# Preface

Advancing an ambitious reform agenda, the six Western Balkan (WB6) economies have emerged over the last two decades as a group of small but growing open economies that are improving business conditions and attracting investment. Since 2000, reforms have contributed to a doubling of the region's GDP and a six-fold increase in export volumes.

Yet more needs to be done: the average gross domestic product per capita is still only one-third of the European Union's and unemployment levels remain too high, especially among young people. Many industries in the WB6 economies remain fragile, their technology largely outdated and their products not sufficiently competitive outside their region. Furthermore, wage increases in the export sector are outpacing productivity growth, thus blunting the region's competitive edge.

The persisting structural weaknesses of the Western Balkan region have been amplified by the COVID-19 pandemic crisis. Lockdown measures to protect citizens' lives have resulted in a sharp drop in economic activity, a collapse of exports and a rise in unemployment in most WB6 economies.

Innovative growth strategies are needed more than ever to support a post-pandemic recovery that is robust, inclusive and sustainable. Further reforms are necessary to ensure the region can avoid the middle-income trap and help unleash growth and investment in knowledge-based sectors with higher potential for value-added and quality jobs. Ultimately, a people-centred policy approach is needed to improve opportunities and living conditions by fostering human capital and well-being, areas where the WB6 economies can benefit from the experience of EU members and OECD countries. In this context, an important driver for balanced reform efforts is the prospect of accession to the European Union (EU).

This third edition of *Competitiveness in South East Europe: A Policy Outlook* provides a wide-ranging representation of economic performance, governance and regulation in the Western Balkan economies. It offers extensive guidance to steer structural reforms, supporting the Economic Reform Programmes and the EU's Economic and Investment Plan for the WB6, and – through its regional collaboration approach – regional economic integration of the Western Balkans. It draws on qualitative and quantitative information across 16 key policy dimensions, and is broken down into over 350 individual indicators that allow WB6 policy makers to directly compare economic performance across countries and benchmark themselves against OECD and EU averages. It also enables policy makers to track performance over time, by comparing outcomes against those reported in previous editions, published in 2016 and 2018. This 2021 edition clearly highlights that while uneven, progress is being made across all areas, together with increasing intergovernmental co-operation. For example, the WB6 economies are engaged in important initiatives to align their tax systems with recent international tax trends and have laid the foundations for a competitive energy market.

Importantly, this report illustrates the benefits of a strategic approach to driving economic reform, which is guided by in-depth evidence-based analysis. This publication was drafted in close collaboration with hundreds of WB6 government representatives as well as local and regional stakeholders and co-funded by the European Union. The WB6 governments provided rigorous qualitative self-assessments and statistical data. We would like to thank all those who have contributed to this collaboration. We very much hope that this *Competitiveness in South East Europe: A Policy Outlook* is used to strengthen the competitiveness of the WB6 countries to build more inclusive, prosperous and resilient economies for the citizens in this increasingly relevant region.

**Mathias Cormann**

OECD Secretary-General

**Olivér Várhelyi**

EU Commissioner for Neighbourhood  
and Enlargement

# Acknowledgements

*Competitiveness in South East Europe: A Policy Outlook 2021* is the outcome of work conducted by the OECD and six Western Balkan (WB6) economies: Albania, Bosnia and Herzegovina, Kosovo\*, Montenegro, North Macedonia and Serbia. The work was co-ordinated by the OECD's South East Europe Division.

The assessment was conducted under the guidance of Andreas Schaal, Director of the OECD Global Relations Secretariat, and Marzena Kisielewska, Head of the OECD South East Europe Division.

The work was led by Martin Kohtze and Ali-Fuad Turgut (OECD South East Europe Division). The project also benefitted from the early guidance of Umur Gökçe (formerly OECD South East Europe Division).

The project benefitted from inputs by Alexander Böhmer and William Tompson (both from the OECD Global Relations Secretariat) as lead reviewers of the publication.

This report was made possible thanks to the contributions of the Competitiveness Outlook (CO) Co-ordinators who supported the data-gathering and verification process in each WB6 economy. Our special thanks also go to 700 government officials and other stakeholders who have been actively involved across the region, whose support and dedication have made the development of this publication possible. We would like especially to acknowledge the contributions of the following individuals and organisations:

**Albania:** Arjana Dyrmishi (CO Co-ordinator of Albania), Eralda Shtylla (Ministry of Finance and Economy), and Elsa Dhuli (Institute of Statistics).

**Bosnia and Herzegovina:** Brankica Pandurević (CO Co-ordinator of Bosnia and Herzegovina), Aida Soko (CO Co-ordinator of the Federation of Bosnia and Herzegovina), Nataša Žugić (CO Co-ordinator of the Republika Srpska), Ranka Bogdanović (Ministry of Foreign Trade and Economic Relations of Bosnia and Herzegovina), Nadir Jahić (Office of the Prime Minister of the Federation of Bosnia and Herzegovina), Dijana Simanić (Federal Bureau of Statistics) and Jasmin Komić (Republika Srpska Institute of Statistics).

**Kosovo:** Hajriz Koca (CO Co-ordinator of Kosovo), Nol Buzhala (former CO Co-ordinator of Kosovo), Kreshnik Thaqi (Ministry of Industry, Entrepreneurship and Trade), Gent Berisha (Ministry of Industry, Entrepreneurship and Trade) and Ilir T. Berisha (Kosovo Agency of Statistics).

**Montenegro:** Jovana Krunić (CO Co-ordinator of Montenegro), Dušan Radonjić (former CO Co-ordinator of Montenegro) and Majda Savićević (Statistical Office of Montenegro).

**North Macedonia:** Stojne Danilova Ivanoski (CO Co-ordinator of North Macedonia), Daniel Josifovski (Cabinet of the Deputy President of the Government of the Republic of North Macedonia) and Branko Hinikj (State Statistical Office of the Republic of North Macedonia).

**Serbia:** Gojko Stanivuković (CO Co-ordinator of Serbia), Verica Ignjatović (Ministry of Finance), Sanja Amanović (Ministry of Finance), Daniela Krnetić (Ministry of Finance), Bojana Tošić (Public Policy

Secretariat), Dijana Ilić Zogović (Public Policy Secretariat) and Miladin Kovačević (Statistical Office of the Republic of Serbia).

The principal authors of the report were Selim Guedouar, Zoé Ryan and Ali-Fuad Turgut (Chapter 4, Investment policy and promotion – Dimension 1); Jaroslaw Mrowiec (Chapter 5, Trade policy – Dimension 2); Ali-Fuad Turgut and Zoé Ryan (Chapter 6, Access to Finance – Dimension 3); Alexandre Jutand and Bert Brys (from the OECD Tax Policy and Statistics Division) in co-operation with Zoé Ryan and Ali-Fuad Turgut (Chapter 7, Tax Policy – Dimension 4); Renato Ferrandi (from the OECD Competition Division) in co-operation with Patrycja Nolbrzak (Chapter 8, Competition policy – Dimension 5); Korin Kane and Patrycja Nolbrzak (Chapter 9, State-owned enterprises – Dimension 6); Caitlyn Guthrie (from the OECD Education Policy Advice and Implementation Division) in co-operation with Matija Lojpur and Martin Kohtze (Chapter 10, Education policy – Dimension 7); Nicola Duell and Elma Aga (Chapter 11, Employment policy – Dimension 8); Marko Atanasovski, Martina Ćirić and James Hermanson (Chapter 12, Science, technology and innovation – Dimension 9); Despina Anastasiadou, Martina Ćirić and James Hermanson (Chapter 13, Digital society – Dimension 10); Danijel Vučković, Matija Lojpur and Jovana Pavlović (Chapter 14, Transport policy – Dimension 11); Andreas Pointvogl, Kai Dunker, Matija Lojpur and Jovana Pavlović (Chapter 15, Energy policy – Dimension 12); Clémence Girin and Jovana Pavlović (Chapter 16, Environment policy – Dimension 13); Stevan Orozović, Jaroslaw Mrowiec and Zoé Ryan (Chapter 17, Agriculture policy – Dimension 14); Darja Radić, Clémence Girin and Camille Hewitt (Chapter 18, Tourism policy – Dimension 15); Valts Kalniņš and Patrycja Nolbrzak (Chapter 19, Anti-corruption policy – Dimension 16). The report's front matter and annex were prepared by Martin Kohtze, Ali-Fuad Turgut, Marija Kuzmanović, Elma Aga, Clémence Girin and Matija Lojpur.

The report benefitted from further input by Alexandre de Crombrughe (OECD Investment Division); John Drummond, Janos Ferencz and Frederic Gonzales (OECD Trade in Services Division); Serdar Çelik (OECD Corporate Governance and Corporate Finance Division); Sean Kennedy (OECD Tax Policy and Statistics Division); Hans Christiansen and Sara Sultan (OECD Corporate Governance and Corporate Finance Division); Elizabeth Fordham and Hannah Kitchen (OECD Education Policy Advice and Implementation Division); Mark Keese and Jonathan Stöterau (OECD Skills and Employability Division); Michael Keenan and Andrés Barreneche (OECD Science and Technology Policy Division); Douglas Herrick (OECD Green Growth and Global Relations Division); Jonathan Brooks and Martin von Lampe (OECD Agriculture and Resource Policies Division); Jane Stacey and Anna Bolengo (Entrepreneurship SME and Tourism Division); Olga Savran and Rusudan Mikhelidze (OECD Anti-corruption Division); and Violeta Kogalniceanu (Energy Community Secretariat).

The publication was also reviewed and supported by the European Commission's Directorate-General Neighbourhood and Enlargement Negotiations (DG NEAR); the Directorate-General Internal Market, Industry, Entrepreneurship and SMEs (DG GROW); and the EU Delegations in the Western Balkans. In particular, the OECD team are grateful for the contributions of Javier Menendez Bonilla and Youssef Tadros (DG NEAR).

The following local experts reviewed and provided input to the report: Edith Harxhi (Albania), ENOVA Consultants and Engineers (Bosnia and Herzegovina), Valmira Rexhëbeqaj (Kosovo), Institute for Strategic Studies and Prognoses (Montenegro), Trajkovski & Partners (North Macedonia), Nemanja Šormaz (Serbia), and Katarina Urošević.

The report was prepared for publication by Poeli Bojorquez (OECD South East Europe Division), with the strategic support of Robert Akam (OECD Global Relations Secretariat). It was edited and proofread by Fiona Hinchcliffe, Sally Hinchcliffe and Elizabeth Zachary. The following people also contributed to the success of the project: William Graff and Spela Berlizg.

This report has been produced with the financial assistance of the European Union. The views herein can in no way be taken to reflect the official position of the European Union nor its Member States.

# Executive summary

Over the past two decades, the six Western Balkan (WB6) economies have implemented a number of economic reforms that have strengthened their competitiveness; however, 2020 has confronted them with unprecedented challenges. The COVID-19 pandemic has taken a heavy toll on the region, with gross domestic product contracting by 3.3%, exacerbating existing structural challenges and bringing new ones to the fore. The pandemic has revealed the need to reorient the region's reform priorities towards a stronger focus on sustainability, inclusiveness and citizen well-being. Against this backdrop, a holistic, evidence-based structural reform agenda that outlines a path to sustainable, inclusive growth and rising living standards is of utmost importance for all WB6 economies.

This publication seeks to contribute to this endeavour. It provides policy makers in the WB6 economies – Albania, Bosnia and Herzegovina, Kosovo, the Republic of North Macedonia, Montenegro and Serbia – with an evidence-based assessment of 16 policy areas key to their competitiveness, as well as tailored policy recommendations built on OECD and European Union (EU) good practice. Unlike the previous editions, this third edition of *Competitiveness in South East Europe: A Policy Outlook* (Competitiveness Outlook) complements a regional analysis of the 16 policy areas with extensive economy-specific profiles for each WB6 economy. It is the result of a participatory assessment process that included more than 700 WB6 government and statistical office representatives, as well as non-government stakeholders.

## Key achievements

On average, the WB6 economies have improved their performance since the publication of the Competitiveness Outlook 2018 report in two-thirds of the policy dimensions analysed. Although this clearly indicates progress in the setting up of policies to enhance their competitiveness, effective and continuous implementation, monitoring, and upgrading these policies should remain a key priority if they are to have a lasting impact. For this assessment cycle, the strongest performance among WB6 economies was in the following areas:

- **Tax policy.** Since the last assessment, all WB6 economies except Kosovo have joined the Inclusive Framework on base erosion and profit shifting (BEPS) and have implemented the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS. They all also carry out some form of regional co-operation and co-ordination on tax matters.
- **Trade policy.** All WB6 economies have made significant improvements to strengthen regional co-operation in trade and open up trade in services within the Central European Free Trade Agreement (CEFTA) framework. This has been achieved through the conclusion of CEFTA Additional Protocol 6 in December 2019 and its ratification by Albania, Bosnia and Herzegovina, Montenegro, North Macedonia and Serbia. These and subsequent efforts will reduce the costs of trade in services in the region.
- **Energy policy.** The WB6 economies have made advances towards aligning their energy policies with EU and Energy Community standards. They have an advanced legislative framework that

transposes a significant share of the EU's Third Energy Package. There has also been progress in deploying EU-style organised markets in energy.

- **Investment policy and promotion.** The WB6 economies continue to be among the most open economies to foreign direct investment (FDI) thanks to their open markets and comprehensive regulatory environments for investment activities. All WB6 economies have established an investment promotion agency mandated to promote and facilitate inward FDI, exports and innovation. By giving the same rights and remedies to foreign and domestic investors in their court systems, the economies are facilitating foreign investment.

## Key priorities

By contrast, challenges remain for all WB6 economies in several policy areas. In particular there is room for improvement in environment policy; digital society; science, technology and innovation policy; and transport policy – dimensions for which the economies score the lowest in this 2021 Competitiveness Outlook assessment. The key areas for improvement are:

- **Improve environmental quality of life.** With levels of fine particulate matter (PM<sub>2.5</sub>) two to three times above the maximum limits recommended by the World Health Organization, the WB6 economies should decrease their dependence on fossil fuels in the energy mix, upgrade household heating systems, reduce transport emissions and decrease emissions from industry. Waste management should also be improved by enforcing measures to separate and reduce waste and increase recycling and recovery in line with circular economy principles. The WB6 should also increase the number of wastewater treatment plants and reassess the fee structure so that fees cover the service costs.
- **Provide stronger support to citizens and businesses to harness the benefits of the digital transformation.** Low digital literacy remains prevalent in the region and threatens to deepen a digital divide despite significant efforts to increase broadband access. Greater co-operation with the information and communication technology (ICT) industry is needed to address digital skills gaps through education and training, while business digitalisation and ICT sector growth should be supported and promoted further.
- **Increase investment in public research and innovation.** Public research remains systemically underfunded, while the allocation of funding does not always encourage optimal research outputs. Human capital for research and innovation is below potential due to limited development opportunities, lack of funding and few incentives to commercialise research. With increased funding for public sector research and by promoting scientific research as an attractive profession to develop human capital and counteract brain drain, innovation systems could be a key driver of economic growth in the region.
- **Improve transport project and asset management and strengthen combined transport.** Most WB6 economies would benefit from improving their systems for transport project identification, prioritisation and selection to make the allocation of funds and investment in transport infrastructure projects more efficient. The WB6 should accelerate the development of an asset management system for all transport infrastructure and ensure that it is in line with the domestic inventory system. They should also develop or prioritise combined transport strategies, which are needed to boost cost efficiency, reduce environmental pollution, and increase co-modality and co-operation among freight forwarding network companies.

# **1 Economic context**

## Key economic features

The Western Balkan region consists of six small open economies: Albania, Bosnia and Herzegovina, Kosovo, Montenegro, North Macedonia and Serbia. In the post-transition period, the economies of this region have become predominantly service-oriented, though some manufacturing sectors have been expanding in recent years. Services account for the largest share of the regional gross domestic product (GDP) at 52.2%, dominated by wholesale and retail trade (World Bank, 2021<sup>[1]</sup>). In Montenegro and Albania, tourism also contributes a significant share to the services sector (32.1% and 21.2% of GDP respectively) (World Travel and Tourism Council, 2020<sup>[2]</sup>). Industry contributes 23.4% to GDP, with the highest contribution coming from the manufacturing and construction sectors. However, the share of the manufacturing sector varies across the six economies – from 4% of GDP in Montenegro and 6% of GDP in Albania to between 12% and 14% in the remaining four economies (World Bank, 2021<sup>[1]</sup>). The agriculture sector has declined significantly over the past two decades, its contribution to GDP having fallen from 15.3% in 2000 to 8.6% in 2020 (World Bank, 2021<sup>[1]</sup>). However, this sector's contribution to employment remains much more significant, at 18.6% in 2019 (World Bank, 2021<sup>[1]</sup>). Its contribution to informal employment is also likely to be significant (ILO, 2021<sup>[3]</sup>).

The growth of the Western Balkan economies has slowed down significantly in the aftermath of the global financial crisis, but it has become more balanced (World Bank, 2021<sup>[1]</sup>). Their annual average growth rate has been 2.3% since 2010, compared to 5.8% in 2001-08. Prior to the crisis, GDP growth was driven predominantly by consumption and investment, fuelled by high capital inflows channelled through the newly privatised financial institutions. In the context of weak export growth and high reliance on imports, this led to the build-up of significant imbalances, including high trade and current account deficits and high levels of (external) debt, both public and private. In the post-crisis period, weaker credit growth has moderated the growth in consumption and investment, including foreign direct investment (FDI). Furthermore, productivity growth has been undermined by weaker labour reallocation from less productive sectors (mainly agriculture) to more productive service and manufacturing sectors, as well as by the decline in within-sector productivity growth. On the other hand, the growth in exports (from 28.8% to 44.6% of GDP between 2008 and 2019), fuelled in some economies (North Macedonia and Serbia) by the influx of export processing FDI, has resulted in more balanced growth and a more stable macroeconomic environment (World Bank, 2021<sup>[1]</sup>).

The moderate economic growth of the past decade reflects numerous underlying structural challenges that undermine productivity and capital accumulation. Despite significant progress, the business environment remains challenging due to corruption, weak and uncertain contract enforcement, lengthy and costly procedures for obtaining licences and permits, and unfair competition from the informal sector, among others. Micro and small enterprises, especially start-ups, face considerable hurdles in obtaining financing from bank and non-bank financial institutions. Infrastructure gaps (including hard and soft transport infrastructure and, in economies such as Albania and Kosovo, energy infrastructure) further undermine competitiveness, investment – particularly export-oriented FDI – and integration into global value chains.

These challenges are also reflected in weak labour market and well-being outcomes. Unemployment remains an important problem for all economies in the region, with rates ranging from 9% in Serbia to 25.7% in Kosovo (Table 1.1). Youth unemployment is particularly high: almost 50% in Kosovo and between 27% and 35.5 in all other economies. A high share of the unemployed are long-term unemployed. Meanwhile, most employed people work in low-wage, low-productivity jobs, which is reflected in the still relatively large gap in per capita income vis-à-vis the European Union (EU) – less than 40% of the EU and OECD average GDP per capita (PPP adjusted) – and the relatively higher poverty rates (World Bank, 2021<sup>[1]</sup>). High inequality also significantly affects well-being in the Western Balkan economies across gender, ethnicity and regions, with well-being also undermined by high pollution levels and environmental degradation.

Table 1.1. WB6: Main regional macroeconomic indicators (2020)

Indicator	Unit of measurement	Albania	Bosnia and Herzegovina	Kosovo	Montenegro	North Macedonia	Serbia	WB6 average
GDP growth <sup>1</sup>	% year-on-year	-3.3	-4.5	-3.9	-15.2	-4.5	-1.0	-3.3
GDP per capita <sup>2</sup>	Current international \$	13 818	15 612	11 368	20 567	16 927	19 231	17 093
Agriculture, forestry, and fishing, value added <sup>2</sup>	% of GDP	19.3	6.2	7.6	6.4	9.1	6.5	8.6
Industry (including construction), value added <sup>2</sup>	% of GDP	19.7	23.9	25.8	16.1	22.6	24.8	23.4
Services, value added <sup>2</sup>	% of GDP	48.4	55.7	44.2	58.7	57.0	51.5	52.2
Net FDI <sup>1</sup>	% of GDP	7.3	1.8	4.2	11.2	1.9	6.2	5.1
Exports of goods and services <sup>1</sup>	% of GDP	23.3	32.1	21.6	25.8	58.1	47.7	40.2
Imports of goods and services <sup>1</sup>	% of GDP	38.1	45.9	53.7	60.6	70.9	56.6	53.9
Current account balance <sup>1</sup>	% of GDP	-8.9	-3.1	-7.1	-26.0	-3.5	-4.3	-5.7
Unemployment <sup>1</sup>	%	12.2	18.0	25.7*	18.4	16.4	9.0	14.1
Youth unemployment <sup>*2</sup>	% of total labour force ages 15-24	27.0	34.0	49.5**	25.3	35.5	27.1	31.6
Inflation <sup>1</sup>	Consumer price index, annual % change)	1.6	-1.1	0.2	-0.8	1.2	1.6	0.5***
Public and publicly guaranteed debt <sup>3</sup>	(% GDP, estimate for 2020)	77.4	39.6	22.8	109.2	60.0	58.2	57.5
External debt <sup>*4</sup>	% of GDP	60.1	64.3	30.8	170.2	72.2	66.1	65.8
Exchange rate (if applicable local currency/euro) <sup>1</sup>	Value	123.77	1.96	..	..	61.67	117.58	..
Remittance inflows <sup>2</sup>	% of GDP	9.9	9.2	18.9	12.6	3.4	7.3	8.5
Mean population exposure to PM2.5 <sup>*5</sup>	Micrograms per cubic metre	18.5	30.3	..	22.3	32.7	25.5	..

Note: Unless specified otherwise, all WB6 averages are weighted averages.

## ***Sustainable development***

All of the Western Balkan economies have committed to implementing the 2030 Agenda for Sustainable Development; however, progress in improving well-being outcomes has been relatively modest over the past decade. Achieving the 2030 targets will require considerable effort across most of the 17 Sustainable Development Goals (SDGs).

Since the start of the economic transition, the WB economies have made significant progress in improving economic and social outcomes. Strong economic growth, particularly in the period leading up to the global financial crisis, led to significant job creation, rising productivity and incomes, and declining poverty. These trends have continued over the past decade, though progress has been slow, and significant gaps with the 2030 targets remain (Table 1.2):

- Health and well-being outcomes are strongly affected by high rates of non-communicable diseases (cardiovascular disease, diabetes, cancer, etc.) and obesity; lack of access to high-quality healthcare; high out-of-pocket expenditures for healthcare etc. Air and water pollution also negatively affect health and well-being.
- High and rising inequality is an important challenge in the Western Balkan economies, as well as globally. Inequality is manifested not only in terms of income (as measured by the Gini coefficient), but also in all kinds of well-being outcomes – from access to quality education and healthcare, to municipal infrastructure, etc. Inequality is visible across various dimensions including gender, ethnicity, regions, and urban vs. rural areas.
- Economic outcomes are undermined by weaknesses in competitiveness, infrastructure and innovation, manifested in low job creation and high unemployment. Weaknesses in the quality and relevance of education also damage productivity and long-term growth prospects.
- Environmental outcomes are poor across all relevant SDGs. Air pollution is high, and is a major problem especially in the region's largest cities. Significant progress can be made in improving energy efficiency. Environmental degradation on land and below water represents a major challenge in most economies, as does the building of a circular economy.

**Table 1.2. Progress towards achieving the SDGs**

SDG	Albania	Bosnia and Herzegovina	North Macedonia	Montenegro	Serbia
1 – No Poverty	Challenges remain	SDG achieved	Challenges remain	Challenges remain	SDG achieved
2 – Zero Hunger	Significant challenges remain	Significant challenges remain	Significant challenges remain	Major challenges remain	Significant challenges remain
3 – Good Health and Well-Being	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain
4 – Quality Education	SDG achieved	Information unavailable	Challenges remain	Challenges remain	SDG achieved
5 – Gender Equality	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain
6 - Clean Water and Sanitation	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain
7 - Affordable and Clean Energy	Challenges remain	Significant challenges remain	Significant challenges remain	Challenges remain	Challenges remain
8- Decent Work and Economic Growth	Major challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain
9 - Industry, Innovation and Infrastructure	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain
10 - Reduced Inequalities	Significant challenges remain	Significant challenges remain	Major challenges remain	Major challenges remain	Significant challenges remain
11 - Sustainable Cities and Communities	Significant challenges remain	Major challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain
12 - Responsible Consumption and Production	Significant challenges remain	Significant challenges remain	Significant challenges remain	Major challenges remain	Significant challenges remain
13 - Climate Action	SDG achieved	Significant challenges remain	Significant challenges remain	Significant challenges remain	Challenges remain
14 - Life Below Water	Major challenges remain	Challenges remain	Information unavailable	Major challenges remain	Information unavailable
15 - Life on Land	Significant challenges remain	Significant challenges remain	Significant challenges remain	Major challenges remain	Major challenges remain
16 - Peace, Justice and Strong Institutions	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain	Significant challenges remain
17 - Partnerships for the Goals	Significant challenges remain	Challenges remain	Challenges remain	Challenges remain	Challenges remain

Note: An assessment is not yet available for Kosovo. The order of progress (from greatest to least) is as follows: SDG achieved; challenges remain; significant challenges remain; major challenges remain.

### **Structural economic challenges**

Significant outstanding structural challenges undermine the Western Balkan economies' competitiveness, investment environment and integration into global value chains (GVCs):

#### *Weak knowledge and skills hinder economic diversification and upgrading*

- **Improving the quality of education** is a major challenge for the six economies of the Western Balkan region (WB6). Student performance in international assessments, such as the Programme for International Student Assessment (PISA), is significantly behind OECD countries, as well as Central and Eastern European peers. For example, around 50% of students in the WB6 fail to achieve the baseline level of proficiency (level 2) in each of the three subjects tested by PISA

(mathematics, science and reading). By comparison, about 80% of OECD students achieve baseline proficiency across each of the three tested subjects (OECD, 2018<sup>[9]</sup>).

- There are many reasons for the poor quality of education at all levels, including low and inefficient spending on education. The relatively low spending on education is reflected in inadequate teaching facilities, limited access to technology and other teaching tools (OECD, 2020<sup>[10]</sup>). The quality of spending is also a challenge in many economies. For example, low student-teacher ratios result in high spending on teacher salaries, which does not translate into superior student performance (OECD, 2020<sup>[10]</sup>).
- **Skills gaps** are another important challenge for education in the Western Balkan economies. Skills gaps undermine investment and growth in existing sectors of an economy, and also limit the scope for economic upgrading through investment (including FDI) in more knowledge-based sectors. The employer Skills Measurement Program (STEP) survey conducted by the World Bank in a number of regional economies has pointed to skills gaps as a major cause of hiring difficulties (World Bank, 2021<sup>[11]</sup>). Meanwhile, a significant share of respondents to the Balkan Barometer survey do not feel that the skills they obtained during their education meet the needs of their jobs. The skills most lacking include technical skills, as well as more cognitive and behavioural skills such as communication, the ability to learn on the job, creativity, innovation and risk taking (Regional Cooperation Council, 2019<sup>[12]</sup>).

### *A challenging business climate undermines investment and private sector development*

Over the past decade, most Western Balkan economies have made progress in simplifying and streamlining administrative procedures to make it easier to start and operate businesses. This has helped boost their rankings in the Doing Business report. However, many challenges still persist, including high corruption, weak and costly contract enforcement, lengthy and costly licensing and permitting procedures, and high levels of informality (World Bank, 2020<sup>[13]</sup>).

- **Corruption** remains an important obstacle to doing business in the Western Balkan region. In recent enterprise surveys, firms from the WB6 economies noted a higher prevalence of corruption than did aspirational peers. Likewise, a large share of WB6 firms identified corruption as a major obstacle to doing business in the region. The challenge is particularly large in Kosovo, Albania and Bosnia and Herzegovina, according to the Business Environment and Enterprise Performance Survey (BEEPS). In Kosovo, for example, over 50% of surveyed firms identified corruption as a major constraint, compared to the Europe and Central Asia (ECA) average of 17.9%. The equivalent figure for Albania was over 43.4%, and 29.5% for Bosnia and Herzegovina. In Albania, 36.1% of firms stated that they had experienced at least one bribe payment request, which is considerably higher than the ECA average of 8.3% (World Bank, 2019<sup>[14]</sup>). The most recent Transparency International Corruption Perception Index ranks most economies in the Western Balkan region at over 100th place out of the 180 participating economies (Transparency International, 2020<sup>[15]</sup>).
- **Contract enforcement** is slow, costly and unreliable in the WB6 economies. It takes on average 542 days, which is somewhat faster than the OECD average (590 days), but considerably longer than the global leaders on the Doing Business index (164 days in Singapore) (World Bank, 2020<sup>[13]</sup>). In many economies, the process is slowed down by an overburdened court system which has a significant backlog of cases. At 34.5% of the claim value, contract enforcement is also costly compared to the OECD average of 21.5% (World Bank, 2020<sup>[13]</sup>). Finally, and perhaps most importantly, confidence is lacking in the judicial system's fair and impartial decision making, which elevates the uncertainty in contract enforcement. In the latest Regional Cooperation Council barometer survey, 58% of respondents in the WB6 stated that they do not trust the court system, while 64% stated that they do not believe that the judiciary is independent of political influence.

Likewise, 70% of WB respondents do not believe that the law is applied equally to everyone (Regional Cooperation Council, 2019<sub>[12]</sub>).

- **Obtaining licenses and permits** is also a relatively long and costly process in most WB6 economies. According to the latest Doing Business report, obtaining a construction permit in Albania, Bosnia Herzegovina and Kosovo takes on average 247 days (compared to a 152-day average for the OECD) and requires 18 procedures (compared to the OECD average of 13). The cost of obtaining these permits ranges from 5.2% of the warehouse value in Kosovo, to 20.3% in BIH (compared to 1.5% for the OECD) (World Bank, 2020<sub>[13]</sub>).
- **Unfair competition**, particularly from the informal sector, represents an important constraint for businesses in most WB6 economies. In the BEEPS enterprise survey, 44.5% of Western Balkan firms stated that they compete against informal firms, while 35.5% of firms stated that informal competition is a major obstacle for their business (World Bank, 2019<sub>[14]</sub>). The share of informal employment in the region is estimated at 17-40% (The Vienna Institute for International Economic Studies, 2019<sub>[16]</sub>).

#### *Infrastructure deficiencies undermine investment, trade and GVC integration*

The infrastructure gap varies across economies. All economies face important challenges with respect to the size and quality of transport infrastructure, particularly in the railway sector, while some economies also experience important challenges in the reliability of electricity supply.

- **Deficiencies in transport infrastructure connectivity:** Road and railway density is low compared to CEEC<sup>1</sup> peers and the EU, and the quality of infrastructure in both transport modes is relatively weak due to underinvestment and inadequate maintenance (Eurostat, 2020<sub>[17]</sub>). The underdeveloped selection and implementation processes for transport infrastructure projects in the WB6 are also an obstacle to the efficient development of the transport network, although some WB6 economies (Albania and Serbia) have recently made progress in implementing more transparent and efficient project prioritisation processes.
- **The unreliable electricity supply** is an important obstacle to doing business in the region. According to the latest World Bank Enterprise Survey, around 30% of surveyed firms stated that they considered electricity supply to be a major constraint in 2019 (an increase of 10% since 2013) (World Bank, 2019<sub>[14]</sub>). High distribution losses are another important challenge, as all the WB6 economies experience higher levels of distribution losses (around 18.5% on average) than the EU (6.7%) and CEEC (5.2%) averages. This is particularly true for Albania and Kosovo, where electricity distribution loss levels are around 34% and 28% respectively (CEER, 2020<sub>[18]</sub>). The WB6 economies are all reliant on coal-fuelled electricity generation (around 50% in 2018), and have limited non-hydro renewable capacity, which limits their domestic generation potential and greenhouse gas emissions reduction capabilities (Eurostat, 2021<sub>[19]</sub>).

