistent "dilemma" and as central to U.S. national identity, race and representation questions have been pivotal in American political development from the Founding to the present. Tracing that development over time, this course focuses, too, on how race-based differences manifest in differences in voting, public opinion, and other behavioral aspects of politics as well as the ways that racial attitudes have been embedded in public policies and reinforced by their implementation.

AS.470.622. Money and Politics. 3 Credits.
This course considers the historical and contemporary relationship between money and government. In what ways do moneyed interests have distinctive influences on American politics? Does this threaten the vibrancy of our representative democracy? Are recent controversies over campaign finance reform and lobbying reform signs that American government is in trouble? This course is reading, writing, and discussion intensive, and we consider the large academic literature on this subject, as well as the reflections of journalists and political practitioners. Election law and regulations on money in politics are always changing, and so part of the course is designed to give students tools at tracking these developments. The overall goal of the course is to foster an understanding of the money/politics relationship in ways that facilitate the evaluation of American democracy.

AS.470.624. Healthcare Analytics and Policy. 3 Credits.
This course covers the ways in which analytics are being used in the healthcare industry. Topics include data collection opportunities created by the ACA and other laws, the use of analytics to prevent fraud, the use of predictive modeling based on medical records, the insurance industry's increasing use of data and the ethical issues raised by these practices. Prerequisites: none required (470.681 Probability and Statistics recommended)

AS.470.625. Resource Development and Marketing in Nonprofits. 3 Credits.
The goal of this course is to prepare future nonprofit leaders and board members with the international resource development and marketing fundamentals that help every nonprofit thrive. The course focuses on how to create and nurture an organizational culture where everyone on the staff and board understands, embraces, and acts on his or her role in developing strategic relationships with funders, potential funders, and media professionals. You will gain an understanding of the process, the metrics that drive the process, and the milestone markers that lead to success. You will explore how to develop a board and/or cadre of volunteers who give generously, share expertise freely, connect you to the right government officials and media leaders, and invite others to join them. Data-driven decision-making and all aspects of fund development, marketing, and communications will be woven throughout the course. Led by an internationally recognized practitioner, consultant, and master teacher, the course will use scenarios, discussion, social media, audio, and video clips so that you will walk away with the knowledge you need to secure private and government funding and social capital as a CEO, senior staff member, board chair, or member, and the confidence to do it all well. Elective course for the Certificate in Nonprofit Management.

AS.470.627. Financial Management & Analysis in the Public Sector. 3 Credits.
This course focuses on financial aspects of public sector organizations and institutions. The objectives of this course include helping students (1) learn the basics of public sector accounting and the construction of their financial reports, (2) become more intelligent users of the financial statements of public sector organizations such as sovereign, state, and municipal institutions, and (3) better understand the factors that affect the financial condition and financial performance of such entities. <o:p></o:p></p><p> More specifically, the course focuses on (1) the financial reporting concepts and standards that are applicable to public sector organizations; (2) ratios and other summary indicators used by analysts to evaluate the financial condition and financial performance of public sector and nonprofit organizations; (3) the analysis and interpretation of financial statements of selected public sector organizations; (4) fundamental finance principles; and 5) basic principles of budget formulation. <o:p></o:p></p>

AS.470.629. Models of Democratic Leadership in America. 3 Credits.
The political scientist James McGregor Burns said "one of the most universal cravings of our time is a hunger for compelling and creative leadership." Today, the craving for sound leadership is felt even more keenly than before, but examples of excellence in leadership are scarce. With both populism and authoritarianism on the rise globally and polarization at high levels domestically, it has become especially urgent to understand what true democratic leadership entails – both its power and its limits. This course will expose students to leadership models in America, starting with the founders and the conditions they set for future democratic leaders. In addition to examples of political leadership, students will study leadership in the area of social reform. Students will assess these models through primary readings, biographies, lectures, and film depictions. The course will help students to identify which models of creative leadership may be helpful in addressing current problems of contemporary politics

AS.470.630. Congress and the Making of Foreign Policy. 3 Credits.
This class will examine the role of Congress in the making of American foreign policy. In particular, this class will discuss the role of Congress in war powers, economic sanctions, human rights advocacy, the approval of international agreements including treaties, international affairs budgets and spending, investigations and oversight of the conduct of foreign policy by the executive branch as well as the impact of Congress on the general direction of American foreign policies and priorities. Special attention will be given to the role of Congress in U.S. policy toward Iran over the past few decades, the use of military force in Iraq and Syria, the role of the legislative branch in U.S policy toward China and Taiwan and the promotion of human rights as a component of American foreign policy. The class will seek to examine the specific actions of Congress on these matters, and their causes and consequences. The class will use books, articles and original source material from committee deliberations and floor action. As we examine these topics, we will come back to larger themes – the balance of power between the executive and legislative branches, the impact of partisan and bureaucratic politics, and the changing role of the United States on the world stage. All this will be discussed with a mind to the role of foreign policy practitioners.

AS.470.631. Economics for Public Decision-Making. 3 Credits.
Economic thinking provides an important set of tools for almost every aspect of public policymaking. This course aims to offer students a basic understanding of economics and its importance in public policymaking. The first half of the course will offer students an understanding of microeconomic and macroeconomic theory, including a discussion of when markets can work to achieve policy goals and when "market failures" call for government intervention. The second half of the class will use these economic tools and theories in order to survey several specific policy areas, including health policy, tax policy, and the national debt. (Core course for the MA in Public Management This course counts toward the Economic Security concentration (GSS). Elective option for Government Analytics students.)

AS.470.632. Security Issues in South Asia. 3 Credits.
The South Asian region, with its complex historical context, a large and diverse population, and contested national borders, especially between nuclearized countries, poses some of the toughest security challenges facing the world. This course highlights salient security challenges in South Asia, and draws out their implications for U.S. strategic interests. It examines the sources and implications of the rivalry between nuclearized India and Pakistan, and how it fuels Sino-Indian security competition. Attention is drawn to the sources of militancy in India, and to the threats to international and regional security arising from the conflict in Afghanistan. The Sri Lankan Tamil Tiger insurgency and its eventual defeat in 2009 are also discussed, alongside the rising Islamist militancy threats in Bangladeshi, and the history of Maoist insurgency in Nepal. Finally, some of the climate-based threats to which no South Asian country is immune will also be discussed.

AS.470.633. Transnational Organized Crime: Gangsters of the Global Underworld. 3 Credits.
Transnational organized crime often is not well understood because crime is most often conceptualized as a domestic legal concern. However, transnational organized crime is more than that. It is crime ordered into complex clandestine networks that operates transnationally with little regard for the borders of states. The gravity of the problem lies not only in the increasing complexity of these organizations, but more importantly, with the serious challenge they pose in their ability to penetrate and operate with relative impunity in several states simultaneously. These illegal enterprises not only threaten aspects of state sovereignty and security that traditionally have been taken for granted, but they prove the permeability of national borders and the vulnerability of state institutions. This course will examine a variety of transnational organized criminal groups, their modus operandi, and their illicit activities. It also will focus on some domestic organized crime groups both to provide a depth of understanding of the operations of organized criminal activity in different countries, as well as to show how international groups can make inroads into domestic markets if they cooperate with local groups.

AS.470.636. Cognitive and Behavioral Foundations for Artificial Intelligence. 3 Credits.
Artificial intelligence is rapidly improving for well-defined tasks and narrow intelligence. But will AI ever have human-like general intelligence? This course is designed to answer this complex question by giving students a working knowledge of the underlying principles and mechanisms of human behavior and cognition. Key topics to be addressed include vision, audition, language, emotion, memory, creativity, and consciousness. We will use current and future advancements in big data and AI as a backdrop for critical and creative analysis.

AS.470.638. Negotiating as a Leadership Skill. 3 Credits.
Conflict is part of organizational life. People in public sector agencies and nonprofit and for-profit organizations disagree over the meaning of regulations, the use of financial resources, office space, leave time, and many other issues. Managers must have the ability to diagnose disputes and to negotiate effectively to resolve conflicts. This course provides the theoretical background and conceptual framework needed for successful negotiation and mediation. Through presentations and discussions students become familiar with the tools necessary for conflict resolution in their agencies and organizations. Analysis of a party's interests, identification of the necessary style, awareness of communication skills, and planning and feedback are part of the process of becoming an accomplished negotiator.

AS.470.640. Challenges of Transnational Security. 3 Credits.
This course focuses on transnational security issues and considers how many of these myriad challenges constitute threats to global peace and security. The combined effects of issues such as drug, weapons, and human trafficking, piracy, terrorism, infectious diseases, and deliberate environmental destruction, along with such critical enablers as corruption, and money movements, are not strangers on the world stage. What is new is their global reach and destructive potential. As a result, these issues have made policy makers consider different conceptions of security and, at times, to move beyond sole considerations of state sovereignty into the realm of human security. Not only are transnational security issues varied in nature and scope, but their effects often are obscured by the fact that many are nascent with gradual and long-term consequences. Further, while some transnational issues may not constitute direct threats to global security, they may threaten the world economy, and quality of life of its citizens. Still others compound and reinforce each other, generating mutations of the original threats. This course will examine a small number of these transnational security issues and relevant policy-making efforts.

AS.470.641. Introduction to Advocacy and Lobbying. 3 Credits.
<p> Lobbying is a Constitutional right guaranteed under the First Amendment. It's also big business in Washington, DC, as more than $4 billion was spent on these efforts in 2015. In fact, for many, the term "lobbying" conjures up an image of a shady character passing a cash-filled envelope to an elected official. <o:p></o:p></p><p> The stereotype of lobbyists as greedy predators of the political system detracts from the efforts made by the tens of thousands of people, from lobbyists and concerned citizens alike, who come to Washington every year to exercise their "Right to Petition" the government to make it more responsive and accountable to the people. <o:p></o:p></p><p> This applied course provides students with a practical understanding of how to lobby Congress and the Executive Branch. The course also teaches students about "advocacy" efforts where unregistered public affairs firms employ campaign-styled tactics to persuade decision-makers to support their client's positions. <o:p></o:p></p>

AS.470.643. Text as Data. 3 Credits.
In this course students will develop expertise in using the tools necessary to collect, analyze, and visualize large amounts of text. The course begins with a hands-on introduction to the programming concepts necessary to collect and process textual data. The course then proceeds to cover key statistical concepts in machine learning and statistics that are used to analyze text as data. Throughout the course, students will develop a research project that culminates in the display of results from a large-scale textual analysis. Prerequisite: 470.681 Probability and Statistics.

AS.470.644. Democracy and Its Modern Critics. 3 Credits.
Much of international politics in the last century can be described as a conflict between liberal democracy and its modern critics. During this period the values and political structures of liberal democracy have been extended to more parts of the world than ever before. Yet the same era also saw the emergence of powerful challengers to liberal democracy from both the right and the left. The resulting clash of ideologies defined such conflicts as World War II and the Cold War. In this course we will survey the intellectual roots of Fascism, National Socialism, and Communism. We will also examine the question of Islam and democracy looking at both its proponents and its radical critics in the Islamic world. Among those whose writings we will examine are Karl Marx, V.I. Lenin, Benito Mussolini, Carl Schmitt, Charles Maurras, Syed Qutb, Ali Shariati, Muktedar Khan, and Ruhollah Khomeini.This course counts towards the Security Studies concentration.

AS.470.645. The Budgetary Process. 3 Credits.
The federal budget process is an enormously complex mixture of administrative routines and mechanisms designed to bias decisions, avoid blame, or reduce conflict. This course explores the structures of federal budgeting in terms of its varied goals and in the context of the wider governing process. The course will review the budgetary process in both the executive and congressional branching, as well as the interaction of those two systems. In order to gain understanding of the difficult policy choices and political pressures policymakers face, students will be asked to do a simulation of a budget process within the executive branch. The role of entitlements, scoring issues, and tax policy will be examined in the context of the debate over budget policy. The course will start with a short primer on finance theory. (Recommended elective for MA in Public Management. Elective option for Government Analytics students.)

AS.470.648. Presidential Election 2020: Campaigning and Communicating. 3 Credits.
The 2020 presidential election will be based largely on how well voters think the incumbent Donald Trump has handled his first term in office. Trump will be seeking re-election with a pandemic that has killed over 100,000 Americans and with the largest number of Americans unemployed since our Great Depression. In addition, the question of racial justice has become an issue of paramount importance to this election. Trump is a master of distraction and should never be counted out as he has all the advantages of the presidency, while his opponent, former Vice-President Joe Biden will need a large Democratic and Independent voter turnout to win the White House. In short, 2020 is a truly unique and historic election. The class will discuss both sides' campaign and media strategies-both social media and traditional media- to win the White House. Will Biden be able to put the Obama coalition together again? Will Trump's base come out in large enough numbers to help him win again? Is America ready for a return to normalcy after the chaotic first term of Trump? Our lively, interactive class will explore all these questions and closely follow the campaign to its conclusion and look at the winning candidate after the November election.

AS.470.649. Separation of Powers and Democratic Governance. 3 Credits.
The separation of powers is America's most profound and useful political contribution to the world. Studying its principles, development, and decay is a requirement for understanding American politics and is as well a potential benefit to students of aspiring democracies throughout the world. For the separation of powers enables self-government, putting democratic principles of equality and liberty into practice while moderating the powers of majorities.We will study the principles and practice of the separation of powers by examining how each elected branch of government protects its rights, while checking the rights of others. The separation of powers can be said to have produced a more just and moderate democratic form of government, but it has also occasioned the complaint that it has produced gridlock and incompetence. To investigate the strengths and drawbacks of the separation of powers, we will pay close attention to the classic texts advocating the separation of powers, such as The Federalist Papers; the great changes in American politics effected by the Civil War, the Progressive movement, and the New Deal; and the domestic and foreign policy debates in recent administrations. Special attention will be paid to the seminal opinions of the unelected branch of American government, the Supreme Court. The course will note in particular the contemporary challenges to the separation of powers, evidenced in the rise of the administrative state, the expanding powers of courts, and the growth of party government. We will also note instances of how parliamentary and presidential governments throughout the world might benefit from separation of powers principles.

AS.470.650. Health Policy and Politics. 3 Credits.
Who knew health care was so complicated." These words remind us that despite decades of work, health policy wonks continue to debate what should come next in health care reform. This course introduces students to the policies and issues surrounding health care in the United States. During the semester the course will review the history of the incremental path to health care coverage since President Truman first called for universal health care in 1947. This will include enactment of Medicare, Medicaid, the Children's Health Insurance Program (CHIP), and the Affordable Care Act (Obamacare). In addition, we will discuss in detail the various reform proposals currently under consideration and analyze their strengths and weaknesses. Finally, we will study how the current U.S health care system is organized, financed, and governed.

AS.470.651. Corruption and Democratic Governance. 3 Credits.
Corruption is ubiquitous. It is a universal phenomenon that has always been around and that can be found almost anywhere. Recent years have seen much focus on the relationship between it and democratic governance. Indeed corruption and politics more generally, are inextricably and universally entwined. In this seminar we will take an in-depth look at the relationship between the two. We will ask: What is Corruption? Is it always the same thing everywhere, or does it vary depending on context or place? Do pork barrel politics and political clientelism count as corruption? What are the implications of corruption? Is it necessarily always a bad thing or can it be beneficial? Is the corruption experienced in developed countries qualitatively different from that in developing ones such that democracy suffers more in developing countries? We will seek to answer these and other questions by taking a critical look at the politics of corruption. We will look at the origins, extent, character and significance of corruption from both a developed and developing country perspective. We will cover various theories relating to corruption as well as look at a number of empirical cases.

AS.470.653. Russian National Security Policy. 3 Credits.
Russia plays a key role in most international issues and openly campaigns to realign the international system away from what it sees as American domination. This course considers the substance and process of Russian national security policy. It acquaints students with the main instruments and mechanisms available to Russian leaders to advance the country's national interests and key policy priorities. The course considers how Russia formulates and conducts its national security policy, the history that informs it, the political culture that sustain it, the ideas and interests that drive it, and the people and institutions responsible for it. The course addresses Russia's role in key global and regional issues and its relations with major powers. It places special emphasis on the wars in Ukraine and Syria, Russian concepts of information war, and on Russian military reform.

AS.470.654. Deterrence & Crisis Stability in the New Era of Geopolitical Competition. 3 Credits.
This course will consider the challenges of conventional and nuclear deterrence in the new era of great power competition among the United States, China, and Russia in particular but also with consideration given to challenges posed by new and aspiring nuclear states. Students will also explore Issues and challenges for crisis stability raised by the to develop and field of emerging military capabilities ranging from lethal autonomous weapons systems to hypersonic missiles to counter space weapons. While Informed by current and evolving concepts in deterrence and strategic stability theory, the course will nevertheless provide an empirical and policy-relevant survey and appreciation of key issues confronting senior national security decision makers today and in the decades ahead.

AS.470.656. Presidential Power and Politics. 3 Credits.
This course considers the evolution of the presidency from its creation by the founders who had "their fingers crossed" while contemplating an executive agent for the emerging government, to its contemporary massive presence in our political system. The class also examines the interactions of the president with the other branches of government—Congress and the Courts—as well as the dynamics and management challenges presented within the executive branch itself. The course focuses on the leadership attributes of effective presidents, as well as aspects of personality or "character" that influence presidential performance. Finally the class focuses on the power and influence exerted by the presidency in domestic public policy and in foreign affairs. Students will be encouraged to develop their own ideas of what makes a great president ion the 21st century.

AS.470.657. Energy, Security, and Defense. 3 Credits.
This course is a seminar-based overview of the role of energy in national security. Using a range of U.S. and non-U.S. case studies, students will review the roles of energy in grand strategy, the role of energy in conflict, and, finally, as a logistical enabler of military operations.

AS.470.658. Religion and American Political Culture. 3 Credits.
The relationship between religion and politics in the American context is one of peculiar complexity in the American context. This course has 3 main objectives: 1) to examine in general terms the role of religion in American public and political life as reflected in the debates concerning the use of religious symbolism and discourse in the public sphere; 2) to analyze how religiously informed moral argument has helped to shape public debate on key issues of public policy including the issues of civil rights, abortion, war and peace, and economic policy; and 3) to provide the necessary historical and philosophical context to help understand the present day intersection of religion and politics, and to see how previous generations of Americans approached similar problems.

AS.470.659. Radicalization and Deradicalization in Terror Networks. 3 Credits.
This course will explore some of the most contested and controversial aspects in contemporary security studies. There are a number of contentious and wide-ranging debates around ideas like radicalization not least concerning its definition, causes, and effects. This course will also prompt you to consider broader issues, such as whether there is a causal link between extremism and violent extremism? Why do some radicalized individuals to embrace terrorism, when other don't? And should security officials concern themselves with radicalization, or only with its violent offshoots? This course will unpack many of these debates, exploring academic and theoretical literature surrounding the issues of radicalization, recruitment, and deradicalization in modern terrorist networks. It will focus primarily on cases in Europe and the United States, while also exploring new phenomena such as homegrown, self-starter, and lone wolf terrorism.

AS.470.660. Program Evaluation. 3 Credits.
This course introduces the student to the literature, theories and approaches to evaluating organizational programs, policies and procedures. Students will acquire a broad perspective on types of program evaluation, including formative and summative evaluation, process evaluation, monitoring of outputs and outcomes, impact assessment, and cost analysis. Students gain practical experience through exercises and assignments involving the design of a conceptual framework, development of indicators, analysis of quantitative and qualitative evaluation data, and development of an evaluation plan to measure impact. In addition, topics such as experimental, quasi-experimental, and non-experimental study designs are introduced in the context of a variety of settings, including schools, welfare agencies, mental health organizations, criminal justice settings, environmental programs, nonprofit organizations, and corporations. Prerequisite: 407.709 Quantitative Methods

AS.470.661. Political Debates and the US Constitution. 3 Credits.
This course explores the political struggles that emerge from the U.S. constitutional system. During the course, we will read contemporary and classic cases in U.S. constitutional law in light of constitutional and political theory. Course discussions will focus on the law as well as the related policy, political, and societal implications of constitutional interpretation. Through paying particular attention to recent decisions and issues before the Court, the course will explore the roles and powers of the branches of federal government, separation of powers, federalism, and the commerce clause. It will also cover individual rights, due process, equal protection, and religious freedoms.

AS.470.662. Expertise and Evidence in Policymaking. 3 Credits.
With the passage of the Foundations for Evidence-Based Policymaking Act, all federal agencies are now required to make data accessible to the public and to implement specific plans for developing statistical evidence to inform policymaking. This course will examine the ways in which evidence and expertise are now being used for policy development and assessment. Specific topics will include cost-benefit analysis, cost effectiveness analysis, contingent valuation, forecasting and the communication of statistical evidence. In addition, the course will explore the interplay between political decisionmakers, experts and citizens in the evidence-based policymaking process.

AS.470.663. Human Security. 3 Credits.
The multiple crises plaguing the world today make evident the mutual inter-dependence and vulnerability of people and nations. The idea of human security has gained increasing significance within this increasingly complex and interconnected world. Human security places emphasis on the security needs of individual citizens, rather than being preoccupied by traditional, state-centric conceptions of security. It takes into account the impact of security threats such as economic crises, pandemics, and climate change on the lives of individuals within and across national boundaries. The course thus draws attention to alternative interpretations of what constitute security threats and how to contend with the underlying causes of volatility and human insecurity that prevail around the world.

AS.470.664. Fundamentals and Applications in Cybersecurity. 3 Credits.
This non-technical course introduces the foundational aspects of cybersecurity policy including basic technical principles of networks and their security, principles of strategy and policy, current governance mechanisms for global information infrastructures, and current strategies and policies for cybersecurity for the public and private sectors. It covers current cybersecurity issues, cyber deterrence and conflict, an inventory and description of state and non-state cyber actors, and the nexus between the public and private sectors. The course assumes little to no exposure to technical and policy aspects of cybersecurity.

AS.470.666. Institutional Fundraising: Raising Maximum Dollars from Government Agencies, Corporations and Foundations. 3 Credits.
In this hands-on course, we'll help you understand the fundamentals of securing funds from institutional donors. As a staff or board leader of a non-profit, understanding the ins and outs of raising funds for priority projects and capacity building from government agencies, corporations and foundations will add to your toolkit for moving your organization forward. We'll cover how this aspect of fundraising fits into your overall fundraising strategy and plan. We'll help you identify the right potential funders for important projects, learn how to land capacity-building funds you can use to grow and sustain your organization, cover the basics of relationship-building with institutional decision-makers, help you use data to build credibility with funders, create pitch-perfect corporate presentations and dive into the process of writing winning proposals and applications. Finally, we'll cover fulfillment and stewardship. Elective course for the Certificate in Nonprofit Management.

AS.470.667. Machine Learning and Neural Networks. 3 Credits.
Machine learning and, more broadly, artificial intelligence, can now be used to perform complex tasks such as image recognition, fraud detection, traffic prediction and product recommendations. These successes are driven by developments in machine learning, such as the use of neural networks. This course introduces students to a variety of machine learning techniques using Python. Students will first learn the fundamentals of the Python programming language and will then implement machine learning algorithms and develop an understanding of how they work. Further, students will learn how to select and implement an appropriate algorithm depending on the type of dataset they have, and will be able to use a machine learning algorithm to generate predictions.
Prerequisite: 470.681 Probability and Statistics

AS.470.668. The Politics and Process of American Foreign Policy. 3 Credits.
Overuse is not the only problem with the maxim that American "politics stop at the water's edge." The slogan has simply never been true. American foreign policy has always been a result not just of the crises and opportunities the nation has faced but its unique politics and policy processes. American national interests are determined through the democratic processes established by the Constitution and other legislation and affected by the politics that drive the nation's elections, its conversations and its foreign policies. These politics and processes have been remarkably consistent since the founding even as the nation's interests have grown significantly. A better understanding of both the politics and processes of American foreign policy will help students appreciate how the country's policies are made today and will be made in the future.

AS.470.670. The Practice & Politics of U.S. Tax Policy. 3 Credits.
Benjamin Franklin famously observed that "nothing can be said to be certain, except death and taxes." Since Franklin's day, however, both the form and prevalence of taxation have undergone a dramatic global transformation. This course will review the history of U.S. federal taxation and delve into the practical mechanics of taxation. It will provide students with an understanding of the processes, institutions, and political influences that shape tax policy. Finally, it will examine alternative methods of taxation and consider what the future may hold for federal tax policy. (Recommended elective for MA in Public Management)

AS.470.671. Risk Management Analytics. 3 Credits.
Risk management has always been in the vanguard of data analytics because risk measurement is a critical element in calculating risk/return tradeoffs. This course will examine both qualitative and quantitative analytical methods commonly used in risk management. Qualitative tools include impact/likelihood analysis; event and fault trees; threats, vulnerability, and consequences (TVC); and failure mode and effects analysis (FMEA). However, a key lesson in risk management is that what gets measured gets managed. As a result, a major part of the course will focus on quantitative tools, including modeling and stochastic simulations. We will use the @Risk software to build realistic risk models, including one in assessing project management risks. The objective of the course is to equip students with practical tools they can apply in risk-based decision making.Prerequisites: 470.681 Probability and Statistics; working knowledge of Excel

AS.470.672. Evolution of American Intelligence. 3 Credits.
This course explores the development of US intelligence system and the ways in which it has influenced (and been influenced by) world events. The goal is to understand how an intelligence system evolves as a result of changes in national strategy, technology, and legal & policy factors. By investigating the US intelligence system, students will develop their analytical skills and increase their understanding of the workings of foreign and security policies. The approach will be historical and topical. The history of US intelligence offers a surprising number of illustrative cases and themes—many of which can now be examined in detail using official records and contrarian views, and can even be compared with analogues across nations and time periods. More-recent events are not as well documented in the public, official record, of course, but an understanding of earlier patterns and activities can provide valid insights on contemporary trends.

AS.470.673. Data Visualization. 3 Credits.
This course instructs students in various visualization techniques and software, including R, Tableau, and vector graphics software (e.g., Adobe Illustrator, Inkscape). Students will learn how to ask interesting questions about politics; identify data that can be used to answer those questions; collect, clean and document the data; explore and analyze the data with statistical and graphical techniques; and create compelling, informative and accurate visualizations and present these visualizations to educated audiences. Prerequisite: 470.681 Probability and Statistics

AS.470.676. From al-Qaeda to Islamic State: Understanding the Roots of the Global Jihad Movement. 3 Credits.
No topic has captured the public imagination of late quite so dramatically as the specter of global jihadism. While much has been said about the way jihadists behave, their ideology remains poorly understood. This course aims to help students explore the intellectual development of jihadist ideology, focusing on how conflict has shaped Islamic theology and law. We go from the movement's origins in the mountains of the Hindu Kush to the jihadist insurgencies of the 1990s and the 9/11 wars. What emerges is the story of a pragmatic but resilient warrior doctrine that often struggles, as so many utopian ideologies do, to consolidate the idealism of theory with the reality of practice.

AS.470.677. The Invisible Primaries: Building Successful Strategies to Win 2020. 3 Credits.
Our interesting and interactive course will focus on the ongoing 2020 presidential campaign as it is actively unfolding in early 2019. We will analyze the background and personality of the candidates and see how they sell themselves to the voters in the "invisible primary" stage. Questions we will explore include: how and why a candidate decides to run for the presidency as well as what early media strategies emerge and how views on key issues of the day from health care to immigration to Syria and North Korea will figure into the campaigns. Running for president is similar to building a huge Fortune 500 corporation starting 50 state subsidiary offices with the one and only product being the candidate. And, we will be inviting most of the presidential candidates to speak at Hopkins.

AS.470.679. Armed Social Movements: Terrorism Insurgency and Crime. 3 Credits.
Drawing on the social movement literature, this course examines the emergence of irregular armed groups and their decisions to use violence. It explains how social movements turnviolent, how violence dictates their nature, and what this nature can tell us in terms of group strengths and weaknesses. It provides the students with the analytical tools needed to distinguish between terrorism, insurgency, and crime – by focusing and understanding group strategies, behavior, and capabilities. Students will thus be familiarized with the theory on armed group formation and evolution – but the course goes further, by counterposing such theory to the complexities of practice through the consideration of key case studies. The course ends with an overview of state strategies intended to counter a wide variety of threats. Particular attention is paid to the notion of operational art and lines of effort to underline the potential and meaning of counterterrorism and counterinsurgency.

AS.470.680. Advanced Academic Writing and Research: Social Movements and Civic Engagement in 21st Century America. 3 Credits.
This course will help students develop graduate writing and research skills. Through the rich scholarship of past and present social movements and civic engagement initiatives, students will gain an in-depth overview of the fundamentals of academic writing, style, and composition. They will learn how to compose a strong research-based argument, thesis statement, supporting paragraphs and conclusion using credible resources with the proper use of citations. These skills will help strengthen their ability to write, synthesize and argue at a graduate level. In the third week of the term, students will identify their own independent research topic, and in the latter part of the term, they will shape it into a research question, learn how to engage in critical inquiry using Hopkins' library resources, and through a writing process broken into scaffolded steps, will formulate an original argument in a cumulative paper. Through learning modules that focus on early social movements like the Women's Suffrage Movement, Civil Rights Movement, Environmental Movement, the White Power Movement, and more contemporary movements like "Me Too", "Black Lives Matter", and Climate Justice, students can explore and analyze how well the United States has realized its democratic ideals and obligations while improving upon their research, writing, and critical thinking skills. The course is intended for those enrolled in one of the Center for Advanced Governmental Studies (CAGS) graduate programs and for other Advanced Academic Program (AAP) students with the permission of their advisor.

AS.470.681. Probability and Statistics. 3 Credits.
This course introduces students to the fundamentals of statistical analysis as well as the R programming language and RStudio environment. Students will learn the building blocks of descriptive and causal inference, including summary statistics, survey sampling, measurement, hypothesis testing, linear regression and probability theory. Students will also learn how to create data visualizations in R, including times series plots, scatter plots and bar graphs. In addition, students will focus on interpreting statistical findings and presenting results in a compelling manner. By the end of the course, students will be able to conduct a statistical analysis to answer a meaningful policy question and will be prepared to take more advanced methods courses. Prerequisites: none

AS.470.682. Mission Meets Profit: Building a Social Enterprise. 3 Credits.
The goal of this course is a comprehensive examination of social enterprises- organizations that, broadly speaking, "apply commercial strategies to maximize improvements in human and environmental well-being". Social enterprises are a relatively new, 21st century phenomenon, and are typically referred to as hybrids of nonprofits and for-profits. While they are similar to nonprofits in that their missions and social and/or environmental objectives drive their very existence, social enterprises can have different structures than traditional 501©3s- some much more complex, legally and otherwise. Throughout the course we will learn about the various types of social enterprises that exist, comparing US models to models operating internationally, and analyze their pros and cons, challenges and opportunities. We will also explore how social enterprises challenge traditional business and nonprofit paradigms, what role social enterprises have come to play in international development, and finally, how to go about developing your own social enterprise. Elective course for the Certificate in Nonprofit Management.

AS.470.684. Legislative Language and Policymaking. 3 Credits.
This course examines the process of drafting legislation and the consequences of legislative language in the implementation and adjudication of federal policies. Focusing on the various stages of the legislative process, this course considers the expert and political sources of the legislative language in the U.S. Congress and the importance of language in coalition-building for policy passage. Examining the interactions of Congress with the other branches of government, the course also considers how presidents, the executive branch, and the judiciary interpret statutory language.

AS.470.685. The Challenge of Change: Innovation in Military Affairs. 3 Credits.
Change is perennial in national security and military affairs, but knowing how, why, and when to embrace change is both difficult and vital. Strategies and tactics may be outdated, new ideas may be resisted, and science and technology continue to change our world faster than we can optimize. The paradox deepens with context: innovation in peacetime has one logic while innovation in war has another. This course unravels the nature of change in military affairs through four themes: ideas, materials, human capital and structure, and, appreciation of the enemy. The course explores these themes through a series of case studies from around the world. Topics include civilian development/military application of science and technology; learning from failure and success (including from other nations); institutional reactions to change; procurement and the role of industry; and, the impact and limitations of individual “champions” of change.

AS.470.688. Political Institutions and the Policy Process. 3 Credits.
Bridging the divide between political science theories of policymaking and the actual workings of the policy process in the institutions of national government, this course examines the individual contributions of each of the legislative, executive, and judicial branches of government as well as the interactions and struggles between those branches. How do these various institutions set the policy agenda, develop and deliberate policy alternatives, make authoritative policy decisions, and implement those decisions? In what ways are the interactions between these institutions best considered conflict or cooperation? Also, how do outside actors and institutions -- the media, interest groups, public opinion, parties and campaigns -- affect policymaking in these various institutional settings? Drawing on the Constitutional design and historical development of these institutions as well as contemporary practice, this course examines the purposes, processes, and outcomes of policymaking from an institutional perspective.

AS.470.689. NGOs in Development and Global Policy-Making. 3 Credits.
This course provides an overview of the role of both national and international non-governmental organizations (NGOs) in processes of development, humanitarian response, and the promotion of human rights and active citizenship. The last decade has been one of rapid change in which NGO relationships with government, the private sector, and donors has been in a state of flux, with unprecedented challenges raised about the legitimacy and effectiveness of NGO actors. The course will look at how systemic changes the evolution of transnational advocacy, the aid effectiveness process, the emergence of new development actors from countries (such as India, China and Brazil) to the primacy of the private sector has influenced NGOs. Elective course for the Certificate in Nonprofit Management.

AS.470.692. Military Strategy & National Policy. 3 Credits.
This course examines how states (primarily the United States) and other political entities harness military capabilities to pursue of policy objectives. It exposes students to levels of strategy—grand strategy, strategy, operations, and tactics—in a national security context. The course will then focus on the practical implications and unique characteristics of military strategy. Students will critically examine topics such as civil-military relations, land warfare, naval warfare, theories of airpower, insurgency and counterinsurgency, and nuclear warfare. The goal is to understand the embedded assumptions of the various theories, the characteristics of the military capabilities animated by them, and, through discussion and case studies, the strengths and limitations of each.

AS.470.693. Comparative Democracies. 3 Credits.
This course uses the comparative method to look at the varieties of democracies that exist today. In the course, we will ask what is democracy, how do we measure it, and how does it vary across space and time? We will look at how democracy manifests in different constitutional forms e.g. parliamentary versus presidential. We will examine how different electoral and party systems influence variation in outcome within the set of democracies, and how social cleavages interact with, and are molded by, these systems. Further, we will use the answers to these questions to explore the issue of democratic consolidation and to ask why some countries become and stay democratic, while others do not. Case studies will be drawn from Europe, Latin America and Asia.

AS.470.694. Big Data Management Systems. 3 Credits.
This course introduces students to big data management systems such as the Hadoop system, MongoDB, Amazon AWS, and Microsoft Azure. The course covers the basics of the Apache Hadoop platform and Hadoop ecosystem; the Hadoop distributed file system (HDFS); MapReduce; common big data tools such as Pig (a procedural data processing language for Hadoop parallel computation), Hive (a declarative SQL-like language to handle Hadoop jobs), HBase (the most popular NoSQL database), and YARN. MongoDB is a popular NoSQL database that handles documents in a free schema design, which gives the developer great flexibility to store and use data. We cover aspects of the cloud computing model with respect to virtualization, multitenancy, privacy, security, and cloud data management. <p>Prerequisite: 470.763 Database Management Systems<o:p></o:p></p><p>Technology Requirements:A 64-bit computer with a chip that supports virtualization (set via BIOS)Windows Operating System 7, 8, or 10At least 8 Gb of Physical RAMOracle VirtualBox version 4.2 (free)Please be in touch with the instructor with questions about the technology requirements.<o:p></o:p></p>

AS.470.695. Proseminar: Essentials of Public and Private Management. 3 Credits.
(The purpose of the class is to help equip students to operate effectively in both the public and private sectors. The class will cover three major topics: (1) an overview of managing public and private organizations, with special attention to their differing missions, capabilities, and environments; (2) a survey of important relationships between the public and private sectors; and (3) the need for improved coordination between the public and private sectors to achieve important public purposes. Students will be encouraged to make the course an interactive one and to share their personal knowledge in the context of the issues discussed. Students will be expected to complete a significant paper on a relevant topic approved by the instructor. (Core course for the MA in Public Management and the MA in Government/MBA program)

AS.470.697. Intelligence and Counterterrorism. 3 Credits.
Counterterrorism is essentially an intelligence war. By definition, both sides use small forces and clandestine means, hiding their presence and activities not only from each other, but often from friends and allies as well. This course will explore the many roles of intelligence in every facet of counterterrorism, and ask students to evaluate their practical, legal, and moral effects and implications. It will also look at the terrorists' own intelligence activities, and the "intelligence race" between terrorists and counterterrorists. There are no pre-requisites for this course. However, students would be well served to have a basic familiarity with intelligence and terrorism before the class starts.

AS.470.698. American Exceptionalism. 3 Credits.
This course will seek to give students a deeper understanding of where the idea of American exceptionalism comes from and what its implications are for America, both domestically and abroad. Students will gain this understanding from reading classic works in the area that trace America's political development, starting with its Puritan heritage. Early American works will be studied from this period, along with Alexis de Tocqueville's Democracy in America. Seminal works of modern political science scholarship on this question will also be assigned, including works from Seymour Martin Lipset, Louis Hartz, Daniel Boorstin, and others. The course will then extrapolate from these historic roots to contemporary issues of America's foreign policy and rationale for its foreign interventions. The course will conclude with questions of America's standing in the world, which has in recent years, declined and seek to understand why this is so and what it means for the future understanding of American exceptionalism.

AS.470.699. Applied Performance Analytics. 3 Credits.
Data are everywhere, and many elected officials and government managers understand they need it. But how can they use it to solve problems and shape policy? What is the best way to make decisions based on a data analysis? How can they communicate those decisions, and the rationale behind them, to employees, citizens, and stakeholders? This course will provide students with an experiential learning opportunity based on real-world scenarios. Students will each take on a role (mayor, police commissioner, human capital director, budget director, public works director, public health director) and participate in a simulated public policy scenario. Working in small groups, students will apply a practical performance analytics process to develop solutions to address governmental challenges. Students will begin by studying foundational concepts and techniques of data collection, analytics, and decision support. They will also learn how to navigate multiple interests, asymmetrical information, and competing political agendas as they make difficult decisions about resource allocation and public policy. Along the way, they will learn how to turn insights into action by effectively communicating the results of analysis to busy executives and decision makers at all levels of the organization. Prerequisites: none required (470.681 Probability and Statistics recommended)

AS.470.700. Cloud Computing in the Public Sector. 3 Credits.
This course provides insights into how to utilize shared cloud computing resources through a service provider. These resources can be storage space, software as a service, or compute servers. This is a hands-on course in which students will access a variety of cloud services and work with different cloud providers such as Apple, Microsoft, Google, and Amazon. Students will set up virtual servers, work with cloud file storage, learn about a variety of cloud collaboration options, and much more. This practical course will help students make the transition to working in the cloud from any device, anywhere, anytime. All areas of the public sector, such as education, healthcare and law enforcement, increasingly use cloud computing both to deliver information to clients and share information within and across agencies. No prerequisite

AS.470.701. Congress: Why the First Branch Matters. 3 Credits.
Congress is the First Branch, "the People's Branch," and one of the most powerful legislatures the world has ever known. At this moment in history, however, the people do not assess the institution favorably and political scientists and pundits have declared it the "broken branch." Is Congress "broken" or merely reflective of our political times? In an era of "unorthodox lawmaking" is a return to "regular order" and "textbook lawmaking" realistic or a fantasy? This course will discuss these questions in the context of the evolving nature of Congress as an institution. The class will examine the institutional development of Congress and explore changes in its representative and legislative functions, as well as constitutional responsibility of holding the "power of the purse." Congress remains a dynamic institution and it behooves citizens to understand its complexity and centrality to governance in the U.S.

AS.470.703. Urban Data Analytics. 3 Credits.
This class applies data analytic skills to the urban context, analyzing urban problems and datasets. Students will develop the statistical skills to complete data-driven analytical projects using data from city agencies, federal census data, and other sources, including NGOs that work with cities. We will examine a variety of data sets and research projects both historical and contemporary that examine urban problems from a quantitative perspective. Over the course of the term, each student will work on a real-world urban data problem, developing the project from start to finish, including identifying the issue, developing the research project, gathering data, analyzing the data, and producing a finished research paper. Prerequisite: 470.681 Probability and Statistics

AS.470.704. Strategies in Insurgent and Asymmetric Warfare. 3 Credits.
This class examines the phenomenon of irregular warfare—of insurgencies and counterinsurgencies in particular—through a historical lens. The course will give you students insight into the origins, objectives, strategies, and tactics of irregular wars, as well as the principles of counterinsurgency theory and practice. Through the course, you will analyze current irregular wars, understand what caused them and whether they are likely to be successful or unsuccessful, and see how they can be combated.

AS.470.705. The Midterm Elections and the Media in the Trump Era. 3 Credits.
<p> Historically, the party out of power gains seats in the House and Senate in midterm elections. Historically, when there is a president with low poll ratings like Trump has today, the opposition party wins seats in Congress. However, with the polarization of our politics and the constant tweets of our president the 2018 midterm elections for the House, Senate, Governor's races and state legislatures could be much different than analysts are predicting. <o:p></o:p></p><p> The interactive class will follow the 2018 midterms in real time as the campaigns are taking place all the way through to election day in November. Social media will play a prominent role in the midterms and we will discuss and analyze the social media and traditional media platforms of the candidates. Plus we will discuss how the so-called mainstream media and other media are covering the midterm elections. We will look at the key issues of the campaign: Is Trump the main issue for many voters? Will issues of impeachment and Special Counsel affect voters? Is immigration and health care the key domestic issues? What role will North Korea, Iran, Syria, Mideast peace, Russian meddling in our elections play in the midterms? We will discuss and analyze whether Democrats move too far to the left and Republicans move too far to the right to capture the votes of their base. And, we will look at the winning campaign strategies of the new members of Congress and how they ran victorious campaigns in the Trump era. <o:p></o:p></p>

AS.470.706. American Military History from the World Wars to Today. 3 Credits.
This course familiarizes students with the general contours of US national security strategy and military policy from the First World War through the so-called “Long War” era of Iraq and Afghanistan. The United States has a long, complex, and increasingly dysfunctional relationship with the use of violence in pursuit of policy aims (war). The institutions of the United States with responsibility for war-making have, over the past century, been shaped by powerful forces of change and continuity as the US adapts to the evolving character of war. Students will develop an appreciation for these factors that have shaped US security policy since WWI, be able to frame current policy debates in that context, and be able to forecast potential implications for the decades ahead.

AS.470.708. Unleashing Open Data with Python. 3 Credits.
Learning the basics of Python empowers analysts to retrieve and leverage data in new ways. After covering the fundamentals of syntax, students learn how to read, create and edit data files using Python. Building on that knowledge, students interact with online resources through bulk data APIs and web scraping. Finally, students will use the data they collect to develop an original analysis. Prerequisite: 470.681 Probability and Statistics

AS.470.709. Quantitative Methods. 3 Credits.
Solutions to policy challenges increasingly require an understanding of how to analyze, present,?and interpret data.? Government agencies use data to evaluate programs and proposed policy initiatives.? Private companies use data to inform their strategic decision making.? Advocacy organizations use data to support their positions.? This course will provide you with the knowledge and skills needed to perform a sophisticated data analysis.? You will learn how to design and test regression models using R/RStudio, an incredibly powerful and open-source statistical software package.? Specific topics covered in the course include measures of fit, logistic and?probit?regression, panel data, instruments,?and translating statistical findings for broad audiences.? The focus of the course is on using statistics in an applied manner to address meaningful research questions.Prerequisite: 470.681 Probability and Statistics

AS.470.710. Advanced Quantitative Methods. 3 Credits.
This course builds upon the concepts taught in 470.709 Quantitative Methods. Students will learn how to construct and evaluate advanced regression models. Topics include experimental data, instrumental variables, panel data, matching and multiple imputation. In addition, you will learn how to use Latex, which is a document preparation system that allows you to incorporate mathematical language, tables and figures into a document in a user-friendly manner. Latex is also incredibly useful for managing references and preparing professional slide presentations. As a culminating project, students will critically evaluate a scholarly article that uses methods covered in the course. Prerequisite: 470.709 Quantitative Methods

AS.470.713. Resisting Tyranny: Strategic Nonviolent Conflict. 3 Credits.
War practitioners, policy makers, and security studies scholars study asymmetric warfare to understand why poorly armed insurgents effectively resist and even defeat technologically advanced and materially stronger armies. This course studies a perfect asymmetry in nonviolent warfare where unarmed ordinary people are able to effectively challenge and eventually defeat a fully armed, resource-rich regimes. In fact, historically, nonviolent movements have been twice as effective against violent regimes as armed insurgencies. This course will consider skills of organized populations in inter-state and intra-state conflicts, including anti-dictatorship, anti-occupation, anti-corruption, anti-violence struggles and analyze how disciplined civilians use nonviolent strategies and tactics to galvanize large and diverse participation, place their violent opponents in dilemma, make repression backfire and cause defections among adversaries' pillars of support.

AS.470.714. Contemporary Politics of Latin America. 3 Credits.
This course covers the politics of Latin America from 1945 to the present. It is designed to introduce students to the academic study of contemporary Latin American politics. Students are required to apply comparative methods of analysis to contrast regimes and political phenomena beyond governments. Students are expected to compare the institutions, policies and development models of different governments and regimes, as well as the ideology, program, organizational structure and support base of different social movements and political parties. These comparisons enable students to explore both similarity and difference. Students may identify broad commonalities in the politics of a region that shares many cultural features and important structural constraints. However, they should also be aware of distinctions; including the important differences between Central America, the Andean region and the Southern Cone, as well as significant variations between neighboring states.

AS.470.715. Political Conventions: Communication, Campaigning, and Controversy. 3 Credits.
This class will examine the history of national political conventions from its earliest days to current time, culminating with conventions this summer in Milwaukee and Charlotte. With winner-take-all primaries a thing of the past we could very likely see a brokered convention in Milwaukee for the Democrats this summer. Will Sanders try to change the convention rules if denied the nomination. Will Biden get the support of the superdelegates? Will Mayor Pete and Mayor Bloomberg still be competitive? Will Senators Klobuchar and Warren rally at the convention? In addition, the class will look at the likely "lovefest" convention the Republicans will hold in Charlotte in August. Will there be any disputes on the GOP platform on issues from immigration to health care? We will hold mock GOP and Democratic Conventions in class and discuss the up to the minute political news the first part of each class. We will discuss the role of social media (Trump's tweets) and current events as they arise in real-time in this lively and interactive class!

AS.470.719. Hate Groups and Domestic Terrorism. 3 Credits.
This course examines domestic terrorism in the homeland with an emphasis on white nationalist movements and anarchist-related groups such as Antifa. We will analyze ways these groups advance their political, ideological, and social agendas through violence and criminal activity in violation of both federal and state laws. Students will also be exposed to other domestic terrorism groups such as eco-terrorists, animal rights, black identity extremists, and sovereign citizen groups. The readings and videos will include a variety of diverse and opposing viewpoints; and utilize case studies such as the Charlottesville Unite the Right Rally in 2017 and the plot to kill the Michigan Governor in 2020. We will also analyze First Amendment and Fourth Amendment protected activities in civil protests and social media platforms in conjunction with these groups' activities. Last, we will address lone-wolf terrorism and whether a federal domestic terrorism law should be enacted to counter future terrorist actions.

AS.470.720. Rhetoric v. Reality in Politics: US Campaigns and Elections. 3 Credits.
The art of political persuasion has evolved rapidly in the past few centuries, but the present mimics the past. Conventional political wisdom asserts that the 2020 election – with the bombastic Donald Trump and a slate of unconventional freshmen Democrats on the ballot – is unlike any witnessed in the nation's history, but with the increase in partisanship over the last few decades, can voters really be persuaded or dissuaded from voting straight party line tickets in November 2020? This course will seek to answer that question in real time, as the students and professor slowly unwrap and examine the packaging – verbal, visual and other – candidates have employed over the last few decades to sell themselves and their platforms to voters. After first laying a historical foundation for understanding the evolution, or devolution, of U.S. rhetoric and campaigns, this course will examine every twist and turn of Election 2020 with an eye towards the means of persuasion employed by candidates, surrogates and PACS. Students will also examine the role money is playing in this post-Citizens United world, along with how free – or "earned" – media and new modes of technology are being employed by contemporary campaigns. The course will also devote a substantial amount of time to examining the media's role in how the public views current and former candidates. Guest lecturers include some of the nation's top political reporters.

AS.470.721. Comparative Federalism: The United States and the European Union. 3 Credits.
Federalism the division of power and sovereignty between a central authority and local governments has emerged as one of the most important themes of contemporary Western politics in both the United States and Europe. For the United States the division of power between the Federal and State governments lies at the very heart of the American Constitution. At the same time disputes over the precise balance of Federal and State power has been a major fault line in American politics since Federalists and anti-Federalists at the time of the founding. For Europe the destruction of two World Wars showed the destructive side of nationalism and acted as an impetus to leverage Europe's common history and cultural inheritance to forge a supranational political and economic union dedicated to peace and prosperity. Since the end of the Cold War and the Treaty of Maastricht the process of European integration has speeded up rapidly resulting in a common European currency as well as common legal and political institutions. At the same time concerns about the perceived loss of sovereignty, national identity, and democratic accountability have led in some places to backlashes against Brussels and resurgent nationalism. There is also the broader question of the European Union's goals and identity is it principally an economic union or is it a super-state in the making? In this course we will explore Federalism in its institutional, legal, philosophical, and historical aspects in both America and Europe.

AS.470.722. Elections 2022: Midterms, Media & Message. 3 Credits.
President Biden and former President Trump are not on the ballot this November but they are the two elephants in the room as voters go to the polls this year.Will Biden's fading poll numbers and Trump's Big Lie on the 2020 election and endorsements impact the midterms? This interactive class will be taking place during the middle of the midterm campaign and class will focus on House, Senate and Governor's races. From abortion to gun control to inflation to immigration to Ukraine we will discuss and analyze the key issues of the midterm election. The course will also focus on the role social media and mainstream media play and the effectiveness of candidate's paid advertising in getting their message out to voters. From the issues and the candidates on the campaign trail to use of media and messaging to the vote and beyond the class will be discussing history as it is happening!

AS.470.723. Western Political and Constitutional Thought. 3 Credits.
Many of the ideas which shape today´s world- democracy, liberalism, conservatism, capitalism, socialism, nationalism - have their roots in a "great conversation" (Robert Hutchins) that spans some 25 centuries from ancient Greece until today. The conversation motivating the Western tradition has included a set of perennial questions such as: Who ought to rule - and how do we decide? What is the purpose of politics? What is the best form of constitution? What makes political authority legitimate? What is political justice? What is citizenship? This course is intended as a broad survey of some the most influential political thinkers in the intellectual tradition of Europe and America. Among the many who will be examined are : Thucydides, Plato, Aristotle, Cicero, St. Augustine, St. Thomas Aquinas, Machiavelli, Thomas Hobbes, John Locke, Voltaire, Baron de Montesquieu, Jean-Jacques Rousseau, Immanuel Kant, Adam Smith, Thomas Jefferson, Edmund Burke, Friedrich Nietzsche, G.W.F. Hegel, Karl Marx, John Stuart Mill, Leo Strauss, and Hannah Arendt.

AS.470.724. Managing Dangerous Futures: Global Political Risk Analysis. 3 Credits.
Political risk affects almost every major decision that governments, corporations, nonprofit organizations, and even individuals make, sometimes turning what appears to be a good decision into a bad one, with severe implications. However, few people really understand political risk or how it can be evaluated and mitigated. The goals of this course are to ensure that all students can assess the political risk of a particular country or situation; assess the political risk of a particular business investment; take a much broader perspective on the possible sources of political risk; understand how the way people think and groups function preclude effective decision making (thus making bad decisions more common); evaluate risks using a variety of different risk assessment tools; and leverage a variety of mechanisms to improve risk management.

AS.470.725. China's Impact on Global Security. 3 Credits.
As China's role on the international stage continues to grow, how will its behavior change the world? Beijing has long espoused a principle of non-interference in the internal affairs of other states, but as China's overseas presence and interests grow, how is it adjusting its approach to global challenges and influencing the interests of other states? Students will put themselves into the position of national security leaders in China, in the United States, and in third countries to explore a range of national interests, priorities, objectives, strategies, and policy tools.

AS.470.726. Education Policy and Federalism. 3 Credits.
This course will explore contemporary issues in education policy, with a focus on the evolving relationships between federal, state, and local governments in guiding America's schools. Topics will include the successes and failures of the soon-to-be-reauthorized federal No Child Left Behind Act, debates over the wisdom of national academic standards, the legal environment for public school finance, the growing role of nongovernmental organizations like Teach for America and national charter school networks in public education, collective bargaining in education, and the political dynamics of education reform. The course will include group discussions and papers in which students will be required to select and defend specific policy positions in the areas discussed. (Recommended elective for MA in Public Management)

AS.470.728. Fundamentals of Nonprofits and Nonprofit Management. 3 Credits.
The goal of this course is to convey the history, size and impact of the nonprofit and philanthropic sector while providing the fundamentals of nonprofit management and the founding of a nonprofit organization. Successful nonprofits today must have strong management systems in place in order to assure quality programs for service and impact. These systems include management of finances, strategic planning, human resources, information technology, marketing, performance measures and other aspects of operations. The course will help the student understand the current thinking regarding "best practices" in managing and improving nonprofit organizations and appreciate the interplay of environmental and organizational factors that influence managerial decision-making. Throughout the course, there will be a comparative perspective that looks at the scope and status of nongovernmental organizations in other countries and the influences on those organizations by their own governments, foreign aid and international philanthropy. Elective course for the Certificate in Nonprofit Management.

AS.470.731. Privacy in a Data-driven Society. 3 Credits.
This course addresses the legal, policy and cultural issues that challenge the government and its citizens in the increasingly complex technical environment of privacy. We will examine the challenges in balancing the need for information and data against the evolving landscape of individual privacy rights. The course will examine privacy at all levels: by analyzing the shifting views of individual privacy by citizens as well as the technological challenges in both protecting and analyzing personal information for government use. Using case studies and hypotheticals, we will discuss the issue of transparency in the government use and retention of data. The cases will range from Facebook to healthcare.gov to sunshine laws to national security uses of information. We will trace the development of legal and policy measures relevant to privacy concerns and envision future solutions needed in an era of great technological innovation including the use of big data.Prerequisite: none

AS.470.732. Communications and Congress. 3 Credits.
We're living in a capital city the founders wouldn't even recognize. In recent years the Capitol itself has been outfitted with state of the art green screens, fiber optic cables, minutely pixelated cameras and new, polished studios where politicians of all stripes roll out proposals that are instantly disseminated to their supporters on multiple mediums, including in email blasts begging for campaign contributions. After a brief exploration of the history of political communications, the course will quickly pivot into a real-time examination and training session for surviving - even thriving - in the contemporary world of communications. The course will instill in students the dire need to stay focused on good policy. While students will leave equipped with the tools that will enable them to thrive in this hyper-partisan atmosphere, the hope of the course is to help Hopkins students stand out as policy focused experts in this soundbite-dominated era. The instructor is a veteran congressional reporter who is offering to bring students enrolled in his course with him to attend press conferences and/or hearings, to witness key votes from the press galleries overlooking the House and Senate floors and to study how reporters and politicians interact inside the marble halls of the Capitol. Students will be offered a front row seat to witness the contemporary congressional communications apparatus in person (some students may not be able to take time off work to accompany the professor to the Capitol, which is fine because they can catch up on those events later on C-SPAN, though students are encouraged to shadow him on the Hill for at least one day during the semester, though some may opt for spending more than one day with him). The main focus is on training students to be communications experts in this new, digital world. Students will have one main project during the semester that will require them to develop their own messaging campaign simultaneously on multiple mediums that's focused on one of the hot button issues being debated at the Capitol during the course

AS.470.733. Origins and Influence of Public Opinion on American Democracy and Elections. 3 Credits.
In a democracy, the views of citizens are intended to guide lawmakers as they shape public policy. This makes public opinion a central component in the study of democratic politics. In this course, we will investigate the psychological and sociological origins, structure, measurement, and consequences of public opinion. We will investigate the content of what people think on a variety of salient topics from immigration, income inequality, taxes, to the 2020 elections. However, the main purpose of this class is to move beyond the what and examine the why. Why do Americans think what they do about politics? The course will draw from theories in political science and political psychology to examine the organizing structures of political beliefs including identity, self-interest, socialization, personality, values and morality. In turn, the course will examine how these various sources of public opinion impact voting behavior and policy preferences.

AS.470.734. Organizational Leadership and Ethics in NGO Management. 3 Credits.
This course focuses on organizational leadership strategies and the role of ethics within nonprofit and nongovernmental work specifically. A wide scope of ethical issues relevant to nonprofit and nongovernmental work will be reviewed, analyzed and discussed. NPOs/NGOs operate under specific ethical guidelines in order to ensure accountability to the public and their many stakeholders. This course will focus on ethical behavior within organizations and explore instances of when prominent NGO leaders and organizations have been situated to face ethical dilemmas. The course will cover a wide scope of management models, techniques, and organizational values and goals. It will also review the impact that various leadership styles have had on organizations through the study of case studies and what has amounted to optimal leadership effectiveness. In addition to learning strategies to lead high performance organizations ethically. This course will combine theory, practical applications, and technical skills that will strengthen their ability to be strong leaders. Core course for the MA in NGO Management.

AS.470.735. Politics and the Media. 3 Credits.
Quickly accelerating changes in the ways we get our news are compelling newsmakers and journalists alike to rethink their craft, and their relationships with their audiences, with repercussions for policy, politics and public discourse. This course will examine how innovations – like social networking, mobile platforms, behavioral targeting, etc --are providing journalists and political leaders with new ways to interact with citizens. It will look at how the rapid migration of consumers to the web is leading news organizations of all types to rethink how they organize, pay for and think about themselves. Students in this course will use real time news developments in the nation’s capital as a laboratory for observing the evolving ways news sources and reporters and the public interact. Questions to be considered include whether this digitized and networked environment has implications for the pace and character of changes in public policy. The course will invite practitioners in journalism and politics who are dealing with these developments daily to share their sense of where all this is leading. This course counts towards the Political Communication Concentration.

AS.470.736. Methods of Policy Analytics. 3 Credits.
Data analytics are an essential part of program and policy evaluation. Policymakers increasingly rely upon analytics when making critical policy decisions. In this course, students will conduct a variety of policy focused data analyses using R. Students will utilize a variety of descriptive and inferential data analysis techniques to inform the design and execution of a policy. Students will utilize data-driven analysis to produce policy memoranda in a variety of domains relevant to today’s practitioners. A good understanding of basic economics and statistics, and an understanding of American government institutions and programs, will be necessary for a student to participate effectively in the class discussions and complete the assignments. Please contact the instructor with any questions.<o:p></o:p></p><p>Prerequisite: 470.681 Statistics and Political Analysis<o:p></o:p></p>

AS.470.738. Policy, Technology and Innovation. 3 Credits.
This course explores technological and data-driven solutions for policy challenges. This includes developments within government, such as the new types of leadership provided by Chief Innovation or Chief Data Officers, the trend toward digitalization of services, and the movement toward open data. It also covers innovation by citizens through the civictechnology movement. Civic tech initiatives have been used to extend and improve services, increase efficiency, design applications for citizen engagement, and improve communication across a variety of policy domains. The course also covers the concept of smart cities and how it can be understood as both new applications of technology (such as sensors and smart infrastructure), and the strategic use of data. For the course project, students will evaluate a policy initiative using city open data, policy research, an analysis of political culture within which the initiative would be implemented, and the technology that could be used for the initiative. Some familiarity with R programming language and theRStudio environment is helpful. Prerequisites: one of the following: 470.681 Probability and Statistics or 470.768 Programming and Data Management

AS.470.740. Cyber Policy, Strategy, Conflict and Deterrence. 3 Credits.
This course will provide an overview of current issues in the cyber realm, focusing on policy and conflict from a U.S. and international perspective. We will begin with an understanding of the power inherent in cyberspace and consider the policy issues facing the civilian, military, intelligence and private business sectors in dealing with offensive and defensive cyber activity. Through the use of case studies, we will examine previous and ongoing cyber conflicts to understand their impacts on international relations. We will analyze the roles of several different types of cyber actors including state actors, non-state actors such as criminal and terror groups and private sector/business responses. This course will also examine the issue of cyber deterrence, and the unique aspects of offensive and defensive cyber activities by all cyber actors. A technical background is not required and basic aspects of cyber operations will be discussed and demonstrated as part of the introductory class sessions.

AS.470.741. Campaigns and Elections. 3 Credits.
This course introduces current theories and controversies concerning political campaigns and elections in the United States. We take advantage of the fact that the class meets during the "invisible primary" of the 2016 presidential campaign, and students are expected to follow journalistic accounts closely. The course is split into two major parts. First, we consider the style and structure of American campaigns. For example, we ask how campaigns have changed in the last fifty years, especially concerning the role of parties, the presence of incumbency advantage, and the role of money. In addition, we consider why candidates decide to run, how they position themselves on important issues, and how they design their campaign messages. We also cover the importance of campaign polling, and the tricky task of forecasting election outcomes. Second, we explore the impact of campaigns on voters. For example, we ask whether campaigns ever convince voters to change their opinion, or whether demographic and socioeconomic factors explain most political behavior. The goal of the course is to review the importance of elections in American politics, and to provide the tools to make normative judgments about the health of American democracy.

AS.470.742. Politics of Cybersecurity. 3 Credits.
In recent years, the United States has become dependent on cyber virtual networks as the engine for our society. However, this digital infrastructure remains extremely vulnerable to cyber attacks. Protecting the networks we rely on presents unique challenges, as networks are without borders and bear the stress of attack millions of times each day. This course will explore the challenges and political factors impacting the judicial, legislative, executive branch agencies of Department of Defense, Homeland Security, National Security Agency, and private industry as they all work to secure and create a national cyber security apparatus. The intelligence community is facing an enormous challenge in working to prevent the transfer of the United States' intellectual property and identifying the cyber attackers. We will discuss the political implications of establishing laws addressing how information is to be shared between governments and industry and the authorities needed for the DoD and intelligence community to operate domestically. We will discuss the impact of the creation of the Department of Homeland Security and examine the evolving relationship of Congressional oversight and legislative mandates. Issues such as jurisdiction of congressional committees, the budget, and the authorization and appropriations processes will be covered. Major policy and counter-terrorism issues of special concern to Congress will also be addressed in this course. Guest speakers will be invited from DHS, Capitol Hill and the media, allowing us to examine the issues from a variety or perspectives.

AS.470.743. Data Mining and Predictive Analytics. 3 Credits.
Many government agencies engage in data mining to detect unforeseen patterns and advanced analytics (such as classification techniques) to predict future outcomes. In this course, students will utilize IBM SPSS Modeler to investigate patterns and derive predictions in policy areas such as fraud, healthcare, fundraising, human resource and others. In addition, students will build segmentation models using clustering techniques in an applied manner. Integration with other statistical tools and visualization options will also be discussed.Prerequisite: 470.681 Probability and Statistics; Recommended: 470.709 Quantitative Methods

AS.470.744. Trade and Security. 3 Credits.
Since World War II, American trade policy has been implemented through agreements with a growing array of foreign governments to encourage global economic integration by lowering barriers to international trade. The course will begin with a look at the foundation of this approach to trade policy at the end of World War II and the relationship the Roosevelt and Truman administrations saw between integration and security policy. It will then introduce students to the American trade regime of the early 21st century and the WTO, and examine the ways the U.S. governments has adapted this regime to regional challenges arising from relationships with Japan, China, and the Muslim world, and to policy issues, like resource dependence, sanctions and export controls. The course will have a midterm exam on America's trade regime and the concepts that have shaped it, and a final paper, in which students will examine an issue of their choice in depth. (Recommended elective for MA in Public Management)

AS.470.745. Terrorist Financing Analysis and Counterterrorist Finance Techniques. 3 Credits.
The course examines how terrorist groups finance their operations. It also explores current policy approaches to curb financial support to terrorists through the application of U.S. and international sanctions, in particular how multilateral fora, such as the United Nations and the Financial Action Task Force, disrupt and deter terrorist financing. At the completion of this course, students will have a better understanding of the key tools, including law enforcement, diplomacy, and intelligence, that are used to counter terrorists' financial networks and activities. Through this course, students will develop proficiency in a series of analytic methods used to study terrorist financing and counter financing. Students will use structured analytic tools such as weighted ranking methods, scenario trees, causal flow diagramming, hypothesis testing, and utility analysis, as well as game theory and logic to form analytic judgments. Prior coursework or professional experience in intelligence, (counter) terrorism, or finance recommended.

AS.470.746. Iran: Security Policy of a Revolutionary State. 3 Credits.
This course will provide the analytical and contextual skills required to understand the current political and security situation of Iran. After laying out the context of the Iranian Revolution through a brief examination of the Pahlavi years, the course then weaves together Iran's political, military, diplomatic, social, economic development during the turbulent years between Iran's 1978-1979 revolution and the 2015 nuclear agreement—covering a time period of roughly 1941 to the present day. This course covers three main inter-related topics: the history and development of the modern Iranian state; the interaction between state and society in modern Iran; and Iran's diplomatic history in the 20th and 21st centuries. The course concludes with a discussion of Iran's present-day foreign, security, and defense structures and processes.