#### *Poor access to finance hinders SME investment, innovation and technology adoption*

- **Access to finance** remains an important challenge across all Western Balkan economies, particularly for micro and small enterprises. These enterprises cannot meet the relatively stringent requirements for bank lending, including high collateral, turnover, credit history and other requirements. Furthermore, they have limited alternatives to bank financing. Progress has been made in many WB6 economies to boost financing for small and medium-sized enterprises (SMEs) through credit guarantee schemes, financing through national development banks, innovation funds and other public entities. Nevertheless, the financing gap still remains relatively wide; closing it will be an important challenge over the coming decade – especially if the region's governments wish to develop more competitive and innovative knowledge-based economies.

### *Cross-cutting and sector-specific constraints undermine the growth of key sectors*

- **Agriculture** in the region is mainly characterised by smallholder and subsistence farming, high land fragmentation, low access to and take-up of new technologies, limited compliance with quality standards, limited access to finance, and, in some cases, high input costs. The result is low productivity and low value added per worker (the latter is roughly one-quarter of the EU average or less in most economies) (World Bank, 2021<sup>[11]</sup>).
- **Manufacturing** development, export growth and GVC integration are all constrained by weaknesses in infrastructure, customs and logistics and the business environment; by skills gaps and firms' limited capacities for technology adoption; and limitations in access to finance, among others. However, analyses of the WB6 economies' product spaces reveal considerable long-term potential for growth in the automotive industry (vehicle and engine parts), electronics, machinery and metal processing (OECD, 2019<sup>[20]</sup>).
- **Tourism** in the region is highly seasonal and mainly concentrated in those economies with coastlines – leading to over-crowded and congested coastal areas. Given their relatively small size, most economies have scope to benefit from more high-end tourism offers, but development of this theme is still limited. The development and upgrading of the tourism sector across the Western Balkan region are hampered by poor infrastructure, lack of quality standards, high pollution levels and environmental degradation, weak protection of cultural heritage, and weak branding and marketing.
- **Information and communication technology (ICT)** is a fast-growing sector in most Western Balkan economies and has considerable potential to boost the value added and exports of services across the region. However, the sector is constrained by infrastructure gaps, the low supply of skilled workers, weak collaboration between the sector and the relevant educational institutions, and lack of access to finance (particularly for start-ups) and high-risk venture capital.

### *Weak management of public finances holds back long-term development*

- **Fiscal policy challenges** are considerable in many economies in the region. Revenue performance is weak due to a relatively narrow tax base, tax evasion and the large informal sector. Low tax rates and lack of tax progressivity in many economies further limit the scope for boosting revenues. On the other hand, a high and growing share of public expenditures go to public sector wages, as well as subsidies and transfers. This has not only limited the level of discretionary spending, as exemplified in the response to the COVID-19 pandemic – it has also had an impact on capital spending in many economies. In some economies, such as Albania and Montenegro, this has also had a strong impact on the levels of public debt and the sustainability of public finances. The economies' long-term development prospects will depend significantly on governments' efforts to widen the tax base, improve compliance and boost the efficiency and effectiveness of public spending and its targeting to areas with strong productivity enhancing potential (e.g. green infrastructure, health, education, etc.)

### *Environmental degradation threatens long-term development and well-being*

- **Air pollution** has become an acute challenge in all the major cities of the WB6. For example, the exposure of the Western Balkan economies' populations to fine particulate matter (PM<sub>2.5</sub>) is two to three times higher than the World Health Organization's (WHO) recommended highest levels of 10 µg/m<sup>3</sup> (OECD, 2021<sup>[7]</sup>). Air pollution levels are particularly high in the winter months, when pollution from ageing vehicles (the average age is considerably higher than in developed countries) and other sources is compounded by pollution from residential heating, often sourced from burning wood or coal.

- **All of the Western Balkan economies are highly prone to natural disasters** (e.g. floods, earthquakes and landslides) and have suffered significant economic and physical damage as a result. With the frequency and severity of some of these hazards likely to increase with climate change, the importance of addressing underlying man-made environmental degradation and strengthening adaptation to climate change will be critical over the coming decades (European Commission, 2020<sup>[21]</sup>).
- **Natural resource conservation** is critical for the well-being of people and wildlife, and has important economic benefits as well. For example, reducing land and water pollution and increasing biodiversity conservation would have a strong positive impact on the region's attractiveness for tourists and the potential for upgrading the tourism offer across all economies.

### *Inequality remains an important challenge*

- Over the past two decades, **incomes per capita and living standards have improved** across all the WB6 economies. Nevertheless, the gap between the WB6 and the average EU and OECD economies remains relatively large. The WB6 average GDP per capita (PPP adjusted) is less than 40% of the EU and OECD averages – and inequality remains a considerable challenge. The level of income inequality, as measured by the Gini coefficient, is relatively high. And there are also considerable regional and ethnic inequalities in access to education, and other public services, employment, etc. (Sachs et al, 2021<sup>[8]</sup>). For example, these inequalities disproportionately affect ethnic minorities such as the Roma, while regional disparities are also significant, with citizens living in large cities benefitting from higher incomes, better employment opportunities, better infrastructure and services than their rural counterparts. Fostering more inclusive growth is thus a critical challenge for the WB6 economies going forward.

### *Covid-19 has exacerbated structural challenges*

The COVID-19 pandemic has had a significant impact on the Western Balkan economies in 2020, with the regional GDP estimated to have declined by 3.3% on the back of falling domestic demand and exports (European Commission, 2021<sup>[4]</sup>). The biggest impact was felt in the second quarter (Q2) of 2020, when lockdown measures, disruptions to global value chains and travel restrictions strongly affected critical service and manufacturing sectors, including retail and wholesale trade, transport as well as tourism and hospitality. Despite some recovery in Q3 and Q4 as travel restrictions and lockdowns were lifted, it was relatively subdued due to high uncertainty in the midst of recurrent waves of the pandemic. As a result, in most regional economies GDP growth remained negative on a year-on-year basis in the second half of 2020.

The degree to which each economy has been affected by the crisis has depended on key economic fundamentals, the strength of the fiscal response as well as the relative strength of the pandemic wave. Montenegro was by far the most badly affected WB6 economy due to its high dependence on tourism, as well as its limited scope for a proportional fiscal response in light of the already high level of public debt. As a result, Montenegro's annual GDP declined by 15.2% in 2020. In Albania, meanwhile, the strong impact on the tourism sector and on domestic demand was mitigated by the recovery from the 2019 earthquake, resulting in a year-on-year GDP decline of 3.3% in 2020. Serbia's economy declined by just 1% in 2020 thanks to its more diversified economic base and the strong fiscal stimulus implemented to combat the economic fallout of the crisis. Meanwhile, the economies of Bosnia and Herzegovina and North Macedonia were more strongly affected by the second wave of the pandemic; this impact could not be lessened despite the additional stimulus measures implemented in the second half of 2020 (World Bank, 2021<sup>[22]</sup>).

The impact on the labour market was mitigated by government measures aimed at supporting employment and the liquidity of companies in the most critically affected sectors of the economy. Montenegro and

Bosnia and Herzegovina saw the highest increase in unemployment: in Montenegro by 3% (from 15.4% in 2019 to 18.4% in 2020) and in Bosnia and Herzegovina by 2.3% (from 15.7% in 2019 to 18% in 2020). In Albania, unemployment remained relatively unchanged (12% in 2019 to 12.2% in 2020), while in the other three economies the decline in unemployment continued despite the pandemic (European Commission, 2021<sup>[41]</sup>).

Many of the structural challenges described above have played a role in either amplifying the impact of the COVID-19 epidemic or limiting the scope of the policy responses to lessen its impact. The crisis has, therefore, provided important lessons on how to build more resilient economies and institutions:

- **Fiscal policy:** As noted above, all WB6 governments introduced fiscal policy measures to stave off the economic and social impact of the crisis. The packages ranged in size and composition, but most included measures to stimulate employment retention (wage and social security subsidies) and firm liquidity (deferred tax payments, reduced VAT rates for specific goods and services, SME credit guarantee schemes, etc.) and boost support for the poorest and most vulnerable households (cash transfers).
- The fiscal response has been critical for avoiding significant economic fallout from COVID-19, especially on labour market outcomes. However, it has resulted in a significant narrowing of the fiscal space. In Montenegro, for example, the fiscal deficit plunged to 11% in 2020 and public and publicly guaranteed debt rose to 109.2% of GDP. In Albania, a deficit of 6.7% resulted in a further increase in public and publicly guaranteed debt to 77.4% of GDP. In North Macedonia, public and publicly guaranteed debt increased by more than 10% in 2020, from 49.4% to 60% of GDP (World Bank, 2021<sup>[22]</sup>).
- In the context of weaker prospective revenues in the wake of the crisis, particularly if the recovery is slow, improving the efficiency of public spending will be critical over the coming months. Expenditures that can support the recovery and promote productivity growth and structural transformation must be prioritised to ensure stronger and more resilient long-term growth. This includes increasing public investment, which has suffered significantly due to high and rising current expenditures. The crisis has also highlighted the importance of rebuilding fiscal buffers in the post-crisis period. In addition to managing expenditures better, achieving this will also require tackling some of the structural constraints that undermine revenue performance.
- **Innovation and technology adoption:** The COVID-19 crisis has starkly demonstrated the importance of firm adaptability in meeting new challenges and changing circumstances. It has also revealed the advantages that firms which have embraced digitalisation and modern practices have over others. The resilience of the post-COVID recovery will therefore depend on addressing structural issues limiting firm innovation and technology (see Structural economic challenges section) and mainstreaming digitalisation and digital skills.
- **Access to finance:** The crisis highlights the significance of having a well-developed and diversified financial sector that can respond to the financing needs of enterprises – not only in times of crisis, but also during the recovery phase. As in the rest of the region, the main instruments for providing additional liquidity for enterprises during the crisis were government support for subsidised lending or lending guarantees. But a robust financial sector made up of diversified financial institutions that can provide financing for riskier and innovative ventures, and not just established enterprises, will be very important in the recovery phase and beyond.
- **Informality:** The large size of the informal sector, and the significant share of informal employment even within the formal sector, have limited the scope of the measures to protect the income and employment of people in the worst-affected sectors. Informality is widespread in the sectors most affected by the crisis, including retail trade and tourism. For example, a study in North Macedonia found that there were 33 000 informal jobs in the nine most vulnerable sectors to the COVID-19 pandemic, accounting for around 26% of total informal employment in the economy (ILO, 2020<sup>[23]</sup>).

This segment has not been able to benefit from government subsidies, favourable loan terms and loan guarantees or other support measures. Developing a more resilient economy will also depend on improving the incentives for formalisation of businesses and improving the oversight and sanctioning of non-compliance.

- **Health sector:** The pandemic has exposed some of the critical challenges that the WB6 health sectors were already facing. Some of these include lower government spending on health care than in EU and OECD countries, resulting in lower quality and poor access. Citizens' high out-of-pocket expenditures are another important challenge for the health systems in the region, with important implications for equality of access as well as quality of care (World Bank, 2021<sup>[11]</sup>). For example, during the pandemic the high cost of testing for the virus resulted in low propensity for testing, underestimation of the number of cases and more rapid contagion (EURACTIV, 2020<sup>[24]</sup>).

### ***EU accession process***

All of the WB6 economies are committed to pursuing EU accession, and the approximation process has been an important anchor for reforms in the region over the past two decades. Of the WB6 economies, four (Albania, Montenegro, North Macedonia and Serbia) are candidates for EU accession and two (Bosnia and Herzegovina and Kosovo) are potential candidates. Since 2010, citizens of all the WB economies except for Kosovo have been able to travel visa-free to all EU Member States that are part of the Schengen area.

The importance of advancing on the socio-economic reform agenda remains a critical priority on the Western Balkan economies' journey to EU membership. The findings of this Competitiveness Outlook (CO) 2021 offer monitoring relevant to a number of critical chapters of the *acquis*, while its recommendations provide the guidance needed to meet the accession requirements. The Competitiveness Outlook also provides a good basis for assessing the critical challenges that the economies face as a starting point for developing their Economic Reform Programmes (Box 1.1)

#### **Box 1.1. Economic Reform Programmes**

Since 2015, all EU candidate countries and potential candidates prepare Economic Reform Programmes (ERPs) which play a key role in improving economic policy planning and steering reforms to sustain macroeconomic stability, boost competitiveness, and improve conditions for inclusive growth and job creation. The ERPs contain medium-term macroeconomic projections (including for GDP growth, inflation, trade balance and capital flows), budgetary plans for the next three years and a structural reform agenda.

The structural reform agenda includes reforms to boost competitiveness and improve conditions for inclusive growth and job creation in the following areas:

1. Public Financial Management
2. Green transition
3. Digital transformation
4. Business environment and reduction of the informal economy
5. Research, development and innovation
6. Economic integration reforms
7. Energy market reforms
8. Transport market reforms
9. Agriculture, industry and services

10. Education and skills
11. Employment and labour market
12. Social protection and inclusion
13. Healthcare systems

The structural reforms part of the ERPs is organised in two parts:

- A first part identifies and analyses the three key challenges across those 13 areas. The identification and prioritisation of key challenges imply a clear political commitment at the highest level to address them and the ERPs should propose a relevant number of reform measures to decisively tackle each of them in the next three years.
- A second part provides an analysis of the remaining areas (not included as key challenges) and may propose additional reforms to address them.

The European Commission and the European Central Bank then assess these programmes, which form the basis for a multilateral economic policy dialogue involving the enlargement economies, EU Member States, the Commission and the European Central Bank. The dialogue culminates in a high-level meeting during which participants adopt joint conclusions that include economy-specific policy guidance reflecting the most pressing economic reform needs. The findings of the Competitiveness Outlook provide guidance to the six Western Balkans EU candidates and potential candidates in identifying the key obstacles to competitiveness and economic growth, and in developing structural reform measures to overcome them.

### ***EU financial and development support***

The EU is the largest provider of external financial assistance to the Western Balkan economies. Since 2007, the EU has provided over EUR 12 billion in pre-accession funds aimed at strengthening democracy and the rule of law, strengthening competitiveness, boosting innovation in agriculture and rural development, reforming the public administration, improving energy and transport infrastructure and policies and fostering climate action. A further EUR 10.2 billion of financing has been provided through the European Investment Bank (EIB) since 1999, while financing of EUR 1.14 billion through the Western Balkans Investment Framework (WBIF) has leveraged additional investment worth an estimated EUR 16.4 billion. Finally, the EU has provided significant grant financing to support disaster relief and reconstruction in the aftermath of the floods that have affected many regional economies, as well as the disastrous earthquake that struck Albania in 2019 (European Commission, 2021<sup>[27]</sup>).

In addition to the grant funding and lending, the EU also provides important support through guarantees for public and private investment to reduce the risks and costs associated with those investments. The new Western Balkans Guarantee Facility is expected to mobilise up to EUR 20 billion in investment over the coming decade (European Commission, 2020<sup>[28]</sup>).

The Connectivity Agenda seeks to support investments in sustainable transport and clean energy. Set up under the WBIF, the latest package, which was presented at the Western Balkans Summit in Sofia on 10 November 2020, completes the delivery of the EU's 2015 pledge to finance EUR 1 billion of investment to support better connectivity in the WB region. It also represents the first step in implanting the flagship projects under the Economic and Investment Plan for the region (European Commission, 2021<sup>[29]</sup>).

The EU has also been instrumental in supporting the Western Balkan economies in their response to the COVID pandemic. This included more than EUR 500 million in repurposed IPA 2014-2020 financing to cover the urgent needs of the health sector, support economic and social recovery in the aftermath of the crisis, and to help WB countries gain access to COVID-19 vaccines through a EUR 70 million package adopted in December 2020. In addition, in February 2021, a joint EU/WHO project provided assistance of EUR 7 million to support vaccination readiness and health sector resilience in the region (European Commission, 2021<sup>[29]</sup>). The WB economies have also been recipients of the EU's regional economic reactivation package of EUR 385 million. A further EUR 500 million was provided in macro-financial assistance to support the economic recovery in Albania, Kosovo, Montenegro and North Macedonia, while the European Investment Bank mobilised EUR 1.7 billion, bringing the EU financial response to COVID-19 in the Western Balkans to more than EUR 3.3 billion in total.

# **2 Assessment methodology and process**

## Introduction

The publication series, *Competitiveness in South East Europe: A Policy Outlook* (Competitiveness Outlook), provides a comprehensive assessment of competitiveness reforms in the six Western Balkan (WB6) economies: Albania, Bosnia and Herzegovina, Kosovo, Montenegro, North Macedonia, and Serbia. The publication uses international and OECD good practice to design sustainable economic reform agendas that enable policy makers to achieve greater competitiveness for their economies.

As the third edition of the Competitiveness Outlook series, the *Competitiveness Outlook 2021* provides an important benchmarking tool that monitors the development, implementation and performance of policies affecting a broad range of policy areas. Its methodology has been only marginally refined in comparison to the 2018 edition, thus making it possible to track progress on policy design and implementation over time. This integral feature supports the domestic policy cycle by equipping policy makers with a tool to measure progress, ensure stronger co-ordination and consistency between policies and identify policy priorities. Likewise, the Competitiveness Outlook's collaborative assessment process is itself a vital exercise that fosters government capacity by integrating the perspectives of government and non-government stakeholders in order to identify the primary economic challenges in an economy and develop tailored policy reforms to address them. This collaborative approach seeks to provide policy makers with a robust source of evidence-based guidance on how to achieve greater economic competitiveness and prosperity.

For the first time in the Competitiveness Outlook series, economy-specific profiles for each of the six WB6 economies offer an in-depth analysis of the key policy areas for strengthening competitiveness post-COVID-19. The inclusion of economy-specific profiles enables this edition of the Competitiveness Outlook to provide individualised structural reform recommendations tailored to the specific challenges of each of the Western Balkan economies.

This assessment cycle of the Competitiveness Outlook took place during the COVID-19 pandemic that began in early 2020. The COVID-19 related developments in France and the Western Balkans had a significant impact on the project activities. Multiple lockdowns in Europe and the Western Balkan economies over the course of 2020 created new challenges associated with remote working and other atypical working conditions. The extraordinary challenges presented by the pandemic necessitated major modifications to the planned project activities. Accordingly, this assessment process used a flexible and innovative approach to successfully conduct data collection and analysis, as well as to engage in the extensive policy dialogue that this assessment requires (Box 2.2).

## Scope

Although the term “competitiveness” is frequently used by academics, policy makers and the general public, it lacks a common definition and can have different meanings in different contexts, such as a firm, industry, regional, national or supranational context. Academics have attempted to find general definitions that recognise the multi-dimensional character of competitiveness and that can be more practical when applied at the macro level.

The Competitiveness Outlook uses the following three definitions of competitiveness, which all include the concept of sustainability and go beyond an exclusive focus on cost competitiveness and GDP:

- “The ability of companies, industries, regions, nations or supranational regions to generate, while being and remaining exposed to international competition, relatively high factor income and factor employment levels on a sustainable basis” (Hatzichronoglou, 1996<sup>[1]</sup>).
- “A measure of an economy’s ability to provide its population with high and rising standards of living and high rates of employment on a sustainable basis” (EC, 2012<sup>[2]</sup>).

- “The ability of a country (region, location) to deliver the beyond-GDP goals for its citizens, today and tomorrow” (Aiginger, Bärenthaler-Sieber and Vogel, 2013<sup>[3]</sup>).

These holistic definitions imply that to increase an economy’s competitiveness, policy reforms should not be pursued in isolation. Instead, they should seek a comprehensive approach with co-ordinated actions across a variety of policy areas, enabling them to build on one other. In order to achieve this holistic policy-making process, the Competitiveness Outlook 2021 used a collaborative assessment approach encompassing 16 policy dimensions. These dimensions are grouped under four key pillars that are crucial for strengthening competitiveness (Table 2.1).

**Table 2.1. Policy dimensions assessed in the Competitiveness Outlook 2021**

Pillar	Policy dimension
I. Business environment	1. Investment policy and promotion
	2. Trade policy
	3. Access to finance
	4. Tax policy
	5. Competition policy
	6. State-owned enterprises
II. Skills and capacity	7. Education policy
	8. Employment policy
	9. Science, technology and innovation
	10. Digital society
III. Economic structure	11. Transport policy
	12. Energy policy
	13. Environment policy
	14. Agriculture policy
	15. Tourism policy
IV. Governance	16. Anti-corruption policy

## Methodology

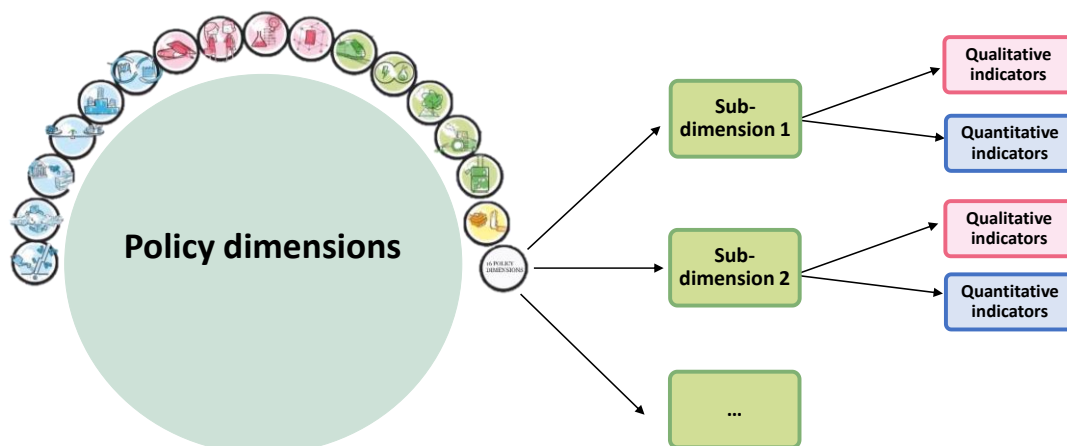

The Competitiveness Outlook’s methodology is designed to provide an evidence-based assessment of progress in the design and implementation of policies related to overall economic competitiveness. The assessment is based on a set of indicators that have been tailored to each of the 16 policy dimensions and evaluated using a highly participatory process that involves more than 700 local stakeholders.

### ***The overall assessment approach***

Each policy dimension is divided into several sub-dimensions that highlight the key elements of that policy area. The sub-dimensions in turn are composed of qualitative and quantitative indicators (Figure 2.1), which capture the design, implementation and performance of policies, processes and institutions. To reflect the latest trends in OECD economic policy research and good practice developed since the previous Competitiveness Outlook (2018) (OECD, 2018<sup>[4]</sup>), new qualitative and quantitative indicators have been included across the 16 assessment frameworks. Moreover, the assessment has been designed to inform economies on their progress towards achieving the UN Sustainable Development Goals.

Figure 2.1. The Competitiveness Outlook 2021 overall assessment approach

The indicators in the Competitiveness Outlook’s 2018 edition were taken as a basis for this publication and further refined in order to increase the focus on critical areas and to integrate additional OECD tools and instruments (Box 2.1). The set of indicators used for each of the 16 policy dimensions can be found in the “assessment framework” included at the beginning of each chapter.

### Box 2.1. Refinements to the Competitiveness Outlook 2021

The Competitiveness Outlook 2021 has introduced new features that build on the assessment framework used during the 2018 edition to strengthen the analysis and increase its salience and impact. These include:

- refined assessment materials to increase the focus on certain critical areas identified by updated OECD methodologies and best practice
- collaborative, cloud-based assessment materials to encourage stronger participation across governments
- more extensive collaboration with OECD directorates and bodies, including an increased application of OECD instruments to Western Balkan economies and more detailed questionnaires to capture more nuanced qualitative information
- six economy-specific profiles containing:
  - an overview of the economy’s key economic features and structural challenges
  - an overview of the economy’s progress towards achieving the UN Sustainable Development Goals
  - a comprehensive, economy-level analysis and targeted policy advice for each of the 16 policy dimensions

### Qualitative indicators

Qualitative indicators assess whether competitiveness-enhancing policy settings, strategies, processes or institutions exist and, if so, the extent to which they have been adopted, implemented, monitored and updated. Each qualitative indicator is assigned a numerical score that reflects the level of policy development and implementation in order to facilitate the comparison of performance among the Western Balkan economies (Figure 2.2).

**Figure 2.2. Qualitative indicators: what does the scoring mean?**

Table 2.2 illustrates how the general structure of the scoring scale used to measure qualitative information has been translated into level descriptors, using the environment policy dimension's climate change mitigation and adaptation indicator as an example.

**Table 2.2. Climate change mitigation and adaptation scoring levels**

Level	Level descriptor
Level 5	Impact assessments on climate change mitigation and adaptation policy, legal and institutional outcomes are regularly conducted with clear accountability mechanisms for government bodies in place.
Level 4	Advanced implementation of approved climate change adaptation and mitigation policy framework, with the policy framework aligned with related policy areas including waste management and sectoral policies such as trade, innovation, industry and agriculture. The implementation is regularly monitored and adjusted if needed.
Level 3	Evidence of policy implementation as measured by programme outputs and inputs of the approved climate change adaptation and mitigation policy. Government bodies' human and financial resources are adequate for executing relevant responsibilities.
Level 2	A policy framework addressing climate change adaptation and mitigation is in place and has clear strategic vision linked with national economic and social objectives, clear and measurable objectives, defined actions and measures.
Level 1	A policy framework addressing climate change mitigation and adaptation is under development – government activity in framework drafting, conducting stakeholder consultations, and/or progressing through the adoption process.
Level 0	A policy framework addressing climate change adaptation and mitigation does not exist or is obsolete.

Policy dimension and sub-dimension average scores are generated by calculating a simple average across the relevant qualitative indicator scores. Indicators are not weighted because the relative importance of each indicator may be different to different stakeholders. Average scores should therefore be interpreted with caution and taken only as a rough estimate of overall policy development.

Unlike the other 15 policy dimensions assessed in this edition, where indicators are allocated a score from one to five, the assessment of the four qualitative policy areas and one quantitative policy area in the Competition policy dimension is based on yes/no (coded as 1/0) answers to 71 questions in a questionnaire (listed in the Annex to the Competition policy chapter). Where a response to a question is yes (coded as 1), this is referred to as an adopted criterion. Each of the five policy areas has a different number of possible

criteria that can be stated as having been adopted. For more information, please see the Competition policy chapter.

### **Quantitative indicators**

The quantitative indicators are input and output factors pertinent to the assessment of policies, policy making, institutional conditions and policy results – e.g. public or private spending in the policy field in question; the share of actors engaging in a certain activity; or the volume of a certain output resulting from a policy or economic activity. They complement qualitative indicators by supplying quantifiable information on the performance of policy settings, processes and institutions.

The Assessment framework part in each of the 16 policy dimension chapters provides an overview of the qualitative and quantitative indicators used to assess this policy dimension.

## **The assessment process**

The Competitiveness Outlook 2021's assessment process consisted of four main phases, conducted between October 2019 and June 2021: 1) the design phase; 2) the evaluation phase; 3) the consolidation phase; and 4) the review and publication phase:

### **1. Design phase (October 2019 – March 2020)**

In this phase, the OECD developed the qualitative and quantitative questionnaires to assess each of the 16 policy dimensions. This process constituted extensive research to ensure that the latest international and OECD good practice were incorporated into the assessment frameworks for each policy dimension. For each qualitative indicator assessed, the OECD compiles a table, which lists the necessary elements that need to be met to attain a certain score level. Respondents have to complete a set of yes/no, multiple-choice and open-ended questions. The answers to these questions and the listed criteria for each score level enable the respondents to self-evaluate the score for this indicator. For every answer, the OECD asks respondents to provide supporting evidence (e.g. adopted strategies, legislation, monitoring reports, etc.), which is subsequently verified and the score level either confirmed or revised. The quantitative questionnaires are tailored to each economy depending on the extent to which statistical data are already available to the OECD. Only quantitative indicators for which data are not available publicly are included in the quantitative questionnaire. The qualitative and quantitative questionnaires had to be digitalised and complemented with additional guidance documents following the impact of the COVID-19 pandemic (Box 2.2).

### **2. Evaluation phase (April – November 2020)**

This phase consisted of the government self-assessment. It was led by a designated Government Co-ordinator (see Acknowledgements for a list of names), and co-ordinated with the help of policy dimension and statistical office contact points in each economy. Since the qualitative and quantitative questionnaires for each policy dimension always cover several sub-dimensions (Figure 2.1), their completion called for an inclusive approach which led to extensive collaboration among different ministries, public agencies and statistical offices in each WB6 economy, often underpinned by dedicated working groups. Completing the OECD questionnaires thus enabled WB6 policy makers of different institutions working in the same policy field to reflect together on the most pressing challenges, priorities and most suitable way forward for their policy field. This phase also enabled WB6 policy makers to reflect on the roles of their respective services in the policy dimension in question, forge closer ties across different institutions, and to improve future inter-ministerial collaboration for holistic policy making beyond this assessment. Remaining information and data gaps were filled through virtual fact-finding meetings with relevant government stakeholders as well as local non-government stakeholders.

### 3. Consolidation phase (December 2020 – March 2021)

The results of the government self-assessments were consolidated into draft economy profiles and draft regional policy chapters whose key findings and initial policy recommendations were presented at seven stakeholder meetings (one for each WB6 economy and one regional meeting). While these meetings were held in the six Western Balkan capitals in previous assessment cycles, COVID-19 restrictions meant that the roundtables had to be held virtually. The meetings brought together Western Balkan government officials as well as international donor representatives and ambassadors from a number of interested EU and OECD countries. The consolidated assessment and first policy recommendations for each policy area were discussed with the meeting participants and formed the basis for completing the draft economy profiles and regional chapters of the Competitiveness Outlook 2021 publication.

### 4. Review and publication phase (January – June 2021)

The 6 draft economy profiles and 16 regional chapters were shared with Western Balkan government officials and experts across the OECD, the European Commission, and regional expert organisations for comprehensive review. Their helpful feedback and comments helped to maximise the accuracy of the publication's analysis as well as its salience for local policy makers. Subsequently, the OECD prepared the report for publication. The publication was released at the Berlin Process Summit on 5 July 2021.

#### Box 2.2. The impact of COVID-19 on the project

The COVID-19 pandemic triggered lockdowns around the world, requiring a novel approach to this assessment cycle of the Competitiveness Outlook. In light of these extraordinary developments, the OECD team adopted the following measures:

- All assessment materials (qualitative and quantitative questionnaires) were transformed into digital formats designed to be accessible and easy to use for all who contributed to the assessment. This approach made it possible for multiple persons to remotely access and work on the assessment materials simultaneously, which was an essential feature during the multiple lockdowns and confinements implemented across the Western Balkans.
- Since the assessment materials could not be explained to WB6 policy makers during dedicated assessment launch meetings, the OECD team prepared extensive explanatory documents for the completion of each policy dimension's assessment materials, including dimension-specific tutorials explaining the assessment framework and the specific elements that merit further clarification, as well as two guidance notes with step-by-step explanations for the completion of the qualitative and quantitative questionnaires.
- In lieu of the planned assessment launch events in each WB6 economy, the OECD team organised individual dimension-specific virtual launch meetings, requiring 77 virtual kick-off meetings to be organised with government dimension co-ordinators, statistical office representatives and their teams.
- In order to retain the vital policy dialogue that underpins each phase of the assessment cycle, the preliminary key findings of each economy profile and the regional policy chapter were presented virtually during 7 virtual stakeholder meetings attended by a total of about 750 stakeholders. This enabled policy makers in the Western Balkans to further contribute to the OECD's findings and incorporate policy developments that occurred after the initial data collection phase was finalised.

Despite these measures, the challenges created by the COVID-19 pandemic caused some delays in the input collection process. A number of dimension co-ordinators of the Competitiveness Outlook 2021 became ill with COVID-19 and needed to be temporarily replaced, necessitating multiple additional kick-off meetings and calls with individuals newly included in the assessment process. Moreover, mandatory lockdowns and teleworking in the Western Balkans negatively affected the co-ordination across various administrative units, which also slowed down the government self-assessment data-collection process.

### The participatory nature of the Competitiveness Outlook 2021 assessment process

The Competitiveness Outlook's methodology is complemented by a participatory assessment process which has been designed to foster peer learning, to create consensus on reform priorities and to facilitate stakeholder co-ordination. The participatory basis of the publication is reflected in the high number and diversity of stakeholders included in the assessment and the Competitiveness Outlook meetings and roundtables (Table 2.3).

**Table 2.3. Competitiveness Outlook assessment: stakeholders and meetings**

<b>Involved stakeholders:</b>	8 Western Balkan Government Co-ordinators 128 Western Balkan Policy Dimension Contact Points 95 Western Balkan Statistical Office Contact Points More than 550 Western Balkan Government Officials 6 local expert consultant agencies Representatives from the private sector, academia, civil society and international donor organisations
<b>Meetings and roundtables:</b>	77 assessment kick-off meetings 27 fact-finding meetings 6 economy-specific stakeholder meetings 1 regional stakeholder meeting

The involvement of these stakeholders strengthened the analysis in terms of data collection. In turn, the stakeholders engaged in gainful exchanges among themselves and with the OECD on concrete policy issues. This participatory approach is a particular strength of the Competitiveness Outlook, enabling the assessment process to:

- catalyse positive organisational change through government self-assessment and roundtables which ask stakeholders to judge the success of current policies and resource allocations, while identifying possible directions for improvement
- strengthen inter-ministerial consultation by asking Western Balkan government officials across various ministries and agencies to exchange and co-ordinate with one another as they assess the policy dimensions, as well as by bringing them together during economy-specific stakeholder meetings to reflect on the roles of their respective services in the policy dimension in question
- encourage Western Balkan statistics offices and government bodies to produce new or more frequent statistics through the process's demand for key indicators for assessing competitiveness
- support regional integration and a regional perspective on policy issues by virtue of the regional virtual stakeholder meeting.

## The strengths and limitations of the Competitiveness Outlook 2021

The Competitiveness Outlook 2021 possesses a number of strengths which make it a uniquely valuable tool for Western Balkan policy makers, citizens, researchers, as well as investors and international donor organisations. Table 2.4 lists the Competitiveness Outlook's main strengths, as well as its limitations.

**Table 2.4. Strengths and limitations of the Competitiveness Outlook 2021**

Strengths	Limitations
Six economy profiles provide accurate and salient analysis and recommendations tailored to the specific context and needs of each economy	While the Competitiveness Outlook 2021 focuses on areas crucial for strengthening competitiveness in the Western Balkans, it does not cover all areas of competitiveness exhaustively
Independent and rigorous assessment enables performance to be benchmarked against peer economies and OECD good practice	Statistical coverage of many issues is limited in the region and the economy-specific context of the quantitative data cannot always be acknowledged
The government self-evaluation acts as a change management tool and creates a process that enhances the quality of pro-competitiveness policy development	As the same set of indicators is applied to all economies in the region, certain economy-specific characteristics may not be fully reflected in the scoring
Good practice examples and policy recommendations offer guidance to policy makers in designing or redefining a sustainable economic reform agenda to foster competitiveness	The benchmarking potential of certain policy areas is limited as some qualitative indicator score levels were refined for the 2021 edition of the Competitiveness Outlook
The analysis draws on both original data collected by the OECD and existing data collected by other organisations	
The participatory assessment process enables stakeholder dialogue on policy, joint learning, and agreement on identified strengths and shortcomings to help build consensus for future reform	
Scoring levels by policy dimension helps public officials communicate more effectively on policy progress and areas where future reform is necessary	
Economy-specific contexts and other wide-ranging factors that affect competitiveness and policy development underpin the analysis and supplement the scores

## **Overview of key findings**

---

This chapter provides an overview of the key findings of the Competitiveness Outlook 2021 for each of the 16 policy dimensions covered in the assessment, as well as the complete scores for each dimension, sub-dimension and qualitative indicator. Full details of the methodology and the background to this assessment are contained in the Assessment methodology and process chapter.

---

## Key findings by dimension

### **Dimension 1: Investment policy and promotion**

Overall, the markets in all WB6 economies are open to FDI, and exceptions to national treatments are limited. All the economies have established regulatory environments for investment and foreign investors have the same rights and remedies before their court systems as domestic investors. However, commercial disputes are costly and lengthy in WB6 most economies, and public awareness, familiarity and use of dispute resolution tools remain low in general. All six economies have established investment promotion agency (IPA) structures and strategies to promote and facilitate investment efficiently. Most IPAs are autonomous public agencies similar to those in OECD countries. The IPA boards in the region have varying compositions, and their roles range from supervisory to advisory. However, all mandates include the promotion and facilitation of inward FDI. In addition, export and innovation promotion are the most recent additions to the investment promotion mandate of the region's agencies. However, financial constraints are an important common challenge for the region's IPAs. All WB6 economies are generally in the early development stages of green investment policy and promotion initiatives. Every economy has shown commitment to establishing and revising environmentally conscious legislation and long-term strategies for the environment. Yet only half of the economies have a clear strategy or programme for attracting and incentivising green investment, or clearly outlining green growth priorities.

Note: Please see the Assessment methodology and process chapter for more information about the score levels in general and the Investment policy and promotion chapter for more information about the scoring in this particular policy dimension.

## Dimension 2: Trade policy

Policy frameworks for trade have been strengthened in all WB6 economies. Inter-institutional co-ordination is also strong in most economies, and there are formal instruments for consultation with the private sector. However, implementation and evaluation vary across economies. The WB6 economies are well integrated commercially with their main trading partners – i.e. the EU and each other – within the Central European Free Trade Agreement (CEFTA). However, integration with other economies is still rather limited. While the WB6 continue to develop their networks of bilateral and multilateral trade agreements, they do so at varying rates, and treaties with non-EU states are still relatively rare. Global integration is still an issue, with Bosnia and Herzegovina and Serbia's accession process to the World Trade Organization (WTO) still ongoing. This may limit the benefits of favourable regulatory regimes for FDI. Notable improvements have been made in the sphere of trade in services through the adoption of Additional Protocol 6 to CEFTA in December 2019. This has given impetus in the region to reform the regulatory regimes for services. Nevertheless, the extent of liberalisation depends on the economy and the sector under analysis. A number of regulatory restrictions remain, limiting the attractiveness of certain sectors to foreign providers even though the region is relatively open to trade. In e-commerce, all economies have taken steps to strengthen their legal frameworks. They have continued to align their sectoral laws with the EU E-Commerce Directive and have made efforts to remove non-tariff barriers to e-commerce. The emergence of the global pandemic and the growing importance of digital trade have driven government responses in this area. However, with regulatory frameworks evolving heterogeneously across the WB6, the economies respond differently to the challenges of global e-commerce.

N.a. = indicator has a different scoring system so results are presented in the text, not in the table.

### Dimension 3: Access to finance

The legal and regulatory frameworks for the banking industries are generally well developed in all WB6 economies, being aligned with Basel II and III requirements. The private sector relies heavily on bank financing in the region. However, collateral requirements remain high, hindering small and growing businesses from accessing credit and securing loans. The six economies have all improved their alternative financing sources, although in practice the use of alternative financing tools is limited in the region. The most progress has been made on regulations for factoring and leasing policies: all WB6 economies have legal frameworks to regulate factoring options and leasing services benefit from dedicated legislation. Private equity and venture capital are generally in the early stages of development in the region, as is crowdfunding. With the exception of Montenegro, none of the WB6 economies have dedicated laws for crowdfunding. Business angel networks are increasingly being used despite the lack of legal frameworks for defining and regulating them. When it comes to the mobilisation of long-term financing, each WB6 economy has adopted a dedicated legal framework for public-private partnerships (PPP) that enables private participation in infrastructure projects. They also have a specialised government entity that facilitates PPP programmes. According to an external assessment, the region performs best on procurement of PPPs, though there is room for improvement in the preparatory activities that take place prior to launching the procurement process for a PPP project. Access to equity capital through the stock market is limited. The low level of activity and liquidity in the stock market is a barrier for companies using it to raise new capital.

**Table 3.3. Scores and indicators for access to finance**

Note: Please see the Assessment methodology and process chapter for more information about the score levels in general and the Access to finance chapter for more information about the scoring in this particular policy dimension.

### Dimension 4: Tax policy

In general, the WB6 economies have made significant efforts to strengthen their tax administrations. They all have a unified tax administration body (except for Bosnia and Herzegovina due to its specific institutional setup), reflecting OECD best practice. All the tax administrations mix a taxpayer with a functional approach. This means that their internal organisation mostly reflects the various tax administration functions (audit, tax collection, taxpayer services, etc.), but there are also divisions targeted at specific taxpayer groups, such as large taxpayers or small and medium-sized enterprises (SMEs). The WB6 economies rely significantly on revenues from social security contributions (SSC) and taxes on goods and services to fund their health system and public spending programmes. Consequently, other taxes play a smaller role. Revenues from personal income tax (PIT) are low in the region, partly explained by low PIT rates and high basic allowances. The WB6 economies could consider rebalancing revenue from SSCs to PIT, perhaps with those economies with flat rates introducing a progressive PIT rate schedule. The region's involvement with international tax initiatives and alignment with international tax trends are increasing. Notably, since the last assessment all the economies with the exception of Kosovo, have joined the Inclusive Framework on base erosion and profit shifting (BEPS), and have also implemented the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS. In addition, the WB6 economies all carry out some form of regional co-operation and co-ordination. However, the region would benefit from greater regional tax co-ordination and tax co-operation to tackle tax avoidance and evasion coherently.

### Dimension 5: Competition policy<sup>1</sup>

Overall, the WB6 economies' legal and institutional competition frameworks are largely aligned with best international practice, including EU competition rules. Although the WB6 competition authorities are committed to enforcing competition rules and advocating against competitive restrictions in laws and regulations, they are limited by a lack of financial and professional resources. In general, implementation of competition decisions is still insufficient, especially for cartels. Above all, sanctions for infringers are not high enough to deter firms from engaging in anti-competitive conduct. Moreover, the fight against cartels

requires the WB6 competition authorities to make full use of their investigative powers, yet some of the WB6 competition authorities have not yet carried out inspections, and others have only started very recently. All WB6 competition authorities have engaged in competition advocacy, which is a necessary element of competition enforcement to avoid legal constraints and promote a culture of competition.

### **Dimension 6: State-owned enterprises**

Most of the WB6 economies lack ownership policies outlining why the state owns companies and what it expects them to achieve. As a result, performance objectives are ad hoc and there is limited accountability among state actors for SOEs' performance. Small steps have been taken to improve SOE board appointments in some of the WB6 economies, for instance by introducing basic qualifications criteria or requirements for independent directors on boards. Although SOEs are mostly subject to sound basic requirements for financial reporting, compliance with these financial requirements is not consistent. There is also significant scope to strengthen disclosure by the state as shareholder, notably through aggregate reports analysing the performance of all SOEs. The legal and regulatory treatment of SOEs is broadly aligned with that of private companies across the WB6 region. However, the existence of the separate legal form of "public enterprise" for some SOEs in several economies may unwittingly distort the playing field with private companies. Many SOEs do not earn economically significant rates of return – this inefficient allocation of resources should be addressed through structural reforms of individual enterprises.

**Table 3.5. Scores and indicators for state-owned enterprises**

<b>6.4. Reforming and privatising state-owned enterprises</b>	<b>n.a.</b>						

Note: Please see the Assessment methodology and process chapter for more information about the score levels in general and the State-owned enterprises chapter for more information about the scoring in this particular policy dimension. N.a. = indicator has a different scoring system so results are presented in the text, not in the table.

### Dimension 7: Education policy

Secondary school students in the WB6 economies performed below their peers in CEEC-11<sup>2</sup> and OECD countries on the 2018 Programme for International Student Assessment (PISA). Around half of the WB6 students who participated in PISA did not achieve baseline proficiency in reading, mathematics or science, compared to one-fifth of students in OECD countries. The WB6 economies have made progress in the design and implementation of education policies, which aim to improve the quality, equity and inclusiveness of their education systems. Most of the WB6 economies have also adopted new strategies to improve the quality of their pre-university education, although they vary in their comprehensiveness, implementation progress and monitoring. Furthermore, all the WB6 economies have developed or are developing competency-based curricula and learning standards. The WB6 economies have also achieved a significant reduction in the level of early school leavers and made progress in increasing the coverage of early childhood education. However, enrolment rates in pre-primary education are still below the EU and OECD average. Teachers' participation in professional development activities is also below the OECD and EU averages. While the WB6 economies have made progress in strengthening the governance of vocational education and training (VET), gaps in core literacy and numeracy skills between VET and general students remain high, according to the 2018 PISA assessment. The low employment rates of recent graduates are a challenge, indicating that there is significant room to improve the labour market relevance of higher education. Data collection remains a cross-cutting challenge across various sectors, particularly in VET and tertiary education. While most WB6 economies have developed education information management systems (EMIS), they do not systematically exploit and analyse the data collected or comprehensively report on overall progress to inform policy.

**Table 3.6. Scores and indicators for education policy**

	ALB	BIH	KOS	MKD	MNE	SRB	WB6

## Dimension 8: Employment policy

The WB6 economies have made some progress on their employment regulatory frameworks and policies, improving the functioning and flexibility of their labour markets. Some economies have improved the regulatory framework for non-standard forms of work and occupational health and safety. However, implementation of the regulatory framework remains a challenge. Labour inspectorates continue to lack capacity and tackling informal employment poses a key challenge. Although the role of tripartism in regulating employment issues is stronger, workplace representation and collective bargaining remain weak. Most economies have made significant progress in analysing skills mismatches and have started to set up strategies to reduce them. Although improvements have been made to help young people gain work experience, the education system is largely failing to produce the skills employers need. Moreover, school-to-work transition mechanisms are not very effective, participation in upskilling and skills adaptation activities among both the employed and unemployed is low, and emigration exacerbates skills shortages and skills gaps. Participation in adult learning is only about one-quarter of the EU average; relevant initiatives consist mainly of systems to recognise and validate prior learning and some small-scale measures for the low-skilled and unemployed. Most economies have been successful in their efforts to increase female employment rates; however, they remain 20 percentage points below OECD and EU averages. The WB6 economies have improved the capacities of their public employment services by introducing tools to better profile the unemployed and creating individual job seekers' action plans. Active labour market programmes have become better targeted, although vulnerable groups and minority groups continue to be less well covered. Unemployment benefits and means-tested minimum income schemes are not very generous and job-search requirements are not sufficiently implemented.

### **Dimension 9: Science, technology and innovation**

Most WB6 economies have a comprehensive strategic framework for science, technology and innovation (STI) in place, or are in the process of reviewing an existing one. However, effective implementation is sometimes hindered by limited co-ordination, as well as a lack of policy prioritisation and impact evaluation. Some economies have or are establishing an innovation fund – a key vehicle for implementing STI policy. However, overall expenditure on research and development remains low, and well below the EU level. Public research remains systemically underfunded, while the allocation of funding does not always encourage optimal research outputs. Human capital for research and innovation is below potential, due to limited development opportunities, lack of funding and few incentives to commercialise research. However, some economies are increasingly supporting young researchers and promoting linkages with their diaspora to address falling numbers of researchers and brain drain. All economies are connected to European and international research networks and international research collaboration is growing, but its results vary across economies. There are few linkages between academic research and industry, and no strategic policy to promote them. While all economies have experimented with financial incentives for business-academia collaboration, non-financial incentives remain almost non-existent. The institutional support for such collaboration has expanded, but often lacks a systemic approach, and efforts collide with broader policy measures to create an innovation ecosystem focusing on start-ups.

## Dimension 10: Digital society

Most of the WB6 economies are increasing efforts to expand broadband access by preparing economy-wide broadband plans and securing significant donor financing to develop rural broadband infrastructure. All economies are transforming their public administrations into user-centric public services using digital technologies, although the pace varies, and are making progress on the accessibility and transparency of public sector data. However, low digital literacy in many Western Balkan economies increases the risk of widening the digital divide as public services move online. All economies recognise digital skills as a key competency in their education policies and have incorporated information technology (IT) subjects in education and training systems, but more efforts and increased co-operation with the IT industry are needed to close the digital skills gap. Shortcomings in schools' information and communication (ICT) equipment, distance-learning platforms, and IT training for teachers are key obstacles to digital skill development. Most economies offer insufficient support for business digitalisation and ICT sector growth, and although legal frameworks for e-commerce and e-business have improved in some economies, implementation of effective support and promotion programmes is lacking. While legal frameworks for privacy and data protection are in place, their enforcement is weak as the competent authorities lack the required resources and executive power. Measures for consumer protection in e-commerce are now included in legislation in all WB6 economies, but they could be more developed and opportunities for consumer education are limited. All economies are also gradually aligning with the EU cybersecurity framework and most have a cybersecurity strategy in place, but insufficient budgetary allocations continue to slow down progress.

### Dimension 11: Transport policy

Most of the WB6 economies have long-term transport strategies to guide the development of their transport sectors and align them further with EU *acquis* and the Transport Community Treaty (TCT). However, most of these strategies lack proper monitoring and implementation plans. The Ministerial Council of the Transport Community Permanent Secretariat (TCPS) endorsed regional action plans for roads, railways, road safety and transport facilitation in October 2020. While reforms in the railway sector have advanced, railway markets in the WB6 economies are not yet fully open, and further efforts are needed to align regulations with the EU *acquis* and TCT. In July 2019, Serbia and North Macedonia opened a one-stop-shop at their road border crossing point on Corridor X. This form of transport facilitation should help to reduce queueing times and promote regional traffic flows. Another significant achievement is the improvement to road safety, with the WB6 economies seeing a more significant fall in road fatalities in the period 2017-19 than the CEEC-11, EU and OECD countries. Most of the WB6 economies would benefit from improving their systems for project identification, prioritisation and selection, to make the allocation of funds and investment in transport infrastructure projects more efficient. Systems for managing transport assets are still in the early stages in most WB6 economies, and mainly in the road sector. The integration of environmental sustainability objectives into transport policies is another area for improvement. Most WB6 economies include these goals in a range of documents, and therefore lack a holistic approach to sustainable transport. Combined transport is also underdeveloped in the region; however, there have been positive developments such as the participation of most WB6 economies in the Integrating Multimodal Connections in the Adriatic-Ionian Region project and ongoing efforts to deploy combined transport infrastructure in North Macedonia and Serbia.

**Table 3.10. Scores and indicators for transport policy**

## Dimension 12: Energy policy

The WB6 economies all have advanced legislative and policy frameworks that transpose significant parts of the EU's Third Energy Package. However, implementation can be improved and key policy documents need to be updated. The latter issue is being tackled for the most part as all WB6 economies are drafting their new National Energy and Climate Plans. There has been progress in deploying EU-style organised markets, with Albania, Kosovo and Montenegro recently establishing power exchanges. However, unbundling of natural monopolies and ensuring third-party access to infrastructure have yet to be finalised in some WB6 economies. These elements are key to the competitiveness of energy markets. The development of energy efficiency measures and non-hydro renewables is still in the early stages across the WB6 region. The economies use outdated subsidy schemes for renewable energy, and energy efficiency suffers from a lack of technical capacity in relevant public bodies and an overall scarcity of funding. The WB6 regional electricity generation mix is still overwhelmingly coal-reliant. The continued subsidisation of coal and other fossil fuels distorts the market and runs counter to the WB6 economies' commitments to reducing greenhouse gas emissions.

**Table 3.11. Scores and indicators for energy policy**

	ALB	BIH	KOS	MKD	MNE	SRB	WB6
<b>12. Energy policy dimension average</b>	<b>3.2</b>	<b>2.1</b>	<b>3.0</b>	<b>3.7</b>	<b>3.0</b>	<b>3.0</b>	<b>3.0</b>

Note: Please see the Assessment methodology and process chapter for more information about the score levels in general and the Energy policy chapter for more information about the scoring in this particular policy dimension.

### Dimension 13: Environment policy

Legal and policy frameworks for the environment and climate change are gradually being introduced and major climate-related risks are being identified across the WB6. Nevertheless, common challenges remain. Air pollution is one of the main environmental challenges, with levels of fine particulate matter (PM<sub>2.5</sub>) two to three times above the maximum limits recommended by the World Health Organization. Moreover, recycling rates of municipal waste remain extremely low across the region – significantly lower than in the EU. Some actions have been taken on waste management and to develop a circular economy, but specific policy frameworks are largely lacking. Industrial waste management frameworks have not advanced and the policy and legislative bases for soil protection are almost non-existent. Unregulated burning and illegal dumping of waste is still prevalent in the region, posing problems to the environment and public health through groundwater, soil and air pollution. The groundwork for the freshwater management legislative framework has been done in most assessed economies, though little has been done to improve international co-ordination of transboundary river basis. Water supply and sanitation systems also remain inadequate. Although investments are ongoing, water service fees are too low to cover or complement the infrastructure investment costs and water supply services. Moreover, insufficient institutional capacities and poor co-ordination among the responsible local authorities impede implementation of water management measures. Finally, all WB6 economies have adopted policy frameworks for biodiversity conservation, and most have plans for endangered species and protected areas. Nevertheless, biodiversity and forestry monitoring systems and public inventories are rarely in place, which impedes proper implementation.

**Table 3.12. Scores and indicators for environment policy**

Note: Please see the Assessment methodology and process chapter for more information about the score levels in general and the Environment policy chapter for more information about the scoring in this particular policy dimension.

### Dimension 14: Agriculture policy

All WB6 economies have undertaken significant investment in agriculture. Implementation of the Instrument for Pre-Accession Assistance for Rural Development (IPARD) programme continues to improve among the accredited economies (Albania, Montenegro, North Macedonia and Serbia), and IPARD disbursing authorities are increasing their administrative capacity. However, harmonisation of the criteria for IPARD funding and national budget subsidies remain an issue. The WB6 economies continue to invest in rural infrastructure. In particular, they support projects related to sewage systems, electricity and gas supply and broadband internet, which are among the essential preconditions for competitive agriculture. Investment in other key areas, such as irrigation systems, is increasing, but their efficiency, sustainability and monitoring (such as of erosion, drainage and soil moisture) are still inadequate. Despite those improvements, some aspects of agriculture are still under-funded. For example, investment in agricultural research projects remains low and agricultural extension services are uneven in scope and quality. Similarly, education and training have been neglected throughout the last decade in the WB6; as a result, the number of students in agriculture continues to decline. Economy-wide agricultural strategies are being implemented, but they often do not address agricultural education or, if they do, the measures are not realised. The sector's performance is also hampered by other weaknesses, such as generally poor cross-sectoral co-operation between agriculture and other relevant public institutions (such as environment and education), which not only limits the sector's productivity but also slows down reforms. And while all six economies have made efforts to improve and create an evidence-based policy system, monitoring and evaluation capacity is still limited.

Note: Please see the Assessment methodology and process chapter for more information about the score levels in general and the Agriculture policy chapter for more information about the scoring in this particular policy dimension.

### Dimension 15: Tourism policy

All the WB6 economies have recognised tourism as an opportunity for economic development. Most economies have developed tourism strategies and have committed to developing an efficient governance structure involving inter-ministerial co-ordination, vertical co-operation, and dialogue with private and other tourism stakeholders. Albania and Montenegro, where tourism is a much more important sector, have the most developed frameworks overall. Progress has been achieved in all economies on collecting tourism data and registering accommodation facilities. Although some progress has been achieved in some economies on developing a tourism VET framework, a qualified workforce is still lacking throughout the region, mainly due to the poor skills supply framework and lack of higher education courses in tourism. Moreover, tourism innovation, marketing and branding, as well as comprehensive natural and cultural heritage enhancement frameworks, are largely lacking in the WB6. Overall, the absence of a common regional tourism brand lessens the visibility of the Western Balkans as an attractive tourist destination offering a diversity of unique tourist experiences.

### **Dimension 16: Anti-corruption policy**

All WB6 economies have anti-corruption strategies and/or plans and mechanisms for monitoring their implementation. However, their analytical frameworks vary. Several of the economies have replaced outdated strategies but not yet adopted them. While the authorities involve civil society in preparing anti-corruption strategies and plans, some NGOs are concerned about the lack of response to their proposals. Most WB6 economies have multi-functional corruption prevention bodies, whose independence is mostly safeguarded and who observe due public accountability. However, some struggle to implement their mandate due to limited resources. Most of the WB6 economies fund awareness-raising and education activities from their national budgets, which is positive a sign that this area is prioritised. None of the WB6 economies have yet achieved a sound and sustainable independent judiciary, however. Several of the economies have implemented reforms, including setting up judiciary councils, introducing competitive procedures for the selection and promotion for judicial positions, and strengthening disciplinary liability mechanisms. Most WB6 economies have recent laws for the registration and provision of public access to data on beneficial owners of legal entities. All WB6 economies envisage the liability of legal persons for all criminal offences. Most WB6 economies have also had at least some convictions in prominent corruption cases.

**Table 3.15. Scores and indicators for anti-corruption policy**

	ALB	BIH	KOS	MKD	MNE	SRB	WB6
<b>16. Anti-corruption policy dimension average</b>	<b>2.1</b>	<b>2.0</b>	<b>1.8</b>	<b>2.9</b>	<b>3.6</b>	<b>2.9</b>	<b>2.5</b>

Note: Please see the Assessment methodology and process chapter for more information about the score levels in general and the Anti-corruption policy chapter for more information about the scoring in this particular policy dimension. N.a. = indicator has a different scoring system so results are presented in the text, not in the table.

## Notes

<sup>1</sup> This dimension is scored using a different methodology to the other dimensions. You can find more details on the competition scoring methodology in the Competition policy chapter.

<sup>2</sup> The 11 Central and Eastern European countries (CEECs) who have joined the European Union: Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

# Part I Assessment findings by policy dimension

# 4 Investment policy and promotion (Dimension 1)

---

Providing investors with a sound regulatory environment, clear non-discriminatory policies, strong implementing institutions and more opportunities for public procurement projects can have a beneficial impact on the volume and quality of foreign investment, in turn creating more employment opportunities, boosting growth, and encouraging technology transfers. This chapter, divided into three sub-dimensions, analyses the extent to which Western Balkan governments have established favourable investment climates that support steady economic growth and sustainable development. The first sub-dimension, the investment policy framework, assesses the breadth and depth of investment policies, notably the regulatory environment of host economies and the protection that it provides to investors – including intellectual property protection – as well as its consistent treatment of both domestic and foreign investors. The second sub-dimension, investment promotion and facilitation, examines the strategies, services, and institutions in place to promote and facilitate investment before, during and after establishment. The third, new, sub-dimension, investment for green growth, reviews strategies to promote investment in renewable energy and energy efficiency projects, and their facilitation through public and private partnerships.

---

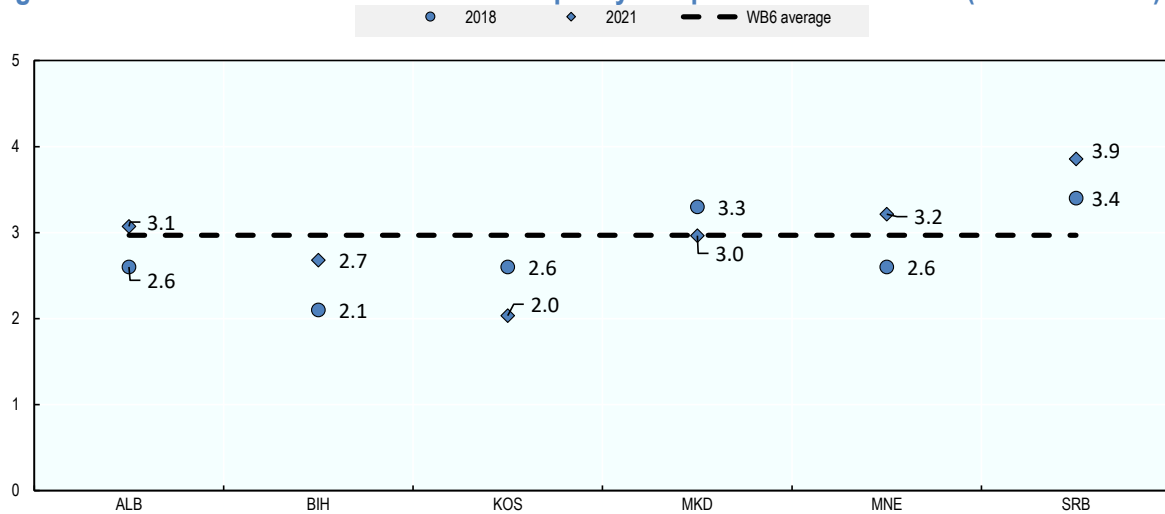

## Key findings

- **The markets in all WB6 economies are open to FDI and regulatory environments for investment are sound.** While there are few sectors closed to foreign investors, most frameworks remain complex and problematic for investors to navigate due to overlapping laws and institutional mandates.
- **Foreign investors in all WB6 economies have the same rights and remedies before national court systems as domestic investors.** All the economies, except Albania, Kosovo and North Macedonia, have dedicated commercial courts that have first instance jurisdiction over commercial matters. However, commercial disputes are costly and lengthy in most economies and enforcing contracts is problematic, except in Montenegro and North Macedonia.
- **Alternative dispute mechanisms are offered in all economies and some have updated their mediation legislation.** However, public awareness, familiarity with and use of dispute resolution tools remain low in all economies except Montenegro.
- **All economies have sound intellectual property (IP) rights laws and regulations.** Albania, Montenegro, North Macedonia and Serbia have made progress in reinforcing the capacities and resources of their authorities in charge of IP rights. However, the relevant authorities in Bosnia and Herzegovina and Kosovo continue to lack resources and inter-institutional co-operation.
- **Each of the six economies has a well-established investment promotion agency (IPA), a clearly defined institutional framework and a strategy in place for investment promotion and facilitation,** though Bosnia and Herzegovina lack the latter two elements. However, the resources and capacities of all IPAs, with the exception of Albania and Serbia, remain insufficient, making it challenging to fulfil their mandates efficiently.
- **Albania, Montenegro, North Macedonia and Serbia have put in place complex and multi-layered investment incentive schemes.** Those in Bosnia and Herzegovina are implemented at the entity level with little state oversight. The mandates of all IPAs include aftercare services with dedicated aftercare units or strategies, including Montenegro's IPA which is currently being established.
- **Almost all economies (except Kosovo) have adopted various policies and mechanisms to encourage green investment and private sector participation in green infrastructure.** Some economies, like Albania and Montenegro, have developed concrete programmes to encourage and facilitate green investment initiatives.