AS.470.747. The FBI and Fusion Centers: Information Sharing in the Post 9/11 World. 3 Credits.
This course examines the “fusion” of information gathering and sharing between the Federal Bureau of Investigation (FBI) and the 79 fusion centers in a Post-9/11 World. We will address federal, state, and international law enforcement jurisdictional issues, the balancing of privacy/civil liberties with information collection/dissemination, and overall assistance to state/local authorities during critical incidents. Students will address broad public policy and perception implications inherent in law enforcement activities. Students will also analyze and discuss case studies such as the Las Vegas Concert, the Orlando Night Club, and the San Bernardino shootings to illustrate the need for timely fusion of information between federal and state law enforcement. The readings and videos will include a variety of diverse and opposing viewpoints relative to law enforcement with practicums and simulations to allow debate in “real-world” situations. An important objective is to determine ways to improve upon the current law enforcement landscape and generate possible solutions to ensure seamless and timely information sharing while safeguarding individual rights.

AS.470.748. The Art & Practice of Intelligence. 3 Credits.
This course introduces students to the field of intelligence, particularly as practiced in the United States. After a brief overview of the historical foundations of modern intelligence, it discusses how intelligence was conducted during the 20th century including collection, analysis, counterintelligence, covert action, and oversight. It then discusses the disruptive influences of September 11, the Iraq War, and new technologies. The course concludes with a discussion of the “democratization of intelligence.”

AS.470.749. Campaigns and Running for Office. 3 Credits.
You can see yourself now – taking the oath of office, giving speeches, and making critical decisions impacting thousands or millions of people. But how do you get there? This class provides a practical guide for students who are interested in exploring a run for elected office. Students will learn how to assess if and when they are ready to run, which office to run for, and most importantly, develop the critical skills needed as a candidate to wage and win a contested campaign. These skills include writing a campaign plan and budget, hiring staff and consultants, learning how to fundraise, and working with the media. This class dispels the myth that only those independently wealthy can serve in office by giving students a real understanding of what it takes to run and win.

AS.470.750. Modern Conflict in the Middle East. 3 Credits.
This course examines the evolution of armed conflict in the Middle East over the past three decades and why the United States’ conventional military dominance has not led to lasting strategic victory. Attention will be paid to how both states and non-state actors in the region have adjusted to America (and Israel)'s overwhelming conventional military superiority through deterrent strategies, asymmetric tactics (i.e. insurgency, terrorism, tunnel warfare), and exploitation of advanced commercial technologies (i.e. improvised explosive devices, UAVs, cyberwarfare, information operations) in lethal and/or strategic operations. Students will utilize "rationalist" and cultural frameworks to critically analyze these innovations across multiple conflicts/operations, including: Operations Iraqi Freedom and Inherent Resolve; various iterations of the Israeli-Palestinian conflict; the civil wars in Syria and Yemen; and strategic conflict between Iran and the United States (and Israel) . The course’s objective is to provide a better understanding of the relationship between military technological capability and strategic success in modern conflict, and of the challenges U.S. policymakers may face in future conflicts both in the Middle East and globally against other great powers.

AS.470.751. Politics and Security in the Middle East. 3 Credits.
This course examines U.S. policy responses to the changing political and security landscape of the Middle East. Bringing together historical events, primary sources and secondary literature and contextual analysis, this course provides the analytical skills required to develop a sophisticated understanding of the current political and security situation in the Middle East. Students will engage key topics in modern Middle Eastern politics and security, including the origins of Islam, Arab nationalism and its rise to prominence, the Arab-Israeli and Palestinian-Israeli conflicts, the internal/external struggles against Western imperialism, the competition among Arab states for regional dominance, the Cold War the Middle East, America’s relations with Iran and Iraq, the oil economy of the Gulf, the challenge minorities pose to the region, the rise of Islamic radicalism, the Arab Spring, and the rise and fall of the Islamic State.

AS.470.752. Intelligence Analysis. 3 Credits.
Intelligence analysis is fundamentally about understanding and communicating to decision makers what is known, not known, and surmised, as it can best be determined. Students will read seminal texts on intelligence analysis, discuss the complex cognitive, psychological, organizational, ethical, and legal issues surrounding intelligence analysis now and in the past, and apply analytic methodologies to real-world problems.

AS.470.754. Project Management for NGOs. 3 Credits.
This course will provide an overview on project management as it pertains to nonprofit work. The course will teach students how to manage the five aspects of project management: project initiation, planning, execution, monitoring and evaluation, and closure. Students will learn the full project cycle from start to finish, drawing on actual examples of projects funded by a diverse range of donors, public and private organizations, and foundations. The course will also utilize templates relevant to project management for students to use as a resource in the field. The class will touch on issues relevant to project management such as project scope, objectives, stakeholders, planning, financial tracking, grants compliance, and closing. Elective course towards the Project Management, Evaluation and Leadership track for the Masters in NGO Management.

AS.470.755. Sustainable Cities in Germany: Lessons for the United States. 3 Credits.
This course addresses two important, but overlooked global urban phenomena – the development of world-class urban sustainability plans in Berlin and the Stuttgart region and their suitable transfer and application to cities in the U.S. This class will be designed to expose the student to the evolution and performance of renewable energy, public transit, water infrastructure, workforce training and social inclusion innovations - in these metropolitan regions and the ways that they may (or not) be considered suitable for adoption in the US. By the end of this course the student will have developed an appreciation for the pioneering urban sustainability programs of Berlin and Stuttgart and the phenomena of cross-national policy transfer to the U.S.

AS.470.756. Understanding Modern War. 3 Credits.
This course examines the phenomenon of modern warfare through both a theoretical and historical lens. It will provide insight into the definitions, origins, objectives, strategies, and tactics of modern conflict. Throughout the course you will analyze recent and ongoing conventional, irregular, and hybrid wars and understand what caused them, how they were conducted, and why they ended the way they did. Through a combination of lecture and online discussion, students will analyze these conflicts from a variety of perspectives to include state security and military forces, insurgents, criminals, and terrorists.

AS.470.757. Language and Power: How to Understand and Use Political Speech. 3 Credits.
<p> Political writing is a subspecies of language with several manifestations. There is an art to the op-ed and to the editorial, to the polemical essay and to the review. Within government, there are skills particular to ghosting speeches and essays, preparing Congressional testimony, Federal commission reports, policy memoranda, and press releases. There are even special forms and qualities of expression for hosting award and memorial ceremonies, and for writing thank-you notes, toasts, and letters of condolence. <o:p></o:p></p><p> This course is designed to teach an appreciation for the range and nature of political writing and speech in both its public and governmental forms. It also introduces students to the fundamental skills required to do effective political writing. The course is designed to be a writing-heavy course, because (most) people learn by doing. It will therefore be somewhat time-consuming, but within reason. <o:p></o:p></p>

AS.470.758. Data-Driven Campaigns and Elections. 3 Credits.
Analytics inform the decision-making process, strategizing, and forecasting of modern American campaigns. This course focuses on the role that analytics play in campaigns and elections in America. Campaign strategists, policy analysts, and social scientists leverage data from voter rolls, consumption and public opinion polls to make better choices. This course surveys the theoretical and empirical literature in American electoral politics to examine how campaigns and political organizations are using field experiments, microtargeting, and public opinion polling to tackle the challenges of getting out the vote and increasing registration and voting rates. Other topics covered include voting behavior, public opinion, partisanship, and campaign finance. Students will gain a rich understanding of how analytics has become a key component of the electoral process. Students will also gain experience analyzing data through simulations and data analysis exercises. Prerequisites: none required (470.681 Probability and Statistics recommended)

AS.470.759. American Political Development. 3 Credits.
This course examines the factors that promote stability and change in American politics. Broad in historical scope, this course considers the development of the American state and its institutions as well as the continuities and complexities of American political culture by analyzing key moments of institution-building and policy change from the American Founding to the present. Key questions include: What explains the character of the American state? What are the consequences of the American state and its policies? Is America “exceptional” in these and other regards? What roles and functions do political institutions perform? What roles do culture, ideas, and rhetoric play in social, political, and economic life? How have these various roles and functions changed over time?

AS.470.760. Comparative Intelligence Systems. 3 Credits.
Do all countries conduct their intelligence activities in the same way? If not, what are the reasons for the differences? This class will consider theoretical ways of understanding and assessing national intelligence systems. It will look at political, historical, and cultural factors which may influence the development and functions of nations’ intelligence agencies and systems. The class will include an examination of the "ways of intelligence" of the United States, the United Kingdom, the USSR/Russia, Germany, China, and Iraq, among others.

AS.470.762. Democracy and Security in Israel. 3 Credits.
The influence of the security circumstances of Israel and its point of departure as a nation for democracy in Israel will be the focus of this class. The exigencies of war put tremendous pressure on liberal-democratic ideals and institutions, and very few democracies have endured such long-term conflict as Israel has. How has Israel managed to combine security with liberty without sacrificing one to the other? How might Israel democracy better serve its multi-ethnic constituencies? What is it about the nature of Israel’s institutions, its history, and its culture that enables it to persevere as a liberal democracy? With authoritarianism on the rise in the world – will Israel be able to resist it? We have planned a variety of units to look at these facets of Israeli democracy – its strengths, challenges, and vulnerabilities.

AS.470.763. Database Management Systems. 3 Credits.
This course provides students with a strong foundation in database architecture and database management systems. Students will evaluate the principles and methodologies of database design and techniques for database application development. Students will also examine the current trends in modern database technologies such as Relational Database Management Systems (RDBMS), NoSQL Databases Cloud Databases, and Graph Databases.Prerequisite: none

AS.470.764. Survey Methodology. 3 Credits.
This course is a comprehensive examination of all aspects of designing questionnaires, conducting survey research, and analyzing survey data. The class will cover question construction, measurement, sampling, weighting, response quality, scale and index construction, IRBs, ethics, integrity and quality control, modes of data collection (including telephone, mail, face to face and focus groups), post collection processing and quantitative analysis of data (including chi-square and ANOVA), as well as report writing fundamentals. The class culminates by fielding a survey of student created questions and writing an executive summary of the survey with a paper discussing the research findings.Prerequisite: 470.681 Probability and Statistics

AS.470.765. Government Regulation of Business: Price and Entry Controls. 3 Credits.
There are two main approaches for implementing government domestic policy: fiscal and regulatory. This is a one-semester course in economic regulation. Economic regulation includes use of market entry and price controls to deal with market imperfections, such as natural monopolies in which competitive markets fail. The course would cover:· the nature of markets and market failure,· a political economy/public choice analysis of the genesis of government intervention,· an evaluation of corrective policies, and· an analysis of alternative regulatory strategies.In addition to the regulation of natural monopolies, potentially competitive markets, and the problem of regulatory capture, the course would cover alternative types of environmental regulation for controlling external social costs. The class would prepare the successful student to examine and interpret problems, policies, programs, and events at all levels of government using the powerful tools of economic analysis applied to government regulation.?

AS.470.766. Economic Growth:The Politics of Development in Asia, Africa and Beyond. 3 Credits.
What makes some countries grow while others do not? What accounts for successful economic development versus stagnation? As these questions become ever more relevant in an increasingly globalized world, this course offers an introduction to the topic. The class will provide an overview of the main classic and current theories of economic development. It will then go on to explore specific current issues in development, including: development aid, role of international organizations, sustainable development, corruption, institution building and regime type. Specific case studies will be examined including China and India, the East Asian 'tigers', development failures in Africa and mixed outcomes in Latin America.

AS.470.767. Defense Policy. 3 Credits.
This course describes the principal challenges facing the making of American Defense Policy and explains previous and current policies declared and practiced to meet them. The course is designed to inform students on the most pressing defense issues confronting the United States, and to present them a framework for defense policy analysis. It emphasizes understanding those defense policies, analyzing them, and considering and weighing alternative approaches to achieving national objectives of deterrence and defense. The course fosters an understanding of the array of U.S. military capabilities providing plausible responses to the use of military power in support of U.S. foreign policy objectives. It examines those policies in the areas of nuclear, conventional, and irregular forces, and weighs alternatives in shaping the size and structure of those forces to meet national objectives.

AS.470.768. Programming and Data Management. 3 Credits.
This course introduces students to the R programming language. The R language is one of the most popular tools used today for performing data analytics, statistics, machine learning, data visualization, and much more. By the end of this course, students will understand fundamental programming concepts that apply to all programming languages. These concepts include variables, functions, loops, data structures, and data types. The course will also cover the use of these tools to solve challenging data problems that students may encounter in their academic or professional careers. Note: The course overlaps a small amount with 470.681 Probability and Statistics, but this course focuses much more heavily on the fundamentals of programming. No prerequisite.

AS.470.769. Data Science for Public Policy. 3 Credits.
Data science is a methodology for extracting insights from data. This course is an introduction to the concepts and tools that are used in data science with an emphasis on their application to public policy questions. The course covers some advanced data mining and machine learning processes including classification and decision trees, random forests, cluster analysis, and outlier detection, while also providing you with training in the basics of data management and data exploration. All of the work in the course will be conducted to prepare you to proficiently conduct predictive analytics in a real-world setting. Some familiarity with R programming language and the RStudio environment is necessary. Prerequisite: 470.681 Probability and Statistics

AS.470.770. Communicating Public Policy. 3 Credits.
This course will introduce students to today's most pressing public policy issues, with an emphasis on writing to achieve impact. Public policy professionals must be familiar with a variety of key issues and be able to effectively make a case for a position. This course will examine such topic areas as health care, energy/environment, fiscal policy, international trade, and education and identify core issues and the politics that characterize each of these policy areas. As part of our study, students will learn the art of writing policy memos, issue briefs, op-eds and speeches. When you complete the course successfully, you will be able to demonstrate a basic understanding of five public policy issues through various forms of writing. You will be able to effectively and succinctly write policy memos, issue briefs, op-eds, blogs and speeches, addressing a specified audience, clearly identifying the problem, and making a case for a position or solution.

AS.470.771. Security and Politics in the South Caucasus. 3 Credits.
This course addresses security and political issues in the South Caucasus, as well as selected economic, cultural and ethnic topics. It examines the histories of Georgia, Armenia, and Azerbaijan prior to the Russian conquest and during the imperial and Soviet periods; political continuity and change since the fall of the Soviet Union; and the origins and evolution of ethno-territorial conflicts. It discusses the region as an arena of security competition between Russia and NATO and as a venue for frozen conflicts. It also considers democratization and global energy politics as well as the role played by regional powers such as Iran and Turkey. Finally, it looks at how the European Union's European Partnership initiative is shaping the region. After initial sessions in Washington the course moves to Tbilisi, Georgia for a week for meetings with policy makers and experts, including those on Azerbaijan and Armenia. Side trips include excursions to the area of the Russia-occupied line near South Ossetia and Georgia's ethnic minorities. The course finishes with a concluding session in Washington.

AS.470.772. Practical Applications of Artificial Intelligence. 3 Credits.
<p>This course will address the practical applications of artificial intelligence particularly in the realms of policy and governance. AI and data science are transformational technologies that hold the promise of improving lives and society at large. While excitement about AI and its applications is growing, its adoption is anything but straightforward. The successful application of AI to lower risk, better understand customers and automate decision making requires a deep knowledge of the right use cases where AI can lead to breakthrough innovations. <o:p></o:p></p> <p>This course will provide students with the opportunity to investigate multiple AI use cases and evaluate their merit. In addition, students will select a specific use case, develop reference architecture and determine an appropriate implementation strategy. The course will culminate in the development and delivery of a lab-to-market strategy for their selected use case.No prerequisite. <o:p></o:p></p>

AS.470.773. Energy and Environmental Security. 3 Credits.
This course examines the nexus of energy, natural resources, and the environment with conflict, war, terrorism, crime, development, diplomacy, politics, and technology. Students critically examine the ways that increased competition for environmental and energy resources, strained resources, and changing conditions can threaten national security. The course also examines how such threats may be mitigated.(Core course for the MA in Global Security Studies)

AS.470.774. Nonprofit Governance & Executive Leadership. 3 Credits.
470.774 Nonprofit Governance & Executive Leadership: Students will advance their understanding of self-governing nonprofit organizations by focusing on nonprofit boards' expectations, challenges, and opportunities and their executive leadership. This course covers the primary responsibilities of nonprofit boards according to law, custom, and best practices, and it includes ethical concepts, public attitudes, and contemporary legislative and regulatory issues. The course explores theories of effective governance and executive leadership. It examines how ethical considerations relate to perceptions of excellence and shape how staff and volunteer leaders manage people and money. In the discussions, there will be opportunities to explore the roles of boards in the context of the nonprofit environment. This is a core course for the MA in Non-Governmental Organization (NGO) Management and Certificate in Nonprofit Management.

AS.470.775. Great Power Competition. 3 Credits.
"Warfare" today is often ambiguous, constant, and non-violent: a combination of low intensity conflict and struggles over information via cyberspace, especially over "narratives" that sway public opinion. Warfare has always included these elements, but our adversaries today fight and stay in this early stage of cyberspace operations, information operations, and limited or no kinetic conflict, careful never to escalate to state-on-state violence. This course will examine how "non-kinetic" warfare (information operations, cyberspace operations, non-violent resistance) takes place today. Students will learn how the control and manipulation of information shapes national security and creates new political realities. Focus will be on Russian hybrid warfare and "information confrontation," Chinese weaponization of business and cyberspace and "coercive gradualism," and terrorist's use of the internet.

AS.470.776. Nationalism in the Democratic Age. 3 Credits.
Nationalism and democracy have been two of the most significant forces shaping the contemporary world. The sense of nationality has provided peoples with a strong sense of shared belonging based around the ideas of a common language, land, and heritage. It has sometimes fuelled the demand for collective freedom and democratic self-determination. At the same time it has been a volatile force generating conflicts within and between nations across the globe. In Europe, the effort at forging a common European identity must confront the challenge of resurgent nationalism in traditional countries like Britain, France, and Austria. Meanwhile traditional states like Britain and Spain must themselves confront secessionist nationalism in Scotland, Catalonia, and elsewhere. The modern Middle East has been shaped in part by the conflicting goals of two major nationalist movements - Arab nationalism and Zionism. In Asia, nationalism is emerging as a dominant theme as countries like China and India rise to political and military power. In spite of economic globalization and the development of international laws and institutions, it is pivotal to understand nationalism if we are to understand world politics today.

AS.470.777. Technology and Terrorism. 3 Credits.
This course explores the phenomenon of terrorism and its nexus with technology. Beginning with an emphasis on terrorist group factors most likely to influence terrorists' perceptions and attitudes towards extant and emerging technologies, the course subsequently investigates cases of terrorist use, and noteworthy non-use, of various technologies. Students also receive a broad understanding of the evolution of technology with an emphasis on current and imminent technologies of acute security concern, including weapons of mass destruction, cyber, robotics, and nanotechnologies. The course then addresses counterterrorism technologies and potential terrorist response actions for overcoming such security efforts. Students operationalize all of these elements in the final phases of the course when engaging in Red Team exercises designed to demonstrate which types of terrorists are most likely to pursue certain types of technologies, the role of tacit versus explicit knowledge, likelihood of successful adoption, targeting options, and potential counterterrorism measures. Please note that students do not need to possess a technical background or prior knowledge of terrorism to succeed in this course.

AS.470.778. Conflict, Security, and Development. 3 Credits.
Over the last two decades, the United States and its partners have sought to “securitize” development assistance to solve a range of national security problems, from resolving conflict, countering violent extremism, insurgencies, and great powers, and promoting democracy. This seminar explores to what extent can and should development be used in these ways, what is the impact of doing so on political order, and has this shift away from supporting longer-term economic growth led to new challenges for both governments and international organizations? The course blends theory with practice and offers students an insider view into how U.S. national security policy is made. The first part of the course examines the theory and practice of using development to achieve short-term political and security goals. The second part of the course examines how the United States and other nations have attempted to address conflict and its drivers through civilian-military approaches in a number of countries.

AS.470.779. Computational Modeling for Policy and Security Analysis. 3 Credits.
This course will introduce computational modeling and demonstrate how it is used in the policy and national security realms. Specifically, the course will focus on agent-based modeling, which is a commonly-used approach to build computer models to better understand proposed policies and political behavior. Agent-based models consist of a number of diverse "agents," which can be individuals, groups, firms, states, etc. These agents behave according to behavioral rules determined by the researcher. The interactions with each other and their environment at the micro-level can produce emergent patterns at the macro-level. These models have been used to understand a diverse range of policy issues including voting behavior, international conflict, segregation, health policy, economic markets, ethnic conflict, and a variety of other policy issues. The course will consist of two parts: First, we will examine the theoretical perspective of computational modeling. Second, you will be introduced to a software platform that is commonly used to develop computational, and, in particular agent-based modeling. No prerequisite

AS.470.784. Technology of Weapons of Mass Destruction. 3 Credits.
Students gain the foundational knowledge behind WMD (both weapons of mass destruction and weapons of mass disruption) and about how these weapons threaten U.S. homeland security. Weapons of mass destruction traditionally include nuclear, biological, and chemical weapons, while weapons of mass disruption include radiological weapons, such as "dirty bombs." In addition, the course covers the technology behind three WMD delivery vehicles: ballistic missiles, cruise missiles, and unmanned aerial vehicles. In assessing each WMD threat, the course first examines the science and technology for each type of weapon and then applies this theory to real world threats emanating from state and non-state actors. Students apply this knowledge by engaging in red team exercises to identify options for preventing and reducing vulnerabilities from WMD. Please note that students do not have to have prior technical knowledge about WMD issues to succeed in this course.

AS.470.785. Nuclear Proliferation and Non-Proliferation. 3 Credits.
Since 1945, eight states have tested nuclear weapons, and perhaps two dozen others have started -- and stopped nuclear weapons programs. This course considers why some countries pursue nuclear weapons and why others forgo them, an issue that bedevils both policymakers, who concerned about the spread of weapons of mass destruction, and political scientists, who attempt to explain and predict it. The class will delve into past and present examples, discussing and evaluating theories of why states pursue such weapons, the technologies that make it possible, and the policy tools available to prevent it. We will also draw on the parallel efforts to control chemical weapons, biological weapons, and ballistic missiles.

AS.470.786. Weapons of War: The Technology and Uses of Weapons. 3 Credits.
Modern warfare utilizes advanced weapons systems. This course will examine various weapon systems ranging from artillery, cruise missiles, aircraft, aircraft launched weapons, ships, submarines and unmanned systems. We will also examine strategic and tactical nuclear weapons. In the examination we will look at capabilities, concepts of operation, and issues surrounding their procurement and use. The course will also involve students working through a crisis scenario utilizing various weapon systems. No pre-existing technical knowledge is assumed nor is any required.

AS.470.787. State and Local Government Financial Management and Analysis. 3 Credits.
The course explores issues of financial management in state and local government, mostly in the United States. Students will study the political economics of property, sales, and income taxation. Non-tax revenue sources such as lotteries and user fees will also be explored. Other financial management strategies and techniques will be assessed as well, and they may include intergovernmental grants, project-based finance, capital project finance, municipal debt valuation, and local economic development. The course is designed for students who desire a practical overview of real-world challenges at the state and local level.

AS.470.788. Monitoring & Evaluation for Nonprofits/NGOs. 3 Credits.
This course provides an overview on the tools, resources, and training needed to measure the impact of an organization's programs and projects. M&E plans help nonprofits to determine if they are meeting their intended results, goals and objectives towards their overall mission. Designing a strong M&E system is critical to identifying realistic indicators, tracking an organization's measurable results; providing programmatic progress; providing accountability to donors; and determining opportunities for growth. The intended results of a strong M&E plan are to enable nonprofits to demonstrate that they are achieving their missions—thus increasing their credibility among beneficiaries and strengthening their appeal to donors. This course will teach students how to develop a strong M&E plan that meets donor, organizational, and/or programmatic needs. Based on M&E results, students will learn how to improve program implementation and achieve greater outcomes. Students will learn to design an M&E plan and the ability to effectively communicate programmatic data to their stakeholders.

AS.470.789. International/Non-Governmental Organizations and Civil Society in Conflict Zones. 3 Credits.
Since the end of the Cold War the world has seen a scourge of civil conflicts emerging across the globe, such as in Bosnia, Rwanda, Darfur, DRC, South Sudan, and now Syria, global conflicts have put enormous pressure on intergovernmental bodies and governments. Whether too slow to respond, afflicted by political restraints or hindered by bureaucracy, the restrictions on international agencies and governments have often placed NGOs at the fore of response. Partnering with both national governments, military, and international agencies, NGOs have gained recognition for their role in diplomacy, conflict resolution, and peacebuilding. NGOs have gained a prominent role at helping to defuse, mitigate, and prevent conflicts strengthening their influence and recognition. This course will provide an overview on the role that international organizations and civil society (including community based organizations) can have in conflict or post-conflict torn countries. Students will learn how to build strategic partnerships when working with local organizations and NGOs. Elective course for the Certificate in Nonprofit Management.

AS.470.792. Social Science in National Security and Intelligence. 3 Credits.
This course examines the role of social science in national security decision making and intelligence. The course lectures, readings and classroom discussion are intended to help students understand the ambivalent relationship between social scientists on the one hand and intelligence personnel and national security policy makers on the other. It also considers the opportunities and limitations in the ways social science could contribute to policy making and how social science has contributed to key national issues. The course will help the student become a savvy consumer of social science.

AS.470.794. Fixing American Politics. 3 Credits.
The widespread diagnosis of American politics is that it is "broken." But what is wrong with American politics? And what, if anything, can be done to fix it? This course will examine the current problems in American politics from a historical, theoretical, and comparative perspective, and explore possible reforms that might make American politics function better.

AS.470.795. The Constitution and National Security. 3 Credits.
This course exams the interpretation of constitutional powers and rights under conditions of heightened national security. We will consider the Supreme Court's role in constitutional interpretation, and the balance of power among the three branches. The course will also examine the tension between security and liberty during a time of war. Topics covered during this semester will include military tribunals, unitary theory of the executive, congressional oversight, war-making power, intelligence authorities, and treatment of detainees.

AS.470.796. 2020 Presidential Campaign: Pre-Primary Phase: Campaigning, Communicating & Controversy. 3 Credits.
The fall before the Iowa Caucus and New Hampshire primary is a key time for the candidates to put their presidential campaigns into high gear. The Democrat debate series will continue into the fall and we will look at the communications strategies of the candidates for the debates as well as analyze and discuss President Trump's media and political strategy for re-election, especially how he rallies his base.The class will delve into the threat of impeachment and other congressional investigations and any impact they will have on the road to the White House. We will analyze the social media strategies of all the presidential contenders (and Trump's Tweets as well) and look at how the mainstream media is covering the race. The class will look at fundraising, policy statements, speeches and the role of personality and character in the 2020 presidential campaign and compare to other presidential elections in American history. We hope to have several of the 2020 presidential candidates speak at Hopkins in the fall.

AS.470.797. Intelligence to Secure the Homeland and Hometown. 3 Credits.
This course provides students with an intellectual foundation for understanding the concepts underpinning homeland security intelligence, as well as an overview of the US national homeland security framework including organization and policies. It examines the underlying intellectual constructs used to frame the comprehension of security issues, intelligence based on those issues and the development of policies and strategies that lead to implementing programs that protect the United States infrastructure and its people from attack. Over the term, students will be challenged to examine the various paradigms that shape homeland security intelligence and critically apply them to contemporary homeland security challenges and examine how well or poorly these paradigms are reflected in current responses, organizations and policies.

AS.470.798. Financial Management and Analysis in Nonprofits. 3 Credits.
From the perspective of a nonprofit leader, this course provides a solid foundation in understanding key financial tools such as audits, financial statements, budgets and tax documents. Using these tools, students will analyze and assess the financial transparency, accountability, and health of various national and international organizations, determine the financial strengths and weaknesses within those organizations, learn how to use that information in the decision-making process, and finally, practice making informed recommendations to organizational leadership. This course is not designed to make students financial experts or practitioners. Instead, it is designed to enlighten students on key financial management concepts that improve their ability to be informed leaders, participants, and donors in the nonprofit sector. Students will also explore the responsibilities and consequences of international nonprofits engaging in activities in the US, as well as implications for US nonprofits operating abroad. This is an elective course for the Certificate in Nonprofit Management.

AS.470.799. State Politics: A Year in the Life. 3 Credits.
<p>State politics and policymaking offer a fascinating contrast to the gridlock in Washington that gets all the media attention. <o:p></o:p></p> <p>This is a particularly timely issue to study as most states gear up for the new legislative session. How are Biden's policies affecting current debates in statehouses? What impact are the 2020 elections having on policymaking at the state level? How has the Trump presidency affected states? We will explore these questions and more in this class. <o:p></o:p></p>

AS.470.800. Research & Thesis III: Government. 3 Credits.
Research and Thesis III (RT III) is the final course for the MA in Government program. You can only enroll in RT III if you have successfully completed the following prerequisites: 470.602 Government and Politics, 470.850 Research and Thesis I, and 470.852 Research and Thesis II or 470.854 Fundamentals of Quantitative Methods or 470.681 Probability and Statistics. The goals of the RT III course are for you to finish the research and writing of your thesis and to prepare for your Thesis Defense.
Pre-requisite to RT III (470.800) only after successful completion (B) of Research and Thesis I: MA in Government (470.850) and Research and Thesis II: MA in Government (470.852). Pre-requisites: AS.470.852 AND AS.470.850

AS.470.803. Independent Study. 3 Credits.

AS.470.820. Independent Study. 3 Credits.
Independent study involves a student working one-on-one with a faculty member. The project must follow a plan of study and end with a final paper. It must not duplicate any course being offered in the Center for Advanced Governmental Studies. Students interested in an independent study should first consult a faculty member to discuss the project and make sure they are willing to participate should an independent study be approved. Proposals for an independent study should be directed to the student's program director at least 30 days before the start of the semester. Proposals must provide details of the project, the name of the instructor, and a plan of study. The program director has sole discretion to approve or disapprove the proposal.

AS.470.830. Practicum in Government & Politics. 3 Credits.
One of the great strengths of the Government Program is that it brings theory and practice together, and recognizes that it is often from work experience that students gather useful and practical insights and information that can be applied to academic work. This course is designed for students who have an internship or who work in a field that will allow them to use that work experience to conduct research that may be applied to their theses. Permission of instructor is required.

AS.470.835. DC Lab: Politics, Policy, and Analytics. 3 Credits.
Washington, D.C. is the laboratory for anyone studying American government and politics or analyzing the policy making process here. DC Lab: Politics, Policy, and Analytics will give any graduate student in one of the programs of the JHU Center for Advanced Governmental Studies the opportunity to bring theory and practice together through an intensive week of lectures, seminars, and site visits in the nation's capital. Sessions will include guest speakers from JHU faculty, think tank scholars, and agency officials. The goal is to experience Hopkins in Washington and assess what is observed to better inform each student's studies of the political process. No prerequisite

AS.470.850. Research and Thesis I: MA in Government. 3 Credits.
(Core course for the MA in Government)The purpose of this core course in the Government Program is for students to refine their thesis topic, develop their research design and complete a working outline for their thesis. Students will begin to research and write their thesis during this class in earnest. The course format is working sessions focused on specific research-oriented tasks. Emphasis will be placed on completing the literature review and methodology sections of the thesis. Students will also complete by semester end a preliminary chapter of their thesis papers and work with the professor to develop a plan for the other two papers that will comprise the portfolio thesis.

AS.470.851. Qualitative Methods in Social Science. 3 Credits.
This course is the first in the Research Study sequence for the Global Security Studies program. The goals of this course are: 1) to help students be producers of scholarly knowledge, 2) to prepare students for later parts of the research study process, and 3) to prepare students to understand and critique others' uses of various methods. The first part of the course will address fundamental issues, such as measurement, causation, and inference. The second part of the course will address research design, data collection, and analysis, focusing on specific methodological tools including case study analysis, interviews, content analysis, participant observation, survey research, etc.

AS.470.852. Research and Thesis II: MA in Government. 3 Credits.
Core course for the MA in Government. Please note that 470.854 Fundamentals of Quantitative Methods or 470.681 Probability and Statistics may be substituted for this requirement with permission from the instructor. This directed research course is designed to help students complete the second paper of their thesis portfolio. Students will work closely with the instructor to revise a current paper, turning it into a research paper that 1) is tightly linked to the theme of the student's first paper and overall thesis portfolio; and 2) meets research and writing standards for being included in the thesis portfolio. Class meetings are designed to give guidance on the methods of research and on the clarity and focus of the research question the student is pursuing. Prerequisite: Students must have passed Research and Thesis I.

AS.470.853. Historical Methods. 3 Credits.
Historians reclaim, recover, and revise what we know about the past. They enter a dialog with the dead to make sense of our world for the living, knowing full well that their hard-earned results may be overturned with new data, analysis, or insights. Yet questionable or flawed "history" is routinely to justify a range of experiences, policies, and events. In this course, we instill the key skills and analytical framework in which historians use to uncover and recreate the past, taking the journey from question, to research (onsite and online), to argument and revision (and revisionism). The importance of argument, objectivity, personal and temporal bias, evidence, narrative and cultural context are examined in detail, along with case studies of history being used, misused, and abused by historians and other actors.

AS.470.854. Fundamentals of Quantitative Methods. 3 Credits.
The main purpose of this class is to train students to be informed consumers of quantitative studies, in addition to teaching the tools of basic statistical work. The emphasis in this class is on application and understanding of existing results, rather than on theory or derivations. The course material will cover basic descriptive statistics, inferential statistics, and data collection. The key learning objective is for students to finish the class with a better understanding of the statistical and econometric results they may encounter, both in papers they read in other classes, as well as in the course of their work. The second key objective is for students to have the skills to employ basic quantitative tools in their own work in the fields of public policy and global security studies. As much as possible, assignments and readings used in class will be drawn from the public policy and security fields. There is no mathematical or statistical pre-requisite for the class. (Core course for the MA in Public Management and the MA in Global Security Studies.)

AS.470.855. Research Study Seminar. 3 Credits.
(Core course for the MA in Global Security Studies). This course is designed for students who have already passed 470.851 Introduction to Qualitative Methods in Social Science and either 470.854 Fundamentals of Quantitative Methods or 470.853 Historical Methods (or 470.709 Quantitative Methods with permission from program director). In this class, students will begin and complete a substantial piece of original research explicitly drawing on research methods they learned in the previous two classes. The research study is expected to be methodologically sound and to make a useful contribution to the issue under study. Class meetings are designed to give guidance in the clarification of issues, collection of data, assembly of various parts, and writing. The class will also prepare students for final defense. Graduation is subject to approval of the research study by the committee. Students should come into the class prepared with a detailed research question. Students may enroll in this course only in their last semester of the MA program.

AS.470.856. Research Study Continuation.
This is a non-credit course required for students in the MA in Global Security Studies program who have completed all of their course work and have taken 470.855 Research Study Seminar but who are still working on their research study. There is a fee associated with this course.

AS.470.860. Capstone for Public Management. 3 Credits.
This is the final required course in the MA in Public Management program, and students can only take the capstone course in their final semester and after having completed all the other core requirements (Students graduating in the summer semester must take the course in the preceding spring semester). In the semester prior to taking the capstone course and conducting the project, students identify a project topic. The adviser for the paper will be the faculty member teaching the course. To complete the course, students must write a 30- to 35-page capstone paper.

AS.470.861. Capstone Continuation.
Required for those who have completed all of their coursework and have taken the capstone course for either Public Management or Government Analytics but have not yet completed their capstone paper.

AS.470.862. Capstone for Data Analytics and Policy. 3 Credits.
<p>This course is for students who are completing their M.S. in Data Analytics and Policy (formerly M.S. in Government Analytics). The course guides through the process of developing and executing an original data analysis project aimed at addressing an issue related to public policy, politics or governance. Students will formulate an empirical research question and answer that question using a quantitative analysis that makes an original, scholarly contribution. To complete the project, students will use the skills, tools and knowledge they have acquired throughout the program. Students should take this course in their final term (or penultimate term with permission from their advisor). </p><p>Prerequisites: All other core courses </p>
For M.S. in Data Analytics Students: 470.681 Probability and Statistics, 470.768 Programming and Data Management, 470.709 Quantitative Methods, 470.673 Data Visualization
For M.S. in Government Analytics Students: 470.681 Probability and Statistics, 470.709 Quantitative Methods, 470.710 Advanced Quantitative Methods, advanced methods course from approved list (see program website)

AS.470.864. NGO Management Capstone Seminar. 3 Credits.
The 470.864 NGO Management Capstone Seminar is the final course required of the MA in NGO Management degree. Students may select one of the following capstone options a) research project/deeper dive on some relevant aspect of non-governmental/nonprofit management; b) a project that will contribute to the sector in some capacity; or c) a volunteership or immersive experience working with a nonprofit/ non-governmental organization (remote options as well). Identifying a specific area of interest will require some forethought and preparation in advance of the class. It is critical that the topic or issue is one that is of profound interest to the student, and/or builds on knowledge acquired throughout the degree. The capstone is not only meant to address an empirical question but nest it within the context of a broader conceptual framework or sector-relevant debate. All capstones must be relevant to the sector, build on present-day questions, issues, or challenges, and possess an “experiential” element. This could be in the form of original data collection, interviews, consultancy, or tackling a real-life problem in a nonprofit/non-governmental organization. This is also an opportunity for students to demonstrate the skills obtained throughout the degree, thus far, to professionals in the nonprofit field, and to the academic committee. The capstone must be presentable and culminate in a 30-60-page paper of publishable quality. (Capstone projects are usually 30 pages, while research papers exceed that amount). Students will dedicate the entire semester to the capstone. Students are encouraged to view this as an opportunity to develop substantive and methodological expertise in an area that will propel their careers forward. This is an intensive course and requires discipline by the student. Student success in this course is contingent on their ability to a) narrow down a focus, b) be organized, c) complete readings ahead of the class, d) meet deadlines, and e) write, write, write. While much of the heavy lifting occurs on your own outside of class, your instructor will check in weekly and guide you through written and verbal feedback. You will also have opportunities for peer-to-peer feedback. This is the final required course for the MA in Non-Governmental Organization (NGO) Management. Students must be in the final semester of their studies to take this course.

AS.470.888. Thesis Continuation.
Required for those who have completed all of their course work, including the Research and Thesis class, but are still working on their thesis. Details of this offering will be posted soon.

AS.470.901. Getting Started with Performance Analytics.
This course will enable participants to: 1) launch a sustainable open data program that increases transparency and public engagement; and 2) leverage data to improve performance-based management with an emphasis on budget, operational, and policy decision making. During the course, participants will receive feedback on the strategies they developed.

AS.470.902. Sports and Entertainment Impact Collective.
The Sports Impact Leadership Certificate (SILC) program serves as a hub for sharing ideas and innovations to build a more sophisticated industry, with a greater community impact through sport. SILC, in partnership with Johns Hopkins University Advanced Academic Programs, offers you the opportunity to earn an innovative non-credit certificate with support from a world-class academic institution. SILC provides working professionals access to a network of top tier faculty, peers and organizations working with athletes, teams, leagues, nonprofit organizations, major consultancies, top firms and other sports industry stakeholders. SILC provides professional development including essential tools, perspectives and meaningful relationships that will help you and your organization adapt and capitalize on future trends and opportunities.

AS.470.904. Community Engagement: Tools and Techniques for Making Meaningful Connections.
“Community engagement” is prized as both a key incentive for and desired outcome of open data and digital government services. However, all too often, the skills, strategies, and activities necessary to develop meaningful community engagement are deprioritized at best or go unrecognized at worst, leaving civil servants scrambling to activate constituents with little time, resources, or capacity.This online course, developed by the Center for Government Excellence at Johns Hopkins University, is a bootcamp designed to introduce and level up essential engagement planning, outreach, and organizing skills, and apply them to a real-world initiative of your choosing. Drawing on best practices in multiple sectors, we’ll delve into the art and science of mobilizing diverse communities, crafting lasting partnerships, and telling the story of our work. Although framed around data and digital initiatives, the skills and strategies learned here can be broadly applied to other government programs as well.Experience working for state or local government strongly recommended, but not required for this course.

AS.470.907. Institute for Corporate Social Responsibility.
The Institute for Corporate Social Responsibility was designed by—and for—those in the corporate social responsibility (CSR) field as a practical, interactive, and affordable professional development opportunity for CSR practitioners. Participants learn from some of the field’s most innovative thinkers, authors, and practitioners, expand their professional networks learning alongside CSR peers from across the country, all while earning a Professional Certificate in CSR from Johns Hopkins University. This non-credit, professional certificate program is an executive education course and initiative of the Washington Regional Association of Grantmakers, offered in partnership with Advanced Academic Programs at Johns Hopkins University and the U.S. Chamber of Commerce Foundation’s Corporate Citizenship Center.

AS.472 (Geospatial Intelligence)

AS.472.600. Introduction to Geospatial Intelligence. 3 Credits.
This course provides an overview of the four disciplines that have merged to create the new discipline of geospatial intelligence and an introduction to the content of the program. The history of imagery analysis and digital cartography, the art of turning observation into insight and communicating those insights to non-experts, the science behind the sensors and platforms, and the mathematics behind imagery collection sampling strategies. The course studies the issues, technologies, and changes over the past 60 years that have developed into geospatial intelligence, and it will introduce the students to the opportunities and challenges of geospatial intelligence as it has shaped intelligence collection, analysis, reporting, and policy decisions. The outcomes of success in this profession have created new industries, and the course will also review the effects of commercial imagery, smallsats, non-governmental collection, and remotely piloted sensors. Students will be introduced to the concepts that will be covered through the remainder of the Master's program through the Capstone exercise.

AS.472.610. Commercial Imagery and the Impact of Small Satellites. 3 Credits.
This course will begin with a brief history of commercial imagery. From there students will learn the fundamentals of various imaging sensor modalities (spectral, thermal, radar, motion imagery, etc.). Next, a historical perspective of collection management will be presented followed by changes to collection management due to technology advances within the commercial imaging industry. The strengths and weaknesses of collection models will be described, and students will learn to apply mathematically defined judgements to assess the value and cost of competitive imagery purchases. These judgments will examine the questions that drive the imagery purchase; the respective kinds of sensors and their applicability to certain questions, and the respective kinds of platforms for these sensors--aircraft, remotely piloted vehicles (drones), and different kinds of satellites, including smallsats (small satellites). The intended outcome would be the students understanding of the fundamentals of commercial imaging satellites and their collection criteria, through the comprehension of existing collection plans; the evaluation of existing collection plans; and the creation and budgeting for new collection plans.

AS.472.611. Analyzing Social Media and Geospatial Information. 3 Credits.
Social media is now present globally in everyday life, and in conflicts. With its reach, social media has also become an increasingly meaningful information source for scholars, advocacy groups, intelligence agencies, and others who are interested in shaping public discourse. This course introduces students to social media as part of present day open source information gathering, and how to plan collection and conduct analysis of information from social media. The course covers the operations security considerations, monitoring real time events, verification of online material, basics of social network analysis, and how to work with imagery sourced from social media, including geolocation of imagery. Automation and the limits of it in different phases of the process, and future developments in social media exploitation will also be discussed. During the course, students will conduct a hands-on investigation using social media data.

AS.472.612. Geospatial Analysis: Communicating with Multiple Audiences. 3 Credits.
The course will cover the art of communicating geospatial intelligence in writing, photographs or images, and mapping. It will address the challenges of communicating technical information and intelligence from satellites, aircraft, and drones, into text, combinations of text, graphics, maps, and data base,. The students will perform their own analysis, and convert their intelligence discoveries into data bases, reporting, analysis, briefings, and video-based presentations.

AS.472.613. Geospatial Law and Ethics. 3 Credits.
As geospatial technology and the power of location becomes more mainstream, lawmakers and policymakers are trying to understand the applicability of existing areas of law, including privacy, intellectual property, liability, national security and licensing. This course will provide geospatial practitioners with an understanding of the legal and ethical issues that will become increasingly important in their careers.

AS.472.800. Capstone in Geospatial Intelligence. 3 Credits.
The Capstone is the culmination of the instruction and the learning in the program. It provides the students an opportunity to demonstrate their applied knowledge of the four disciplines of geospatial intelligence—the history of the profession, the science of the sensors and platforms, the art of analysis and geospatial communication, and the mathematics of collection sampling strategies. In this semester-long experience, the student selects a mentor/advisor, identifies a geospatial issue of interest, defines a collection strategy, an analytic methodology, a reporting strategy, and a written summary product and presentation.

AS.472.803. Capstone Continuation for Geospatial Intelligence.
Noncredit, required for those who have completed all of their coursework and have taken the Capstone course, but have not yet completed the Capstone paper.

AS.475 (Research Administration)

AS.475.601. Introduction to Research Administration. 3 Credits.
Provides an overview of research administration including how it has evolved in the United States, the role it plays nationally and at the state level, and how conducting research in the U.S. differs from elsewhere. The course also examines the research continuum and the research enterprise as it exists in higher education, nonprofit organizations, and the federal government. The course allows students the opportunity to become familiar with issues, problems and strategic outcomes as they affect research administration.

AS.475.602. Organization and Leadership for Research Administration. 3 Credits.
The course provides an overview of the organization, structure, and language of the research enterprise; how the enterprise functions in the discovery to commercialization pipeline; who the players and stakeholders are and how they interact; the organizational models used by institutions; the role and effect of national policy in shaping research; the impact of the information age and technology; the qualities and requirements for students to become successful leaders; and, how university, federal, and non-profit research administration organizations are managed and led. The course allows students the opportunity to become familiar with the issues faced by leadership in the ever-changing and fluid world of the research enterprise.

AS.475.603. Assistive Technologies for Research Administration. 3 Credits.
This course explores the role of software applications and systems utilized by research administrators and by those seeking and receiving funding. Students examine and compare software applications such as COEUS, SunGard Public Sector, Grants.Gov, GrantsOnline, Conversis, PeopleSoft, ERA Software, Compliance Software, SAP, and others.

AS.475.604. Introduction to Legal, Ethical, Regulatory, and Compliance Issues. 3 Credits.
During this course students examine the legal, ethical, and regulatory framework underlying most research activities in the U.S. Students discuss the trajectory of legal, ethical, regulatory and compliance issues affecting research administration, including the role of Congress, the role of the Executive Branch of government, and the role of federal and state agencies in the issuance and auditing of compliance regulations. Students will also discuss practical considerations for human subjects and animal research, financial conflict of interest, misconduct in science, export controls, safety and security and risk assessment.

AS.475.605. Program Development and Evaluation. 3 Credits.
From the perspective of funders, this course explores ways in which initiatives become sponsored programs, the role of strategic planning, how proposals are designed and disseminated, how responses are solicited and evaluated. The important role that communication plays is emphasized, and communication strategies and work products are examined. The course also allows students to become familiar with key roles and relationships, such as those played by the program officer, the proposal development specialist, and the principle investigator.

AS.475.606. Project Management of Sponsored Programs. 3 Credits.
The course explores how research projects and sponsored programs are best catalyzed and later managed utilizing project management theory, best practices, case studies, and research. The course examines the emergence of pre-award research development within the realm of research administration and its impact on post-award project management. Issues related to team building, group dynamics, and building collaborative win-win relationships with multiple principle investigators and team leaders will be emphasized in the course.

AS.475.607. Grantsmanship, Grant Writing and Evaluation of Grant Proposals. 3 Credits.
This course describes the process of applying for, writing, and evaluating grants and sponsored program opportunities offered through non-profit, foundation, think-tank, government, and university settings. Emphasis is placed on how to evaluate opportunities, how to use online resources, how to ensure that prerequisites are met, and how to respond to RFPs with fully-vetted, well- written proposals. Students will be required to write and edit portions of proposals as well as evaluate current opportunities.

AS.475.608. Procurement and Award Process. 3 Credits.
This course provides a detailed examination of request for proposal (RFP) as well as RFAs, RFQs, and other proposal submission requests. It examines the procurement processes of the government through grants, contracts, and cooperative agreements. The course also focuses on award processes from the perspective of those planning and offering them. Students compare and contrast these processes in different environments, including federal and foundation grant-making and private sector funding for specific projects. In the final segment of the course, these same processes—solicitation of proposals, and negotiation and acceptance of awards—will be examined from the perspective of the research administrator at the grantee institution.

AS.475.609. Financial Management of Sponsored Programs. 3 Credits.
Provides an introduction to topics related to financial operations of sponsored programs, including how to establish a financial reporting system, budgeting, effort reporting, preparing for and engaging in an audit, procuring resources, and sub-contracting. Students also learn how to translate the financial terms of a proposal into a project budget and how to engage in specialized oversight and reporting, such as required for projects undertaken within the GSA Schedule.

AS.475.610. Financial Accounting and Compliance Auditing. 3 Credits.
Focuses on the specifics of financial and non-financial auditing as related to sponsored programs and grants. Clinical accounting is presented as well as the role of clinical research in a university and non-profit research environment. The audit process is also examined in detail and the roles of the financial research administrator, auditors, PI, and project participants are discussed. Special attention is paid to compliance pitfalls, record keeping, information technology, and accepted accounting standards and practices.

AS.475.611. Reporting and Statistical Analysis for Sponsored Programs. 3 Credits.
Provides hands-on opportunities for students to understand reporting requirements and work with the types of reports required for research projects and sponsored programs. The course examines reporting as a CRM (customer relationship management) and PM (project management) strategy, as well as special requirements affecting research administration. Specific types of reporting requirements are analyzed, including federal government agency-based requirements, Star Metrics, Data Act, and GSA Schedule.

AS.475.612. Intellectual Property and Technology Transfer. 3 Credits.
This course examines the role of research administrators in safeguarding Intellectual Property (IP), identifying patentable material, creating and operating a technology transfer office, facilitating various aspects of technology transfer, and developing and implementing such specialized agreements as non-disclosure agreements, material transfer agreements, licensing agreements and other related intellectual property agreements. Students examine case studies, case law, institutional and agency policies.

AS.475.613. Advanced Topics in Compliance, Legal, and Regulatory Issues. 3 Credits.
This course examines in-depth advanced issues of compliance, legal and regulatory affairs. Students will examine and discuss critical issues and real world applications in research compliance and research ethics. Topics to be examined include an in-depth examination of research, human tissue centers, use of special populations in research, informed consent, use of primates in research, and misconduct in science. This course will also look at the issues affecting high containment research and facilities, infectious diseases research, and the regulatory agencies that govern these special areas.

AS.475.614. Managing Compliance, Legal, and Regulatory Issues in Research Hospitals and Health Care. 3 Credits.
This course looks at what is needed to develop, maintain, and manage compliance, legal and regulatory issues in a research hospital or health care setting. The elements of patient care, clinical trials, and other research administration issues affecting healthcare are discussed. Areas such as the Physicians Self-Referral (Stark) Law, Anti-kickback laws, HIPPA and HITECH regulations as well as the Privacy Rule, and the Security Rule are examined. Elements of a good compliance program are also discussed.

AS.475.615. Research Contracts & Industrial Agreements: Domestic and International. 3 Credits.
This course examines how to prepare and execute research contracts and industrial agreements. It examines issues affecting both domestic and international contracting, including issues such as U.S. regulations that affect the contracting process, good terms and conditions in research contracts, maintain your nonprofit status, safe harbor laws, unrelated business income, and profit v nonprofit legal issues. The course also examines issues related to the human dynamics and cultural aspects of international and industrial contacting.

AS.475.616. Domestic and International Special Issues in Research, Legal and Regulatory Affairs. 3 Credits.
This course discusses special issues both domestic and international that affect research administration. Special issues such as seeking, obtaining, and monitoring an export control license, issues affecting research with pharmaceutical companies, issues affecting small business contracting, and requirements for international conflict of interest, research integrity, and use of research results will be discussed.

AS.475.617. The Federal Acquisition Regulations and Defense Contracting. 3 Credits.
This course covers the Federal Acquisition Regulations or FAR, with an emphasis on contracting with the Defense Department. The purpose of the FAR and its application to different types of contracts is explored. Using a hypothetical program, the development of a large federal contract program is examined from the earliest phases through the delivery of the required product. The different phases and decision points in the program are explored from the positions of multiple participants. Both federal contracts and subcontracts and related contract clauses are examined. By the end of the course, students will have a recognition of how the FAR is applied to federally funded programs.

AS.475.618. International Research Infrastructure and Management for Higher Education. 3 Credits.
This course discusses, analyses, compares and contrasts the higher education and research landscapes and infrastructures of a number of countries around the world. The course focuses on the ever changing research information management landscape, including initiatives such as information systems, unique identifiers, international standards, metrics, league tables, and scholarly communication. This course also looks at processes to engage in policy, health, and public discourse in higher education management. It also examines the successful operation and the associated perils and pitfalls of trans-national research offices.

AS.475.619. International Funding and Grantsmanship: Proposal Development, Submission and Management. 3 Credits.
This course looks at differing international funding mechanisms and how to navigate them. It focusses on collaborative proposals where at least one partner is not in the jurisdiction of the funder, and also joint funding initiatives involving funders from more than one jurisdiction. All aspects of the grant lifecycle are covered from identification, through proposal development, submission, negotiation, management, and close-out.

AS.475.621. International Research Regulatory, Ethical and Compliance Issues in Research Management. 3 Credits.
This course examines the differing regulatory environments in a number of countries and how these differences can be managed within a joint collaborative project or initiative. Similarly differing standards of ethical and compliance requirements and attitudes are examined. Ethical standards for research are discussed and analyzed from a global perspective. International initiatives such as the World Congress on Research Integrity and the Asia Pacific Research Integrity Network are discussed. Best practices in regulatory and compliance issues are also addressed.

AS.475.623. University-Corporate Relations: Principles and Best Practices. 3 Credits.
The course explores university and corporate research and partnerships. It delves into the history of corporate funding of university based research and how corporations differ from other university partners and how corporations view their relationships with universities. It also examines strategies and best practices needed to organize an academic office of corporate relations; develop metrics to track and manage corporate engagement; the role of intellectual property and technology transfer; stages and categories of university-industry engagement; the role of federal government in corporate engagement; the role of the National Academy of Sciences, Engineering, and Medicine, including the Government-University-Industry Research Roundtable and related national commissions; and, state and local government in academic-corporate relationships.

AS.475.624. The Role and Importance of Culture and Communication in International Research Collaborations. 3 Credits.
This course discusses and analyzes a myriad of cultural and social mores that can foster or inhibit effective communication and collaborative work, even for those sharing a common language. The course will provide strategies and best practices to enhance effective communication across institutions and to anticipate, recognize and address misunderstandings before they escalate. Issues include: language, local meanings, socio-political structures, cultural identity, time zones, working weeks, institutional imperatives, faculty-administration dynamics, and the role of a research administrator in differing countries.

AS.475.800. Capstone Project in Research Administration. 3 Credits.
The Capstone Seminar is the culmination of the Master's in Research Administration where students will integrate and build on their previous coursework in the program to apply it to practical settings. Students must have completed ten of the twelve courses required for the M.S. degree in order to enroll in this course. During the semester students will identify and analyze an issue or problem and propose a solution during this semester long course. Those electing the Capstone may explore issues related to a current research administration project in a "real world" setting. This original work can be for the organization or agency for which the student works or for a hypothetical organization, but it should result in the student conducting original research and applying strategies, testing solutions, and using tools to meet the particular needs of chosen work environment. To complete the course students must write a 25-35 page capstone project paper. If the project is not completed by the end of the semester, students will need to enroll in AS.475.855.

AS.475.801. Research and Thesis in Research Administration. 3 Credits.
The Research and Thesis Seminar is the culmination of the Master's in Research Administration where students embark on a designing and conducting research in the field of research administration. Students must have completed ten of the twelve courses required for the M.S. degree in order to enroll in this course. The purpose of this core course is for students to refine their thesis topic, develop their research design and conduct and complete the research. Students will conduct research and write their thesis during this class in earnest. The course format is working sessions focused on specific research-oriented tasks. Emphasis will be placed on completing the literature review and methodology sections of the thesis. Students will also complete by semester end their thesis paper. To complete the course students must write a 25-35 page thesis. If the thesis is incomplete students will then need to enroll in AS.475.855.

AS.475.802. Thesis and Capstone Continuation (non-credit).
This is a non-credit course required for those who have completed all of their course work including the Research and Thesis class or the Capstone Project in Research Administration class, but who are still working on their Research Thesis or Capstone Project. There is a fee associated with this course.

AS.475.803. Independent Study for Research Administration. 3 Credits.
The Research and Thesis Seminar is the culmination of the Master's in Research Administration where students embark on a designing and conducting research in the field of research administration. Students must have completed ten of the twelve courses required for the M.S. degree in order to enroll in this course. The purpose of this core course is for students to refine their thesis topic, develop their research design and conduct and complete the research. Students will conduct research and write their thesis during this class in earnest. The course format is working sessions focused on specific research-oriented tasks. Emphasis will be placed on completing the literature review and methodology sections of the thesis. Students will also complete by semester end their thesis paper. To complete the course students must write a 25-35 page thesis. If the thesis is incomplete students will then need to enroll in AS.475.855.

AS.475.804. Independent Study. 3 Credits.
The Capstone Seminar is the culmination of the Master's in Research Administration where students will integrate and build on their previous coursework in the program to apply it to practical settings. Students must have completed ten of the twelve courses required for the M.S. degree in order to enroll in this course. During the semester students will identify and analyze an issue or problem and propose a solution during this semester long course. Those electing the Capstone may explore issues related to a current research administration project in a "real world" setting. This original work can be for the organization or agency for which the student works or for a hypothetical organization, but it should result in the student conducting original research and applying strategies, testing solutions, and using tools to meet the particular needs of chosen work environment. To complete the course students must write a 25-35 page capstone project paper. If the project is not completed by the end of the semester, students will need to enroll in AS.475.855.

AS.480 (Communication)

AS.480.600. Research & Writing Methods. 3 Credits.
Communication professionals take on diverse and multiple roles within and across organizations, but they share one role in common as strategic problem solvers. This course will teach you how to find, read, interpret, evaluate, and apply scientific research studies to solve practical problems encountered by communication practitioners. Topics covered include how to effectively use library resources to find research that can be of strategic value; how different research methods, including focus groups, case studies, surveys, and experiments are used in communication research; how to evaluate the quality of research reports; how to interpret qualitative and quantitative findings, including statistics; and how to distill the information found in research reports down to what is most relevant and usable. In addition to learning how to become a competent and critical research consumer, you will also be exposed to current research across different areas of the communication discipline.

AS.480.601. Foundations of Digital Media. 3 Credits.
The digital age is changing how communication professionals communicate with public groups and how people access, understand, and process information. As a result, digital tools are an increasingly important part of the modern communicator's tool kit. This course examines empirical research that will help communication professionals in the digital age. Topics include creating usable and credible websites and effective internet advertising. The course also examines blogs, social networking, and digital journalism. The digital age is explored through primary research across a range of subjects including public relations, political communication and health communication. Prerequisite: Research and Writing Methods
You must complete AS.480.600 in order to register for this course. You can enroll for this course when registration opens for the next semester.

AS.480.602. Changing Behavior through Communication. 3 Credits.
The goal of many communication initiatives is to encourage some type of behavior change. Communication professionals who understand how people change their behavior can createmore successful campaigns. This course surveys major theories used to predict when and under what circumstances individuals are most likely to change their behavior. Behavior changeincludes a variety of actions, such as voting for a candidate, purchasing a product, joining a social networking group, or adopting a new health habit. Individual-level, interpersonal level, and community-level models of change are covered. By becoming familiar with specific theories and the empirical support for those theories, students learn how to use social sciencebased models to guide their communication strategies effectively. Prerequisite: Research and Writing Methods
You must complete AS.480.600 in order to register for this course. You can enroll for this course when registration opens for the next semester.

AS.480.603. Communication in Practice. 3 Credits.
(This course is reserved only for those students who are admitted to the program with Provisional status. If you are a degree candidate, or are not a Communication student, you can not take this course.) Communication is a fast-changing field that requires practitioners to keep current with trends in technology, audience segmentation, needs of stakeholders, message techniques, evaluation methods, and much more. Equally important, practitioners must master new ways of branding themselves in a competitive job environment. This course covers up-to-date perspectives in communication practice so that students gain a concrete understanding of the practice environment. The content includes strategic management, presentation styles, ethics, branding, campaigns, evaluation, cultural diversity, client tactics, and professional networking. Experts in practice will lecture and lead class activities. Students will create deliverables throughout the semester that will showcase their personal brand, talents, and skills in communication.

AS.480.604. Theory of Mass Communication Practices. 3 Credits.
This course surveys major theories and perspectives on how mass media can influence individuals, organizations and society, with a focus on content areas that have the moststrategic relevance for public relations practice. The course covers readings on the role media plays in shaping what issues people attend to, how they think about those issues andpotential outcomes; how public relations practitioners attempt to use media strategically to meet their objectives; and the implications that current media systems, technologies, and practices have for their media relations efforts. Prerequisite: Research and Writing Methods
You must complete AS.480.600 in order to register for this course. You can enroll for this course when registration opens for the next semester.

AS.480.605. Organizational Communication. 3 Credits.
This course explores the complexities and strategies of internal and external communications in public, private, and non-profit organizations. As a leadership tool, communications serves a political, informational, symbolic and influential function. Topics covered include a competency-based approach of organizational communication, the interplay between internal and external communications, communicating effectiveness through problem-solving, decision-making, managing conflict and mitigating crises, organizational change management, addressing workforce diversity issues and others. Students gain exposure to various dimensions of organizational communication from different industry leaders and field experts and gain first-hand experience in critiquing, crafting and developing communication strategies, tactics and tools, as communication professionals and leaders in the workplace.

AS.480.606. Persuasion. 3 Credits.
This course addresses two questions of vital importance to communication professionals: what aspects of a message make it persuasive (or not), and what attributes of individual people and audiences make them susceptible or resistant to influence. The course examines all varieties of messaging, from individuals communicating one-on-one, to messages communicated via mass media. We study topics such as how the expertise, trustworthiness, and likeability of a spokesperson can enhance or weaken a message's persuasiveness, and how people's social groups can affect their willingness to believe. The course draws on both theory and empirical evidence to provide students with a well-rounded understanding of influence and persuasive strategies in today's world. Prerequisite: Research and Writing Methods
You must complete AS.480.600 in order to register for this course. You can enroll for this course when registration opens for the next semester.

AS.480.608. Analytic Techniques in Communication Research. 3 Credits.
This course will explore quantitative research methods, but will take the next step into quantitative communication research by investigating quantitative tools used by communication practitioners, in particular to measure the effectiveness of campaigns. In addition to standard quantitative methods, you will gain an insight on digital analytics, how to understand them, and how to make important information out of the data to report on the effectiveness of campaigns and messages. This class will satisfy the requirement for Applied Quantitative Research. Students should take this course prior to the semester in which they begin their research for Thesis . Prerequisite: 480.600 Research and Writing Methods.
You must complete AS.480.600 in order to register for this course. You can enroll for this course when registration opens for the next semester.

AS.480.609. Applied Qualitative Research. 3 Credits.
Communication professionals use qualitative methods to craft messages that resonate with audiences. This hands-on class exposes students to qualitative research methods that can be used on the job to guide communication efforts more strategically. Students learn how to design and conduct studies to gain insight into audience perceptions on a variety of issues. Specific techniques covered include in-depth interviews, focus groups, qualitative content analyses, and case studies. Through applied activities, students learn how to collect, analyze, and present qualitative research data. Students should take this course prior to the semester in which they begin their research for Thesis. Prerequisite: 480.600 Research and Writing Methods.
You must complete AS.480.600 in order to register for this course. You can enroll for this course when registration opens for the next semester.

AS.480.613. Communication Ethics in Action. 3 Credits.
Have you ever doubted whether you are doing the right thing as a communication researcher or practitioner? Regardless of whether you realize it, you base your professional decisions and subsequent actions on morals, referring to them in different ways. For example, you may turn to your inner compass, organization's values, or professional codes of conduct. This course will not give you quick and easy solutions; however, it will help you learn how to use an ethics framework with confidence as you move forward in your career. In particular, you will learn how to consider the one or more moral problems related to a situation, facts, options for moving forward, and values to consider throughout the process. Readings will draw from fictional and non-fictional literature, news and popular media, and industry and academic research. Not only the instructor but also other communication professionals will deliver lectures. Throughout the semester, you will work as an individual and in groups to use your critical thinking to complete various activities, including reflection, discussion, presentation, and writing based on current, real-world case studies. Your experience will culminate with a final project.

AS.480.614. Communication Strategies for the 2020 Democratic Presidential Primary Debates. 3 Credits.
The Democrats are planning a dozen primary debates for the 2020 candidates with the first debate to be held this June televised by NBC/MSNBC. The second debate will be held this July hosted by CNN. With a field of presidential candidates that could surpass more than 20 people the Democrats will hold their debates on two consecutive evenings. With such a large field, the Democratic presidential hopefuls are busy planning a communications strategy for the debates and a media plan for the long campaign for 2019/2020. Our lively, timely and interactive class will focus on all of the presidential candidates, their policies, their debate strategies, their overall media and social media plans. We will look at the history and future of presidential debates in American politics. The class will analyze, observe and discuss how the media in all its many forms cover the upcoming debates and how they are covering the many presidential candidates. We will be watching the first two debates as part of our class assignment discussing how the candidates performed and if their communications strategy is helping or hurting their hoped for goal of becoming the Democratic presidential nominee and America's next president.

AS.480.620. Becoming a Press Officer. 3 Credits.
Becoming a sought-after press officer takes practice, but it also takes a very specific set of learned skills. This class uses current events and interactive discussions to put into practice skills learned through AAP courses and to focus on what is required to be an effective press officer, press secretary, and communications advisor. It examines the roles, duties and responsibilities of press officers in a variety of settings: on Capitol Hill, in federal agencies, the White House, industry associations, non-profit and advocacy organizations, domestic and international political campaigns, and on the global stage. The course includes engaging guest lectures that share insight from journalists, press officers, and communications professionals in the field about effective techniques and lessons learned. Students will engage in real-time exercises that deal with typical situations that a press officer faces in the course of a day, and participate in discussions on the complex environments in which a press officer works. In addition to gaining valuable skills, students will complete this course with a portfolio of writing samples that mimic what would be expected from a press officer.

AS.480.622. Branding by Motion Picture. 3 Credits.
Branding by Motion Picture is a course for those who want to use the motion picture medium to promote brands. It's a writing course, not a production course, on the art of expressing a brand in linear form —as a 30-second commercial for television and the Web or a longer, branding video for the Web. We study commercials and branding videos for what they can tell us about brands, audience desires and watchability. Students also choose and develop brands and write scripts in the commercial and branding video formats. Branding by Motion Picture gives students the understanding and the tools that have traditionally belonged to a small cadre of creatives in advertising agencies.

AS.480.624. Public Affairs Communication. 3 Credits.
This course is designed to give students an opportunity to learn about strategic online approaches and techniques affecting and influencing public affairs. During this course, students will develop the knowledge to: <o:p></o:p></p><ul style="list-style-type:disc">
Distinguish between public affairs and other forms of communication, such as public relations
Describe the different components of digital public affairs communications
Conduct basic outreach and adhere to ethics guidelines
Propose and choose from the most effective public affairs tools and tactics to achieve a client's goals
Describe the role of stakeholders and create a target list of issue stakeholders for an issue-based organization or corporation that practices corporate social responsibility
Create a comprehensive public affairs influence plan

AS.480.629. Public Relations in the Age of Digital Influence. 3 Credits.
Marketing and communication are changing. The levers that we have pulled for years to sell products and services, change behaviors, and advocate for causes, no longer work the way they did. As trust in media and marketing plummets, trust in our peers, friends, family, and colleagues rises. Today we recognize new influencers in the people sitting next to us. Now, sparking a digital conversation is just as important as crafting messages, forming partnerships, and driving media coverage. Call it influencer marketing or brand stewardship in the network age; it's all public relations. This class covers how to design impactful public relations strategies in the age of digital influence and, ultimately, how to support business imperatives more effectively through public relations.

AS.480.632. Digital Political Strategy. 3 Credits.
No president will ever be elected again without an internet strategy. Mobile phones and Facebook are being used to organize mass protests. Thanks to YouTube, two Senators lost elections, and bloggers took down former CBS anchor Dan Rather and former Senate Majority Leader Trent Lott. Clearly, the world of political and issue campaigns has changed in the digital age. In this course students explore new strategies possible in a networked world and learn what it takes to be adigital political strategist.

AS.480.633. Interactive Marketing and Advertising. 3 Credits.
Understanding the ever-changing world of digital marketing is no longer optional - it is critical. This course is based on real world case studies from known brands that demonstrate best practices for owned, earned and paid digital communications strategies. Students will learn how to define target audiences, establish KPI's (key performance indicators), measure results and learn how to optimize user experience. We will also gauge the importance of strong and relevant content and choosing the right digital channels. Students will understand how to apply social media, e-mail marketing, SMS, digital advertising, organic search engine optimization, mobile and native apps and others. We will introduce emerging technologies and trends and how they influence digital marketing and advertising practices.

AS.480.634. Journalism & Publishing in the Digital Age. 3 Credits.
From charges of fake news to viral hoaxes that spread on social media after breaking news events, it's crucial to understand and judge the credibility of the news we consume. In what has become a 24-hour news cycle, news consumers need to have the necessary skills to navigate the digital media landscape, assess the credibility of the news organizations that produce stories, determine authenticity on social media, and gain insight into how reporters produce their work. This course aims to provide these skills through a constantly updated guide to a rapidly shifting media landscape. We'll consider current challenges, including journalism's collapsing business model, the role of platforms such as Facebook and Google, and the loss of local news and the impact of the resulting news deserts. We'll also review the guidance of leading media critics, and attempts by news organizations to engage their audiences using newsletters, events, and other methods. And we'll read and assess a wide range of stories and sites, from niche news gatherers like The Information, to upstarts like BuzzFeed and Vox, to legacy sites like the The Atlantic and the New York Times.

AS.480.635. Communication.org:Not-for-Profits in the Digital Age. 3 Credits.
Students examine the primary reasons non-profit organizations exist, and the unique communication challenges they face in reaching their audiences and motivating their desiredbehaviors. They will examine leading trends in 21st century communication, and assess how non-profit communicators can capitalize on these trends for the benefit of their organizations.Finally, they will devise practical solutions to one or more of a non-profit "client's" challenges, using one or more of a wide variety of communication tools offered in the current medialandscape.

AS.480.636. Web Writing and Content Strategy. 3 Credits.
You have 3.5 seconds to capture a web visitor's attention. How do you make sure your website entices them to stick around and learn more? This course examines how compelling web content is essential to engaging visitors and driving their behavior. We'll explore writing styles appropriate for B2B and B2C websites and blogs, and work with a variety of content formats, such as videos, infographics, contests, polls, and more. Using the website as the hub for content, we'll cover techniques for driving web visitors to your site with inbound and outbound content marketing strategies. We'll discuss the intersection of search engine optimization, social media and content marketing and the importance of an integrated approach to content creation and distribution. Lectures and exercises draw on real-world examples from a variety of industries. By the end of the semester, students will be able to create and execute a comprehensive content marketing program.

AS.480.637. Using Social and Digital Media. 3 Credits.
In this class students learn about multiple social and digital media tools, such as blogging, Twitter, Facebook, and Instagram, along with platforms to manage social media content and understand social media analytics. Students apply what they learn by developing a social media campaign for a company or organization that they choose. Each week, students learn how to use social media tools to effectively tell an organization's story. Students also learn the theories behind why social and digital media shape the ways that customers, advocates, audiences and consumers are interacting with influencers and organizations. By the end of the semester, students will be able to not just answer, but inspire, the inevitable questions: Why should we care about social media? How can we put social and digital media to work for our personal and organizational brands?

AS.480.638. Utilizing Images: Media Literacy In Practice. 3 Credits.
This course will teach you how to critically evaluate media, create effective visual communication by identifying key elements of a visual message, and apply relevant theory as it relates to visual message design. This course provides an overview of the approaches and strategies communication practitioners use to incorporate media literacy in their practices. This course will address the following questions: What is media literacy and how does it relate to visual communication? How can visual media be used effectively to promote strategic messages or positive change? How can we critically evaluate the quality of visual messages and create effective and ethical visual communication?

AS.480.639. Advanced Social Media Management. 3 Credits.
In today's complex digital media environment, companies and organizations expect communication practitioners to possess advanced social media management skills. Students in the Advanced Social Media course will gain in-depth knowledge in social media ecosystems, social business models, and digital media policy and law. In addition, students will have an opportunity to analyze quantitative and qualitative data to extract audience insights; develop and implement strategies; create engaging content and messages; and ultimately become skilled social media practitioners. Prerequisites: Students must have completed either 480.601 Intro to the Digital Age, or 480.637 Using Social and Digital Media prior to taking this course.

AS.480.640. Health Communication. 3 Credits.
This survey course will provide a broad overview of topics relevant to health communication research, theory, practice, and promotion. Students will learn about the history and evolution of health communication, examine multiple levels of communication (including intrapersonal, interpersonal, group, and societal), various channels of communication, and the importance of ethics in communicating about health. Class members will examine links between health, communication, culture, health literacy, and health disparities. Students will also evaluate and develop health communication interventions. The primary focus will be on investigating the role of health communication in improving health care delivery and better patient outcomes.

AS.480.642. Corporate Social Responsibility Campaigns. 3 Credits.
The Corporate Social Responsibility (CSR) movement is a world-wide phenomenon, and corporations, trade associations and nonprofits are being asked to step up and be accountable. Public relations and communication professionals need to develop the skills to prepare strategic communication plans that reflect their organization's commitment to CSR in order to protect and enhance their employer's reputation in the marketplace. This course examines the global CSR movement, explores the communication challenges it presents and offers practical suggestions and tactics to respond to this trend. The class features in-class activities, outside research and guest speakers from NGOs, communication firms, and major corporations with practical advice on meeting this challenge in the global marketplace.

AS.480.643. Branding and Advertising. 3 Credits.
Branding and advertising are major components of any business or non-profit organization. Showcasing products and services in creative ways increases visibility and improves sales. Thiscourse teaches students how to develop brands, create concepts and develop advertising campaigns. Students also learn practical tips including how to organize a creative department,write a creative brief, create budgets and time-lines, research and purchase visual imagery, and how to determine appropriate media for particular branding and advertising campaigns.

AS.480.645. Health Literacy, Language and Culture. 3 Credits.
This course offers a skills-oriented approach to addressing literacy, language and culture within a health care context. Understanding the relationship between literacy, language and culture will benefit those in heath communication, as well as professionals in areas such as public and media relations, digital communication, political communication, and corporate and non-profit communication. Students will explore how low literacy and poor health literacy affect quality and outcomes at the individual and systems level and consider the integration of health literacy, cultural competency and language assistance strategies to reduce disparities in health and well being. Overall, this 13-week course aims to improve the cultural and health literacy competency of professionals and the systems in which they work.

AS.480.646. Managerial Communication. 3 Credits.
Writer and historian James Humes said, "The art of communication is the language of leadership." It is that simple comment that forms the foundation of this course. Here students explore the role of communication with stakeholders including subordinates, superiors, internal and externalcustomers, suppliers and the community. Students examine effective communication in hiring and promoting, in conflict, in community interaction and in the internal communication of an organization. The class is built around three precepts or questions: With whom does one communicate, what does one communicate and how does one communicate effectively?

AS.480.653. Communicating for Social Change. 3 Credits.
How do professionals in the nonprofit/government/issue- oriented world determine what communication strategies will help their cause? Students will be introduced to various critical theoretical frameworks and sets of conditions that describe how social challenges occur. Students in this skills-based course will individually identify a social change challenge, target specific audiences and develop various communication strategies and tactics that will advocate for, and guide their desired social change. Examples are based on global real-world experiences and address some of the challenges involved in working in the nonprofit space.

AS.480.654. Strategic Communication Program Management. 3 Credits.
This course covers strategic leadership and communication program development, management and evaluation. It emphasizes formative communication research, strategic communication objectives and message design, selection of media, development of materials, management of teams and impact evaluation. Crisis and issues management as well as the use of new communication technologies will also be covered. </p><p>The course will focus on a step-by-step design of a communication program using SCOPE (Strategic Communication Planning and Evaluation) worksheets. The course requires you to develop a strategic communication plan. </p><p>This course combines reality-based and conceptual approaches to provide you with the intellectual tools needed to assume senior management or outside counsel roles in developing and implementing fully integrated communications programs. You will prepare for program management by asking - and answering – appropriate questions about goals, activities, management, and measurement. There will be core readings as well as use of research and planning exercises.

AS.480.657. Introduction to Public Relations. 3 Credits.
The Bureau of Labor Statistics lists public relations as one of the fastest growing professions in the United States. This introductory course, designed for career changers and those new to public relations, details the ideas, skills, and principles that underlie the public relations craft. Students in this class study the role and contributions of public relations practitioners in contemporary society, learn about potential legal and ethical aspects of the practice of public relations, study the communication process and how persuasion is usedwith various audiences, and learn how to develop a strategic communication plan to achieve specific goals and objectives. The class will also introduce students to specialized practiceareas within the public relations field such as business and industry, government, nonprofit and associations, and health care.

AS.480.658. Public Relations Writing. 3 Credits.
The primary goal of this course is for students to develop the professional-level persuasive writing skills expected of the best PR practitioners. Students are given weekly writingassignments outside of class and write on deadline during many class periods. The course covers various forms of public relations writing including press releases, op-ed essays, crisiscommunications and internal communications. Written work is judged using 10 tenets of good writing: organization, persuasion, clarity, focus, flow, tone, proper usage, timeliness,accuracy and relevance.

AS.480.659. Risk and Crisis Communication. 3 Credits.
This course provides students with a fundamental understanding of crisis management, risk communication, media relations, and public-opinion research techniques in multiple contexts. It introduces students to crisis management principles, strategies, tactics and communication methods. Course participants work as a team to develop a crisis management plan for analysis and discussion. Successful students are able to transfer to the workplace the knowledgeand skills developed in this course. Students learn to predict, manage, and control real-world controversies that they may confront as they pursue their careers. Moreover, students areable to manage effectively, participate in, and control volatile situations involving the news media.

AS.480.660. Media Relations. 3 Credits.
Media outreach is a critical piece of any strategic communication effort. This course prepares students to build, implement, and measure earned media programs that achieve policy, business and philanthropic objectives. Class lectures, guest speakers, readings and assignments give students an understanding of the priorities and expectations of various types of contemporary media, and how to successfully engage them through research-based strategies and tactics designed to reach key audiences.

AS.480.661. International Public Relations and Public Diplomacy. 3 Credits.
In today's global world, reaching international audiences is a key function of U.S. government-funded public diplomacy programs, corporate public relations, and non-governmental organizations involved in relief and development. Through readings, lectures, discussions and exercises, this course examines the differences between domestic and internationalmedia environments. Students develop communication skills needed to deliver messages and craft outreach strategies and programs for non-American audiences. Special attention ispaid to communicating with audiences in Africa, Latin America and Southeast Asia, including Afghanistan, Pakistan and India. Topics include a historical overview of international public relations and public diplomacy, opportunities and challenges for today's public diplomacy practitioner, using research to understand international audiences, writing effectively for international audiences, health and development communication, and communication in international conflict resolution. Students emerge with skills to work overseas in the fast-growing areas of public diplomacy and international public relations.

AS.480.662. Opinion Writing. 3 Credits.
The world of Washington revolves around opinion, and access to the nation's editorial and op-ed pages is key to making sure your opinions (or those of your employer) are successfully shared with the policy makers and opinion leaders who shape public policy. Opinion pieces carry far more impact than news; consequently, the editorial and op-ed pages are much more difficult markets to crack than the news pages. The editorial and op-ed pages have their own writing style and standards of news judgment; once a writer knows them, though, opinion writing is some of the most rewarding journalism, personally and professionally. Students in this class learn to understand the anatomy of good editorial writing; how to write for opinion sections of newspapers, magazines, and other news outlets; how to pitch op-ed and opinion pieces; and how to sell ideas to editorial boards.

AS.480.663. Integrated Marketing Communication. 3 Credits.
Integrated marketing communication breaks down the traditional advertising, public relations and marketing silos by challenging practitioners to apply the optimum mix of media and message to motivate the target audience to act. The rise of the internet and now Web 2.0 support the need to embrace integrated marketing communication as a comprehensive approach to reach target audiences. In this course students learn to evaluate audience demographics and apply theappropriate communication channels and messages based upon the audiences' needs and the business realities of marketing campaigns. During the semester, students develop a tool kit ofsteps to follow to attain marketing success. Through simulation exercises, case study analysis and self-directed reading, students develop a results-oriented and measurable marketing campaignproposal.

AS.480.665. Speech Writing. 3 Credits.
Speech writing is one of the most important but least instructed skills for communications professionals. Through hands-on practice, students learn to write speeches for diverse audiences and contexts. Throughout the course, students will curate a speaker's narrative and public persona to develop a portfolio of work. The portfolio encompasses speeches for ceremonial occasions, public policy speeches and the keynote address. The course also incorporates practical considerations such as the speech writer's role in analyzing speaking situations and audiences, and collaborative drafting processes typical of large organizations.

AS.480.668. Understanding Markets and Audiences. 3 Credits.
This course demonstrates the important role market research—and the use of existing data to better understand audience and environment —plays in the overall campaign process. Thiscourse will focus on the integral steps that facilitate target audience definition and how to extract a keen understanding of this audience and its interactions within its environment to develop effective campaign strategy. The course's structure and various assignments will often mimic a client/consultant relationship to ensure a real-world experience. To that end, the instructors will play the role of "client" in many instances, asking students to articulate how an assignment or deliverable contributes to the overall goals of the campaign.

AS.480.675. Public Policy Management & Advocacy. 3 Credits.
Washington D.C. is home to thousands of organizations attempting to influence public policy. Associations, foundations, think tanks and private lobbying firms are all competing for the attention of policymakers and the public. These groups invariably need competent communicators who can help them cut through jargon, crystallize their messages and strategically communicate with the key audiences imperative to advancing their policy goals. This course introduces students to thedeliberate process organizations undertake to speak out on issues and exert influence over the policies that have the potential to impact them and the way they do business. The class will cover how organizations conduct advocacy efforts and how communication is used as a tool to advance policy change. Students will gain a practical understanding of how policygroups and communications professionals operate in the field.

AS.480.678. Spokesperson Development & Training. 3 Credits.
This course provides students with the knowledge and skills necessary to perform effectively as spokespersons in news media interviews and other high-stakes situations requiring public testimony. Students learn what motivates news media and how journalists cover stories. They learn to recognize the numerous interview techniques used by reporters, and the major differences between broadcast and print interviews. Course participants also learn successful spokesperson strategies, tactics and techniques designed to enhance their performance and reduce the risks inherent in today's volatile media environment. Students develop effective messages and the other tools needed to prepare for interviews and public testimony. Students use on-camera training throughout the course to sharpen interview skills and to critique studentperformance. Successful students are able to transfer the knowledge and skills acquired in this course to the workplace. They are prepared to serve as spokespersons in a wide array ofsituations ranging from routine news interviews to potentially volatile confrontations.

AS.480.680. Nonfiction Filmmaking. 3 Credits.
Today's communication environment calls for a good understanding of the process and methods of nonfiction filmmaking. This course introduces students to nonfiction storytelling in the motion picture medium, from conceptualization to writing to production. Using smartphones, simple production equipment and editing software, students will produce their own videos and be prepared for real-world production with professional crews.

AS.480.681. Communication Evaluation. 3 Credits.
This course will prepare communication researchers to gather evidence that guides the planning, implementation, and refinement of communication campaigns. Throughout the semester, students will practice using evaluation to inform the various stages of a communication effort based on real world conditions. They will draw from behavior theory; and formative (including pretesting), process, and summative evaluation. They also will learn how to ensure the protection of the rights of human research participants.

AS.480.682. Health Psychology & Behavior Change. 3 Credits.
This course provides an overview of health psychology: the scientific study of behaviors and cognitive processes related to health states. It addresses the mind/body connection, theinfluence of social and physical environments on our health, cognitive processing of health information, health belief models, and the link between personality traits and health. Understanding the interactions between these biological, psychological, and social influences on individuals' health states is a key element in developing effective health communication and intervention programs. Students approach all course topics from both theory-driven and applied perspectives.

AS.480.685. Argument & Public Address. 3 Credits.
Argument construction, engagement, and analysis are critical skill sets for communication professionals. Whether substantiating your own position or refuting claims made by others, it is important to understand how arguments function, interact, and effect action and policy. This course prepares students to understand and construct arguments by exploring how they are developed and communicated to diverse audiences. Students will learn to analyze, critique, and fashion arguments through written and speech-based exercises.

AS.480.686. Behavior Change and Education through Entertainment. 3 Credits.
This course explores the various ways communication professionals can use entertainment to educate people and encourage them to adopt and enjoy improved life styles. Throughout history, stories, drama, poetry, music, dance, and other entertainment formats have been used to enlighten and educate both adults and children. In today's society, the channels of communication are ever increasing. This course investigates ways in which education can be subtly but effectively worked into both new and time-honored genres of entertainment to foster positive behavior change.

AS.480.687. Intercultural Communication. 3 Credits.
This course examines the meaning and importance of intercultural communication as it applies to individuals, groups, organizations and nations. Students examine the meaning of "culture" and how "culture" can affect personal, national and international understanding and communication,beliefs and behaviors. The course examines the difficulties and dangers that can result from cultural misunderstanding. In a modern world with diverse communication methods, there isan ever-increasing need for intercultural understanding and communication. The course investigates the various ways in which cultures differ and the necessity of understanding andrespecting other cultures. The course assists communication professionals to be more effective with external communication campaigns in other countries and internal communication within a diverse workplace. The course emphasizes clear and logical spoken and written expression to enhance individual ability to interact effectively with people of different cultures.

AS.480.800. Thesis. 3 Credits.
This course is designed to guide students though the thesis process. It is the last course students take in finishing their masters' degrees. Students select a topic for original research and conduct and write up their research in the course of the class. Students are encouraged to select a topic that will be useful in the workplace and that can be part of their professional portfolio. Graduation is subject to approval of the thesis by the thesis committee and completion of a successful defense. Students are encouraged to enter the class with a clear idea of what they would like to research. All core courses must be completed before starting Thesis.

AS.480.801. Independent Study. 3 Credits.
This course is designed to guide students though the thesis process. It is the last course students take in finishing their masters' degrees. Students select a topic for original research and conduct and write up their research in the course of the class. Students are encouraged to select a topic that will be useful in the workplace and that can be part of their professional portfolio. Graduation is subject to approval of the thesis by the thesis committee and completion of a successful defense. Students are encouraged to enter the class with a clear idea of what they would like to research. All core courses must be completed before starting Thesis.

AS.480.804. Practicum. 3 Credits.
Strategic-planning students complete the Practicum course during their last semester in the MA in Communication program. This optional core course offers a culminating experience that helps students integrate new or enhanced capabilities into a significant evidence-based project relevant to their profession. Each student can identify an organization or individual in need of support for a communication-related project and how to fulfill that need. In addition, the student must prepare (a) a proposal that outlines objectives, scope of work, any deliverables, timeline, and method for evaluating achievement of objectives; and (b) any final deliverables. The student must complete the Practicum course in one semester.
You must complete AS.480.600 in order to register for this course. You can enroll for this course when registration opens for the next semester.

AS.480.806. Practicum: Independent Study. 3 Credits.
Strategic-planning students complete the Practicum course during their last semester in the MA in Communication program. This optional core course offers a culminating experience that helps students integrate new or enhanced capabilities into a significant evidence-based project relevant to their profession. Each student can identify an organization or individual in need of support for a communication-related project and how to fulfill that need. In addition, the student must prepare (a) a proposal that outlines objectives, scope of work, any deliverables, timeline, and method for evaluating achievement of objectives; and (b) any final deliverables. The student must complete the Practicum course in one semester.

AS.480.888. Thesis Continuation.
Students not finishing the thesis during the term in which they enroll in the Thesis course must enroll in Thesis Continuation in every ensuing semester (including summer) until they complete their degrees. It is not possible to take a semester off or a leave of absence while working on the thesis.

AS.485 (Organizational Leadership)

AS.485.605. Ethics, Integrity and the Responsibility of Leaders. 3 Credits.
The first part of this course introduces students to the classical literature in philosophical ethics, including consequentialist, regularian, deontological, and virtue approaches. The second part of the course explores the ethical responsibilities professionals have toward themselves, corporations, the government, and the public. In the third part of the course, students apply an appropriate decision-making framework and gain experience in decision-making surrounding ethical issues. Course discussions will center on issues involving research, research designs and populations, privacy and confidential or sensitive information. During their final project, students will codify an individual code of ethics in relation to professional codes of conduct.

AS.485.615. Leading and Managing Change. 3 Credits.
Leading and managing organizational change requires knowledge and skills for analysis, development and the reengineering of processes. This course provides an overview of organizational change management theories and aligns specific strategies to organizational processes. Using the case study method, students will examine examples of organizational change across industries and the leadership characteristics that contribute to organizational dynamics and facilitate sustainability.

AS.485.620. Managerial Economics. 3 Credits.
The field of managerial economics integrates the concepts of microeconomics and logical decisionmaking to facilitate the development of organizational policies and strategies. These organizational policies and strategies in turn, provide leaders with an effective cost-benefit analysis for implementing change. In this course, students study the principles governing managerial economics and apply them to guide the allocation of limited resources to competing entities within the organization. The goal is to optimize spending to maximize value and output. This course recognizes the impact of markets and the challenges of managing production and performance costs. Students then have the opportunity to build skills for distinguishing between business decisions that provide an immediate benefit return, and those decisions designed for longer term investment. The course also addresses optimization tools and techniques to strengthen decision-making during times of uncertainty.

AS.485.635. Leadership and Organizational Behavior. 3 Credits.
The study of leadership and organizational behavior increases our understanding of the complex nature of employees and how their individual interactions impact corporations, government agencies, academic institutions and other working environments. Leadership, on the one hand, involves making sound judgments to inspire others to perform well while working toward a common goal. Organizational behaviors, on the other hand, reflect the impact of environmental characteristics and job duties on the health, safety and wellbeing of employees. Therefore, leadership and organizational behavior are inextricably linked. To understand this connection, this course presents the primary theories of leadership which drive interaction and the key elements of organizational behavior. The course helps students build knowledge and skills to develop protocols for leadership and organizational behavior that result in increased efficiency and productivity in the workplace.

AS.485.700. Team Building: Individual and Group Dynamics. 3 Credits.
Individual and group dynamics are at the core of evidence-based practices. Leaders direct individuals and groups and also the interaction that occurs among multiple groups toward accomplishment of a mission or purpose. Additionally, leaders must come to terms with the concept of self-leadership-which involves personal resilience and methods for building cultures of resilience. The knowledge of how groups and followers function is essential to sound decision making, implementing new concepts, changing direction, solving problems, and motivating others. To acquire this knowledge, students will dissect modern theories and research in individual and group dynamics, identify 'fit' and apply accepted principles of dynamics to a work environment. Students will also differentiate between small and large group dynamics, evaluate the role of a group leader, by focusing on issues such as boundaries, group identity, cohesion, conflict, power, group recognition, and intergroup alliances.

AS.485.712. Project Management: Leading Projects to Successful Outcomes. 3 Credits.
Project management, as a strategic organizational competence, focuses on the goals, resources and timeline of workplace endeavors designed to achieve a unique product or service. Leading projects to a successful outcome will require attaining all project goals within given constraints. This course provides students the opportunity to learn the stages critical to successful project management and build skills to lead project teams through establishing scope, calculating cost, and assessing risk. Students in this course distinguish between project management and true leadership of projects, and proactively observe, assess and remedy extenuating circumstances to reach successful outcomes. The course will examine current project management processes associated with project. Students will develop mastery of the fundamental project management concepts through the use of case studies and software tool to lead successful projects through the entire project life cycle. Students will also acquire the leadership skills to monitor project statuses, document lessons learned, and successfully close a project.

AS.485.715. Portfolio Management. 3 Credits.
Portfolio management aligns the selection, prioritization and control of an organization's projects and programs to the organization's strategic objectives and capacity to deliver. This course will examine the process of portfolio management in organizations and its relationship to projects and programs. Students learn to construct optimal portfolio(s) for an organization that manage risk effectively while supporting strategic operations, change management and sustainability. The concepts and principles of project portfolio maturity (PPM) models are evaluated and applied to ensure strengthening organizational capability for successful divestiture and allocation of resources. Through the use of case studies and hands-on assignments, students will master the foundations of portfolio management in order to maximize their leadership skills for successful projects and programs in organizations.

AS.485.717. Organizational Development and Innovation. 3 Credits.
This course explores the historically rich field of organizational development (OD). The goal of organizational development is to increase efficiency and productivity of organizational processes through planned intervention. To do so effectively, organizational development as an approach will encompass the analysis, development and implementation of planned efforts, often organization-wide and managed from the top. Students will examine common OD efforts that may include diagnostic activities, systems realignment, team-building, sensitivity training, or technology innovation. The outcomes of OD are rich with reward: organizations which embrace this approach also foster a learning culture and incorporate related behaviors that are dynamic, flexible, innovative and creative.

AS.485.718. Strategic Planning for Leaders. 3 Credits.
This course explores models and principles of strategic planning and the leadership characteristics that promote effective strategic planning, including setting priorities, allocating resources to support priorities, and focusing energies to strengthen operations and employee engagement. The outputs of strategic planning, which include documentation and communication that guide achievement of an organization's identified goals. Students learn to recognize the degree of alignment between these goals and actual outcomes from execution of the strategic plan, as a measure of the organization's strategic advantage. Students will extract a set of practical principles useful in any future leadership role.

AS.485.719. Crisis Mitigation. 3 Credits.
This course provides the opportunity to study the process of crisis mitigation in organizations. Primary activities include spending time to assess risks, developing and prioritizing response mechanisms, and training staff and stakeholders in threat detection. Students utilize up-to-date strategies to observe and interpret signals of disruption, and build viable, actionable scenarios to defend the organization's people and processes. Crisis mitigation, as part of an organization's crisis management effort, occurs on several levels (i.e., individual, departmental and organization-wide) and across many functions (i.e., IT, HR, finance, and marketing). This course provides students the knowledge and skills to lead crisis management in organizations with authority and engagement, and to decrease vulnerabilities in diverse circumstances.

AS.485.720. Leadership: A Developmental Process. 3 Credits.
The theory of developmental leadership encompasses three basic assumptions: leadership skills can be learned, the individual is the focus, and many leadership roles exist. This course explores the elements of a successful developmental process for leaders in organizations. Students will learn the characteristics of effective leaders and examine the impact of cognition and emotion on individual behaviors and attitudes. Through the case study method, students will examine the following areas of leadership development: information and communication, decision-making, interpersonal relationships, personal resources, and effective use of self.

AS.485.820. Capstone: Current Issues in Leadership. 3 Credits.
The program culminates in this Capstone Seminar, which requires each student to complete an independent, faculty-approved project that will address a substantive or methodological challenge in Organizational Leadership. A successful capstone will include research that provides evidence of the student's mastery of the theoretical knowledge and analytical skills central to the degree's learning outcomes. The capstone provides an opportunity to apply the skills acquired throughout the program to a key challenge facing their organization or community. This course will introduce a variety of research and statistical methods intended to provide a basis for designing the capstone. Students will prepare a literature review, a bibliography, select a research method appropriate to their study, and analyze data in their capstone project.

AS.485.888. Capstone Continuation.
Required for those who have completed all their course work, including AS.485.820 Capstone: Current Issues in Leadership, but are still working on their capstone project.

AS.490 (Writing)

AS.490.652. Contemporary American Writers. 3 Credits.
This foundation course surveys issues and trends in recent fiction and nonfiction, with emphasis on the diverse work and methods of American writers publishing today. Students read and discuss contemporary writing and hear from accomplished writers. This core course focuses on developing skills to read as a writer, and it explores the similarities and differences between factual and nonfactual writing, including the roles of truth, accuracy, and reader expectation. This core course is required for all incoming fiction and nonfiction students and usually must be completed before students in those concentrations enroll in a writing workshop.

AS.490.654. Fiction Techniques. 3 Credits.
In this foundation course, students explore the elements of fiction, including point of view, plot, character, setting and the forms of short stories and the novel. The course also introduces students to the writing process, the techniques of reading as a writer, and the workshop process. Readings usually include short stories, one or more novels, and books or articles on craft. Writing assignments involve exercises, response writings, and one complete piece, either an original short story or novel chapter. Revisions also may be required. This core course is required for all incoming fiction students as a prerequisite to any workshop. Nonfiction students may take it as an elective, although the program may limit the number of registrants from outside the fiction concentration.

AS.490.656. Nonfiction Techniques. 3 Credits.
The intensive reading and writing exercises of this foundation course help students gather information and transform it into clear, creative prose – whether in literary essay and memoir or journalistic forms such as profiles, reviews or opinion. Reporting techniques include interviewing, personal observation, and examining documents. Writing techniques include structure, quotation, detail, word choice, transition and revision. This core course is required for all incoming nonfiction students prior to enrolling in a workshop. Fiction students may consider this course as an elective.

AS.490.657. Speculative Fiction Workshop: Writing New Realities. 3 Credits.
The term Speculative Fiction encompasses a broad array of subgenres: science fiction, fantasy, urban fantasy, supernatural, alternate history, horror, etc. This Zoom-based workshop is designed for students who want to bring speculative elements into their fiction, even if they may not yet have deep knowledge of the genre. In addition to workshopping each other’s stories, students will read and discuss published fiction that demonstrates how contemporary authors are examining human lives and relationships through alternate realities. Prior knowledge of science fiction and fantasy is not required, but a willingness to step outside the bounds of our current reality is essential. This class counts toward Workshop credits. Prerequisites: Fiction Techniques

AS.490.660. Fiction Workshop. 3 Credits.
Fiction Workshops concentrate on intensive writing and revision, with some required reading. As members of a general workshop, students submit short stories or novel chapters to their instructor and peers for critiques. Typically, two or three stories or chapters are submitted during a semester; revisions are usually required. Workshop participants also submit detailed critiques of their fellow students’ writing. We recommend, but do not require, that students take at least one general workshop before progressing to more specialized workshops, and we urge students to take workshops from different instructors, if possible. Students may take Fiction Workshop up to three times, although specialized workshops also can count toward the requirement of three workshops for a master’s degree. The 660-1-2 sequential numbering of workshops relates only to the three annual academic terms and does not indicate cumulative coursework.

AS.490.661. Fiction Workshop. 3 Credits.
Fiction Workshops concentrate on intensive writing and revision, with some required reading. As members of a general workshop, students submit short stories or novel chapters to their instructor and peers for critiques. Typically, two or three stories or chapters are submitted during a semester; revisions are usually required. Workshop participants also submit detailed critiques of their fellow students’ writing. We recommend, but do not require, that students take at least one general workshop before progressing to more specialized workshops, and we urge students to take workshops from different instructors, if possible. Students may take Fiction Workshop up to three times, although specialized workshops also can count toward the requirement of three workshops for a master’s degree. The 660-1-2 sequential numbering of workshops relates only to the three annual academic terms and does not indicate cumulative coursework.

AS.490.662. Fiction Workshop. 3 Credits.
Fiction Workshops concentrate on intensive writing and revision, with some required reading. As members of a general workshop, students submit short stories or novel chapters to their instructor and peers for critiques. Typically, two or three stories or chapters are submitted during a semester; revisions are usually required. Workshop participants also submit detailed critiques of their fellow students’ writing. We recommend, but do not require, that students take at least one general workshop before progressing to more specialized workshops, and we urge students to take workshops from different instructors, if possible. Students may take Fiction Workshop up to three times, although specialized workshops also can count toward the requirement of three workshops for a master’s degree. The 660-1-2 sequential numbering of workshops relates only to the three annual academic terms and does not indicate cumulative coursework.

AS.490.665. Combined Workshop and Readings in Memoir. 3 Credits.
Writers have long enjoyed a major impact on contemporary thought by producing compelling essays about personal experiences, feelings, or ideas. This innovative experience allows students to earn either Nonfiction Workshop credit or a Nonfiction reading elective credit in a single, combined course. The workshop component allows students to experiment with memoir and the personal essay as distinct forms and as explorations of the self, while the reading component focuses on essay and memoir both short and long, with the goal of deeper understanding of these popular writing forms. Students may count this course as either a workshop or an elective, depending on their needs. There is no prerequisite for students in the Nonfiction concentration; students in other concentrations or programs must seek permission from their advisor and the Writing Program director.

AS.490.666. Combined Workshop and Readings in Fiction and Nonfiction. 3 Credits.
This course introduces students to innovative readings in both fiction and nonfiction. It is designed for students who wish to stretch the boundaries of their own writing in fiction and nonfiction. In exploring craft in blurred-genre readings, students are encouraged to find ways to introduce new techniques into their own work. Readings may include such writers as Paula Vogel, Susan Griffin, James McBride, Alexandra Marzeno-Lesnevich, Rick Moody, Margaret Atwood, bell hooks, Te-Nehisi Coates, Sam Shepard, Moshin Hamid, Han Kang, Daniyal Mueenduddin, John Tateishi, Yiyun Li, Kathy Acker, and others. This course will follow traditional-workshop format during the last weeks of the class, and readings and exercises will take precedence during the first weeks. This course counts as an elective for either fiction or nonfiction students or it may count as a workshop for either genre.

AS.490.668. Combined Workshop and Readings in Nonfiction. 3 Credits.
The innovative experience allows students to earn either Nonfiction Workshop credit or a Nonfiction reading elective credit in a single, combined course. Students seeking workshop credit will submit nonfiction in the usual manner; enrollees needing elective credit will complete extensive reading and exercises in factual writing. At times, all students will engage together in workshop discussion or reading analysis. At other times, the two groups might separate for special attention to reading or the workshop. The dual goal is to provide nonfiction elective students with workshop experience, while workshop students enjoy the full writing critique process as they complete helpful reading. Students must complete Nonfiction Techniques before enrolling in this course. Nonfiction students earn either workshop or elective credit from this course.

AS.490.669. Combined Workshop in Nonfiction and Fiction. 3 Credits.
This course allows students in nonfiction and fiction to earn a workshop credit in the same class. Students in both concentrations and from either are urged to enroll. Students from both concentrations will be expected to critique work across genres and learn the intricacies of craft in both fiction and nonfiction.

AS.490.670. Nonfiction Workshop. 3 Credits.
These general workshops give students extensive experience in writing and revising their factual work, regardless of topic or form. Submissions are critiqued by peers as well as by the instructor. Students typically submit two to four essays, articles or book chapters. Revisions, exercises and readings also are required. Students may take this general workshop or any specialized workshop to meet the requirement of three workshops for the MA in Writing. The 670-1-2 sequential numbering of workshops relates only to the three annual academic terms and does not indicate cumulative coursework.

AS.490.671. Nonfiction Workshop. 3 Credits.
These general workshops give students extensive experience in writing and revising their factual work, regardless of topic or form. Submissions are critiqued by peers as well as by the instructor. Students typically submit two to four essays, articles or book chapters. Revisions, exercises and readings also are required. Students may take this general workshop or any specialized workshop to meet the requirement of three workshops for the MA in Writing. The 670-1-2 sequential numbering of workshops relates only to the three annual academic terms and does not indicate cumulative coursework.

AS.490.672. Nonfiction Workshop. 3 Credits.
These general workshops give students extensive experience in writing and revising their factual work, regardless of topic or form. Submissions are critiqued by peers as well as by the instructor. Students typically submit two to four essays, articles or book chapters. Revisions, exercises and readings also are required. Students may take this general workshop or any specialized workshop to meet the requirement of three workshops for the MA in Writing. This is a dual-campus, videoconference course. Baltimore students meeting in a classroom in Baltimore will be connected by video with students in a D.C. classroom. The instructor will alternate campuses each week.

AS.490.676. Sentence Power: From Craft to Art. 3 Credits.
This craft elective focuses on revision at the sentence and paragraph level and is open to fiction or nonfiction students. Through close reading and brief exercises, students learn various techniques to assemble sentences and establish syntactic relationships within paragraphs. Students imitate other writers, as well as revise, exchange and discuss revisions of their own work. Authors to be studied may include Updike, Munro, and Welty in fiction, and Dillard, McPhee, or Didion in nonfiction.

AS.490.681. The Craft of Poetry: An Introduction for Fiction and Nonfiction Writers. 3 Credits.
This popular elective course helps fiction and factual writers apply the techniques, vision and benefits of poetry to their writing. Through reading, discussion and writing, students explore the lessons of free verse and formal poems, especially their careful attention to language, rhythm, theme, and other tenets of poetic craft. This course engages those with experience in poetry, as well as those new to the field. As part of this course, students will write and workshop poems with their classmates. This onsite course also may involve some online interactivity.

AS.490.684. Heritage of Literature--Examining the 20th Century. 3 Credits.
This reading elective examines the historical development of fiction and nonfiction from a craft perspective, emphasizing the interrelationship of social and cultural development with the maturation of writing. Students learn to appreciate how contemporary authors have roots in the past, and how they themselves might be inspired by those who came before them. Readings and discussions will revolve around William Carlos Williams and T.S. Eliot, two giants who locked horns for forty years and whose disagreements have gone a very long way toward shaping literature in their own era and ever since. All of the authors students study in the class purposely challenged narrative art in the name of forging new and more relevant literary models. Reading list may include James Joyce, Ernest Hemingway, Virginia Woolf, James Baldwin, Philip Roth, Toni Morrison. The course requires extensive reading as well as creative and critical writing. Both nonfiction and fiction students are invited to enroll.

AS.490.685. Writing the Body. 3 Credits.
This course will look at how writing about the body documents and manifests the relationship between experience and consciousness. It will examine questions of self, politics, and genre as questions of craft: How can we shape the physical worlds of our writing? How is the self – and the way we write about the self – shaped by its physical vessel? How can paying attention to the body affect the way we write, and what we write about? Using major bodily experiences like eating, movement, illness, intimacy, and ecstasy as a frame, students will read and analyse work by writers such as Eula Biss, Garth Greenwell, Sinead Gleeson, and James Baldwin, as well as complete creative writing exercises. This elective is open to both fiction and nonfiction students.

AS.490.686. Writing Identity: Race and Ethnicity in Fiction and Nonfiction. 3 Credits.
This cross-concentration elective presents intensive readings in fiction and nonfiction from various racial and ethnic communities in the United States. By studying marginalized and diverse voices, students learn how different cultures, experiences, and histories createa rich and vibrant American literary tapestry. Students also learn methods and techniques for expressing their own cultural perspectives in their creative work. Fiction and nonfiction students earn elective credit in this course, which focuses on craft analysis and discussion. Students will choose whether their final project will consist of creative or analytical writing.

AS.490.687. The Short Story: Past & Present. 3 Credits.
This fiction reading elective begins with a brief review of the history and development of short fiction, moving to analysis of contemporary forms, trends and practitioners. Featured authors may include Chekhov, Carver, Paley, Barthelme, Munro and Dixon. The course focuses on intense reading, analysis and discussion more than writing assignments. Students also may be asked to make class presentations and to review a range of literary journals.

AS.490.690. Travel Writing Workshop. 3 Credits.
The best travel writers weave a rich “sense of place”— a trait also crucial to literary fiction, memoir, and creative nonfiction. The telling detail, apt metaphor, historical reference, cultural connection, and vivid character sketch, coupled with reflections that link these observations to broader themes, can elevate travel writing beyond the guidebook. In this specialized nonfiction workshop, students complete exercises, hear guest speakers, and analyze the works of acclaimed writers such as Jan Morris, Barry Lopez, Ian Frazier, and Jonathan Raban. Students may be asked to visit an assigned nearby location to prepare writing. This workshop counts as one of the three required for a nonfiction degree. Enrollees must have completed or waived the nonfiction core courses. Fiction students may enroll only with program permission.

AS.490.693. Writing Memoir & Personal Essay Workshop. 3 Credits.
Writers have long enjoyed a major impact on contemporary thought by producing compelling essays about personal experiences, feelings, or ideas. In this specialized nonfiction workshop, students experiment with memoir and the personal essay as distinct forms and as explorations of the self. Seminal essays are read to clarify students’ thoughts and to help them develop their own voice and style in personal nonfiction. This workshop counts as one of the three required for a nonfiction degree. Enrollees must have completed or waived the nonfiction core courses. Fiction students may enroll only with program permission.

AS.490.702. Readings in Global Fact and Fiction. 3 Credits.
This cross-concentration elective course presents intensive readings in fiction and nonfiction from around the world. By discussing both fact and fiction, students learn how different cultures, values and histories create differing literature. Readings include a sampling from at least three continents, with specific texts announced in advance for each section. Fiction and nonfiction students earn elective credit in this course, which focuses on craft analysis and discussion but also may involve student and team presentations and a final project of creative or analytical writing. This course combines the content of the previous International Nonfiction and 20th Century World Literature courses.

AS.490.705. Crafting Nonfiction Voice. 3 Credits.
This craft elective is for factual writers. Through reading and writing exercises, students learn the techniques of re-creating voices of others and of shaping a writing voice of their own. The skill to represent a person’s character, mind and feelings also is essential to ghostwriters, speechwriters, writing collaborators, feature writers and novelists. This course focuses on the tools such writers use to craft a voice.

AS.490.711. Masterworks: Examining the Boundaries. 3 Credits.
This cross-concentration reading course, designed for fiction or nonfiction students, focuses on a writer’s analysis of masterworks in fiction, nonfiction, nature, travel or poetry – and how those forms may be combined in various hybrids. The course involves extensive reading and discussion of technique and the changing boundaries among the genres. The format includes craft reports, response writing and individual or team presentations, plus a final creative or critical work.

AS.490.714. Essence of Place: Description, Detail, and Setting. 3 Credits.
This craft elective, designed for students from any program concentration, focuses on how detail and setting combine with other techniques to create a sense of place in fiction, nonfiction or other forms. Readings come from travel, short fiction, memoir, science, novels, nature, poetry and creative nonfiction. Through reading, discussion and writing exercises, students learn how to enhance the sense of place in their own writing. This course counts as an elective in nonfiction or fiction.

AS.490.715. Noticing as a Writer. 3 Credits.
In this craft elective, fiction and nonfiction students will take as a premise the words of novelist Alice LaPlante: “[O]ur first job as writers” is “to notice.” We all notice things as we make our way through each day, but “noticing” as a writer is different. Whether working on fiction, nonfiction, poetry, or any other genre, the writer needs to pay attention to the very small, to zoom in on the specific detail or insight that can make even the most mundane moment feel entirely new and surprising. Noticing in this way is a skill that, like most skills, is developed with practice. In this class, students will practice with weekly writing prompts designed to help them describe their physical and emotional worlds in concrete language. Along the way, students will review each their writing as a group and read works by great contemporary noticers, including Karl Ove Knausgaard, Chimamanda Ngozi Adichie, Ben Lerner, and Weike Wang.

AS.490.731. Film & Screenwriting. 3 Credits.
This intensive writing course is designed to provide students with a broad foundation in the fundamentals of screenwriting and visual storytelling, from idea to story to structure, character, dialogue, and beyond. Readings, screenings, and weekly writing assignments will provide students with the basic theory and practice of screenwriting as an art and a craft, contextualize the form within the history of storytelling, and enable students to put that knowledge to practical use in the development of their own feature-length screenplay. This craft elective is open to fiction and nonfiction students, but nonfiction students should be prepared to develop a fictional feature rather than any documentary work.

AS.490.734. Digital Storytelling and Multimedia Journalism. 3 Credits.
As news organizations increasingly require journalists to work on multiple platforms, this digital storytelling class will help you move your narrative journalism off the page and onto the screen or into the earbud. In this hands-on, experiential course students will learn the basics of audio recording and editing as well as video recording and editing. Students will do multiple projects including developing a short podcast series and several short videos. They may wish to invest in some audio-video recording equipment or rent some for the course but can also use cell phones for these basic exercises.

AS.490.745. Voice in Fiction and Nonfiction. 3 Credits.
In this cross-concentration craft elective, students examine aspects of voice in fiction and factual writing, considering how style, point of view, tone, structure and culture all contribute to an author’s or narrator’s individual writing personality. Students use exercises to strengthen their individual styles or the voices of the characters they portray. Readings include novels, short stories, essays, articles and nonfiction books, as well as articles on craft. Class assignments may include response writings and original fiction or nonfiction as well as oral presentations. This course is the dual-concentration version of 490.683 Voice in Modern Fiction, which covers only fictional works, and 490.705 Crafting a Nonfiction Voice, for factual writers.

AS.490.746. Readings in Narrative Fiction and Nonfiction. 3 Credits.
This cross-concentration elective course presents intensive readings in fictional, factual, and poetic narrative. The course covers elements of narrative, including plot, character, setting, tone, pacing, dialogue, and theme, plus the terms writers use to discuss and analyze narrative. Readings in both traditional and contemporary narratives will include novels, short stories, essays, articles and nonfiction narrative books, and may include some poetry and articles on craft. Class assignments may include response writings and original narratives from prompts. This course counts as an elective in nonfiction or fiction.

AS.490.747. Advanced Revision Techniques in Fiction. 3 Credits.
This elective course is designed to hone skills in the elements of fiction through an intensive revision process. The course explores in depth exercises and techniques such as expanding/slowing down, mapping structure, defining and refining character and characterization, and using syntax and word choice to strengthen sentences. Students improve the use of these and other techniques by reviewing and revising their own writing and the writing of their classmates. While some workshop methods will be employed, this course focuses more on specific revision techniques and exercises than a workshop-style evaluation of student writing. Pre-requisite: Fiction Techniques.

AS.490.748. Advanced Workshop in the Novel. 3 Credits.
This course is for students who have made significant progress on a novel and are looking for help in bringing the book closer to completion. “Significant progress” here might mean you’ve written a hundred pages, or it could mean you’ve finished a complete draft. This hybrid course will meet 3-5 times onsite; during the rest of the course, students will work one-on-one with the instructor on issues particularly relevant to the novels they are writing. Class discussions may focus on general concepts of novel structure, plot points and character arcs, along with advice on publishing. There may be some workshop aspects, but the bulk of the course will focus on one-on-one interaction with the instructor giving singular attention to each individual student’s novel. While students who have completed Fiction Techniques and one previous Fiction Workshop will be on firmer ground in this course, there are no prerequisites; any student who has made “significant progress” on a novel may enroll.

AS.490.765. Children's and YA Writing Workshop. 3 Credits.
This elective course focuses on writing fiction and nonfiction for children and young adults. Students will study the markets, trends, genres, and publishing opportunities for this age group and read several novels, memoirs, and other current works. The majority of class time will be spent reviewing craft elements and workshopping original material. The course is designed as an elective for fiction and nonfiction students, who are urged to complete Fiction Techniques and Nonfiction Techniques before enrolling.

AS.490.766. Completing the Novel. 3 Credits.
Many writers begin novels, but far fewer finish them, let alone have the manuscripts fully ready for a publisher’s consideration. In this new fully online class, JHU writer-in-residence Tim Wendel helps students move forward with their works. The class will focus on writing, revising, selling novels in general, as well as some workshop components. The “point of no return,” effective set pieces, quality dialogue and utilizing lessons from film and other art forms are a few of the class topics. Wendel is the author of 13 published books, including a pair of full-length novels, two children’s books and a novella.

AS.490.767. Writing the Nonfiction Book Proposal. 3 Credits.
This fully online course is designed for writers who have a specific nonfiction book project in mind and are looking to secure an agent or publisher based on the well-drafted proposal. Students can be working on a book based on reporting, a memoir, or a collection of essays but they should register for the class only if they already have an idea for a book and have two or three chapters completed. (Ideally those chapters have been workshopped and refined in other classes before enrolling in this course.). Over the course of the semester, students will draft, revise, and refine a 15-page proposal, will develop a chapter outline, and will refine a sample chapter or two. Based on feedback from the instructor and fellow students, each writer will complete the course with a polished proposal based on publishing industry standards.

AS.490.770. Writing the Other. 3 Credits.
The course focuses on practical approaches to writing "the other." We examine dominant paradigms of otherness, drawing from a worldview that is shaped by our own biographies. We explore varied methods, including defamiliarization and empathization exercises, of bridging cultural and other socially constructed differences, for the writing of successful fiction. Though our emphasis is on writing our own stories that are then reviewed and critiqued by our peers in an online "author-centered" workshop, we shall also discuss some texts which will include: Writing the Other: A Practical Approach by Nisi Shawl & Cynthia Ward, The Art of Perspective: Who Tells the Story by Christopher Castellani, The Art of Subtext: Beyond Plot by Charles Baxter (also Baxter’s chapter on "Defamiliarization" from his book, Burning Down the House), "Write What You Don’t Know: An Outsider’s Reflection on Place, Memory and the Creative Process" by Zakes Mda (a chapter from Mda’s book, Justify the Enemy: Becoming Human in South Africa), and "The Uses and Misuses of Other people’s Myths" by Wendy Doniger O’Flaherty.

AS.490.773. New England Residency: Noticing as a Writer. 3 Credits.
This condensed, one-week course will take place at College of the Atlantic in Bar Harbor, Maine, where Writing students will join with students in the Science Writing and Teaching Writing residencies. The course counts as an elective for students in any concentration and students should plan to do extensive work prior to arriving for the residency. In this craft elective, fiction and nonfiction students will take as a premise the words of novelist Alice LaPlante: “[O]ur first job as writers” is “to notice.” We all notice things as we make our way through each day, but “noticing” as a writer is different. Whether working on fiction, nonfiction, poetry, or any other genre, the writer needs to pay attention to the very small, to zoom in on the specific detail or insight that can make even the most mundane moment feel entirely new and surprising. Noticing in this way is a skill that, like most skills, is developed with practice. In this class, students will read texts from the pantheon of great noticers, they will workshop each other’s work with an eye on this theme, they will practice with daily writing prompts that send them out into the field to describe their physical and emotional worlds in concrete language, and they will attend an evening reading series with visiting authors. Students signing up for this section plan to stay on campus at College of the Atlantic; rooms are doubles and triples so students should count on a roommate.

AS.490.782. Books and the City: Literary Dublin. 3 Credits.
Books and the City: Literary Dublin explores some of this UNESCO City of Literature’s deep literary roots— it counts W.B. Yeats, Oscar Wilde, George Bernard Shaw, James Joyce, Samuel Becket, and Seamus Heaney, to name but a few, among its own. In examining the interplay between city and writer, the course also considers how Dublin has shaped the works of some of Ireland’s most vivid and celebrated contemporary writers, possibly including Anne Enright, Colm Toibin, and Roddy Doyle. This residency course is based at the eminent and historic Trinity College, home to the Book of Kells. The college lies in the heart of the historic capital, with its walkable Georgian squares and Royal Canal, in this city that continues to flourish as a creative center. The course week includes craft discussions and work shopping at Trinity, readings and talks with local Irish writers, and field trips. Possible trips include ones to the Dublin Writers Museum and the James Joyce Centre, the National Print Museum, and some of the city’s exquisite libraries to tour their special collections, including Trinity’s Long Room.

AS.490.784. Reading, Writing, Walking. 3 Credits.
This cross-concentration reading and craft course focuses on the flaneur tradition and the curious link between the mind and feet. From Charles Baudelaire to Virginia Woolf, from Max Beerbohm to E.B. White, writers who walk –and write about their walks or their characters' walks—have proliferated in the last two centuries. We will analyze this literature and make forays of our respective neighborhoods to experiment with the form. Drawing on the outward facing gaze of walkers, we'll pay particular attention to creating a strong sense of place and braiding the exterior world with internal rumination. We will also be workshopping writing that is submitted in advance and hearing from an invited author each evening. This condensed course counts as an elective for students in either the fiction or nonfiction concentration.

AS.490.785. Our American West: The Evolution of a Counter Narrative. 3 Credits.
<p> Using classic western films as a springboard for discussion, this class will explore the evolution of a counter-narrative from writers of both fiction and nonfiction. Readings will include novels, histories and literary nonfiction, all with an eye toward understanding our complicated western expansion, and how our shifting literary legacy corrects, amends, or counters prevailing narratives of the American West. This condensed, one-week course will take place at the University of Montana in Missoula, where Writing students will join with students in the Science Writing and Teaching Writing residencies. The course counts as an elective for students in any concentration. <o:p></o:p></p><p> Because the stories we tell ourselves about place shape our identity and sense of self, students will study the craft of scenes and settings in these works with an eye toward deepening our own observations and skills through writing exercises in the landscape of Montana. <o:p></o:p></p>

AS.490.800. Independent Study in Writing. 3 Credits.
An independent study is a special project that an advanced student proposes to complete within a single semester, for either elective or workshop credit. Most independent studies in the Writing Program involve a student working one-on-one with a faculty member or other writer or editor. The project must involve writing, reading or writing-related work equivalent to a full-semester, graduate-level course, and the project should not duplicate any course or other part of the program's curriculum. Students usually are not eligible to propose independent studies until they have completed at least five courses, including at least one workshop. The tuition for an independent study is the regular, single-course rate for the term in question. Proposals for an independent study should be submitted in writing to program leadership no later than 60 days before the start of the target semester. Proposals are evaluated competitively after that date, and only a small number of proposals will be approved. This course number is only for Writing Program students. Science Writers should consider 490.807.

AS.490.801. Thesis And Publication. 6 Credits.
This final course is required for all degree candidates in fiction or nonfiction and is offered only in the fall and spring terms. The two course goals are the completion of a successful thesis and an enriching, challenging capstone experience for the entire program. The creative writing thesis will contain portions of a novel or a nonfiction book, and/or a collection of short stories, essays, or articles. We recommend that students select their best work and the work they most want to work on revising during the thesis semester; not all program writing will become part of a thesis. Students taking this course are required to submit a full thesis draft early in the course; the author spends the term working one-on-one with a thesis advisor to revise this draft. In addition, thesis students meet as a class. During classes, students engage in forward-looking discussions on the writing life, participate in a program-capping roundtable discussion, and rehearse and conduct a public reading. Prerequisite: All other required and elective courses. Students may take a second course during their thesis term with the program director's permission; such a course must be in addition to program requirements.

AS.490.803. Independent Study. 3 Credits.
An independent study is a special project that an advanced student proposes to complete within a single semester, for either elective or workshop credit. Most independent studies in the Writing Program involve a student working one-on-one with a faculty member. The project must involve writing or writing-related work equivalent to a full-semester, graduate-level course, and the project must not duplicate any course or other part of the program's curriculum. Students usually are not eligible to propose independent studies until they have completed at leastfive courses, including at least one workshop. The tuition for an independent study is the regular, single-course rate for the term in question. Proposals for an independent study must be submitted in writing to the program's independent study coordinator no later than 60 days before the start of the target semester. Proposals are evaluated competitively after that date, and only a small number of proposals will be approved.

AS.490.805. Writing Internship. 3 Credits.
Advanced students in the MA in Writing program may propose an internship to receive on-the-job experience in writing or a writing-related profession. An approved internship receives one full course credit toward the MA in Writing degree—usually an elective. Students may propose to participate in existing internship programs or they may arrange a unique experience. In most cases, students should have completed four or more courses toward their degree before seeking an internship, and proposals must be submitted in writing to program leadership at least 60 days before the start of the target term. Proposals are evaluated on a competitive basis. Only a limited number will be approved, and priority will be given to students who have completed the most degree-level courses and who submit proposals that demonstrate the best internship experience. Internships may be paid or unpaid. Because students receive academic course credit for internships, they pay tuition levels equal to one graduate course.

AS.490.806. Thesis And Publication. 3 Credits.
This final course is required for all degree candidates in fiction or nonfiction and is offered only in the fall and spring terms. The two course goals are the completion of a successful thesis and an enriching, challenging capstone experience for the entire program. The creative writing thesis will contain portions of a novel or a nonfiction book, and/or a collection of short stories, essays, or articles. We recommend that students select their best work and the work they most want to work on revising during the thesis semester; not all program writing will become part of a thesis. Students taking this course are required to submit a full thesis draft early in the course; the author spends the term working one-on-one with a thesis advisor to revise this draft. In addition, thesis students meet as a class. During classes, students engage in forward-looking discussions on the writing life, participate in a program-capping roundtable discussion, and rehearse and conduct a public reading. Prerequisite: All other required and elective courses. Students may take a second course during their thesis term with the program director's permission; such a course must be in addition to program requirements.

AS.490.888. Thesis Continuation.
This course is for students who completed 490.801 Thesis & Publication or 490.802 Thesis and Careers in Science Writing but failed to finish an approved thesis and were not approved for an Incomplete. If both conditions are met, students must register for this course and pay its accompanying fee for every term (including Summer) until a final thesis is approved.

AS.491 (Science Writing)

AS.491.658. Techniques of Science and Medical Writing. 4 Credits.
This core course develops and hones the reporting, creative and explanatory skills demonstrated by the best science-medical writers. The course features writing assignments and exercises in journalistic and literary writing, plus interviewing, ethics and the use of scientific journals and databases. In some cases, students may be able to choose from a range of writing topics, including nature, technology, health, space, biology, medicine, or other scientific issues. Science Writing students should complete this course before enrolling in any writing workshop. Departmental approval and a writing sample required for students not enrolled in the Science Writing Program.

AS.491.673. Science and Medical Writing Workshop. 4 Credits.
In a writing workshop, students receive professional guidance in translating complex scientific, medical, or technological knowledge and research into graceful, lucid prose. Students submit individual essays or articles, or parts of a larger work in progress. Writing submissions are critiqued by peers as well as by the instructor, then revised. Students are encouraged but not required to take this course from different instructors. (The three section numbers designate the academic term in which the workshop is offered. Students earn workshop credit by taking any section number multiple times, or by combining any sections.) Prerequisite: 491.658

AS.491.674. Science-Medical Writing Workshop. 4 Credits.
In a writing workshop, students receive professional guidance in translating complex scientific, medical, or technological knowledge and research into graceful, lucid prose. Students submit individual essays or articles, or parts of a larger work in progress. Writing submissions are critiqued by peers as well as by the instructor, then revised. Students are encouraged but not required to take this course from different instructors. (The three section numbers designate the academic term in which the workshop is offered. Students earn workshop credit by taking any section number multiple times, or by combining any sections.) Prerequisite: 491.658

AS.491.675. Science-Medical Writing Workshop. 4 Credits.
In a writing workshop, students receive professional guidance in translating complex scientific, medical, or technological knowledge and research into graceful, lucid prose. Students submit individual essays or articles, or parts of a larger work in progress. Writing submissions are critiqued by peers as well as by the instructor, then revised. Students are encouraged but not required to take this course from different instructors. (The three section numbers designate the academic term in which the workshop is offered. Students earn workshop credit by taking any section number multiple times or by combining any sections.) Prerequisite: 491.658

AS.491.680. Writing the Tech Story Workshop. 4 Credits.
This workshop course explores the reporting and writing techniques used to produce compelling stories about technology, its inventors, and its consumers. Students first analyze outstanding examples of technology writing on a range of subjects, forms, and styles, from hard news to creative nonfiction. They then submit their own writing about technology for standard workshop discussion. Special topics include making technology interesting to the non-geek and avoiding a tendency to sound promotional about consumer goods. Guest speakers who specialize in technology writing will discuss how to attract readers and find work in the field. This course counts as a workshop for degree or certificate requirements. Prerequisite 491.658

AS.491.691. Science Policy, Funding and Politics. 4 Credits.
This Residency course, intended to be onsite in Washington, D.C., explores how science, medicine and technology are affected by politics and practices within government, the private sector and within the fields themselves. Students or program alumni use the evolution of science policy as context for discussion, research, and writing about contemporary issues. Students meet with leaders from Capitol Hill, the White House, and federal agencies, and they visit important sites relevant to science policy.

AS.491.696. The Nature of Nature. 4 Credits.
This reading course focuses on the species and phenomena that make up "nature" (the outdoors, ecosystems) and human interaction with nature. Students analyze books, essays, and articles from writers who tell stories ranging from the gripping outdoor adventure to the reflective yet penetrating personal essay. Students will also engage in immersive nature writing exercises. For this course, you will be taking a step into the wild. Nature writing is considered a subset of science writing. Readings may include authors such as David Quammen, John McPhee, Elizabeth Kolbert, Gretel Ehrlich, Camille T. Dungy, Helen Macdonald, Kathryn Schulz, Latria Graham, Robin Wall Kimmerer, and Bonnie Tsui.

AS.491.697. The Literature of Science. 4 Credits.
In this reading elective, students analyze current and classic books, magazine articles, and newspaper series to discover how the best science, medical, nature, and environmental writers create compelling, entertaining, factual literature. Craft topics include structure, pace, sources, content, explanatory writing, and clear, lyrical language. Assignments may include brief reviews and a team presentation of an assigned book, from such writers as Erik Larson, Atul Gawande, Rachel Carson, John McPhee, James Gleick, Lewis Thomas, Elizabeth Kolbert, or Jonathan Weiner.

AS.491.700. Subatomic Writing. 4 Credits.
This elective examines writing on the particle level: sound, syntax, punctuation, rhythm, and pacing. Together, these elements can generate meaningful, understandable, and nuanced content. How does sound echo sense? How does the spin of syntax affect the flavor of the sentence? How does pacing affect the joke? Writers who know the laws of language can navigate them with flexibility or break them with aplomb and purpose. Momentum and energy at these basic levels keep readers engaged and make editors and agents sit up with interest. This elective with workshop elements asks students to bring their favorite sentences from literature and analyze why they work at the most fundamental levels. Class discussions on VoiceThread or other online tools allow students to interact with sound and old-school sentence diagrams. Students will then create science writing projects crafted at the quantum level without losing sight of global goals and overall quality. Science writers who feel like weak bosons when it comes to voice, style, grammar, and punctuation will particularly benefit from this course.