## Comparison with the 2018 assessment

Since the last assessment, almost all economies have increased their scores in both the investment policy and investment promotion and facilitation sub-dimensions. However, the WB6 average remains almost unchanged due to differences in the assessment framework: the scores of the new sub-dimension on green investment lower the average by 0.3 points compared to the scores for the first and second sub-dimensions.

Figure 4.1. Overall scores for the investment policy and promotion dimension (2018 and 2021)

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Table 4.1. Implementation of the CO 2018 policy recommendations: investment policy and promotion

Competitiveness Outlook 2021		
2018 Policy recommendations	Main developments during the assessment period	Regional progress status
<b>Further improve the clarity, transparency, and predictability of the regulatory framework for investment</b>	Most economies have continued to update investment legislation since the last assessment, aiming to improve the predictability of their regulatory framework. However, implementation has been slow to materialise in some economies.	Moderate
<b>Systematically ensure prompt legal procedures and consistent interpretation of the law, especially when it comes to enforcing commercial contracts</b>	While some economies remain without dedicated commercial courts, Albania, Montenegro, North Macedonia and Republika Srpska <sup>1</sup> have all significantly improved the efficiency of their commercial procedures and substantially reduced backlogs.	Limited
<b>Strengthen co-ordination among IP-related institutions and make further efforts to sensitise businesses and the public and provide them with better access to information on IP rights</b>	Several economies have established strategies and guidelines to develop and improve the legislative and institutional framework for IP enforcement and establish inter-institutional co-operation; however, implementation is weak. Most economies still have very limited co-operation and co-ordination of IP-related institutions, with the exception of Albania, Serbia, and Republika Srpska, which have strong frameworks for inter-institutional co-operation.	Limited
<b>Give IPAs adequate resources and capacity to conduct key investment promotion and facilitation functions, such as investor targeting and aftercare.</b>	Some economies, like Kosovo and Serbia, have substantially increased funding for IPAs, while Montenegro has completely overhauled its structure by establishing a new IPA with significantly improved staffing and funding. However, many IPAs in the WB6 still lack the resources and capacity to carry out their mandates effectively, including suitable investment promotion and aftercare services.	Limited
<b>Take steps to enhance the impact of FDI by creating linkages between foreign investors and domestic firms.</b>	The large majority of WB6 economies have made significant progress in establishing and implementing strategies and support programmes to reinforce linkages between local firms and multinational companies through financial support, facilitating contacts between local suppliers and multinational enterprises, training and information exchanges.	Moderate

## Introduction

Foreign direct investment (FDI) is a crucial component for promoting international economic integration. It can provide economies with financial stability, encourage economic development and enhance the well-being of societies. With the right policy framework, FDI can not only help increase economic competitiveness and create jobs, but also bring further benefits, such as technology and skills transfers, increased innovation and exports, and support the transition towards green growth. Non-discriminatory principles, limited barriers to investment, property rights protection and strong mechanisms for settling investment disputes underpin a quality investment environment. Meanwhile, continuous efforts to promote and facilitate investment can enable investors to establish or expand their activities with ease and thus contribute to a hospitable investment environment. While the WB6 economies have seen a surge in FDI over the last decade, the COVID-19 pandemic has limited the region's steady progress towards becoming a strong investment destination. The pandemic has had detrimental consequences for the region, including deep contractions in economic activity, steep increases in unemployment, and severe repercussions for small and medium-sized enterprises (SMEs). Although public investment has increased in some economies due to policy support packages to stimulate the economy, private investment has plummeted, putting an end to the region's upturn. In the months following the pandemic, the six Western Balkan economies will need to turn their attention to policies to mobilise support for existing foreign investors, promote strategic sectors catering to economic and technological development, and leverage investor networks and investment promotion agencies to protect global value chains (OECD, 2020<sup>[1]</sup>).

Creating sound legislation and strategies to promote the attractiveness of the WB6 economies as investment destinations can stimulate the region's overall economic growth and development, encourage further market integration efforts, and support a sustainable and resilient recovery from the COVID-19 crisis. To this end, WB6 governments need to establish a fair, transparent, and predictable regulatory framework for investment. The Competitiveness Outlook's investment policy and promotion dimension assesses the quality and predictability of the WB6 investment climates, including their legal frameworks, judicial systems, investor rights and protection, as well as activities to make them more conducive for strategic and targeted investment projects.

Building a favourable climate for investment requires a whole-of-government approach. Although almost all policy areas analysed in the Competitiveness Outlook play a role in contributing to a hospitable investment landscape for foreign investors, the following dimensions are particularly important to the investment policy and promotion dimension:

- **Chapter 5. Trade** and investment relationships are at the core of globalisation and are vital for facilitating the cross-border transfer of goods, services and capital. Enterprises combine trade with investment to ensure global value chain (GVC) performance and to organise the supply of inputs, expand to new markets, access knowledge, and provide services to consumers.
- **Chapter 6. Access to finance** in the long term is crucial for infrastructure investments; public-private partnerships play an important role in facilitating foreign investment projects where public investment cannot meet the needs of the economy.
- **Chapter 7. Tax policy** is often used as an incentivising tool for investors through which host governments can create a competitive advantage for their economies. However, tax policies must balance the need for foreign investment with collecting appropriate tax revenue from multinational enterprises (MNEs).
- **Chapter 8. Competition policy** can improve the fairness and efficiency of markets, thus contributing to a more attractive environment for investors. It also plays a role in minimising exceptions to national treatment and in ensuring equal treatment between domestic and foreign investors.

- **Chapter 9. State-owned enterprises** and their corporate governance play a large part in investor confidence, as does treatment of private investors in relation to public enterprises, where fair dispute settlement and upheld legal frameworks can encourage investment.
- **Chapter 10. Education policy** helps provide investors with access to a highly qualified workforce and adequate skills and abilities, especially for MNEs operating in science, finance or R&D, as well as for staff training in the production and manufacturing sectors.
- **Chapter 12. Science, technology and innovation** relies on a dependable intellectual property legal framework which can protect individuals and businesses and enable technology transfers for investors interested in innovative SMEs and entrepreneurs.
- **Chapter 15 and 16. Energy and environment policies** play a key role in creating a hospitable environment for green investment. Strong environmentally conscious legislation and strategies to cut carbon emissions and focus on renewable energy and energy efficiency solutions can create profitable green project opportunities for investors.
- **Chapter 19. Anti-corruption policy** plays a key role in investor confidence by ensuring a sound, reliable and fair justice system that investors can depend on when it comes to commercial matters and enforcing contractual rights.

## Assessment framework

### Structure

This chapter assesses policies to improve the investment policy and promotion in the WB6 through the three main sub-dimensions and one cross-cutting sub-dimension:

1. **Sub-dimension 1.1: Investment policy framework.** To what extent have the economies designed and implemented sound legal frameworks for investors; are the economies open to FDI; and how does the legal framework for investment protect investors, including their intellectual property rights regime?
2. **Sub-dimension 1.2: Investment promotion and facilitation.** What is the institutional framework to attract and facilitate inward investment, including strategies and investment promotion activities, measures to facilitate investments and expansions, and the promotion of business linkages?
3. **Sub-dimension 1.3: Investment for green growth.** Are the WB6 developing favourable and specific frameworks that encourage green investment, and are they encouraging private procurement partnerships for green investment projects, including in infrastructure?

Figure 4.2 shows how the sub-dimensions and their constituent indicators make up the investment policy and promotion assessment framework. Each sub-dimension is assessed through quantitative and/or qualitative information which the OECD collected with the support of the WB6 governments and their statistical offices. Qualitative indicators are based on the OECD's Policy Framework for Investment (OECD, 2015<sup>[2]</sup>). They have been scored in ascending order on a scale of 0 to 5. The statutory restrictions assessed for the foreign direct investment indicator are based on the OECD FDI Regulatory Restrictiveness Index (Box 4.1).

### Box 4.1. The OECD FDI Regulatory Restrictiveness Index

The OECD FDI Regulatory Restrictiveness Index seeks to gauge the restrictiveness of an economy's FDI rules. The FDI Index is currently available for more than 60 economies, including all OECD and G20 members, allowing FDI policies to be compared and potential areas for reform identified. It is commonly used on a stand-alone basis to assess the restrictiveness of FDI policies when reviewing candidates for OECD accession and in OECD Investment Policy Reviews, including reviews of new adherent economies to the OECD Declaration on International Investment and Multinational Enterprises. The index does not provide a full measure of an economy's investment climate as it does not score the actual implementation of formal restrictions and does not take into account other aspects of the investment regulatory framework, such as the extent of state ownership, and other institutional and informal restrictions which may also impinge on the FDI climate. Nonetheless, FDI rules are a critical determinant of an economy's attractiveness to foreign investors; and the index, used in combination with other indicators measuring the various aspects of the FDI climate, may help to explain variations among economies in attracting FDI.

The FDI Index covers 22 sectors, including agriculture, mining, electricity, manufacturing, and the main services (transport, construction, distribution, communications, real estate, financial and professional services). For each sector, the scoring is based on the following elements:

- the level of foreign equity ownership permitted
- the screening and approval procedures applied to inward foreign direct investment
- restrictions on key foreign personnel
- other restrictions such as on land ownership, corporate organisation (e.g. branching).

Restrictions are evaluated on a 0 (open) to 1 (closed) scale. The overall restrictiveness index is the average of the 22 individual sectoral scores. The discriminatory nature of measures, i.e. when they only apply to foreign investors, is the central criterion for scoring a measure. State ownership and state monopolies, to the extent they are not discriminatory towards foreigners, are not scored. For OECD and non-OECD member adherents to the OECD Declaration on International Investment and Multinational Enterprises, the measures taken into account by the index are limited to statutory regulatory restrictions on FDI, as reflected in their list of exceptions to national treatment and measures notified for transparency under OECD instruments, without assessing their actual enforcement. For non-OECD economies, information is collected through Investment Policy Reviews or, when not in the review process, through a dedicated questionnaire. Regulatory information is updated on a yearly basis following the monitoring of investment measures carried in the context of OECD Freedom of Investment Forum for participating economies, and on the basis of ad-hoc monitoring for the remaining ones.

Source: (Kalinova, 2010<sup>[3]</sup>), *OECD's FDI Restrictiveness Index: 2010 Update*, [www.oecd.org/daf/inv/investment-policy/WP-2010\\_3.pdf](http://www.oecd.org/daf/inv/investment-policy/WP-2010_3.pdf). For the latest scores, see: [www.oecd.org/investment/index](http://www.oecd.org/investment/index).

The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more details on the methodology underpinning this assessment please refer to the Methodology and assessment process chapter.

The leaders of the WB6 endorsed the Common Regional Market (CRM) 2021-2024 Action Plan (AP) at the Berlin Process Summit held on 10 November 2020 in Sofia. The action plan is made up of targeted actions in four key areas: 1) regional trade; 2) regional investment; 3) regional digital; and 4) regional industrial and innovation (Regional Cooperation Council, 2021<sup>[4]</sup>).

In the regional investment area, the WB6 economies commit to greater regional alignment of investment policies and better co-ordinated investment promotion by removing existing barriers to regional investment, conducting regional investment promotion campaigns, developing regional guidance criteria for screening mechanisms, attracting investment in sustainable regional value chains, and concluding economy-specific international investment agreements (IIAs) with the EU.

The regional investment area section of the CRM 2021-24 AP includes the following three components: 1) regional investment promotion; 2) regional investment policy reforms; and 3) regional investment retention

and expansion. The findings of the investment promotion and facilitation sub-dimension can inform the implementation of actions under this component (Box 4.4).

### ***Key methodological changes to the assessment framework***

Since the 2018 edition of the Competitiveness Outlook, Investment for green growth (Sub-dimension 1.3) has been added. In addition, the court system analysis under Investment policy (Sub-dimension 1.1) has been broken down into investor protection against expropriation and alternative dispute resolution. Under Investment promotion and facilitation (Sub-dimension 1.2), the strategy and institutional framework for investment promotion and facilitation has been split into investment promotion agency structure and strategy as well as investment facilitation services and strategy, to better map the investment promotion agencies in the WB6 region and benchmark them against OECD economies. Furthermore, the starting a business and FDI-SME linkages indicators have been absorbed into existing indicators under Investment promotion and facilitation (Sub-dimension 1.2).

## **Investment policy and promotion performance and context in the WB6**

After a steady decrease in global FDI flows over the last decade, COVID-19 shrunk investment circulation to 1% of world GDP in 2020, the lowest levels since 1999 (OECD, 2021<sup>[5]</sup>). The pandemic hit the WB6 in the midst of an economic upturn after several years of sizable investments that provided economic growth, lowered unemployment, and boosted innovation and technological development. COVID-19 caused a deceleration of both public and private investment as the region's high concentration and composition of FDI created vulnerability.

FDI fell globally by 38% in 2020, from USD 1.37 trillion in 2019 to an estimated USD 846 billion, according to the OECD FDI in Figures Report (OECD, 2021<sup>[5]</sup>). While the global economic outlook is positive, with the OECD expecting an estimated 5.8% growth, according to UNCTAD, as of January 2021, FDI flows are expected to fall further, by 5-10%, in 2021 (UNCTAD, 2020<sup>[6]</sup>). The Western Balkans have seen a less severe drop of FDI inflows during the first half of 2020 than at the global level. FDI relative to GDP remained stable in Albania and Bosnia and Herzegovina, and increased in Montenegro (European Commission, 2020<sup>[7]</sup>).

Prior to the COVID-19 pandemic, WB6 economies attracted USD 6 billion of foreign investment annually over 2015-19. This was up from the USD 5.1 billion attracted over 2010-14, with FDI in the region increasing by 4.6% a year over 2010-19 (Figure 4.3). Serbia continues to account for more than half of the region's FDI each year, given its relatively large economy, reaching 59% of the region's FDI inflows in 2019. In relative terms, Albania and Montenegro have been the leading economies for FDI inflows measured as a percentage of GDP, whereas the lowest ratios in 2019 (and in 2017) remain in Bosnia and Herzegovina (2.7%) and North Macedonia (2.9%) (Figure 4.4).

StatLink  <https://doi.org/10.1787/888934253347>

FDI stocks represented over 45% of GDP in the six economies in 2019, reflecting the important role FDI plays in the WB6 (Figure 4.5). Compared to the EU and to the peer economies of Croatia and Slovenia, FDI as a proportion of GDP is higher in Montenegro (104%) and Serbia (82%) and slightly below the EU (but higher than Croatia and Slovenia) in Albania (57%), Kosovo (53%) and North Macedonia (51%). Bosnia and Herzegovina has the lowest FDI stock-to-GDP ratio among the WB6 economies (45%), but is still higher than Slovenia. In comparison to the last assessment, FDI as a percentage of GDP remains largely the same in the WB6 economies, with the exception of Albania, where the FDI stock-to-GDP ratio increased by 16%.

FDI in the region is largely dominated by EU companies, accounting for 65.5% of total WB6 FDI stock in 2018 (European Commission, 2020<sup>[9]</sup>). For the past two decades, foreign investment in the WB6 economies has primarily originated from Western Europe (Austria, France, Germany, Italy, the Netherlands, and Switzerland) and the Russian Federation (Table 4.2). Investment in the region also comes from neighbouring economies such as Croatia, Cyprus, Greece, Slovenia, and Turkey, as well as the United Arab Emirates and Canada. It is also worth noting that Serbia is an important investor in the region, accounting for 14% of the FDI stock in Bosnia and Herzegovina and 5% of FDI stock in Montenegro in 2018. China is increasingly investing in the region, initially focusing on Serbia, as part of its Belt and Road Initiative (BRI).

The sectoral distribution of FDI varies across the WB6 economies. In Albania, FDIs are concentrated in the energy sector, extractive industries, financial and insurance activities, utilities and real estate. In Bosnia and Herzegovina, manufacturing (34% of total FDI stock), and banking (25%) are the largest beneficiaries of FDI,

followed by telecommunications and trade (12% each) and by the tourism sector. In Kosovo, real estate and leasing activities are the largest beneficiaries of FDI, followed by financial services and energy, while food, information and technology, infrastructure, and energy are growing sectors. FDI in Montenegro is mostly concentrated in the tourism, energy and agriculture sectors. In North Macedonia, manufacturing remains the sector that attracts most FDI, ahead of financial and insurance activities. Finally, in Serbia, FDI is concentrated primarily in manufacturing, trade, real estate, logistics and financial mediation.

The composition of FDI stock in the Western Balkans underlines the region's vulnerability to the impact of the COVID-19 pandemic. The manufacturing sector accounts for the greatest share of FDI stocks in North Macedonia (36%), Serbia (32%), Bosnia and Herzegovina (28%), and Kosovo (12%). As EU investors have located export-oriented activities in the region to serve their home markets (Novik and de Crombrughe, 2018<sup>[11]</sup>), a potential demand contraction might result in a fall in earnings affecting sectors such as automotive, machinery parts and textiles (OECD, 2019<sup>[8]</sup>).

### Investment policy (Sub-dimension 1.1)

Developing an enabling investment climate that attracts investors and promotes sustainable growth requires a sound legal framework including laws, regulations and policies that ease the admission of investors and protect their property. In addition, governments should ensure that policies and legislation are transparent, predictable and easy to implement.

These elements are covered in four sections: 1) the quality of the legal and regulatory framework for investment; 2) market access and exceptions to national treatment (assessed through the measurement of statutory restrictions to FDI); 3) investor protection (assessed through the guarantees against expropriation and alternative dispute resolution indicators); and 4) intellectual property rights (assessed through the intellectual property rights laws, enforcement and awareness-raising indicators).

**Table 4.3. Scores for Sub-dimension 1.1: Investment policy framework**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 1.1: Investment policy framework	Legal frameworks for investment	3.5	2.0	2.5	3.0	3.5	4.0	3.1

### ***Frameworks for investment are sound; legislation could be more transparent and predictable***

All WB6 economies have established sound legal frameworks for investment. Investment laws are the main instrument regulating investment in the majority of the WB6 economies. While North Macedonia and Serbia have unified investment laws covering both foreign and domestic investors, Albania, Bosnia and Herzegovina, Kosovo and Montenegro have dedicated foreign investment laws. In addition, legislation governing investment is complemented with strategic investment laws in Albania, Kosovo, and North

Macedonia, as well as with free economic zones laws in some economies, such as the Law on Technological Industrial Development Zones, which plays an important role in attracting investment in North Macedonia.

In recent years, governments have made some efforts to modernise their legislation. For instance, Kosovo adopted a law on strategic investment in 2017 and a law on business organisations in 2018, while Montenegro adopted a public private partnership law and public procurement law in 2019 that modernise the investment promotion institutional setting. Albania prepared a new draft investment law in 2017 that simplifies and unifies the legal framework for investment by replacing the former laws on foreign investments and strategic investments. While consultations have been initiated, the new investment law has yet to be adopted. In addition, governments have begun to improve and simplify their legislation. For instance, North Macedonia and the Republic of Srpska are implementing regulatory impact analysis (RIA) programmes to improve their regulatory environment and enhance consultations with stakeholders.

Overall, the quality of the investment frameworks is improving as governments progressively align their legislation with EU standards. According to the Worldwide Governance Indicators, Albania, Montenegro, North Macedonia and Serbia have solid frameworks (though they still rank below CEEC, EU and OECD benchmarks), whereas Kosovo and Bosnia and Herzegovina's legislation is lagging behind other economies in the region, as investors have to navigate differences in legislation across several levels of government, including the cantonal level (Figure 4.6). Nevertheless, in some economies, investment legislation remains unclear (US Department of State, 2020<sup>[12]</sup>). For example, in North Macedonia, frequent changes and inconsistent interpretation of the rules tend to create an unpredictable business environment.

**Figure 4.6. Regulatory quality in the WB6: the Worldwide Governance Indicators (2015-19)**

Note: This dimension of the Worldwide Governance Indicators reflects perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development. Percentile rank among all economies, ranging from 0 (lowest) to 100 (highest) rank. EU includes all EU Member States in 2015-2019 period. CEEC-11= Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. OECD high income definition: The World Bank defines a high-income country as one with a gross national income per capita exceeding USD 12 056.

Source: (World Bank, 2020<sup>[13]</sup>) *World Bank, The Worldwide Governance Indicators (WGI) project*, <http://info.worldbank.org/governance/wgi/>.

StatLink  <https://doi.org/10.1787/888934253385>

Governments in the region are making efforts to increase transparency, the accessibility of legislation as well as public involvement in policy making. For instance, all WB6 economies publish and regularly update their investment legislation online. However, some economies do not have a single website or portal for investors and the legislative texts are not always available in English. In addition, public involvement in policy making is not sufficiently systematic and remains below EU standards overall (European Commission, 2020<sup>[14]</sup>). While all WB6 economies have established mechanisms for public consultation using online platforms, they often suffer from insufficient time allocated for comments, late inclusion of stakeholders in policy making, frequent use of urgent procedures for adopting legislation, and limited inclusion of shareholders' contributions in final texts.

### Exceptions to national treatment remain low in the WB6

WB6 economies are among the most open to FDI, as measured by the OECD FDI Regulatory Restrictiveness Index (which only covers statutory measures discriminating against foreign investors) (Figure 4.7). Albania, Bosnia and Herzegovina, Kosovo, Montenegro, North Macedonia and Serbia maintain only a handful of restrictions, making their FDI regimes less restrictive than those of the average OECD economy. They also compare favourably with the average of the 22 EU Member States covered by the Index.

**Figure 4.7. OECD FDI Regulatory Restrictiveness Index (2020)**

Note: Restrictions are evaluated on a 0 (open) to 1 (closed) scale. The OECD FDI Regulatory Restrictiveness Index only covers statutory measures discriminating against foreign investors (e.g., foreign equity limits, screening and approval procedures, restriction on key foreign personnel, and other operational measures). Other important aspects of an investment climate (e.g., the implementation of regulations and state monopolies, preferential treatment for export-oriented investors and special economic zone regimes) are not considered. Data reflect regulatory restrictions in December each year.

Source: (OECD, 2020<sup>[15]</sup>), *FDI Regulatory Restrictiveness Index* (database); OECD (2021), *FDI Regulatory Restrictiveness Index* (database), [www.oecd.org/investment/fdiindex.htm](http://www.oecd.org/investment/fdiindex.htm).

StatLink  <https://doi.org/10.1787/888934253404>

None of the six economies has established a foreign investment negative list to clearly delimit the sectors where foreign investment is prohibited or conditioned and outlining which discriminatory conditions apply. Negative lists can improve the accessibility of the legal framework for foreign investors as it relieves them of the burden of reviewing multiple laws to understand the market access and treatment conditions applicable to them.

There are no pre-establishment screenings requiring foreign investors to obtain approval from the host economy prior to making an investment in the WB6 economies. National treatment of foreign investors in the post-establishment phase is guaranteed. All foreign investors, when incorporated and headquartered in WB6 economies, are considered to be domestic legal entities, with all the rights and obligations applied to domestic investors. The WB6 economies maintain a few *de jure* restrictions, primarily in service sectors, which is common practice in OECD economies as well. Foreign equity restrictions are also used less in WB6 economies than in the other economies covered in the FDI index. They are generally limited to a few service sectors, while FDI in manufacturing is allowed in all sectors with the exception of arms and ammunition. Local legislation allows full foreign ownership of service companies, with restrictions limited to service sectors which regularly face restrictions in OECD and non-OECD economies such as defence, media and transport (Table 4.4). Sectors where foreign ownership restriction exists in the WB6 are also common in EU and OECD economies and the WB6 remain very open in comparison. It is also worth noting that some of these restrictions are lifted for nationals from EU economies, the United States and other economies that have signed bilateral agreements with the WB6.

**Table 4.4. Key sectoral restrictions to foreign service ownership in the WB6**

Albania	Bosnia and Herzegovina	Kosovo	Montenegro	North Macedonia	Serbia
Transport, media, fisheries, notary services, legal services	Media	Legal services	Transport, legal services	Transport, gambling	Media, legal services, defence sector

Source: OECD, based on existing laws in the WB6 economies.

Yet despite the openness of the WB6 economies, there are still exceptions to national treatment for foreign investors in key sectors where historical monopolies dominated by state-owned enterprises (SOEs) persist. However, it should be noted that Kosovo, Montenegro and Serbia are undergoing a process of structural reforms and privatisations which should reduce these barriers.

Foreign ownership of non-agricultural land is generally permitted in the WB6 economies; however, some economies maintain some restrictions on the acquisition of land by foreign investors for business purposes. Restrictions primarily concern ownership by legal entities established abroad and can be circumvented by establishing a legal entity in the territory. For instance, Bosnia and Herzegovina, North Macedonia and Serbia maintain discriminatory restrictions on real estate ownership by legal entities established abroad. These are subject to reciprocity, with exceptions for the EU and the OECD member states' residents, who have the same rights as local residents. Ownership of commercial property in Albania is only permitted if the proposed investment is worth three times the price of the land. In Montenegro and Kosovo there are no restrictions on foreign ownership of real estate assets. All WB6 economies, with the exception of Kosovo, also impose restrictions on ownership of agricultural land by foreign investors (OECD, 2018<sup>[16]</sup>).

### ***Investor protection against expropriation has been bolstered***

Investor protection is included in a wide range of policies, laws and regulations that provide investors with the legal guarantee that their rights will be respected, and their property protected. By enhancing investor confidence, sound investment protection is likely to increase not just the level, but also the quality of investment, its durability, and its contribution to economic development (OECD, 2015<sup>[2]</sup>). Key elements of investor protection include guarantees against unlawful expropriation and securing property protection; effective contract-enforcement mechanisms; an independent court system; and alternative dispute resolution mechanisms, including commercial and investment arbitration.

All WB6 economies provide investors with solid protection against expropriation without fair compensation. Policy makers have incorporated in their respective legislation guarantees that investors' rights will be respected and that their property will be protected against unlawful expropriation. They have also included transparent and predictable procedures in the event of expropriation and for determining financial compensation. Core protection standards are enshrined in the constitutions of Albania, Montenegro, North Macedonia and Serbia; in Bosnia and Herzegovina's Law on the Policy of Foreign Direct Investment;<sup>2</sup> and in the Law on Foreign Investment of Kosovo. The laws regulating investment across WB6 economies stipulate that expropriation can only occur when it is in the public interest without discrimination, against compensation and under due process of law. In all the WB6 economies, the modalities and procedures governing expropriations are regulated by the laws on expropriation. These laws also provide for calculating the amount of compensation, as well as judicial and administrative appeal mechanisms for reviewing or contesting decisions on expropriation. In practice, this assessment found that the business community does not perceive unlawful expropriation to be a major concern in WB6 economies; disagreements tend to be limited to the amounts of compensation.

The concept of indirect expropriation is ultimately covered by the respective legislation in the region. Indirect expropriation occurs when a state interferes indirectly with business operations, affecting the benefits, investments or use of an investor's property, but without actually taking the property. However, only Kosovo provides a clear definition of indirect expropriation.<sup>3</sup> Providing clearer definitions of expropriation that also

include indirect expropriation can provide additional protection to investors from the uncertainty of compensation linked to indirect expropriations.

All six economies have also signed a large network of investment agreements, constituting an additional layer of protection for foreign investors. Several governments in the region, notably Albania and Montenegro, are also currently reforming their existing network of bilateral investment treaties (BITs) and defining a new BIT model that will balance investor protection provisions with national strategic interests, whilst also fully complying with EU standards and good international practices. This means ensuring that protection provisions are transposed into their respective national laws and are consistent with international standards of protection.

### **Enforcing contracts and settling disputes remain challenging**

Contract enforcement and dispute settlement mechanisms are fundamental if markets are to function properly. Good enforcement procedures enhance predictability in commercial relationships by assuring investors that their contractual rights will be upheld promptly by local courts. When procedures for enforcing contracts are overly bureaucratic and cumbersome or when contract disputes cannot be resolved in a timely and cost-effective manner, companies may restrict their activities (OECD, 2015<sub>[2]</sub>).

Overall, the quality of the justice system and its responsiveness to the needs of businesses and people alike remain a challenge for the majority of the WB6 economies. Economies' low ability to enforce contracts (Figure 4.8) is challenging for investors. The efficiency of the legal framework in settling disputes is underperforming compared to EU-28 and OECD averages (Figure 4.9). Confidence in the judiciary system and the courts is remarkably low in the Western Balkan region (OECD, 2015<sub>[17]</sub>). In 2019, on average, the level of confidence stood at 33% in the WB6, compared to 56% for OECD-EU economies. Only 22% of citizens in North Macedonia have confidence in the judiciary system – the lowest rate registered in the region.

**Figure 4.8. Economies' ability to enforce contracts (2015 and 2019)**

Note: The enforcing contracts indicator is scored on a scale of 1 (low ability to enforce contracts) to 100 (high ability to enforce contracts). The enforcing contracts indicator of the Doing Business Index measures the time and cost for resolving a commercial dispute through a local first-instance court, and the quality of judicial processes index, evaluating whether each economy has adopted a series of good practices that promote quality and efficiency in the court system. EU includes all EU Member States in 2015-2019 period. CEEC-11=Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. OECD average includes high income economies (Colombia, Chile and Turkey are not included).

[http://www3.weforum.org/docs/WEF\\_TheGlobalCompetitivenessReport2019.pdf](http://www3.weforum.org/docs/WEF_TheGlobalCompetitivenessReport2019.pdf).

StatLink  <https://doi.org/10.1787/888934253442>

The quality of the region's judiciary is undermined by limited human and financial resources and inadequate training for judges, notably in commercial law. In addition, procedures for enforcing contracts and resolving disputes remain overly bureaucratic and cumbersome, and contract disputes are often not resolved quickly or cost-effectively enough. As a result, backlogs in the courts remain sizeable, especially in Kosovo (European Commission, 2020<sup>[14]</sup>). Local and foreign investors, which have the same rights and remedies before domestic court systems as domestic investors in the region, often complain that courts are slow in processing cases; that judicial procedures are complex; and that judges' decisions suffer from lack of capacity as well as interference, corruption, political pressure and nepotism in the justice system, particularly in Albania, Bosnia and Herzegovina, and North Macedonia (US Department of State, 2020<sup>[12]</sup>).

Several WB6 economies are pursuing comprehensive justice reform agendas as part of their accession negotiations and alignment with EU standards. Key reforms include streamlining the functioning of the judicial system, including by rationalising the courts network; modernising infrastructure and adopting modern information technologies; and promoting mediation as an alternative dispute resolution methods (see next section). However, while positive recent upgrades in Albania, Montenegro and North Macedonia have seen improvement both in terms of efficiency and effectiveness of commercial procedures, progress is still slow and difficult in Bosnia and Herzegovina and Kosovo (European Commission, 2020<sup>[14]</sup>).