AS.491.701. Communicating Climate Change. 4 Credits.
This elective course will examine the unique challenge of effectively engaging the public on climate change, the most serious environmental issue of our time. A highly politicized and polarizing topic, climate change is often called a wicked problem. It is scientifically complex and while global in nature, the effects of climate change are felt locally, with the most serious impacts disproportionately affecting those least responsible for the problem. What's more, the worst impacts of climate change will occur sometime in the future, but minimizing those impacts will require large-scale and widespread changes to current society.</p><p>Students taking this course will compare a range of material representing contemporary climate change communication from books and magazine/newspaper articles to literary journal essays to gain an understanding of how science writers engage, inform and inspire the public. Students will also evaluate social science research that attempts to explain and overcome the challenge of engaging a public that can be in denial, disengaged, disheartened and frustrated. Students will practice effective journalistic methods for gathering information and will experiment with pitching ideas and translating those ideas into articles. They will demonstrate their own strategies for assuring accuracy and for gauging the credibility of their sources. </p><p>The course includes a lot of assigned reading as well as writing and writing-prep exercises, and extensive class discussion on Blackboard. This is not a course on the history of climate science, and nor is it a comprehensive survey of the field of climate science. The overall purpose of this course is to produce writers who can generate exceptional articles and essays about climate change. Course activities will help students publish their writing about climate in newspapers, magazines, podcasts, broadcasts, and other venues for the lay public. </p>

AS.491.702. The Funny Side of Science. 4 Credits.
Students learn techniques of humor writing and how to include humor effectively in science writing. Aided by funny weekly readings, hilarious multimedia examples, and completely serious class discussions (on VoiceThread, Blackboard, or other modalities), students analyze their favorite comedic sentences and scenes, discover their own style of humor, and practice applying the 11 Funny Filters of Scott Dikkers—a founding editor of The Onion—to science writing. Students complete two projects: a collection of their best one-liners (a foundational skill in comedy writing) and either a funny made-for-web science video (based on a workshopped script) or a funny science essay/article. Possessing a funny bone is not a prerequisite for this course, but PLEASE NOTE—we will be following the Seinfeld Strategy, where students will be expected to write for 20 minutes every day. This is a highly entertaining course, but be prepared to work! As John Cleese said, those who laugh most, learn best

AS.491.703. The Online Science Magazine. 4 Credits.
Students learn the magazine editorial and production process through the creation of a special issue of The Science Writer, the Science Writing Program's online publication. Working with the instructor and an editorial team comprised of JHU Science Writing alumni, students participate in every aspect of a modern editorial process, including choosing a theme for the issue, pitching articles or multimedia pieces, creating content, revising work based on the editors' feedback, and working with copy editors, fact-checkers, and web designers. Each student in the class is expected to publish at least one article in The Science Writer. Class guests will include editors and publishers of online magazines. No tech or design skills are required.

AS.491.707. Prizewinners: The Best Writing about Science, Technology, Environment & Health. 4 Credits.
Whether they have received a National Magazine Award, a Pulitzer, a Peabody award for electronic media, or other honors, the work in this course offers lessons in reporting and writing for any science writer. Readings may include articles, essays, or books. Included will be guest sessions with prize-winning authors, by video or tape, to discuss how they created their winning work. Readings and guests for each section of this course will be announced, but they might include Pulitzer-winners Diana Sugg, Siddhartha Mukherjee or Natalie Angier, Peabody winner Christopher Joyce, or National Book Award finalist Lauren Redniss. Students join in team or individual presentations, with several options for a final writing assignment.

AS.491.708. Medicine in Action. 4 Credits.
This special Residency course based at world-renowned Johns Hopkins Hospital in Baltimore allows students, program alumni, and others to experience the front lines of medicine. Participants spend time observing doctors and nurses in action and may be assigned to follow a practitioner during a shift at the hospital. The course includes meetings with doctors, nurses, and patients, plus a final writing exercise. Previous sections of this course included meetings with winners of the Nobel Prize and Pulitzer Prize.

AS.491.709. Science in Action. 4 Credits.
This Residency course takes students to the front lines of scientific research, with a focus on reporting skills, story idea development, and the craft of explanatory writing. Science in Action explores fields beyond medicine and health, including space, environment, energy, climate change, and other topics. The course involves field trips and lab visits, plus video and other links with visiting or out-of-town scientists. This Residency course is held in Washington, Baltimore, or other locations, as announced.

AS.491.710. In the Field: Science Writing in the Woods, Coasts, & Labs of Mt. Desert Island. 4 Credits.
Maine's Mount Desert Island, home to Bar Harbor and Acadia National Park, is a place of exquisite natural beauty. With thriving environmental science centers and a world-class genetics laboratory, the island is also a hub of cutting-edge research. This Residency course allows participants to immerse themselves in the region's stimulating natural and intellectual environments while honing their reporting skills, refining their writing artistry, and gathering information for stories. The course will include field excursions, group discussions, and independent writing/reporting time

AS.491.711. Public Health in Action. 4 Credits.
<p>This residency course is a fast-moving journey into the world of public health. Over 7 to 10 days, students will come face-to-face with public health practitioners and researchers working on the world's most pressing health issues, as well as with journalists who cover the critical work they do. Topics will include everything from how to explain confusing concepts such as prevalence vs. incidence and the uncertainty of disease modeling, to how to avoid sensationalizing or downplaying a public health issue, and tell accurate and complete stories that present diverse perspectives. This course will examine a specific timely public health issue as a case study for learning how to report and write about public health. </p><p>In presentations and meetings, public health researchers, practitioners, and advocates will discuss their work; and the instructor and guest journalists will describe the challenges of explaining public health and the tools and techniques they have used in writing articles, essays, or books in this field. Students will develop their own story ideas on public health, receive coaching on publishing their writing, and may have the opportunity to contribute writing to a class-produced news website or other group project. Most of the course's work will take place during a residency or virtual residency, an intensive week to 10 days of real-time activities (delivered through Zoom, Blackboard, or in person when feasible). Some additional coursework will occur through an online learning platform before and after the residency period, and students will complete extensive readings. </p>

AS.491.748. Principles of Editing. 4 Credits.
In this writing- and editing-intensive course, you will learn the art and craft of editing science-focused nonfiction stories. Writing exercises and editing projects are designed to mimic what it's like at a real publication, and you will learn to think like an editor as you work through each step in the process of making concise and compelling nonfiction articles—from idea development and draft review to primary editing, copyediting, and proofreading. You will face the myriad decisions editors must consider at every stage—audience, deadlines, grammar, style, delivery method, publication size, website optimization—as you craft your own nonfiction story while editing the work of your colleagues. The course includes insights from guest editors as well as illustrative case studies. This course will benefit any writer hoping to pursue an editing career or wanting to sharpen self-editing skills.

AS.491.750. Contemporary Science and Medical Writing: Creative and Professional Forms. 4 Credits.
This core course provides a broad foundation in the diverse forms and venues encountered in contemporary science writing careers. Students learn elements of classic forms, such as essay, profile, news article, and op-ed, and they explore magazines, institutional publications, literary journals, blogs, speeches, and even museum exhibit text. The course covers the differing goals of various forms and how they might be used in multimedia, social networks, and other digital communication. Guest speakers present real-world expertise, with students engaged in discussion, exercises, and writing assignments. Science writing students needing a stronger foundation should complete this course before enrolling in any writing workshop.

AS.491.751. Marine Science & Science Writing on the Emerald Isle. 4 Credits.
This Dublin-based residency course, with accompanying Blackboard site, will explore the confluence of sea, science, and writing. During the week-long onsite portion of the course, students will take field trips to labs and sites along Dublin Bay, meet with marine scientists, read and discuss Irish literary works inspired by the sea, and take part in "plein air" creative writing exercises, among other activities. Talks with science journalists and ocean conservation leaders will probe some of the major threats to Ireland's – and the world's – oceans, and the challenges for writers who cover those issues.

AS.491.752. Advanced Reporting & Writing in Science. 4 Credits.
This course builds on foundation skills in reporting and writing about science, medicine, or technology by expanding into advanced techniques of research, documents, computer analysis, extended interviews, and other tools. The course also expands knowledge of longer or more sophisticated forms, such as magazine essays, narrative nonfiction, and investigative reporting. Students engage in reporting and writing exercises, which may be discussed in group workshops. With adviser permission, this course may be counted as a workshop. Prerequisite: 491.658 or adviser permission.

AS.491.754. Science Narratives Workshop. 4 Credits.
Students in this specialized workshop explore and write science narratives, an approach that joins scientific information and storytelling. Students read and discuss examples by authors such as Rebecca Skloot, Ferris Jabr, and Lee Gutkind, as well as write their own narratives. This course provides a workshop credit for science writers. Prerequisite: 491.658

AS.491.755. Science Personal Essay and Memoir Workshop. 4 Credits.
In this specialized workshop, students experiment with memoir and the personal essay as distinct forms and as an exploration of the self. Seminal essays are read to clarify students' thoughts and to help them develop their own voice and style in personal science writing. The topics of health, technology, environment, and other realms of science or medicine will be paramount, whether in reported content or within the personal experience, feelings or ideas of the writer. This course provides a workshop credit for science writers. Prerequisite: 491.658

AS.491.757. Science Profiles Workshop: Writing About People. 4 Credits.
This workshop focuses on writing about people involved in science, medicine, technology, or policy. Students analyze models of the form, then report and write profiles of various lengths and purpose, from mini-profiles to quick features to longer, in-depth works. The course includes guest speakers who specialize in the research, interviews, and writing needed for effective, readable biographical works. This course provides a workshop credit for science writers. Prerequisite: 491.658.

AS.491.785. In the Wild: Science Writers Explore Montana's Wilderness and Wildlife Biology. 4 Credits.

<p> With its snow-capped mountains, icy trout-filled streams, glaciers, bison, and grizzly bears, Montana is a land of rugged natural beauty. It is also home to a unique set of environmental concerns. Those glaciers are melting. Invasive species threaten native habitats. The range and population of the grizzly are hotly debated. Climate change appears to be increasing the size and intensity of wildfires. </p><p> Students in this residency course will meet with scientists -- wildlife biologists, ecologists, and wildfire management experts -- who use Montana's lakes, mountains, forests, and animals as their laboratories to explore such issues. The class will take field trips to sites of active research, with possible excursions to a world-class ecology research station on a 30-mile-long lake; a fire science lab where scientists model fire behavior and develop tools for wildfire management; and the Clark and Blackfoot Rivers, site of a Superfund success story and the inspiration for Norman Maclean's A River Runs Through It. </p><p> During the onsite portion of the course, students will practice reporting skills and gather story ideas, engage in craft discussions and creative writing exercises, and be invited to take part in an open mic. Discussions will explore how writers can explain complex, nuanced environmental issues to broad groups of readers, and how writers can evoke the region's lyricism in their prose. For inspiration, the class will study works by the many literary greats (Maclean, David Quammen, Rick Bass) who have used Big Sky country as their muse. </p><p> The class will be based at the University of Montana in Missoula, noted for its beautiful campus and as the nation's premier institution for the study of wildlife biology. </p>

AS.491.787. In the Field: Writing about How Science Can Save Our Wild Lands. 4 Credits.

This course will examine the issues and inspiration to be found in national lands across the United States. Most of the course's work will take place during a residency or virtual residency, an intensive week to 10 days of real-time activities (delivered through Zoom, Blackboard, or in person when feasible). In presentations and meetings, scientists will discuss their latest field research; park personnel will explain the biggest environmental issues facing national lands; magazine writers and editors will relate how they are covering environmental challenges and successes using different media; and members of underrepresented groups will talk about their role in these vital landscapes. Issues for examination may include the extraction of resources, effects of climate change, and loss of biodiversity on national lands. Instructors will present lectures and discussions on the tools and techniques of writing nature/science/national lands-related articles, essays, and books, and students will have group and individual time to pursue their own writing, culminating in a student reading. Additional coursework will take place on Blackboard before and after the residency period.

AS.491.802. Thesis and Careers in Science Writing. 4 Credits.

This final degree program course involves the creation of a thesis and a final capstone experience that prepares a student for a writing career. Students usually enroll in this course after completing all other cores, workshops, and electives. Thesis: Each student's thesis is created from work in earlier courses. Students revise and refine an individual portfolio that includes creative writing, journalism, multimedia and communication writing. The first draft of a thesis is due in the second week of the thesis term; students spend the term revising that work under the direction of a one-on-one thesis advisor. Capstone: The group experience of the course requires each participant to develop a career plan that includes personal goals such as publication, job applications, or career advancement. Other capstone experiences may include attending science writing events or seminars, publication of a course magazine or journal, and discussions of the changing business of writing. The Science Writing Program also may propose an optional mini-residency for thesis students that includes commencement and other onsite experiences at Johns Hopkins in Baltimore and Washington. Note: All thesis students should submit a Science Writing Thesis Planning Form at least one month before the course begins. See the Science Writing Program website for more information.

AS.491.807. Independent Study in Science Writing. 4 Credits.

An independent study is reserved for science writing students who have special interests not covered in the program's curriculum. Most independent studies involve a student working one-on-one with a faculty member or other writer or editor. Students should submit an Independent Study proposal at least 60 days before the start of any term. The proposal must include work equivalent to a full-semester, graduate-level course; interested students should consult their advisor well in advance. Only students who have completed four courses or more are eligible to propose an independent study, and only a limited number are approved each year. The tuition for an independent study is the regular, single-course rate for the term in question. With advisor approval, this course counts as an elective or workshop. For more information, see the Science Writing Program website.

AS.491.808. Internship in Science Writing. 4 Credits.

Internships are available to select students with advisor approval. Students should submit an internship proposal well in advance. With the advisor's help, students may develop their own internship where they live, or they may apply for existing internships at publications, companies, agencies or elsewhere. Internships usually are reserved for students who have completed four courses or more. In most cases, an internship counts as an elective.

AS.491.888. Thesis Continuation.

This course is for students who completed 491.802 Thesis and Careers in Science Writing but failed to finish an approved thesis and were not approved for an incomplete. If both conditions are met, students must register for this course and pay its accompanying fee for every term (including summer) until a final thesis is approved.

AS.492 (Teaching Writing)

AS.492.601. Fundamentals of Writing for Graduate Students. 4 Credits.
This intensive writing course offers students a foundation in essay composition and provides an in-depth review of sentence structure, grammar, and punctuation. Designed for those students who need to improve their written communication skills, the curriculum in Writing Basics examines the various techniques writers use to compose their sentences, to establish syntactic relationships within paragraphs, to draft thesis and transitional sentences, and to relate syntactic structure to ideas. Students will master a basic format for the expository or argumentative essay that will include strategies for finding and drafting a thesis, for shaping a proof of that thesis, and for drawing conclusions that demonstrate synthetic, independent thinking. Working through multiple drafts of their essays, students will develop strategies for revision that will focus on both syntax and structure. Note: AS.492.601, Fundamentals of Writing for Graduate Students has been designed for students in all AAP Programs who seek additional help to strengthen their writing skills. The course is not intended for students in the Teaching Writing Program, and Teaching Writing students should not sign up for it.

AS.492.612. Teaching Writing. 4 Credits.
This core course is designed for teachers in all disciplines and at all grade levels who use writing in their teaching and who have an interest in exploring their own writing as well. Someone not currently in a classroom can also complete the course successfully. The course has three main goals: 1. To help participants add to their existing knowledge of teaching writing, focusing particularly on writing as process and the various methods and practices that focus on each individual stage of that process (prewriting, drafting, responding, revising, editing and publishing). 2. To encourage participants to reflect upon their current practices in teaching writing, helping them clarify for themselves their goals and methods in teaching writing, and to provide additional ideas and possibilities that might add to their existing “tool box”. 3. To allow participants to engage in their own writing and writing process, in order to experience both roles of writer and writing teacher, and to see how one’s own writing experiences can enhance one’s knowledge as a teacher of writing. In addition, participants will consider the relationship of reading and writing, will become familiar with leading theories and theorists on the teaching of writing, will share their ideas, their knowledge, and their experiences, and will be encouraged to adapt their learning to make it most useful to their individual teaching situations (grade level, discipline, student population, etc.).

AS.492.630. The Power of Story: Teaching and Writing Narrative. 4 Credits.
This course is designed for participants who wish to teach and write fictional, factual, and poetic narrative. The course covers elements of narrative, including plot, character, setting, tone, pacing, dialogue, and theme, plus the terms writers use to discuss and analyze narrative. Program participants learn how to introduce this language in their classrooms and to engage their own students in discussion about assigned reading and writing. Participants in this course write original narratives from prompts and discuss those writings in a workshop environment. Participants may also read narrative poems, short stories, one or more novels or novel excerpts, and one or more nonfiction narratives, with an eye toward how reading can inform and enrich the writing experience, as well as reading articles on teaching process and theory – including recent brain research concerning the value of narrative. This course also helps teachers understand the differences between factual and nonfactual writing, and how they can be separated or combined.

AS.492.632. Teaching Creative Writing. 4 Credits.
This course is designed for participants who wish to write and/or teach fiction, poetry and creative nonfiction. The course covers elements of writing in each genre, as well as the creative process and the similarities and differences between creative and other forms of writing. The course will also include readings in creative writing and lessons on how to use literature in a creative writing class. With the goal of integrating their writing and knowledge into their own classrooms, participants produce their own original creative writing and discuss it in a workshop environment. This course also may cover elements of playwriting and screenwriting.

AS.492.635. Teaching and Writing Nonfiction. 4 Credits.
This course explores various forms of nonfiction via reading and writing, including personal essays, speeches, opinion pieces, essays about art or literature, biographies, memoirs, journalism, and historical, scientific, or technical accounts written for a broad audience. Students will read nonfiction works as writers and teachers, and will practice various strategies for in-depth research (including deeper evaluation of online sources.) A primary course focus includes the selection and exploration of mentor texts for various reading levels, and nonfiction treatments of various topics, including history. Students will hone their own nonfiction writing skills to enhance clarity, precision, and grace in their work, and will learn teaching methods to encourage students' clear and coherent writing, organization and style. Course also emphasizes classroom community, interactivity, and personal engagement with instructor and classmates.

AS.492.640. Teaching Argument. 4 Credits.
This course is designed for teachers in all disciplines and at all grade levels that currently teach or plan to teach argument writing. Its focus will be in four main areas: 1) Understanding Argument. Participants will be asked to read and reflect on current theory and methods of argument and will be asked to define “what does good argument writing look like” as it applies to their specific classroom and context. 2) Structure and Content of Argument. Participants will be asked to explore, reflect, and duplicate various forms of argument typically seen in classroom settings such as extended research, on-demand writing, self-selected topics, etc. Furthermore, participants will be asked to explore unconventional forms of argument and their value and impact on writing. 3) Assessment. Participants will be required to investigate and reflect on current trends in assessment within the classroom setting to include peer review, self-evaluation, reflection, holistic vs. analytic rubrics, etc. Participants will also explore and evaluate the impact that assessment has on the writer and their writing specifically addressing standardized test assessment. 4) Resources. Participants will be asked to investigate, evaluate, create and share resources on the teaching of argument. In addition, participants will be required to participate in group discussions, activities, and reflections.

AS.492.650. Reading Like a Writer. 4 Credits.
Participants in this class will develop the skills needed to engage in the close reading of fiction, non-fiction, non-peer-reviewed science and medical writing, and poetry in order to apply what they glean from close reading to their own writing. They will also consider how they can apply the techniques of close reading to the teaching of writing in their specific subjects and grade levels. Through the exercises and assignments in "Reading Like a Writer," participants will examine the various techniques writers use to compose their sentences, to establish syntactic relationships within paragraphs, to suit writing style to topic and purpose, and to relate syntactic structure and design to thinking and to the ideas specific writing projects intend to communicate. Through learning to "Read Like a Writer," participants will develop strategies for improving their own writing.

AS.492.651. Special Topics in Reading: Multicultural Texts. 4 Credits.
This reading course in the Teaching Writing Program covers fiction, nonfiction, and poetry written from a multicultural perspective. Texts are selected from a variety of genres aimed at various grade levels, and might include books such as Sherman Alexie’s The Absolutely True Diary of a Part-time Indian, James Baldwin’s The Fire Next Time, and Unsettling America: An Anthology of Contemporary Multicultural Poetry. Texts will be examined as models for writing and as works of current or classic literature. Course participants also present multicultural texts appropriate to the grade levels they teach.

AS.492.652. Writing in Literature. 4 Credits.
Writing is a natural tool for responding to, noticing, and noting the conventions of powerful literature. This course is designed to give instructors of literature writing tools to assist students in finding and expressing their own response to literature in lieu of lecturing on a single ‘read’ of a piece. Participants in the course will experience a number of protocols for responding to literature including literature workshops—which mimic the intellectual moves of an alert reader—response logs, questioning logs, Harkness discussions, and routine rehearsal of writerly moves in a low-risk environment. During the course, participants can expect to create and analyze in both poetry and prose and read and respond to literature. The course ends with an analytical paper mimicking an academic community of peers.

AS.492.660. Writing for Young Readers. 4 Credits.
This course focuses on reading and writing stories and books for children and young adults. Readings include poetry, fiction, and nonfiction. Participants read published writing geared toward young readers with an eye toward understanding techniques and approaches to writing for this particular audience. They also write their own works designed for young readers. The course goals are threefold: to focus on teaching students to read children’s and young adult literature; teaching students to write children’s and young adult literature; and teaching the teacher participants to write children’s and young adult literature.

AS.492.661. Teaching Composition in College and Community College. 4 Credits.
This course is for students who currently teach or wish to teach first-year composition in college or community college. Students design a first-year composition course and study many of the major components that might go into a first-year composition course, including major and low-risk writing assignments, assessments, and effective ways to use reading, discussions, revision, peer response and other practices.

AS.492.662. Teaching Reluctant Writers. 4 Credits.
All educators will encounter students who struggle with writing. This course first focuses on the reasons student writers may be reluctant and then provides participants with a variety of methods to increase student participation and success in writing. Participants will learn about low-stakes writing, classroom relationships, the writing workshop methodology, and scaffolding for special education, English Language Learners (ELLs), and those who have developed an aversion to writing. Participants will be required to investigate methods by doing them and will develop a metacognitive stance by reflecting on articles and strategies. All participants will be required to work in writing workshop, including being a writer and responder in a peer revision group. The instructor will help students to differentiate for subject area and grade level and will provide a framework for developing a writing classroom that works for our most reluctant writers.

AS.492.663. Writing Across the Curriculum. 4 Credits.
In careers and classrooms, professionals and students use writing to communicate information, clarify thinking, and learn new concepts. Writing Across the Curriculum generally extends to two categories: Writing to Learn and Writing in the Disciplines. The first half of the course will focus on Writing to Learn, which is comprised of short, low stakes, expressive activities designed to help students think through a process, connect with a text, and personalize information. These lessons include learning logs, interactive notes, group writing, metaphors, found poems, and difficulty papers. The second half of the course will be dedicated to Writing in the Disciplines. These assignments are created to give students practice with the language conventions, patterns of thinking, and formats of specific disciplines. These sort of activities include proposals, presentations, articles, literature review, lab and field reports, and position papers. Participants in this course will experience Writing to Learn and Writing in the Disciplines firsthand. They will be able to experiment with both types of writing in their classroom contexts regardless of grade level or subject matter. This course is collaborative with teacher to participant commentary and peer feedback and review.

AS.492.665. Teaching Writing to English Language Learner Students. 4 Credits.
Teaching writing to English language learning (ELL) students can be daunting when students have significant needs in listening, speaking, and reading. But even students with limited proficiency can write, and the time spent learning writing yields results in the other language skills. In this course (designed to have value for both ESOL teachers and regular classroom teachers with some ELL students), we'll discuss strategies for pre-writing, drafting, and revision. These strategies can be adapted to students' levels of English proficiency, levels of writing ability in students' home languages, and students' ages (young children through adults). We'll discuss how to foster writing confidence through drawing on students' backgrounds and building students' overarching understanding of genre, as well as when and how to address accuracy in vocabulary, grammar, and mechanics. We'll focus on developing a classroom writing community—whether it is a self-contained ELL classroom, a typical classroom with embedded support for ELL students, or another learning setting-that encourages ELL students to take the risks that enable them to grow as writers and users of English.

AS.492.667. Peer Response and Writing Centers: Theories and Practice. 4 Credits.
This course is designed to help teachers develop and implement meaningful peer writing response in their classrooms as well as to introduce them to theories, pedagogies, and practices of peer-led writing centers. Beginning with an overview of the foundational scholarship on peer response and writing center theory, participants will collaborate in ongoing peer writing groups in which they will practice a variety of response strategies on their own and each other's writing. The second half of the course will introduce participants to key principles and various models of writing centers in secondary and postsecondary settings. Drawing on course readings and activities, students will propose, develop, and present a course curriculum centered around peer response methods or a writing center development plan pertinent to their teaching contexts.

AS.492.668. Teaching Writing Online. 4 Credits.
In this course we will explore the ways that writing can be taught online, while discovering what it means to use digital and networked tools to write and to learn. Whether you have been successfully teaching writing in face-to-face workshops and want to bring your curriculum and best practices online and/or you are curious to explore how online forums and tools can be used to support face-to-face teaching and workshop, this course is design to support that work. Participants will be encouraged to play with the ways that they teach and write in and across online networked spaces while learning from the teaching designs and practices of experienced networked educators and teachers of writing. We will explore the intersections of compositional theory, pedagogical practice in writing, and theories of connected learning and teaching while using both public and private writing spaces. All participants will be encouraged to provide peer feedback as learners and teachers throughout, to engage in social forums to explore what's possible in writing and teaching today, and to design a project they can take forward in their teaching and writing beyond this course.

AS.492.669. Digital Writing and Multimodal Composing. 4 Credits.
In this course we will explore the ways that writing shifts and changes over time, influenced by new tools and technologies as well as its purpose, audience and context. We will dive deep into what it means to write today, using digital tools and technologies as well as explore multimodal composition inspired by many mentor texts that we find in the world around us. We will explore the ways that digital writing and multimodal composing can support teaching that is culturally responsive and relevant for a diversity of learners. And we will write and compose together while curating compositions that inspire us and push our writing forward. Whether you are teaching digitally or hybrid, writing in formal school environments or running a community workshop, this course will be designed to support you in considering the ways you might support digital writing and multimodal composition. All participants will be expected to compose and share their compositions, provide peer feedback as co-learners and co-teachers throughout, to engage in social forums to explore what's possible in writing and teaching today, and to design a project they can take forward beyond this course.

AS.492.682. Neuroscience, Creativity, and Writing. 4 Credits.
This course explores the latest research and practice in the effect of writing on the brain, and of the brain on writing. Students will read both theoretical texts and creative works that examine writing "under the influence" of various brain states, including typical variations throughout the writing life, as wells as variations correlated to physical and psychological brain changes. Virtual guest speakers, case studies, and multimedia experiences provide students access to cutting edge expertise in this fast-growing field. Students complete exercises and semester-long writing projects to develop methods to promote creativity and tap into deeper areas of the brain to aid their own writing and that of their students.

AS.492.690. Residency: Best Practices in the Teaching of Writing. 4 Credits.
This 7-10-day residency, held each summer in Baltimore, MD, Washington, DC or other locations, will include readings, roundtables, field trips and other residency events. Teaching Writing students will meet for four to six hours each day in a face-to-face, classroom environment. Students will design and present a mini-lesson involving writing that they have used, or wish to use, in their own classrooms. Students will engage in discussions of theory and best practices in the teaching of writing, and will also participate in a writing workshop focusing on their own writing. One residency is required for M.A. candidates and is optional for those seeking the certificate.

AS.492.700. Thesis in Teaching Writing. 4 Credits.
In this final capstone course, students work on defining and expressing their own theories and best practices in teaching writing, while at the same time developing and refining their own writing. Students create and revise an individual portfolio that includes creative or personal writing along with writing about issues, theories and practices in the teaching of writing. Thesis students also create and research a statement of inquiry related to their specific teaching interests and situation. Students refine all these writings during this course, working with other students and independently with the instructor and/or individual project advisors. All eight prior courses must be completed before a student may enroll in Thesis.

AS.492.800. Independent Study in Teaching Writing. 4 Credits.
An independent study involves a special project a student proposes to complete within a single semester, working one-on-one with a faculty member. The project must involve writing and teaching writing, and it must not duplicate material covered in existing courses. Proposals for an independent study should be submitted in writing to program leadership no later than 60 days before the start of the target semester.

AS.492.888. Thesis Continuation.

AS.492 (Non-Departmental)

AS.990.951. SAB/JHU CASA Brazil Program.
Placeholder for full-time study abroad on the JHU CASA Brazil Program, Rio de Janeiro, Brazil. Permission required.

AS.990.952. SAB/JHU St. Andrews Program.
Placeholder for full-time study abroad on the JHU/St Andrews University Program, Scotland. Permission required.

AS.990 (-JHU Department)

EN.900.895. Graduate Study. 3 - 9 Credits.
Full-time equivalency.

EN.990.977. Research Practicum.

EN.990.978. JHU In Tours Program.

AS.999 (AAP)

AS.999.999. Graduate Internship Project.
Internship projects are available for students needing transcript documentation of an approved Advanced Academic Programs Internship. The Internship Project course is an audit only, no credit course offered during each semester. Advanced Academic Programs students must be enrolled in a degree program at least one semester (9 credits) before seeking an internship. Students should apply and register for the internship project course at least two weeks before the internship begins. (0 credit)

BU.001 (Graduate Business)

BU.001.450. Quantitative Basics.
Now more than ever, being successful in business means having a solid foundation of quantitative skills, leading to better understanding of data and ways of modeling behavior or business interactions. This course covers basic concepts in mathematics that are crucial for students studying business at the graduate level, including algebra, calculus, statistics and matrix algebra. It is not intended to develop a mastery of these subjects, but simply to familiarize students with or refresh these quantitative skills to prepare for success in Carey's business programs.

BU.001.510. Career and Life Design for Experienced Professionals.
Career and Life Design for Experienced Professionals provides you with an opportunity to learn and develop the necessary skills to engage in career and life design. From exploring opportunities to switch or advance within your career and strategically updating your resume, to interviewing and job search strategies, this mixed synchronous/asynchronous eight-week course will help you understand, tell, and live your career story.

BU.001.520. Professional Development for Career Success.
Professional Development for Career Success provides you with an opportunity to learn and develop the necessary skills to engage in career planning. From clarifying your values and interests, exploring opportunities, and learning about professional branding, to interviewing and job search strategies, this hands-on and exploratory eight-week course will help you understand, tell, and live your career story.

BU.001.700. Independent Graduate Project. 1 Credit.
An independent study provides an opportunity for students to study a particular topic of interest in depth. Students who demonstrated competency in a certain area may elect to pursue an independent study project under the supervision of a faculty sponsor with expertise in the selected area.

BU.003.893. Leadership Development Expedition. 2 Credits.
This course is a leadership-intensive seminar and expedition focused on helping students develop their own leadership capacity, while also emphasizing a conceptual understanding of leadership in diverse settings. The course utilizes the unique opportunity for leadership development embedded in outdoor experiential education, providing students the challenge of serving as a leader. The course combines a thorough academic introduction to leadership development and opportunity for self-assessment with repeated reflection and feedback to help students develop their own path as leaders.

This is a physically demanding course. Students should be in moderate physical condition. However, no technical outdoor skill or experience required.

Expedition destination, activities, physical demands, fees, and eligibility requirements vary.

BU.003.903. Global Immersion:Finance in Europe. 2 Credits.
This course is offered to Carey Business School students interested in learning more about European financial markets. The course takes place in Frankfurt, Germany, and London, England. It aims to develop in-depth knowledge of the European financial system through a partnership with the Frankfurt School of Finance and Management (FSFM). Both Carey Business school faculty and FSFM professors will provide classes on the history and current status of the financial system in Europe and compare those systems to the US financial landscape. Corporate and government organization visits will complement lectures and case studies.

BU.141.710. Effective Teaming. 2 Credits.
In today's businesses, teams are a basic organizational building block. Teaming is perennially listed as one of the top skills that recruiters look for in graduating MBAs. This course conveys knowledge and practical tools that help students become more productive team members and leaders. Topics include the characteristics of high performing teams, leadership strategies for creating performing teams, strategies for avoiding dysfunctional team dynamics, and best practices for managing diverse and virtual teams.

BU.142.720. Managing in a Diverse & Global World. 2 Credits.
Business organizations and other critical organizations operate in both a market and nonmarket environment. A major focus of the course is examining contextually global diversity, inclusion, and multicultural issues through the lens of multiple dimensions. Successful, globally minded managers align the firm's capabilities with the demands of both its market and nonmarket environment. This course examines political, regulatory and societal factors of influence. Students learn to analyze the motives for focused intervention to better judge when and how political developments may affect business or organization interest. It explores the rise of "private politics" (activists, civil society networks, and NGOs), which are increasingly complementing conventional "public politics." This new plurality also opens exciting new nonmarket strategic opportunities for profit and socially driven business, providing it with new potential allies. This course stresses collective moral agency and the ethical dimensions of business and management in such a global political economy. Students explore cross-cultural perspectives on economics and business culture, and how to analyze and proactively manage the nonmarket environment through integrated market and nonmarket strategies. Cumulatively through class interaction and team activities students develop strategies for managing aspects of global diversity and inclusion within the context of a real organization opportunity.

BU.150.710. Discovery to Market I. 2 Credits.
This course teaches the process of bringing scientific discoveries to market. Students learn about innovation and invention processes, how to identify opportunities and assess when ideas are inventions, the steps required to bring the product to market, including intellectual property protection and regulatory processes, and strategies to license early stage inventions to third parties for further development. Students work in small teams on early-stage invention projects that are patented or patent pending sourced by the instructor from university and government technology transfer offices. Students will analyze the feasibility of commercializing the invention so that it can be licensed to a third party that can pursue entrepreneurial funding and development.Students must complete at least one semester at Carey Business School prior to enrolling in this course.

BU.150.715. Discovery to Market II. 2 Credits.
This course is the second part of a two part course. This course teaches the process of bringing scientific discoveries to market. Students learn about innovation and invention processes, how to identify opportunities and assess when ideas are inventions, the steps required to bring the product to market, including intellectual property protection and regulatory processes, and strategies to license early stage inventions to third parties for further development. Students work in small teams on early-stage invention projects that are patented or patent pending sourced by the instructor from university and government technology transfer offices. Students will analyze the feasibility of commercializing the invention so that it can be licensed to a third party that can pursue entrepreneurial funding and development.Students must complete at least one semester at Carey Business School prior to enrolling in this course.
BU.150.710

BU.151.720. Corporate Strategy. 2 Credits.
This course is concerned with the formulation and analysis of corporate strategy. Corporate strategy asks the question, 'In what industries should a firm compete?' These are the objectives and policies that collectively determine how a business positions itself to increase its returns and create economic value for its owners and stakeholders. In this course, students learn analytical techniques for diagnosing the industrial landscape of a business, a firm's overall portfolio, and identifying and analyzing specific business options. These concepts and frameworks will help you to learn to put structure on complex and unstructured problems in corporate strategy to provide a solid foundation for managerial decision making.
BU.150.620 OR BU.920.607

BU.151.770. Power and Politics. 2 Credits.
The purpose of this course is to immerse you in issues and dynamics related to power and politics in organizations. We seek to make power and politics discussable, recognizable, and usable. In other words, this course is designed to fuel learning of concepts that are useful for understanding, analyzing, and harnessing power and political processes. But beyond discovering ways to extend your own power, influence, and political skill, we will also uncover lessons about ways in which power and politics can blind and deceive you, and how you might better navigate situations in which you are up against relatively more powerful people or forces. We will use a range of learning methods including theoretical and business articles, cases, exercises, assessments, and simulations. We will cover a variety of topics ranging from political skills, bases of power and influence, dangers of power, power and change, and leading with power.

BU.152.710. Entrepreneurial Ventures. 2 Credits.
This course focuses on the knowledge, skills, and attitudes that enable entrepreneurs to pursue opportunities in business development. Students form teams to experience each step of the entrepreneurial process. The end result is an opportunity assessment of a business idea. Emphasis is placed on a hands-on approach with learning supplemented by cases appropriate to each phase of the course. Students are exposed to real entrepreneurial operations and businesses, via final project and presentations.
Before registering, please note that this course is graded on a team-based term project involving field work. You should be prepared to spend 15 hours per week, in addition to the time for readings, quizzes and case studies. If you anticipate heavy travel, work or family commitments, please consider registering at a future semester.
(BU.210.620 OR BU.910.610 OR BU.920.602) AND (BU.410.620 OR BU.911.610 OR BU.920.605)

BU.152.735. Strategy Consulting Practicum. 2 Credits.
This virtual course pairs student teams with business clients to solve complex problems. Student teams will have the opportunity to choose from a diverse selection of business clients, ranging from large companies and organizations to smaller local start-ups. The course challenges students to ask, "How should this business compete?" and "What strategic, innovative, and inclusive responses make the most sense?" Students identify and navigate resources, adapt products and services to best reach consumers, and create business strategies to help these companies pivot, sustain, and thrive.

BU.152.740. CityLab Catalyst: Business Innovation for Social Impact. 2 Credits.
For the first time in history, humans are an urban species; the livability of cities now determines the future of humanity and the planet. CityLab is an urban innovation platform engaging students in a global experiment of reinventing cities by revitalizing urban neighborhoods from within. The CityLab Toolkit immerses you in the concrete context of people and places dealing with the disruptive uncertainty and frustration of livability challenges that threaten the environment, human health, social cohesion, civic order, and prosperity of cities. It introduces strategies, tools, and practices for tackling these challenges as opportunities to co-create value for the flourishing of humanity and the planet. This course is a hands-on, active learning experience requiring a high degree of individual commitment, initiative, self-discipline, adaptability, and collaboration. PREREQUISITES: This course is open to graduate students throughout the University who have completed at least four courses of their graduate program prior to enrolling.

BU.152.745. CityLab Practicum: Social Impact Project. 2 Credits.
The CityLab Practicum puts the CityLab Toolkit knowledge and skills to work on a social impact project sponsored by a neighborhood entrepreneur, business, or organization. The Practicum is an opportunity to solidify your skills, demonstrate your expertise, deepen your network, and position yourself as an innovative social impact leader. This course is a hands-on, active learning experience requiring a high degree of individual commitment, initiative, self-discipline, adaptability, and collaboration.
BU.152.740

BU.450.630. Designing Experiments. 2 Credits.
Did a new compensation scheme motivate employees to work harder or stay with the organization longer? Do larger subsidies for health insurance lead to improved employee health and productivity? Did a new website format increase user activity on the site? Did a charitable organization's program to train community leaders lead to positive changes in the community? Cause and effect questions like these are crucial to developing evidence-based practice in business, nonprofits and governments. Yet answering these questions is difficult when new ideas are not implemented with the explicit intent of measuring their impacts. In other words, developing evidence requires a scientific approach to business and policy.
</br>This class aims to teach students to develop empirical evidence about the best ways to achieve their aims, whether these aims are to increase profits or to address social problems. The use of randomized controlled trials to test program impacts is becoming increasingly popular in businesses and government. An employee estimated that the average Facebook user is a participant in about 10 randomized controlled trials at any point in time. The U.S. government recently created a "Nudge Squad" that works with federal agencies to test new ideas through randomized controlled field trials. Experiments are an integral part of the 'big data' revolution going on in business, nonprofits and government. Importantly, they do not require advanced statistics or powerful computers to implement and interpret.
</br>The course will blend lectures, group discussions, readings, homework, a group project, and guest speakers from private industry, nonprofits and government agencies. I am a firm believer that the most fundamental principles can be stated in plain English. Thus the course stresses intuition (in English) over math and mechanics. Nevertheless, there will be math and mechanics in the course.
BU.510.601 OR BU.914.610

BU.510.001. Statistical Analysis Waiver Exam.
This exam affords students the opportunity to confirm proficiency in Statistical Analysis. Students who successfully complete the waiver exam will be granted a waiver with replacement for BU.510.601. Please note: Waiver exams may only be taken once per student, in the first or second semester of registration in a new program. The exam will be completed online in Blackboard within the timeframe stipulated listed within this course description. Students will be required to use Remote Proctor for the actual completion of the exam.

BU.520.701. Enterprise Risk Management Frameworks. 2 Credits.
This course provides an introduction to the formal principles and practices of modern COSO- and ISO-style enterprise risk management (ERM). The course provides a framework that integrates the core, foundational, and elective courses in the school's Enterprise Risk Management Curriculum. A combination of didactic lectures, group conversation, and student presentations will be used to impart the material and bring it alive.

BU.520.710. Big Data Machine Learning. 2 Credits.
This course provides students with a firm understanding of the mathematical and statistical theories that underlie the foundations of big data and machine learning. Students will be engaged in solving real-world problems by directly applying their data science skills through the implementation of code and rigorous analysis of financial data sets. In particular, this course will highlighted some of the challenges and limitations of applying such machine learning algorithms. Focus will be on understanding the subtle differences in each technique. This course will be hands-on with weekly homework assignments and a final presentation geared towards fully immersing students in the data science process. Students will program in Python (e.g. Pandas, NumPy, Scikit-Learn, Matplotlib, pattern, NLTK, etc). Topics that will be covered include: Principle Components Analysis, Multinomial Logistic Regression, Naïve Bayes, Perceptron, Support Vector Machines, Random Forest, Neural Networks, model evaluation ROC/AUC, k-fold cross-validation, etc.

BU.001 (MBA)

BU.001.351. Professional Development for Career Success.
This experience-based course is designed to help first-year, full-time MBA students develop the skills needed to accomplish their personal and professional goals and build lifelong career management skills to navigate the changing world of work and global marketplace. Students will engage in online discussions and interactive career labs to practice course content, collaborate and learn best practices from colleagues and instructors. Active participation is essential so that students develop skills in sequence an receive feedback. Students are expected to interact and engage with peers, coaches and employer relations team members, alumni, and industry professionals throughout this course.

BU.001.600. Graduate Internship Project.
Internship projects are available for students needing transcript documentation of an approved Carey Business School Internship. The Internship Project course is an audit only, no credit course offered during each semester. Carey Business School students must be enrolled in a degree program at least one semester (9 credits) before seeking an internship. Students should apply and register for the internship project course at least two weeks before the internship begins. (0 credit)

BU.910.610. Accounting Foundations. 2 Credits.
This course emphasizes the vocabulary, methods, and processes by which for-profit business transactions are communicated. Topics include the accounting cycle; basic business transactions involving assets, liabilities, equity, revenues, and expenses; and preparation and understanding of financial statements, including balance sheets, statements of income, and cash flows. The course also introduces the analysis of financial results and basic managerial accounting concepts and tools. This course prepares students for topics including capital budgeting, valuation and more advanced financial statement analysis courses.

BU.910.611. Corporate Finance. 2 Credits.
This course studies corporate finance and capital markets, emphasizing the financial aspects of managerial decisions. The course touches on the major areas of finance, including the valuation of real and financial assets, risk and return, the Capital Asset Pricing Model (CAPM), optimal portfolio choice, estimating the cost of capital, capital structure, capital budgeting, the effects of leverage, and financial distress.

BU.911.610. Marketing Management. 2 Credits.
This course covers principles of market-driven managerial decision making that determine competitiveness in dynamic consumer and organizational markets. Particular areas of emphasis include industry analyses, dynamics of competition, market segmentation, target marketing, channels of distribution, and product and pricing decisions. In-depth analytical skills are developed through case analyses, class discussions, and applied projects.

BU.912.610. Competitive Strategy. 2 Credits.
This course requires students to assume the role of a general manager. General managers have to cope with tremendous complexity, uncertainty, and inadequate information. An important requirement of a general manager's job is the ability to think in a cross-functional and holistic manner. Creativity and innovation are critical to achieving success, and so is the ability to execute and manage day to day. The concepts and frameworks to be covered in this course include Porter's 5-forces Analysis, PEST Analysis, SWOT, emergent versus deliberate strategy, Resource-Based View of the Firm, Core Competencies and Dynamic Capabilities, Cost Leadership Strategies, Differentiation Strategies, Vertical Integration, Diversification, Cost Accounting, Business Process Management, Inventory Management, Newsvendor Problem, Value Chain Analysis, Activity-Based Accounting, and more.
BU.930.633

BU.912.611. Operations Management. 2 Credits.
Within a manufacturing or service organization, operations management's role is to orchestrate technology and resources in creating products and services to meet the needs of end consumers. Operations management, accordingly, consists of ideas for shaping and innovating an organization's business model. This course provides a conceptual and actionable introduction to operations management and covers a ? wide? range of topics,? including operations strategy, process ?mapping and ?design, queuing theory, inventory management, lean manufacturing, and revenue management?, unified by a thought framework known as "the operations prism"? (flows, variability, and buffers).?? ?By ?taking ? a process view of value-added functions that lead to an understanding of how to make ?operations ?design choices,? ??students will acquire analytical and strategic thinking skills crucial for ?managing? 21st-century ?operations.

BU.913.610. Business Analytics. 2 Credits.
This course lays the analytical foundation for modeling that supports many managerial decisions that entail tradeoffs among competing objectives. Building on concepts from Operations Research, Economics and Probability Theory, this course provides a basic introduction to a variety of resource allocation problems.

BU.913.611. Judgement and Decision Making. 2 Credits.
The purpose of this course is to improve students' leadership capabilities through a critical examination of the organizational and psychological forces that guide human decision-making. Grounded in behavioral science and geared toward an understanding of decision-makers within organizations, topics in this course include heuristics and biases, Bayesian updating (taught with a behavioral lens), prediction accuracy, social and motivational influences on decisions, trust decisions, and expert intuition. The course culminates in a final project geared toward improving managers' judgment and decision-making.

BU.914.610. Business Statistics. 2 Credits.
Students learn statistical techniques for further study in business, economics, and finance. The course covers descriptive statistics, probability, discrete and continuous random variables, estimation, hypothesis testing, regression analysis. The course emphasizes statistics to solve management problems.

BU.920.601. Business Communication. 2 Credits.
Effective leaders are also skillful communicators. To succeed as a leader, you not only must drive individual and team performance, but also inspire diverse stakeholders to trust you and believe in you. Developing and implementing the right strategy is only part of the job; you also must convince colleagues and clients that you are ready to lead.

BU.920.602. Accounting Foundations. 2 Credits.
Business leaders must be conversant in accounting, the language of business. This course equips future business leaders with essential understanding of financial and managerial accounting and the ability to interpret financial status and make effective managerial decisions by using accounting numbers. The covered topics include fundamentals of financial statements, evaluation of financial positions and risks, managerial accounting concepts, and capital budgeting techniques.

BU.920.603. Microeconomics and Market Design. 2 Credits.
This course develops the students' ability to apply fundamental microeconomics concepts and tools to decision making by consumers and firms, and to understand economic exchanges and markets. The first half of the course covers consumer choice and market demand, production costs and firms' profit maximization, market competition and equilibrium, market power and the implications of different market structures for output and pricing decisions. The second half is devoted to understanding the principles and design of practical market mechanisms; topics include game theory, auctions, matching algorithms, and market "platforms".

BU.920.604. Finance. 2 Credits.
This course covers central issues in financial management and corporate finance. Students will learn how financial managers make investment, financing and other decisions and the tools they use to reach such decisions. Topics covered include time value of money, risk, valuation, capital structure, capital budgeting, and mean-variance portfolio selection. The course provides the analytical tools and the financial theories needed to implement sound financial decisions within a corporation (and outside of a corporation). Ideas are presented in a cohesive way within the framework of the no-arbitrage principle, the fundamental principle shaping all aspects of modern finance. Command of the subject is crucially important for anyone considering a career not only in investment banking, investment management or trading, but also in general management, corporate strategy, management consulting, entrepreneurship, and the non-profit world.

BU.920.605. Marketing Management. 2 Credits.
New digital technology has enabled consumers to take more control of their lives. Wearable devices, smartphone apps, etc., provide consumers with new tools to connect with friends, expand their network, obtain information to improve their buying decisions, change bad habits, monitor health indexes, manage mental health, etc. Individual decisions are often influenced by others.In this course, we learn what drives consumers' needs and their choices, with special reference to the new tech environment. Making use of these insights and taking into account a company's constraints and the competitive environment (i.e., competitors' product portfolio, their constraints, etc.), we study how firms can come up with new products/services or modify their existing portfolios to serve unmet needs. The customer insights also allows us to achieve more efficient segmentation, targeting and positioning (STP), and design more powerful tactical tools like pricing, distribution, advertising, and marketing communication (commonly referred to as the 4Ps) to help reach targeted consumers and improve their adoption and loyalty, with the goal of providing superior customer value to the consumers.Marketing is a multidisciplinary area that makes use of economics, psychology, sociology, experiments, field data, statistics, and econometrics to understand how individuals make their decisions. A unique aspect of this course is to study how the internet has empowered peer effects via social networks and two-sided market platforms, and how companies should take advantage of these new tools in managing customers and developing their businesses.

BU.920.606. Operations Management. 2 Credits.
Operations Management seeks to match supply with demand in a marketplace: On the supply side, it generates value by orchestrating technologies, resources, and processes needed for creating products and services; on the demand side, it captures value by fulfilling the promises of revenue models with the right balance of various competing objectives. This course provides an actionable overview of Operations Management, emphasizing both quantitative models and qualitative strategies needed for shaping and innovating service and manufacturing organizations' business models. We will apply a diverse set of marketplace analytics tools (e.g., flow analysis, process redesign, queueing theory, inventory control, lean, and data analytics) to a variety of operational scenarios, from automobile factories to healthcare organizations, from brick-and-mortar stores to e-retailing, and from airlines to online platforms, centering around a coherent framework known as "the operations prism" ? (flows, variability, and buffers). Through this course, students are also expected to gain a perspective on the role of artificial intelligence in managing 21st-century operations.

BU.920.607. Competitive Strategy. 2 Credits.
This module requires students to assume the role of a general manager in the 2020's and beyond. General managers have to cope with tremendous complexity, uncertainty, and inadequate information. An important requirement of a general manager's job is the ability to think in a cross-functional and holistic manner. Since the beginning of the new millennium, technology progress has been accelerated. The internet, mobile devices, and the abundance of personal data available to companies reshaped the competitive landscape and new business models emerged. As technology does not show any sign of slowing down, creativity and innovation are more critical than ever to achieve success, as is the ability to digest and apply tremendous amounts of cutting-edge research quickly. The concepts and frameworks to be covered in this course range from the, now classic, Porter's 5-forces Analysis, through well understood framework of vertical and horizontal integration, and to cutting edge theories of two-sided markets, network effects, and advertisement-driven, transaction-driven, and data-monetization-driven businesses.

BU.920.621. Data Science: Statistics. 2 Credits.
Students learn statistical techniques for further study in business, economics, and finance. The course covers descriptive statistics, probability, discrete and continuous random variables, hypothesis testing, and analysis of variance. The course emphasizes statistics to solve management problems. Case studies, spreadsheets, and computer software are used.

BU.920.622. Data Science: Econometrics for Market Analysis. 2 Credits.
Our course will be centered around the experiment and why experimentation is so important. We will develop the basic linear regression framework, which is a commonly used econometric technique to evaluate real-world questions and quantify experimental results. We will study three cutting-edge techniques for understanding cause and effect: randomized control trials, difference-in-differences, and regression discontinuity. We
BU.920.621

BU.920.623. Data Science: Big Data Consulting Project. 2 Credits.
Big Data Consulting Project is the first in a sequence of experiential courses for full-time MBA students. The course features a partnering organization (client), which provides a large dataset accompanied with inquiries. Students work in teams, to answer the client's inquiries using a combination of descriptive and predictive analytics. To this end, students may use a combination of data visualization tools and programming languages for data analysis (such as Tableau and R). The students will be introduced to these techniques and tools in the lecture component of the course as well as in earlier courses such as the Bootcamp: Immersion in Technology, Data Science: Statistics, and Data Science: Econometrics for Market Analysis. In this first course of the experiential sequence, the students will adopt several planning and feedback tools that will help them work as a team.

BU.920.624. Data Science: Artificial Intelligence. 2 Credits.
Since its inception in 1950s, Artificial Intelligence (AI) has been shaped by the rise and fall of various competing ideas and techniques emerging from a myriad of disciplines, including computer science, economics, ethics, linguistics, mathematics, operations research, philosophy, psychology, and statistics. Since 2012, deep learning has taken center stage in AI and expanded the landscape of AI to include applications spanning virtually all industries and sectors. This course introduces key concepts of AI, including its mathematical, computational, and economic foundations, and how to manage and lead businesses in the age of AI. Students will learn how to develop concrete AI applications that transform structured and unstructured data to tools with potential of generating business and human value. Students will develop a concrete understanding of AI strategy in a variety of scenarios, including health, operations and supply chain management, marketing, and marketplace design. Students will also develop AI leadership skills that synthesize human and non-human intelligence, with limitation of AI in mind, including, for example, how AI can amplify or mitigate human biases.

BU.920.631. Behavioral Science: Leadership and Organizational Behavior. 2 Credits.
The purpose of this course, required for students in the full-time MBA program at the Carey Business School, is to introduce students to fundamental topics related to managing, leading, and working in modern organizations. The course exposes students to a broad array of frameworks for understanding individual, team, and organizational behavior, with particular emphasis on the design of work, interpersonal dynamics, organizational innovation and change, global work environments, and crafting meaningful careers. This breadth of topics, ranging across organizational levels and career stages, distinguishes the course and is meant to complement students' later coursework focused on individual decision-making, solving problems in teams, and avoiding pitfalls of early career managers.

BU.920.632. Behavioral Science: Design Thinking. 1 Credit.
During this course, students will learn about and participate in Design Thinking: a human-centered problem-solving approach utilized by some of the most creative and competitive businesses globally. With emphases on research, ideation, iteration, prototyping, and multidisciplinary teams, Design Thinking helps practitioners leverage their creativity to achieve novel solutions to complex problems. This two-day intensive course will leverage experiential learning, with students working together in teams to solve a complex problem using Design Thinking.

BU.920.633. Behavioral Science: Negotiating Collaboratively I. 1 Credit.
We negotiate every day—many of us, all day. Determining what we will pay, how much we will get paid, and how to convince our colleagues of our data-driven solutions: All of these are negotiations. Despite the ubiquity of negotiation and its centrality as a leadership competency, however, many of us know little about the strategy and psychology underlying it. This course provides students with the foundational knowledge and skills needed to negotiate. Designed around a series of research-based negotiation exercises, the course exposes students to multiple negotiation situations that help them understand the two fundamental approaches to negotiation. By reflecting on these exercises in light of negotiation theory, students develop an awareness of their personal negotiation style and how to hone it. By the end of the course, students will have the basic skills needed to negotiate collaboratively and effectively—skills that they can further refine in Negotiating Collaboratively II.

BU.920.634. Behavioral Science: Leading Change. 2 Credits.
A core leadership challenge is strategically, efficiently and fluidly guiding others through the stages of organizational change. Change is an important aspect of life for people, groups, and especially organizations. Change is ever more important as we, and the organizations in which we work, face multiple and shifting imperatives. In fact, the ability to create change can make or break careers. We often muddle through change satisfactorily. Yet, we can improve our success if we apply frameworks, techniques, and perspectives that elevate our abilities beyond the common sense level of performance. We do this by analyzing the forces that drive organizations to change, examining impediments to change, and surveying approaches for making organizational change more effective.

BU.920.636. Behavioral Science: Negotiating Collaboratively II. 2 Credits.
We negotiate every day—many of us, all day. Determining what we will pay, how much we will get paid, and how to convince our colleagues of our data-driven solutions: All of these are negotiations. Despite the ubiquity of negotiation and its centrality as a leadership competency, however, many of us know little about the strategy and psychology underlying it. Building from Negotiating Collaboratively I, which provides students with the foundational knowledge and skills needed to negotiate, Negotiating Collaboratively II teaches students advanced negotiation skills and prepares them to negotiate in complex but critical situations. Examples of advanced skills include negotiating across cultures and over virtual media like Zoom. Examples of complex but critical negotiation situations include disputes and ethically fraught deals. Finally, and in addition to learning advanced skills and encountering complex negotiations, students in Negotiating Collaboratively II will negotiate additional simulations involving data and healthcare, receive additional personalized feedback, and apply their skills to negotiations occurring in other classes (i.e., Commercializing Discovery) and/or in their careers (i.e., to job offers they are receiving). By the end of the course, students will be able to display and successfully deploy a variety of sophisticated and situation-appropriate negotiation strategies.

BU.920.711. Foundations of Business Analytics. 2 Credits.
Being a leader in a data driven world requires the knowledge of both data-related (statistical) methods and of appropriate models to use that data. The Business Analytics class focuses on the latter: it introduces students to analytical frameworks used for decision making. These include Linear and Integer Optimization, Decision Analysis, Risk modeling, and Monte Carlo Simulation. For each methodology students are first exposed to the basic mechanics, and then apply the methodology to real-world business problems using software. Emphasis will be not on programming, but rather on formulating problems, translating those formulations into useful models, optimizing and/or displaying the models, and interpreting results.The course will not produce experts at modeling and/or programming (although students may be able to pick up a few spreadsheet skills along the way). Rather, the goal is to prepare managers who are comfortable with translating trade-offs into models, understanding the output of the software, and who are appreciative of quantitative approaches to decision making.
BU.920.621

BU.920.713. Ethical Leadership. 2 Credits.
Students in this course will critically examine ethical questions at the heart of contemporary organizational life. What is a leader's ethical obligation to the people they serve? How can ethics and pragmatism in business co-exist? Why do individuals within organizations fall prey to unethical behavior? And how can one maintain an ethical compass in a globalized world with competing value claims? Contemporary program-specific topics, such as the ethics of privacy, big data, and automation will also be scrutinized. With cases and empirical research as a backdrop, this highly interactive seminar will help students develop the skills, dispositions, and frameworks required of an effective leader.
BU.920.711

BU.920.721. Foundations of Business of Health. 2 Credits.
This course provides an overview of the evolution, structure and current issues in the health care system. It examines the unique features of health care as a product, and the changing relationships between patients, physicians, hospitals, insurers, employers, communities, and government. The course examines three broad segments of the health care industry: payors, providers and suppliers. Within the payor segment, the course examines the sources and destinations of spending, managing care, insurance design, payment models, strategy, and efforts to address payer gaps including insufficient access and social determinants of health. Within the provider segment, the course examines the impact of cost containment, payment reform, and competition on the structure, innovation, care quality, and efficiency of hospitals, physicians, and integrated delivery systems. Within the supplier segment, the course will examine developments in the biotechnology, pharmaceutical, medical devices, genomics, connected health and IT industries.

BU.920.722. Business Law, Health Law, and Regulations. 2 Credits.
This course provides students with an overview of the legal and regulatory environment as it affects health care and business. With the increasing intersection between health care delivery and law, this course introduces students to the legal and regulatory issues they are likely to face in managing health care organizations. Using cutting-edge cases, students will explore medical malpractice, negligence, liability (physician, product, and corporate), criminal aspects of health care, patient consent and rights, and health care reform. In today's economy, a thorough working knowledge of the legal and regulatory environment in which businesses operate is essential for well-prepared business executives. This course provides an overview of the legal and regulatory frameworks affecting business in the United States. Topics include forms of business organization, contracts, torts and product liability, intellectual property, constitutional law business transactions, and discrimination and employment issues.
BU.920.721

BU.920.723. Ethics of Business of Health. 2 Credits.
Students in this course will critically examine ethical questions at the heart of the contemporary healthcare industry. What are the unique ethical obligations of healthcare organizations to patients, providers, and society? How can ethics and pragmatism in healthcare co-exist? Contemporary program-specific topics, such as the ethics of privacy, ethical resource allocation and access to care, and paternalism in healthcare, will also be scrutinized. With cases and empirical research as a backdrop, this highly interactive seminar will help students develop the skills, dispositions, and frameworks required of an effective leader in health fields.

BU.920.811. Design Lab. 2 Credits.
This experiential course is the first part of a two-part series that will provide a hands-on, data-driven experience for students to develop a product or service that has the potential to improve healthcare for patients around the world. In this first part, students will learn how to explore unmet needs in the industry by connecting with leading experts in the field, doing background research and conducting interviews. Students will identify problems that have potential to result in significant opportunities and will learn how to translate these problems into need statements. Students will learn how to screen needs with a deep-dive into the problem through primary and secondary research, understanding existing solutions and competitors, a stakeholder analysis and a detailed market analysis through customer segmentation and discovery. Students will apply principles of ideation, design thinking and user-centered design to develop the winning concepts and develop a prototype that can be tested for commercialization in the second part of the course.

BU.920.812. Commercializing Discovery. 2 Credits.
This course teaches the process of bringing discoveries to market. Students learn about innovation and invention processes, how to identify opportunities and assess when ideas are inventions, determine the steps required to bring the product to market, including intellectual property protection and regulatory processes, and craft a strategy to license early stage invention to third parties for further development. Students work in small teams on early-stage invention projects that are patented or patent pending sourced by the instructor from university and government technology transfer offices. Students will analyze the feasibility of commercializing the invention so that it can be licensed to a third party that can pursue entrepreneurial funding and development. Students enhance their business education by developing collaborative consulting engagements with businesses and nonprofit organizations in which students assist their client organizations in addressing existing and emerging challenges in the health care space.
BU.920.811

BU.920.813. Leadership Development Expedition. 2 Credits.
This course is a leadership-intensive seminar and expedition focused on helping students develop their own leadership capacity, while also emphasizing a conceptual understanding of leadership in diverse settings. The course utilizes the unique opportunity for leadership development embedded in outdoor experiential education, providing students the challenge of serving as a leader during an adventure expedition, and helping students reflect on this challenge to develop their own conceptualization and practice of leadership. The course combines a thorough academic introduction to leadership development and opportunity for self-assessment with repeated reflection and feedback to help students develop their own path as leaders.

BU.920.814. Advising Project Teams. 2 Credits.
Organizations commonly rely on teams to get work done. At the same time, the effectiveness of teams can vary greatly depending on the its leadership and processes. After completing the Innovative Field Project, students can elect to participate in this experiential course to further develop their capacity to lead teams. During the quarter students will be exposed to behavioral research to enhance their knowledge of collaborative work, and practice the corresponding skills by advising an Innovative Field Project team.
BU.920.816

BU.920.815. Applied Behavioral Strategy for Organizational and Social Impact. 2 Credits.
Have you wondered why monetary incentives sometimes work to achieve intended outcomes, whereas they spectacularly backfire in others? Were your decisions affected by "choice architecture" in school or your workplace? Can Netflix incentivize its customers to exercise, and do they have a responsibility to do so? These are examples of inquiries you will encounter in this experiential learning course. A business partner will offer a real-world problem for you to solve, learn and apply concepts from neoclassical economics (incentive theory) and behavioral economics (choice architecture, framing, nudges). You will be challenged to apply learnings on how incentives and nudges (or a combination) impact decisions to improve organizational processes, outcomes, or society. Students will learn principal-agent theory and incentive design, and behavioral concepts such as hyperbolic discounting, loss aversion, and the potential of "choice architecture" to affect behavior. Students will apply economic and behavioral concepts and tools working in teams on a real business problem in partnership with an organization. Teams will scope and provide actionable recommendations to solve a problem. Applications may cover a wide range, such as converting first-time customers into repeat customers, or encouraging employees or community members to recycle, exercise or lower their carbon footprint. The course is relevant to students interested in public service, management and leadership.

BU.920.816. Innovation Field Project. 4 Credits.
The Innovation Field Project is the second experiential course in the full-time MBA program. Students work in teams to define, and scope problems posed by partner organizations, and deliver innovative solutions using evidence-based approaches. Students use the concepts and tools studied in their first year – such as research methods, data analytics, creative problem-solving techniques, and discipline-specific knowledge – to analyze the business issue at hand and provide innovative, actionable recommendations to the project partners. The business problem might relate to a wide range of issues, including process or service design, strategy development, financial risk management, or marketing. Projects might also encompass large scale thematic issues facing contemporary organizations, such as the ethical dilemmas that leaders face. Projects can be in any sector including tech, retail, banking, health or manufacturing. HTI focused projects may include physician group practices, hospitals, pharmaceutical firms, public health organizations and biotechnology firms.

BU.930.610. Effective Communication. 1 Credit.
This course prepares Innovation for Humanity (I4H) teams to communicate effectively with internal and external audiences. Students refine their skills by analyzing and practicing research-based strategies adopted by successful business professionals. In particular, students learn how to write compelling memos, develop executive presence, and deliver informative presentations.

BU.930.630. Solving Organizational Problems. 2 Credits.
This course aims to equip GMBA Innovation for Humanity (I4H) teams with the fundamental knowledge and skills needed to thrive in their I4H projects and future organizational problem-solving endeavors. It differs from other management courses in its focus on the specific challenges faced by problem-solving teams (e.g., I4H teams) versus teams or individuals in other organizational settings (e.g., decision-making situations, organizational change efforts). It includes units intended to help students set up a problem-solving team for success, follow the iterative problem-solving process, adapt that process to manage scope and ambiguity, and both collect and evaluate the quality of problem-relevant evidence. Students will leave with foundational abilities needed to solve organizational problems.