As part of their efforts to improve justice efficiency on commercial matters, all WB6 economies have dedicated commercial courts or designated departments or units to handle commercial matters. Montenegro and Serbia have specialised commercial courts which have first instance jurisdiction on commercial matters. In Bosnia and Herzegovina, commercial cases are handled by commercial courts in the Republika Srpska, and by the commercial departments of municipal courts in the Federation of Bosnia and Herzegovina. In Albania, the Tirana District Court has a special division to judge commercial matters, known as the Commercial Section, while commercial disputes are handled by specialised court divisions in the basic courts with extended competence in North Macedonia. Finally, in Kosovo, commercial cases will be examined by a designated department for commercial matters within the Pristina Basic Court, pending the approval of the draft law on commercial courts.<sup>4</sup>

### ***Alternative dispute mechanisms should be further reinforced***

Alternative dispute resolution (ADR) mechanisms, including arbitration, mediation and conciliation, are additional instruments that are increasingly used for resolving commercial disputes. Multiple economies are fostering the use of ADR to alleviate the burden on judiciary systems, especially for low-value commercial cases. They are favoured by investors as they allow for swift resolution of commercial disputes and/or to cope with an under-performing judiciary with limited commercial expertise, complex procedures, lengthy delays, and hefty costs. In most OECD economies, arbitration plays a primary role as an ADR mechanism, either to settle disputes between foreign investors and host states (international investment arbitration) or to resolve disputes between businesses (private commercial arbitration).

All six WB6 economies have ratified the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID Convention) and the 1958 Convention on the Recognition and enforcement of foreign arbitral awards (New York Convention). Ratification of the New York Convention means that foreign investors can enforce their rights and contracts in the event of a dispute. In addition, in 2019 Montenegro, North Macedonia and Serbia signed the Singapore Convention on Mediation.<sup>5</sup> Nevertheless, stakeholders report that enforcement of arbitral decisions can be lengthy. For instance, the enforcement of an international arbitration award in Serbia can be a slow and difficult process and in some cases, it can take up to five years for Serbian courts to recognise International Court of Justice rulings (US Department of State, 2020<sub>[20]</sub>). However, the number of investor-state disputes in the region that are brought before international arbitration is limited and mainly involve large investors.

All WB6 economies provide for local arbitration and laws on arbitration exist in North Macedonia (2006), Serbia (2006), Kosovo (2007) and Montenegro (2015). These four economies host private arbitration centres in their local or foreign chambers of commerce. In Albania and Bosnia and Herzegovina, arbitration is less regulated. Nevertheless, their law/code on civil procedure regulates arbitration procedures if the parties agree to entrust the resolution of their dispute to arbitration. Montenegro is also in the process of adopting a new law on ADR, which notably provides for compulsory recourse to ADR mechanisms for specific types of cases. Mediation mechanisms are also increasingly promoted and regulated in the WB6 economies. All WB6 economies have mediation laws, with Albania and Kosovo having adopted dedicated legislation in 2018.

Despite the availability of out-of-court methods of dispute resolution in WB6 economies, in practice, the use of arbitration and mediation as an alternative to resolving disputes remains very low partly due to a lack of awareness. The use of mediation and of ADR mechanisms in general varies greatly between WB6 economies. For instance, Montenegro adopted a programme for ADR promotion and an accompanying action plan for 2019-21 and has seen a positive trend in the use of ADR mechanisms since 2017. In North Macedonia, on the other hand, the use of ADR mechanisms is not common, and arbitration is not yet considered a viable tool to ensure justice, either by parties or by the courts and as a result, “the number of mediation cases has decreased over recent years” (European Commission, 2020<sub>[21]</sub>).

### ***Intellectual property rights laws are in place, but enforcement is a challenge***

The granting and protection of intellectual property (IP) rights is an important component of a sound legislative framework that attracts investments. Protection of IP rights through trademarks and patents fosters development and innovation by reinforcing linkages and transfers between local firms and multinationals. It is widely acknowledged that a well-functioning and balanced IP system is key to promoting innovation and creativity, which are the main drivers of economic development in knowledge-based economies.

Developing effective IP systems also requires: 1) a sound legislative framework; 2) effective implementation and enforcement; as well as 3) efforts to raise the awareness of businesses and citizens on the importance of IP rights. IP enforcement involves a high level of co-ordination among the various institutions in charge of implementing and enforcing IP, as well as strong legal structures.

All six WB6 economies generally have sound **intellectual property rights legal frameworks** which are in line with international practice. With the exception of Kosovo, they are all members of the World Intellectual Property Organization (WIPO) and have adhered to the main international treaties and conventions on IP rights, such as the Patent Co-operation Treaty, the Paris Convention, the Madrid Protocol and the Hague Agreement.

All the economies have progressively introduced IP-specific legislation over the past decade and are continuing their alignment with EU standards through amendments of IP laws and regulations. Albania adopted secondary legislation on trademarks and the legal protection of designs in 2018;<sup>6</sup> Bosnia and Herzegovina is largely aligned with the EU *acquis* on copyright and neighbouring rights; while Serbia has notably adopted a new trademark law that came into force in 2020 and amended its copyright law and related rights in 2019, further aligning with EU *acquis*. According to the (European Commission, 2020<sup>[14]</sup>), Serbia and Montenegro's IP legislation is the most aligned with the EU *acquis*, while the other four economies still have a way to go. Investors complain that their IP rights are poorly protected in the region, as illustrated by the WB6 economies' ranking in the Global Competitiveness Index Report 2019, where all economies score in the bottom half of the rankings on intellectual property protection,<sup>7</sup> with Bosnia and Herzegovina ranking 134 and Albania ranking 130 out of 140 assessed economies (World Economic Forum, 2019<sup>[19]</sup>). This policy area remains a challenge in most of the WB6 economies.

**Intellectual property rights enforcement** also remains a challenge in the region and intellectual property right infringement problems persist in all six Western Balkan economies. All WB6 economies have established IP institutions in charge of implementation and enforcement. However, IP enforcement institutions generally lack human and financial resources as well as the authority and means to co-ordinate the various institutions involved in IP enforcement.

Governments in the region are well aware of these challenges and are increasingly focusing on IP rights implementation and enforcement. Most of the WB6 economies have also adopted IP dedicated strategies and action plans and implemented reforms in order to better protect investors' rights. However, their implementation and outcomes vary greatly.

Albania, Kosovo, and Serbia have seen positive progress by reinforcing the resources and capacities of the agencies in charge of registration, protection, and enforcement of IP rights. For instance, the General Directorate of Industrial Property (GDIP) in Albania has seen its staff increase from 24 to 38 since 2018. The Industrial Property Agency (AIP) in Kosovo added three new staff in 2019, and Albania has progressed on IP implementation with increases in the number of applications to register trademarks since 2018.<sup>8</sup> Kosovo has reduced the backlog of applications for patents, trademarks and industrial designs (European Commission, 2020<sup>[22]</sup>), while in Serbia the procedures for registering industrial property rights and to deposit works and authorship are efficient and in line with EU standards (US Department of State, 2020<sup>[20]</sup>).

In Montenegro and North Macedonia, developments are more subdued. Montenegro is still to adopt its National Intellectual Property Strategy (2021-2024) and its already understaffed IP office has seen a further reduction in staff (OECD, 2018<sup>[16]</sup>). In the meantime, the government has stepped up its efforts to reinforce the capacity of enforcement agencies and specialised judges on IP matters through regular training. It has also reinforced co-ordination among relevant institutions. In North Macedonia, the State Office of Industrial Property (SOIP), in charge of industrial property rights, has improved its registration process. However, effective IP implementation and enforcement in the economy are still hampered by the myriad institutions in charge and their lack of human resources, which tend to limit their co-operation and efficiency.

IP enforcement is particularly problematic in Bosnia and Herzegovina as the enforcement agencies and the judicial system lack capacity and resources and their co-operation is limited in this very decentralised state. In 2019, the economy adopted the Strategy for the Enforcement of Intellectual Property Rights in Bosnia and Herzegovina for the period 2018-2022. This sets out guidelines and measures to develop and improve the legislative and institutional framework for IP enforcement and to establish inter-institutional co-operation.

However, progress has been slow, and the strategy has yet to be implemented (European Commission, 2020<sup>[23]</sup>).

**Intellectual property rights awareness raising and access to information** play an important role in the broader IP policy framework. However, with a few exceptions, there is generally little awareness of IP rights and obligations, either among the general public or the judiciaries of the six economies. In Albania, additional resources for the GDIP have improved IP rights awareness-raising efforts and access to information. Since 2018, the GDIP has intensified its IP rights awareness-raising activities in co-ordination with businesses and technical and scientific information centres through seminars and lectures in public and private universities as well as for interest groups. It has also enhanced access to information through various services including a help desk, Patlib (providing local access to patent information and related issues), information kits and other information brochures, etc.

### ***The way forward for investment policy***

- **Continue reform efforts to improve the efficiency of the judiciary.** The ability to make and enforce contracts and resolve disputes is fundamental if investors' rights are to be protected. Good enforcement procedures enhance predictability and trust in commercial relationships by assuring investors that their contractual rights will be upheld promptly by local courts. To this end, it is essential to further reinforce the ability of commercial justice to handle conflict resolution and enforce contracts, including by greater capacity building and training for judges in dealing with commercial and IP cases.
- **Streamline investment legislation** and improve its predictability. Throughout this process, governments should reinforce transparency and ensure well-structured and inclusive public participation in policy making. It is also important to ensure that the effectiveness of regulations is regularly monitored and evaluated. These reforms will help to build an environment of trust that fosters compliance with laws and regulations, strengthens investor confidence and reduces risk aversion.
- **Improve the clarity of the investment regime**, notably for foreign investors. To make the legislation more intelligible, governments could establish negative lists of the sectors that are prohibited or restricted for foreign investors, as well as the discriminatory conditions that apply – even if the latter are very limited in the WB6 economies. Gathering all relevant regulations into a single platform in English and regularly updating it would also increase accessibility.
- **Improve the definition of indirect expropriation** in order to reinforce investor property protection. Better definitions of indirect expropriation should also clarify whether the governments' actions require compensation for investors while better protecting the general public's interests and welfare.
- **Continue to strengthen the frameworks for alternative dispute resolution** and encourage their use by businesses. These mechanisms, which are generally appreciated by the business community, could help to alleviate the pressure on the judiciary systems and reduce the backlog of cases.
- **Reinforce IP implementation and awareness raising.** This will mean reinforcing the capacity and resources of IP agencies. IP policy and implementation requires a whole-of-government approach and strong co-ordination among various IP-related institutions, as recommended by WIPO guidelines (Box 4.2). Efforts to sensitise businesses and the public about IP matters should be bolstered. Doing so will help to reinforce linkages between local and multinational firms as well as fostering innovation.

### Box 4.2. WIPO guidelines and good practice for developing IP strategies

Private enterprises and academic institutions see patents, trademarks, copyrighted works and other forms of IP as economic assets. Solid IP regulations permit universities, enterprises or R&D institutions to assess existing stock of IP and human capital, which can also help entrepreneurs and innovative SMEs to access bank financing using IP capital as collateral. The WIPO guidelines on developing IP strategies include several key recommendations that may be useful for WB6 economies in the strengthening and reinforcement of existing IP action plans or developing new strategies:

- Including essential features of a strong IP strategy by specifying strategic goals and objectives, mechanisms, policies, actions, costs and resources, as well as links with other planning tools, including development, economic and education plans. While many economies opt to develop stand-alone IP plans, economies may also choose to establish economic plans with IP components, or multifaceted strategic plans integrating education, technology, health, agriculture, commerce, IP and finance.
- Targeting specific areas of competitive advantage allows economies to select clusters or target areas in which their enterprises or research institutions may have a competitive advantage, or which harmonise with national needs and capacities. This definition of cluster areas may also work as a strategy for researchers and enterprises.
- Incorporating incentives and awards by establishing multifaceted motivations and support for IP asset development and commercialisation. These may include tax incentives, payments, patent application funds, venture funds for SMEs in cluster areas and financial rewards in private enterprise for inventors and creators.
- Making the IP system easy to use, accessible and affordable through reduced fees for individual inventors and research institutions or those with incomes under an established threshold. Economies may also create funds to support patent applications by national research centres and individuals. Surveying research institutions, private enterprises and other users to understand the challenges of existing IP systems can allow governments to tailor IP strategies to their economy's specific needs.
- Building public awareness concerning IP by developing programmes for public secondary-level education to raise awareness of the importance of invention and creativity at an early age through information products like interactive websites and even comic books explaining the basic concepts of IP. Granting publicised awards to inventors, creators and IP professionals also raises recognition of the cultural and economic value of IP.

## Investment promotion and facilitation (Sub-dimension 1.2)

Investment promotion and facilitation measures can be powerful means of attracting investment and maximising its contribution to development, but their success depends on the quality of investment-related policies, as reviewed in the previous section (OECD, 2015<sup>[2]</sup>). The roles of investment promotion and investment facilitation are complementary: the former focuses on marketing an economy or a region as an investment destination, while the latter aims at making it easy for investors to establish, operate and expand their existing investments.

The investment promotion and facilitation sub-dimension is assessed through five qualitative indicators (Table 4.5). As the scores indicate, the quality of the institutional framework for investment promotion and

facilitation varies across the region. Strategies to promote, attract and retain FDI are well established overall, but there is scope to further enhance their implementation.

**Table 4.5. Scores for Sub-dimension 1.2: Investment promotion and facilitation**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 1.2: Investment promotion and facilitation	Investment promotion agency structure and strategy	4.0	2.0	2.0	3.0	2.0	4.0	2.8
	Investment facilitation services and activities	3.5	2.0	3.0	2.0	2.5	3.5	2.8
	Investor targeting	3.5	3.5	2.0	3.0	3.5	4.0	3.3
	Investor incentives	2.5	2.5	1.0	4.0	2.5	4.0	2.8
	Aftercare activities	3.5	3.5	4.0	2.0	3.5	4.0	3.4
<b>Investment promotion and facilitation average score</b>		3.4	2.7	2.4	2.8	2.8	3.9	3.0

### ***Institutional frameworks and strategies for investment promotion and facilitation are solid***

Most governments around the world have established investment promotion agencies (IPAs) to create awareness of investment opportunities, attract investors and support their expansion (Box 4.3) – although many functions can also be carried out by other public structures. Their institutional settings differ in their organisation, function and strategies as well as their levels of interaction with other government bodies.

All six Western Balkan economies have established solid investment promotion agency structures and strategies to efficiently promote and facilitate investment. The region's IPAs include the Albanian Investment Development Agency (AIDA), the Foreign Investment Promotion Agency (FIPA) of Bosnia and Herzegovina, the Kosovo Investment and Enterprise Support Agency (KIESA), the Agency for Foreign Investments and Export Promotion (ASIP) of North Macedonia, the Montenegro Investment Agency (MIA) and the Development Agency of Serbia (RAS). In North Macedonia, the Directorate for Technological Industrial Development Zones (DTIDZ) also plays an important role in investment promotion and facilitation in Special Economic Zones. Investment promotion also largely takes place at the entity level, for example, through the Ministry of Economy and Finance in the Republika Srpska which, among other services, promotes investment potentials, attracts foreign investors, provides pre- and post-investment support, and promotes and regulates free zones.

Montenegro has recently modernised its institutional framework and strategy for investment promotion and facilitation. Following the adoption of the new Public Private Partnership Law in December 2019, the Montenegro Investment Promotion Agency (MIPA) and the Secretariat for Development Projects ceased to exist and were replaced by the Montenegro Investment Agency (MIA) in 2020 with a much broader set of responsibilities and reinforced resources. However, as this new institutional setting has yet to have an impact, this report mainly assesses the old institutional setting for investment promotion and facilitation.

### Box 4.3. Key success factors in high-performing IPAs in developing economies

World Bank and OECD research and operational experience have identified the following key success factors common to high-performing investment promotion agencies (IPAs) in developing economies:

- Strong strategic alignment stemming from consultations with public and private sectors and cascading from a national development plan or FDI strategy down to IPA corporate plans and industry-specific strategies.
- A clear, uncontested mandate, ideally focused on investment promotion, especially when starting or restructuring the IPA. Developing economy IPAs with multiple mandates take much longer to, or never do, deliver substantial FDI impact. Regulatory functions (including one-stop shops) are best performed by a separate public institution that ensures proper delivery of this essential function without compromising the equally essential investment promotion mandate of an IPA.
- A high degree of institutional and financial autonomy (or semi-autonomy), emulating private sector flexibility to act according to agreed-upon strategic plans and to hire staff using specified and transparent job qualifications; avoiding political interference; and providing sustainability through political cycles.
- An independent and well-functioning board of directors or advisory board with strong and active private sector representation to better understand investors and provide direction in catering to their needs.
- A strong investor-centric service orientation to design and provide relevant and high-quality services to investors throughout their investment cycle.
- Management and key promotion staff with strong private sector experience, as well as international exposure and language skills, within the IPA's mix of employees with public and private sector experience.
- Sufficient and sustained financial resources over three- to five-year periods to provide continuity of strategic efforts over the long-cycle nature of investment promotion and to avoid struggling over funds every year or having to charge fees.

Source: (World Bank, 2020<sup>[25]</sup>), *Global Competitiveness Report 2019/2020*, [http://www3.weforum.org/docs/WEF\\_GlobalCompetitivenessReport2019.pdf](http://www3.weforum.org/docs/WEF_GlobalCompetitivenessReport2019.pdf); (OECD, 2018<sup>[26]</sup>), *Mapping of Investment Promotion Agencies in OECD Countries*, <https://www.oecd.org/investment/investment-policy/mapping-of-investment-promotion-agencies-in-OECD-countries.pdf>.

The governance of an IPA is related to the way it is supervised, guided, and managed. When IPAs are established, their legal status – often formalised by law – will determine many of their organisational and functional aspects. It will have a particular bearing on the IPA's level of autonomy vis-à-vis the government, especially in terms of financial and human resources management. From the least to the most autonomous forms of IPA, the most common types of legal status are the following: 1) governmental (often as a department or a unit within a ministry); 2) autonomous public agency; 3) joint public-private body; and 4) entirely privately-owned organisation (OECD, 2018<sup>[26]</sup>).

All economies in the region have established their IPAs as autonomous public agencies except for AIDA, which is a governmental entity under the Ministry of Finance and Economy. As a comparison, in OECD economies, the majority of IPAs (60%) are autonomous public agencies while 31% are governmental. Most of the IPAs around the world have also established boards providing supervisory or advisory roles to the agency, or both. For instance, 69% of the IPA agencies in OECD economies have included boards in their organisations (OECD, 2018<sup>[26]</sup>). When IPAs are public agencies or autonomous public agencies, it is

particularly important to include private sector and civil society – notably research and academia representatives – on their boards.

The IPA boards in the region have varying compositions and roles. For instance, AIDA's board has a supervisory role, while the boards of IPAs in Serbia and Bosnia and Herzegovina have advisory roles. With the exception of Kosovo's IPA KIESA, which did not report having a board, all of the economy's IPA boards comprise both public and private sector representatives. Kosovo's IPA reports directly to the National Council for Economic Development of Kosovo (NCEDK),<sup>9</sup> which is chaired by the Prime Minister of Kosovo and composed of the ministries with an economic orientation as well as the economic business associations.

The IPAs in the six economies differ in their mandates and functions (Table 4.6). All the national IPAs' official mandates include the promotion and facilitation of inward FDI. While the mandates of FIPA and MIA are more focused on foreign investment promotion, KIESA and AIDA have very large mandates, performing respectively 10 and 9 functions. It is also worth noting that domestic investment promotion, followed by export and innovation promotion, are the most frequent additions to the investment promotion mandate of the region's agencies. In the OECD economies, IPAs' mandates range from 2 to 13, with an average of 5.7 (OECD, 2018<sup>[26]</sup>).

**Table 4.6. IPA mandates in the WB6 economies (2020)**

\* For strategic investments

\*\* MIA's official mandate is being expanded.

Source: OECD based on existing laws.

In addition to the above-mentioned mandates, IPAs in the region also perform other functions. These include participating in the design of policies related to FDI and overall economic development strategies. For instance, in Serbia, RAS is systematically involved in the design and implementation of all policies, programmes and measures for investment promotion, including the Strategy for Development of SMEs, Entrepreneurship and Competitiveness 2015-2020, the Strategy and Policy for Industrial Development 2011-2020, as well as work on the new strategy for 2021-2030. Meanwhile, in addition to designing and implementing policies, programmes and measures related to foreign investment, the Ministry of Economy and Entrepreneurship of Republika Srpska also establishes and implements several economic development strategies at the entity level, such as the Foreign Investment Encouragement Strategy for the period 2021-2025, Strategy for the Development of Small and Medium Enterprises for the period 2021-2027 and Strategy and Policy of Industrial Development for the period 2016-2020 (a new strategy is being drafted).

Most of the IPAs have well-established mechanisms for developing annual strategic plans and objectives derived from the national investment strategies. They also conduct annual reporting on their activities and spending. AIDA, ASIPI, MIA and RAS have established monitoring and evaluation units that primarily report to the board of the IPA. Most of these IPAs report on the performance of the agency itself using indicators such as the number of campaigns launched, time to respond to investors or number of assisted firms, etc. Only AIDA, and to a lesser extent RAS, reported monitoring the effectiveness and efficiency of their actions for investment promotion. It should be also noted that MIA only recently set up a monitoring and evaluation unit and that the evaluation indicators are yet to be discussed by the board.

Since the last assessment, all six economies have concluded national strategies that include provisions for attracting investment. For instance, Montenegro, North Macedonia, and Serbia have all established industrial strategies that aim to increase investments in the manufacturing sector, facilitate innovation and technology transfers, and incorporate green growth into future investment objectives. These three economies have also adopted long-term strategies on sustainable development until 2030 that aim to strengthen regulatory frameworks and incentives, especially for attracting FDI to infrastructure and green energy projects. Meanwhile, Albania has established the comprehensive National Diaspora Strategy 2021–2025. This lays out 72 specific actions to create a favourable climate for diaspora investment through fiscal stimulus activities, disseminating information, reducing corruption and risks, and improving other incentives, as well as the responsible institution and time limit for their implementation. Kosovo has also established the Strategy for Local Economic Development 2019-2023, which lays out innovative solutions to overcome barriers to attracting foreign investors, such as increasing vocational capacities, investing in human capital and infrastructure projects, as well as enhancing the regulatory environment to offer better protection and security for potential investors. All the IPAs in the region are also involved in developing linkages between local companies and multinationals, with services extending from match making to the management of funds aiming at reinforcing the capacities of local firms in Serbia<sup>10</sup> and Albania.

While the IPAs' financial and human resources should be adapted to their mandate and role, staffing levels in the region do not necessarily reflect important differences in mandates (Table 4.7). Only AIDA, RAS and MIA seem to be adequately staffed given their mandate and objectives, while KIESA has a very large mandate, but only 22 staff members. Since the adoption of the strategic law in Albania, AIDA has substantially increased its staffing from 28 employees in 2018 to about 38 employees in 2020. In 2019 alone, the agency concluded 20 new employment contracts and confirmed 17 existing contracts (AIDA, 2019<sub>[27]</sub>). These changes are a direct result of an expanded mandate and aim to achieve the most effective division of tasks. The agency is split into 5 directorates: directorate of investment (13 employees), SMEs and projects (8), marketing and research analysis (5), co-ordination (4), and support services (8). While there is no “one size fits all” staffing level for IPAs, the following 2017 examples from OECD economies can provide guidance on the balance between staff numbers and agencies' mandates: Hungary's IPA had 129 staff members to execute 7 mandates, the Czech IPA had 147 staff members to execute its 9 mandates, while the Estonian agency had 300 staff to execute 12 mandates (OECD, 2018<sub>[26]</sub>). Financial constraints are also an important common challenge for IPAs in the region. Most of the IPAs in the WB6 economies report that inadequate resources – along with the lack of political support and weak business climate or regulatory framework – are among the top three biggest obstacles to their ability to attract investment in the next 5-10 years (OECD, 2018<sub>[26]</sub>).

**Table 4.7. Investment promotion agencies: Number of employees and mandates (2019)**

	Number of employees	Number of mandates
AIDA (Albania)	38	9
FIPA (Bosnia and Herzegovina)	7	2
KIESA (Kosovo)	22	10
MIA (Montenegro)	27	3
ASIPI (North Macedonia)	10	6
RAS (Serbia)	29	4

Note: Figure for MIA from 2020. Based on the MIA's personnel plan, 42 employees are planned by 2021.

Source: OECD based on existing laws/mandates.

Attracting FDI requires a whole-of-government approach as it entails effective co-ordination and co-operation among various stakeholders in the public sector (national and subnational administration and public or semi-public organisations) and the private sector (industry groups, associations, and chambers of commerce). In the OECD economies, IPAs have a dense interaction network as they deal on average with 25 different organisations, 50% of which are deemed strategic (OECD, 2018<sub>[26]</sub>). All the WB6 economies try to ensure effective co-ordination between the IPA and other public entities through formal co-ordination mechanisms, including the participation of key ministries on the IPAs boards, as well as joint task forces. However, in some economies, like Bosnia and Herzegovina, effective co-ordination with other government bodies involved in investment promotion and facilitation, both at economy-wide and entity levels,<sup>11</sup> continues to be challenging due to a lack of resources and sometimes the lack of political support.

None of the IPAs in the region have reported having offices abroad, whereas more than three-quarters of IPAs in OECD economies have a network of offices abroad that are affiliated to their headquarters (OECD, 2018<sub>[26]</sub>). However, most of the agencies report relying on their embassies to boost the image of their economies and attract foreign investment. Although how IPAs are presented overseas is primarily a matter of institutional setting and cost-benefit analysis, relying on embassies that are under the purview of a different line ministry requires a higher level of co-ordination and co-operation and additional effort.

The co-ordination of investment promotion and facilitation activities and monitoring of interactions with investors can be helped by using the Customer Relation Management System (CRM). According to the OECD-IDB survey, 94% of surveyed IPAs in OECD economies use CRM software (OECD and IDB, 2017<sub>[28]</sub>). AIDA, FIPA and RAS reported using CRMs, whereas ASIPI uses a dedicated platform for planning activities, keeping records, and supervising economic promoters.

### ***Investment facilitation could benefit from more IPA involvement***

Investment facilitation aims to make it easier for investors to establish, operate and expand their existing investments in an economy. Investment facilitation starts at the pre-establishment phase, when an investor shows interest in a location, and involves a whole-of-government approach to encourage investments by providing investors with a transparent, predictable, and efficient regulatory and administrative framework for investment. It combines policies, tools, and processes that should be adopted by host economies to reduce or eliminate potential and existing obstacles faced by investors once they have decided to invest and to maximise the positive contributions of investment to the economy (Novik and de Crombrughe, 2018<sub>[11]</sub>).

Facilitation activities include: 1) policies aiming at developing sound and consistent legal frameworks for investment, as well as regulatory measures to simplify and streamline administrative procedures; 2) tools to help investors navigate the various regulations and procedures, such as setting up one-stop shops, online business registration systems, information portals for business establishment, etc.; and 3) processes to make these policies more useful and effective, such as building IPA capacity, bolstering inter-agency co-operation and co-ordination as well as reinforcing public-private dialogue (OECD, 2018<sub>[26]</sub>).

The WB6 economies have adopted a number of policies for developing sound and consistent legal frameworks for investment – see Investment policy (Sub-dimension 1.1). They also continue to streamline their regulations, and reduce the costs and steps involved in starting a business. For instance, several economies have begun digitalising business permit and licensing registration processes as well as improving access to information and administrative procedures by providing documentation online and opening governmental portals. Even so, some WB6 economies have regressed in the starting a business rankings of the annual World Bank Doing Business survey (World Bank, 2020<sup>[18]</sup>). For example, in Bosnia and Herzegovina, regulations for starting a business remain very complex, as they differ among the entities and cantons. This is illustrated in the 2020 Doing Business Index: the economy is among the most difficult environment in the world for starting a business (ranking 184<sup>th</sup> out of 190 economies) (Figure 4.10). It should be noted that some positive developments have been recorded in the entities. For instance, the Republika Srpska has conducted major reforms to its business registration, cutting the time necessary for business registration from 23 to 3 days, as well as cutting the number of procedures from 11 to 5.

**Figure 4.10. Ease and time to start a business in the WB6 (2020)**

Note: The starting a business indicator is scored by rank and takes into account the number of procedures, time, cost and paid-in minimum capital requirement for a small- to medium-sized limited liability company to start up and formally operate in each economy's largest business city. Economies are ranked for their ease of doing business from 1–190. A high ease of doing business ranking means the regulatory environment is more conducive to the starting and operation of a local firm. Time to start a business is measured in days.

Source: (World Bank, 2020<sup>[18]</sup>) *World Bank, Doing Business Index*, <https://www.doingbusiness.org>

StatLink  <https://doi.org/10.1787/888934253461>

WB6 economies have adopted tools to help investors navigate the various regulations and procedures. As part of this effort, they have also accelerated the digitalisation of the services dealing with investors, and are at different stages in developing electronic portals of administrative procedures and formalities for business activities. All the economies have established one-stop shops for business registrations. It should be mentioned that reforms in North Macedonia will facilitate business operations through the establishment of a virtual one-stop shop for investors that gathers 10 online services<sup>12</sup> in a single portal.

Some WB6 economies could further reinforce their processes and co-operation mechanisms for investment facilitation. All the economies have sound mechanisms to design and reform policies, and have established solid consultation mechanisms for public-private dialogue. However, burdensome procedures for investors in the region are still fuelled by the uncoordinated actions of the various government agencies and levels of government involved in approving and granting business licences, which result in suboptimal treatment of investors. Stakeholders have also indicated that difficulties in obtaining licences in some sectors prevent investment and affect the whole economy (UNCTAD, 2017<sup>[29]</sup>). However, governments in the region have engaged in processes to simplify their licensing requirements and improve their administration, notably at lower administrative levels.

Investment facilitation is further weakened by the limited role played by the IPAs in this area in the region. For instance, none of the IPAs are officially mandated to issue business permits and the issuance of business permits at the lower administrative level in WB6 economies creates confusion and overlap in responsibilities between the different levels of government (UNCTAD, 2017<sup>[29]</sup>). One-stop shops in the region are also

primarily operated by business registration agencies,<sup>13</sup> with limited involvement by the IPAs. Overall, the IPAs' role in facilitating investment in most of the WB6 economies is limited to providing information to foreign investors to help them navigate the administration while redirecting them to the relevant authorities as they do not have the authority to collect or approve documents. MIA is the exception, having recently been mandated to speed up administrative procedures and provide the conditions for efficient work (its predecessor MIPA was not involved in business registration procedures). It should also be noted that RAS and AIDA play more advanced roles in facilitating important or strategic investment projects.

Investment facilitation in the WB6 economies would benefit from greater involvement by the IPAs. Indeed, as IPAs are the first point of contact for international investors, they can play a central co-ordination and liaison role with other government entities in charge of managing and delivering business licences. It is therefore crucial to build the capacity of both the IPA and the relevant civil service agencies. Finally, regular monitoring and evaluation are also necessary to ensure that investment facilitation tools and policies are useful, up-to-date and respond to investors' needs (Novik and de Crombrughe, 2018<sup>[11]</sup>).

### ***Proactive investor targeting is progressively being adopted***

Investor targeting is one of the key functions of IPAs. It is one of the most resource-intensive, but also one that can lead to the best results in terms of securing actual FDI projects. Research has found that one dollar spent on investment promotion in a specific sector translates into USD 189 of FDI inflows (Harding and Javorcik, 2011<sup>[30]</sup>). It refers to the direct targeting of investors, sectors, projects or economies through events, including one-to-one meetings with investors, pro-active campaigns, and inquiry and request handling (OECD, 2018<sup>[26]</sup>). It is the opposite of reactive promotion, in which IPAs answer investor-initiated inquiries. A clear prioritisation strategy that is in line with national development strategies is needed to guide IPAs' targeting activities.