BU.930.631. Experiences in Leadership.
The goal of this course is to help students translate research about individuals and groups into capabilities to become effective leaders. The course will provide students with analytical frameworks that will help them understand behavior in organizations, along with the practical experience to put that understanding into action. Key to developing this experience is using the classroom as a forum to apply knowledge and develop skills through immersive exercises, cases and interaction with practitioner experts.

BU.930.632. Management and Organizational Behavior. 2 Credits.
The purpose of this course is to introduce students to fundamental topics related to managing, leading, and working in modern organizations. The course exposes students to a broad array of frameworks for understanding individual, team, and organizational behavior, with particular emphasis on the design of work, interpersonal dynamics, organizational innovation and change, global work environments, and crafting meaningful careers. This breadth of topics, ranging across organizational levels and career stages, distinguishes the course and is meant to complement students' later coursework focused on individual decision-making, solving problems in teams, and avoiding pitfalls of early career managers.

BU.930.633. Business Microeconomics. 2 Credits.
This is a foundational microeconomics course with emphasis on the application of economic principles and methodologies to private and managerial decision problems. Major topics include consumer choice and market demand, costs and profit maximization, market structures (competition, monopoly, and oligopoly), short- and long-run output/price decisions, and strategic interactions (game theory).

BU.930.634. Financial Valuation. 2 Credits.
This course provides comprehensive methods for valuing securities, projects, assets and firms. Notions and methods from corporate finance, corporate strategy, investments and financial statement analysis are employed extensively.

BU.932.610. Ethical Leadership. 2 Credits.
In this course, students will be challenged to think critically about the ethics of organizational life. What is an organization's or leader's ethical obligation to the people they serve? How can ethics and pragmatism in business co-exist? And, why do individuals within organizations fall prey to unethical behavior? With cases and empirical research as a backdrop, this highly interactive seminar will challenge students to examine these and other fundamental questions, in an effort to cultivate the skills and dispositions that are required of an effective leader.

BU.940.611. Innovation for Humanity. 4 Credits.
This experiential learning course is designed to develop agile and creative business leaders who understand how to build sustainable, impactful businesses within developing communities around the world. The course is consistent with the Carey Business School's signature theme of "teaching business with humanity in mind" and it provides an understanding of the needs of developing communities around the world. Students will work domestically and abroad engaging with entrepreneurs, public officials, faculty and NGOs, exploring critical development issues. The students will learn to understand the complex systems that prevail in the emerging economies, the role of appropriate technologies and interventions in solving pressing problems, and to recognize the sustainable business opportunities embedded in these community needs.

BU.120 (Management)

BU.120.601. Business Communication. 2 Credits.
This course refines students' skills in business writing, public speaking, and interpersonal communication. Through analyses and practice of communication strategies adopted by successful business professionals, students learn to write clearly and concisely, deliver compelling presentations, and construct effective arguments.

BU.121.610. Negotiation. 2 Credits.
This course provides students with the foundational knowledge and skills needed to negotiate. Designed around a series of research-based negotiation exercises, the course exposes students to a variety of negotiation situations that help them to understand two fundamental approaches to negotiation. By reflecting on these exercises in light of negotiation theory, students develop an awareness of their personal negotiation style, including its strengths and weaknesses. By the end of the course, students will be able to negotiate in an effective, ethical, and culturally appropriate manner.

BU.131.601. Business Leadership and Human Values. 2 Credits.
This foundational course develops students' capacities for ? understanding themselves as moral agents in a complex environment of competing values and often ambiguous ethical challenges inherent in business. Through a rigorously discursive exploration of human moral capabilities, value systems, ethical frameworks, and contemporary ethical dilemmas, students clarify their personal moral compass and develop a toolkit of knowledge and practices for sound ethical leadership in business and society?.

BU.132.601. Business Law. 2 Credits.
A thorough working knowledge of the legal and regulatory environment in which businesses operate is essential for well-prepared business executives. This course provides an overview of the legal and regulatory environment affecting business in the United States. Topics include forms of business organization, contracts, torts and product liability, intellectual property, constitutional law business transactions, and discrimination and employment issues. Students are expected to utilize electronic library and Internet resources to complete assignments.

BU.142.601. Leadership and Organizational Behavior. 2 Credits.
Leadership requires a deep understanding of human behavior – how we make sense of the world (or fail to do so), how we make decisions, what brings us together and what sends us apart. Good leaders understand the power of motivation, the benefits and challenges of groups and how to create a context in which others will thrive and perform at their best. The goal of Leadership and Organizational Behavior is to help students leverage knowledge of human behavior to enhance their overall effectiveness within organizations and their ability to lead. This course will provide students with analytical frameworks and practical experience designed to help them put learning into action, whether or not they are currently in a formal leadership role.

BU.142.620. Leadership in Organizations. 2 Credits.
The goal of Leadership in Organizations is to help students learn how to leverage organizational behavior to enhance their ability to lead. Specifically, this course seeks to provide students with both the analytical frameworks and the practical experience necessary to better lead individuals and groups in organizations. The analytical frameworks will help students to understand leadership; the practical experience will help students put that understanding into action. The aim is to help students lead, even if they do not currently find themselves in a formal leadership role. The practices that are discussed will promote effectiveness at any level.

BU.142.730. Strategic Human Capital. 2 Credits.
Developing and managing human capital is vital for the success of any organization. In this course, students will examine ways in which human resources management can be used to enhance organizations' competitive capabilities. The goal will be to understand how an organization can select, train, and retain the right employees, and how it can effectively motivate them to make decisions that will allow the organization to successfully implement its overall strategy. Students will explore and master topics such as hiring and layoff decisions; human capital and on-the-job training; turnover; the provision of incentives; the advantages and disadvantages of alternative compensation schemes; objective and subjective performance evaluation; relative performance evaluation; promotions and other career-based incentive schemes; team production and team incentives; stock options and executive compensation; intrinsic and extrinsic motivation; non-monetary compensation; and mandated benefits.

BU.150.620. Strategic Management. 2 Credits.
Generally, strategy is defined as a set of choices that managers make in order to increase their firm's performance relative to competitors. This course provides the theoretical concepts and analytical tools required for formulating and evaluating strategies appropriate for long-term success. Topics include the internal and external environment analysis, competitive interactions, and business strategy. We will also introduce concepts important for corporate strategy, global strategy, and strategy execution. This course emphasizes the application of theory to real world strategic issues facing managers today.

BU.151.620. Global Strategy. 2 Credits.
This course provides students with the conceptual tools necessary to understand and work effectively in today's interconnected world by developing strategic perspectives that link this changing environment, the state of the global industry, and the capabilities and position of the firm. The course provides frameworks for identifying and taking advantage of the opportunities presented in a dynamic global environment at the level of the country and industry. It then focuses on firm-level strategic choices regarding where to engage in which activities. Finally, it covers the challenges of integrating the multiple perspectives, functions, and interests that constitute the multinational firm.
BU.150.620 OR BU.920.607

BU.450.730. Design Leadership. 2 Credits.
This course offers students the opportunity to learn and participate in design thinking: a human-centered process utilized by some of the most creative and competitive business organizations. With emphases on research, ideation, and prototyping, design thinking helps students leverage their creativity and collective expertise to achieve innovative solutions. During this course, students will work in teams to solve complex problems while applying the entire design thinking process. A large component of the course is experiential, but students will examine design thinking through multiple academic lenses (design and design theory, organizational behavior, and social psychology).

BU.132 (Real Estate)

BU.132.615. Real Estate Legal Environment. 2 Credits.
Complex legal issues involved in a real estate development and management transaction are reviewed and analyzed in this course. Students explore legal topics, beginning with the basic principles of property law and extending to zoning and comprehensive planning, environmental issues and safeguards of site acquisitions through construction, including leasing, conflict resolution, operation, and sale of a real estate project. Negotiation, legal aspects of entity structures and resolving disputes are discussed.

BU.152.725. Real Estate Entrepreneurship. 2 Credits.
Real Estate is historically and fundamentally an entrepreneurial industry. This class examines how to become a real estate entrepreneur and compete in today's marketplace. Course topics focus on the skills and knowledge real estate entrepreneurs successfully use to thrive. Students will learn techniques such as: how to create wealth, real estate pro-formas, back-of-the-envelope calculations, leverage, attracting external investors, and creating a winning business plan. Students will work in teams on case studies.
BU.241.610 OR BU.231.620 OR BU.920.604

BU.230.640. Development Modeling and Risk Analysis. 2 Credits.
This course emphasizes the estimation of development and investment budgets, including construction costs, construction loan interest, tenant improvements, lease-up reserves, marketing costs, and other soft costs. Ongoing property operations, including lease-up and refit allowances, are also examined. In this context, various capital structures are analyzed including mortgage loans, various equity investors, and possible refinancing opportunities. In addition, critical risks are examined using sensitivity analysis, Monte Carlo simulation, scenario analysis to calculate the most likely returns, and the probability of loss.
BU.241.610 OR BU.231.620 OR BU.920.604

BU.234.610. Real Estate and Infrastructure Finance. 2 Credits.
This course examines selected techniques and issues in the area of real estate finance. Special emphasis will be placed on the design and valuation of mortgage instruments. This class will be conducted using a lecture format. While lectures will follow the textbook to some extent, supplemental readings will be required. Students are assumed to have some knowledge of finance. Before taking this class, it is important for students to have a clear understanding of the time value of money concept and knowledge of how to use spreadsheets to solve time value of money problems. Knowing how to use a calculator to solve present value problems (but without a clear understanding of the underlying concept) is not sufficient for tackling the course material of this class. Use of calculators or spreadsheets will not be taught in this class.

BU.241.610. Real Estate Investment and Development. 2 Credits.
This course provides an overview of the real estate development and investment processes, as well as introduces students to various disciplines, professionals, and industry sectors, and how they interact and participate in these processes. Students learn to apply direct capitalization models and discounted cash flow models to estimate real estate values by converting future income expectations into present values. These values are compared to current costs and prices to determine the financial feasibility of proposed projects and existing properties. The concept of highest and best use is also introduced and discussed. The use of Excel software is introduced along with the CoStar database. This course was previously titled Development I.

BU.241.620. Design and Construction Feasibility. 2 Credits.
This course examines site planning, building design, and managing the construction project. The class is divided into two sections. The design section focuses on the conceptualization of the project, and the construction section looks at the management of the implementation of the project. Emphasis is placed on how the selection of materials, equipment, and systems can affect both the function and cost of the building. The course also includes a detailed review of the forms of construction contracts and associated documents commonly used in the industry.

BU.241.725. Global Perspectives in Real Estate. 2 Credits.
This course focuses on real estate and infrastructure investment and financing issues around the globe. Using a case approach supplemented by assigned articles and textbook readings, the course examines the global nature of the real estate asset class, the market players and the issues they encounter when identifying opportunities, and executing real estate strategies in various global markets. Topics covered include risks and returns of international real estate investment; challenges in international real estate development; identification of opportunities and execution of real estate strategies around the world; REITs around the globe; and global real estate portfolio considerations.
BU.241.610 OR BU.234.610 OR BU.231.620 OR BU.920.604

BU.241.735. Infrastructure Development for Sustainable Cities. 2 Credits.
This course provides an understanding of the demand and supply of sustainable infrastructure in a context of accelerating urbanization and growing risks related to global warming. The economic principles that make sustainability in cities so challenging are examined. Then, the course presents potential new strategies, new technologies, new business models, and new financing techniques that could make a difference in addressing a full range of infrastructure needs while addressing sustainability objectives. The course includes an understanding of the demand and supply side, cultural factors, politics, and the potential impact of technology and innovation on sustainability of infrastructure, real estate projects and urban policies.

BU.241.740. Project Finance and Public-Private Infrastructure Delivery. 2 Credits.
Project financing, as an alternative to conventional direct financing, is a well-established technique for large capital intensive projects. It grew in importance in the 1990s as a means of financing projects designed to help meet the tremendous infrastructure needs existing in both developed and developing countries. Whether project financing is suitable for such a purpose will depend, ultimately, on if this financing method offers the most cost-effective means of accomplishing the project after all social and private benefits and costs are considered. This course will discuss the basic project financing framework; the rationale for using project financing as opposed to direct conventional financing; the identification and management of risks associated with a large scale project; evaluating a project's viability using analytical tools; sources of project funds; using public-private partnerships as a mode of project financing; and the crafting of contractual arrangements to allocate a project's risk and economic rewards among the parties involved.
BU.234.610 OR BU.231.620 OR BU.910.611 OR BU.920.604

BU.241.750. Advanced Valuation and Investment Analysis. 2 Credits.
This course will integrate advanced valuation principles with the science of econometrics. Trend analysis, in the form of regression analysis, is used to reveal the influences on value for real estate. This integrates the results of regression analysis into the discounted cash flow methodology. This course is intended to prepare the student for real-world challenges in valuing complex real estate through the use of three case studies.
BU.242.715 OR BU.510.601

BU.241.760. Strategic Commercial Leasing. 2 Credits.
Strategic Commercial Leasing teaches students how to understand and negotiate commercial leases to create maximum value for property owners of all sizes, including institutional owners and investors. The course provides in-depth coverage the economic, legal and control issues related to commercial leasing. In-class discussions include the risk-return considerations property owners must evaluate when negotiating individual lease provisions. Leasing considerations include the impact on property valuation, property financing and asset disposition strategies. Students evaluate how a company's leasing strategy impacts their overall real estate portfolio risk, valuation and returns. The course structure will include lectures, group discussion, in-class negotiation. Guest speakers will include institutional owners, lenders and appraisers, enabling students to understand how lease terms are evaluated by a range of professionals. A special focus will be on how institutional owners and REITS view leases, various tenant uses, and overall leasing strategies. This highly interactive course will also cover the differences between apartment leases and commercial leases.

BU.241.770. Smart Growth, Infrastructure and Real Estate Development. 2 Credits.
For the past twenty years smart growth has had an increasingly significant impact on the built environment. Smart growth results in better cost-benefit outcomes for both developers and the public sector, more efficient and appealing land use in prime locations, and new financing tools.This course provides an understanding of historic development patterns of cities and towns, the emergence of the American suburb, and the countervailing smart growth approach. Examined are the principles behind smart growth, the demographic and economic forces furthering the widespread adoptions of these principles —urban revitalization, smaller households, a more transient workforce and racial and ethnic diversity. The growing strength of the Baby Boomers and the Millennials on the market is discussed. Attention is given to the increasingly important impacts of climate change, sustainability, changing tools of economic development competitiveness, health and equity of communities.The main tools of smart growth, such as higher density, mix of land uses, transportation and housing choices, transit-oriented development, walkable neighborhoods, and form-based zoning are examined. Collectively many of these tools are parts of Complete Streets policies. The impacts of public policies and private demand are discussed.

BU.242.601. Real Estate Market Feasibility Study. 2 Credits.
Understanding the urban environment is the key to understanding the marketability of real estate. Likewise, understanding the marketability of real estate is the key to making wise investment decisions. In this course, students will examine the forces that form, shape, and influence the growth of cities with the goal of understanding how real estate benefits and suffers from these dynamics. Students will explore the techniques for forecasting demand and supply in specific markets, as well as evaluating sites based on product criteria. Products include residential, commercial, and retail properties. Final sessions deal with feasibility analysis.

BU.242.701. Real Estate Investment Trusts: Analysis and Structuring. 2 Credits.
This course examines the role that Real Estate Investment Trusts play in commercial real estate capital and investment. Topics include the history, legal structure, and financial basis for establishing REIT portfolios. Students will examine the role of public and private capital markets in facilitating commercial real estate investments through REITs using real world examples. The primary course objective combines public company finance theory with practical real estate capital applications for intelligent business decisions in complex scenarios. Subjects include a history of the REIT industry; how REITs compete for capital and control investment risk; how to value individual REIT stocks and REIT shares generally; the regulatory and capital markets process for the REIT IPO; quarterly and annual filings; follow-on capital raising; and recent developments and strategies in the REIT industry.
BU.234.610 OR BU.231.620 OR BU.241.610 OR BU.920.604

BU.242.710. Real Estate Funds and Portfolio Management. 2 Credits.
A significant amount of commercial real estate investments is held in the form of large real estate funds. These funds typically range in size from $50 million to over $50 billion. Many of the large office buildings, regional malls, apartment buildings, and industrial parks in the country are held in these funds. Some funds invest in senior housing, student housing, parking, healthcare, and even farm and timberland. The managers of these funds are large institutional investment management firms that manage the properties on behalf of wealthy investors, pension funds, endowments, and sovereign wealth funds. The purpose of this course is to understand how these funds are organized, how they arrive at an investment strategy, and how to evaluate how they have actually performed relative to that strategy. Case studies and actual industry data will be used to reinforce the concepts discussed in the course.
BU.231.620 OR BU.234.610 OR BU.920.604

BU.242.715. Real Estate and Infrastructure Valuation. 2 Credits.
This course integrates the real estate curriculum with the valuation process. The three traditional approaches to value (land and site valuation; building cost estimates, depreciation, direct capitalization; and yield capitalization) will all be covered in the course. This course is integral for students pursuing the appraisal/valuation concentration within the MS Real Estate and Infrastructure Program.

BU.242.720. Real Estate Capital Market Analysis. 2 Credits.
This course examines selected topics and issues related to real estate capital markets. Special emphasis will be placed on mortgage backed securities (MBSs) and real estate investment trusts (REITs). This class will be conducted using a lecture format. While lectures will follow the table of contents of the textbook rather closely, quite often supplemental readings are required. Students are assumed to have some knowledge of real estate finance. Before taking this class, it is important that students have a clear understanding of the design of mortgages and knowledge of how to use spreadsheets to solve mortgage related problems. Knowing how to use a calculator to solve present value problems is not sufficient for tackling the course materials of this class.
BU.234.610 OR BU.231.620 OR BU.920.604

BU.245.790. Real Estate and Infrastructure Capstone. 2 Credits.
The Capstone course provides you with a mentored professional real estate industry experience that integrates all aspects of the MS in Real Estate and Infrastructure curriculum. You may choose one of three options:A real estate and/or infrastructure development project proposal. Students selecting this option work in teams to produce a state-of-the-art development proposal for a challenging site selected by Capstone faculty and judged by a project review board of faculty and industry professionals.A real estate and infrastructure research. Students selecting this option work individually or in teams to conduct original research and analysis of a critical issue in real estate and infrastructure development.An internship with a real estate company. Students selecting this option work on a portfolio of defined assignments mentored by an industry professional in a real estate company, agency, professional or industry association, or portfolio management company.Capstone choices will differ based on individual interests and career goals, but you are encouraged to choose experiences that provide an opportunity for growth and showcase your professional knowledge, skills and talent. Examples include a development proposal for a brownfield site; an analysis of weather-related risks in coastal infrastructure security; or a written participation/ observation report based on a supervised internship. The structure of deliverables may vary, but deliverables for all capstone experiences will include a written report, presentation slide deck, and oral presentation.<p>Students must receive approval and permission from their academic adviser before enrolling in this course.

BU.210 (Finance)

BU.210.001. Accounting and Financial Reporting Waiver Exam.
This exam affords students the opportunity to confirm proficiency in Accounting and Financial Reporting. Students who successfully complete the waiver exam will be granted a waiver with replacement for BU.210.620. Please note: Waiver exams may only be taken once per student, in the first or second semester of registration in a new program. The exam will be completed online in Blackboard within the timeframe stipulated listed within this course description. Students will be required to use Remote Proctor for the actual completion of the exam.

BU.210.620. Accounting and Financial Reporting. 2 Credits.
This course emphasizes the vocabulary, methods, and processes by which business transactions are communicated. Topics include the accounting cycle; basic business transactions involving assets, liabilities, equity, revenues, and expenses; as well as preparation and understanding of financial statements, including balance sheets, statements of income, and cash flows.

BU.210.650. Financial Statement Analysis. 2 Credits.
Financial Statement Analysis is designed to prepare you to analyze, interpret, and use financial statements effectively, both from a general manager and from an investor perspective. The course will review and extend the topics introduced in Accounting and Financial Reporting with an emphasis on value creation. Specifically, the course will introduce a thorough framework for financial statement analysis, including advanced financial (ratio and cash flow) analysis, financial statement adjustments, and financial forecasting.
BU.210.620 OR BU.910.611 OR BU.920.602

BU.210.680. Cost Measurement and Control. 2 Credits.
This course emphasizes the vocabulary, methods, and processes by which managerial accounting concepts and cost management practices are applied across organizations to improve operational performance and achieve strategic goals. Topics include cost behavior, profit planning, product costing, overhead allocation, cost estimation, costing systems for short-term and long-term decision-making, capital budgeting, variance analysis, responsibility accounting, and performance measurement.
BU.210.620 OR BU.910.610 OR BU.920.602

BU.220.610. The Firm and the Macroeconomy. 2 Credits.
This course explores the workings of an economy from a macroeconomic perspective. Although the course focuses primarily on the United States economy and its relation with the rest of the world, the concepts and tools apply to market economies around the world. Major topics include: the determinants of an economy's output and price level in the long run; money and banks in the long run and short run; the role of interest rates and exchange rates in the U.S. economy and in small, open economies; the causes and nature of the business cycle and inflation; the role of fiscal and monetary policy in stabilizing the economy and ensuring full employment and price stability.
BU.220.620 OR BU.920.603 OR BU.930.633

BU.220.620. Business Microeconomics. 2 Credits.
This is a microeconomics course with emphasis on the application of economic principles and methodologies to private and managerial decision problems. Major topics include consumer choice and market demand, costs and profit maximization, market structures, output/price decisions, and strategic interactions.
BU.510.601 OR BU.914.610 OR PH.140.611 OR PH.140.621

BU.220.720. Financial Econometrics. 2 Credits.
Financial econometrics is the intersection of statistical techniques and finance. It provides a set of empirical tools to analyze historical financial data, model underlying economic mechanisms, and predict future price trends. This course covers both cross-sectional and time-series data. Multivariate regression analysis is developed to study the cross-sectional differences in stock returns of individual firms and associated portfolio models. Applications of these techniques to evaluate the performance of new trading strategies and hedge fund managers are also discussed. Furthermore, time-series models are introduced to model and forecast both time-varying aggregate stock returns and volatility. The course prepares students to conduct empirical research in an academic or business setting. Stata will be used for the class.
BU.232.701 AND (BU.510.601 OR BU.914.610)

BU.230.620. Financial Modeling and Valuation. 2 Credits.
The objective of this course is to introduce students to the current practices in financial modeling and valuation using Excel. Students will learn how to manipulate financial data and how to perform financial analyses using various analytical tools. Using the skills, students will learn how to forecast financial statements and build interactive valuation models for firms. By the end of the course, students will complete an equity research paper. One important aspect of this course is also to introduce students to portfolio modeling, efficient frontiers, and portfolio choice subject to constraints.
BU.232.701

BU.230.710. Quantitative Financial Analysis. 2 Credits.
This course explores the fundamentals of Monte Carlo simulation techniques and their applications in finance. Using MATLAB as the programming platform, this course intends to train students to become familiar with simulation techniques in financial modeling, such as derivative pricing and market risk assessment. This course is taught mostly using hands-on computer exercises, and students are required to bring their laptops to class.
BU.232.710 AND BU.232.701

BU.230.730. Managing Financial Risk. 2 Credits.
The course offers an introduction to financial risk management. Risk management is a complex process of identifying, measuring, and controlling risk exposure. The course will balance theory and practical application. Topics include market and credit risks, liquidity, and operational and legal risks, including volatility modeling, and derivatives as tools for controlling risk. Using modern econometric models, such as ARCH and GARCH, along with widely used quantitative methods (Monte Carlo simulation and Filtered Historical simulation), the course will describe how to measure and control risk exposure towards various types of risks, especially market and credit risk.
Prerequisite Requirements Differ by Program:MS BARM (Full-Time): Required: BU.510.601; Recommended: BU.232.710MS Finance (Full-Time Part-Time): Required: BU.510.601 AND BU.232.701 AND BU.232.710All other programs: Required: BU.510.601 AND BU.232.701; Recommended: BU.232.710

BU.230.750. Financial Crises and Contagion. 2 Credits.
What and when will the next financial crisis be? No one knows, but the past provides clues. This course takes students through the history of finance in the United States, with a focus on the last 100 years of financial bubbles, manias, and scandals, from the crash of 1929 to the thrift crisis of the 1980s; Enron and other accounting debacles; and the mortgage meltdown known as the Great Recession. Examining the upheavals is key to understanding how the landscape and laws of modern financial markets evolved and where they might be headed.
</br> With the Great Recession of 2007–2012, the United States experienced the biggest economic crisis and ensuing downturn since the crash of 1929 and Great Depression of the 1930s. While every boom-and-bust is unique, all share certain characteristics—most notably, the seemingly inexhaustible ability of humans to forget the lessons of financial history. This forgetfulness comes at great expense to society. This course provides a tour of the country's major boom-and-bust-cycles, with a focus on last century, and particularly the last three decades, when such events became more numerous. After each debacle, laws and rules changed. Executives must know what those changes are and the reasoning behind them, but they also will have a competitive edge in recognizing future crises if they remember and understand the events underpinning those of the past.
BU.231.620 OR BU.910.611 OR BU.920.604

BU.231.620. Corporate Finance. 2 Credits.
This course is designed to introduce students to the basic, yet fundamental, issues of modern finance. The goal of the course is to provide students with the basic tools needed to successfully complete more advanced finance courses. This course deals primarily with a firm's investment and financing decisions, and its interactions with the capital markets. Students are taught the fundamental principles of financial valuation and analysis, which provide a solid foundation for all other finance courses.
BU.210.620 OR BU.234.610

BU.231.710. Financial Institutions. 2 Credits.
The financial service industry plays a significant role in the economy and it continues to undergo dramatic changes. Financial institutions (FIs) perform the essential function of channeling funds from savers to users of funds. Financial intermediation is subject to a significant risk as the recent financial crisis vividly illustrated. The risk management of FIs is crucial not only in maximizing shareholders' value, but also in ensuring the stability of the whole financial system. In this course, students will acquire a working knowledge of (a) the function of financial intermediaries in the economy, and how this role has changed in the United States; (b) the sources of risks banks are exposed to (e.g., interest rate risk, market risk, credit risk, liquidity risk, sovereign risk) and how they manage them, and (c) elements of capital regulation.
BU.231.620 OR BU.910.611 OR BU.920.604

BU.231.720. Corporate Governance. 2 Credits.
The course is mainly about the practical implications of the principal-agent dilemma due to separation of ownership and control. The separation leads to conflicts of interest between the principals (shareholders) and agents (management) that results in increased risk. The value of a firm depends on good corporate governance practices that protects shareholders rights and lowers the cost of capital due to better risk mitigation. The set of good governance practices, rules, and regulations that attract investments and creates jobs, as well as effective environmental and socially responsible considerations promote opportunities for better access to finance and improve firm value. The three main topics in this course are the shareholders; the board; and the management. Topics cover executive compensation practices and policies, boardroom structure and practices, benefits and problems of corporate disclosure and transparency, and the value of the shareholder vote. The course also covers management abuses, takeovers, mergers and acquisitions, and the role of financial institutions and credit rating agencies. We emphasize transparency, accountability, responsibility, and fair and equitable treatment of all shareholders to help implement good corporate governance practices that reduce agency conflicts and reduce risk. Good corporate governance practices is about building the business case rather than simple compliance. A corporate governance scoring project demonstrates how a company's sustainable, socially responsible investing and governance (ESG) standing profile can be rated as an indicator for building investor confidence and ensuring shareholder protection.
BU.231.620 OR BU.910.611 OR BU.920.604

BU.231.740. Mergers and Acquisitions. 2 Credits.
This course explores the incentives for using mergers, acquisitions, divestitures, and alliances as vehicles to achieve corporate strategic objectives. Students address analytical techniques often employed in M&A, negotiation strategies, and valuation, and the evolution of M&A transactions. Also discussed are problems encountered in post-merger integration, and alternative modes of market entry, including joint ventures and internal development.
BU.231.620 OR BU.910.611 OR BU.920.604

BU.231.790. Advanced Corporate Finance. 2 Credits.
By employing a case study approach, students learn how the theoretical concepts and tools learned in Corporate Finance and other finance classes are applied in solving real-world problems. Through such key concepts as financial forecasting, cost of capital, capital budgeting, optimal capital structure, dividend policy, and firm valuation, students learn the analytical techniques necessary to make rational financial decisions.
BU.231.620 OR BU.910.611 OR BU.920.604

BU.232.610. Computational Finance. 2 Credits.
Modern financial markets are characterized by the widespread use of ever more powerful computational technology. The solutions to pricing, hedging, and portfolio allocation problems require familiarity with it, and so does effective trading in an age in which accuracy and speed are essential. This course teaches students the fundamentals of coding. The emphasis is on coding for inferential, modeling and simulation purposes. While class instruction will be based on MATLAB, one of the most popular programming platforms in the industry and the common language of choice for all courses in this program, students will also be exposed to other popular programming languages.

BU.232.620. Linear Econometrics for Finance. 2 Credits.
Linear Econometrics deals with the estimation of linear economic models. This is a quantitative class requiring strong foundations in multivariate calculus, matrix algebra, probability and statistics as pre-requisites. The course covers linear regression models with both finite-sample and large-sample inference. Topics include the univariate linear regression model, the multivariate linear regression model, regression functional form, conditional heteroskedasticity, weighted least squares, generalized least squares, instrumental variables, stationary and nonstationary time series models and linear panel regression models. Particular emphasis is placed on the notion of causality.
BU.510.601 OR BU.920.621

BU.232.630. Non-Linear Econometrics for Finance. 2 Credits.
Nonlinear Econometrics introduces advanced econometric tools needed to analyze financial data and build sophisticated nonlinear financial models. This is an advanced class requiring strong foundations in multivariate calculus, matrix algebra, probability and statistics as prerequisites. Linear Econometrics is also a pre-requisite. The course will cover methods of asymptotic (i.e., large-sample) inference in extremum (nonlinear) modeling. Among them, particular emphasis is placed on the generalized method of moments and maximum likelihood estimation. Simulation-based methods, like the simulated method-of-moments and indirect inference, will also be studied.
BU.232.620

BU.232.640. Empirical Finance. 2 Credits.
This course introduces students to the empirical methods used in financial econometrics. The techniques we study are employed by a wide range of institutions including commercial banks, non-banking financial companies, mutual funds, hedge funds, investment banks, as well as central banks, consulting firms and governments. Applications include the evaluation and backtesting of trading strategies, risk management and hedging, transactional analysis, and applications in regulation and policy making. The course draws on the econometrics sequence taught in the program but the emphasis is on how to use the techniques in actual applications such as event studies, the analysis of short- and long-run stock returns, multi-factor models, and the analysis of credit risk. The course embraces the traditional approaches in financial econometrics as well as predictive modeling from the data sciences and applications in "Big Data" environments. Students will learn about the typical datasets used in financial econometrics and learn how to design, code, and analyze the models used to analyze these datasets.
BU.232.620 AND BU.232.630

BU.232.650. Continuous Time Finance. 2 Credits.
This course provides a conceptual understanding of the basic ideas in mathematical finance and shows how these ideas are applied to practical situations, through the development and use of financial models. Mathematical abstractions are created which deal with issues including option pricing, risk neutrality, incomplete markets, stochastic volatility, and other responses to the realization of a variety of "unknowns". Topics include Ito calculus, options theory, martingale pricing, exotic options, jump-diffusion processes, and variance gamma models.
BU.232.710

BU.232.701. Investments. 2 Credits.
This course offers the financial theory and quantitative tools necessary for understanding how different kinds of financial instruments are priced and used for investment decisions. Rather than delving into the details of current practice, it takes a rigorous and critical view to the process of investing. The aim is to provide the students with a lasting conceptual framework in which to view and analyze investment decisions. Students learn how to value assets given forecasts of future cash flows and the risk characteristics of different asset classes. The focus is mainly on common stocks, but fixed income securities (bonds) and derivative securities (options) are also analyzed. Topics covered include: time value of money, optimal portfolio selection based on mean–variance analysis, economic and statistical models of the relation between risk and return (including the CAPM and multifactor models), term structure of interest rates, no-arbitrage derivative pricing, and market efficiency (including asset pricing anomalies and behavioral finance).
(BU.510.601 OR BU.914.610 OR BU.920.621 OR PH.140.611 OR PH.140.621) AND (BU.231.620 OR BU.910.611 OR BU.920.604)

BU.232.710. Derivatives. 2 Credits.
This course offers a rich overview of forwards, futures, swaps and options. The course will cover both the actual working of derivatives and the analytical tools needed to effectively understand derivatives. Skills are developed in pricing analysis, use of pricing models, trading, and hedging strategies. The strategies are developed to match specific economic goals, such as portfolio risk reduction.
BU.231.620 OR BU.910.611 OR BU.920.604

BU.232.715. Financial Stability. 2 Credits.
Financial stability has become an explicit objective of central banks around the world. The design of bank regulatory requirements increasingly focuses on mitigating systemic risk as a source of financial instability. Stress testing has emerged as a major risk management tool for both supervisors and banks. This course introduces the analytical underpinnings of the current methodologies to monitor and manage systemic risks. Key learning tools are in-class workshops and case studies drawn from central bank financial stability reports, rating agencies reports, and IMF financial stability assessments. Students will acquire a detailed knowledge of (a) the role of financial frictions in determining macro-financial linkages; (b) current methodologies of systemic risk measurement; (c) micro- and macro- prudential bank regulation; and (d) the architecture of banking system-wide stress testing exercises.
BU.510.601

BU.232.720. Fixed Income. 2 Credits.
Fixed Income securities represent the largest market in the world. However, given the complexity and the relative lack of liquidity in this market, we generally do not hear much about Fixed Income. This advanced course focuses on how to navigate the complexity of the global debt market in a practical way. The course covers major markets and instruments including treasuries, fixed income swaps, forwards, futures, term structure theories and risk management techniques. By completing the course, students will learn actionable concepts and tools about some of the major activities on Wall Street in terms of size and opportunities. The course is both theoretical and practical.
BU.232.701 AND (BU.231.620 OR BU.910.611 OR BU.920.604)

BU.232.725. Emerging Markets. 2 Credits.
What makes emerging financial markets different from those in the US, Western Europe, or Japan? What are the benefits of adding these markets to traditional investment portfolios? Why invest in certain countries versus others? Within a country, which asset class should we invest in - debt or equity? How do hedge funds approach these markets vs. traditional investors? From the practical perspective of a U.S. institutional investor, this course tries to help answer these questions. Through videos, readings, and problem sets, students should develop greater abilities to analyze global macro trends and country fundamentals, master portfolio construction concepts, and implement practical investment strategies.
BU.231.620 AND BU.232.701

BU.232.730. Wealth Management. 2 Credits.
This course provides strategies for coordinating financial planning for high-net-worth individuals. Students will become skilled at identifying and dealing appropriately with clients' goals, needs, and problems in the areas of investment and investment planning.
BU.231.620 OR BU.910.611 OR BU.234.610 OR BU.920.604

BU.232.750. Advanced Portfolio Management. 2 Credits.
This is an advanced course designed as a comprehensive study of primarily institutional investment analysis and portfolio management. It will approach investment management as a rational decision-making process based on the theoretical foundation and best practice techniques of investments. The course is presented to help understand how the basic theories of managing a portfolio of financial assets within the risk–return framework will be addressed. Due to the increasing globalization in the capital markets, portfolio management has become an international business. Thus, a good understanding of valuation of equities and fixed income securities, options and futures, and other investment instruments within a global setting is necessary to maintain optimal investment in this dynamic environment. The course emphasizes portfolio management as a dynamic process in which the concepts from security analysis are factored into the dynamics of strategic and tactical investment decision-making criteria. The course covers the formulation of appropriate investment portfolio objectives for a key institutional investor, and alternative techniques for achieving them. Determination and allocation of asset classes—including bonds, equities, and alternative investment instruments into efficient portfolios—will be discussed, along with such topics as portfolio optimization, risk management, asset selection and allocation, investment management, monitoring, and revising and rebalancing a portfolio. Finally, criteria for evaluating portfolio performance will be discussed. Students are encouraged to incorporate corporate social responsibility and sustainable investing concepts into class discussions and deliverables.
BU.230.620 OR BU.930.634

BU.232.770. Cryptos and Blockchain. 2 Credits.
This course introduces students to one of the most exciting financial technological innovation in modern time -- the Blockchain. Students will gain a strong understanding of how blocks are created and linked together by cryptography. Within this decentralized peer-to-peer ledger system, students will examine in detail its construction, immutability, and security with a keen focus on the potential benefits and weaknesses of its fundamental structure as applied to businesses and organizations. Moreover, students will learn how companies are applying blockchain technologies in practice. We will review the first use-case of the blockchain – Bitcoins. Additionally, the course will chart the evolution of Bitcoins to Ethereum and the advantages of Ethereum's smart-contract framework. Additionally, we will dive into the growing alternative crypto-currencies markets. Initial Coin Offerings (ICOs) will be discussed with focus on their potential implications for destabilizing traditional funding sources. The regulatory challenges and current ICO best practices will be reviewed and analyzed. We will be discussing this industry from the perspective of the academic, entrepreneur, investor, and software engineer. The course will be delivered by standard lectures, presentations, case study discussions, assignments, guest speakers, programming exercises in Python, group presentations, and a final comprehensive exam.

BU.232.790. Advanced Hedge Fund Strategies. 2 Credits.
This course surveys a broad range of hedge fund and proprietary trading strategies with an emphasis on understanding their fundamental investment process. Students will gain practical knowledge in regards to creating, back-testing, and implementing these strategies. There will be particular focus on the theoretical justification for the existence of inefficiencies or risk premium, and the successful extraction of them. The course will cover the gambit of popular hedge funds strategies, such as Long/Short, Event-Driven (Distressed, Risk Arbitrage), Equity Market Neutral, Statistical Arbitrage, Dedicated Short-Bias, Convertible Arbitrage, Emerging Markets, Fixed Income Arbitrage, Global Macro, Managed Futures, and Multi-Strategy. Particular attention will be placed on understanding the mechanics of the alpha-extraction methodology. An example of the type of question that will be addressed in this course is: What do hedge fund managers strive to capture, and how do they do it? Hidden risks and limitations associated with the implementation of such strategies will be highlighted throughout this course. Upon successful completion of this course, students should gain a firm understanding of the popular hedge fund trading strategies currently employed in the industry. This course is presented from a practitioner's perspective and will assume that students have knowledge of basic financial theory, portfolio construction, arbitrage concepts, return calculations, statistics, and financial instruments and derivative products. The class projects will be highly quantitative and will require that students be able to analyze and manipulate market data using statistical and mathematical modeling techniques.
(BU.231.620 OR BU.910.611) AND BU.232.701

BU.233.730. Entrepreneurial Finance. 2 Credits.
This course introduces students to identifying, accessing, and evaluating sources of financing for start-ups and expanding technology companies. The approach uses case studies, group interaction, and presentations from experts in the field. Attention will be given to financial theory, risk assessment, valuation options, term sheets, due diligence techniques, and the setting up of financial reports for monitoring progress toward meeting milestones.
BU.231.620 OR BU.910.611 OR BU.920.604

BU.300 (Information Systems)

BU.300.620. Managing Complex Projects. 2 Credits.
This course aims to equip you with effective techniques, methods, and practices for defining, scoping, and planning a project, and then managing it to successful completion. Special areas of emphasis in the course are driven by practical experiences with large and complex projects frequently being late, over budget, and failing to meet specifications. We will pay particular attention to understanding project complexity, risk, and uncertainty so that you are prepared to address these challenges to success. You will gain experience using a leading project management software package.

BU.300.700. Developing Internet Systems and Services. 2 Credits.
The subject of this course is the development of services that are delivered over the Internet: system feature specification, design, user interface, implementation, and the role of development environments. Increasingly the delivery of services and user access to them is driven by considerations of third-party development, user platform specifications, security, privacy, and performance. Much of the focus of contemporary development is on mobile apps, reflecting the changing modes of behavior and expectations of users for instant availability of highly special-purpose and location-aware applications. This course will consider these trends and their implications for design and development.

BU.330.705. Data Networks: Infrastructures & Emerging Technologies. 2 Credits.
This course covers technological advancements in telecommunications and emerging wireless mobile systems, with emphasis on their business application: how the nature of these advances are driving business models and amplifying the strengths of today's firms; how businesses can select, integrate, and apply telecom and emerging mobile systems and cloud services into their business processes to maximize their value creation value capture, and value delivery. Business applications and contents delivered by mobile systems in public and private sectors – such as in healthcare services (mHealth), in financial and banking industries (mCommerce), mobile money and credits in social entrepreneurship will be covered. Analysis and selection of the needed telecom and mobile technologies, necessary to support business applications and processes, are examined. This course enables the students to gain an in-depth understanding of different telecom network systems, their developments and international standards. Finally, managerial, business critical, and technical issues such as technology evaluation, cost vs. performance trade-offs analysis, requirements analysis and vendor selection as they are needed by today's commercial and public organizations are covered.

BU.330.710. Cybersecurity and Data Vulnerabilities. 2 Credits.
Cybersecurity Information vulnerabilities enable cyber attacks against organoization's didital enterprize systems. In this course, we will introduce the notions and of enterprize systems and software weaknesses, vulnerabilities, and attacks; the corresponding real-world repositories; and the NIST Bugs Framework (BF). Then we will discuss the basic principles and the weaknesses related to information exposure, memory management, access control, random number generation, and the use of cryptography to achieve security services. You will learn about the involved processes and flows via the BF models and the related BF classes. Finally, you will learn to identify, analyze, and clearly and precisely describe real-world vulnerabilities.
BU.350.620

BU.330.730. Cybersecurity. 2 Credits.
This course considers the contemporary cybersecurity threat landscape facing organizations. Students apply various risk frameworks to provide structure to the decision-making needed to invest in resources for security controls and countermeasures. Multiple strategies are explored, including policies, procedures, training, strategic alliances, technologies, and methodologies, especially drawing upon risk management and financial decision-making that are used in other sectors of an organization. Topics include qualitative and quantitative risk analysis, audits, metrics, vulnerability assessment, capital budgeting, return on security investment, legal and regulatory compliance, and security best practices. The course will prepare students to be successful in taking on leadership roles in assuring the security of an organization's operations.

BU.330.740. Large Scale Computing with Hadoop. 2 Credits.
Internet of Things (IoT) is connecting almost all the components together in every aspect of business and our daily life. As a result, huge amount of data is being generated. The term "big data" implies the large scale of data that cannot be stored on one single computer. The analyses of such large-scaled data usually require massively parallel software running on tens, hundreds, or even thousands of servers. Enterprise technology managers are often called upon to organize large-scaled data repositories, to manage and schedule resources between technology components, and to support decision making based on information that resides in distributed data sources. This course prepares students with fundamental concepts of distributed data systems and analytics algorithms. It equips students with advanced techniques to extract the value from the large-scaled data generated and collected in everyday business life. The course uses a hands-on, learning-by-doing approach to understand some of the key technologies within the Hadoop ecosystem, which is the current state of art to provide a framework for distributed storage and processing of large-scaled data. Topics include: enterprise Application Programing Interfaces (APIs), API connectivity to distributed networks, MapReduce model, distributed file system (HDFS), distributed system resources scheduling (Yarn) and user interface (Hue), transferring data in and out of Hadoop (Sqoop), distributed data warehousing (Hive), and high-level distributed platforms such as Pig and Spark. The focus is on creating awareness of the technologies, allowing some level of familiarity with them through assignments, and enabling some strategic thinking around the use of these in business.

BU.330.750. AI: Principles and Business Applications. 2 Credits.
This course covers the foundations of Artificial Intelligence (AI) technologies with emphasis on their business application. It will cover models of machine learning and pattern optimizations. This course will enable the student to gain a fundamental understanding of the foundations and applications of different AI technologies, analysis of the required AI algorithms and machine Learning technologies, necessary to support different business applications. It will require basic uses and applications of an AI tool's (IBM Watson, Python, or R,), however, it does include teaching software coding.

BU.330.760. Deep Learning with Unstructured Data. 2 Credits.
With the enterprises' usage of Information and Communication Technology (ICT), a huge amount of data is being generated every second. Much of this big data is unstructured and loosely connected. Enterprise technology managers are often called upon to support decision making based on information that resides in this unstructured data. Managers of technology need to be able to support such decision making by delivering analytical applications via enterprise wide APIs and secure corporate networks. The ability to organize large repositories of unstructured data and run analytical applications on them is key creating an effective information architecture for the modern corporation. This course prepares students to manage enterprise technology needs by acquiring advanced data analytics skills for driving business insights from large amounts of unstructured data using network analysis and deep learning. The technology function in corporation is increasingly called upon to involve both managers and analysts to support and participate in data driven decision making. Therefore, this course uses a hands-on, learning-by-doing approach. Topics include: organization of corporate data warehouses containing unstructured data, unstructured data distribution through enterprise APIs, graph theory, network evolution and block models, API-based visualization methods, graphical models, deep feedforward network, regularization, convolutional neural network, and recurrent neural network. Students will use Python packages such as NetworkX, graph-tool, TensorFlow, Theano and Keras. Students will also use Gephi, an open source software for exploring and manipulating networks. The focus is on creating awareness of the technologies, allowing some level of familiarity with them through assignments, and enabling some strategic thinking around the use of these in business.

BU.330.770. Database Management. 2 Credits.
The emerging trend of organizations and business decision making is based on data-driven decision making. In fact, database systems are central to most organizations' information systems strategies. At any organizational level, users are expected to face frequent contact with and use of database systems. Therefore, skills in using such systems, which include understanding the capabilities and limitations of the systems, identifying whether to access data directly or through technical specialists and knowing how to retrieve and utilize the information effectively became essential in any industry vertical. Also, skills in designing new systems and related applications are distinct advantage and necessity today. The Relational Database Management System (RDBMS) is one type of database systems, which is widely used and is the primary focus of this course. Further, the course will provide students with an opportunity to apply the knowledge they learn from the lectures, homework assignments, SQL assignments, and a database implementation project.

BU.330.780. Data Science and Business Intelligence. 2 Credits.
This course introduces a set of fundamental principles and a framework that guide extracting business insights from data to generate competitive advantage. We will discuss how the ubiquity and massiveness of digital data and the application of business intelligence have changed competitive landscapes. The business intelligence techniques that will be covered in this course include data visualization, online social network and sentiment analysis (for user-generated content), and predictive analytics (e.g. classification and clustering), which are widely used in the real world. The topics and cases discussed in this course cover a wide range of fields, including marketing, finance, healthcare, and more. This course is not a statistics or computer programming course. The emphasis will be on applications and interpretations of the results from business intelligence techniques for making business decisions. Students will apply these techniques in hands-on exercises as we analyze strategic concepts, which will allow students to deepen their understanding of the fundamentals and the applicability of business intelligence.
BU.510.650

BU.330.790. Applied IS Architecture. 2 Credits.
This course provides students with an integration over prior learning and an application of IS principles and practices in a challenging setting of a significant case or real organization. Within this project-based context, students investigate contemporary information systems and technology architectures that constitute operational and productivity platforms for modern enterprises.
BU.330.705

BU.350.620. Information Systems. 2 Credits.
This course addresses how markets, market mechanisms, and channels of product and service delivery are impacted and often transformed by information and communication technologies. Students will learn how technology, brought together with people and processes into systems, contributes to leveraging the creation of business value. The course considers different elements of the information architecture of the corporation and its impact on the nature of the work and the structure of the corporation.

BU.350.710. IT and Global Sourcing Strategy. 2 Credits.
This course covers information technology developments and global-sourcing strategies. Specifically, it includes two interrelated topics. First, it covers strategic planning models in which it examines business and corporate strategies which require students to assume the role of a general manager or chief technology officer (CTO) where they have to cope with tremendous complexity, uncertainty, and inadequate information to make strategic decisions. Second, this course covers how advances in telecommunication technology along with the process of global collaboration and value creation enable the creation and delivery of new products and services. The course also explores various country evaluations and risk analyses techniques, and the opportunities and threats that business organizations face as a result of these business and technological trends. Finally, this course examines various global-sourcing and collaborations strategies, the role of standardization in global supply chains integration, and how technology influences new forms of value creation such as public-private partnerships and hybrid entrepreneurial forms in developing economies and how their businesses can develop capabilities, capacities, and competencies required to participate in global collaboration and value creation networks.
BU.350.620

BU.360.701. Competitive Intelligence. 2 Credits.
Competitive Intelligence (CI), as defined by the Society of Competitive Intelligence Professionals (SCIP), is a systematic and ethical program for gathering, analyzing, and managing external information that can affect an organization's plans, decisions, and operations. Students learn to apply the CI process and CI-related methodologies, techniques, and tools to better analyze an organization's current and future competitive position. Students apply analytical and socio-technical techniques to improve organizational decision making as related to CI, and should understand the issues related to the collection, analysis, and management of external information.

BU.410 (Marketing)

BU.410.601. Marketing Research. 2 Credits.
This course is an introduction to fundamental concepts, processes and techniques in marketing research. The goal is to enable the students to apply these tools to solve real world problems and to differentiate good research from bad research. The topics in this course cover the whole research process from defining research problems, selecting appropriate research designs and research methods, conducting data analysis to making strategic recommendations. The course will also build on the foundations of statistics and introduce more advanced statistical tools relevant for marketing decision making.
(BU.410.620 OR BU.911.610 OR BU.920.605) AND (BU.510.601 OR BU.914.610 OR BU.920.621 OR PH.140.611 OR PH.140.621)

BU.410.620. Marketing Management. 2 Credits.
This course covers principles of market-driven managerial decision making that determine competitiveness in dynamic consumer and organizational markets. Particular areas of emphasis include industry analyses, dynamics of competition, market segmentation, target marketing, channels of distribution, and product and pricing decisions. In-depth analytical skills are developed through case analyses, class discussions, and applied projects.

BU.420.710. Consumer Behavior. 2 Credits.
This course provides students with a solid foundation in consumers' decision making based on theoretical and empirical findings from the fields of psychology, anthropology, and sociology. Topics include consumers' knowledge and involvement, attention, comprehension, learning, attitude, and purchase intention. Emphasis on cognitive learning, social influence and persuasion, and behavioral science provides an overview of the various methods used to drive behavioral change and social impact when marketing products, services and social issues. Also explored is the practical impact of consumer behavior analysis on marketing mix strategies, market segmentation/positioning, brand loyalty, persuasion process, and promotion.
BU.911.610 OR BU.410.620 OR BU.920.605

BU.420.720. Customer Relationship Management. 2 Credits.
Students investigate the critical role and impact that customer relationship management (CRM) plays in marketing and business decision making. Topics include CRM history and evolution, database marketing, big data, customer lifetime value, predictive modeling, analytics, key performance indicators (KPIs), multichannel customer management, and CRM platform systems. Course content begins with the definition and overview of CRM, and then proceeds to detail the evolutionary trend from database management to the current use of big data and analytics in the multichannel environment. Students are expected to understand how data can be leveraged by marketers to quantify marketing results, forecast marketing goals, and realize marketing objectives. The course in divided into three sections: (1) Customer Centricity & Data Evolution; (2) Leveraging & Quantifying Data; and (3) CRM Management.

BU.420.730. Advanced Behavioral Marketing. 2 Credits.
Marketing, in particular, begins and ends with the consumer – from determining consumer needs to ensuring customer satisfaction. In this advanced behavioral marketing course, we will explore classic as well as the most recent scientific research in marketing, psychology, and behavioral economics on judgment and decision-making. Readings will include primary empirical research articles, business journal articles, and research reviews. We will develop your ability to understand and influence what people want, how people decide what and when to buy, and whether people will be satisfied or dissatisfied with their decisions. These psychological insights are not only particularly useful for marketing management decision making such as target marketing, brand positioning and marketing communication, but also shed light on common decision biases beyond marketing. In addition, we will examine the methodology of behavioral research to build the tools you will need to interpret scientific findings and base decisions on them.
BU.410.620 OR BU.911.610 OR BU.920.605

BU.430.710. Branding and Marketing Communications. 2 Credits.
A brand is a name, term, sign, symbol, or design—or a combination of these—intended to identify the goods and services of one seller or group of sellers, and to differentiate those of the competition. The essence of formulating competitive strategy is relating a brand to its environment. Although the relevant environment is very broad, encompassing social as well as economic forces, the key aspect of the brand's environment is the industry(ies) in which it competes. Therefore, the goal of competitive strategy for a brand is to find a position in the industry where the brand can: 1) articulate a compelling value proposition, 2) defend itself against competitive forces, and 3) leverage communication resources to sell the brand message and build brand equity. In this course, students examine how a favorable brand and memorable brand experiences can influence a firm's ability to withstand competitive pressures and thrive in dynamic market conditions. Students will study brand management from the consumer perspective to highlight the importance of customer perceptions in bringing brands to life and the role of brand knowledge in building brand equity. Students will become acquainted with cutting-edge frameworks, concepts, and tools that have been adopted across industries and around the globe to build lucrative brand franchises. Additionally, students will consider the role of marketing communication vehicles and platforms in effective brand management.
BU.410.620 OR BU.911.610 OR BU.920.605

BU.430.720. Pricing Analysis. 2 Credits.
Pricing is one of the most important and least-understood business decisions. This course aims to equip students with proven concepts, techniques, and frameworks for assessing and formulating pricing strategies. The objective is to prepare students for addressing strategic and tactical pricing issues and identifying profit-boosting changes in pricing practices across a range of professional contexts – as product/service managers, business unit managers, management consultants, entrepreneurs and M&A advisors.
(BU.410.620 OR BU.911.610 OR BU.920.605) AND (BU.510.601 OR BU.914.610 OR BU.920.621 OR PH.140.611 OR PH.140.621)

BU.430.740. Sales Force Management. 2 Credits.
Sales is changing rapidly. In 2011, customers were completing 57% of the buying process before engaging a sales professional. Today, this proportion has passed 70%. In the face of well informed and digital-enabled customers, it is critical to engage them and to lead the sales process both during the 70% portion (i.e., digital-world sales process), and the 30% portion (i.e., physical-world sales process). A modern and well-staffed sales function and full knowledge of sales force management thus is vital for business success. This course takes a close examination into sales force management strategies with a hands-on approach through simulation, role playing, case studies, readings, and interaction with marketing professionals who are engaged in the dynamics of modern sales force management.
BU.410.620 OR BU.911.611

BU.450.710. Marketing Strategy. 2 Credits.
This course provides students an in-depth understanding of marketing strategy. It is designed to help students experience the role of senior business executives in formulating, implementing, and evaluating marketing strategies for a variety of complex, real-world business scenarios. Students will analyze and learn the key factors underlying the successful and lackluster marketing strategies of both major corporations and smaller firms across different industries, across different tiers of brands and products (luxury versus mass-market), and across the globe. Topics covered include industry and market analyses, dynamics of competition, value creation, branding, segmentation, targeting, positioning, product development, pricing, distribution, and promotion. Through case analyses, in-class discussions, course assignments, and a research project, students will develop skills in devising, executing, and evaluating marketing strategies, as well as working in teams on complex business projects.
BU.410.620 OR BU.911.610 OR BU.920.605

BU.450.740. Retail Analytics. 2 Credits.
The retail and service sector is the largest of all economic activities and evolving rapidly in the age of big data and Artificial Intelligence. This course will leverage data-driven tools and theoretical models to analyze decisions of retail firms. We will cover a wide range of topics in strategic decisions in retailing: pricing, location, franchising, and omni-channel retailing. Using the real data in retailing, we will demonstrate and implement a wide range of statistical methods in econometrics and machine learning: single and multi-variate linear regressions, logistic regressions, classification trees, random forest, and multi-layer neural network. The focus is on predicting the effects of marketing decisions on profitability, although we will touch on causality as well. The questions this course will explore includes:How is the landscape of retailing changing in the age of Artificial Intelligence and big data?What is the right price and promotion in presence of competitors?How should a retailer choose a store location?How does omni-channel retailing influence the way shoppers move through all channels in their search and buying process?This class is practical and hands-on. All strategic decisions in business require a quantitative assessment of cause and effect. Each week we will introduce a new data set and data-driven tool that is valuable in the context of data scientists in retailing. You will learn how to perform convincing data analyses to answer specific questions. We will use R and ArcGIS for analyzing data. We do not assume that you have used R or ArcGIS, software for statistical and geographical analyses, respectively, in a previous class. For potential overlaps with other courses, we will cover them at a faster pace and emphasize techniques that are not covered in other courses.
(BU.510.601 OR BU.914.610 OR BU.920.621 OR PH.140.611 OR PH.140.621) AND (BU.410.620 OR BU.911.610 OR BU.920.605)

BU.450.750. Strategic Market Intelligence. 2 Credits.
This course is focused on understanding advanced issues in marketing strategy and processes that determine marketing competitiveness in dynamic consumer and organizational markets. An important objective of the course is to teach students the skills of anticipating competitor's next marketing moves and incorporating them when setting own marketing strategies. Students will learn to apply game theoretic tools in various marketing contexts to understand the strategic implications of competitor's as well as own marketing decisions. Students will also learn strategies to help them make effective decisions when lacking important information and facing an uncertain market environment.
(BU.410.620 OR BU.911.610 OR BU.920.605) AND a basic understanding of microeconomics is recommended

BU.450.760. Customer Analytics. 2 Credits.
This course introduces students to the modern practice of customer analytics. Its main goal is to illustrate how marketing practitioners can improve decision-making by leveraging scientific approaches in the analysis of big data. Leading analytical techniques and data structures are illustrated in the context of their most prominent applications. For example, predicting customer responses to marketing campaigns, and managing customer churn. The class has a strong "hands on" component, enabled by several in-class examples and group assignments (implemented on Microsoft Excel and the statistical language "R"). Students are not expected to become expert programmers or statisticians, but to acquire basic skills and knowledge to orchestrate an effective analytics strategy, given the firm's goals.
(BU.510.601 OR BU.914.610 OR BU.920.621 OR PH.140.611 OR PH.140.621) AND (BU.410.620 OR BU.911.610 OR BU.920.605)

BU.450.765. Social Media Analytics. 2 Credits.
The rapid growth of social media has given the mass consumers a powerful tool to create knowledge and propagate opinions. At the same time, social media has created an unprecedented opportunity for companies to engage real-time interactions with consumers. In addition, the size and richness of social media data has provided companies an unusually deep reservoir of consumer insights to transform the business and marketing operations. The social media analytics course will enable students to grasp the analytics tools to leverage social media data. The course will introduce tools such as engagement analytics, sentiment analysis, topic modeling, social network analysis, identification of influencers and evaluation of social media strategy. It will involve lots of hands-on exercises.
(BU.510.601 OR BU.914.610 OR BU.920.621 OR PH.140.611 OR PH.140.621) AND (BU.410.620 OR BU.911.610 OR BU.920.605)

BU.460.700. Integrated Digital Marketing. 2 Credits.
Integrated Digital Marketing is a course designed to give the student an understanding of the digital marketing environment and how it functions. This course is intended to prepare students for the complexities and nuances of the digital world and provide them with foundational skill-sets that will translate into business value. The course will cover a wide spectrum of topics, including the history of the Internet, new and emerging digital trends, website design and development best practices, digital marketing campaign design, digital analytics, channel decision making, e-marketing research, digital positioning and branding, social network management, and digital messaging/creative best practices. Lectures, readings, case discussions and project assignments will offer both a digital agency management and an end-user perspective. Timely case studies, relevant text materials, digital marketing tools and group projects are used to augment the lectures and gain hands-on experience in the digital space.
BU.410.620 OR BU.911.610 OR BU.920.605

BU.460.710. Business-to-Business Marketing & Channel Strategy. 2 Credits.
This course provides a managerial introduction to the strategic and tactical aspects of business marketing decisions and marketing channel strategy. Students examine the strategic concepts and tools that guide market selection, successful differentiation in business markets, and supply chain management. A mixture of lectures, discussions, cases, videos, and readings are used to examine how product and service decisions are designed to deliver the B2B value proposition, how pricing captures customer value, how value is communicated to and among customers, and how marketing channels are used to make this value accessible to target customers. Students will compare and contrast how the strategic and tactical processes of developing and managing value-generating relationships differ between B2B and B2C markets. Students will also gain understanding of how to manage channel power, conflict, and relationships.

BU.460.730. New Product Development. 2 Credits.
While developing new products and services is vital to the growth to any company, it is also one of the most risky business decisions. This course examines the strategies and processes used by leading companies for successful new product development. Identifying consumers' pain points is the starting point. Practical techniques were introduced to navigate the processes of ideation, market analysis, new product development, and commercialization. Real-world examples were presented to showcase the applications of these concepts and techniques.

BU.510 (Quantitative Methods)

BU.510.601. Statistical Analysis. 2 Credits.
Students learn statistical techniques for further study in business, economics, and finance. The course covers sampling distributions, probability, confidence intervals, hypothesis testing, regression and correlation, basic modeling, analysis of variance, and chi-square testing. The course emphasizes statistics to solve management problems. Case studies, spreadsheets, and Excel Add-in Data Analysis ToolPak computer software are used.

BU.510.615. Python for Data Analysis. 2 Credits.
This is an introductory course in using Python for analytical purposes. Python (www.Python.org) is a general-purpose cross-platform programming language that has a strong presence in the diverse areas of analytics. This course will provide a pragmatic and hands-on introduction to the fundamental aspects of Python programming language with a focus on data exploration, analysis, and driving insights from data. Additionally, towards the end of the semester, students will be exposed to using Python for introductory optimization and machine learning. Class time will be used for short overview lectures followed by analysis of worked-out examples and in-class coding exercises. As the course progresses, students will learn to work with libraries such as statistics, random, numpy, scipy, pandas, matplotlib, seaborn, and plotly. By the end of this course, students should be able to start writing useful Python programs on their own or to understand and modify Python code written by others. Additionally, they should have a solid understanding of forecasting using time series.This course is an introductory Python course for students with a working statistical analysis knowledge. It does not assume any prior coding experience. If you have an extensive knowledge of Python, you might experience significant repetition.Starting the 3rd week, students will be exposed to basic time series analysis. Not only does time series analysis have a strong presence in all areas of business; it also provides a rich context for practicing Python's data handling capabilities (from applying a regression model for forecasting to data aggregation, dataset merging, slicing, and grouping). Time series analysis theory will be covered via a pre-recorded video; students are required to watch the videos prior to each class. The instructor will briefly review this theory at the beginning of each lecture; the majority of the lecture will be spent on learning and practicing Python's capabilities.

BU.510.650. Data Analytics. 2 Credits.
This course prepares students to gather, describe, and analyze data, using advanced statistical tools to support operations, risk management, and responses to disruptions. Analysis is done targeting economic and financial decisions in complex systems that involve multiple partners. Topics include probability, statistics, hypothesis testing, regression, clustering, decision trees, and forecasting.
BU.510.601 OR BU.914.610 OR BU.920.621 OR PH.140.611 OR PH.140.621

BU.520.601. Business Analytics. 2 Credits.
Business analytics makes extensive use of data and modeling to drive decision making in organizations. To become a leader in a data driven world, it is therefore critical to acquire hands-on experience of both data-related (statistical) and modelling skills. This class focuses on the latter: it introduces students to analytical frameworks used for decision making to make sense of the data. The methodologies covered include Linear and Integer Linear Programming, Decision Analysis, Foundations of utility and risk, and Monte Carlo Simulation. For each topic/methodology students are first exposed to the basic mechanics of the framework, and then apply the methodology to several business problems using software.
BU.510.601 OR BU.920.621 OR PH.140.611 OR PH.140.621

BU.520.620. Advanced Business Analytics. 2 Credits.
This course trains decision makers to function in the face of multi-dimensional uncertainty, through the development and use of optimization models. Mathematical abstractions are created which deal with issues including resource allocation, scheduling, pricing, and other responses to the realization of a variety of "known unknowns". Topics include linear programming, dynamic programming, multi-criteria optimization, and non-linear optimization.
BU.520.601 OR BU.913.610 OR BU.920.711 OR BU.920.721

BU.520.650. Data Visualization. 2 Credits.
This project-based course prepares students to make informed decisions based on data using descriptive-analytical techniques. Students will view examples from real-world business cases in which data visualization helps the decision makers to visualize, discover, and decode the hidden information from within the data, and to exploit such information for making educated decisions. We will use R to import, clean, transform, analyze, visualize, and present data. It is assumed that students have basic knowledge of programming in R prior to taking this class. As the course progresses, students will learn to work with libraries such as readr, tidyr, ggplot2, leaflet, and shiny in R. During the eight weeks of the course, students will collaborate with each other in small teams to analyze real-world datasets as well as design, build, and deliver web applications containing interactive visualizations and dashboards. Topics include cognition and visual perception, design principles, fundamental charts, interactive visualizations, storytelling in dashboards, and maps and big data visualization.
BU.510.650 OR BU.450.760 OR BU.330.780

BU.610.615. Simulation for Business Applications. 2 Credits.
This course provides a foundation for applying Simulation in managerial decision making in all areas of an organization. These decision areas could be in both predictive and prescriptive analytics area. Students learn to build quantitative models, in the presence/absence of reliable data, for quantifying and understanding impact of uncertain future on performance metrics under consideration. Simulation constructs probabilistic estimates of quantities of interest such as net present value of an investment, rate of a disease spread under a certain policy, or cost and time of a mega-project. This provides a very insightful information for decision makers to evaluate risks involved and make decisions accordingly. Results of Monte Carlo Simulation could be used for short-term and strategic planning of an organization. @Risk software package will be used for this part of the course. Additionally, in real world complex problems, where closed-form solutions, offered by classical mostly deterministic optimization methodologies, are not readily available/ reachable, Simulation enables decision makers to see the distribution of all possible outcomes as a function of underlying uncertainties and using simulation-optimization methodology to make the best decision in the presence of uncertainty. Students will learn RiskOptimizer for this part of the course.
BU.520.601 OR BU.232.620 OR BU.920.711 OR BU.920.721

BU.550 (Business of Health)

BU.550.620. The U.S. Health Care System: Past, Present, and Future. 2 Credits.
This course provides an overview of the health care delivery system in the United States, and explores the drivers of change over time that shape the organization and delivery of healthcare services and opportunities for innovation and improvements in the cost, quality, and access dimensions of health care services. The course considers the paradox of the U.S. health care delivery system, and how large expenditures on health care have not resulted in best outcomes due in part to issues of cost, access, and quality.

BU.555.710. Applied and Behavioral Economics in Health Care. 2 Credits.
This course covers the application of economic theory to health care markets and decision-making. It explores the economic analysis of the health care industry across the continuum of care, including the role of non-profit and for-profit providers, the nature of competition, the effects of regulation and antitrust activity on hospitals, the effects of alternatives to hospital care and shifting of services between inpatient and outpatient settings and its effect on health care costs and quality. The course builds on analytical tools of economics applied to issues in health care to explore the use of economic incentives to influence health behavior, the role of asymmetric information and agency in health care, the role of decision-making biases as they apply to health care, the incentive implications of government as payer and regulator, issues surrounding equity and ethics, the role of health insurance in the economics of pricing, and the theory of the firm as it applies to physicians, hospitals, and systems.
BU.220.620 OR BU.912.610

BU.881.700. Health Care Overview Bootcamp.
This case-based course provides an overview of the strategic and policy challenges of delivering health care around the world, summarizing the philosophy, pedagogical approaches, and courses in the program. Over a two-week introductory period, discussions will focus on the 4 Managerial Skills (Sense Making, Problem Solving, Sense Giving, and Global Mindset) and 4 Strategic Pillars (Quality, Access, Cost, and Innovation) that leaders in the industry require to achieve the triple aim of high quality, efficiency, and optimal health outcomes.

BU.881.701. Fundamentals of Health Care Systems. 2 Credits.
Nationally organized health systems around the world seek to ensure comprehensive access to health services, improve the quality of care, and contain the growth of health care expenditures. This course provides an overview and synthesis of the four major models of national health systems in five different countries, and the challenges and opportunities for developing and strengthening these systems to maximize population health and the market dynamics for health care products and services under these different models.

BU.881.702. Frameworks for Analyzing Health Care Markets. 2 Credits.
This course introduces students to basic economic concepts and the language used to analyze market structure, conduct, and performance, as well as nonmonetary outcomes including health outcomes and distributional issues. Students learn to discuss system changes and challenges faced by health care providers and patients, facility managers, insurers, and product manufacturers. Lectures and cases explore the drivers of costs, prices, access, innovation, and outcomes.

BU.881.703. Health Care Law and Regulation. 2 Credits.
This course provides students with an overview of the legal environment as it affects medicine and business. Cutting-edge cases are utilized as students explore medical malpractice, negligence, liability (physician, product, and corporate), criminal aspects of health care including fraud and abuse, patient consent and rights, and the current state of health care reform. This is the foundational course in the health services management curriculum.

BU.881.704. Providers and Payers. 2 Credits.
This course focuses on strategies and tactics for provider networks and payers to manage resource constraints as well as insurance and reimbursement issues in order to deliver quality, ethical, and efficient care. Interactions between providers and payers are a critical topic, along with how these interactions lead to changes in health care provision and policy change.

BU.881.705. Health Marketing and Access. 2 Credits.
This course focuses on how standard marketing techniques do, and do not, apply within the health sector, which poses several important constraints and challenges. Students explore the implications of these for marketing analysis, tactics, and strategy. We do so by reviewing existing applied work within the topic area of health care marketing and by leveraging students' experiences in this sector. The main topics covered include product, pricing, distribution and communications to patients, providers, and external stakeholders, such as regulators and nongovernmental organizations. Other topics of discussion include the role of marketing to encourage access; pricing as part of decisions on access; and the role of marketing communication to foster community health.

BU.881.706. Health Innovation and Evaluation. 2 Credits.
This course focuses on emerging models of health care provision, including the role of information technology, mobile technologies, point of care diagnostics on a chip, health care at home, telemedicine, and technology-mediated innovations in health care for both consumers and providers. The course discusses various models of evaluation and how health care innovation is valued, funded, and commercialized.

BU.881.707. Accounting for Decision Making in Health Care. 2 Credits.
This course offers an introduction to the most used tools and techniques of health care accounting, and financial management from a decisional perspective. It is intended to expose students to health care accounting theory, and practice, so as to enable enhanced decision-making at the executive level. The primary objective of this course is to impart financial, and managerial accounting knowledge required in managing contemporary health care organizations. The teaching approach will be to provide fundamental concepts of healthcare financial management, including both accounting and financial management principles with emphasis on the current financial environment in which providers operate. The course will be structured in a way accounting information could be interpreted, and applied to better understand operational efficiency, financial soundness, and strategic opportunity. Mobilization of financial statements, cost reports, and budgeting information will be articulated to support optimality of the managerial decision-making process. Case studies, and other real live anecdotes will be used to supplement concepts, and enhance comprehension.

BU.881.711. Research and Policy Seminars in Health. 2 Credits.
These seminars — led by faculty experts from around the Johns Hopkins University such as the School of Medicine, Bloomberg School of Public Health, and School of Nursing — focus on current issues and cutting-edge research related to health care. Deliverables include a research paper on a topic approved by the instructor, and a reflection paper of a personal development plan for how the student will keep abreast of the field.

BU.883.701. Fundamentals of Health Care Operations. 2 Credits.
This course focuses on designing, measuring, and improving processes that deliver care in both inpatient and outpatient settings. The course provides an introduction to process analysis, queuing theory, capacity management, cost measurement, and the metrics of process flow.

BU.883.702. Health Information Technology. 2 Credits.
This course examines health care organizations from the perspective of managing the information systems that exist within the enterprise. Identifying the clinical and health care delivery processes and how they relate to information systems is the main focus. The intent of the course is to identify key issues confronting the management of today's health care information systems and health care organizations, examine their causes, and develop reasonable solutions to these issues. Specific federal regulations, vendor solutions, and financial implications as they relate to health care information systems are also examined.

BU.883.703. Medical Devices and Diagnostics. 2 Credits.
The goal of this course is to provide the latest market trends and industry analysis for products, services, and technologies in the medical device and diagnostics industry, as well as an assessment of market needs in the context of changing global demographics. The course discusses the barriers to and triggers for innovation with reference to the role of culture, regulation, cost effectiveness, and appropriate pricing. Students are introduced to medical device innovations across various geographic markets and industry sectors.

BU.883.704. Pharmaceutical Strategy. 2 Credits.
Based on an overview of scientific, clinical, legal, financial, strategic and ethical perspectives, this course focuses on new strategic developments in the pharmaceutical industry. Topics covered include business strategies in research and development, intellectual property, clinical trials and getting approval from regulatory bodies, pricing, reimbursement and marketing in the pharmaceutical industry. It explores fast evolving market models for innovation in the pharmaceutical industry in the context of changing global demographics. This course assumes students have basic knowledge of the US Healthcare system through previous work or course experience and/or BU.550.620.

BU.883.705. Health Care Financing and Financial Management. 2 Credits.
This course covers the analysis of the major financial decisions of corporations in the health care industry and application of techniques of corporate finance in the health care industry. Financial and operating decisions in the health care industry are discussed, as are the valuation of profitability and cost performance of service and product lines, the impact of cost containment and competition on hospitals and integrated delivery systems and other providers, modeling of cost drivers in health care including cost and production functions, cost accounting systems, and the concept of price and value. This course also covers managed care and risk management in relation to the relative roles of private sector and public sector insurance and providers, and the effect of delivery system design on cost, quality, and efficiency and equity. Topics related to the payment for the elderly, the poor, medically indigent, and the underinsured are also discussed. Finally, innovations such as insurance exchanges and changing models of employer self-insurance are explored.

BU.883.706. Health Care Organization and Management. 2 Credits.
The overall goal of the course is to increase student effectiveness in understanding and managing individuals and teams. These tools are essential to improve operations and consumer outcomes. The specific aims of the course are to enable students to a) learn theories and concepts in organization behavior and health care management, b) integrate theories with real world situations, c) learn to understand perspectives and value of health care management, and d) develop the ability to work productively with diverse teams. Students will develop the knowledge and skills to analyze strategic issues in health care organizations. Topics that will be discussed include management styles, performance improvement, culture, change, and leadership. We will draw on several sources to meet the course objectives, including conceptual and experiential approaches, case studies, role plays, and exercises.

BU.883.707. The Wire: Business Solutions for Community Health Improvement. 2 Credits.
This course provides students with the opportunity to study "business with humanity in mind" using Baltimore as a case study of the effects of the long-time economic decline of a city on the health status and quality of life of the people who live in it. We will study social determinants of health and focus on leadership and management strategies to effect change.The fundamentals of creating and managing non-profit (tax exempt) organizations is incorporated into the course work. Students will develop and assess the feasibility of an innovative solution to a health issue inspired by The Wire. In addition to the use of video as a text, students will read and discuss assigned articles and book chapters.

BU.883.708. Negotiation in Health Care Settings. 2 Credits.
Negotiating successful agreements in today's healthcare environment presents a formidable challenge for healthcare professionals. In a world of managed care, hospital physician integration, and multi-institutional mergers, members of the healthcare profession are faced with creating agreement in which the complex services of healthcare can be delivered in a coordinated and financially viable fashion. To meet this challenge, healthcare professionals must develop negotiating skills that can achieve mutually beneficial, value added agreements. This course will provide you with the basic knowledge and applied skills to negotiate in a wide array of health care settings. The first part of the course focuses on understanding and systematically preparing for, structuring, and executing increasingly complex negotiations involving administrators, insurers, patients and providers. The second part of the course extends these basic principles to variety of health care settings, including group negotiations, agency relationships, and conflict resolution.

BU.883.711. Analysis of Health Care Operations. 2 Credits.
This course expands on elements of Operations Management including process analysis, queuing theory, and process improvement to focus on nuances of the healthcare setting. It also used tools of statistical analysis and linear programming to consider performance metrics in the presence of variability or across multiple sites. Finally, it introduces new tools including Discrete Event Simulation as a way to gain insights into system performance.
BU.520.601 OR BU.913.610 OR BU.920.711 OR BU.920.721

BU.890.711. Health Policy Design and Implementation I. 2 Credits.
The Health Policy Design & Implementation Practicum consists of two courses, the Health Policy Toolkit and the Health Policy Project, that prepare students with an operational understanding of health policy and its role in healthcare delivery and population health. Students will enhance their portfolio of health policy expertise by completing: 1) A policy analysis brief on a compelling health policy issue and 2) A mentored health policy project with a healthcare provider or facility. The Health Policy Toolkit (Practicum I) provides students with a global contextual overview of US health policy goals, challenges, and initiatives as well as the frameworks, processes, and tools used by multi-sector actors through public, private, and market systems at the federal, state, and local jurisdictional levels. Students will prepare weekly policy memos and collaborate in conducting weekly health policy case labs focused on key public health and healthcare issues. Students will also complete individual health policy briefs on specific health policy issues of their own choosing.

BU.890.712. Health Policy Design and Implementation II. 2 Credits.
The Health Policy Project (Practicum II) enables students to expand their portfolio of expertise by completing a project that applies health policy skills to design, develop, test, or evaluate a healthcare project, program, or policy sponsored by a healthcare facility, agency, or provider. The sponsor works closely with faculty and students to define a value-creating project and deliverable that challenges and stretches student capabilities. The experience of working as a collaborative team with a healthcare sponsor also provides the opportunity to observe organizational operations, policy processes, and decision-making.
BU.890.711

BU.890.713. Health Care Strategy Consulting Practicum I. 2 Credits.
This course is the first part of a two-part course. This course examines business strategies for health care industries and services. It prepares the student to assume the role of a consultant or decision maker in a complex organization who has to cope with tremendous complexity, uncertainty, and inadequate information. The focus throughout is on strategic management—the process of choosing and defining purposes and objectives, formulating and implementing a viable strategy, and monitoring strategic performance. Strategic tools such as SWOT, PESTLE, Competitive Analysis are covered and practiced in-class on contemporary healthcare organizations' strategies. The emphasis is on the kinds of problems and issues that affect the success of the entire organization.
Prerequisite(s): BU.890.714

BU.890.714. Health Care Strategy Consulting Practicum II. 2 Credits.
This course is the second part of a two-part course. Students enhance their business education by developing collaborative consulting engagements with businesses and nonprofit organizations in which students assist their client organizations in addressing existing and emerging challenges in the health care space. These clients may be domestic or international.
Prerequisite(s): BU.890.713
BU.890.713

BU.890.715. Health Services Improvement I. 2 Credits.
This course is the first of a two-part sequence. Students work with clients in the Baltimore/Washington, D.C. area to measurably improve the costs and quality aspects of their organization. The typical "real-world lab" for this project is a working facility within the Johns Hopkins medical system. While our efforts will evolve as we gather data and insight into actual operations, our focus will be on three interrelated sets of issues: physical flows, information flows, and cash flows. Physical flows include the movement of human assets such as medical staff and patients. Information flows involve data shared between agents via direct communication or via information systems. Cash flows include the assessment of cost savings and/or revenue enhancement projected to stem from project outcomes.
BU.883.711 OR BU.883.701 OR BU.680.620 OR BU.912.611

BU.890.716. Health Services Improvement II. 2 Credits.
This course is the second part of a two-part sequence. Students work with clinical clients in the Baltimore/Washington, D.C. area to measurably improve the costs and quality aspects of their organization. The typical "real-world lab" for this project is a working facility within the Johns Hopkins medical system. While our efforts will evolve as we gather data and insight into actual operations, our focus will be on three interrelated sets of issues: physical flows, information flows, and cash flows. Physical flows include the movement of human assets such as medical staff and patients. Information flows involve data shared between agents via direct communication or information systems. Cash flows include the assessment of cost savings and/or revenue enhancement projected to stem from project outcomes.
BU.890.715

BU.890.717. Commercializing Biomedical Innovations I. 2 Credits.
This course is the second part of a two part course. This course teaches the process of bringing scientific discoveries to market. Students learn about innovation and invention processes, how to identify opportunities and assess when ideas are inventions, the steps required to bring the product to market, including intellectual property protection and regulatory processes, and strategies to license early stage inventions to third parties for further development. Students work in small teams on early-stage invention projects that are patented or patent pending sourced by the instructor from university and government technology transfer offices. Students will analyze the feasibility of commercializing the invention so that it can be licensed to a third party that can pursue entrepreneurial funding and development.

BU.890.718. Commercializing Biomedical Innovations II. 2 Credits.
This course is the second part of a two part course that teaches the process of bringing discoveries to market. Students are required to register for parts of the course. Students learn about innovation and invention processes, how to identify opportunities and assess when ideas are inventions, the steps required to bring the product to market, including intellectual property protection and regulatory processes, and strategies to license early stage invention to third parties that can pursue entrepreneurial funding and development. As part of the experiential learning process, students work in small teams on early-stage invention projects sourced by the instructor from university and government technology transfer offices.

BU.890.720. Health Care Consulting Practicum I. 2 Credits.
This course will allow students to integrate healthcare knowledge from previous coursework and apply it to the health care sector by working on real case studies and eventually, real health care challenges. The course will enhance students' ability to work effectively in a team, implement effective consulting and communication strategies which address current healthcare challenges and create viable solutions and plans for implementation. Students will also be expected to utilize a variety of skills from pre-requisite classes such as market analysis, accounting, process modeling, organizational leadership, effective verbal and written communication skills, and financial modeling. During part one, these skills will be practiced with case study analysis and creation of verbal and written consulting strategies that address the challenges.

BU.890.725. Health Care Consulting Practicum II. 2 Credits.
This culminating course allows students the opportunity to establish and maintain relationships with leaders of health care organizations, define and scope challenges faced by those organizations, and scope projects that create feasible solutions regarding operations, strategy, and public policy. Students will enhance their business acumen by working with a professional project sponsor to address real world challenges and present their consultative recommendations based on research and by implementation of the strategies learned during part one and throughout their program.Through lectures, case studies, guest speaker seminars, and field work with sponsoring health care organizations, students will significantly improve their ability to apply knowledge and skills to addressing health care organizations' challenges by formulating and implementing viable research-based strategies.

BU.610 (Operations Management)

BU.610.630. Pricing and Insuring Risk. 2 Credits.
This course prepares students to understand risk and insurance, including decision making under uncertainty. The course will balance theory with industry-best practices and applications. Topics include: understanding the actuarial foundations of risk and insurance, including risk transfer pricing and risk pooling; both deterministic and stochastic risk application processes; understanding insurance product valuation using a variety of methods including simulation; construction of short-term analysis for capital at risk and optimal risk sharing along with analysis of claims and liabilities with extended time horizons; understanding the overall risk and insurance process, including structure and framework, empirical observations and business cycles; appreciation of managing uncertainty in the context of risk and insurance markets.

BU.610.705. Crisis Management. 2 Credits.
In this course, we will examine the entire crisis management lifecycle – from prevention and preparedness through response, recovery, and mitigation – and consider the lifecycle's principles and practices. We will identify and use the entire crisis management toolkit to address challenges faced by managers when organizations face any crisis, due to either external factors outside the organization's control or internal control or strategic management failures. We will develop a complete crisis management plan, including tools and methods to identify potential crises, implement response and mitigation strategies to limit exposure, manage crisis response teams, and create communications to address stakeholder and public relation issues.
BU.120.601 OR BU.930.610 OR BU.920.601

BU.610.730. Contracting: Incentive Design and Analytics. 2 Credits.
This course explores fundamental drivers of human and system behavior embedded in business contracting, with a view integrating economical, operational, legal, and political perspectives. These drivers include alignment of incentives for performance and information sharing, provisions for recourse in the face of unsatisfactory performance, and design of options to facilitate the pursuit of opportunities that arise after contract terms are set. Emphasis will be placed on analyzing and designing contracts to create win-win opportunities and share or minimize risks in global networks.
BU.680.620 OR BU.912.611

BU.610.750. Global Supply Chain Management. 2 Credits.
In this course, we show applications of inventory theory to global supply chain management. In addition, we discuss several related issues in supply chain management, including distribution, coordination, global sourcing and mass customization. We will take analytical and detailed approach in model development. The presentation is designed to refine intuitions developed from models and case studies to build managerial insights.
BU.680.620 OR BU.912.611

BU.610.760. Supply Chain Analytics. 2 Credits.
For a firm to execute its competitive strategy successfully, its supply chain must be able to deliver on the firm's promise to its customers. Therefore, it is important for all managers to have an understanding of key supply chain concepts. With this in mind, this course introduces the main trade-offs involved in supply chain management, and provides analytical, data-driven tools that can be used to evaluate supply chain trade-offs. The course emphasizes (i) building spreadsheet-ready models that capture supply chain challenges, (ii) using these models to ask what-if questions by applying simulation and optimization tools (e.g., @Risk, a powerful Excel add-in for simulations), and (iii) distilling managerial insights from what-if questions and communicating recommendations based on those insights.
(BU.520.601 OR BU.913.610 OR BU.920.711 OR BU.920.721) AND (BU.680.620[C] OR BU.912.611 OR BU.920.606)

BU.680.620. Operations Management. 2 Credits.
Within a manufacturing or service organization, operations provide the power necessary for orchestrating technology and resources in creating products and services to meet the needs of end consumers. Operations management, accordingly, consists of ideas for shaping and innovating an organization's business model. This course provides a conceptual and actionable introduction to operations management and covers a ? wide? range of topics,? including operations strategy, process ?mapping and ?design, queuing theory, inventory management, lean manufacturing, and revenue management?, unified by a thought framework known as "the operations prism"? (flows, variability, and buffers).?? ?By ?taking ? a process view of value-added functions that lead to an understanding of how to make ?operations ?design choices,? ??students will acquire analytical and strategic thinking skills crucial for ?managing? 21st-century ?operations.
BU.520.601

ED (Education)

Counseling & Educational Studies

ED.820.600. Introduction to Statistics. 3 Credits.
This course is designed as an introduction to basic descriptive and inferential statistics, with a focus on how they are used in education research. Students will learn to describe variables using graphs and tables, and summarize variable distribution using measures of central tendency and spread. As a basis for inferential statistics, students will explore concepts of basic probability, and apply them to understand probability sampling, sampling distribution, hypothesis testing and confidence intervals. Finally, students will learn to describe the relationship between two variables using correlation and regression.Students will apply this knowledge to a series of problem sets that ask them to think about research problems in education, and conduct their own analysis of an educational or other social science problem in a research paper that asks them to conduct a bivariate analysis and discuss their results.

ED.820.601. Intermediate Statistics. 3 Credits.
This course introduces students to multiple regression as a tool for inferential statistics in the social science, with a focus on applications to education research. Students will begin with a review of basic statistical concepts, then move on the basics of linear regression including model assumptions, estimation, and statistical inference. Emphasis will be placed on interpreting coefficients, assessing model fit, and critiquing empirical studies. We will review methods for specific types of data in the linear model, including categorical variables, interactions, data transformations and limited dependent variables. Finally, students will consider the limitations of regression and diagnostics for challenges including missing data and outliers.This course is designed for students who have had at least a one-semester introduction to statistics. Students should have existing knowledge of probability theory, properties of distribution and random sampling, and basic statistical tests.

ED.820.602. Introduction to Education Policy. 3 Credits.
Introduction to Education Policy is an intensive hybrid course in the first summer, which will be delivered partially in-person in Washington, DC, and partially online. Through the preparatory readings, an online pre-test, and a five full-day study and learning experience, students will grapple with the current challenges that apply to different levels of education policy and their relevance to the structure, content, and funding of education in the United States. The readings, assignments, and seminars with senior policy experts will introduce students to the central dilemmas and debates in education policy. Students will leave the course with a strong foundation from which to engage, in much greater depth, with course material throughout the degree.

ED.820.603. Federal Education Policy. 3 Credits.
This course will explore the federal government's role in K-12 education policy. While the course will address the historic roots of the federal government's role, it will focus largely on the federal government's rapidly evolving policy role in education over the past two decades. During this period, on global measures of education, U.S. performance has stagnated while other countries' results trend up, and educational achievement gaps continue to reflect a system that is riddled with inequity. Technology is playing a greater role in students' learning out of school – and indeed in all facets of Americans' personal and professional lives – but educators are struggling to use technology effectively in schools. Teachers unions are engaged in existential identity crises, while over one million new teachers will enter the profession in the coming decade. And the hyper-partisan conflicts that we see across the country come home to roost in the context of education policy as fights over which level of government is in charge of what. In this course, students will explore many of these issues, including: the historic roots of the federal role in education within the context of the Civil Rights movement; the structure of the U.S. educational system; school accountability and the Elementary and Secondary Education Act (ESEA)'s evolution over time; academic standards and assessments; school turnaround and choice; and educator effectiveness and teacher policy.

ED.820.604. Diversity. 3 Credits.
This course introduces students to the ways in which diverse student bodies are constructed, educated, and multiply challenged in K-12 American education. Students will analyze research on, and craft responses to, the following issues: the social construction of race; racial achievement gaps; the impact of socioeconomics upon educational performance; the ways in which students of diverse religions and sexual orientations, and who are differently-abled, experience the classroom; and the challenges to creating high-quality culturally relevant educational experiences.

ED.820.605. International Education Policy. 3 Credits.
K-12 education outcomes in the United States are often contrasted with those of other countries, especially nations now showing stronger results than America on international assessments such as TIMSS (Third International Math and Science Study) and PISA (Program for International Student Assessment). But what, exactly, are the top-performing countries doing differently from the United States? How do they structure K-12 education, and how do they manage accountability for excellence? Students will research these questions from several vantage points. They will review synoptic treatments that span multiple countries, and do a “deep dive” on one country’s reforms and evaluate the impact of the different ways in which countries abroad structure their public education systems. Finally, students will assess the strengths and weaknesses of applying international models to their own national or state contexts.

ED.820.606. State and Local Education Policy. 3 Credits.
Since the creation of public schools, education in the US has predominantly been a state and local prerogative. Through this course, students will acquire an empirically-grounded and theoretically-informed understanding of state and local education policy and politics, investigating how various actors, institutions, interests, and issue contexts influence the development, implementation, and outcomes of education policies within and across states and school districts. Through engagement with primary data, documents, and in-depth case studies of different jurisdictions and policy issues, students will develop an appreciation of the complexity of state and local education governance, the opportunities this system presents for educational innovation and diversity, the challenges of reforming education through policy, and the role of research in shaping policy. The course will also introduce students to the concept of intergovernmental relations and the implications of this dynamic for education policymaking and outcomes. Ultimately, the course will push students to engage in thoughtful discussions about the contours, purpose, promise, and limitations of state and local education policy.

ED.820.607. Understanding Education Research. 3 Credits.
One of the most familiar refrains in education policy is: “research shows….” But what exactly does this mean? This course will help students better understand education research, with a focus on methodology and its application in education research. For each method studied, students will learn the structure and requirements of the method, common challenges faced by researchers employing the method, and conclusions that can be drawn from the method. Once students understand the method from a theoretical standpoint, this knowledge will be applied by reading and discussing a peer-reviewed journal article that employs the method to answer a question in the field of education. Students will demonstrate their understanding of the methodologies and articles by leading an online discussion of one article; writing a summary of each methodology/article read; participating in online discussions; and writing a summative research proposal.

ED.820.608. Education Finance. 3 Credits.
This course will give students a strong understanding of the history of education finance, how and from what sources public education is financed in the United States, various finance reforms, and the impact of finance structures on student outcomes and other educational policies. Specifically, the course will layout the tri-part structure of funding between federal, state, and local governments, the revenue sources available to each, and policy tensions created between the three levels of government. The course will cover specific federal funding elements such as the Elementary and Secondary Education Act (ESEA), Title I, and the Individuals with Disabilities Education Act (IDEA). On a state level, the course will provide an understanding of the constitutional requirement that each state has to finance public education and the various ways states elect to do this. The course will use case studies from states that have unique funding structures, such as Indiana which abolished local funding of public education. Next, the course will offer an analysis of various finance reforms focusing on court ordered reforms as a result of state finance litigation as well as more recent funding interventions such as education savings accounts and tax credits along with the debates surrounding these issues. Throughout the course, students will wrestle with ideas over what it means to have equitable, sufficient, and adequate education funding and how education finance affects student outcomes.

ED.820.609. Outside the Schoolhouse. 3 Credits.
It is often said that the greatest impact on student learning comes from outside the school, via family background and the educational opportunities associated with income and education levels. Students will be introduced to the macro-data that is used to test these claims. They will review evidence on family structure and its intersection with race and economics, behavior that can challenge economic determinism, and initiatives such as Say Yes and Thread that are intended to support students to achieve outsized success. How successful are these programs – and where they are successful, and are they scalable? The course will also review the research on “community schools” and “wrap-around services” – two related approaches to giving less privileged students some of the supports that are automatic for those of greater means.

ED.820.610. Capstone Course. 3 Credits.
The capstone course will offer students real-world work scenarios in which they will apply knowledge and skills gained during the program. Students will choose from a list of topics provided by the supporting organizations of the program – from the public and non-profit sector. They will research the topic, and then create three items: a policy brief, an Op. Ed., and a blog entry on their findings. Their work will be read by the most appropriate program partner, as well as being read and graded by the course instructor. The strongest of the policy briefs will be published by the Institute for Education Policy.

ED.820.611. Experiential Learning. 3 Credits.
This course is an elective that may be taken by candidates who have not yet worked in an organization that influences, responds to, studies, or implements education policy. Based on initial market analysis, IEP anticipates that the majority of our applicants will come to us with some in-field experience. This may come from legislative or Congressional offices, state education agencies and district offices, mayoral offices, education research centers, or public policy think tanks. To candidates who are undertaking the program for the purpose of gaining skills that enable a transition into this field for the first time, we will offer a field placement designed to support a sustained, on-the-ground experience with education policy.The field placement will be designed in collaboration with the candidate, to reflect his or her professional goals and geographic environment, and the needs of the hosting institution. Candidates must have received, prior to the start of Spring semester, written program approval of their proposed placement, mentor, projects, and deliverables. Mentors will receive a stipend for their role. Candidates' work will be supervised by the mentor and evaluated by IEP faculty.

ED.840.600. Instructional STEM Leadership and Professional Development in the Elementary School. 3 Credits.
This course is designed to provide students with an overview of theoretical perspectives and research influencing STEM instructional leadership in elementary schools. Students will consider curriculum development, supervision and evaluation of teaching, assessment of student learning, and the design and implementation of school improvement programs. Strategies for developing a constructive, collaborative approach to supporting STEM teachers to improve student learning outcomes will be emphasized.

ED.840.601. Mathematical Foundations in the Pre-K-6 Classroom. 3 Credits.
The goal of this course is to support Pre-K-6 content knowledge for teaching related to the following topics: patterns; number and operation; measurement and data. Connections of these topics to an integrated approach to curriculum and instruction will be emphasized.

ED.840.650. Physical Science in an Integrated Pre-K-6 Classroom. 3 Credits.
The goal of this course is to provide Pre-K-6 teachers a rich understanding of foundational physical science concepts and their applications in an integrated science, technology, engineering, and mathematical world. Topics will include; structure, properties, and interactions of matter; physical and chemical properties of materials; mechanicsforce, and motion; gravity, energy transformation, energy sources, electricity, magnetism, light, sound, and wave interactions. Problem-based inquires will be organized to engage the participants in planning investigations, gathering and analyzing data, offering plausible explanations, and developing a deeper knowledge base in the physical sciences. The engineering design process will be integrated throughout the course.

ED.840.651. Earth and Space Science in an Integrated Pre-K-6 Classroom. 3 Credits.
The goal of this course is to provide Pre-K-6 teachers a rich understanding of Earth and space science content and pedagogy. Topics will include: chemical and physical interactions of the environment, Earth, and the universe; weathering and erosion; processes and events causing changes in Earth's surface; Earth history; plate tectonics; and astronomy. Problem-based inquiries will be organized to engage participants in planning investigations; gathering and analyzing data; offering plausible explanations, and developing a deeper knowledge base of Earth and space science. The engineering design process will be integrated throughout the course.

ED.840.652. Life Science in an Integrated Pre-K-6 Classroom. 3 Credits.
The goal of this course is to provide Pre-K-6 teachers a rich understanding of life science content and pedagogy. Topics will include: living organisms and their interactions, diversity of life, genetics, evolution, flow of matter and energy, and ecology. The applications and impact of technology on human life will be an important feature of the course. Problem-based inquiries will be organized to engage the participants in planning investigations, gathering and analyzing data, offering plausible explanations, and developing a deeper knowledge base of life science. The engineering design process will be integrated throughout the course.

ED.840.670. Advanced Methods in the Elementary STEM Classroom. 3 Credits.
This course will engage students in technology-enhanced, problem-based, and student-centered instructional strategies. Participants will learn to create an integrated, inclusive, and equitable STEM approach to support Pre-K-6 student learning and positive affect toward STEM. The course will include skills essential to the STEM learning environment.

ED.840.671. Algebraic and Geometric Thinking in the Pre-K-6 Classroom. 3 Credits.
This course will model the process standards of problem-solving, reasoning and proof, representations, connections and communication within the context of algebraic and geometric thinking (NCTM, 2000).

ED.840.672. Advanced Topics in the Pre-K-6 Mathematics Classroom. 3 Credits.
The purpose of this course is to develop teachers' content knowledge for teaching (knowledge of mathematics content, pedagogy, and student learning) in the context of advanced mathematics. This course builds on the previous courses: Mathematical Foundations in the Pre-K-6 Classroom and Algebraic and Geometric Thinking in the Pre-K-6 Classroom.

ED.840.673. Practicum in STEM and Mathematical Instructional Leadership. 3 Credits.
Candidates participate in a supervised practicum experience in an educational setting under the direction of the faculty where they demonstrate the application of knowledge, dispositions, competencies, skills and solutions to day-to-day activities performed by Mathematical and or STEM Instructional Leaders. Experiences are reflective of real and simulated field-based activities in a variety of educational settings. Candidates must complete a final practicum reflection paper, as well as a comprehensive portfolio that includes artifacts that are illustrative of their best work from the program.

ED.851.630. School, Family, and Community Collaboration for School Improvement I. 3 Credits.
Participants examine the theory, research, and best practices on school, family, and community partnerships. Individuals explore different types of partnerships, challenges to developing school-based partnership programs, and the components of effective partnership programs that enhance student performance and success. Participants design an action plan for partnerships to address school improvement goals.

ED.851.631. School, Family, and Community Collaboration for School Improvement II. 3 Credits.
Building on the knowledge and skills developed in 851.630 (School, Family, and Community Collaboration for School Improvement I), students continue to explore research-based theories and best practices in school, family, and community collaboration. The emphasis of this second course in the sequence is on students revising, implementing, and evaluating a key activity in the action plan for partnerships developed in 851.630.
ED.851.630

ED.851.633. Introduction to the Independent School. 3 Credits.
This course will focus on the unique quality of the independent school. A specific focus will remain on the relationship between the parent and the teacher, reworking curriculum to fit the diverse needs of the student, understanding the importance of pedagogy and history in the independent school, and fostering a love of learning in each child.

ED.851.634. Curriculum, Instruction, and Assessment in Independent School Settings. 3 Credits.
Students consider the philosophical, historical, and psychological foundations for lower and upper school curriculum and explore the linkages between assessment-based curriculum and instructional strategies. After examining the scope and sequence of the lower and upper school curricula, students evaluate options presented in various school reform plans that pertain to independent schools and contemporary research findings on effective schools and effective instruction.

ED.851.635. Educating the Whole Child: Teaching to the Developmental Needs of the Child. 3 Credits.
This course will provide students with a whole picture of the child they will be, or are, teaching. In-depth examination will be on the cognitive, physical, and emotional development of a child from age 4 through 18 years.

ED.855.500. Language Acquisition in TEFL. 3 Credits.
This course focuses on the language acquisition process when learning English as a foreign language, including research on current theories of language learning, using translanguaging as a pedagogical tool, incorporating multilingual learning strategies, and creating linguistically and culturally responsive programs. Students will review the foundational components of English language learning and the knowledge, skills, and attitudes of those who demonstrate intercultural communicative competency.

ED.855.501. Language and Culture in TEFL. 3 Credits.
This course focuses on the development of intercultural knowledge, awareness, skills, and the impact of culture on language learning and communication. Students will take a critical, sociocultural, and functional view of the role for understanding culture when teaching English as a foreign language or as a lingua franca. Students will investigate the cultural, social, and historical underpinnings of communication across cultures.

ED.855.510. Building Productive Learning Relationships for TEFL. 1 Credit.
This course provides an opportunity for individuals to develop competency in teaching English as a foreign language. Students engage in a series of interactive online modules to learn and apply research-based instructional practices designed to provide processes that 1) build a trusting and inclusive partnership, group, or community that maximizes engagement, learning, and achievement and 2) emphasize how to create a motivating and safe environment to learn and communicate with each other using both their heritage language and English. These practical practices are tailored specifically to motivate learners with different heritage languages to actively speak, understand, and communicate in English.

ED.855.530. Foundational Concepts of STEM. 3 Credits.
This course will build upon student understanding of the science of learning related to the integration of STEM disciplines. In the present course, students will be challenged to apply the understanding of integration by deepening their understanding of STEM instructional strategies. Students will examine STEM instructional programs and their opportunities for supporting learning through an opportunity to learn perspective. That is, students will be able to articulate how they would create STEM instructional units and programs with the focus on both the affordances and barriers to developing STEM curriculum. Students will enact this learning by developing technology-enhanced, problem-based, and student-centered instructional programs. Participants will learn to create an integrated, inclusive, and equitable STEM approach to support student learning and positive affect toward STEM.

ED.855.540. Integration of STEM Content through the Science of Learning. 3 Credits.
This course will examine STEM integration from a science of learning perspectives at the theoretical, empirical, and applied level. Students will explore the ways in which STEM integration supports memory, conceptual understanding, active learning, metacognition, conceptual understanding, and transfer of knowledge from multidisciplinary perspectives on learning. Specifically, the course examines the process and environments in which STEM integration can promote learning.

ED.855.550. Leading STEM Instructional Programs & Professional Development. 3 Credits.
This course is designed to provide students with an overview of theoretical perspectives and empirical research pertaining to leadership and effective professional development. Students will critically examine models of professional development, coaching, supervision, and evaluation of STEM instruction. Students will explore data-driven design to integrate STEM content areas and explore school improvement programs. Strategies for developing a constructive, collaborative approach to supporting STEM teachers to improve student learning outcomes will be emphasized.

ED.855.600. Extended Learning I.
Students will participate in a variety of informal educational experiences, from guest lectures and one-on-one mentor conversations, to exploring how the use of museums, cultural institutions, and other real-world scenarios can be leveraged to promote learning. Students will both learn from these experiences as well as gain exemplars to implement in their own educational systems.

ED.855.601. Extended Learning II.
Students will participate in a variety of informal educational experiences, from guest lectures and one-on-one mentor conversations, to exploring how the use of museums, cultural institutions, and other real-world scenarios can be leveraged to promote learning. Students will both learn from these experiences as well as gain exemplars to implement in their own educational systems.

ED.855.603. The Early Childhood Learner. 3 Credits.
This course focuses on the growth and development of the young child, including current theory and practice in child development and neuroscience. Early childhood educators will analyze the diversity of learner characteristics in young children, including growth and development in the cognitive, physical, and social-emotional domains.

ED.855.608. Comparative High Quality Practices in Early Education. 3 Credits.
This course presents research-based content on high quality, developmentally appropriate practices in early childhood education. Early childhood educators will incorporate tenets of learning theory into proposed lesson planning that reflects developmentally appropriate and inclusive practices for young children. Early childhood educators will demonstrate strategies for professional development and coaching of peers and families in developmentally appropriate practices.

ED.855.609. Introduction to Entrepreneurship in Education. 3 Credits.
This course provides students with the foundational skills necessary to think and behave entrepreneurially within educational systems and organizations in order to solve intractable problems. Students will formulate an understanding of themselves as entrepreneurs and intrapreneurs, evaluate entrepreneurial opportunities around them, and develop a method for solving a problem relevant to them. Further, students will learn the role of capital and socially conscious capitalism in creating sustainable ventures.

ED.855.610. Seminar in Teacher Leadership. 2 - 3 Credits.
Students in the final year present and evaluate their projects and plans for implementing change in their work environments. In addition, participants examine selected topics and current issues in educational leadership.

ED.855.614. Planning a New Venture in Education. 3 Credits.
This course provides students with a survey of the skills necessary to plan a new venture in education, either within an organization or a brand-new enterprise. Topics taught in this course include Human Resources, Sales and Marketing, Finance and Budgeting, and Leadership.

ED.855.617. Launching a New Venture in Education. 3 Credits.
This course provides students with a survey of the skills necessary to launch and operate a venture in education, either within an organization or an independent enterprise. Topics taught in this course include Human Resources, Sales and Marketing, Securing Funding and Capital, and Strategic Growth and Transition.

ED.855.618. The Sustainable Venture. 3 Credits.
This course provides students with the tools and resources necessary for ensuring long-term success and impact for an educational venture. The course will review how to build stability with strategic partnerships. Further, it will teach students how educational ventures weather leadership transitions and changing sociopolitical landscapes. Additionally, the course will cover the importance of social capitalism in education and a venture's contribution to social justice to ensure long-term sustainability.

ED.855.619. Global Leadership. 3 Credits.
This course explores the nature of leadership in the current global society. Students will analyze the behaviors, practices, characteristics and qualities of effective global leaders across a variety of sectors. Students will understand global competence and learn how to become a globally competent leader.

ED.855.630. Authentic Assessment and Measuring Child Outcomes and School Readiness. 3 Credits.
This course presents foundational concepts of authentic assessment in early childhood, including the types and purposes of assessments for young children and accompanying requisite skills in their administration. Early childhood educators will learn interpretation of assessment data and apply assessment data results to program planning in the implementation of early childhood programs.

ED.860.501. Crisis Intervention and Assessment. 1 Credit.
This course provides an overview of the various crises that may trigger trauma; theories and models of intervention; assessment techniques in crisis situations, and the issue of client resistance is also examined from a cognitive-behavioral point of view.
ED.861.507

ED.860.639. Cognitive Behavioral Therapy. 3 Credits.
Cognitive behavior therapy is one of the most popular contemporary models across the helping professions because it allows clients to evaluate and alter maladaptive thought patterns that may have an adverse impact on behavior. This course explores foundations of cognitive behavior therapy to include theoretical underpinnings, methods/models, applications, and research findings around efficacy for use with various adult populations. Cross-cultural issues and ethical practices are also examined, and the course reviews models and methods for child and adolescent populations.
ED.861.502 AND ED.863.501 AND ED.861.605 AND ED.861.507 AND ED.863.607 AND ED.861.609 AND ED.863.709

ED.860.822. Entrepreneurship in Mental Health: Introduction to Building a Private Practice. 3 Credits.
Students investigate principles related to business foundation, principles, legal and ethical implications, and the development of private practice. The course will explore legal, ethical, and practical ways to start a private practice while ensuring that students have a comprehensive expectation and exposure to current practice sites. Students will examine methods to combine the counseling profession, with clients, while establishing and leading a business.

ED.861.502. Counseling Theory and Practice. 3 Credits.
(Lab course) This course provides an overview of the major theories of counseling and therapy, such as cognitive, behavioral, existential, Gestalt, and Adlerian. Students explore integrative approaches, as well as multicultural and feminist perspectives. Participants focus on a wide range of specific techniques and practices that are associated with each theory and how they are applied in various situations. <P><I>Notes: </I>Students are required to attend the two-day laboratory sessions. Laboratory courses and internship classes involve an exploration of personal factors as they contribute to counseling skills and techniques.
ED.861.605

ED.861.503. Group Counseling and Group Experience. 3 Credits.
(Lab course) Students investigate practical and theoretical concepts of group dynamics and group counseling to acquire skills in facilitating various kinds of group interaction. Students explore interpersonal dynamics, personal communication styles, fundamental group counseling strategies, and group facilitation through class and laboratory experiences. <P><I>Notes: </I>Students are required to attend the two-day laboratory sessions. Laboratory courses and internship classes involve an exploration of personal factors as they contribute to counseling skills and techniques.
(ED.861.614 OR ED.861.605) AND ED.861.502 AND ED.861.507 AND ED.863.501 AND ED.863.607 AND ED.861.609 AND ED.863.709 AND ED.863.795

ED.861.507. Counseling Techniques. 3 Credits.
(Lab course) This course provides an overview of the history and philosophy of professional counseling, with special attention to the roles, functions, and limitations of school, community, and organizational counselors. Included is an understanding of the essentials of basic counseling skills; attending, listening, and interviewing stages of clinical treatment; and client/counselor relationships. Students learn about professional counseling organizations, professional credentialing, and standards and ethics in counseling and related human services. The course emphasizes self-growth, awareness, and observational skills as related to becoming a facilitator of individual, group, family, and systems change.

ED.861.511. Career/Life Development and Planning. 3 Credits.
Participants review major theories of career development and decision making, occupational sociology, and vocational psychology. The course places career counseling concepts in a life-span perspective and reviews career development materials and cross-cultural strategies. <P><I>Notes: </I>Tuition includes materials fee.
(ED.861.614 OR ED.863.501) AND ED.861.605 AND ED.861.502 AND ED.861.507 AND ED.863.607

ED.861.513. Integrating Alternative Approaches to Mental Wellness. 3 Credits.
The course seeks to include culturally diverse counseling practices such as mindfulness, yoga meditation, and expressive arts combining them with conventional psychotherapies such as Adlerian, existential, Gestalt, behavioral and cognitive behavioral therapies. It builds on the foundation established in ED.861.502 Counseling Theory and Practice wherein students introspect, analyze and synthesize essential concepts from various psychotherapeutic theories aiming to develop a personalized integrative theory. The emphasis is on a therapist's creation of a repertoire of counseling techniques and interventions, drawn from multiple theories and most importantly from the client's own life practices. Students learn to integrate key concepts from theories such as cognitive, behavioral, existential, Adlerian and Gestalt while concurrently resourcing alternative therapeutic modalities of expressive arts, mindfulness, movement, music, and yoga meditation. Emphasis will be placed on the importance of a therapist's regard for client's competence in overcoming challenges to facilitate relief from emotional distress, reprieve from behavioral dysfunction and restructuring of maladaptive cognitive schema. (3 credits)

ED.861.605. Human Development and Counseling. 3 Credits.
This course reviews significant findings regarding current theory and practice in human growth and development along the life span through a biopsychosocial lens. Learners gain insights into aspects of human development that impact behavior in a variety of realms to include biological, cognitive, socio-emotional, and dispositional influences. Course outcomes focus on theoretical understanding and application of research findings to normal functioning as well as case conceptualization and counseling interventions within school and clinical mental health counseling populations.

ED.861.609. Diagnosis in Counseling. 3 Credits.
Students study the Diagnostic and Statistical Manual of Mental Disorders (DSM V) to learn to assess, diagnose, and treat psychopathology based on current DSM criteria. Theories related to the etiology of major categories of mental disorder such as anxiety, depression, substance abuse, and personality disorders are examined. Students gain an understanding of the impact of abnormal behavior on individuals, families, and society. Instructors provide a developmental framework for understanding diagnosis from multicultural, feminist, and systems perspectives. <P><I>Notes: </I> Must be taken before ED.863.809 or ED.863.870.
ED.861.507 AND ED.861.502 AND ED.861.605 AND ED.863.501

ED.861.612. Appraisal and Testing for Counselors. 3 Credits.
Students explore individual and group approaches to assessment and evaluation through the use of standardized test instruments and rating scales. Emphasis is given to principles of test construction, reliability and validity, psychometric properties, and strategies for the selection, administration and interpretation of behavioral, psychological, and educational tests. Implications of age, gender, ethnicity, culture, heritage, language, disability, and professional/ethical issues are examined. <P><I>Notes: </I> Tuition includes materials fee.

ED.861.614. The Foundations of School Counseling. 3 Credits.
This course is a survey of the knowledge base and practices in contemporary school counseling. It will emphasize the educational, historical, sociological, economic, philosophical, and psychological dynamics of the professional school counselor's role. Students integrate knowledge and learn skills to examine data driven comprehensive school counseling programs that enhance academic, career, and personal/social development for all students.

ED.861.713. Advanced Treatment Approaches. 3 Credits.
This course explores a wide range of effective techniques and strategies in counseling and therapy, in the context of successfully treating various mental and emotional disorders. Approaches and procedures from such diverse models as psychodynamic, cognitive, behavioral, experiential, and systemic are explored, along with theories of change and research findings on effective counseling and therapy.

ED.863.501. Introduction to Clinical Mental Health Counseling. 3 Credits.
This course provides an overview of the role and scope of the clinical mental health counseling profession. Students address a number of topics including the historical, theoretical, philosophical, and empirical foundations of clinical mental health counseling. The course addresses role functions and employment settings of mental health counselors; program development, emergency management, prevention, intervention, consultation, assessment approaches, and education; and the contextual dimensions of diverse clients seeking mental health counseling services.This course is a requirement of our accrediting body, the Council for the Accreditation of Counseling and Related Educational Programs (CACREP). This is a foundational course that prepares students to work in a broad range of mental health counseling programs by acquainting them with the foundations of clinical mental health counseling.

ED.863.524. Individual and Group Dynamics: Behavior in Context. 3 Credits.
Individual and group dynamics are at the core of adaptive or maladaptive human behavior. A solid grounding in basic empirically-derived principles of motivation aids counselors in better formulating and presenting problems and in conceptualizing appropriate interventions. Foundations for this course are derived from classic theories and research findings in personality psychology, social psychology, cross-cultural psychology, and neuroscience. Students explore the influence of the person, the situation, and cultural diversity as forces in shaping behavioral tendencies. A unifying theme within the course is the influence of resilience as a dispositional perspective for both the client and the helping professional.

ED.863.571. Counseling Adolescents. 3 Credits.
This course provides an overview of the various aspects of adolescent counseling, ranging from adolescent depression, suicide, crisis, drug and alcohol abuse, peer pressure, self-esteem issues, culture, family issues, and developmental themes. Part of the course is dedicated to examining current research on adolescents. The emphasis of the course is on clinical training in group, family, and individual contexts. Relevant ethical and legal issues are addressed. <P><I>Notes: </I> This course must be taken prior to ED.863.820. Master's students must have completed a minimum of 15 credits before registering for this course.
ED.861.502[C] OR ED.861.503[C] OR ED.861.507[C] OR ED.861.609[C]

ED.863.603. Couple and Family Therapy. 3 Credits.
(Lab Course) Students study the theory and practice of family therapy with an emphasis on models of family development and major approaches to intervention with families. Systemic models of family intervention are emphasized, as well as the study of other historically important and contemporary approaches to family therapy. The course blends didactic and experiential learning. <P><I>Notes: </I> Students are required to attend the two-day laboratory sessions. Laboratory courses and internship classes involve an exploration of personal factors as they contribute to counseling skills and techniques. Master's students must have completed a minimum of 15 credits before registering for this course .
ED.861.605 AND ED.861.502 AND ED.861.507 AND ED.863.501 AND ED.863.607 AND ED.861.609 AND ED.863.709

ED.863.607. Diversity and Social Justice in Counseling. 3 Credits.
Participants explore aspects of counseling clients from diverse ethnic, racial, and socioeconomic backgrounds. Through didactic and experiential learning techniques, students consider counseling strategies for enhancing cross-cultural interventions. (3 credits)

ED.863.626. Behavioral Medicine and Health Psychology Applications in Clinical Mental Health Counseling. 3 Credits.
This course provides a broad introduction to the field of behavioral medicine as part of the field of health psychology. Through a culturally-sensitive biopsychosocial lens, students examine theory and research as it applies to behavioral and emotional factors that impact the delivery of primary, secondary, and tertiary prevention efforts as part of a multidisciplinary team within medical settings. The content will explore applications of behavioral medicine and health psychology principles to a variety of health care conditions as they occur across the developmental continuum, preparing the clinical mental health counselor for a variety of roles in health care systems.

ED.863.630. Addictions Counseling I: Theory and Approaches. 3 Credits.
Students explore the fundamental principles of addictions counseling from a wide range of perspectives. These include the psychopharmacological aspects of alcohol and abusable drugs, along with theories and assessments of addictive disorders. Many treatment models are considered and examined in the context of individual, group, and family therapy perspectives. The course also addresses the research literature on codependence, COA's, AA and other 12-step programs, dual diagnosis, relapse, prevention, and multicultural and gender issues. (3 credits)
ED.861.605 AND ED.861.502 AND ED.861.507 AND ED.863.501 AND ED.863.607 AND ED.863.709 AND ED.861.609

ED.863.674. Meditation and Mindfulness. 3 Credits.
This course explores various methods of meditation from a counseling perspective to experientially understand multicultural practices that offer relief from emotional disorders such as anxiety and depression. Emphasis is placed on neuroscientific validation of meditation as a process to cultivate mindfulness and healing presence in a counseling setting. Students research natural outcomes such as concentration, awareness and insight both into self and with client. Eastern world concepts of ego, mind, body, mental health, psychopathology, suffering, compassion, and liberation are also addressed. A portion of class will be devoted to the actual practice and application of techniques from reading assignments.
ED.861.502

ED.863.681. Research and Evaluation for Counselors. 3 Credits.
Participants learn the basic concepts for understanding and conducting research and program evaluation related to the counseling and human services fields. Students study experimental and quasi-experimental designs, examine quantitative and qualitative methodologies, and learn basic statistical procedures for data analysis.
ED.861.605 AND ED.861.502 AND ED.861.507 AND ED.863.501 AND ED.863.607 AND ED.861.609 AND ED.863.709

ED.863.709. Psychopathology. 3 Credits.
This course provides a broad overview of the field of psychopathology using lifespan development and biopsychosocial models to understand the etiology, psychological dynamics, trajectory, and symptomatology of disordered behavior. Students examine theoretical, clinical, legal, ethical, multicultural, and empirical perspectives as they influence case conceptualization, diagnosis, and treatment formulations within a social justice framework.
ED.861.502 AND ED.861.507 AND ED.861.605 AND ED.863.501 AND ED.861.609

ED.863.718. Counseling Military Families. 3 Credits.
Students explore aspects and issues affecting military families. Students consider the military as a unique culture within American society; the cultural context of the transmission of values, beliefs, and customs; and the needs of children and spouses of those serving in the military. Considerable time will be spent exploring counseling for issues of PTSD, substance abuse, isolation, frequent relocations, deployment, reintegration into family life, anticipatory loss and grief, anxiety, uncertainty, the effects of war, managing stress and anger, staying healthy, improving sleep and building resiliency. (3 credits)
ED.861.503[C] AND ED.861.507[C] AND ED.861.609[C] AND ED.861.502[C]

ED.863.736. School Counseling Leadership and Consultation. 3 Credits.
This course is designed to prepare students to lead programs and employ consultation strategies in the development and implementation of data driven school counseling programs. Students will learn leadership and school-based consultation principles, theories, skills, and models necessary to enhance the learning environment. Emphasis is placed on the role of the school counselor as a systemic change agent. Ultimately, the course will assist future school counselor leaders build effective stakeholder consultation teams that promote equitable services for all K-12 students.
ED.861.614[C];ED.863.808[C]

ED.863.795. Ethical and Legal Issues of Mental Health Counseling. 3 Credits.
Participants explore professional issues in counseling, with specific regard to ethics and laws that pertain to the profession, such as ethical codes, responsibility, competence, public statements, confidentiality, reporting abuse, and dual relationships. Professional issues in the context of community mental health are also covered in terms of historical, societal, and philosophical aspects, as well as licensing, roles, policies, legislation, reimbursement, and the professional identify of community counselors. Racial and ethnic issues, as well as gender, sexual orientation, socioeconomic status, and mental status in community counseling settings are also addressed. (3 credits)
ED.861.605 AND ED.861.502 AND ED.861.507 AND ED.863.501

ED.863.808. Practicum in School Counseling. 3 Credits.
This supervised practicum experience is offered in two modalities. The first modality is an experiential course including seminar discussions, review of major theories of counseling with an emphasis on the integration of theory and practice, interview analysis, video and/or audiotape observations, and supervised exercises. Emphasis here is given to the development of foundational counseling skills (i.e. trust building, collaborative goal development, interpretation, summarization, paraphrasing, case conceptualization). The second modality is a practicum course involving 100 hours of individual counseling and group counseling, as well as supervisory experience in a school setting or clinical setting where children and/or adolescents are served. Supervision of this experience will be provided by the on-site supervisor and a school counseling program faculty member. Emphasis here is given to the development of cultural competence, social/emotional issues of children and adolescents (e.g., depression, bullying) and school-related issues (e.g., crisis management). The course is taken near the end of a student's program of study just prior to the internship.
ED.861.605 AND ED.861.502 AND ED.861.507 AND ED.861.614 AND ED.861.609 AND ED.863.795 AND ED.861.503

ED.863.820. Internship in School Counseling. 3 Credits.
This supervised internship is the first semester of a two-semester supervised internship in school counseling. The course includes both class instruction and a 300-hour internship.
ED.861.503 AND ED.861.609 AND ED.861.612 AND (ED.861.614 AND AND ED.863.809 OR ED.863.808) AND ED.863.681

ED.863.828. Internship in School Counseling II. 3 Credits.
This supervised internship is the second semester of a two-semester supervised internship in school counseling. The course includes both class instruction and a 300 hour internship

ED.863.830. Graduate Project in Counseling. 3 Credits.
Students of demonstrated ability with a special interest in counseling study under the personal direction of a faculty member in the School of Education. Students must meet with their faculty adviser and prepare an outline of the proposed project prior to registration. (1- 6 credits)

ED.863.870. Practicum in Clinical Mental Health Counseling. 3 Credits.
This supervised practicum experience is offered in two modalities. The first modality is an experiential course including seminar discussions, review of major theories of counseling with an emphasis on the integration of theory and practice, interview analysis, video and/or audiotape observations, and supervised exercises. Emphasis here is given to the development of foundational counseling skills (i.e. trust building, collaborative goal development, interpretation, summarization, paraphrasing, case conceptualization). The second modality is a practicum course involving practical training at a community-based agency or institution. Training focuses on integrating counseling theories in social context with individual counseling practice. Emphasis here is given to the development of cultural competence in joining, trust building, developing clinical hypotheses and interventions, and collaborating with clients in the development of goals, relevant legal and ethical issues. The course includes both didactic and experiential learning and is taken near the end of a student's program of study just prior to the internship.
ED.861.605 AND ED.861.502 AND ED.861.507 AND ED.863.501 AND ED.861.609 AND ED.863.709 AND ED.863.795 AND ED.861.503;ED.861.503

ED.863.875. Internship in Clinical Mental Health Counseling I. 3 - 6 Credits.
This supervised internship is the first semester of a two-semester supervised internship in clinical mental health counseling. The course includes both class instruction and either a 300 or 500-hour internship.

ED.863.876. Internship in Clinical Mental Health Counseling II. 3 - 6 Credits.
This supervised internship is the second semester of a two-semester supervised internship in clinical mental health counseling. The course includes both class instruction and either a 300 or 500-hour internship.
ED.863.875

ED.880.603. Educating the Whole Child: Teaching to the Developmental Needs of the Urban Child. 3 Credits.
This course will focus participants' learning on child and adolescent development consistent with developmental pathways: cognitive, linguistic, emotional, social, and physical. Topics include the needs of urban school children relative to health care, nutrition, differentiation, inclusion, special education, gifted education, arts education, higher order thinking and creative problem-solving.

ED.880.611. The Social Context of Urban Education. 3 Credits.
The course examines the role played by culture, race, language, and class in creating the conditions that lead to structured inequality of educational outcomes in urban areas. Through a diverse set of readings, students will consider questions such as: What is the role of a state-sponsored, public education in a multicultural democracy? Should all students receive the same education, both in terms of curriculum and pedagogy? Why might some students resist efforts to educate them? Does education reproduce social divisions or provide a way for the most talented to rise in society? Through an exploration of these and related questions, the class addresses the relationship between the concepts of race, language and culture; the controversy over efforts to take language into account in the teaching of some students; "multicultural" approaches to education; pedagogical interventions meant to (a) reach "culturally diverse" learners, and (b) create culturally diverse learners; and the role of education in a pluralistic, democratic society.

ED.880.613. Teaching, Learning and Leadership for Successful Urban Schools. 3 Credits.
This course will examine the principles, policies, and practices of leadership and instruction that promote effective schools. Students will be exposed to the Effective Schools Correlates, the principles of the Coalition of Essential Schools and numerous efforts on the local and state and federal level designed to improve the quality of education, particularly as those practices and policies affect urban student achievement. Students will weigh the traditional patterns of teaching, learning, and governance with current federal, state, and local standards and new evidence-based, collaborative practices. Emphasis will be placed on examining models and methodologies currently in use in Baltimore City Public Schools and other local metropolitan areas. Students will use this research and knowledge as a basis for selecting effective methods that could be adapted to their particular setting.

ED.880.617. Urban School Reform. 3 Credits.
This course examines systemic school reform movements in the urban school context. School reform occurs at many different levels, from the classroom level with individual teachers, to the national level with federal mandates. We will explore reform at different levels and analyze the theory, policies, practices, and controversies of various mechanisms of reform, including the K-8 movement, small high schools, school choice (charters and vouchers), mayoral control, merit-pay, and alternative routes to teaching. Participants will synthesize information about school reform in urban schools and systems and will reflect on their role in this process. Final evaluation of reform strategies will be grounded in the effect these reforms are having on improving learning for all students in urban schools.

ED.880.623. Instructional Design for Online Learning. 3 Credits.
This course will guide participants through a process of designing online instruction for adult learners, applicable for a variety of content areas and settings. Building upon a research-based instructional design model, participants will plan online learning experiences that combine pedagogy, organization, design, and technology. Participants will be able to design media-enhanced, engaging online activities and assess learning.

ED.880.633. Curriculum Development. 3 Credits.
In this course, participants will propose a curricular project in health professions education, which will be documented in their professional portfolio. They will learn and apply six steps to curriculum development: problem identification and general needs assessment, targeted needs assessment, writing goals and specific measurable objectives, choosing educational strategies, implementation, and evaluation. Educational methods include readings, mini-lectures, interactive web modules, discussion groups, and application exercises. The course also addresses issues related to curriculum maintenance and enhancement and dissemination of curriculum-related work.

ED.880.635. Instructional Strategies I. 1.5 Credits.
In this course, participants will learn about various instructional strategies to enhance interdisciplinary learning experiences in health professions education. Instructional methods will include such collaborative educational models as small and large group teaching, team-based, interactive and experiential case-based learning. Techniques will include the use of simulations as well as teaching at the bedside with a focus on educator behaviors that stimulate achievement of learners. With an appreciation of the diversity of the student body, participants will effectively integrate and apply technology into instruction to develop and deliver health professions curricula, including web-based teaching environments, content management systems, collaborative project development, and interactive media with an emphasis on instructional design advancements which affect the learning environment. Evidence of participants' knowledge and application of course topics will be captured in a professional portfolio.

ED.880.639. Development, Management, and Evaluation of Health Professions Education Programs. 3 Credits.
In this course, participants will demonstrate their ability to implement a systemic approach to program development and evaluation. They will review the literature on program effectiveness and examine the components that contribute to success. They will also approach program development from the perspective of its critical components – population characteristics, needs assessment, content, logistics, instructional formats, implementation, assessment, and evaluation using quantitative and qualitative methods. In addition, participants will incorporate a continuous process of program improvement that includes closing the loop by analyzing information on student performance, stakeholders, trends, and funding to identify changes that will enhance the effectiveness of the program. Course products and reflections will be highlighted in a professional portfolio.

ED.880.642. Leadership Theory in Action for Health Professions Educators. 3 Credits.
Leadership extends beyond management and involves multiple skills. This course addresses: 1) organizational change theory and the leadership of change; 2) leadership of tasks/processes/systems (including principles of task management and the use of strategic planning, quality improvement, policy/procedure and data to achieve organizational goals and promote efficiency); and 3) resource management and creation (including financial management, fund raising, alignment of resource use and development with function and goals).

ED.880.652. Survey Design for Research in Health Professions Education. 1.5 Credits.
This course will examine Survey Design. Surveys wield tremendous impact on decision-making and are becoming increasingly common when evaluating educational processes, conducting research, and in society more broadly. The major topics of the course will include defining constructs; creating items and item wording; response anchors; formatting surveys; and bolstering response rates. The course will also cover some basic design features of Qualtrics, a leading survey software system. Students do not need to have any previous experience with developing surveys to be successful in this course. The course is targeted toward 1) students who are actively adapting or developing survey measures for research projects and 2) students who are interested in professionally designing surveys. The course is more orientated toward collecting quantitative data, but only minimal knowledge of data analysis is needed.

ED.880.673. Leadership Capstone in Health Professions Education II: Implementation and Results. 1.5 Credits.
Participants will engage in a three-course series capstone to culminate the MEHP program. They will employ principles and concepts from their MEHP educational experiences to develop, implement, and disseminate a research or evaluation project focused on an issue of importance to health professions education. Their projects will be performed under the guidance of assigned capstone instructors and the director with support from fellows' institutional sponsors. In the second course fellows will implement the project by following prescribed design, implementation, and evaluation guidelines. They will conduct the process, collect data, and select appropriate statistical tools for data analysis. They will submit as amendments to Hopkins IRB any modifications to the project components that require IRB approval.Fellows continue preparation of scholarly manuscripts of their work for peer-reviewed dissemination or potential publication. Fellows submit deliverables according to the course schedule to their instructors and consult as needed with their institutional sponsors. Fellows continue to add evidence to their Specialization Portfolio.

ED.880.674. Leadership Capstone in Health Professions Education III: Analysis, Discussion, Conclusion, Dissemination. 1.5 Credits.
Participants will engage in a three-course series capstone to culminate the MEHP program. They will employ principles and concepts from their MEHP educational experiences to develop, implement, and disseminate a research or evaluation project focused on an issue of importance to health professions education. Their projects will be performed under the guidance of assigned capstone instructors and the director with support from fellows' institutional sponsors. In this third course fellows will complete data analysis, construct tables and figures, develop the discussion, identify limitations, write the conclusion, close the Hopkins IRB, and prepare the manuscript for submission to a target journal. They will create a Voice Thread presentation of their project. Fellows complete the Specialization Portfolio including the final program reflection.Fellows complete their scholarly manuscript of their work for peer-reviewed dissemination or potential publication. Fellows submit deliverables according to the course schedule to their instructors and consult as needed with their institutional sponsors.