IPAs in the six Western Balkan economies have historically focused on image building and strengthening their economies' profiles as competitive investment destinations. However, they are increasingly moving towards more proactive approaches for targeting sectors and economies. All WB6 economies have well-identified targets in terms of economic sectors and markets for FDI attraction. These are laid out in the strategic investment laws of Albania,<sup>14</sup> Kosovo and North Macedonia,<sup>15</sup> and in strategic documents and medium-term documents in Bosnia and Herzegovina, Montenegro and Serbia.

Since the last assessment, most of the WB6 economies have put in place more sophisticated mechanisms for targeting potential investors in a proactive and systematic manner:

- Albania's AIDA organised outreach campaigns for the agriculture sector in 2019 and the car manufacturing sector in 2020.
- In Bosnia and Herzegovina, outreach is conducted at both state and entity levels. FIPA and the Federation, in co-operation with the International Financial Corporation and the World Bank, launched an outreach programme in 2016 that targets the agriculture and automotive industries for investment. To date, Bosnia and Herzegovina has successfully conducted three outreach missions in Italy, Germany and the Netherlands, with a fourth having been postponed due to the pandemic. The Republika Srpska organised outreach campaigns in the fruit and vegetable processing sector targeting German companies in 2017 and Austrian companies in 2018.
- In Montenegro, MIA has already started to move from the reactive stance of MIPA to a more proactive targeting of potential investors and economies. It has defined target economies and started organising missions. For instance, it embarked on an investor outreach campaign for the furniture manufacture sector in 2020.
- Serbia has also continued to organise targeted outreach campaigns that are followed by analysis, lessons learned and follow-up mechanisms.

KIESA, on the other hand, does not have a clear strategy targeting priority sectors. It promotes the economy as an investment destination through participation in international fairs, and organising FDI conferences abroad. It should be noted that both Kosovo and Albania have also established mechanisms to target their respective diasporas, mainly relying on their representations abroad and embassies.

Most of the WB6 economies have also developed dedicated approaches to investment targeting in special economic zones, which have become a widely used instrument for attracting investment to the region (OECD, 2017<sup>[31]</sup>). For instance, in North Macedonia, DTIDZ has developed a more proactive and direct investor targeting strategy. It regularly reaches out to potential high value-added manufacturing companies to host in the zones in order to support a competitive environment and generate links with domestic firms. KIESA is also mandated with promoting the emergence of industrial clusters in special economic zones.

### ***Investor incentives in WB6 economies are driving a “race to the bottom”***

WB6 economies have long used investor incentives as a key tool for attracting investors through an abundance of tax breaks, relief and incentives (IMF, 2018<sup>[32]</sup>). Such policies include profit tax breaks, exonerations from social contributions, custom tax relief, tax holidays for employee benefits, subsidies for salaries and grants for investments. Economies also often offer preferential treatment when dealing with the administration, notably for strategic investment (under the new strategic investment laws) as well as in special economic zones.

The economies of the region seem to be competing to attract foreign investors, with incentives being used as the main instrument in a “race to the bottom”, or where host economies compete for foreign investment by unilaterally lowering standards due to co-ordination failure (Fitzgerald, 2001<sup>[33]</sup>). The positive impacts of these policies are often difficult to evaluate in terms of growth, development or job creation, but their negative consequences are rapidly felt as they lead to the erosion of public revenue. In addition, there is little evidence that lower taxes are a determining factor for attracting FDI. For instance, a World Bank survey found that predictability and transparency of public institutions, ease of setting up businesses and legal protection are considered more important than financial incentives for multinational companies when selecting an investment destination (World Bank, 2018<sup>[34]</sup>).

Over the last decade, most of the WB6 economies have increased their investment incentive schemes, rendering their incentive system more complex and sometimes difficult to navigate for investors. The management of these incentives is not always centralised as incentives are often managed by different and sometimes competing public bodies and at different levels of government, with limited accountability to a central authority. Comprehensive evaluations of the cost of these measures are often hampered by the multiplication of the structures as well as the lack of transparency in the management and implementation of FDI incentives.

For example, in North Macedonia, incentives are included in: 1) the 2018 Plan for Economic Growth, which provides incentives<sup>16</sup> to domestic and foreign companies operating in the 15 free economic zones; 2) the 2019 Law on Financial Support to Investment; 3) the 2018 Law on Technological Industrial Development Zones; and 4) the 2020 Strategic Investment Law. Albania also has a complex and multi-layered investment incentive regime characterised by multiple tax breaks included in various laws and changing fiscal measures (most recently the 2019 fiscal package) as well as incentives for strategic sectors in the 2015 Law on Strategic Investment and to investors in the Technological and Development Areas (TEDA). In Bosnia and Herzegovina, direct taxes and tax incentives, including supervision, are primarily provided at the entity level.

Nevertheless, some economies have simplified their investment incentive regimes by adopting a simple and predictable tax regime providing greater clarity for investors. For instance, Serbia has a 15% flat corporate profit tax and provides tax incentives that target large projects in which no special groups or regions benefit more than any others. The only tax incentive applied in Serbia is a 10-year corporate profit tax holiday for an investment superior to approximately EUR 8.5 million in fixed assets and with employment for at least 100

additional employees throughout the investment period. Kosovo has also adopted a 10% flat corporate profit tax and other investment incentives are provided in the 2016 Strategic Investment Law. These are directly negotiated with the government on a discretionary basis. It also offers customs breaks for investors in the free trade zones.

It is important to ensure that tax incentives do not place a disproportionate or unplanned strain on domestic resources. Reinforcing transparency and good governance allow for better distinction between beneficial and wasteful tax incentive programmes. A good practice to reinforce transparency and facilitate control by the relevant authorities is to include all tax incentives in the main body of tax law and under the authority of the tax administration (OECD, 2015<sup>[21]</sup>). This is the case in Serbia and Montenegro. In North Macedonia, tax incentives are provided through the tax laws and the Law on Technological Industrial Development Zones and are under the authority of the Public Revenue Office (PRO), which is the institution authorised for tax assessment and collection. In Albania, the Tax Administration and the Customs Administration oversee the introduction and granting of tax incentives, while the Ministry of Finance is in charge of avoiding unintended overlaps and inconsistencies in tax incentives policies. Finally, in Bosnia and Herzegovina, incentives for direct taxation are under the competence of the entities, while incentives for indirect taxation are the state's responsibility. The economy has nevertheless established mechanisms to avoid unintended overlaps and inconsistencies.

### ***Aftercare services are more focused on policy advocacy***

It is crucial for investors, notably foreign investors, to understand that the government is listening to their problems and concerns and that they have a reliable and responsive counterpart that can settle their problems. A key outcome effect of aftercare is policy advocacy, as maintaining a regular and constructive dialogue with the private sector can provide crucial insights and feedback that influence policy design and reforms to enhance the overall investment climate (De Crombrughe, 2019<sup>[35]</sup>). In addition, efficient and proactive aftercare services are important for investors to maintain and expand their activities in an economy.

Aftercare services are not limited to solving problems encountered by businesses – increasingly they support existing businesses to expand their activities by anchoring their operations in the local economy. Key aftercare functions and services that can be offered by IPAs include: 1) problem solving through structured trouble-shooting with individual investors; ombudsman intervention and mitigation of conflicts; and 2) business support services by providing databases of local suppliers, matchmaking between investors and local firms; capacity-building support for local firms; promoting cluster programmes; and facilitating the recruitment of local staff through assistance programmes and training or educational programmes (OECD, 2018<sup>[26]</sup>).

All six Western Balkan economies are increasingly reinforcing their aftercare services and formally including them in their IPAs' official mandates. In Serbia, aftercare activities have been defined as a permanent activity of the RAS following the adoption of its 2017-2019 strategic framework. In Albania and Kosovo, aftercare services are included in the official mandates of both AIDA and KIESA. In Bosnia and Herzegovina, post-investment investor support is recognised as a key component of FIPA's mandate, along with policy advocacy and drafting proposals for legislation and legal measures aimed at improving investment conditions. In Montenegro, the recent establishment of the new and better resourced investment promotion agency MIA is a positive step towards improving the economy's aftercare services, although the agency does not have a formal mandate to provide aftercare services.

In the WB6 economies, the sophistication of IPAs' aftercare services and their extension to business support activities are often hampered by the absence of dedicated units and structured services as well as their limited human and financial resources. A good model in the region is North Macedonia, where ASIPI has developed an online platform to make it easier to find local suppliers, and to communicate with other administrations and local authorities. The DTIDZ offers a broad range of aftercare services for investors in the zones, including dealing with administrative services (taxes, visas, construction permits, customs, etc.)

as well services for creating linkages with universities, developing company linkages, and identifying local suppliers, etc. In addition, DTIDZ is developing an online aftercare registration platform in order to improve the services for existing investors in the zones through improved communication protocols and aftercare services.

In addition, most of the WB6 IPAs organise targeted field visits to collect feedback from businesses on recurrent issues affecting their activities. In Bosnia and Herzegovina, such visits to investors are primarily conducted within the entities. For instance, between 2016 and 2019, joint teams including representatives from the Ministry of Economy and Entrepreneurship of the Republic of Srpska and local self-government units visited around 135 companies and discussed the business difficulties that investors are facing. By 2020, FIPA representatives (from all three offices: Sarajevo, Banja Luka and Mostar) had visited a total of 664 companies under the Post-Investment Support Programme or the Aftercare Programme. FIPA has also established a database of companies that includes the feedback received from field visits. It publishes an annual report of aftercare visits consisting of suggestions for improving the business environment, proposals for amending the legal framework, and recommendations for resolving business community issues. This is then submitted to the Council of Ministers of Bosnia and Herzegovina. Similarly, the Ministry of Economy and Entrepreneurship of Republika Srpska conducts aftercare visits and creates a report on the problems encountered by investors, which is then sent to the government. A regulatory impact assessment is done based on the results. In Kosovo, KIESA, despite its limited resources, visits 300 to 350 foreign investors each year to get their perspectives on the investment and business climate. It drafts a report with proposed measures that is submitted to the Kosovo Economic Council so it can take the measures proposed. In Albania, AIDA conducts an annual investor satisfaction survey, as well as on-site visits, to collect concerns and needs by sector.

The majority of the WB6 economies have well-established and structured public-private policy dialogue platforms that feed into policy making. These include Foreign Investors Councils or National Economic Councils that organise regular dialogue between representatives of foreign and multinational companies, as well as SMEs and local businesses, and high-level government officials. The IPAs' level of involvement in public-private dialogue depends on the characteristics of the overarching institutional framework for investment facilitation and retention. However, IPAs' involvement in aftercare and policy advocacy should be fostered. Their interactions with foreign investors mean they are best placed to understand their challenges and expectations and can provide invaluable insights and feedback to enrich the policy-making process and enhance the overall investment climate (Novik and de Crombrughe, 2018<sup>[11]</sup>).

In Bosnia and Herzegovina, FIPA has developed a collaborative network for post-investment support to investors and prepares the annual Proposals for Improving the Business Environment and Investment Conditions in Bosnia and Herzegovina report. Similarly, the Ministry of Economy and Entrepreneurship of Republika Srpska has formed a collaborative network consisting of local government and line ministry representatives which annually gives proposals for improving the business environment, amending relevant laws and creating plans to attract investment. In Kosovo, KIESA organises regional conferences with the private sector in different municipalities in order to ensure public-private dialogue. In North Macedonia and Serbia, ASIPI and RAS maintain strong collaboration with business associations such as the Chamber of Commerce and Industry and Foreign Investment Council. They also maintain active dialogue through a working group consisting of representatives of the public and private sector within the Support Programme for Entering Supply Chains. Albania's Investment Council was established in 2015 as the main public-private dialogue mechanism and AIDA has permanent membership status on the council.

Most IPAs in the region are also involved in resolving the problems and issues faced by individual investors. However, their interventions are not structured and often conducted on an ad-hoc basis, redirecting the investors to the competent services and with limited follow-up. Around 81% of the IPAs in the OECD economies offer structured troubleshooting with individual investors (OECD, 2018<sup>[26]</sup>), which is becoming a popular approach to solving their problems; 45% of the IPAs engage in conflict mitigation.

The findings of this assessment, particularly in the domain of investment promotion and facilitation frameworks, are also relevant for the WB6 economies' implementation of the Common Regional Market Action Plan, which includes a component on regional investment (Box 4.4).

#### Box 4.4. Towards co-ordinated investment promotion in the Common Regional Market

The following key findings of the CO2021 investment promotion and facilitation sub-dimension can inform the implementation of actions under the investment component of the Common Regional Market (CRM) 2021-2024 Action Plan (Regional Cooperation Council, 2021<sup>[4]</sup>):

- Albania, Bosnia and Herzegovina, Montenegro and Serbia already conduct targeted outreach campaigns and organise missions while promoting their economies through participation in international fairs.
- All WB6 economies have developed investment incentives to promote the emergence of industrial clusters in special economic zones and facilitate the establishment of businesses in these areas.
- All WB6 economies have outlined strategic sectors for investment targeting within their regulations or IPA mandates, with agriculture and manufacturing being the most commonly promoted industries, followed by the tourism, ICT and energy sectors.
- Regarding information databases, only AIDA, FIPA and RAS use CRMs, while ASIPI uses a dedicated platform for planning activities, keeping records, and supervising economic promoters.
- Albania, Bosnia and Herzegovina, Kosovo, Montenegro, and Serbia have begun to implement green investment promotion schemes aimed at renewable energy and energy efficiency projects, with several of them having already released large public procurement opportunities in these fields.

Source: (Regional Cooperation Council, 2021<sup>[4]</sup>) *Regional Cooperation Council, Common Regional Market 2021-2024 Action Plan*, <https://www.rcc.int/docs/543/common-regional-market-action-plan>.

#### The way forward for investment promotion and facilitation

- **Strengthen the IPAs' abilities to implement their mandates efficiently.** It is particularly important to clearly define the roles and objectives of the IPAs and to ensure that they have sufficient resources and capacity to conduct key investment promotion and facilitation functions, such as investor targeting, facilitation and aftercare.
- **Simplify and clarify tax incentive regimes for investors.** Unclear, complicated or overlapping tax legislation where incentives are dispersed across multiple laws can be difficult for investors to navigate and open the door for discretionary decisions. Reinforcing transparency, facilitating control by a single relevant authority, and including all tax incentives in the main body of tax law under the authority of the tax administration creates a clear incentive regime for investors to follow.
- **Ensure the effective participation of the IPAs in investment facilitation as well as in defining priority sectors and economies.** As the first point of contact between the government and the foreign investor, the IPA is often well placed to understand the concerns of investors, help resolve problems and provide useful feedback to inform public policy. Investment promotion agencies will play an even bigger role in the post COVID-19 investment landscape to reinvigorate foreign interest in the region. To this end, IPAs can support previous investors with ongoing projects and supply chain issues while creating a stable investment landscape for new investors through adapted policies and incentives (Box 4.5).

### Box 4.5. Investment promotion agencies in the time of COVID-19

The COVID-19 pandemic has not only provoked a worldwide health crisis, it has also halted global trade and international investment transactions, further hampering the ability of economies to best respond to and overcome the social and financial costs of the pandemic. IPAs, as key players in business attraction and supply chain management, have the unique ability to adapt and adjust to changes in the investment landscape to better mitigate the economic consequences of COVID-19.

To overcome these challenges in the short-term, IPAs have taken to reorganising their work methods and refocusing their priorities. Most OECD IPAs have switched to digital tools such as dedicated and regularly updated COVID-19 sections on their website to counter the inability to work through in-person investor visits, events, fairs, and missions. Meanwhile, focus has been shifted from marketing to new investors towards concentrating on existing clients, helping them cope with supply chain disruptions and business operations as well as actively updating them on COVID-related developments and ongoing government support programmes. IPAs are also using their business networks to mitigate supply chain issues in hard hit sectors by helping them acquire equipment necessary to avoid further disruptions.

IPAs are also implementing medium and long-term solutions in response to the pandemic. Agencies are creating long-lasting digital solutions for servicing existing clients and identifying future clients, such as video-conference systems, virtual sit-visit facilities and new investor facilitation tools such as digital signatures, one-stop shops and, electronic licenses or permits. They are also amplifying the reliability and accessibility of client databases. Finally, IPAs are also beginning to revise previously strategic sectors and are moving towards a narrower mix of industries, while putting more effort into better developed investor targeting practices for projects with the highest impact to help overcome revenue losses due to the pandemic.

## Investment for green growth (Sub-dimension 1.3)

Developing an investment landscape that prioritises green growth and sustainable development requires a strong commitment to environmentally conscious practices and legislation, as well as comprehensive strategies that promote economies as green destinations through well-crafted incentives, focused targeting and widespread awareness-raising campaigns.

The investment for green growth sub-dimension is assessed through two qualitative indicators (Table 4.8). As a newly assessed sub-dimension for the investment chapter of the Competitiveness Outlook 2021, the scores for the investment for green growth sub-dimension are lower than the first two sub-dimensions. This can be attributed to the very recent adoption of green investment strategies that have yet to be fully implemented, partially due to the effect of COVID-19 on foreign investment attraction. Kosovo was given a score of zero as information and data were too limited for a reliable analysis of the economy's green investment initiatives.

**Table 4.8. Scores for Sub-dimension 1.3: Investment for green growth**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 1.3: Investment for green growth	Green investment policy and promotion	3.0	2.5	0.0	1.0	3.0	3.0	2.1
	Choosing public and private partnerships for green growth	2.5	1.5	0.0	2.0	3.0	3.0	2.0
<b>Investment for green growth average score</b>		2.8	2.0	0.0	1.5	3.0	3.0	2.0

### **Green investment frameworks and initiatives are generally in the early stages**

Green investment projects, like most infrastructure projects, provide unique advantages for investors. These include steady, long-term, inflation-linked income streams for renewable energy and energy efficiency projects irrespective of returns on other investments. As these sectors typically provide low to modest interest rates and generally low yields for fixed income, governments should be inclined to provide an adequate enabling investment environment to attract institutional investors and exploit the industry's potential (Röttgers, Tandon and Kaminker, 2018<sup>[37]</sup>). However, green infrastructure projects often remain seriously constrained by specific investment barriers such as erratic and undefined policy frameworks, subsidies and regulator rigidities that promote inefficient resource use and an inability to capture the value of sustainable natural resource management, among others.

All WB6 economies are generally in the early development stages of green investment policy and promotion initiatives. Every economy has shown commitment to establishing and revising environmentally conscious legislation and long-term strategies for the environment (Box 4.6). Bosnia and Herzegovina and North Macedonia have recently amended their energy strategy and energy law (respectively), to further promote the use of renewable energy sources and energy efficiency. Governments can promote their economies as green investment destinations by creating campaigns to raise awareness of investment opportunities in energy efficiency or renewable energy projects, as well as eco-tourism, green transportation, circular economy, waste management and sustainable agriculture. However, only half of the WB6 economies (Albania, Montenegro and Serbia) have a clear strategy or programme for attracting and incentivising green investment, or clearly outline green growth priorities.

#### **Box 4.6. Creating a green investment landscape in Montenegro**

Montenegro has shown a particularly strong commitment to improving its green economy and increasing projects that ensure energy efficiency and encourage the use of renewable energy. The economy has adopted several policies to ensure good energy practices, including the Energy Policy of Montenegro until 2030, Energy Development Strategy by 2030, Energy Law, Strategic Environmental Assessment Law and National Renewable Energy Action Plan to 2020 and action plan for implementation of the Energy Development Strategy by 2030. The Government of Montenegro also introduced financial incentives for new projects in the renewable energy sector, leading the economy to achieve 41.6% of energy gross final consumption from renewable sources in 2018. From May 24 to June 2, 2019, for the first time, Montenegro produced all its electricity from renewable sources. In the field of energy efficiency, the Government of Montenegro is currently implementing three projects to improve the green landscape:

1. **Energy efficiency in Montenegro (MEEP):** in partnership with the International Bank for Reconstruction and Development (IBRD), the project will improve energy efficiency and monitor energy and water consumption in 20 health facilities around the economy, and create a sustainable system of financing energy projects in the public sector by December 2023.
2. **Energy efficiency programme in public buildings (EPPB):** in partnership with KfW bank, Montenegro has reconstructed 20 primary and secondary schools to improve energy efficiency and will continue to implement measures for better energy efficiency in selected educational, social and administrative institutions. It has set energy consumption standards of maximum 150 kilowatt hours per metre squared (kWh/m<sup>2</sup>) for facilities in the north, 125 kWh/m<sup>2</sup> for facilities in the central zone and 100 kWh/m<sup>2</sup> for facilities in the south of Montenegro.
3. **Energy efficient home programme:** this provides a sustainable financial mechanism for applying energy efficiency measures in households. The Ministry of Economy subsidises interest rates and loan fees for households in Montenegro to:

- purchase and install heating systems based on modern forms of biomass (pellets, briquettes) including boilers, furnaces, piping and/or radiators
- install thermal insulation on the facade of a residential building
- install energy efficient facade joinery.

Additionally, since 2018, the UNDP has been implementing the Growing Green Business in Montenegro project which promotes private sector investment in low-carbon and green businesses, stimulating low-emission economic growth and green job creation in the economy. The project uses a combination of policy de-risking (implementation of favourable policy frameworks and provisions of business support services) and financial de-risking instruments (improving access to finance for innovative green businesses and partnerships, in particular agriculture, tourism and energy sectors).

Source: (European Commission and Government of Montenegro, 2020<sup>[38]</sup>) *Montenegro Progress Reports under Renewable Energy Directive 2009/28/EC as adapted by the Ministerial Council Decision 2012/04/MC-EnC*, [https://energy-community.org/dam/jcr:5dfac2b4-b0bd-4204-a820-86555cb2d2fd/MO\\_3RES\\_progress\\_032020.pdf](https://energy-community.org/dam/jcr:5dfac2b4-b0bd-4204-a820-86555cb2d2fd/MO_3RES_progress_032020.pdf).

Governments can support private investment for green growth by establishing a predictable policy and regulatory environment for green investment. The OECD has created several references and recommendations to guide economies in creating policies to attract sustainable and green investment (Box 4.7). Most economies have implemented environmental strategies that include green investment objectives; however, they remain at varying levels of development and specificity. Only half of the region's strategies include in-depth details such as compliance requirements, cost estimates, financing sources and strategies, or project priorities. Institutional frameworks to support green investment remain complex and unclear in some WB6 economies. Montenegro's national strategy, the Smart Specialization Strategy of Montenegro or S3.me (2019-2024), promotes green growth and encourages green investments by defining the priorities and focal areas to be developed for sustainable and green growth. In 2020, Serbia also established its Multi-annual Investment and Financing Plan (MIFP) for the environment that includes detailed priorities and strategies for investment projects, particularly for waste, wastewater and drinking water infrastructure. Bosnia and Herzegovina and Kosovo have also implemented strategies aimed at promoting green investment – the Integrated Energy and Climate Plan of Bosnia and Herzegovina (NECP BiH) for the period 2021-2030 and Kosovo's Strategy for Supporting Innovation and Entrepreneurship (2019-2023).

#### Box 4.7. OECD Centre on Green Finance and Investment

In 2016, the OECD established its Centre on Green Finance and Investment to support member states in transitioning to green, low-emission and climate-resilient economies. The centre aims to increase the attractiveness of economies for green investments by developing effective policies, institutions, and instruments to facilitate these transactions while further harmonising members with the principles of the Sustainable Development Goals and Paris Agreement.

The centre holds a global annual forum on green finance and investment to enable knowledge exchange between leaders from the private sector, government and regulatory institutions, academic and civil society on integrating and prioritising green goals in their agendas. The institution also develops innovative analysis and practical recommendations for supporting the rapid scaling-up of green investment and financing flows that can help relevant actors implement policies to achieve these goals.

Source: (OECD, 2020<sup>[39]</sup>) OECD Centre on Green Finance and Investment (webpage), <https://www.oecd.org/cgfi/>.

Some economies have implemented strategies at the lower administrative level that align with economy-wide strategies to create a predictable strategic and legal framework for investors. In Albania, for instance, the municipality of Tirana has adopted its Sustainable Development Strategy 2019-2022, which covers sustainable economic, social, and ecological development in line with the national Green Development Agenda. Meanwhile, in 2019 Serbia launched its National Strategy for Sustainable and Integrated Urban Development as well as a three-year action for its implementation, further aligning all administrative levels with the EU Urban Agenda.

Governments can mitigate regulatory risk by providing greater certainty for investors through transparency and comprehensive regulations to afford investors equal opportunity and protection (OECD, 2015<sup>[2]</sup>). In this sense, all economies continue to respect core investment principles such as investor protection, intellectual property rights protection and non-discrimination in most areas of investment, including those inclined to attract green investment. These rights are typically enshrined in the economies' laws on investment or foreign investment.

### ***Frameworks for public and private partnerships for green growth are improving***

Mobilising and scaling-up green investment implies leveraging domestic and international public and private investment. Public-private partnerships (PPPs) can be mutually beneficial, especially while economies battle the financial consequences of the COVID-19 pandemic and public spending on green infrastructure is likely to be low as decreasing deficits take priority. The private sector benefits from risk transfer, increased investment opportunities and business development. Most economies have developed strong frameworks for public-private partnerships and continue to show commitment to non-discriminatory public procurement opportunities for green projects.

Albania, Montenegro, North Macedonia and Serbia have developed relatively strong frameworks for choosing public and private partnerships for green growth. These economies not only have dedicated PPP laws, but have also shown a commitment to non-discriminatory public procurement opportunities in energy efficiency and renewable energy projects. For instance, the 140 MW Karavasta photovoltaic park project in Albania is being implemented by the winner of a non-discriminatory public procurement auction (the French company Voltalia). Meanwhile, the energy laws of both Albania and North Macedonia provide for feed-in premium tariffs for investment in renewable energy sources. However, Bosnia and Herzegovina only partially encourages PPP for green growth, as Republika Srpska and selected cantons of the federation have PPP laws and regulations that do not explicitly define investment in green growth, and the economy's regulatory framework is hindered by institutional complexities and unclear division of responsibilities.

### ***The way forward for green investment***

- **Integrate green growth priorities into existing strategies on investment promotion.** While some economies have already established dedicated strategies to attract green investment, those economies without such frameworks could streamline green investment promotion efforts by incorporating these principles into existing investment strategies.
- **Create awareness-raising campaigns** to promote the region as a green investment destination. Economies can design national or regional campaigns that highlight successful energy efficiency or renewable energy projects, emphasise innovative or green product manufacturing, and promote opportunities in green sectors and activities (Box 4.8). Nominating as "brand ambassadors" the domestic enterprises that are pursuing green initiatives would show potential investors the real green opportunities available in the region. Campaigns could be accompanied by easily communicable information materials such as brochures, websites and videos that can be shared with investors at external events.

- **Promote public-private dialogue on green investments.** Although most WB6 economies are conducive to public-private partnerships, enhancing the dialogue between public and private institutional and financial entities on the challenges, areas in need of support, and opportunities that exist for green investment can enhance investor confidence in bidding for existing renewable energy and energy efficiency projects.

#### Box 4.8. Slovenia's "Green. Creative. Smart." campaign

In recent years, Slovenia has renewed its commitment to encouraging green and sustainable projects, notably by providing EUR 10 million in cheap loans for environmental investments; approving grants on top of subsidised interest rates for investment in renewables and energy efficiency; and renewing subsidy schemes for companies and entrepreneurs dedicated to energy efficiency, renewables and measures to reduce pollution and greenhouse gas emissions.

In 2019, Slovenia's investment promotion agency, SPIRIT, launched an international communications campaign called "Green. Creative. Smart." In line with the CO2021 green investment recommendations, the campaign was incorporated under the existing business branch of the economy's tourism brand "I feel Slovenia". The campaign highlights key economically competitive advantages of the Slovenian economy in the fields of environmental technologies, robotics, mobility, research and development, digitisation, and creative industries.

The movement draws attention to Slovenian enterprises involved in, among others, light aviation, greenhouses powered by geothermal energy with production controlled by smart-sensors, and self-sustainable zero emission houses. The campaign is disseminated through promotional videos, external fairs, outreach programmes and partnership ambassador testimonials. As part of this project, SPIRIT held a series of webinars for investors of ongoing projects and potential foreign investors in 2020, covering Slovenian sustainable mobile solutions for road, air and sea transport; top solutions in the field of health; and green solutions for transition into the circular economy.

## Conclusion

Overall, the WB6 economies have established solid legislative frameworks that have become the building blocks for open and favourable investment climates. In addition, they all benefit from solid institutional frameworks and well-crafted strategies for investment promotion and facilitation, with dedicated IPAs that conduct the core functions of investment promotion and facilitation. Several economies have also strengthened their investor incentive and aftercare services to simplify procedures for foreign investors.

Further efforts are required to reinforce their policy framework, notably in conflict resolution, enforcing contracts and intellectual property rights. The IPAs' ability to fulfil their mandates is often hampered by a lack of capacity and resources, as well as complex institutional settings and limited co-ordination with other government bodies. The WB6 economies should continue streamlining administrative procedures for investors and improving the predictability of their regulatory environment, while pushing for greater capacity and resources to ensure IPAs can carry out their investment facilitation roles. Leveraging on their strong investment frameworks, the WB6 economies are well-positioned to pursue their reforms and further align themselves with international standards.

## Notes

<sup>1</sup> The Competitiveness Outlook 2021 assesses Bosnia and Herzegovina at the state-level and the entity-level. For more details on the methodology used to evaluate Bosnia and Herzegovina, please refer to the Assessment methodology and process chapter and Annex A on Bosnia and Herzegovina scoring models.

<sup>2</sup> Protection against unlawful expropriation is also enshrined in the constitution and the Law on Foreign Investment of the Republika Srpska as well as the Law on Foreign Investment for the Federation of Bosnia and Herzegovina.

<sup>3</sup> Kosovo's Law No. 04/L-220 on Foreign Investment defines expropriation as: "any act or measure, any series of acts or measures, any failure to act or series of failures to act, if the direct or indirect effect thereof is to deprive the concerned foreign investor of the ownership or control of, or a significant benefit or use of, an asset".

<sup>4</sup> As of December 2020, the draft law to establish a Kosovo commercial court was at the public consultation stage. The draft has received a wide and positive public response according to key stakeholders.

<sup>5</sup> The Singapore Convention on Mediation is a uniform and efficient framework for international settlement agreements resulting from mediation. It applies to international settlement agreements resulting from mediation, concluded by parties to resolve a commercial dispute.

<sup>6</sup> Albania has also prepared a draft law on trade secrets to further align with EU acquis. It is pending adoption.

<sup>7</sup> Kosovo is not included in the WEF Global Competitiveness Report.

<sup>8</sup> In 2018, the number of applications to register trademarks rose by 24.4% compared to 2017 and applications for patents and utility models increased by 11.7% in Albania.

<sup>9</sup> The NCEDK was reorganised in August 2020. It is now named the National Council for Economy and Investments (NCEI). The NCEI should act as an active forum for economic and investment promotion and is expected to be more active in the development and steering of KIESA. Detailed information on the new body and its mission is not yet available.

<sup>10</sup> In Serbia, RAS manages the Support Programme for Companies to Join the Supply Chains of Multinationals with a budget of circa USD 5 million. It provides advisory and financial support aiming at reinforcing the capacity of manufacturing firms in targeted supply chains.

<sup>11</sup> In addition to FIPA, numerous bodies are involved in FDI attraction activities at the entity level notably the Ministry of Economic Relations for Investment Promotion of the Republic of Srpska, which also undertakes investment promotion and facilitation activities.

<sup>12</sup> 1) e-Tax; 2) Central Registry; 3) e-Construction Permit; 4) Online Employment Registration; 5) E-Procurement; 6) EXIM (Export –Import licensing); 7) Automated System for Management of International Cargo Transport Licenses; 8) Government Land Auction; 9) Online Cadastre; 10) System for issuing Work and Residence permits to foreigners

<sup>13</sup> The National Business Centre in Albania, the Kosovo Business Registration Agency, the Central Register in North Macedonia, the Central Register of Business Entities in Montenegro and the Serbian Business Registers Agency

<sup>14</sup> The law on strategic investment in Albania considers strategic sectors to be: energy and mining; transport, electronic communications infrastructure and urban waste; tourism (tourist structures); agriculture (large agricultural farms) and fisheries; economic zones; and development priority areas.

<sup>15</sup> Strategic sectors defined in North Macedonia's 2020 Strategic Investment Law are: energy, transport, telecommunication, tourism, manufacturing, agriculture and food, forestry and water economy, health, industrial and technological parks, wastewater and waste management, sport, science and education.

<sup>16</sup> The incentives include a variety of measures including job creation subsidies, capital investment subsidies, and financial support to exporters.

# 5 Trade policy (Dimension 2)

---

A trade policy that facilitates cross-border economic activity promotes the competitiveness and growth of an economy. Trade liberalisation measures provide access to larger markets, leading to greater economies of scale and efficiency gains. This chapter assesses the frameworks, strategies, processes, and institutions in the six Western Balkan economies (WB6) related to trade policy. In doing so, it focuses on three key sub-dimensions. The first, the trade policy framework, examines governments' capacities to design, implement and evaluate trade policy, including institutional co-ordination, public-private consultations and monitoring and evaluation mechanisms. It also examines the development of market opening in the region through the evolution and outcomes of the network of trade facilitation agreements concluded by the WB6 economies. The second sub-dimension, trade in services restrictiveness, focuses on the regulations that govern and hinder the degree of openness of the economies in 12 service sectors. The third sub-dimension, e-commerce and digitally enabled services, focuses on the regulatory environments governing the most dynamic areas of trade flows – those operated through digital means. The sub-dimension analyses the regulations in force on e-commerce and the degree of restrictiveness of digitally enabled services. The chapter includes suggestions for policy enhancements for each of these sub-dimensions in order to improve trade performance and in turn increase the economies' competitiveness.

---

## Key findings

- **Trade policy institutional frameworks are functioning well and have been strengthened since the previous assessment.** Inter-institutional co-ordination of trade policy formulation is solid in most WB6 economies, usually involving official committees or working groups led by the ministry in charge of trade policy (either the trade or economy ministries). There are formal instruments for consultation with the private sector and civil society, and the economies have recently established trade facilitation committees.
- **The WB6 economies are well integrated commercially with their main trading partners.** Albania, Bosnia and Herzegovina, Montenegro, North Macedonia and Serbia are signatories to the Central European Free Trade Agreement (CEFTA), alongside with United Nations Interim Administration Mission in Kosovo on behalf of Kosovo in accordance with the United Nations Security Council Resolution 1244, through which they have achieved full liberalisation of tariffs on trade in manufactured and agricultural products. They are also parties to bilateral free trade agreements and stabilisation and association agreements (SAAs) with the EU. Overall, while the six economies continue to develop their networks of bilateral and multilateral trade agreements, they do so at disparate rates and most of the efforts focus on the EU. Indeed, there have been no substantial developments in global trade integration since the last round of analysis. Bilateral treaties with non-EU member states are rare and the process of accession of Bosnia and Herzegovina and Serbia to the World Trade Organization (WTO) is still ongoing, which in particular may limit the benefits of a favourable foreign direct investment regulatory regime in the latter economy.
- **Significant improvements have been made in opening up trade in services** through the adoption of Additional Protocol 6 to CEFTA in December 2019 and its ratification by Albania, Bosnia and Herzegovina, Montenegro, North Macedonia and Serbia, as well as through reforms to services trade policies. These and subsequent efforts will significantly reduce the costs of trade in the WB6. Nevertheless, the extent of liberalisation depends on the economy and the sector analysed, with a number of regulatory restrictions reducing the attractiveness of certain service sectors for foreign service providers. However, none of the economies have reported an increase in the restrictiveness of their regulatory environment.
- **All six economies have taken steps to strengthen their legal framework for e-commerce.** They have continued to align their sectoral laws and regulations with the EU e-commerce directive and have worked to remove non-legal barriers to the adoption of e-commerce, including raising awareness among small and medium-sized enterprises (SMEs). The emergence of the global pandemic and the increasing importance of e-commerce in world trade has boosted government responses. However, regulatory frameworks have evolved heterogeneously across the region and respond disparately to the challenges created for e-commerce globally in the context of COVID-19.
- **Regulations on digitally enabled services largely reflect international best practice.** The six economies' regulatory environments are more open than those of the OECD member states' average, and variations in performance across the region are very small, pointing to the potential for a high degree of regulatory harmonisation. The remaining restrictions mainly relate to infrastructure and connectivity measures. This indicates that telecommunications regulations could be further improved, particularly in the area of interconnection.

## Comparison with the 2018 assessment

Since the Competitiveness Outlook 2018, the economies of the WB6 have made progress in the areas of inter-institutional co-ordination and public-private consultations, and their evaluation and monitoring capacities have also improved overall, but at a slower and more irregular pace (Figure 5.1). Economies have also made progress on their e-commerce frameworks, but also at very variable speeds. The remaining elements of the current framework cannot be compared with the previous Competitiveness Outlook because this edition has prioritised different services sectors for analysis.

**Figure 5.1. Overall scores for the trade policy dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Progress on implementing the CO 2018 policy recommendations ranges from moderate to advanced (Table 5.1). Progress has been made in improving the regulatory framework by developing single strategies or action plans designed to increase trade performance, while advanced improvements have been made to enhance public-private consultation mechanisms. Implementation across economies however varies.

Table 5.1. Implementation of the CO 2018 policy recommendations: Trade policy

Competitiveness Outlook 2021		
CO 2018 policy recommendations	Main developments during the assessment period	Regional progress status
The WB6 economies could consider developing single strategies or action plans designed to improve trade performance.	<ul style="list-style-type: none"> <li>In Albania the National Plan for Trade Policy Coordination and Trade Facilitation (2017-2020) was adopted in 2017 and is aligned with Albania's National Strategy for Development and Integration 2014-2020. The new National Plan for Trade Policy Coordination and Trade Facilitation (2021-2023) is prepared. This plan contains concrete trade facilitation measures for Albanian businesses aiming to develop trade in the WB region, EU countries and beyond, and is harmonised with the trade policy developments undertaken by Albania in the framework of the implementation of the Protocol. Addendum 5 "On Trade Facilitation", Additional Protocol 6 "On Trade in Services" of the Regional Free Trade Agreement CEFTA 2006 and in full harmonisation with the Action Plan for the establishment of the Common Regional Market approved by the Prime Ministers of the economies of the Western Balkans at the Sofia Summit on 10 November 2020 (MAP REA 2021-2024).</li> <li>Kosovo has a trade facilitation strategy (covering the period 2017-2021) and an action plan (2017-2019)</li> <li>The other WB6 economies have incorporated trade elements in their recent development strategies but do not have or have not updated their strategies or action plans dedicated primarily to trade facilitation since 2018.</li> <li>The first action plan of Serbian Trade Facilitation Body was adopted for two-year period 2018/2019 and the second one was adopted for 2020/2021.</li> </ul>	Moderate
The public-private consultation mechanism could be improved.	<ul style="list-style-type: none"> <li>In Bosnia and Herzegovina, progress has been made with the adoption of the Regulation for the Implementation of Public Consultation Standards at the state level within the 2017 <i>Regulation of Consultations in Legislative Drafting</i> which contains the provisions on minimum requirements for consultations. According to the regulation, BIH institutions at the state level are obliged to publish draft laws on a dedicated website (eConsultation) which allows the public to submit proposals and remarks. The use of the eConsultation website is growing by BIH institutions as well as the business community.</li> <li>In Kosovo progress has been made since the regulation on Minimal Standards for Public Consultation Process entered into force in 2017. According to the annual reports of the Office of Good Governance (OGG), the government has been consulting with an increased number of institutions and stakeholders. A dedicated website has been set up to enable free access to draft and final laws and regulations and for the private sector to comment on draft laws in a transparent manner. The OGG produces reports on the implementation of the minimum standards of PPCs set up in the law.</li> <li>In Montenegro, a mandatory consultation procedure for all draft legislation was introduced under the new Decree on State Administration (2018). The government now must conduct a public hearing when preparing laws and strategies. In addition, the government has formalised the requirements for participation in working groups, making it mandatory for it to invite relevant stakeholders to provide inputs and comment on draft laws. The decree has also extended the scope of public consultations to cover national strategies. An online participation platform was created to facilitate public consultations.</li> <li>North Macedonia has implemented the 2019 Rules for the Organization of the Public Consultation in starting the Legislative Process, which improved its regulatory transparency by simplifying public consultation mechanisms and making them more accessible via the centralised and dedicated PPCs website, ENER.GOV.MK.</li> <li>Serbia has made strides in increasing stakeholder participation by NGOs, academia, private sector, and Chamber of Commerce during both the formation and the implementation phases of policy making, as mandated by the Law on Planning System of the Republic of Serbia, Decree on Public Policy Management Methodology, Policy Analysis and Regulations, the content of individual public policy documents and amendments to the Law on State Administration. The Rulebook Governing the Guidelines of Good Practice for the Realization of Public Participation in the Preparation of the Draft Laws and Other Regulations and Acts in 2019 further defines the consultation process and methods. Additionally, in January 2020, the government adopted guidelines on including civil society in working groups for drafting regulations and public policies.</li> </ul>	Advanced

## Competitiveness Outlook 2021

CO 2018 policy recommendations	Main developments during the assessment period	Regional progress status
Ease conditions on the temporary movement of natural persons and reduce the remaining barriers to market entry and competition in their services sectors.	<p>The WB6 economies have made efforts to reduce non-tariff restrictions in their services related regulations:</p> <ul style="list-style-type: none"> <li>• Serbia, North Macedonia and Kosovo have been the most active in implementing reforms: Serbia in 2014-16 and North Macedonia in 2016-19, in particular targeting the architecture and engineering sectors. Kosovo has maintained a steady flow of reforms in the period 2014-20 with a notable highlight being the opening of its courier market in 2019.</li> <li>• Montenegro has mainly opened up its construction, engineering and architecture sectors. Albania started with a more attractive environment in 2014 so that it has had a more stable environment until 2019. The exception is the 2015 reforms in the courier sector. It is also the economy that has lowered its degree of restrictiveness the most in 2019 and 2020. Finally, BIH has maintained a low degree of variation in its indices over the years.</li> <li>• The six economies also refrained from implementing protectionist measures in 2020, which contrasts with the marked STRI increases observed in some OECD economies for the same period.</li> <li>• Significant progress has been made in easing the conditions for the movement of persons between the CEFTA economies through the adoption of Additional Protocol 6 to the CEFTA agreement.</li> </ul>	Moderate

## Introduction

While decades of multilateral, regional and unilateral efforts have significantly reduced traditional trade barriers such as tariffs, many elements can still impede trade. Regulatory heterogeneity and non-tariff barriers are now increasingly seen as a major source of trade limitations and costs, affecting both domestic producers and foreign suppliers (OECD, 2017<sup>[1]</sup>). These latter barriers particularly affect services, which constitute a large part of the global economy, generating more than two-thirds of global gross domestic product (GDP), attracting more than three-quarters of foreign direct investment (FDI), employing the largest number of workers, and creating most of the world's new jobs (OECD, 2017<sup>[2]</sup>).

A trade policy that facilitates cross-border economic activity therefore promotes the competitiveness and growth of an economy. Trade liberalisation measures provide access to larger markets, leading to greater economies of scale and efficiency gains. Better market access also leads to greater competition from international firms in domestic markets, resulting in increased competition and better allocative efficiency.<sup>1</sup> In addition, transparent and well-designed policies facilitate access to global value chains (GVCs), which are very effective ways to integrate into the global economy and connect to modern technologies and skills (OECD, 2015<sup>[3]</sup>). Trade facilitation through transparent, predictable, and simple border procedures speeds up the movement of goods and allows firms to reduce losses of perishable goods, lower costs, be more responsive to changing consumer preferences and participate in time-sensitive global value chains (OECD, 2018<sup>[4]</sup>).

Economies are therefore faced with the need to put in place trade policies that on the one hand smooth trade flows, while at the same time refraining from putting in place measures that act as disincentives to trade, all the while maintaining a balance with the international environment and public utility considerations. In recent years, attention has grown on the regulatory heterogeneity and inclusiveness of other areas such as environmental protection and labour laws. While regulatory heterogeneity is often the result of diverging national public policy objectives, it may be the undesired result of rule-making that ignores the international regulatory environment and interconnectedness of our societies and economies (Basedow and Kauffmann, 2016<sup>[5]</sup>). Good regulatory practices involving stakeholder feedback and evaluation are therefore critical to ensure that regulations achieve their desired objectives.

This chapter is intended to provide guidance to help economies develop appropriate and balanced trade regulatory policies. In doing so, it is linked with other policy dimensions analysed in this Competitiveness Outlook:

- **Chapter 4. Investment** (and in particular FDI) depends on an open and liberal trade regime with effective trade facilitation measures in place, such as efficient customs administrations and reduced transaction costs. Moreover, investment is complementary to trade as foreign investment abroad stimulates the growth of exports by investing economies. Finally, both a sound investment framework and unrestricted trade are seen as facilitators of economic growth.
- **Chapter 11. Employment policy** and job creation for both skilled and unskilled workers are stimulated by more open goods and services markets and competitive environments. Exporters benefit from reduced barriers to the movement of people in services increases the demand for more highly skilled labour. Foreign skilled labour, on the other hand, can encourage a transfer of knowledge that increases the expertise of local workers.
- **Chapter 12. Science, technology and innovation** are sources of comparative advantage which drive trade. Exports, investments abroad or licensed technologies are driven by innovative and more productive companies. Open and more liberal markets contribute to the diffusion of innovation and the international transfer of technology (Ferencz, 2019<sup>[6]</sup>). Trade in capital goods and intermediate goods and services, the movement of people and licensing agreements, allow for new technologies to be transmitted across borders.
- **Chapter 13. Digital society** stimulates trade. High quality access to competitively priced communication networks and services is fundamental (OECD, 2019<sup>[7]</sup>), including to digital trade which has become vital for economic activity and innovation during the global COVID-19 pandemic. Digitalisation facilitates trade, the co-ordination of global value chains and the dissemination of ideas, changing the way companies engage in international trade, what they sell and to whom. Digitalisation creates new business opportunities for companies to sell more products to more markets, allowing economies to diversify their export baskets. It increases trade in goods and services across all sectors and allows economies to make better use of their trade agreements. However, barriers to digital services, which form the backbone of digital trade transactions, are increasing and are not necessarily only regulatory (OECD, 2019<sup>[8]</sup>).
- **Chapter 14. Transport** is key for trade facilitation, which depends mainly on physical infrastructure, traffic management, and customs and border crossing points. Sectors with high export intensity, such as manufacturing and agriculture, depend on quick, cost-effective, and reliable transport modes. Delays due to poor transport and logistics can be costly: an extra day can reduce exports by at least 1% and can also impede export diversification (OECD/WTO, 2013<sup>[9]</sup>). Poor logistics act as a heavy barrier to the growth of cross-border e-commerce for physical goods in many economies, especially the developing ones (Rodriguez, 2018<sup>[10]</sup>).
- **Chapter 17. Agriculture policy** and trade are highly interdependent. Trade plays a crucial role in providing food to consumers around the world. It helps to provide a wider choice of consumer goods and has played a role in reducing global food insecurity. Over the past decade, international food and agricultural markets have undergone some significant changes, bringing national and international markets closer together. Since 2000, agri-food trade has grown strongly as world markets have responded to a more rules-based trading environment, lower tariffs, and reduced trade-distorting producer support (OECD, 2019<sup>[11]</sup>). But agri-food trade is not only growing, it is also becoming global. Food is increasingly made from a wider range of products, produced in more places around the world. Now a growing share of agri-food trade takes place in global value chains (GVCs) that link agri-food sectors with other sectors of the economy around the world (OECD, 2020<sup>[12]</sup>). Since agri-food products in GVCs may cross borders several times before reaching final consumers, their costs can be substantially increased by uncontrolled non-tariff measures – those

related to laws, regulations and requirements such as sanitary and phytosanitary measures (SPS), technical barriers to trade and customs procedures (OECD, 2019<sup>[11]</sup>).

## Assessment framework

### Structure

This chapter measures trade policies in the WB6 economies by assessing the following three broad sub-dimensions:

1. **Sub-dimension 2.1: Trade policy framework** focuses on the quality of the decision making in trade-related policies and the effectiveness of the government in formulating and implementing new trade policies. This is assessed by their degree of integration into the network of international trade agreements as well as their implementation of the OECD Trade Facilitation Indicators.
2. **Sub-dimension 2.2: Services trade restrictiveness** assesses restrictions to services trade in the WB6 economies. As services are a major part of the global economy, estimated at around 80% of global GDP, this chapter puts a strong focus on trade in services, which allows economies to specialise according to their comparative advantages in services and skills. To do so, it makes use of the main tool in this field, the OECD's Services Trade Restrictiveness Index (STRI). Compared to previous editions, the 2021 iteration of the WB6's STRI has been significantly expanded.
3. **Sub-dimension 2.3: E-commerce and digitally enabled services** assesses the regulatory environment for e-commerce and trade in digitally enabled services. This area of global trade is currently rising and the anticipation is that e-commerce will grow more in the near future, especially with new technologies. The sub-dimension therefore focuses on the two main components of trade: trade in goods and trade in services enabled through digital networks. They are assessed through two indicators: the quality of the e-commerce framework and the degree of restrictiveness of digitally enabled services.

Figure 5.2 shows how these sub-dimensions and their constituent indicators make up the assessment framework for the trade policy dimension. The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. The main part of the analysis of trade in services in the WB6 region is based on a partial OECD Services Trade Restrictiveness Index (STRI) for the six economies that make up the region (Box 5.1). The regulatory databases set up for the partial OECD STRI for the WB6 were created thanks to co-operation with the WTO and CEFTA, which is gratefully acknowledged. They are based on the WTO/World Bank I-TIP Services regulatory databases, updated in November 2020 and to which the OECD STRI methodology has been applied. For more information on the methodology see the Methodology and assessment process chapter.

OECD Digital Services Trade Restrictiveness Index</li> </ol>

The leaders of the WB6 endorsed the Common Regional Market (CRM) 2021-2024 Action Plan at the Berlin Process Summit held on 10 November 2020 in Sofia. The plan is made up of targeted actions in four key areas: (1) a regional trade area; (2) a regional investment area; (3) a regional digital area; and (4) a regional industrial and innovation area.

In the regional trade area, the WB6 economies commit to closely align rules and regulations with the core principles governing the EU Internal Market, based on the “four freedoms”: enabling goods, services, capital, and people to move more freely across the region. The findings of the services trade restrictiveness sub-dimension can inform the implementation of actions under this component (Box 5.6).

### **Key methodological changes to the assessment framework**

The assessment has undergone a substantial change in its 2021 iteration since the 2018 CO analysis framework.

This chapter aims to help the WB6 economies to put in place effective trade policies that maintain a balance between domestic considerations and the fluidity of trade flows while refraining from imposing or maintaining regulations that are not conducive to trade. In addition, in view of the region's new trade considerations, which aspire to greater regional integration and ultimately the adherence into the EU, the chapter also aims to identify points of regulatory divergence and convergence with these goals. To do this, the trade policy assessment framework now gives pride of place to three sets of unique regulatory transparency tools from the OECD which serve to identify bottlenecks and give benchmark opportunities in trade related policies:

1. The OECD Services Trade Restrictiveness Index (STRI), an evidence-based tool that provides information on regulations affecting trade in services (Box 5.1).
2. The OECD Trade Facilitation Indicators (TFIs), which help policy makers assess the state of their trade facilitation efforts, pinpoint challenges and identify opportunities for progress (Box 5.3).
3. The OECD Digital STRI, the latest OECD tool that identifies, catalogues, and quantifies cross-cutting barriers that affect digital trade with a focus on services (Figure 5.20).

These three tools should be read together to help policy makers decide on trade reform options, benchmark them against global best practice, and assess their likely effects; for trade negotiators to clarify restrictions that most impede trade; and for businesses to understand the requirements when entering foreign markets. The use of these three sets of tools, together with the analysis of the qualitative and quantitative questionnaires, provides a comprehensive view of the state of trade policies in the region.

### Box 5.1. The OECD Services Trade Restrictiveness Index (STRI)

The OECD Services Trade Restrictiveness Index (STRI) was used to evaluate the WB6 economies' policies for 12 services sectors. The STRI is a unique, evidence-based diagnostic tool that inventories trade restrictions in OECD member states and partner economies (Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa, and Thailand). It covers 22 services sectors, allowing countries to benchmark their services regulations against global best practice, identify outlier restrictions, and prioritise reform efforts.

For this CO assessment cycle, the 12 services sectors are grouped into four clusters: 1) transport and distribution supply chain (air transport, road transport, rail transport, courier); 2) market bridging and supporting services (commercial banking, insurance, legal services); 3) physical infrastructure services (construction, architecture, engineering); and 4) digital network services (computer services, telecommunications).

Information was collected from the WB6 economies' laws and regulations, and indices were calculated for seven years (2014-20). These composite indices compute restrictions across five policy areas: foreign entry, movement of people, barriers to competition, regulatory transparency, and other discriminatory measures. The indices quantify regulatory restrictions in each of the 5 policy areas for the 12 sectors by giving them a value between 0 and 1. Complete openness to trade in services gives a score of 0, while being completely closed to foreign service providers yields a score of 1.<sup>1</sup>

Each policy area is composed of a series of measures. These measures are called "horizontal" if they are present in all sectors, or "sector specific" if they only affect a particular sector.<sup>2</sup> The STRI measures the most-favoured-nation (MFN) restrictions and does not take into account any specific concessions, such as regional trade agreements or mutual recognition agreements (Geloso Grosso et al., 2015<sup>[13]</sup>)

Relevant STRI tools include:

- **Compare your country:** ([www2.compareyourcountry.org/service-trade-restrictions](http://www2.compareyourcountry.org/service-trade-restrictions)). This interactive website can be used to compare services trade restrictiveness across 22 sectors in all OECD countries and partner economies. Key economic indicators are projected onto a world map to give a comparative view of the importance of services in the economies covered by the STRI.
- **Policy simulator:** (<http://sim.oecd.org>). The policy simulator provides all STRI information by economy and by sector. It can be used to understand how the STRI indices are calculated, to analyse the contribution of each policy measure to the index, to compare economies in detail, and to simulate the impact of a policy change on the index value. The focus view option provides links to legal sources. Finally, simulations can be saved and shared with other users, and the relevant data can be downloaded.
- **Online regulatory database:** (<http://qdd.oecd.org/subject.aspx?Subject=STRI>). The online STRI regulatory database displays complete and up-to-date regulatory information collected for the sector composite indices. This qualitative database contains information on trade restrictions and behind-the-border regulations. The database entries are documented with reference to the sources (title and articles of the relevant law), with an internet link to each legal source.

- **Indices:** (<http://stats.oecd.org/Index.aspx?DataSetCode=STRI>). The STRI indices are easily accessed and extracted from OECD.Stat (under the heading: Industry and Services, subheading: Services Trade Restrictions). In addition to the five policy areas, the indices are presented by four additional classifications: GATS market access/national treatment and domestic regulation/other, GATS modes of supply, discriminatory versus non-discriminatory measures, firm's establishment versus on-going operations. The indices of regulatory heterogeneity based on the same information included in the STRI regulatory database are also displayed under this section.

1: The full set of OECD STRI indices and comparison tools as well as policy simulators for OECD member and partner states that have undertaken the OECD STRI are available on the dedicated OECD website <https://www.oecd.org/trade/topics/services-trade>.

2: The complete list of measures sector by sector is also available on the OECD STRI website.

## Trade policy dimension performance and context in the WB6

In the period 2009-19, the total foreign trade in goods and services of the six Western Balkan economies grew steadily, largely due to an increase in exports initiated after the economic crisis of 2009. The share of trade in the region's gross domestic product (GDP) reached 110% on average in 2019, compared to 80% in 2009. Despite this increase, the region remains below the average for Central and Eastern European countries (CEEC-11)<sup>2</sup> averages (Figure 5.3).

### Figure 5.3. Key trends in external trade in goods and services (2015-19)

StatLink  <https://doi.org/10.1787/888934253480>

The EU is the WB6 region's main trading partner, accounting in total for around two-thirds of the region's total trade (Figure 5.4). Germany and Italy play a predominant role, accounting for about one-third of all WB6 exports. The other EU Member States, and in particular the neighbouring states of Bulgaria, Croatia, Romania and Slovenia, are also important export destinations and account for 15% of the exports of the six economies. Trade among the WB6 represents 10% of the region's imports and 20% of its exports. Finally, China plays an increasing role in the region's trade, accounting for 10% of the region's imports, particularly as a source of raw materials needed for the region's integration into global value chains.

Figure 5.4. Main trading partners of the WB6

Source: (Eurostat, 2020<sub>[15]</sub>), <https://ec.europa.eu/eurostat/web/international-trade-in-goods/data/database>.

The COVID-19 crisis, combined with the related export bans, limitations on the movement of people and retail shutdowns, resulted in a significant drop in imports and exports in Q2-Q3 2020 relative to 2019 (Figure 5.5). On average, WB6 exports and imports dropped by 20% and 14% respectively (IMF, 2020<sub>[16]</sub>). While Albania, and Montenegro suffered the largest decrease of import and export volumes, ranging from -20% to -45%, Bosnia and Herzegovina and Serbia experienced the smallest fall (above -12%) in the region (OECD, 2020<sub>[17]</sub>).

StatLink  <https://doi.org/10.1787/888934253499>

The GVC links in WB6 economies are mostly oriented towards services and low-value manufacturing products (OECD, 2019<sub>[19]</sub>). In all WB6 economies, services account for the largest share of GDP – see Services trade restrictiveness (Sub-dimension 2.2) – followed by a sizeable manufacturing industry. However, the impact of the containment measures has varied according to the composition of the economies' export basket, which partly explains the differences in the region's declining trade flows. Overall, the sectors of tourism, transport and manufacturing have been the most affected.

Service-oriented economies, such as Albania and Montenegro, are mainly dominated by travel and tourism.<sup>3</sup> The latter contributes to 15% of the overall GDP of the region. It is also the sector most affected by the long-lasting restrictions linked to COVID-19. The industry suffered a 50% to 70% drop compared to 2019 (RCC Int., 2020<sub>[20]</sub>). In Kosovo, diaspora tourism fell by around 60% in the first three quarters of 2020 compared to the same period in 2019 due to restrictions on international mobility. The balance of services surplus is estimated to have contracted to 5.8% of GDP in 2020 from 13.1% in 2019 in this economy. (Tourism chapter)

In contrast, economies that maintain the highest share of manufacturing in the WB6 region, such as Bosnia and Herzegovina, North Macedonia and Serbia, initially saw their trade flows come to a halt. For North Macedonia and Serbia, trade in intermediate industrial goods linked to GVCs accounts for about two-thirds of exports (World Bank, 2020<sub>[21]</sub>). The disruption of supply chains resulting from the combined slowdown of manufacturing production in China, as well as reduced demand in the United States and the EU, initially brought trade to a virtual standstill in these two economies. Their GVCs are concentrated in a few sectors (automotive, electrical equipment, machinery, chemicals, and metals) in several European countries (mainly Germany). In mid-2020, exports resumed to some extent once the supply of relevant components was restored and demand from the EU stabilised.

Although less integrated into GVCs, the remaining economies have not escaped disruption, primarily due to the decline in demand from EU Member States rather than to supply shortages. For example, Albania's export basket is highly concentrated, mainly on outward processing in the fashion sector with Italy. As the latter alone accounts for almost 50% of the economy's exports and 27% of its imports, Albanian exports collapsed when Italy went into lockdown.

## Trade policy framework (Sub-dimension 2.1)

The recent contraction in world trade has demonstrated the importance of implementing structural policies that strengthen export competitiveness. Global trade policy now goes beyond its original focus on the simple reduction of tariffs and the elimination of quantitative restrictions. It involves policies aimed at reducing non-tariff restrictions that hamper trade. Non-tariff barriers can take the form of rules that go far beyond those that emanate from the legislator's aim to regulate trade. Conversely, trade now involves crosscutting policies. A global method is therefore necessary to respond to modern trade issues. This holistic approach to trade requires the establishment of strong institutional mechanisms for co-ordination, consultation, and transparency. Therefore, this first sub-dimension of the trade policy dimension assesses the effectiveness of governments in formulating, evaluating, and implementing trade policy.

Trade policy makers and negotiators need to regularly co-ordinate different ministries, government agencies and institutions when formulating and implementing trade policy. They should also consult a broad range of private and civil society actors, to ensure that policy development is transparent and inclusive. Governments also need to monitor and evaluate the impact of trade policy on the wider economy, including environmental and social impacts. Finally, building a comprehensive and structured network of bilateral and regional trade agreements promotes regulatory initiatives to open markets in a harmonised manner and encourages increased trade policy co-operation by stimulating trade flows.

The economies with the highest average score for this sub-dimension are Kosovo, North Macedonia and Serbia (each scoring 3.8; Table 5.2), which demonstrate strong implementation across all indicators and monitoring and evaluation activities. Albania and Montenegro score 3.5, meaning that policy frameworks are adopted and implemented. Bosnia and Herzegovina's score of 2.8 implies that policy frameworks are largely in place, but there is a need to improve implementation.

**Table 5.2. Scores for Sub-dimension 2.1: Trade policy framework**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 2.1: Trade policy framework	Institutional co-ordination on trade policy formulation	3.5	2.5	3.5	4	3.5	4	3.5
	Public-private consultation	3.5	3	4	3.5	3.5	3.5	3.5

<b>Sub-dimension average score</b>		<b>3.5</b>	<b>2.8</b>	<b>3.8</b>	<b>3.8</b>	<b>3.5</b>	<b>3.8</b>	<b>3.5</b>

\* Note: Indicator does not have a scoring system attributed to it and is therefore assessed descriptively.

### ***Institutional co-ordination has been strengthened***

The institutional co-ordination indicator considers whether there is a leading ministry or institution<sup>4</sup> co-ordinating the work of the various stakeholders in trade policy while shielding trade policy from sectoral interests in order to facilitate coherent trade development.

All WB6 economies have solid inter-institutional co-ordination of trade policy formulation, usually through official committees, councils or working groups led by the trade or economy ministries. The work of these inter-ministerial committees is generally focused on implementing or negotiating regional and international commitments (CEFTA, WTO); facilitating the EU accession process (through the preparation of relevant trade policy-related EU *acquis* chapters); and designing or amending specific trade measures.