ED.880.676. Research Capstone in Health Professions Education I: Problem, Gap, Hook, and Methods. 1.5 Credits.
Participants will engage in a three-course series capstone to culminate the MEHP program. They will employ principles and concepts from their MEHP educational experiences to develop, implement, and disseminate a research or evaluation project focused on an issue of importance to health professions education. Their projects will be performed under the guidance of assigned capstone instructors and the director with support from fellows' institutional sponsors. In the first course of the series, fellows will focus on the identification of a problem of urgent concern, establish a gap in the current knowledge or thinking about the problem, and articulate a compelling hook to convince readers that this gap requires attention. They will explore the literature to identify the methodology, the method, and instruments for the project. They will prepare and submit the IRB for their home institutions and prepare the Hopkins IRB for their instructor to submit as the project PI. This course will be complete with the receipt of Hopkins IRB approval.Fellows begin preparation of a scholarly manuscripts of their work for peer-reviewed dissemination or potential publication. Fellows submit deliverables according to the course schedule to their instructors and consult as needed with their institutional sponsors. They also submit progress on their overarching Specialization Portfolio. Fellows may build on educational projects begun in previous courses with the approval of their instructors.

ED.880.677. Research Capstone in Health Professions Education II: Implementation and Results. 1.5 Credits.
Participants will engage in a three-course series capstone to culminate the MEHP program. They will employ principles and concepts from their MEHP educational experiences to develop, implement, and disseminate a research or evaluation project focused on an issue of importance to health professions education. Their projects will be performed under the guidance of assigned capstone instructors and the director with support from fellows' institutional sponsors. In the second course fellows will implement the project by following prescribed design, implementation, and evaluation guidelines. They will conduct the process, collect data, and select appropriate statistical tools for data analysis. They will submit as amendments to Hopkins IRB any modifications to the project components that require IRB approval.Fellows continue preparation of scholarly manuscripts of their work for peer-reviewed dissemination or potential publication. Fellows submit deliverables according to the course schedule to their instructors and consult as needed with their institutional sponsors. Fellows continue to add evidence to their Specialization Portfolio.

ED.880.678. Research Capstone in Health Professions Education III: Analysis, Discussion, Conclusion, Dissemination. 1.5 Credits.
Participants will engage in a three-course series capstone to culminate the MEHP program. They will employ principles and concepts from their MEHP educational experiences to develop, implement, and disseminate a research or evaluation project focused on an issue of importance to health professions education. Their projects will be performed under the guidance of assigned capstone instructors and the director with support from fellows' institutional sponsors. In this third course fellows will complete data analysis, construct tables and figures, develop the discussion, identify limitations, write the conclusion, close the Hopkins IRB, and prepare the manuscript for submission to a target journal. They will create a Voice Thread presentation of their project. Fellows complete the Specialization Portfolio including the final program reflection.Fellows complete their scholarly manuscript of their work for peer-reviewed dissemination or potential publication. Fellows submit deliverables according to the course schedule to their instructors and consult as needed with their institutional sponsors.

ED.881.611. Action Research for School Improvement. 3 Credits.
Students explore the role of the educator as an action researcher, with special emphasis on formulating and refining research questions as well as on selecting appropriate methodologies for classroom or school-based research. Students review research as a tool for assessing and improving teaching/learning environments.

ED.885.501. The Gifted Learner. 3 Credits.
Graduate students survey a historical overview of gifted education and examine research literature, intelligence theorists, and current practices used with gifted learners to gain perspective on the academic, social, and affective nature and manifestations of giftedness. Special needs populations are examined for unique characteristics and needs to further support the premise of a diverse gifted audience. Emphasis will be placed on gifted learning characteristics as they inform identification, planning, and support strategies. Participants explore the potential role they play in working with gifted youth, recommending program delivery options, and the identification process.

ED.885.505. Creativity in Education. 3 Credits.
Graduate students will examine the psychological and educational aspects of creative thinking. Participants review studies of the characteristics of creative children and adults, the creative process, and the identification of potentially creative children and adolescents. The course introduces teaching strategies and curriculum materials for fostering creative behavior at both the elementary and secondary school levels.

ED.885.510. Curriculum, Instruction, and Assessment for Advanced Learners. 3 Credits.
Graduate students explore the various approaches to differentiating curriculum, instruction, and assessment for advanced learning. Strategies and techniques that are supported by research and best practice are discussed and analyzed. Candidates design interventions that translate theories about gifted education into practice in their education contexts.

ED.885.512. Twice Exceptional Learners. 3 Credits.
Graduate students review recent research-based findings regarding identification and programming for the gifted child with learning differences. Candidates consider appropriate strategies and teaching techniques that address learning challenges as well as the development of enriched content and accelerated and innovative approaches for maximization of potential in areas of giftedness.

ED.885.515. Leadership of Gifted Education and Talent Development Programs. 3 Credits.
Graduate students will learn how to develop, implement, and supervise interventions for gifted students in both K-12 and out-of-school settings. An emphasis is placed on how talent identification, service delivery, student assessment, and program evaluation are included in the design of talent development systems.

ED.885.519. Seminar I in Gifted Education and Talent Development. 3 Credits.
Graduate students will explore current issues, research, and trends in gifted education and talent development at the local and national levels, including ways to advocate for programs and services, and the roles of a leader in the field.

ED.885.520. Seminar II in Gifted Education and Talent Development. 3 Credits.
Graduate students will expand upon knowledge gained in Seminar I as they continue to explore current issues, research, and trends in gifted education and talent development at the local and national levels, including ways to advocate for programs and services, and the roles of a leader in the field.

ED.885.604. Social and Emotional Needs of the Gifted. 3 Credits.
Graduate students will examine the unique social and emotional needs of gifted and talented learners and their families. Primary emphasis will be on consultation, guidance and counseling strategies for use with diverse gifted learners including those from special populations.

ED.885.720. Research in Gifted Education and Talent Development. 3 Credits.
Graduate students who have competed their general coursework in Gifted Education and Talent Development may register for this capstone course with their adviser's approval. This course provides an opportunity for graduate students who are not pursuing the MSDE state Gifted and Talented Specialist certificate to conduct research and pursue a special project related to their area of interest under the guidance of the instructor. In collaboration with the instructor, a personalized project will be developed and implemented. Graduate students will select a current issue or problem of practice in the field of gifted education or talent development, conduct a review of the literature, design an intervention or research proposal to address the issue, create and share a written product to inform the community on the issue.

ED.885.820. Practicum in Gifted Education and Talent Development. 3 Credits.
Candidates participate in a capstone supervised practicum experience in an educational setting with a focus on advanced learners under the direction of the faculty. Practicum experiences will be individually designed in consultation with the student's advisor to address the student's professional goals. Individual and small group consultation sessions are held. (3 credits)

ED.887.615. Explorations in Mind, Brain, and Teaching. 3 Credits.
During the past decade, the learning sciences have produced a vast frontier of knowledge on how the brain processes, stores, and retrieves information. Educators have increasingly recognized a role as consumers of this emerging knowledge. Participants in the course will review this research, examining how it intersects with the correlates of a model of research-based effective teaching including the teaching of the arts across content areas. Topics of study will include the brain's memory systems, the impact of emotions on learning, the processes involved in higher order thinking and learning, and issues related to child development. Participants will apply course studies to the creation of learning units that emphasize application of knowledge and the integration of the arts. (3 credits)

ED.887.616. Fundamentals of Cognitive Development. 3 Credits.
This introductory course surveys theoretical and empirical work in the study of cognitive development. A variety of methodological approaches are addressed, with a focus on cognitive processes related to learning. The course proceeds from behaviorist, cognitivist, and sociocultural perspectives of the early and mid- 20th century to recent and ongoing research in the neuro- and cognitive sciences. Topics include the development of language, motivation, and intelligence, as well as the acquisition of skills and concepts related to mathematics, reading, writing, and problem-solving. Implications for education are considered.

ED.887.617. Neurobiology of Learning Differences. 3 Credits.
This course is intended to prepare educators with information about how differences and disabilities in brain development impact the abilities of school aged children and adolescents to participate in instructional activities. Particular attention is given to autism spectrum disorder (ASD), specific learning disabilities (SLD), attention deficit disorder and attention deficit disorder with hyperactivity (ADD and ADHD), and psychiatric disorders that are found in the constellation of disabling conditions identified as emotional disturbance (ED). The course will include case studies of students with each disabling condition, with a focus on how the disability affects learning, the current status of imaging technologies, and the current uses of medications for assisting students in school settings. Students taking this course will review research and link information from lecture to the creation of an instructional unit demonstrating knowledge of how a disabling condition can be accommodated in school.

ED.887.618. Cognitive Processes of Literacy & Numeracy. 3 Credits.
This course is designed to offer students an opportunity to study, discuss and explore aspects of brain function that influences learning, remembering, and utilizing textual and numeric concepts. The inter-relationship of developmental factors, prior knowledge, instructional design and implementation, and assessment mandates will be investigated and discussed. Current research, differentiated strategies, technologies and the impact of disabilities will be included.

ED.887.619. Special Topics in Brain Sciences. 3 Credits.
This capstone course addresses specific topics in brain research and encourages the participants to apply research to inform instructional practices.

ED.893.508. Technology and the Science of Learning. 3 Credits.
Technologies are part of the intellectual landscape in which new kinds of knowledge are breaking down the boundaries of previous distinct disciplines. The design and use of new technologies make possible new approaches to learning, new contexts for learning, new tools to support learning, and new understandings of the dynamics of the learning process itself. This course examines the role of technology relative to the key concepts of active learning, metacognition, and transfer of knowledge from multidisciplinary perspectives on learning. Based on their readings of empirical literature from the science of learning, students will develop and implement a technology-related strategy that aligns educational technology to standards-based instruction, promote problem solving and higher-order thinking skills, facilitate cooperative learning, and use reflective teaching and inductive approaches to increase student achievement. Students must take Technology and the Science of Learning as one of their first courses in the program.

ED.893.545. Technology Integration for the 21st Century Learner. 3 Credits.
This course prepares educators in K-12 and adult education settings to implement instruction and assessment that targets four essential digital-age learning objectives: critical thinking, creativity, communication, and collaboration. Students will learn about and apply the TPACK framework, which describes three forms of knowledge educators need to integrate educational technologies into instruction effectively - technical knowledge, pedagogical knowledge, and content knowledge. Alongside the TPACK framework, students will learn about and apply the SAMR Model, which describes four different types of educational technology integration: Substitution, Augmentation, Modification, and Redefinition. Applying their understanding of TPACK, SAMR, and other concepts and practices from course readings and activities, students will design technology-rich learning activities/learning units for use in their own professional settings.

ED.893.546. Technology for Learner Variability. 3 Credits.
This course provides an overview of the historical foundations and the advancements in the learning sciences related to learner variability. Students will learn to apply the Universal Design for Learning framework in understanding and addressing learning variability. Students will develop the knowledge and skills necessary to anticipate and plan for systematic differences in learners, and apply technology to that end. Students will investigate existing and emerging technologies to determine how these may support all learners in becoming purposeful and motivated, resourceful and knowledgeable, and strategic and goal-directed.

ED.893.550. Emerging Issues in Digital Age Learning. 3 Credits.
The new digital landscape is drastically changing how people work, collaborate and learn. New innovations in digital technologies are powerful influences in 21st century classrooms. In this course, participants are exposed to emerging issues for Internet-based culture and digital age learning, including gaming, virtual and augmented reality, digital libraries and databases, big data and data mining, and the use of social media and digital tools for enhancing instructional delivery. Learners will explore the use of emerging technologies and their integration into schools and organizations. (3 credits)

ED.893.600. Maker Education: Cultivating Curiosity, Creativity, and Problem Solving in Thoery and Practice. 3 Credits.
Maker Education is an educational approach and culture that emphasizes collaboration and community-mindedness, and uses hands-on, project-based learning methods to demonstrate student learning. Well-designed and implemented maker activities and curricula promote creativity, problem-solving, experimentation, and collaboration, as well as content learning, and they are often connected to STEM and STEAM initiatives. In this course, students will learn and apply theoretical principles for Maker Education and the culture of making. They will investigate tools and strategies that hold promise for engaging and empowering learners of all ages in maker-related activities. Students will develop authentic learning experiences that support inclusive and equitable access to technology and maker education for diverse learners in a range of learning environments. Students will also become familiar with critiques of maker education, formulate plans to integrate maker activities with "traditional" learning activities, and develop rubrics to assess student learning with maker activities.

ED.893.601. Evaluation and Research in Digital Age Learning. 3 Credits.
In this course students learn and practice the skills necessary to evaluate the use of educational technology in learning environments and educational settings. The course covers a range of alternative and mixed methods for data collection, such as observation, interviewing, the use of surveys, and analysis of data. Students develop an evaluation plan that can be implemented in their own educational settings and demonstrates their ability to select and/or develop appropriate metrics to identify the impact of technology in the teaching-learning process. Students use empirical methods to describe, explore, and/or explain the relationships between technology and program and/or individual outcomes.

ED.893.628. Gaming and Simulations for Learning. 3 Credits.
This course provides an overview of game-based learning theories and best practices for incorporating educational games and simulations into a range of learning environments. Students will learn to apply analytic frameworks to commercial and educational games so as to evaluate a game's potential as a learning tool or environment for K-18, business, and government settings. Students will integrate games with lessons and other learning activities, as well as produce prototypes for their own educational games and plan to use gameplay data for assessment.

ED.893.632. Data-Driven Decision Making. 3 Credits.
The increasing impact of a knowledge economy and globalization has been a catalyst to the fields of knowledge management and organizational decision making. This course is designed to introduce knowledge management concepts into an educational context and to provide an in depth focus on data-driven decision making in educational organizations and institutions. Participants investigate how decisions and strategies are developed and how tacit or explicit knowledge can be identified, captured, structured, valued and shared for effective use. Course topics include leadership and strategic management relative to organizational decision making, managerial and organizational structures, organizational learning, and decision support systems. A related intent is to develop an understanding of data mining metrics that can be used to create predictive models that support systemic change in schools. Opportunities are provided for participants to use online and electronic tools that can assist in facilitating meaningful conversations about instruction and learning among their school's faculty and staff.

ED.893.634. Technology Leadership for School Improvement. 3 Credits.
Education leaders need to understand the use of technology for teaching, learning, and managing their school environment. These skills include schoolwide technology planning and leadership that incorporate instructional design, curriculum integration with standards, logistics of technology implementation, professional development, and evaluation. Students will develop an understanding of how to create and support technological change through a systems approach. Topics include sources of resistance to change, tools for planning, decision making and change, creating and supporting a culture for learning and change, and managing and institutionalizing change systems.

ED.893.645. Explorations in Blended and Hybrid Learning. 3 Credits.
In this course, students will become familiar with different models of blended learning, discuss how blended learning differs from "technology integration," and examine the potential for blended learning instructional models to provide learners with more personalized learning experiences. Students will evaluate and compare different blended learning models to justify their rationale for selecting models appropriate for their teaching and learning contexts. They will describe instructional strategies and technologies that can be used to increase learner engagement in blended learning environments. Through course readings and their own analyses, students will also examine challenges associated with the implementation of blended learning activities and the impact that implementation has on students, teachers, schools, or stakeholders in other workplace contexts. While exploring these topics, students will to choose a path for their learning based on their teaching and learning context. The course will culminate with students designing their own blended learning initiative that is authentic to their teaching and learning context.

ED.893.650. Fundamentals of Design Thinking. 3 Credits.
This foundational course in the DALET program, to be taken during a student's first term of enrollment, operationalizes principles of design thinking, instructional design, and learning theories to equip learners with foundational knowledge and skills for designing learning experiences in a range of contexts. Throughout the course, students will independently and collaboratively engage in the multiple phases of an iterative design cycle (framing, ideation, prototyping, testing and evaluating) to create human-centered design prototypes to address specific learner/user needs. Students will leave the course with a set of practical tools and techniques to design innovative design solutions within their own professional setting.

ED.893.651. Computational Thinking for K-12 Educators. 3 Credits.
In 2006, Jeannette Wing published a seminal paper on computational thinking, arguing that "it represents a universally applicable attitude and skill set everyone, not just computer scientists, would be eager to learn and use." This course will provide an overview of computational thinking (CT), in theory and in practice, with an emphasis on its use in different K–12 disciplines and contexts. Students will investigate CT theories, CT measures, the benefits of building CT competencies, and approaches to developing CT in many different disciplines. Students will work with a variety of tools, including the Scratch block programming environment, to explore how these can be used to develop CT competencies among their learners, and create a long-term plan for nurturing CT in their particular context.

ED.893.701. Advanced Seminar in Digital Age Learning. 3 Credits.
The seminar is the capstone course in the Digital Age Learning and Educational Technology master's program and reflects students' individual mastery for leveraging technology with diverse learning populations. The seminar focuses on examining the constructs of educational technology topics and culminates in the student creation of his/her online portfolio. The portfolio showcases the products and skills developed by learners during the core courses throughout the term of their academic studies. The goals of the seminar are to engage and support participants in understanding the historical, cognitive, technical, political, and sociological issues involved in the effective use of technology in education and particularly in the integration of technology into instruction.
ED.893.601

ED.893.850. Advanced Applications in Digital Age Learning. 3 Credits.
The advanced applications course provides students the opportunity to individualize their program experience, to sharpen existing skills, to gain new skills, and to pursue their educational technology interests related to curriculum and professional development in support of technology-based programs. Students work with their advisor to create a professional, customized learning experience that stretches the student through his/her participation in the development, design, implementation, or evaluation of high-quality technology products, projects, or services. The activities in this course are aligned to individual students' schedules and can include collaborative opportunities with public and private sector organizations and agencies that have local, regional, national, or international interests. This course supports the development of leadership expertise in an area designated by the student as a set of skills needed to advance the individual in their chosen area of study and professional practice.

Counseling & Human Services

ED.860.666. Applied Cognitive Behavioral Therapy. 3 Credits.
This course covers advanced issues in the real-time application of the theories of Cognitive Behavioral Therapy (CBT) to the treatment and treatment planning of the most commonly diagnosed DSM-5 disorders. Building on the theoretical learning objectives in the Cognitive Behavioral Therapy course, the emphasis of this course will be on the development and application of CBT-based techniques and skills to clinical cases presented by the students.
ED.860.639[C] AND ED.861.609[C]

ED.863.526. Introduction to Play Therapy with Children. 3 Credits.
The major goal of this course is to facilitate students' knowledge, dispositions and skills to counsel children through play therapy and other major theoretical applications. Students' learning will be facilitated through didactic presentations, interactive discussions, and supervised counseling practice with elementary school children. This course also emphasizes the counselor's collaborative work with children's legal guardians/family members. (3 credits)
ED.861.507

Innovative Teaching & Leadership

ED.810.602. Curriculum, Instruction, and Assessment in School Settings. 3 Credits.
Students consider the philosophical, historical, and psychological foundations for elementary and secondary school curriculum and explore the linkages between assessment-based curriculum and instructional strategies. After examining the scope and sequence of the K-12 curriculum, students evaluate options presented in various school reform plans and contemporary research findings in effective schools and effective instruction. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools. (3 credits)

ED.810.603. Methods of Teaching in the Elementary School: Part I. 3 Credits.
This course is designed for candidates in the elementary education certification program. Students explore strategies for teaching mathematics, language arts, and the aesthetic areas of music, art, and physical education in the elementary school. Activities, materials, and technology address the varying developmental and learning needs of elementary school children and examine ways of integrating aspects of the curriculum. Participants engage in lesson planning and micro-teaching activities for teaching problem solving and higher order thinking skills. This course includes uses of the Internet to obtain curricular resources. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools.

ED.810.604. Methods of Teaching in the Elementary School: Part II. 3 Credits.
This course is designed for candidates in the elementary education certification program. Students explore strategies for teaching social studies with an integration of language arts, and the aesthetics areas of music, art, and physical education in the elementary school. Activities, materials, and technology address the varying developmental and learning needs of elementary school children and examine ways of integrating aspects of the curriculum. Participants engage in lesson planning and microteaching activities for teaching problem solving and higher order thinking skills. This course includes uses of the Internet to obtain curricular resources. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools.

ED.810.606. Human Development and Learning. 3 Credits.
This course integrates key insights into current theory and practice in human growth and development and educational psychology (learning). Participants analyze a variety of learner characteristics that influence student development and academic achievement. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools. (3 credits)

ED.810.607. Culturally Responsive Teaching. 3 Credits.
Candidates will explore the social, organizational, and structural factors influencing educational opportunities, experiences, and outcomes of culturally diverse students. Through personal reflection and analysis, candidates will determine the best way for them to positively impact students, regardless of ethnicity, gender, socioeconomic status, sexual orientation, etc. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools. (2-3 credits)

ED.810.611. Methods of Teaching in Secondary English: Part I. 3 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.612. Methods of Teaching in Secondary Mathematics: Part I. 3 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.613. Methods of Teaching in Secondary Science: Part I. 6 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.614. Methods of Teaching in Secondary Social Studies: Part I. 3 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.621. Special Topics in Secondary English. 3 Credits.
The purpose of this course is to improve prospective teachers' content knowledge in English. Students explore specific topics in English through seminar discussions, research, projects, and classroom application assignments. Topics are content-focused and vary each semester with the needs of the students. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools. (3 credits)<P><I>Notes: </I>Open only to students admitted to Master of Arts in Teaching program.

ED.810.622. Special Topics in Mathematics. 3 Credits.
The purpose of this course is to improve prospective teachers' content knowledge in mathematics. Students explore specific topics in math through seminar discussions, research, projects, and classroom application assignments. Topics are content-focused and vary each semester with the needs of the students. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools. (3 credits)<P><I>Notes: </I>Open only to students admitted to the Master of Arts in Teaching program.

ED.810.623. Special Topics in Science. 3 Credits.
The purpose of this course is to improve prospective teachers' content knowledge in science. Students explore specific topics in science through seminar discussions, research, projects, and classroom application assignments. Topics are content-focused and vary each semester with the needs of the students. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools. (3 credits)<P><I>Notes: </I>Open only to students admitted to the Master of Arts in Teaching program.

ED.810.624. Special Topics in Secondary Social Studies. 3 Credits.
The purpose of this course is to improve prospective teachers' content knowledge in social studies. Students explore specific topics in social studies through seminar discussions, research, projects, and classroom application assignments. Topics are content-focused and vary each semester with the needs of the students. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools. (3 credits)<P><I>Notes: </I>Open only to students admitted to the Master of Arts in Teaching program.

ED.810.631. Methods of Teaching in Secondary English: Part II. 3 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.632. Methods of Teaching in Secondary Math: Part II. 3 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.633. Methods of Teaching in Secondary Science: Part II. 3 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.634. Methods of Teaching in Secondary Social Studies: Part II. 3 Credits.
Students will use their subject area content expertise to design effective lesson and unit plans that apply significant concepts and understandings as defined by local, state, and national curriculum and professional standards. Discipline appropriate pedagogy will be the focus of instructional delivery as course content when taken into the internship classroom. In both Part I and Part II, unit plans will be developed and assessed. Part I will focus on planning and the integration of standards and content and classroom management. Part II will expand upon this focus and will also include an emphasis on instructional technology and differentiation for students with special needs.

ED.810.640. Supervised Internship and Seminar in the Elementary Schools. 6 Credits.
Students spend a minimum of a semester in appropriate elementary school settings under the guidance and direct supervision of a certified teacher and/or a university supervisor, depending upon the program format. A support seminar meets to enable students to discuss and reflect upon their experiences. Emphasis is placed on applying concepts, techniques, and theories learned in courses and other structured learning experiences to classroom settings. Supervisors provide guidance in the application of rigorous content in developmentally appropriate ways. Participants reflect, continue to develop their portfolios, and prepare for portfolio presentations. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools.

ED.810.641. MAT Clinical Practice for Elementary Candidates: Part I. 2 Credits.
This school based experience is designed to provide MAT candidates with an opportunity to work with public and private school students in diverse settings. Hosting sites (Professional Development Schools and partnership schools) serve as clinical laboratories where students begin a minimum 100-day internship where they can observe how pupils learn, discover appropriate teaching strategies, plan lessons, implement teaching methods, as well as develop classroom management skills. This course is aligned with the expectations of the Maryland Common Core. This course provides an opportunity to practice clinically while being guided by an experienced master teacher and university faculty.

ED.810.642. MAT Clinical Practice for Elementary Candidates: Part II. 3 Credits.
This school-based experience is designed to provide MAT candidates with an opportunity to continue working with public and private school students in diverse settings. Hosting sites (Professional Development Schools and partnership schools) serve as clinical laboratories where students complete their minimum 100-day internship observing how pupils learn, practicing appropriate teaching strategies, planning lessons, implementing teaching methods, as well as refining classroom management skills. Students will complete their professional portfolio with evidence acquired in this course. This course is aligned with the expectations of the Maryland Common Core. This course provides an opportunity to practice clinically while being guided by an experienced master teacher and university faculty.
ED.810.641

ED.810.645. Supervised Internship and Seminar in the Secondary Schools. 6 Credits.
Students spend a minimum of one semester in appropriate secondary school settings under the guidance and direct supervision of a certified teacher and/or a university supervisor, depending upon the program format. A support seminar meets to enable students to discuss and reflect upon their experiences. Emphasis is placed on applying concepts, techniques, and theories learned in courses and other structured learning experiences to secondary classroom settings. Supervisors provide guidance in the application of rigorous content in developmentally appropriate ways. Participants reflect, continue to develop their portfolios, and prepare for portfolio presentations. Course content is aligned with the Maryland Common Core Curriculum employed by partnership schools.

ED.810.646. MAT Clinical Practice for Secondary Candidates: Part I. 2 Credits.
This school-based experience is designed to provide MAT candidates with an opportunity to work with public and private school students in diverse settings. Hosting sites (Professional Development Schools and partnership schools) serve as clinical laboratories where students begin a minimum 100-day internship where they can observe how pupils learn, discover appropriate teaching strategies, plan lessons, implement teaching methods, as well as develop classroom management skills. This course is aligned with the expectations of the Maryland Common Core. This course provides an opportunity to practice clinically while being guided by an experienced master teacher and university faculty.

ED.810.647. MAT Clinical Practice for Secondary Candidates: Part II. 3 Credits.
This school-based experience is designed to provide MAT candidates with an opportunity to continue working with public and private school students in diverse settings. Hosting sites (Professional Development Schools and partnership schools) serve as clinical laboratories where students complete their minimum 100-day internship observing how pupils learn, practicing appropriate teaching strategies, planning lessons, implementing teaching methods, as well as refining classroom management skills. Students will complete their professional portfolio with evidence acquired in this course. This course is aligned with the expectations of the Maryland Common Core. This course provides an opportunity to practice clinically while being guided by an experienced master teacher and university faculty.
ED.810.646

ED.810.660. Teacher as Thinker and Writer. 3 Credits.
Novice teachers will reflect upon and write about their teaching experiences as a means of improving their teaching practice. They will employ a variety of writing forms to reflect on their different roles and contexts required of them in their classrooms, schools, and communities. Each class session will serve as a writing workshop with collaborative activities designed to generate pieces of writing (expository, narrative, descriptive, imaginative, and dramatic). (3 credits)

ED.810.665. In the Age of Change: School Reform in the United States. 3 Credits.
This course examines reform movements across the United States. School reform occurs at many different levels, from the classroom level with individual teachers, to the national level with federal mandates. We will explore reform at different levels and analyze the theory, policies, practices, and controversies of various mechanisms of reform, including the K-8 movement, small high schools, school choice (charters and vouchers), mayoral control, community schools and federal reform initiatives. Participants will synthesize information about school reform in the United States schools and systems and will reflect on their role in this process. Final evaluation of reform strategies will be grounded in the effect these reforms are having on improving learning for all students across the United States schools.

ED.810.679. Classroom Management. 2 Credits.
Students consider the practical ways of managing the classroom by examining organizational techniques, procedures and routines, and teaching strategies that help foster appropriate student behavior. Class members investigate management styles and discipline models to develop their own framework for effective classroom management. (2-3 credits)

ED.811.603. Special Education: Promises and Challenges I. 1 Credit.
This course provides: (a) an overview of the characteristics of students with exceptional learning needs and (b) the field's history, laws, procedures and trends. This is a foundational course in special education that will allow participants to explore the state of special education in the United States today and its impact on urban education.

ED.811.604. Special Education: Promises & Challenges II. 1 Credit.
This course examines a framework for understanding key concepts in inclusion as they relate to the academic, social, and emotional development of all learners. This course encourages participants to consider the cultural and linguistic issues that influence students' needs as well as families' understanding of special education services.

ED.811.608. Building Productive and Nurturing Classroom Communities II. 1 Credit.
In this course, participants will continue to explore models of community building practices for their classrooms that will demonstrate inclusivity and respect for all students. The course emphasizes reinforcement techniques to support student needs and behavior while diving deeper into culturally responsive and restorative discipline approaches. Participants are supported in developing their philosophies for building classroom communities that will support student voice and independence while fostering family and community relationships. Participants will practice enacting reinforcement techniques while developing appropriate systems to use in the clinical setting.

ED.811.612. Introduction to Assessment and Tiered Instruction. 2 Credits.
This course examines teaching and learning for students with exceptional learning needs in the general education classroom, with specific attention to the role of informal assessment and subsequent differentiation in response to findings. Foci include: (a) best practices for nondiscriminatory assessment, (b) practice administering group and individual informal assessments, (c) knowing how, when, and why to vary learning environments, learning activities, and content, and (d) implementing Tier 1 accommodations/modifications and Tier 2 interventions to support student learning opportunities.

ED.811.614. Small Group Practicum (Secondary). 2 Credits.
Practicum is designed to provide participants with an opportunity to work intensively with a small group of students from the host classroom by assessing and analyzing data as well as planning and teaching data-driven lessons. Participants will progress monitor students over the course of the 12+ weeks of small group instruction. The primary goal of the practicum experience is to increase student academic performance. A secondary goal is to provide participants with sufficient opportunities to enact the pedagogy of highly effective mathematics teachers. For mathematics practicum, participants will maintain a working group of 3–4 students across the entire semester, five days a week, and for 30–45 minutes per day, utilizing the Do the Math Now! intervention program. Do the Math NOW! focuses on mathematics topics that are typically taught at grades 6–8 and which—if not mastered—can later interfere with success in secondary mathematics at grades 7–12.

ED.811.615. Formal Assessment and Designing Individualized Education Programs. 1 Credit.
This course provides review of measurement statistics and practice with the administration, scoring, and interpretation of commonly used norm-referenced instruments and procedures for determination of eligibility for special education. Comparisons are made with informal assessment results, and ways to communicate results are discussed. Writing a formal report based on multiple data points is explained and detailed. The IEP process, from referral to eligibility determination and placement, is examined.

ED.811.616. Understanding and Managing Behavior. 2 Credits.
An overview of behavior management is presented within the framework of understanding the context and function of behavior, as well as developing systems that promote prosocial behaviors in the classroom. Residents will consider the interactions of people, environments, and responses to behaviors as factors that influence student behavior. Residents will also demonstrate understanding of Functional Behavior Assessments (FBA) and develop a Behavior Intervention Plan (BIP) as a method to address challenging behaviors.

ED.811.617. Specialized Instructional Techniques. 2 Credits.
Participants will investigate Tier 3 interventions in literacy, math, and behavior to establish how they differ from the kind of support that students already receive, the evidence base for them, the factors that would need to be considered to implement them, the ways in which they are implemented, and the ways to monitor their effectiveness.

ED.811.618. Clinical Residency I. 2 Credits.
Fellows are expected to reflect on their many opportunities to develop and refine their instructional practice and classroom management skills in a whole class setting as well as plan and deliver targeted tiered instruction. Fellows are expected to implement the content and skills developed through coursework and the inherent clinical experiences in a comprehensive manner during their first year as a teacher of record. Fellows will examine the evolution in their unit and lesson planning throughout the year and draw conclusions that inform their ongoing ability to plan targeted, rigorous, and engaging lessons.

ED.811.623. Building Productive and Nurturing Classroom Communities I. 1 Credit.
In this course, participants will be introduced to and practice the implementation of techniques for building classroom communities that are inclusive, equitable, and culturally responsive to all students. During the course, the participants will explore and critique multiple models of behavior management and modification, analyze the behavioral theories behind them, and practice techniques that support culturally relevant behavioral and learning outcomes. Participants will practice the fundamentals of building classroom communities, such as building responsive rapport with their students, enacting strong teacher presence, crafting and delivering explicit directions, and engaging in positive narration and restorative discipline. Participants will develop routines and procedures for implementation in the clinical setting.

ED.811.625. Emergent Literacy. 3 Credits.
This course will prepare participants for teaching literacy in early grades classrooms. Participants will be immersed in the instructional methodology that support the social, cultural, cognitive, and linguistic aspects of young children's reading and writing development in the classroom. Emphasis will be placed on utilization of assessment and its data to guide instructional planning aligned to K-2 standards. Additionally, participants will explore ways technology and new literacies practices can be used to support and enhance instruction.

ED.811.628. Intermediate Literacy. 2 Credits.
This course will prepare participants for teaching literacy in intermediate grades classrooms. Participants will be immersed in instructional methodology that supports the development of literacy in grades 3–6. Emphasis will be placed on the teaching of reading and writing as a means of developing comprehension, critical analysis, and discourse of fiction and nonfiction text. Additionally, participants will focus on the selection and utilization of relevant complex digital and print materials.

ED.811.630. Supporting Writer's Development. 2 Credits.
This course prepares participants for the thoughtful examination of students as writers and writing instruction. Throughout the course, participants will be introduced to strategies and skills they can use to enhance their own writing and the writing of their students. Using a process approach, participants will learn how to teach students to communicate ideas effectively in a variety of genres, for different purposes, and for diverse audiences. Data generated from student writing samples will be used to plan lessons, monitor progress, provide on going feedback, and differentiate instruction. Explicit attention will be given to sentence composing and the use of mentor texts and exemplars to support writing achievement.

ED.811.631. Elementary S.T.E.M. Methods. 3 Credits.
This course is an introduction to teaching inquiry-based science, technology, engineering, and mathematics (STEM) topics in grade level K-5. Participants will examine the practice of science by determining what it means to understand science and be scientifically literate, recognizing the importance of teaching scientific inquiry and process skills, and learning to create 5E inquiry lessons to promote meaningful science instruction; identify disciplinary core ideas by learning some science together, engaging in scientific inquiry just as you might do with your students, and considering inaccurate thinking children (and adults) have about specific science concepts; and use crosscutting concepts when designing thematic lessons. Emphasis will be placed on designing and evaluating instruction and curriculum in terms of how they effectively promote inquiry, critical, and design thinking.

ED.811.632. Small Group Literacy Practicum. 2 Credits.
Participants plan for and deliver small group differentiated instruction. The small group instructional experience prepares participants for intervention instruction. The small group instructional experience prepares participants for intervention instruction to students who need additional academic support(s). Participants are expected to implement the appropriate constructs and models for teaching and learning that they have acquired throughout coursework.

ED.811.640. Secondary ELA Immersion and Discourse. 3 Credits.
This course models a productive and nurturing classroom environment. Participants become completely immersed in their own learning about reading and writing, speaking and viewing, and discussing texts of all kinds. For each sequence of instruction, participants debrief the learning and the instructor's onstage/offstage decision making. Participants also develop and present lessons that are closely aligned to the Common Core State Standards.

ED.811.641. Language Acquisition. 2 Credits.
Participants will look deeply at three major topics that are important to supporting linguistically and culturally diverse students in urban, secondary education settings: language variation, academic language, and second language acquisition. Participants will explore these interrelated topics, attending to both socio-cultural and cognitive-linguistic perspectives on learning and learning environments. The purpose of the course is to guide educators to use linguistic awareness to inform their teaching. Participants will examine state standards andthe role of language in assessment and learning.

ED.811.642. Reading Diagnosis and Intervention. 2 Credits.
In this course, participants will deepen their understanding of reading processes, methods of reading assessment, and reading intervention strategies. They will assess students' skills and knowledge in word recognition, fluency, vocabulary, and reading comprehension, and prepare lessons in response to students' needs. To ensure effective management and clear communication with colleagues and caregivers during the first semester as lead instructors, participants will prepare thorough plans for classroom procedures related to reading assessment and instruction, and they will develop careful scripts for conferences. Course sessions will include time for collaborative lesson planning.

ED.811.643. Writing in the Secondary Classroom. 3 Credits.
This course prepares participants for the thoughtful examination of writers and writing instruction. Throughout the course, participants will be introduced to strategies and skills they can use to enhance the writing of their students. Using a process approach, participants will learn how to teach students to communicate ideas effectively in a variety of genres, for different purposes, and for diverse audiences. Explicit attention will be paid to reading and writing connections, and technology will be used to explore new literacy practices. Data will be used to plan lessons, monitor progress, provide on-going feedback, and differentiate instruction.

ED.811.644. Genre Study I: Argument and Informational Texts. 3 Credits.
In this course participants will be immersed in reading and writing informational and argumentative texts. Participants will analyze texts to identify the characteristics, structures, and techniques commonly used in a variety of texts within each genre. Participants will develop comprehension lessons in each genre and will develop a unit that integrates reading and writing of informational and argumentative texts. To support the development of the unit, participants will explore a wide range of texts for their quality, complexity, and the diverse roles they play in secondary English-Language Arts. Participants will examine how the texts being used in conjunction with it, through the process of reading and then designing original multi-modal, multi-genre text sets with a focus on informational and argumentative texts.

ED.811.646. Genre Study II: Poetry, Drama, and the Novel. 3 Credits.
What we reads determines our reading process, and adolescents need opportunities to read, respond to, and write in different genres. By gaining an understanding of the structures and conventions of a variety of genres, students improve their reading comprehension. First as learners and then as teachers, participants will read and analyze texts in four genres: novel, short story, poetry and drama. These readings will include contemporary texts and those traditionally taught at the secondary level. Emphasis will be placed on fostering and developing student stamina and engagement. Participants will (1) study the major components used within these genres; (2) investigate the reading, writing, and critical-thinking skills required of students when reading and responding to complex texts; (3) identify the challenges unique to teaching diverse learners; and (4) conceptualize, design, and implement a thematic unit that incorporates at least three genres.

ED.811.650. Secondary Math Immersion. 3 Credits.
This course is designed to provide participants with an overview of mathematical thinking and reasoning put forth in the Common Core State Standards for grades 6-12. Participants will experience first-hand a mathematics learning environment that places a premium on students' mathematical sense-making. The overarching goal of this course is to immerse participants in the kind of high cognitive demand math learning experiences they will ultimately provide for their own students. Participants will not only leave this course with lasting images of high quality mathematics instruction, they will also be able to connect those images to specific exemplary teacher behaviors articulated in the Urban Teachers' Teacher Practice Rubric.

ED.811.651. Proportional Reasoning. 3 Credits.
Participants will work with their small group teaching assignments to integrate ideas of proportional thinking, such as using a factor-of-change, a ratio table, cross-multiplication, and scaling up and down. This work with their students will provide an opportunity for exploring ways to identify a student's level of understanding for proportional thinking, such as the ability to differentiate between additive and multiplicative relationships, and developing tasks and activities that will correct and deepen that understanding.

ED.811.652. Algebra, Functions, and Modeling in the Real World. 3 Credits.
This course aims to provide participants with a rich understanding of essential conceptsundergirding high school algebra, functions and the modeling process. Participants considercritical components of how students in grades 6-12 develop algebraic thinking and skill, beyondtraditional focus on algebraic manipulations. An in-depth focus on functions in the course allowsparticipants to systematically explore and analyze patterns, change and relationships amongquantities in everyday events and problems in life and society. Participants will further theiralgebra experience by exploring functions as fundamental mathematics objects that allow us tomodel real life situations. Understanding and applying components of the modeling process allows participations to examine authentic real-world situations by building mathematical models and applying solutions using the lens of culturally relevant pedagogy and social justice mathematics.

ED.811.653. Math Methods I. 2 Credits.
This course is designed to provide participants with initial structure and resources to provide a framework for teaching that includes data collection, case analysis, small group instruction, whole group paired and individual instruction. Participants will discuss effective methods for lesson planning, incorporating the needs of students with IEPs and 504 plans, and assessment. Participants will have the opportunity to rehearse lessons prior to implementation and respond to feedback.

ED.811.655. Math Methods II. 2 Credits.
This course will continue the work done in Math Methods I around planning, collaborating, data collection, self-assessment, rehearsal, revision of lessons to suit students' needs, and general support. Participants will continue to receive guidance on addressing the Specially Designed Instruction (SDI) needed for students with IEPs and 504 plans. This course will focus on issues arising in the participants' clinical work providing effective math instruction to a diverse group of learners.

ED.811.656. Practices Concepts, and Core Ideas in Secondary Science (6-12). 3 Credits.
This course integrates space, engineering, technology, and physical, life, and earth science. Participants will experience inquiry as learners and doers of science and demonstrate knowledge of the practices, crosscutting concepts, and disciplinary core ideas articulated in the Next Generation Science Standards at the middle and high school levels. Participants will reflect on their planning and delivery of science, the science teaching of others, themselves as learners of science, and the opinions of science experts.(3 credits)

ED.811.661. Secondary Classroom Management Seminar. 1 Credit.
This course will focus on introductory exposure to classroom management through readings, discussion, practice, and reflection. Participants will develop an understanding of effective classroom management systems by actively implementing strategies in a summer classroom placement. Participants will also be introduced to the concept of the school-to-prison pipeline and its relationship to classroom management and disciplinary practices. Participants will learn about and understand how effective classroom management strategies, procedures, and strong student-teacher relationships can help counteract the school-to-prison pipeline.

ED.811.665. Trauma Informed Teaching Practices. 1 Credit.
This course is designed to help participants develop skills to support students who have experienced trauma. Participants will also examine current research about trauma-sensitive classroom environments that promote student learning and interpersonal skills for coping with trauma.

ED.811.667. Social Studies Inquiry: Content Area Reading and Writing. 2 Credits.
This online course will engage participants in the inquiry process as learners. Participants apply this process as they design and plan a thematic social studies inquiry unit that supports students in becoming agents of change in the communities in which they reside through historical, cultural, political, and geographical exploration. Specific attention is given to developing rigorous and meaningful units of study to support students in developing relevant content knowledge through multimodal texts using content area and disciplinary literacy practices. Participants will utilize their understanding of literacy practices from previous coursework and social studies methodology to support students in achieving the goals of this unit of study.

ED.811.670. Race, Culture, and Equity in Urban Education. 2 Credits.
In this course, residents will be prompted to see themselves as diversity advocates who understand and respect differences among learners in their classrooms, schools, and organizations. They will explore how by first understanding their own beliefs and biases they can then begin to better understand those around them; particularly those they have chosen to serve – students. They will learn that in order to become effective teachers who will build upon the strengths and skills of urban students and their families and communities they will need to build healthy, meaningful relationships and promote academic achievement. Residents will also explore the intersection of beliefs and practices through the examination of various learning theories and frameworks for effective, culturally responsive instruction.

ED.811.671. Reading, Writing, and Language Development. 2 Credits.
This course provides a foundational understanding of the ways children develop in the areas of reading, writing, speaking and listening. Participants will be immersed in the social and cultural perspectives related to literacy development, the developmental stages of literacy, the five components of reading instruction (phonemic awareness, phonics, fluency, vocabulary, and comprehension) and instructional methods and materials for supporting the literacy development of students with diverse language and learning needs.

ED.811.672. Numbers, Operations, and Algebraic Reasoning. 2 Credits.
This course focuses on building the content understandings and pedagogical skills to teach elementary mathematics. Participants investigate the procedures, concepts, models, and representations that are required to understand our base-ten number system and operations with whole numbers, fractions, and decimals. Additionally, participants will experience and plan for Mathematics Workshops as a structure for implementing equitable, high quality mathematics teaching and learning. Participants will rehearse and plan effective teacher moves for facilitating a student-centered Mathematics Workshop lesson. Particular attention is also given to unpacking standards, identifying quality math tasks, and planning instruction which places emphasis on the representation and communication of student mathematical thinking and reasoning. Participants will also rehearse, plan, and implement effective teacher behaviors that foster student engagement in the eliciting and synthesis of mathematical ideas.

ED.811.673. Counting & Cardinality. 1 Credit.
This course focuses on the scope and sequence of mathematics concepts and skills and developmentally appropriate environments for young learners. Participants will learn about the learning trajectories for number sense, counting, and cardinality. Participants will engage young learners in academic discourse to uncover student thinking and to assess student readiness. Participants will also examine, plan, and implement instructional routines that engage young learners—including examining and discussing appropriate models and manipulatives to support the acquisition of automaticity, fluency, and conceptual understanding.

ED.811.674. Small Group Math Practicum. 2 Credits.
Small Group Practicum is designed to provide participants with a rigorous opportunity to work intensively with a small group of elementary students to provide Tier 2 mathematics intervention instruction using the Number Sense Screener, Number Sense Interventions, Do the Math, or a specialized program for pre-k. Participants learn how to assess and analyze the mathematical skills and knowledge of their students using appropriate diagnostics from the intervention program. Participants will practice using pre-test data to plan and implement Tier 2 mathematics lessons. Participants will monitor the progress of students over the course of the 12+ weeks of small-group instruction with the goal of monitoring the student achievement and attendance of 3–4 children. Mathematics intervention instruction, excluding assessments, occurs 4–5 days a week, for 45 minutes per day, for 12+ weeks (i.e., a total of 45 hours).

ED.811.675. Geometry for Elementary Grades. 2 Credits.
In this course, participants will be immersed in the progression of the standards for geometry in grades K–5. Participants will acquire knowledge about the theoretical model of geometric understanding (Van Hiele) and use this to select a math task aligned to standards, develop lesson plans, and analyze and use student performance data to inform future instruction. Emphasis will be placed on identifying community assets and resources and leveraging those assets to plan geometry instruction that is real-world, authentic, and meaningful for elementary learners. Participants will demonstrate their understanding of geometric progression in the standards, levels of geometric understanding, and community assets by developing a week-long unit.

ED.811.676. Measurement and Data. 2 Credits.
This course focuses participants on developing understanding of the strands of mathematical proficiency involved in concepts of measurement and data in grades K–5. Participants are immersed in the progression of the measurement and data standards aligned to the state standards for mathematics at grades K–5. Emphasis is placed on participants examining the crosscutting mathematics concepts that are connected to measurement and data topics (e.g., Algebraic Reasoning or Number & Operations). Participants acquire strategies for helping students monitor their learning, rehearse the planning of lessons that embed choice options (process), and differentiate the demonstration of learning for students (product).

ED.811.677. Motivation and Engagement of Adolescent Readers and Writers. 1 Credit.
In this course, participants will examine the factors that support engagement and motivation of adolescent readers and writers. Adolescents have distinct identities that inform their relationship to reading and writing, identities that have been formed over the course of many years of experiences in schools. Participants will identify ways to positively engage and motivate students as readers and writers. This work is essential for students entering secondary grades with negative academic identities informed by prior academic experiences. Increasingly negative identities are inversely associated with future academic outcomes. By unpacking the factors that impact identity, motivation, and engagement, participants will be equipped to design lessons that positively support positive identity formation by their students.

ED.811.678. Data and Community: Statistics and Probability in Action. 2 Credits.
This course combines an exploration of fundamental principles of data science with essential concepts in K-12 statistics and probability. Participants explore the place and prevalence of real-world data and examine how data is gathered, represented, analyzed and utilized to drive decision-making in today's world. In the course, participants use statistical tools and work with data to uncover patterns that impact our communities and the world at large. Integrating social justice standards as a basis for problem- solving through statistics and probability empowers participants, and subsequently the students they teach, to be able to unveil data patterns in their communities and lived experiences. Integrating the use of the statistical thinking process, data science and probability will help participants and their students to analyze and respond to individual and institutional bias and injustice.

ED.811.679. Adolescent Development and Urban Youth. 1 Credit.
This course is designed to build an understanding of adolescent development and apply that knowledge to practice as teachers of adolescent learners. It is intended to create teachers who are more informed and better prepared to respond to the abilities, behaviors, and needs of adolescent learners. To that end, residents will explore adolescent development through an examination of their physical, cognitive, and socio-emotional development. In addition, as teachers of adolescents in urban communities, they will also examine how issues related to race and gender identity inform and impact the development of nurturing and productive classroom environments that create inclusive learning spaces for all students

ED.813.601. Seminar in Transformational Leadership and Teaching: Part I. 1 Credit.
In the Seminar in Transformational Leadership and Teaching, educators will determine what transformational teaching looks like in the unique context of their field experience: classroom, school, and community. Each session will focus on specific topics that educators will evaluate for alignment with their vision of transformational teaching. Finally, they will develop a plan of action to apply within their own context. Topics may include the attributes of exemplary teachers, services of community organizations, and characteristics of today's learners.

ED.813.602. Seminar in Transformational Leadership and Teaching: Part II. 1 Credit.
In the Seminar in Transformational Leadership and Teaching, educators will determine what transformational teaching looks like in the unique context of their field experience: classroom, school, and community. Each session will focus on specific topics that educators will evaluate for alignment with their vision of transformational teaching. Finally, they will develop a plan of action to apply within their own context. Topics may include the attributes of exemplary teachers, services of community organizations, and characteristics of today's learners.
ED.813.601

ED.813.603. Seminar in Transformational Leadership and Teaching: Part III. 2 Credits.
In the Seminar in Transformational Leadership and Teaching, educators will determine what transformational teaching looks like in the unique context of their field experience classroom, school, and community. Each session will focus on specific topics that educators will evaluate for alignment with their vision of transformational teaching. Finally, they will develop a plan of action to apply within their own context. Topics may include the attributes of exemplary teachers, services of community organizations, and characteristics of today's learners.
ED.813.602

ED.813.604. Seminar in Transformational Leadership and Teaching: Part IV. 2 Credits.
Teach For America corps members are required to attend a Seminar in Transformational Leadership and Teaching course all four semesters while in the corps. This course will develop corps members' competencies in the Teaching as Leadership (TAL) framework, the TAL impact model, and our developing understanding of transformational teaching. While much of a corps members' university development is rooted in instructional methods and teacher execution, the Seminar in Transformational Leadership and Teaching course develops teachers' ability to foster the more enduring qualities of access, advocacy, and habits of mind. Additionally, the students in this class will be observed once per quarter via a video-based online protocol.
ED.813.603

ED.813.611. Classroom Management: Part I. 1 Credit.
In this course, educators will gain a deep understanding of basic classroom management approaches including skills to maintain organized and efficient learning environments through classroom procedures and routines. Further, teachers will study motivation theory and apply the research in their own classrooms. This course focuses on how to drive students to invest in their own academic success and be self-motivated in school and beyond.

ED.813.612. Classroom Management: Part II. 2 Credits.
In this course, educators learn advanced strategies to help students become self-motivated to drive their own academic growth and future life options. By studying motivation theory, educators develop plans to support the individual learning and behavioral needs of all students, even those who may be disruptive in class. Educators use their own unique classroom experiences to further their professional growth and learning in this course.
ED.813.611

ED.813.621. Effective Practices in Teaching and Learning I: General Educators. 3 Credits.
In this course, educators will acquire the knowledge and skills of research-based effective practices in teaching and learning. Through a combination of coaching and online modules, educators will reflect upon their practice and apply instructional skills to motivate their students to achieve at the highest academic level. Educators will select online modules that best address their development as a transformational teacher.

ED.813.622. Effective Practices in Teaching and Learning II: General Educators. 3 Credits.
In this course, educators will build upon the knowledge and skills of research-based effective practices acquired in Effective Practices in Teaching and Learning I. Through a combination of coaching and online modules, educators will reflect upon their practice and apply instructional skills to motivate their students to achieve at the highest academic level. With guidance from advisors and coaches, educators select online modules that best address their development as a transformational teacher.
ED.813.621

ED.813.631. Effective Practices in Teaching and Learning I: Special Educators. 3 Credits.
In this course, educators will acquire the knowledge and skills of research-based effective practices in teaching and learning. Through a combination of coaching and online modules, educators will reflect upon their practice and apply instructional skills to motivate their students to achieve at the highest academic level. Educators will select online modules that best address their development as a transformational teacher. Special educators will also receive differentiated instruction to address the specific needs of their classrooms.

ED.813.632. Effective Practices in Teaching and Learning II: Special Educators. 3 Credits.
In this course, educators will build upon the knowledge and skills of research-based effective practices acquired in Effective Practices in Teaching and Learning I. Through a combination of coaching and online modules, educators will reflect upon their practice and apply instructional skills to motivate their students to achieve at the highest academic level. With guidance from advisors and coaches, educators select online modules that best address their development as a transformational teacher.
ED.813.631

ED.813.641. Effective Practices in Teaching and Learning I: ESOL Educators. 3 Credits.
In this course, educators will acquire the knowledge and skills of research-based effective practices in teaching and learning. Through a combination of coaching and online modules, educators will reflect upon their practice and apply instructional skills to motivate their students to achieve at the highest academic level. Educators will select online modules that best address their development as a transformational teacher. Further, elements of effective ESOL education will be highlighted.

ED.813.642. Effective Practices in Teaching and Learning II: ESOL Educators. 3 Credits.
In this course, educators will build upon the knowledge and skills of research-based effective practices acquired in Effective Practices in Teaching and Learning I. Through a combination of coaching and online modules, educators will reflect upon their practice and apply instructional skills to motivate their students to achieve at the highest academic level. With guidance from advisors and coaches, educators select online modules that best address their development as a transformational teacher.
ED.813.641

ED.813.651. Introduction to Education Budgeting. 3 Credits.
Educational leaders must be equipped to analyze and create budgets and other financial tools in order to fully realize their vision of high quality instruction in high performing schools. This course will introduce students to the fundamental principles of budgeting for educational institutions and provide them with a set of basic skills to create and analyze budgets in their specific professional context.

ED.813.652. Introduction to Global Education Policy and Analysis. 3 Credits.
The course provides an introduction to international comparisons of education systems as it reviews the history, comparisons and the educational systems in Europe, Asia and the OECD countries. International education systems and policies are examined on the local and national levels. Methodologies for comparison are explored. Education leaders will become knowledgeable of the systems in competitor countries in order to make their schools academically competitive in the global economy.

ED.813.653. Current Issues in Educational Leadership. 3 Credits.
Today's educational leaders are confronted with a myriad of diverse issues on a daily basis. Those issues traditionally include governance, academic affairs and resources. In the current education environment, leaders must also be prepared to act on issues concerning accountability, accessibility, technology, competition and community partnerships as well as quickly changing local, state and federal policies. This course will introduce students planning to pursue careers as education leaders, in both K-12 and higher education, to the issues and pressures they will encounter in real time. After receiving instruction in a broad overview of a number of important current issues, students are asked to examine case studies and develop leadership strategies to manage these high profile education issues.

ED.813.654. Race, Power and Policy in Education. 3 Credits.
This course examines the intersections of race, power and policy and their impact on education. The course is designed to review historical and systematic drivers of racial and social class inequality in American education. Through this course, students will examine various theories, concepts, principles, and dynamics of race, power, and policy and how these ideas apply to and impact education, organizations, and communities with the intent of acting as advocates and change agents to eradicate racial inequalities to a solutions based orientation.

ED.813.661. Assessment for Reading Instruction for Young Children. 3 Credits.
This course presents foundational concepts of assessment in reading as well as the various types and purposes of emergent and beginning reading assessments. Educators will plan and implement research-based reading assessments and use assessment data to make educational decisions and inform early literacy instruction. Educators will use effective techniques for communicating assessment results to peers, students, and parents.
You may not enroll in this course if you have previously enrolled in 813.662 course or have 813.662 course on your enrollments for this semester already.

ED.813.662. Assessment for Reading Instruction. 3 Credits.
This course presents foundational concepts of assessment in reading as well as the various types and purposes of literacy assessment. Educators will plan and implement research-based reading assessments and use assessment data to make educational decisions and inform literacy instruction. Educators will use effective techniques for communicating assessment results to peers, students, and parents.
You may not enroll in this course if you have previously enrolled in 813.661 course or have 813.661 course on your enrollments for this semester already.

ED.813.664. Portfolio Development, Part I: Teacher Growth.
The course is part one of the yearlong process, requiring monthly submissions from the candidates and communication with a portfolio coach to support them as they develop their Master's portfolio. (0 credit)

ED.813.665. Portfolio Development, Part II: Student Growth.
The course is part two of the yearlong process, requiring monthly submissions from the candidates and communication with a portfolio coach to support them as they develop their Master's portfolio. (0 credit)
ED.813.621 OR ED.813.631 OR ED.813.641;ED.813.622 OR ED.813.632 OR ED.813.642;ED.813.681 OR ED.813.682;ED.813.611 AND ED.813.612

ED.813.666. Instruction in Reading for the Young Child. 3 Credits.
This course presents research-based approaches to developing a comprehensive literacy program for children at varying stages of literacy development. Early childhood educators will incorporate into their daily lessons effective practices to promote language and literacy development, including concepts of print, phonological and phonemic awareness, word recognition (e.g., phonics and spelling), fluency, vocabulary, comprehension, and writing. This course focuses on accelerating literacy development through early intervention strategies. Also emphasized are strategies for involving families and the community in support of the literacy program.
You may not enroll in this course if you have previously enrolled in 813.667 course or have 813.667 course on your enrollments for this semester already,

ED.813.667. Instruction in Reading. 3 Credits.
This course presents research-based approaches to developing a comprehensive literacy program for students at varying stages of literacy development. Educators will incorporate into their daily lessons effective practices to promote language and literacy development, including phonological and phonemic awareness, word recognition (e.g., phonics and spelling), fluency, vocabulary, comprehension, and writing. This course focuses on accelerating literacy development in students with low reading achievement through early identification and intervention strategies. Also emphasized are strategies for involving families and the community in support of the literacy program.
You may not enroll in this course if you have previously enrolled in 813.666 course or have 813.666 course on your enrollments for this semester already.

ED.813.668. Materials for Teaching Reading to the Young Child. 3 Credits.
This course focuses on evaluation and selection of reading materials for a comprehensive early literacy program. Early childhood educators will learn and apply effective practices for selecting, evaluating, and organizing texts and materials, including informational and digital texts and resources, for a variety of purposes of reading. Attention will be given to evaluating quality of literature, addressing diverse cultural and linguistic backgrounds, leveling systems, intervention and family support, and children's interests and motivation.
You may not enroll in this course if you have previously enrolled in 813.669 course or have 813.669 course on your enrollments for this semester already.

ED.813.669. Materials for Teaching Reading. 3 Credits.
This course focuses on evaluation and selection of reading materials for a comprehensive literacy program. Educators will learn and apply effective practices for selecting, evaluating, and organizing texts and materials, including informational and digital texts and resources, for a variety of purposes of reading. Attention will be given to evaluating quality of literature, addressing diverse cultural and linguistic backgrounds, leveling systems, intervention and family support, and student interest and motivation.
You may not enroll in this course if you have previously enrolled in 813.668 course or have 813.668 course on your enrollments for this semester already.

ED.813.681. Teaching for Transformation I: Secondary Content. 3 Credits.
In this course, educators in grades 6-12 will take a three-part journey to advancing their knowledge and skills as secondary instructional leaders. They will: 1) learn and apply effective practices for conducting action research in the classroom to inform teaching and learning; 2) engage in a process for providing students access to opportunities otherwise unavailable to them that will inspire students to become lifelong learners and make productive and fulfilling life choices; and 3) build upon their knowledge and skills in content area teaching and learning to become strategic instructional decision makers, increase their self-efficacy in the classroom, and improve student learning and achievement. Emphasis will be on synthesizing learning, reflective practice, and professional growth.

ED.813.682. Teaching for Transformation I: Elementary Content. 3 Credits.
In this course, educators in grades PreK-5 will take a three-part journey to advancing their knowledge and skills as elementary instructional leaders. They will: 1) learn and apply effective practices for conducting action research in the classroom to inform teaching and learning; 2) engage in a process for providing students access to opportunities otherwise unavailable to them that will inspire students to become lifelong learners and make productive and fulfilling life choices; and 3) build upon their knowledge and skills in content area teaching and learning to become strategic instructional decision makers, increase their self-efficacy in the classroom, and improve student learning and achievement. Emphasis will be on synthesizing learning, reflective practice, and professional growth.

ED.813.683. Teaching for Transformation II: Secondary Content. 3 Credits.
In this course, educators in grades 6-12 will take a three-part journey to advancing their knowledge and skills as secondary instructional leaders. They will: 1) learn and apply effective practices for conducting action research in the classroom to inform teaching and learning; 2) engage in a process for providing students access to opportunities otherwise unavailable to them that will inspire students to become lifelong learners and make productive and fulfilling life choices; and 3) build upon their knowledge and skills in content area teaching and learning to become strategic instructional decision makers, increase their self-efficacy in the classroom, and improve student learning and achievement. Emphasis will be on synthesizing learning, reflective practice, and professional growth.
ED.813.681

ED.813.684. Teaching for Transformation II: Elementary Content. 3 Credits.
In this course, educators in grades PreK–5 will take a three-part journey to advancing their knowledge and skills as elementary instructional leaders. They will: 1) learn and apply effective practices for conducting action research in the classroom to inform teaching and learning; 2) engage in a process for providing students access to opportunities otherwise unavailable to them that will inspire students to become lifelong learners and make productive and fulfilling life choices; and 3) build upon their knowledge and skills in content area teaching and learning to become strategic instructional decision makers, increase their self-efficacy in the classroom, and improve student learning and achievement. Emphasis will be on synthesizing learning, reflective practice, and professional growth.
ED.813.682

ED.851.512. Politics of Education. 3 Credits.
Federal involvement in education has grown enormously in recent decades with calls for national standards and increasing reliance on standardized tests. While state legislatures and school boards traditionally provide funding and policy, mayors, parents and advocates of charter schools are seeking to redefine the nature of local control. Education leaders should understand the politics of education; the swiftly changing balance of power; and how education politics is practiced between and within the levels of government and the public. Students will study and analyze current issues and case studies that focus on the politics of education.

ED.851.601. Organization and Administration of Schools. 3 Credits.
Students examine the role of the school administrator, with emphasis on instructional improvement, pupil development and services, school and community relations, administration of facilities and finance, professional development and services for staff, and organizational relationships and responsibilities. Participants will explore best practices for fostering student achievement.

ED.851.603. School Law. 3 Credits.
Participants explore the legal foundations and structure of education and consider contemporary issues based on legislation and court decisions. Students develop techniques of legal research and analyze a topic of interest.

ED.851.609. Administrative and Instructional Uses of Technology. 3 Credits.
Prospective and practicing school administrators examine the issues, ideas, and programs surrounding the use of technology as a tool for administration and instructional management. Through hands-on experience, participants explore practical uses for software that can be applied to their daily work.

ED.851.616. Issues in K-12 Education Policy. 3 Credits.
This course provides an introduction to and an overview of several key and rapidly expanding areas of educational policy research, teacher effectiveness, teacher labor markets and teacher policy. The goals of this course are to familiarize students with some of the most current research in these areas, and to encourage and support students to develop skills as critical consumers of empirical work and policy debates in educational policy.

ED.851.642. Leadership in Curriculum, Instruction, and Assessment for Independent Schools. 3 Credits.
Students examine curriculum theory, design, and content and their relation to instruction and assessment as applied to independent schools. Topics include: curriculum and the independent school mission statement; K-12 curriculum scope and sequence; leadership of curriculum change; curriculum mapping and its implications; methods of assessment; interdisciplinary curriculum development; culturally responsive curriculum, instruction, and assessment; and differentiation of curriculum and instruction. Participants apply course content by developing a plan for curriculum implementation in their own schools.

ED.851.643. Supervision and Professional Development for Personnel in Independent Schools. 3 Credits.
Students examine models of instructional supervision, including clinical supervision and various approaches to personalizing supervisory strategies appropriate for independent schools. Emphasis is on development of an annual, school-based professional development plan; alignment of instructional goals with the supervision and evaluation of teachers; delegation of supervisory roles; recruitment, retention, and support of faculty and staff in independent schools; designing teacher incentives, recognition, and award programs; and using the principles of high-quality professional development to enhance teachers' knowledge and skills. Students apply concepts to practical situations in clinical observations.

ED.851.644. Public Relations, Marketing, and Fund-raising for Independent Schools. 3 Credits.
Students explore the importance of public relations, marketing principles, and fund raising to independent school success. Topics include: maintaining positive community relations; management of admission policies and procedures; operation of public relations and publicity functions; coordination of relations with other independent schools; facilitating relations with educational, governmental, and social service agencies; and fund-raising strategies. Students analyze and critique various strategies through case studies and discussion.

ED.851.645. Governance of Independent Schools. 3 Credits.
Students learn to facilitate positive working relationships within the board of trustees and build effective partnerships between the board and the school's faculty and staff. Topics include: setting, communicating, and evaluating progress toward annual goals; strategic planning with faculty, staff, and board members; establishing structures for boards to accomplish their work; reporting effectively to boards on important issues and concerns; models for evaluating the head of school; models for evaluating board performance and contributions of individual board members; developing trustees as effective school advocates; and managing crises. Students gain an understanding of the pressures exerted from multiple constituencies, finding ways to base decisions on what is good for students, what is good for the institution, and what is consistent with their own values.

ED.851.646. Business Management and Finance for Independent Schools. 3 Credits.
Students learn to apply business principles and financial processes that are the foundation for successful independent school management. Content includes: oversight of independent school budgets; understanding of tuition and other revenue sources; knowledge and effective use of endowments, financial aid, and loans; understanding of major expenses; annual budget planning; grasping the legal and ethical implications of financial management; developing salary scales and policies; using principles of strategic, long-range planning; and facilities planning, maintenance, and management. Applications include case studies for identifying and resolving common problems and challenges.

ED.851.705. Effective Leadership. 3 Credits.
Students review the principles and techniques required of principals, assistant principals, and teacher leaders. The course emphasizes diagnosis of the school climate, principles of inclusive leadership, motivation of faculty teams, and the dynamics of working in and with groups to accomplish school improvement goals. Emphasis is placed on the leader's role in creating a collaborative vision/mission for a school and in establishing meaningful working relationships with the larger community.

ED.851.708. Systemic Change Process for School Improvement. 3 Credits.
Students examine the literature on systemic change in schools, with an emphasis on the roles of the teacher leader. Topics include planning, implementing, and evaluating the change process for school improvement.

ED.851.809. Seminar in Educational Administration and Supervision. 3 Credits.
Students prepare and present a seminar paper on a problem in educational administration or supervision. The paper includes a comprehensive literature review, an assessment of implications for administrative and supervisory behavior, and an implementation plan for addressing the problem in an educational setting. Students engage in case study analyses, role playing, and assessment exercises.
ED.851.601 AND ED.851.603 AND ED.851.705 AND ED.852.602 AND ED.881.611 AND ED.881.622 AND ED.881.610

ED.851.810. Internship in Administration and Supervision. 3 Credits.
Students participate in a supervised practicum experience in an educational setting. Individual and group sessions of the interns are held. (3 credits)

ED.851.814. Internship in Administration and Supervision. 3 Credits.
Students participate in a supervised practicum experience where they demonstrate the application of knowledge, dispositions, competencies, skills and solutions to day-to-day activities performed by practicing administrators or supervisors. Students are required to complete a minimum of 200 observation and performance hours aligned with leadership standards. Experiences are reflective of real and simulated field-based activities in a variety of educational settings. Students must complete a final internship reflection paper, as well as a comprehensive portfolio that includes artifacts that are illustrative of their best work.

ED.852.602. Supervision and Professional Development. 3 Credits.
Students examine models of instructional supervision, including clinical supervision and various approaches to personalizing supervisory strategies. Emphasis is on supervision skills, including the assessment of teacher performance, effective conferring strategies, and working with teachers to construct instructional improvement plans. Students apply concepts developed to practical situations in laboratory sessions.

ED.871.501. Introduction to Children and Youth with Exceptionalities. 3 Credits.
Students investigate the major areas of exceptionality addressing the characteristics and educational needs of students with a broad range of special instructional needs. Students review incidence and etiology, diagnostic and instructional services, educational continuum of programs, and findings of recent research. (3 credits)

ED.871.502. Educational Alternatives for Students with Special Needs. 3 Credits.
Designed especially for general educators, counselors, supervisors, and administrators, this course examines differentiated instruction for students with special needs in general education classrooms. Students review the legal foundations and requirements of special education and the collaborative role of general and special educators in the implementation of individualized educational programs in general education classrooms. (3 credits)

ED.871.510. Legal Aspects, Service Systems, and Current Issues in Special Education. 3 Credits.
This survey course reviews litigated and legislated standards for special education and related services for persons with disabilities. Students explore current issues in the provision of services for persons with disabilities, including inclusion, the response to intervention (RTI), and regulations for eligibility. (3 credits)

ED.871.511. Instructional Planning and Management in Special Education. 3 Credits.
Students focus on the instructional and organizational skills necessary for teaching students who receive special education services. Topics of primary emphasis include developing effective individualized education plans; preparing and delivering exemplary lesson plans; and identifying instructional best practice strategies that promote effective classroom organization and instruction. Students create lesson plans using best practice strategies. (3 credits)

ED.871.512. Collaborative Programming in Special Education. 3 Credits.
This course focuses on collaboration themes common to various educational settings: interpersonal communication, problem solving, cultural diversity, teamwork, and family systems theory. Students examine techniques that promote effective communication between teachers, school administrators and related professionals, and families of students with special needs. Co-teaching models that work effectively are also discussed. (3 credits)

ED.871.513. Applied Behavioral Programming. 3 Credits.
This course will focus on the methodology of applied behavior analysis including how the principles of behavior can be used to make changes and improvements in classroom behavior. Observational methods, single-subject designs, behavior promotion and reduction, and generalization strategies are reviewed in relation to the needs of students with disabilities. Students assess and develop individual behavior projects that demonstrate their ability to design, implement, and evaluate behavioral support programs in an ethically responsive manner. (3 credits)

ED.873.601. Introduction to Applied Behavior Analysis and Special Education. 3 Credits.
This course provides introductory knowledge of Applied Behavior Analysis (ABA). Among the topics explored will be the scientific foundation on which ABA is built, the concepts and principles of behavior analysis, and an overview of the application of ABA in educational settings.

ED.873.602. Research Methods: Evaluation, Measurement and Single Case Design. 3 Credits.
The course will examine the methods of single subject research design, including defining and measuring behavior, data collection and interpretation of graphs, and single case research designs. Students will learn to utilize research methods to evaluate and measure the effectiveness of intervention and instructional procedures within an educational setting.

ED.873.603. Behavioral Assessment and Intervention for Challenging Behaviors. 3 Credits.
This course will investigate the principles and procedures of the field of applied behavior analysis as it relates to challenging behaviors. Observational methods, behavior promotion and reduction, and generalization strategies will be reviewed in relation to the needs of students with disabilities. Students will design, implement, and evaluate a behavior reduction program based on assessment results to decrease inappropriate behaviors for an individual student or a group of students in an educational setting.
ED.873.601[C] OR ED.873.602[C]

ED.873.604. Behavioral Assessment and Instructional Strategies. 3 Credits.
The course will focus on developing effective teaching plans based on Applied Behavior Analysis (ABA), exploring a variety of teaching strategies including discrete trial instruction, applied verbal behavior, shaping, chaining, direct instruction, precision teaching, personalized systems of instruction, incidental teaching, functional communication training, augmentative communication systems, programming for acquisition, generalization, and maintenance, and making data-based decision making to improve instruction. Students will design, implement and evaluate an instructional program based on assessment results to increase a desired behavior/skill for an individual student or a group of students in an educational setting. (3 credits)
ED.873.601[C] OR ED.873.602[C] OR ED.873.603[C]

ED.873.605. Ethics and Professional Conduct for Behavior Analysts. 3 Credits.
This course will provide discussion and examination of ethics and responsible conduct of behavior analysts with an in-depth review of the Guidelines for Responsible Conduct for Behavior Analysts (BACB, 2012). It will also include an overview of the behavior consultation model and examine the influence of Applied Behavior Analysis (ABA) on autism, developmental disabilities, and special education.
ED.873.601[C] OR ED.873.602[C] OR ED.873.603[C]

ED.873.606. Applications of Applied Behavior Analysis in the Classroom. 3 Credits.
This course will provide in-depth discussion and strategies regarding the implementation of applied behavior analysis in the classroom setting. Strategies will focus on documentation of services, training, and monitoring of others in carrying out behavior change procedures, performance monitoring and procedural integrity, supervision, evaluating effectiveness of intervention and teaching, and maintaining behavior change in the natural environment. Students will learn and plan for unwanted effects of reinforcement, punishment, and extinction in a classroom setting. Students will also examine current issues in special education as they relate to the implementation of applied behavior analysis, including inclusion, effective data collection, choosing evidence-based practices, and discussing the benefits of behavior analysis with other professionals. Finally, the course will help candidates prepare for the Board Certified Behavior Analysts (BCBA) exam. (3 credits)
ED.873.601[C] OR ED.873.602[C] OR ED.873.603[C] OR ED.873.604[C] OR

ED.873.607. Supervision and Consultation in ABA. 3 Credits.
This course will focus on supervision and consultation as it applies to working with personnel within an educational setting (pre-k through 12th grade). The importance of behavior analytic supervision will be reviewed with a specific focus on building skills to develop the supervisor/supervisee relationship including establishing performance expectations, goal setting, training others in the implementation of behavioral procedures, performance monitoring, and evaluating supervision outcomes. Among the topics explored will be behavioral consultation professional practice guided by the science of behavior analysis, utilizing treatment integrity measures, data based decisions, and collaboration within a school environment.

ED.873.610. Applied Behavior Analysis Practicum I. 3 Credits.
The practicum is designed to meet the field experience requirements as outlined by the Behavior Analyst Certification Board (BACB). This practicum provides supervised experiences in the application of behavior analytic services in educational setting. The practicum will also include a face-to-face seminar with an instructor. (3 credits)
ED.873.601 AND ED.873.602 AND ED.873.603 AND ED.873.605

ED.873.611. Applied Behavior Analysis Practicum II. 3 Credits.
The practicum is designed to meet the field experience requirements as outlined by the Behavior Analyst Certification Board (BACB). This practicum provides supervised experiences in the application of behavior analytic services in educational setting. The practicum will also include a face-to-face seminar with an instructor. (3 credits)
ED.873.601[AND ED.873.602 AND ED.873.603 AND ED.873.604 AND ED.873.605

ED.874.512. Characteristics of Students with Mild to Moderate Disabilities: Learning Disabilities, Behavioral Disorders, and Intellectual Disabilities. 3 Credits.
Students examine the incidence, etiology, and characteristics of students with learning disabilities, behavioral disorders, and intellectual disabilities, and review major theoretical models and instructional practices associated with each. (3 credits)

ED.874.513. Educational Assessment of Students with Mild to Moderate Disabilities: Elementary/Middle. 3 Credits.
Students explore assessment instruments and procedures for diagnosing elementary and middle school students who are experiencing learning and behavior problems. Participants administer and interpret norm-referenced, criterion-referenced, and curriculum-based instruments that assess academic achievement, social behavior, and emotional functioning. (3 credits)

ED.874.514. Educational Assessment of Students with Mild to Moderate Disabilities: Secondary/Adult. 3 Credits.
Students examine assessment instruments and procedures for diagnosing secondary level students who are experiencing learning and behavior problems in school. Students administer and interpret norm-referenced, criterion-referenced, and curriculum-based instruments that assess academic achievement, social-emotional behavior, and vocational functioning. (3 credits)

ED.874.524. Spoken and Written Language: Methods for Students with Mild to Moderate Disabilities. 3 Credits.
Students learn teaching strategies that can be used by teachers with students who have difficulty with oral and written expressive language. Instructional methods include both curriculum modifications and teacher-devised tasks. (3 credits)

ED.874.525. Mathematics: Methods for Students with Mild to Moderate Disabilities. 3 Credits.
Students examine effective instructional strategies for the remediation of problems frequently found in the mathematics performance of students with mild to moderate disabilities.

ED.874.526. Classroom Management: Methods for Students with Mild to Moderate Disabilities. 3 Credits.
This course reviews the theoretical foundations for developing practical interventions and management strategies to deal with inappropriate classroom behaviors, as well as strategies for individualized education program (IEP) development and implementation. Behavior modification, therapeutic strategies, social skills instruction, and communication principles are applied to the design and implementation of structured classroom management programs.

ED.874.527. Career Assessment and Programming: Education of Students with Mild to Moderate Disabilities. 3 Credits.
This course examines the assessment and instructional methods needed to implement and evaluate career transition and vocational programs that promote successful post-school adjustments for students with mild to moderate disabilities. Participants review the practice of vocational and career assessment, vocational instruction, vocational counseling, and the development of recreation and leisure skills and activities. (3 credits)

ED.874.528. Diversifying the General Education Curriculum: Methods for Secondary Students with Mild to Moderate Disabilities. 3 Credits.
Students discuss the characteristics of adolescents with mild to moderate disabilities. Students review the goals of the secondary school and gain an understanding of the range of curricular demands and graduation requirements, and their impact on students with special needs. The implications of school organization and service delivery models for students with disabilities are explored. Students develop accommodations, modifications, co-teaching plans, and projects across secondary curricular content areas. (3 credits)

ED.874.541. Reading: Methods for Students with Mild to Moderate Disabilities. 3 Credits.
Students learn to apply strategies designed to improve the reading performance of elementary/middle school students with mild to moderate disabilities. Highlighted are strategies related to word identification and paraphrasing and methods such as progress monitoring and self-evaluation. During the course, students apply a strategy with a student who is experiencing reading difficulties. (3 credits)

ED.874.542. Reading, English, and Language Arts: Methods for Secondary Students with Mild to Moderate Disabilities. 3 Credits.
Students learn to apply strategies designed to improve the reading and writing performance of secondary students with disabilities. Highlighted are strategies designed to maximize content area reading comprehension and writing within the content areas. During the course, students apply strategies with a secondary student or students experiencing reading difficulties. This course incorporates goals and objectives that correspond to the MSDE required course, ED.884.508 Methods of Teaching Reading in the Secondary Content Area, Part I. (3 credits)

ED.874.860. Mild to Moderate Disabilities Internship: Induction - Elementary/Middle. 3 Credits.
Designed for students seeking Maryland generic special education certification at the elementary/middle level, this internship, scheduled approximately midpoint in a student's program, provides supervised experiences in the education of children and youth in grades one through eight who require special education services. The internship sites and activities are assigned according to each student's interest and training needs. The participant implements foundational knowledge, skills, and dispositions gained in coursework in the areas of assessment, instruction, classroom management, and individual behavior intervention appropriate for the learning characteristics of elementary and middle school age students with disabilities.

ED.874.861. Mild to Moderate Disabilities Internship: Culmination - Elementary/Middle. 3 Credits.
Designed for students seeking Maryland generic special education certification at the elementary/middle level, this internship, scheduled near the completion of a student's program, provides supervised experiences in the education of children and youth in grades one through eight who require special education services. The internship sites and activities are assigned according to each student's interest and training needs. The participant continues professional development begun during the induction internship by implementing content specific knowledge, skills, and dispositions gained in subsequent coursework, with a focus on evaluating, selecting, and using reading materials and instructional methods appropriate for the learning characteristics of elementary and middle school age students with disabilities. This course incorporates goals and objectives that correspond to the MSDE required course, ED.884.505 Materials for Teaching Reading. (3 credits)

ED.874.870. Mild to Moderate Disabilities Internship: Induction - Secondary/Adult. 3 Credits.
Designed for students seeking Maryland generic special education certification at the secondary/adult level, this internship, scheduled approximately midpoint in a student's program, provides supervised experiences in the education of adolescents and young adults in grades six through 12 who require special education services. The internship sites and activities are assigned according to each student's interest and training needs. The participant implements foundational knowledge, skills, and dispositions gained in coursework in the areas of assessment, instruction, classroom management, and individual behavior intervention appropriate for the learning characteristics of middle and high school age students with disabilities.

ED.874.871. Mild to Moderate Disabilities Internship: Culmination - Secondary/Adult. 3 Credits.
Designed for students seeking Maryland generic special education certification at the secondary/adult level, this internship, scheduled near the completion of a student's program, provides supervised experiences in the education of adolescents and young adults in grades six through 12 who require special education services. The internship sites and activities are assigned according to each student's interest and training needs. The participant continues professional development begun during the induction internship by implementing content specific knowledge. This course incorporates goals and objectives that correspond to the MSDE required course, ED.884.510 Methods of Teaching Reading in the Secondary Content Area, Part II. (3 credits)

ED.877.513. Education of Students with Severe Disabilities: Augmentative Communication Systems. 3 Credits.
Students examine the design of augmentative communication systems that include use of graphic symbols for individuals with severe disabilities. Participants design and construct communication aids and develop strategies for integrating augmentative communication into the curriculum.

ED.877.514. Community and Independent Living Skills. 3 Credits.
This course reviews the philosophical movements that have fostered the improvements to the instruction of children, youth, and adults with disabilities. Participants: (a) apply the principles of ecological assessment in the development of curriculum sequences for children and youth with severe disabilities; and (b) examine current research-based teaching practices designed to promote the adaptive skills that contribute to the social competence and community acceptance of individuals with severe disabilities. (3 credits)

ED.877.550. Inclusive Practices for Autism Spectrum Disorders. 3 Credits.
This course examines the legal mandates for inclusive practices in public schools and barriers to successful inclusion for students with autism. Students will identify the process for determining the most appropriate educational environment and learn the critical steps in preparing students and teachers for inclusion. Models of inclusion and instructional modifications for the general education classroom will be reviewed. Students will learn to define the varying applications of inclusive settings, plan goals and objectives that reflect the inclusion goals, and implement strategies that lead toward inclusion. (3 credits)

ED.877.551. Survey of Autism and Other Pervasive Developmental Disorders. 3 Credits.
Providing a comprehensive review of current information about autism and other pervasive developmental disorders, this course draws on research findings and clinical experience from a number of related disciplines, including psychiatry, psychology, neurobiology, and pediatrics. In addition to exploring theories of causation, developmental aspects, descriptive and diagnostic characteristics, and legal and social issues, students are introduced to the primary therapeutic and intervention strategies employed with students who have autism. The theoretical basis of, and empirical evidence for, the diverse traditional and nontraditional therapies that have been proposed for persons with autism are also explored.

ED.877.553. Classroom Programming for Students with Autism. 3 Credits.
Students examine the design and implementation of effective classroom programs for students with autism who differ in age and level of functioning. The course topics include classroom structure and organization, group instruction strategies, educational assessment and IEP development, data collection, curriculum, instructional activities and materials, parent involvement, and staffing and support services. (3 credits)

ED.877.555. Teaching Communication and Social Skills. 3 Credits.
This course examines the assessment and instructional strategies that have been shown to be effective in promoting the development of cognitive, language, and social skills by students who have severe disabilities, including those diagnosed with autism, Asperger's Syndrome, or other pervasive developmental disorders. Participants examine the instructional adaptations needed to promote the development of cognitive, communicative, and social skills in students with severe disabilities, and review the relevant empirical literature.

ED.877.810. Internship in Severe Disabilities: Induction. 3 Credits.
Designed for severe disabilities program participants on the Maryland State certification and Non-certification track, this internship provides supervised field experiences in the application of instructional strategies and curriculum adaptations needed to teach children with severe disabilities. Students completing the induction internship gradually assume leadership responsibilities in their placement setting and are expected to demonstrate fluency of applied instructional and behavioral skills. (3 credits)

ED.877.811. Internship in Severe Disabilities: Culmination. 3 Credits.
Designed for severe disabilities program participants on the Maryland State certification track, this internship provides supervised field experiences in the application of instructional strategies and curriculum adaptations needed to teach children with severe disabilities. Students completing the culminating internship assume a more complete leadership role in their placement setting and are expected to demonstrate applied instructional and behavioral skills at and advanced mastery level. (3 credits)

ED.881.610. Curriculum Theory, Development, and Implementation. 3 Credits.
Students examine curriculum theory through philosophical, historical, and sociological perspectives and apply course content to contemporary curriculum issues. Topics include aligning instruction with state and school district curricula and modifying curricula to meet individual learner needs. Students also explore effective strategies for implementing curriculum changes.

ED.881.622. Advanced Instructional Strategies. 3 Credits.
Students review recent research on effective instruction and explore advanced classroom strategies and techniques designed to enhance their effectiveness in meeting the needs of diverse populations of learners. Examples include direct instruction, cooperative learning, dimensions of learning, creative problem solving, and applications of technology to thinking and learning. Students develop expert teaching skills and learn to diagnose and deliver instructional strategies that are most appropriate in specific circumstances.

ED.882.524. Education of Culturally Diverse Students. 3 Credits.
Participants analyze recent research related to the education of culturally diverse children and youth and explore case studies of successful minority education programs. The course focuses on understanding the interrelated roles of the school, the family, and the community in addressing the educational needs of culturally diverse children and youth.

ED.884.501. Processes and Acquisition of Literacy. 3 Credits.
This online course is designed to provide a deep understanding of the component processes associated with reading and writing (with mention of speaking and listening) and the ways that students develop into skilled readers and writers. There are five major themes: the component processes of reading and writing; the nature and structure of the English language; the ways that native English speakers and English learners differ in the ways they read and write; the developmental phases associated with learning to read and write for native English speakers and English learners; and the many factors the influence literacy development. Where appropriate, candidates will explore how to assess literacy processes and acquisition.

ED.884.502. Assessment of Literacy. 3 Credits.
Students in this course learn approaches for assessing and addressing the reading abilities and needs of children. Course activities include the examination of learner characteristics and implications for appropriate reading instruction. Students study and analyze a broad selection of formal and informal assessment techniques and instruments, their application to reading instruction and classroom practice, and strategies for effectively communicating relevant information to parents, educators, and other professionals about children's reading performances.

ED.884.507. Instruction for Literacy. 3 Credits.
Students in this course study how reading research is applied to the various methods, strategies, and techniques of elementary classroom reading instruction. Emphasis is placed on developing expert knowledge in teaching phonics, word recognition, vocabulary, reading comprehension strategies, organization, and study skills related with reading and academic achievement. Participants explore strategies for differentiating instruction to address the wide range of reading abilities and cultural experiences found in classrooms.
ED.884.501

ED.884.508. Literacy in the Content Areas Part I. 3 Credits.
This course is intended to present the reading process from initial to proficient adult levels for teachers of content subjects in middle or high school. Organizing principles of learning development, differences, and environments will be introduced, and connected with principles of content knowledge and application. Additionally, the uses of assessment will be explored and joined to evidence-based practices of planning and multimodal instruction. Finally, issues of professional practice and ethics will be discussed.

ED.884.510. Literacy in the Content Areas Part 2. 3 Credits.
This online graduate level course extends the understanding of the adolescent learner as they explore, apply and discuss literacy skills across the disciplines. Application of information acquired in the first part of the course sequence (Literacy in the Content Areas - Part 1) will be referenced and emphasized to demonstrate understanding and the ability to design, implement and assess effective literacy instruction in the content classroom.
ED.884.508

ED.892.562. Access to General Education Curriculum with Technology Accommodations. 3 Credits.
(Lab Class) Class members investigate student characteristics, the collaborative role of educators, and strategies for differentiating instruction for students with learning disabilities within the general education environment. Participants examine universal design for learning strategies and technologies to enhance student participation in educational programs.

Interdisciplinary Studies in Education

ED.811.611. Special Education and Inclusion: Promises and Challenges. 2 Credits.
This course provides: (1) an overview of the characteristics of students with exceptional learning needs; (2) the field's history, laws, procedures and trends; and (3) a framework for understanding key concepts in inclusion as they relate to the academic, social, and emotional development of all learners. Participants will begin to consider the cultural and linguistic issues that influence students' needs and families' understanding of special education services.

ED.811.612. Introduction to Assessment and Tiered Instruction. 2 Credits.
This course examines teaching and learning for students with exceptional learning needs in the general education classroom, with specific attention to the role of informal assessment and subsequent differentiation in response to findings. Foci include: (a) best practices for nondiscriminatory assessment, (b) practice administering group and individual informal assessments, (c) knowing how, when, and why to vary learning environments, learning activities, and content, and (d) implementing Tier 1 accommodations/modifications and Tier 2 interventions to support student learning opportunities.

ED.811.615. Formal Assessment and Designing Individualized Education Programs. 1 Credit.
This course provides review of measurement statistics and practice with the administration, scoring, and interpretation of commonly used norm-referenced instruments and procedures for determination of eligibility for special education. Comparisons are made with informal assessment results, and ways to communicate results are discussed. Writing a formal report based on multiple data points is explained and detailed. The IEP process, from referral to eligibility determination and placement, is examined.

ED.811.619. Clinical Residency II. 3 Credits.
Fellows are expected to reflect on their many opportunities to develop and refine their instructional practice and classroom management skills in a whole class setting as well as plan and deliver targeted tiered instruction. Fellows are expected to implement the content and skills developed through coursework and the inherent clinical experiences in a comprehensive manner during their first year as a teacher of record. Fellows will examine the evolution in their unit and lesson planning throughout the year and draw conclusions that inform their ongoing ability to plan targeted, rigorous, and engaging lessons.

ED.811.620. Foundations in Elementary Education: Introduction to Teaching and Learning. 3 Credits.
In this course, participants will begin to examine the features of high-quality instruction and in what ways are they the same and different across the content areas. Participants will explore the issues central to urban education, including race, culture, and diversity, as well as the importance of building relationships with students and families. Participants will also explore the ways in which colleagues can support each other in improving the teaching practice of all.

ED.811.621. Language Development in Children. 2 Credits.
In this course, participants will begin to learn about language development. Participants will examine various aspects of language development, including second language acquisition and dialect, including the milestones that mark English and second language development at various stages, and the factors that influence first and second language acquisition and development. Participants will also explore how language-rich environments and practices contribute to lasting language development.

ED.811.622. Number, Operations, and Algebraic Thinking I. 2 Credits.
Participants investigate the conceptual and procedural knowledge involved in learning to count, understanding our number system, and adding and subtracting whole numbers. Particular attention is given to the importance of the representation and communication of mathematical ideas, the attributes of worthwhile tasks, and to gaining a deep understanding of the ways in which algebraic thinking underpins arithmetic.

ED.811.635. Children's Literature.
In this course, participants will immerse themselves in the study of a wide variety of children's literature including traditional and nontraditional texts, informational texts, and media texts. Participants will understand the different variables for choosing texts by class and individual child. Participants will use research and literary criticism, along with their deepening content knowledge, to develop a lens for analyzing texts in terms of possible instructional purposes, student access and interests, and issues of equity (both for biased representations and the cultural and linguistic challenges of texts). Participants will examine the use of assessment strategies to select and design instruction to meet specific learning goals and will monitor progress. Data will be used to plan further lessons, systematically mark growth, and differentiate instruction for student success.

ED.811.641. Language Acquisition. 2 Credits.
Participants will look deeply at three major topics that are important to supporting linguistically and culturally diverse students in urban, secondary education settings: language variation, academic language, and second language acquisition. Participants will explore these interrelated topics, attending to both socio-cultural and cognitive-linguistic perspectives on learning and learning environments. The purpose of the course is to guide educators to use linguistic awareness to inform their teaching. Participants will examine state standards andthe role of language in assessment and learning.

ED.811.642. Reading Diagnosis and Intervention. 2 Credits.
In this course, participants will deepen their understanding of reading processes, methods of reading assessment, and reading intervention strategies. They will assess students' skills and knowledge in word recognition, fluency, vocabulary, and reading comprehension, and prepare lessons in response to students' needs. To ensure effective management and clear communication with colleagues and caregivers during the first semester as lead instructors, participants will prepare thorough plans for classroom procedures related to reading assessment and instruction, and they will develop careful scripts for conferences. Course sessions will include time for collaborative lesson planning.

ED.811.652. Algebra, Functions, and Modeling in the Real World. 3 Credits.
This course aims to provide participants with a rich understanding of essential conceptsundergirding high school algebra, functions and the modeling process. Participants considercritical components of how students in grades 6-12 develop algebraic thinking and skill, beyondtraditional focus on algebraic manipulations. An in-depth focus on functions in the course allowsparticipants to systematically explore and analyze patterns, change and relationships amongquantities in everyday events and problems in life and society. Participants will further theiralgebra experience by exploring functions as fundamental mathematics objects that allow us tomodel real life situations. Understanding and applying components of the modeling process allows participations to examine authentic real-world situations by building mathematical models and applying solutions using the lens of culturally relevant pedagogy and social justice mathematics.

ED.811.654. Geometrical Thinking. 2 Credits.
In this course participants learn how students in grades 6-12 develop geometric thinking and skill; learn and practice the skills necessary to plan; and enact and reflect on teaching in terms of its effect on student learning. Through field experiences, observation, reflection and reading, participants will continue to identify and analyze teacher moves and mathematical tasks in terms of how well they support the development of students' geometric thinking.

ED.811.660. Foundations in Secondary Education: Introduction to Teaching and Learning. 3 Credits.
In this course, participants will be pushed to see themselves as diversity advocates that understand and respect differences among adolescent learners in their classrooms, schools, and communities. They will explore how to become diversity advocates by first understanding their own beliefs and biases so as to better understand those around them, particularly those that have chosen to serve: urban youth. They will learn that in order to become highly-effective teachers that will build upon the strengths and skills of urban youth and their families and communities, they will need to build healthy, meaningful relationships and promote academic achievement. Participants will also explore the intersection of beliefs and practices through the examination of various learning theories and frameworks for effective, culturally responsive secondary instruction. Through the examination of social, political, economic and racial readings, case studies and discussion, participants will immerse themselves in the work of urban education and self-examination.

ED.811.662. Reading Processes and Acquisition. 1 Credit.
This course introduces participants to reading processes and acquisition. Specifically, the fundamental principles of reading and reading acquisition are presented and discussed. Participants will learn how young children learn to read, where reading developmental may break down, and about issues common among adolescents who struggle to make meaning of grade-level texts in the classroom. Participants will be introduced to instructional strategies, materials, and classroom-based assessments to support the adolescent reader.

ED.811.663. Secondary Content Area Reading/Literacy. 2 Credits.
This course explores how listening, speaking, reading, writing, and viewing are tools for both accessing and demonstrating content knowledge within an academic discipline at the secondary level. Through the lens of disciplinary literacy, participants will explore the centrality of word knowledge in the academic disciplines, and a range of reading and writing strategies to support comprehension of diverse content area texts.

ED.811.664. Self-Management of Learning. 2 Credits.
This course focuses on the concept of self-management and its critical role in promoting student achievement in secondary classrooms. It is meant to give teachers an understanding of how to cultivate and build upon their students' interests in learning in order to promote self-management skills. The course will discuss learning theory and motivation as it relates to adolescent learning. Participants will have opportunities to practice and implement lessons that support students' self-management skills, and ultimately student success.

ED.855.502. Program Evaluation and Learner Assessment in TEFL. 3 Credits.
Through this course, students will demonstrate mastery of program evaluation development and design as a means for data-driven decision-making for program improvements to language learning programs. Students will also focus on the formative assessment measures for assessing learners' acquisition of English as a foreign language.

ED.855.520. Promoting Active Engagement and Learning for TEFL. 1 Credit.
This course provides an opportunity for students to develop competency in applying current theories of language learning and translanguaging pedagogy within a consistent cycle of instructional delivery. The pairing of an instructional delivery system with theory and pedagogy for language learning enables students to develop coherent and effective English lessons for speakers of other languages. Students use instructional protocols to create effective lesson experiences that promote engagement, advance English competency, and motivate learners with different heritage languages to actively speak, understand, and communicate in English.

ED.855.602. Extended Learning III.
Students will participate in a variety of informal educational experiences, from guest lectures and one-on-one mentor conversations, to exploring how the use of museums, cultural institutions, and other real-world scenarios can be leveraged to promote learning. Students will both learn from these experiences as well as gain exemplars to implement in their own educational systems.

ED.880.619. Foundations of Online Teaching and Learning. 3 Credits.
This course will provide a research, theoretical, and practical foundation to online teaching and learning. Participants will engage in collaborative inquiry regarding the field of distance learning, resulting in the ability to address common assumptions about online learning, cultural competence in online learning, and ethical issues. Participants will be able to distinguish an effective online learning experience for adults and create criterion for selection, implementation, and integration of an online learning tool or application.

ED.880.830. Graduate Project in Interdisciplinary Studies. 3 Credits.
Students of demonstrated ability with special interest in interdisciplinary projects study under the direction of a faculty member in the School of Education. Students must meet with their faculty adviser and prepare an outline of their proposed project prior to registration.

ED.887.611. Understanding Human Behavior and Helping Relationships, Part I. 3 Credits.
This course provides an introduction to the various helping professions that are available to support teachers in their work with students, including school counselors and clinical mental health counselors. The differences between these helping professions and services provided through special education will be discussed. The course addresses various approaches to helping students, as well as means for collaborating with helping professionals, consulting with other school leaders, and counseling students. Finally, students will learn how to use data in making decisions about how best to address socio-emotional issues so as to promote academic achievement.

ED.887.612. Understanding Human Behavior and Helping Relationships, Part II. 3 Credits.
Building on the information presented in Understanding Human Behavior and Helping Relationships, Part I, this course examines ways of assisting with emotional disorders that teachers may face in the classroom. The main focus of the course is on recognizing the signs of these disorders and working with the school counselor to support children with these diagnoses in the classroom setting. General school issues such as bullying and abuse prevention will also be covered.

Research & Doctoral Programs

ED.855.702. Causal Inference When Regression Fails. 3 Credits.
This course introduces strategies for estimating causal effects from a counterfactual perspective when conditioning techniques, such as matching and regression, do not identify the parameter of interest. After a review of scenarios when such conditioning will fail, the course then presents intervention designs, explaining randomization from both a potential outcome and causal graph perspective. The challenges to implementation of these designs are then discussed, with a special focus on large-scale randomized trials in education research. The course then considers the most prominent designs for causal inference in observational research in the presence of troubling unobservables: instrumental variable estimators, pre-post longitudinal designs, regression discontinuity, and estimation via exhaustive mechanisms. The course concludes with a consideration of credible avenues for investigation when point identification cannot be achieved, including an analysis of bounds and the estimation of a provisional estimate followed by a sensitivity analysis.

ED.855.752. Trends, Principles, and Practices of 21st Century Learning. 3 Credits.
This course explores pedagogical shifts in education that have arisen as a result of the integration of advanced digital tools and considers how these shifts and tools impact leadership, organization, instructional delivery, and student learning in today's schools. Participants learn essential principles and practices for building 21st century content and technology-rich learning environments for all students including those with disabilities and other special needs.

ED.855.753. Digital Age Technology and Instruction. 3 Credits.
This course provides opportunities for participants to explore integration of technology within the K-16 classroom environment. First, students will examine barriers to technology integration in the K-16 context with implications for professional development. Students will examine theoretical perspectives and research to investigate the advantages and challenges of effectively integrating technology to support learning. Specifically, students will be engaged in critically examining "evaluation practices" related to effective application of digital technology in the classroom from an informed theoretical, empirical, and pedagogical perspectives. Examples from research that examines evaluation practices can be related to classroom connectivity technology, mobile technologies, one-to-one computing, and video use. Participants will also be engaged in considering measurement to examine the effectiveness of the technology integration in instruction and gauge the capacity of their school organization in implementing digital age technology successfully. Participants draw upon relevant instructional theories, conceptual frameworks, and effective best practices as criteria for selection, implementation, and integration of technology.

ED.855.807. Career Development and Academic Writing. 1 Credit.
What is the next step? Doctoral students face a variety of career development stages as they work toward their professional goals. This course will cover a wide range of topics related to Ph.D. students' career development, including the university and non-university job market, research and teaching portfolios, CV and resume, job interview skills, networking, and negotiating tips. Furthermore, it is critical for graduate students to have writing skills to effectively convey their ideas to different types of audiences and to achieve their goals as a researcher. This course will also offer an introduction to scientific writing and will provide an overview of important features of academic writing. We will primarily focus on academic writing tasks that may be required in the earlier stages of an academic career. This course will help students to feel prepared for their career and to accomplish their professional goals.

ED.900.895. Graduate Research.
Fulltime Equivalency

Special Education

ED.871.514. Medical and Physical Aspects of Disabilities. 3 Credits.
This survey course provides students with information from the medical sciences concerning the etiologies and treatments of disabilities. Topics include human genetics and embryology; the newborn period; the structure, functions, and interrelationships of the major systems of the human body; infectious diseases; and emergency procedures. The relationship between students' medical issues and classroom activities is discussed. (3 credits)

ED.872.500. Seminar: Current Trends and Issues in Early Childhood Special Education. 3 Credits.
Beginning students in the Early Childhood Special Education (ECSE) program will explore research, policy and practice in the field of ECSE. Students will acquire a broader schema for roles and responsibilities, career planning, accepted standards, contemporary practice, and organizational structures related to ECSE. Students will become familiar with features of national, state, and local ECSE systems. Students will also examine issues related to reform-based preschool and primary special education in Maryland. (3 credits)

ED.872.501. Screening, Diagnosis, and Assessment of Young Children with Disabilities. 3 Credits.
The first few years of life establish initial patterns of learning, literacy, and behavior, and set the pace for subsequent development. In this course, the emphasis is on the translation of evaluation and assessment information into meaningful outcomes for young children with disabilities. Students will review instruments and procedures for screening, evaluating, and assessing the status of a young child's cognitive development, physical development (including vision and hearing), communication development, social and emotional development, and adaptive development. (3 credits)

ED.872.502. Instructional Program Planning and Methods: Birth-3 Years. 3 Credits.
Early intervention can have a significant effect on developmental outcomes for young children with disabilities and their families. This course will prepare students to support the facilitation of a family-centered foundation for learning and literacy in infants and toddlers. Students will focus on planning, implementing, and evaluating programs for eligible infants, toddlers, preschoolers, and their families. Topics include: (a) a survey of curricular options for young children and families; (b) selection of family-centered treatment outcomes; (c) design of instructional activities for promoting developmental progress; (d) evaluation of program effectiveness; and (e) evaluation of family satisfaction with services.

ED.872.503. Instructional Program Planning and Methods: Grades Pre-K-3. 3 Credits.
In this course, students will develop competencies in planning, administering, and reporting the results of a variety of screening, evaluation, and assessment instruments or procedures for children in pre-kindergarten through primary level special education programs. Students will interpret test results for purposes of: (a) communicating findings to families; (b) communicating findings to colleagues; (c) individual program planning for learning and literacy; and (d) monitoring of individualized programs. Students will create strategies for effective management of resources and information related to the screening, evaluation, or assessment process at pre-kindergarten through primary levels of special education. (3 credits)

ED.872.504. Materials for Teaching Reading to Young Children with Disabilities: Grades K-3. 3 Credits.
This course examines the variables associated with the selection and use of appropriate materials for teaching reading to kindergarten and primary level students with disabilities. Students will create an organized, comprehensive intervention plan that effectively integrates meaningful and engaging technology and print materials to address the essential components of reading (phonemic awareness, phonics, fluency, vocabulary, comprehension) and written expression. Students will develop a print-rich classroom environment that promotes interests, motivation, and positive attitudes about literacy. (3 credits)

ED.872.509. Assessment of Reading for Young Children with Disabilities: Grades K-3. 3 Credits.
In this course, students will select, administer, and interpret a variety of reading assessments to use as the basis to create individualized prevention and intervention strategies. These assessments will include formal and informal measures with a focus on the diagnosis of reading problems, individualized planning for reading instruction, and implementation of such reading programs as Orton-Gillingham, the Stevenson method, phonemic awareness, the alphabetic principle, and modification of the literacy environment. (3 credits)

ED.872.810. Internship: Early Intervention and Preschool Special Education. 3 Credits.
Designed for students seeking Maryland special education teacher certification at the infant/primary level, this internship provides supervised field experiences in early intervention or preschool special education programs for young children with disabilities in the birth-to-five-years age range. Internship sites and activities are individually selected according to student interest and training needs. (3 credits)

ED.872.811. Internship: Preschool and Primary Level Special Education. 3 Credits.
Designed for students seeking Maryland special education teacher certification at the infant/primary level, this internship provides supervised field experiences in special education for children in the three-to-eight year age range. Field sites and activities are individually selected according to student interest and training needs. (3 credits)

ED.873.612. Applied Behavior Analysis Practicum III. 3 Credits.
The practicum is designed to meet field experience requirements as outlined by the Behavior Analyst Certification Board (BACB; www.bacb.com). This practicum provides supervised experiences in the application of behavior analytic services in educational settings. The practicum will also include a face-to- face seminar with an instructor. ED.873.601, ED.873.602, ED.873.603, ED.873.604, ED.873.605, ED.873.607

ED.873.613. Applied Behavior Analysis IV. 3 Credits.
The practicum is designed to meet field experience requirements as outlined by the Behavior Analyst Certification Board (BACB; www.bacb.com). This practicum provides supervised experiences in the application of behavior analytic services in educational settings. The practicum will also include a face-to- face seminar with an instructor. ED.873.601, ED.873.602, ED.873.603,ED.873.604, ED.873.605 and ED.873.607

ED.877.515. Education of Students with Severe Disabilities: Hearing and Vision Impairments. 3 Credits.
Participants review suitable methods of assessing the visual and auditory capabilities of students with severe and multiple disabilities and the instructional adaptations necessary to increase their function in daily activities. Topics include ocular and auditory pathologies and their educational implications, functional vision evaluation, and behavioral audiometry.

ED.877.518. Education of Students with Severe Disabilities: Management of Motor Skills. 3 Credits.
This course examines atypical variations in the motor development of students with severe disabilities, with an emphasis on the remediation of abnormal patterns in the performance of daily activities. Participants gain information about specific remediation strategies and the appropriate use of assistive equipment to promote functional positioning, movement, and oral motor skills.

ED.878.501. Differentiated Instruction and Inclusion. 3 Credits.
Students examine practical, ethical, and theoretical issues in the context of national, state, and local initiatives for least restrictive placement of students with diverse learning needs, including typical students, ESOL students, students with disabilities, and those who are gifted. Individuals compare and contrast existing service delivery systems and model programs that are successful at integrating students with a range of educational needs into general education settings. (3 credits)

ED.878.502. Curriculum Design and Adaptations for Strategic Interventions I. 3 Credits.
Students analyze and adapt curricula from general education and design lessons to implement goals and objectives from learners' individualized education programs into their general education settings. Topics include frameworks for curriculum design, assistive technology, effective teaching methods for heterogeneous instruction, and instructional planning techniques that address the needs of students. (3 credits)

ED.878.503. Educational Measurement and Curricular-Based Assessment. 3 Credits.
Students review standardized achievement tests, criterion-referenced tests, and curriculum-based measurement, and interpret results as they relate to program planning for learners with diverse learning needs in general education classrooms. The course emphasizes developing curricular-based assessments and progress monitoring of students, determining local and school norms for tests, and evaluating learners' progress and performance in academic and social curricular areas. (3 credits)

ED.878.505. Cooperative Learning for Diverse School Programs. 3 Credits.
Students explore the recent research on cooperative learning and develop methods for using cooperative systems in heterogeneous settings that accommodate individuals with a range of diverse learning needs. Participants discuss cooperative and peer learning programs and explore research findings and practical classroom organization and instructional strategies. (3 credits)

Teacher Development & Leadership

ED.851.648. Team Leadership. 3 Credits.
This course is designed for school leaders, including administrators, supervisors, and teachers, who want to improve their knowledge and ability to facilitate change in the classroom, school, or district. The course is based on the premise that educational leaders devote considerable time working in group situations. The course is based on research and theory in education and other fields related to individual, group, intergroup, and organizational development. Opportunities are provided for participants to explore and practice various strategies with special emphasis on how these relate to change in educational settings.

ED.881.621. Effective Schools and Effective Instruction. 3 Credits.
Participants review recent research on effective schools and effective instructional techniques. Additional topics include strategies for implementing relevant research findings and implications for administrators, supervisors, and teachers.

ED.882.511. Human Growth and Development: A Lifespan Perspective. 3 Credits.
Students consider an overview of the physical, social, and emotional aspects of human development throughout the lifespan. The course considers developmental theory and reviews current areas of research.

ED.884.505. Materials for Teaching Literacy. 3 Credits.
This course focuses on evidence-based evaluation and selection of materials for a comprehensive literacy program. Candidates will explore and evaluate characteristics of effective literacy programming and instruction, and apply that knowledge to selecting, evaluating, and organizing print and multimedia materials that reflect engagement and respect for student diversity. Diverse cultural and linguistic backgrounds, learning differences, leveling systems, intervention and family support, and student interest and motivation will receive specific focus.

ED.884.508. Literacy in the Content Areas Part I. 3 Credits.
This course is intended to present the reading process from initial to proficient adult levels for teachers of content subjects in middle or high school. Organizing principles of learning development, differences, and environments will be introduced, and connected with principles of content knowledge and application. Additionally, the uses of assessment will be explored and joined to evidence-based practices of planning and multimodal instruction. Finally, issues of professional practice and ethics will be discussed.

ED.884.510. Literacy in the Content Areas Part 2. 3 Credits.
This online graduate level course extends the understanding of the adolescent learner as they explore, apply and discuss literacy skills across the disciplines. Application of information acquired in the first part of the course sequence (Literacy in the Content Areas - Part 1) will be referenced and emphasized to demonstrate understanding and the ability to design, implement and assess effective literacy instruction in the content classroom.
ED.884.508

ED.884.604. Emergent Literacy: Research into Practice. 3 Credits.
This course addresses in-depth instructional issues involving emergent literacy processes. Topics include the application of current literacy theory to alphabetics, word identification, and word study strategies for classroom instruction; designing and providing authentic early literacy experiences and literacy-rich environments; and strategies and methods for storytelling and in developing contextual oral reading fluency. (3 credits)

ED.884.610. Advanced Diagnosis for Reading Instruction. 3 Credits.
This course advances and refines the knowledge of students about advanced diagnostic processes in determining reading difficulties and designing appropriate and related interventions. Case study and small group collaboration are used to develop students' abilities to integrate data from multiple sources, generate diagnostic profiles, and make instructional recommendations. Students learn to administer standardized and criterion-referenced assessments and about the principles, philosophies, and strategies of effective remedial approaches. (3 credits)

ED.884.615. Cross-Cultural Studies in Literacy. 3 Credits.
Students in this class investigate how culture, language, school and out-of-school literacy experiences, and education policy influence student attitude, learning, and content area knowledge. Participants evaluate multicultural literacy research, curriculum, literature, and new literacies, and how social and cultural factors contribute to daily classroom literacy instruction and everyday life. The course emphasizes creating democratic and culturally sensitive learning environments.

ED.884.620. Seminar in Reading: Roles of the Reading Specialist. 3 Credits.
Students in the final year present and evaluate their projects and plans for addressing the needs of students at all levels of reading ability in their classrooms, schools, and school districts. In addition, participants examine selected topics and issues in reading instruction.
ED.884.811[C] OR ED.884.810[C]

ED.884.642. Linguistics for Teachers. 3 Credits.
This course acquaints teachers and other reading professionals with aspects of linguistic theory that apply in elementary and secondary classrooms. Emphasis is on a thorough, research-based understanding of phonology, morphology, semantics, syntax, and pragmatics. Students learn ways to use the information to strengthen existing reading and language arts instruction. Issues of cultural diversity, second language learning, and developmental issues of language are covered in this interactive format.

ED.884.701. Reading Comprehension and Critical Literacy. 3 Credits.
Building on the instructional strategies and skills of earlier coursework, this advanced graduate course examines classic and contemporary research and theory in reading comprehension and critical literacy and how these dimensions and processes are applied to literacy education. During the course, students learn to explore and appreciate the diversity of literacy research perspectives, and to learn to think and write critically and analytically about research, literacy education policy, and practices that influence and are used in classroom education. These topics are overlapped by advanced instructional methods and strategies for teaching students reading comprehension and critical literacy skills and dispositions. (3 credits)

ED.884.811. Supervised Clinical Practicum I for Masters in Reading Candidates. 3 Credits.
This first practicum is a midpoint program experience for Reading candidates. Candidates demonstrate abilities to translate literacy education research into practice. The overarching intent of Practicum I is to develop literacy education leaders while refining candidates' knowledge and applications of research. Coursework centers on actual work with children and allows candidates to provide evidence of their mastery of reading education skills and strategies. (3 credits)

ED.884.820. Supervised Clinical Practicum in Reading II. 3 Credits.
This second practicum is a capstone course that builds on all previous program coursework and especially the pre-requisite ED.884.620 Seminar in Reading: Roles of the Reading Specialist course. Work concentrates on developing effective reading specialist and literacy coaching qualities and skills, facilitating change in school communities, and fostering teacher growth and student achievement. A strong emphasis of the course is on job-embedded professional development. Candidates deliver demonstration lessons and lesson planning assistance to teachers and conduct professional development workshops in school settings. The practicum allows candidates to provide evidence of their mastery of particular ILA leadership/reading specialist standards.
ED.884.610 AND ED.884.620 AND ED.884.810

ED.884.850. Clinical Practicum in Writing and Other Media. 3 Credits.
Reading and writing printed texts have been, by tradition, interconnected processes. In the Digital Age, other media, such as still and moving images and audio texts, increasingly coexist alongside printed texts. During this practicum experience, candidates examine current issues involving the communication shifts that are occurring in the 21st century. Using digital literacies, writing, and object-centered multimedia ideas and instructional approaches, candidates work with teachers and students in designing, producing, and using new and traditional literacies to best prepare themselves and others for advancing technologies and practices that are changing the ways that people communicate and network.

ED.893.830. Graduate Project in Technology. 3 Credits.
Students of demonstrated ability with special interest in technology study under the direction of a faculty member in the School of Education. Students must meet with their faculty adviser and prepare an outline of their proposed project before they register for this course.

Teacher Preparation

ED.813.663. Teaching Reading in the Content Areas: Part II. 1 Credit.
This course focuses on research-based approaches to developing content literacy, a critical component for student achievement in the content areas. Students will learn and apply assessment practices, including diagnostic, portfolio, and student self-assessments, which pinpoint students' content literacy strengths and areas for improvement. Educators also will learn and apply instructional strategies to use before, during and after engaging with content area texts and materials. An emphasis will be on assessing the responsiveness to student's learning differences (e.g., language, culture, learning styles, multiple intelligences, learning difficulties/disabilities, and giftedness).

ED.813.690. TNTP Independent Study. 6 Credits.
In this course, educators will demonstrate competency of objectives related to effective instruction. Through a combination of independent personal development and cultivation of classroom evidence, educators will create a portfolio. Topics covered in the portfolio will include: instructional planning, assessment and data review, classroom management and culture, and special education.

EN.500 (General Engineering)

EN.500.101. What Is Engineering?. 3 Credits.
This is a course of lectures, laboratories, and special projects. Its objective is to introduce students not only to different fields of engineering but also to the analytic tools and techniques that the profession uses. Assignments include hands-on and virtual experiments, oral presentations of product design, and design/construction/testing of structures. Freshmen only or Permission Required.

EN.500.103. Hopkins Engineering Sampler Seminar. 1 Credit.
This course provides students with an overview of the undergraduate programs in the Whiting School of Engineering. Faculty from various departments will introduce students to their discipline including aspects of their personal research. Freshmen only.

EN.500.109. What is Engineering?-Summer. 3 Credits.
To introduce engineering ideas, thoughts, and problem-solving to potential engineering students. The course is intended to establish the framework within which engineers typically operate. Registration Requirement: Algebra II with Trig. Open only to high school students admitted to the Engineering Innovation Summer Program. Undergraduates should refer to EN.500.101.
Students may enroll in and complete EN.500.109 or EN.500.110, but not both.

EN.500.110. Engineering Innovation. 3 Credits.
To introduce engineering ideas, thoughts, and problem-solving to potential engineering students. The course is intended to establish the framework within which engineers typically operate. Registration Requirement: Algebra II with Trig. Open only to high school students admitted to the Engineering Innovation Summer Program. Undergraduates should refer to EN.500.101.
Students may enroll in and complete EN.500.109 or EN.500.110, but not both.

EN.500.111. Hopkins Engineering Applications & Research Tutorials. 1 Credit.

EN.500.112. Gateway Computing: JAVA. 3 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming. algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Students may not have earned credit in courses: EN.500.113 OR EN.500.114 OR EN.510.202 OR EN.530.112 OR EN.580.200 OR EN.601.107 OR EN.500.132 OR EN.500.133 OR EN.500.134.

EN.500.113. Gateway Computing: Python. 3 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming. algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Students may not have earned credit in: EN.500.112 OR EN.500.114 OR EN.510.202 OR EN.530.112 OR EN.580.200 OR EN.601.107 OR EN.500.132 OR EN.500.133 OR EN.500.134.

EN.500.114. Gateway Computing: Matlab. 3 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming. algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Students may not have earned credit in: EN.500.112 OR EN.500.113 OR EN.510.202 OR EN.530.112 OR EN.580.200 OR EN.601.107 EN.500.132 OR EN.500.133 OR EN.500.134.

EN.500.115. Gateway Data Science. 3 Credits.
This course introduces fundamental data science concepts and techniques. It is intended for all who plan work on data driven projects, and will serve as a prerequisite for advanced courses in data science and machine learning. Topics covered include linear and nonlinear regression, classification, clustering, and dimensionality reduction. Students deploy Python packages on data sets and apply data science methods on engineering and science problems. Course homework involves significant programming. Attendance and participation in class sessions are expected.
(EN.500.112 AND EN.500.133) OR EN.500.113 OR (EN.500.114 AND EN.500.133)

EN.500.130. Biomedical Engineering Innovation. 3 Credits.
To introduce biomedical engineering ideas, thoughts, and problem-solving to potential engineering students. The course is intended to establish the framework within which engineers typically operate. Registration Requirement: Either Chemistry with Lab or Physics with Lab.

EN.500.132. Bootcamp: Java. 1 Credit.
This on-line course provides students who have already achieved a basic understanding of programming and computational thinking in one programming language with an opportunity to apply these skills in another programming language. Students will be expected to complete projects to demonstrate proficiency in the new language. Satisfactory/unsatisfactory only.
Not open to students who have completed EN.601.107, EN.600.107, or EN.500.112;Students must have completed: EN.500.113 OR EN.500.114 OR EN.510.202 OR EN.580.200 OR EN.530.112 OR EN.520.123 OR EN.601.220

EN.500.133. Bootcamp: Python. 1 Credit.
This on-line course provides students who have already achieved a basic understanding of programming and computational thinking in one programming language with an opportunity to apply these skills in another programming language. Students will be expected to complete projects to demonstrate proficiency in the new language. Satisfactory/unsatisfactory only
Not open to students who have completed EN.500.113 or EN.580.200;Students must have completed: EN.500.112 OR EN.500.114 OR EN.601.107 OR EN.510.202 OR EN.530.112 OR EN.520.123 OR EN.601.220

EN.500.134. Bootcamp: MATLAB. 1 Credit.
This on-line course provides students who have already achieved a basic understanding of programming and computational thinking in one programming language with an opportunity to apply these skills in another programming language. Students will be expected to complete projects to demonstrate proficiency in the new language. Satisfactory/unsatisfactory only.
Not open to students who have completed EN.500.114 OR EN.580.200.;Students must have completed: EN.500.112 OR EN.500.113 OR EN.601.107 OR EN.510.202 OR EN.530.112 OR EN.520.123 OR EN.601.220

EN.500.501. SAB/JHU General Engineering Research (Abroad). 3 Credits.
General Engineering Research Project Abroad for undergraduate participating on summer projects with NUS, EPFL, SJTU, and DTU. Permission required.
You must request Independent Academic Work using the Independent Academic Work form found in Student Self-Service: Registration > Online Forms.

EN.500.551. Engineering Research Practicum.

EN.500.601. Research Laboratory Safety. 1 Credit.
This course covers physical, chemical, radiation, and biological hazards typically found in Johns Hopkins University research laboratories. It will use the “RAMP” (Recognize, Assess, Minimize, Prepare) framework originating in (Hill, R.H. Finster, D.C. Laboratory Safety For Chemistry Students, Wiley, 2nd Edition, 2016, 576pp.) and adopted by the American Chemical Society as a core concept for teaching laboratory safety. This framework does not depend on chemistry-specific practices (although it encompasses them as well as other disciplines), so it transfers well to general university-level research. The course also discusses the concepts of Inherently Safer Design of experiments. The course begins with a RAMP analysis of an assigned paper from the literature and concludes with a project analyzing a paper of the student’s choice.

EN.500.602. Seminar: Environmental and Applied Fluid Mechanics. 1 Credit.

EN.500.603. Graduate Orientation and Academic Ethics.

EN.500.851. Engineering Research Practicum. 1 - 9 Credits.

EN.510 (Materials Science & Engineering)

EN.510.106. Foundations of Materials Science & Engineering. 3 Credits.
Basic principles of materials science and engineering and how they apply to the behavior of materials in the solid state. The relationship between electronic structure, chemical bonding, and crystal structure is developed. Attention is given to characterization of atomic and molecular arrangements in crystalline and amorphous solids: metals, ceramics, semiconductors and polymers (including proteins). The processing and synthesis of these different categories of materials. Basics about the phase diagrams of alloys and mass transport in phase transformations. Introduction to materials behavior including their mechanical, chemical, electronic, magnetic, optical and biological properties.

EN.510.107. Modern Alchemy. 3 Credits.
Can you really turn lead into gold? Converting common substances into useful materials that play important roles in today’s technologies is the goal of many modern scientists and engineers. In this course, we will survey selected topics related to modern materials, the processes that are used to make them as well as the inspiration that led to their development. Topics will include the saga of electronic paper, the sticky stuff of gecko feet and the stretchy truth of metal rubber.

EN.510.135. MSE Design Team I. 3 Credits.
This course is the first half of a two-semester course sequence for freshmen majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Freshman Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.

EN.510.136. MSE Design Team I. 3 Credits.
This course is the second half of a two-semester course sequence for freshmen majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Freshman Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.

EN.510.235. MSE Design Team I. 3 Credits.
This course is the first half of a two-semester course sequence for sophomores majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Sophomores Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.

EN.510.236. MSE Design Team I. 3 Credits.
This course is the second half of a two-semester course sequence for sophomores majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Sophomores Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.

EN.510.311. Structure Of Materials. 3 Credits.
First of the Introduction to Materials Science series, this course seeks to develop an understanding of the structure of materials starting at the atomic scale and building up to macroscopic structures. Topics include bonding, crystal structures, crystalline defects, symmetry and crystallography, microstructure, liquids and amorphous solids, diffraction, molecular solids and polymers, liquid crystals, amphiphilic materials, and colloids. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.500.113 Gateway Computing: Python.
((AS.110.106 AND AS.110.107) OR (AS.110.108 AND AS.110.109) OR (AS.110.107 AND AS.110.108) OR (AS.110.106 OR AS.110.109)) AND (AS.030.103 OR(AS.030.101 AND AS.030.102)) AND ((AS.171.101 OR AS.171.103 OR AS.171.107) AND (AS.171.102 OR AS.171.104 OR AS.171.108))

EN.510.312. Thermodynamics/Materials. 3 Credits.
Second of the Introduction to Materials Science series, this course examines the principles of thermodynamics as they apply to materials. Topics include fundamental principles of thermodynamics, equilibrium in homogeneous and heterogeneous systems, thermodynamics of multicomponent systems, phase diagrams, thermodynamics of defects, and elementary statistical thermodynamics. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.500.113 - Gateway Computing - MatLab.

EN.510.313. Mechanical Properties of Materials. 3 Credits.
Third of the Introduction to Materials Science series, this course is devoted to a study of the mechanical properties of materials. Lecture topics include elasticity, anelasticity, plasticity, and fracture. The concept of dislocations and their interaction with other lattice defects is introduced. This course contains computational modules; some prior knowledge of computer programming is needed.
EN.500.113 AND EN.510.311

EN.510.314. Electronic Properties of Materials. 3 Credits.
Fourth of the Introduction to Materials Science series, this course is devoted to a study of the electronic, optical and magnetic properties of materials. Lecture topics include electrical and thermal conductivity, thermoelectricity, transport phenomena, dielectric effects, piezoelectricity, and magnetic phenomena. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
EN.510.311

EN.510.315. Physical Chemistry of Materials II. 3 Credits.
Fifth of the Introduction to Materials Science series, this course covers diffusion and phase transformations in materials. Topics include Fick's laws of diffusion, atomic theory of diffusion, diffusion in multi-component systems, solidification, diffusional and diffusionless transformations, and interfacial phenomena. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
EN.510.311 AND EN.510.312

EN.510.316. Biomaterials I. 3 Credits.
Sixth of the Introduction to Materials Science series, this course offers an overview of principles and properties of biomedical materials. Topics include properties of materials used in medicine, synthesis and properties of polymeric materials, polymeric biomaterials, natural and recombinant biomaterials, biodegradable materials, hydrogels, stimuli-sensitive materials, and characterizations of biomaterials. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.

EN.510.335. MSE Design Team I. 3 Credits.
This course is the first half of a two-semester course sequence for freshmen, sophomores, and juniors majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen, sophomores, and juniors, working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. *The team will meet 150 minutes per week at a time to be designated by the instructor.Recommended Course Background: EN.510.101, EN.510.109, or equivalent courses.

EN.510.336. MSE Design Team I. 3 Credits.
This course is the second half of a two-semester course sequence for juniors majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE juniors working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Freshman Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.
EN.510.335

EN.510.400. Introduction to Ceramics. 3 Credits.
This course will examine the fundamental structure and property relationships in ceramic materials. Areas to be studied include the chemistry and structure of ceramics and glasses, microstructure and property relationships, ceramic phase relationships, and ceramic properties. Particular emphasis will be placed on the physical chemistry of particulate systems, characterization, and the surface of colloid chemistry of ceramics. Recommended Course Background: EN.510.311, EN.510.312, or permission of instructor.

EN.510.402. Dynamics of Soft Materials. 3 Credits.
The structure and properties of soft materials will be studied with the focus on understanding ways to control and measure the dynamics. Soft materials to be studied include colloids, emulsions, dispersions, drops, polymers and gels. We will use experimental tools to study these materials including optical microscopy, rheometers, and atomic force microscopy. Recommended Course Background: EN.510.311 or permission of instructor.

EN.510.403. Materials Characterization. 3 Credits.
This course will describe a variety of techniques used to characterize the structure and composition of engineering materials, including metals, ceramics, polymers, composites and semiconductors. The emphasis will be on microstructural characterization techniques, including optical and electron microscopy, X-ray diffraction, and thermal analysis and surface analytical techniques, including Auger electron spectroscopy, secondary ion mass spectroscopy, X-ray photoelectron spectroscopy, and atomic force microscopy. Working with the JHU museums, we will use the techniques learned in class to characterize historic artifacts.

EN.510.405. Materials Science of Energy Technologies. 3 Credits.
This course examines the science and engineering of contemporary and cutting-edge energy technologies. Materials Science and Mechanical Engineering fundamentals in thisarea will be complemented by case studies that include fuel cells, solar cells, lighting, thermoelectrics, wind turbines, engines, nuclearpower, biofuels, and catalysis. Students willconsider various alternative energy systems, and also to research and engineering of traditional energy technologies aimed at increased efficiency, conservation, and sustainability. Recommended Course Background: undergraduate course in thermodynamics.

EN.510.407. Biomaterials II: Host response and biomaterials applications. 3 Credits.
This course focuses on the interaction of biomaterials with the biological system and applications of biomaterials. Topics include biomaterials fabrication and characterization, host reactions to biomaterials, cell-biomaterials interaction, biomaterials for tissue engineering applications, biomaterials for controlled drug and gene delivery, and biomaterials for artificial organs.
EN.510.316 or permission of instructor.

EN.510.414. Transmission electron microscopy: principle and practice. 3 Credits.
Introduction to basic principles of electron diffraction, phase contrast and Z-contrast and applications of these principles in microstructural characterization of materials by electron diffraction, high-resolution electron microscopy and scanning transmission electron microscopy. Also listed as EN.510.665.

EN.510.415. The Chemistry of Materials Synthesis. 3 Credits.
Many of the latest breakthroughs in materials science and engineering have been driven by new approaches to their synthesis, which has allowed the preparation of materials with fanciful structures and fascinating properties. This advanced course will explore synthetic approaches to multifunctional and nanostructured materials, ranging from opals to complex polymers to nanowires and quantum dots . Applications include electronics, energetics, and drug delivery. Participants will gain sufficient familiarity with synthesis options to be able to design research programs that rely on them. Emphasis will be placed on broad strategies that lead to material functionality, rather than detailed step-by-step sequences. Some topics will be selected “on the fly” from the most exciting current literature.

EN.510.416. Physical Behavior of Metamaterials. 3 Credits.
The field of metamaterials is a rapidly evolving area within the physical and engineering sciences that relates to diverse applications such as transformation optics for advanced imaging, acoustic noise reduction for architectural spaces and electromagnetic shielding for electronic devices. The goal of metamaterials design is to guide energy transport through specified regions of a material avoiding others that might contain delicate or otherwise susceptible structures that must be shielded. Energy transport can occur via electromagnetic waves, acoustic waves, electrical currents or thermal fluxes. Through rational design of the material micro/meso/macrostructure, any one of these can be effectively directed in the material. The challenge is to engineer materials that respond in a way that approximates the desired design. In this course, the methods for metamaterials design will be investigated along with those aspects of materials science and engineering that allow for the fabrication of these materials. Also listed as EN.510.616
EN.510.31 AND EN.510.314 or their equivalents

EN.510.420. Stealth Science & Engineering. 3 Credits.
The goal of stealth engineering is the creation of objects that are not easily detected using remote sensing techniques. To achieve this end, engineered systems of materials are arrayed to alter the signature of objects by reducing energy returned to remote observers. This course will provide an introduction to the general principles behind signature reduction by examining the mathematics and science behind basic electromagnetic and acoustic transport processes. Specific topics will include energy absorbing materials, anti-reflection coatings, wave guiding and scattering, metamaterials and adaptive screens. Co-listed with EN.510.640

EN.510.422. Micro and Nano Structured Materials & Devices. 3 Credits.