The economies are also establishing co-ordination mechanisms to address the more challenging areas of trade policy. All six economies have a National Trade Facilitation Committee (NTFC). These often function in co-operation with other working groups, sometimes in more specialised frameworks, on an ad-hoc basis as in BIH, or institutionalised. The most recent institutionalised example is Kosovo's Committee for Trade in Services, established in July 2020,<sup>5</sup> as a consultative body to propose trade policies in the field of services.<sup>6</sup> Economies have also improved their trade frameworks by implementing new Trade Facilitation Strategy Policies. However, implementation is uneven. All economies have trade-related goals in their latest development strategies,<sup>7</sup> but only Albania and Montenegro have dedicated trade facilitation strategies. Albania's National Plan for Trade Policy Coordination and Trade Facilitation (2017-2020) was recently revised reflecting new developments in Albania's trade policy, and now covers 2021-2023. Montenegro has a Strategy for Trade Facilitation 2018-2022. Overall, the relevant ministries are better equipped to improve trade-related co-ordination and consultation with an increased number of agencies and institutions.<sup>8</sup>

Inter-ministerial co-ordination and consultations with stakeholders (private sector and civil society) complement each other, mainly during the policy initiation and formulation stage. However, evidence suggests that involvement of the private sector in the policy implementation and evaluation phase varies across the region. It seems that the inter-institutional co-ordination mechanisms can be improved in all economies. Some NTFCs are not fully able to fulfil their objectives. The region's business sector stakeholders were critical about the actual impact of their participation in the NTFCs' work. OECD stakeholder consultations as part of the CO2021 assessment framework have highlighted the perception that the NTFCs do not always address sufficiently substantive issues related to the region's business development. These criticisms are more pronounced in some economies than in others, and also vary

according to the type of private actor. SMEs express more reservations about the frameworks established in the region, given their generally less organised nature; and as they are not always members of the business associations that are regularly included in co-ordination and consultation processes.

### ***Public-private consultations are required in all economies, but implementation varies***

Effective public-private consultation (PPC) improves regulatory policy making, particularly for business, as it brings private sector expertise, perspectives and ideas to the design and implementation of policy changes. The participation of private actors in decision making helps to increase the transparency and openness of the legislative process as a whole, but is particularly important in trade-related matters as it ensures that the international commitments and needs of the business community are properly addressed and harmonised. Increased transparency and stronger private sector engagement in turn leads to greater acceptance of government programmes and projects and builds confidence in government institutions (OECD, 2018<sup>[22]</sup>). Consultations with the private sector should take place within a formal structure and at all stages of policy development, from preliminary discussions on possible legislation to monitoring and evaluation of a given policy.

The WB6 governments have continued their efforts to institutionalise consultations on trade with private stakeholders. All the economies have legal and regulatory frameworks in place that define the general principles and procedures for conducting PPCs. All business legislation in the region (both primary and secondary) is subject to a form of public consultation – either institutionalised (in all economies) or both institutionalised and informal, such as in Albania and Serbia. In Albania, business associations are members of the Inter-Institutional Working Group for Trade Policy and Trade Facilitation. Representatives of these associations are taking part intensively in trade co-ordination meetings and are coming up with concrete proposals. In terms of content, Kosovo, Montenegro, North Macedonia and Serbia go beyond consulting only on laws, and submit other relevant documents for PPCs or public availability as part of the transparency process.<sup>9</sup> As was already the case in the previous CO assessment, all WB6 economies require line ministries to report the outcomes of consultations and to publish reports on them, including suggestions that were accepted and those that were not, and, if not, specifying the reasons with legally binding deadlines. However, the public-private consultations in the WB6 differ as to frequency, the depth of stakeholder participation and the availability of information published online. There is also variability in the amount of time stakeholders are given to contribute to the consultation process.

In Albania and Serbia, formal consultations take place on a regular basis and are complemented by informal meetings to facilitate feedback. Draft laws are then published and comments from different types of stakeholders (citizens, NGOs, business organisations, chambers of commerce, etc.) are made available to the public via the ministries' websites. Similarly, in Montenegro, the ministry responsible for the draft regulation publishes a report on the consultation on its website and on the e-Government portal. However, its responsibility is to only disseminate the report to the entities that participated in the process.

The most effective and transparent way to solicit the participation of private stakeholders in legislation is through a centralised and dedicated website that serves as a hub for all PPC procedures, as well as a platform for reporting on these procedures. The advantage of a centralised system over publishing draft laws on ministry websites is that a dedicated website reduces the need to solicit institutions, such as chambers of commerce, to disseminate calls for consultation. This is particularly important in the case of trade, which is by nature a cross-cutting area.

All the economies have a centralised dedicated website except Serbia, which, however, is in the final stages of setting one up. Consultations are carried out via the ministries responsible for enacting laws and regulations in this economy. The most recent PPC online platforms have been established in Kosovo and Bosnia and Herzegovina – although the latter's only lists PPCs relating to BIH state-level institutions. The use of portals could still be perfected in all economies. Even though each institution proposing new trade related legislation is obliged to publish information on the PPC process on its dedicated website and on

the centralised government portal, it is left to the discretion of each institution to announce the future publication of such projects.

In all WB6 economies, participation in PPCs on the dedicated websites is open to all interested participants. There are, however, disparities in the *de facto* participation of private-sector stakeholders according to their legal nature and nationality. North Macedonia and Serbia have the largest number of non-government stakeholders participating in consultations as they incorporate into the process the full extent of civil society. In the other economies, consultations tend to take place through chambers of commerce and participation is often limited to their members, which does not always include all SMEs (OECD et al., 2019<sup>[23]</sup>) or non-business-related NGOs. Calls for public-private consultation therefore do not always reach all interested entities. However, statistics from Albania, Kosovo and Montenegro suggest that participation in commentary procedures is increasing. With the exception of Montenegro, which indicates involvement by foreign embassies in its PPCs (Montenegro Ministry of Public Administration, Digital Society and Media, 2020<sup>[24]</sup>), there is no evidence that the processes involve foreign private stakeholders. Involving foreign private stakeholders is good practice and promotes well-harmonised trade policies (Basedow and Kauffmann, 2016<sup>[5]</sup>).

Monitoring of the quality and shortcomings of public-private consultations is not yet systematic in the region. Public bodies that supervise consultations and monitor their quality remain an exception. However, some initiatives have been introduced. Kosovo has the most developed consultation evaluation mechanisms. PPCs, promotion tools and timelines of consultations are evaluated annually by the Office on Good Governance to determine whether an open, transparent, and non-discriminatory form of PPC was used from the beginning to the end of the legislative process. Moreover, the Office on Good Governance annually reports and monitors public consultation implementation based on effectiveness and inclusiveness goals (Box 5.2).

Albania, Montenegro and Serbia have ad-hoc systems for monitoring public consultations. In Albania, the Law on Public Consultations requires institutions that prepare acts to publish annual reports and analysis on the consultations they have conducted. However, the reports in question are only available for 2020 and not all institutions that conducted public consultations in the same year have published their reports. In addition, the system requires institutions to self-assess, which raises the question of harmonisation of approaches. In Serbia, the role of collecting data on public consultation procedures is assigned to an entity independent of the ministries that develop regulations, the Public Policy Secretariat, whose main role is to support the government in managing the quality of public policies and regulations through evaluation mechanisms. The secretariat produces statistics on the number of legislative proposals that have been subject to public consultation, but not on compliance with consultation standards. Moreover, these reports are still produced irregularly. According to the Serbian Government, in the future the E-participation website will enable monitoring and control of the implementation of consultations and public hearings on public policy documents and regulations, as well as control of reporting on implementation of consultations and public discussion processes. Similarly, in Montenegro, the Ministry of Public Administration, Digital Society and Media produces statistical data on the number of legislative projects that have been subject to PPCs. The reports are comprehensive and detailed but focus mainly on statistics, and do not comply with the standards mandated by Montenegro's legislation.

### Box 5.2. Monitoring public-private consultations in Kosovo

The Office of Good Governance is tasked with preparing an annual report on the public consultation process. It checks whether draft proposals comply with public consultation requirements before the proposals are submitted to the government for decisions. Kosovo's annual reports on the public-private consultation process present the results for 2017 and 2019. Based on the Minimum Standards for the Public Consultation Process (Regulation No. 05/2016), the reports are prepared in co-operation with all the institutions involved in the legislative development process.

Since 2017, the Office for Good Governance has established co-ordination structures involving public consultation co-ordinators in each ministry. It also carries out capacity-building activities, such as two rounds of on-the-job training on PPCs, using the electronic PPC platform and numerous information workshops. Introducing the electronic public consultation platform was one of the most important steps the government has taken to facilitate PPCs.

As the reports show, a total of 274 documents were drafted by all ministries in 2019, 100% of the acts approved by the government were opened to PPC (compared to 90% in 2017), 272 through the platform while 2 documents were consulted by other means. These were 5 concept documents, 31 draft laws, 77 draft regulations, 129 draft administrative directives, 6 strategies, 5 programmes, 7 action plans and 8 other documents. In addition to the portal, which was the most used tool by the PPC, other tools were used, including e-mail communication, stakeholder workshops and public meetings.

The total number of participants in the consultation process rose to 3 577 in 2019 – a 143% increase on 1 469 in 2018 (and 2 104 in the first report of 2017). A total of 1 339 comments were received; 688 of which (or 51%), were accepted and implemented by the drafting institutions; 97, (7.2%), were partially accepted, while 543 comments, (40%), were rejected. There is a lack of information for the last 6 comments.

Finally, the minimum standards provided for in the regulations were met by 183 consultations or 67% (compared to 52% in 2017), while 91 documents did not meet all the minimum standards (33%). It should also be noted that all documents submitted by the Ministry of Trade and Industry met the minimum standards in 2019.

### ***The network of free trade agreements integrates the WB6 with their main trade partners but less into global trade***

The network of free trade agreements<sup>10</sup> indicator looks at the number of bilateral and multilateral free trade agreements in place and their scope. Free trade agreements are paramount as they aim to further co-operation in trade policy and boost trade flows within groups of two or more partners. Regional trade agreements (RTAs) also promote trade in services from the year they enter into force. This immediate effect is not surprising as RTAs take time to negotiate and ratify, allowing firms to prepare in advance (OECD, 2018<sup>[27]</sup>).

Integration with the main EU and regional trade partners is well established (Figure 5.4). All WB6 economies are signatories to the Central European Free Trade Agreement (CEFTA), through which they have achieved tariff liberalisation on trade in manufactured and agricultural products. In December 2019, the WB6 economies strengthened their treaty network through the conclusion of Additional Protocol 6 on trade in services to CEFTA, which will improve the fluidity of trade flows in services in the region. So far, the protocol has been ratified by Albania, Bosnia and Herzegovina, Montenegro, North Macedonia and Serbia. All six WB economies have signed a Stabilisation and Association Agreement (SAA) with the EU.<sup>11</sup>

Integration into global trade is still timid. Albania (2000), North Macedonia (2003) and Montenegro (2012) are WTO members, and while the six economies continue to develop their networks of bilateral and multilateral trade agreements, they do so at disparate rates.<sup>12</sup> Bilateral treaties with non-EU states are rare, with the WB6 integrating only with Turkey and to a lesser extent with Ukraine<sup>13</sup> and the United Kingdom (Table 5.3). Albania is in some ways a counter-example and is relatively active, with 7 agreements under negotiation.<sup>14</sup> Overall, however, the region has not significantly advanced its integration into the global trading system since the last round of analysis and major bottlenecks remain: the accession process of Bosnia and Herzegovina and Serbia to the WTO is still ongoing. Serbia compensates for this through bilateral treaties and partnerships, notably an FTA with the Eurasian Economic Union (EAEU) signed in 2019 (for its trade relations with the Russian Federation) but still not in force, and a limited strategic partnership agreement signed in August 2009 with China.

In consequence, the integration of the WB6 region into international trade is half-hearted, with economies having strong legal bases with major partners, in line with their regional integration policies and with the EU, but limiting their trade outside this scope. This is particularly negative for the largest economy, Serbia, as it may hinder the benefits of a favourable regulatory regime for foreign direct investment in this economy (see Investment policy and promotion chapter) and close the doors to third-country investors.

**Table 5.3. WB6 economies' bilateral and multilateral free trade agreements**

Economy	Bilateral free trade agreements	Multilateral free trade agreements
Albania	Turkey, United Kingdom, SAA	CEFTA, EFTA
Bosnia and Herzegovina	Turkey, SAA	CEFTA, EFTA
Kosovo	Czech Republic, Turkey, United Kingdom, SAA	CEFTA, EFTA Joint Declarations on Cooperation
Montenegro	Turkey, Ukraine, SAA	CEFTA, EFTA
North Macedonia	Turkey, Ukraine, SAA	CEFTA, EFTA
Serbia	Turkey, United Kingdom, SAA	CEFTA, EAEU FTA, EFTA

Note: CEFTA = Central European Free Trade Agreement; EFTA = European Free Trade Association; EAEU FTA = Eurasian Economic Union Free Trade Agreement; SAA = Stabilisation and Association Agreement.

Source: OECD Competitiveness Outlook 2021 qualitative questionnaires.

### ***Trade facilitation has seen significant progress***

The implementation of the CEFTA Agreement, and in particular its Protocol 5, has led to significant progress on trade facilitation in the WB6 economies, but challenges remain. The OECD Trade Facilitation Indicators (TFIs) are a powerful tool to assess and monitor efforts to improve border procedures, reduce trade costs, stimulate trade flows, and contribute to inclusive growth.

They are the most precisely targeted instrument for monitoring and comparing the trade facilitation performance of economies Box 5.3. According to the OECD's 2019 TFIs, WB6 economies<sup>15</sup> have improved in all areas since 2017 (Figure 5.6).

**Figure 5.6. OECD trade facilitation indicators: WB6 evolution (2017-19)**

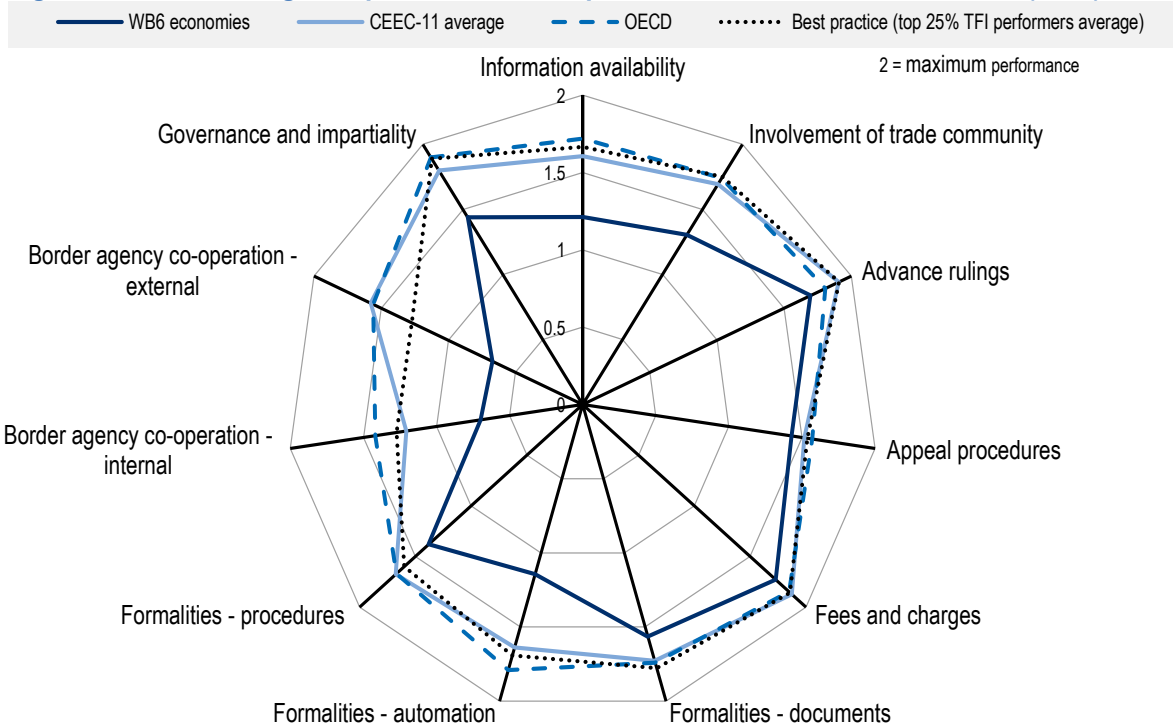

Note: The time comparison displayed is based on the same components covered both by the 2017 and the 2019 trade facilitation indicators (TFI). The figure does not include Kosovo, for which data are not available.

Source: (OECD, 2019<sup>[28]</sup>), *Trade Facilitation Indicators* (database), [www.oecd.org/trade/facilitation/indicators.htm](http://www.oecd.org/trade/facilitation/indicators.htm).

StatLink <https://doi.org/10.1787/888934253518>

As shown in Figure 5.7, in some areas they are close to global best practice (i.e., the top 25% of countries covered by the TFI indices) and to the average performances of CEEC and the OECD.

**Figure 5.7. WB6 average TFI performance compared with the OECD and CEEC-11 (2019)**

Note: The figure does not include Kosovo, as data are not available; CEEC-11 economies: Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovak Republic, Slovenia

Source: (OECD, 2019<sup>[28]</sup>), *OECD Trade Facilitation Indicators* (database), [www.oecd.org/trade/facilitation/indicators.htm](http://www.oecd.org/trade/facilitation/indicators.htm).

StatLink <https://doi.org/10.1787/888934253537>

### Box 5.3. The OECD Trade Facilitation Indicators (TFIs)

The TFIs consist of a set of variables measuring the extent to which countries have introduced and implemented trade facilitation measures, as well as their performance relative to others. The TFIs are divided into 11 sub-category indicators:

1. Information availability: Enquiry points; publication of trade information, including on the Internet
2. Involvement of the trade community (consultations): Structures for consultations; established guidelines for consultations; publications of drafts; existence of notice-and-comment frameworks
3. Advance rulings: Prior statements by the administration to requesting traders concerning the classification, origin, valuation method, etc., applied to specific goods at the time of importation; the rules and process applied to such statements
4. Appeal procedures: The possibility and modalities to appeal administrative decisions by border agencies
5. Fees and charges: Disciplines on the fees and charges imposed on imports and exports; disciplines on penalties
6. Formalities – documents: Acceptance of copies, simplification of trade documents; harmonisation in accordance with international standards
7. Formalities – automation: Electronic exchange of data; use of automated risk management; automated border procedures; electronic payments.
8. Formalities – procedures: Streamlining of border controls; single submission points for all required documentation (single windows); post-clearance audits; authorised operators.
9. Internal co-operation – Control delegation to customs authorities; co-operation between various border agencies of the country.
10. External co-operation – Co-operation with neighbouring and third countries.
11. Governance and impartiality – Customs structures and functions; accountability; ethics policy.

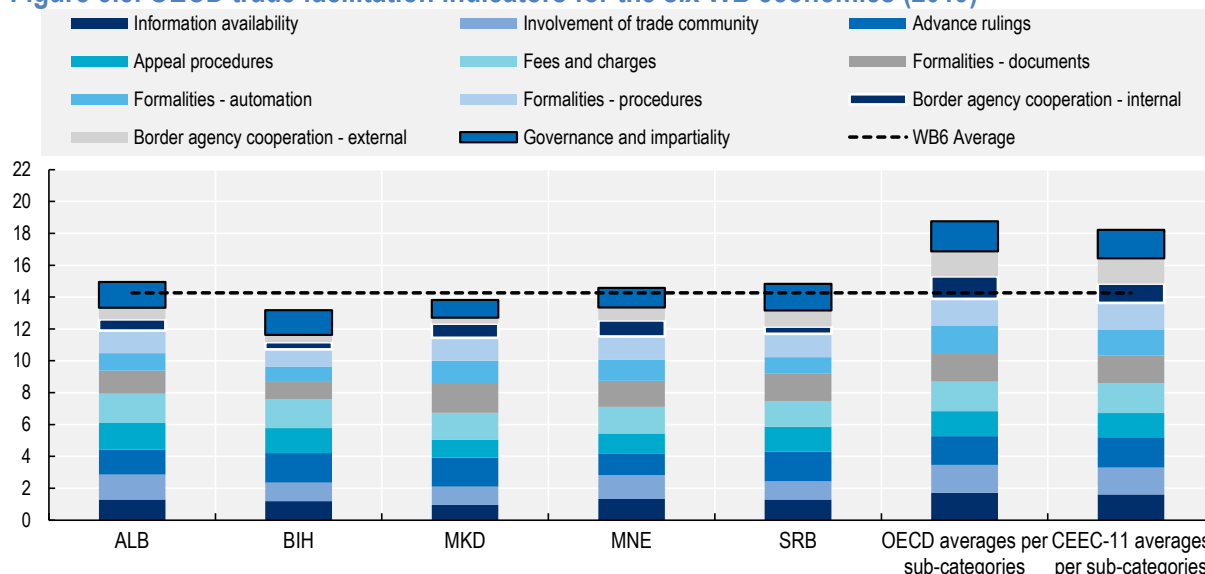

Each TFI indicator is composed of several specific, precise and fact-based variables on existing trade-related policies and regulations and their implementation in practice.

Note: Further information on how the TFIs are calculated is available at OECD Trade Facilitation Indicators' dedicated webpage: <https://www.oecd.org/trade/topics/trade-facilitation/>.

Source: (OECD, 2018<sup>[4]</sup>), *Trade Facilitation and the Global Economy*, <https://dx.doi.org/10.1787/9789264277571-en>.

The performance of the individual WB6 economies (Figure 5.8) is quite variable, with highs and lows. In the area of *advance rulings*, all economies except Albania and Montenegro performed better than the OECD averages. Bosnia and Herzegovina and Serbia scored just below best practice (i.e., average of the top 25% of all OECD TFI participants) in the same area.

**Figure 5.8. OECD trade facilitation indicators for the six WB economies (2019)**

Note: The figure does not include Kosovo, as data are not available; CEEC-11 economies: Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovak Republic, Slovenia.

Source: (OECD, 2019<sup>[28]</sup>), OECD Trade Facilitation Indicators database, <http://www.oecd.org/trade/facilitation/indicators.htm>.

StatLink  <https://doi.org/10.1787/888934253556>

On *appeal procedures* Albania scored above the OECD and CEEC-11 averages, Bosnia and Herzegovina and Serbia reached best practice level and the OECD average, and only Macedonia and Montenegro scored lower. These areas were already solidly structured in 2015, and improvements to the regulatory frameworks have addressed the most challenging aspects of this sub-category – the timing of the appeals mechanisms (i.e., granting sufficient time to contest a decision; prepare, and lodge an appeal; and avoiding undue delays in the rendering of decisions).

*Fees and charges* and *formalities* are of particular interest as the region has seen the greatest improvement since 2017 (Figure 5.8). In the first area, *fees and charges*, Albania and Bosnia and Herzegovina are level with OECD average. Montenegro, North Macedonia and Serbia are slightly lower. Key challenges lie in making comprehensive information available online, as well as in conducting periodic reviews to ensure their continued relevance. Only Albania has a dedicated fees and charges webpage on its Customs website. In Montenegro, North Macedonia and Serbia, customs administrations charge fees for answering enquiries and providing forms and documents. All economies allow adequate time between publishing new or amended fees and charges and their entry into force. Provisions for penalties were especially challenging for Albania and Montenegro in 2015, but adequate measures were introduced in 2019. In 2021, Montenegro has gone further, introducing the Register of Fees, which includes 2 299 types of fees defined through 827 regulations at the local and state level.<sup>16</sup>

In the area of *formalities - documents*, North Macedonia and Serbia exceed the OECD and CEEC-11 averages. Border agencies in all economies periodically review documentation requirements; and unduly time-consuming and costly requirements for traders are being simplified, but this is still work in progress. Efforts have been made to simplify and harmonise documents, indicated by the lower number of documents currently requested for import and export compared to 2015 (except in Albania and Bosnia and Herzegovina). However, in Kosovo, Montenegro, North Macedonia and Serbia, the number of documents requested is still above the good practice thresholds. The average time necessary to prepare these documents is also still too long. The acceptance of copies is showing noticeable improvement in the majority of the economies, but copies are still only accepted as an exception in Albania, Montenegro, North Macedonia and Serbia.

WB6 performance in the remaining TFI areas is still below world best practice and OECD averages, although the gaps have narrowed since the last round of analysis. In 2019, economies still lagged behind in the areas of *information availability*, *formalities - automation* and *co-operation between internal and external border agencies*.

In *information availability*, Montenegro, North Macedonia and Serbia had shortcomings in the availability and user-friendliness of data on agreements with third countries. The first two economies also had a weak system of access to rules and examples of customs classification, while Bosnia and Herzegovina had flaws in the provision of information on trade policy changes.

In *formalities – automation*, all economies' IT systems capable of electronic data interchange (EDI) – essential for simplifying documentation requirements and reducing the complexity of document submission – are either being implemented or have been functional since 2015 (OECD, 2018<sup>[22]</sup>). Challenges remain in the set up and functioning of automated administrative procedures at borders, with most economies having weaknesses in their automated processing capacities. Bosnia and Herzegovina has yet to complete its automated risk management procedures, Albania needs to integrate the electronic payment system with a computerised declaration/cargo processing system, while North Macedonia and Montenegro's IT system capacity is insufficient to exchange data electronically. Serbia still has to promote the availability of full-time automated processing for customs.

*Border agencies co-operation* is still an issue for the economies, which consistently score around the average. However, economies have made progress in developing a strategy for co-ordination between state agencies. All have demonstrated co-operation and co-ordination of activities by agencies involved in managing cross-border trade, with a view to improving the efficiency of border controls and facilitating trade. However, the alignment of procedures and formalities and of working days and hours with neighbouring economies at land borders has not been fully achieved. The economies have made progress in co-ordinating inspections, but only the border agencies of Montenegro and partly those of Serbia have shared inspection and control results. The development of interconnected or shared IT systems and the real-time availability of relevant data, as well as inter-agency collaboration on certification of Authorized Operators (AOs), has been incomplete in all economies since 2015.

The next analysis of border agency co-operation should show marked improvement: in April 2020, at the peak of the first global wave of COVID-19, the Western Balkan economies set up the CEFTA co-ordination body to exchange all information on trade in goods. They also established priority "green lanes" and "green corridors to facilitate the free movement of essential goods through priority green border/customs crossing points (respectively with the EU-WB6 and within the WB6). Most road transport operators in the six economies used these green corridors. The border posts of the green corridor system operated continuously, as did the customs and other border services. The Systematic Electronic Data Exchange for Customs Administrations (SEED) was updated as a matter of urgency and was used to pre-code products on the essential goods list. The SEED system sends data electronically to customs and other border services (customs directly through the system, while the system generates emails that are automatically sent to phytosanitary, veterinary, and sanitary services for each crossing). These initiatives and the co-operation between the border agencies have helped to maintain a degree of international trade between the WB6 economies and the EU Member States. During the COVID-19 crisis, about 20% of the goods that benefited from the green corridor regime were necessities, the rest being normal trade. This regime, put in place in a time of crisis, has been the catalyst for further co-ordination among agencies and is becoming the basis for considering more efficient transit of goods within the WB6 and with the EU.

The economies have developed the mutual recognition of the national programmes of the Authorised Economic Operators (AEO) of the CEFTA Parties in the field of safety and security. The respective decisions entered into force on 1 April 2020 (CEFTA, 2021<sup>[29]</sup>). The AEO programme, as a voluntary co-operation between customs and business, allows operators to benefit from reduced customs controls and mutual recognition extends these benefits without additional costs within CEFTA.

### ***The way forward for the trade policy framework***

- **Establish mechanisms for evaluating and monitoring public-private consultations** (an integral part of the RIA process) to regularly assess the degree of openness and transparency of consultations in economies that do not have such tools. Ideally, a monitoring programme with an adequate budget and independent office could be introduced to conduct systematic evaluations. In addition, training could be provided in the use of various quantitative and qualitative approaches to measure compliance with the minimum standards set by regulatory frameworks for public consultations. Economies could follow Kosovo's Office for Good Governance initiative (Box 5.2).
- **Improve public-private consultation mechanisms further** by publishing summaries of consultations on draft legislation more systematically. In addition to the regulations already in force, specific guidelines and principles on consultations with the private sector and civil society could be developed, setting out the precise steps and criteria to be followed and monitored. Similarly, a **policy to promote public consultations could be put in place** to invite stakeholders, especially SMEs – which are usually more reluctant or unaware – to become more involved in the legislative process as well as raising perceptions of their capacity to participate in the regulatory decision-making process. Economies could base their efforts on the 2015 EU Better Regulation Guidelines to improve stakeholders' involvement in trade regulatory processes (Box 5.4).
- **Continue to expand the network of bilateral and multilateral FTAs.** Despite progress, Bosnia and Herzegovina and Serbia have not advanced in their accession procedures to the WTO. Within the region, a certain number of bilateral treaties are in an embryonic phase. Similarly, not all economies have ratified the CEFTA's Additional Protocol 6 on Trade in Services. The common regional market is a priority for the WB6 region. However, integration into the global trade network opens up opportunities that should not be overlooked. The economies should therefore continue their efforts towards global trade integration.

#### **Box 5.4. Stakeholder engagement throughout the policy cycle at the European Commission**

Following the adoption of the 2015 Better Regulation Guidelines, the European Commission has extended its range of consultation methods to enable stakeholders to express their view over the entire lifecycle of a policy. It uses a range of different tools to engage with stakeholders at different points in the policy process. Feedback and consultation input is taken into account by the Commission when further developing the legislative proposal or delegated/implementing act, and when evaluating existing regulation.

At the initial stage of policy development, the public can provide feedback on the Commission's policy plans through roadmaps and inception impact assessments (IIA), including data and information they may possess on all aspects of the intended initiative and impact assessment. Feedback is taken into account by the Commission services when developing the policy proposal further. The feedback period for roadmaps and IIAs is four weeks.

As a second step, a consultation strategy is prepared setting out consultation objectives, targeted stakeholders and the consultation activities for each initiative. For most major policy initiatives, a 12-week public consultation is conducted through the website "Your voice in Europe" and may be accompanied by other consultation methods. The consultation activities allow stakeholders to express their views on key aspects of the proposal and the main elements of the impact assessment being prepared.

Stakeholders can provide feedback to the Commission on its proposals and their accompanying final impact assessments once they are adopted by the College. Stakeholder feedback is presented to the European Parliament and Council and aims to feed into the legislative process. The consultation period for adopted proposals is 8 weeks. Draft delegated acts and important implementing acts are also published for stakeholder feedback on the European Commission’s website for a period of 4 weeks. At the end of the consultation, an overall synopsis report should be drawn up covering the results of the different consultation activities that took place.

Finally, the Commission also consults stakeholders as part of the ex-post evaluation of existing EU regulations. This includes feedback on evaluation roadmaps for the review of existing initiatives, and public consultations on evaluations of individual regulations and “fitness checks” (comprehensive policy evaluations assessing whether the regulatory framework for a policy sector is fit for purpose). In addition, stakeholders can provide their views on existing EU regulation at any time on the website “Lighten the load – Have your say”.

## Services trade restrictiveness (Sub-dimension 2.2)

Services contribute almost two-thirds of GDP in the WB6 economies (Figure 5.9). More and more business models rely on offering services rather than selling manufactured goods. This is the so-called “servitisation” of manufacturing (Miroudot and Cadestin, 2017<sup>[33]</sup>). Opening up trade in services can improve domestic firms’ efficiency and productivity (Handjiski and Sestovic, 2011<sup>[34]</sup>). The potential gains from open markets in services trade are significant because greater domestic and foreign competition complemented by effective regulation can enhance trade performance (Hoekman, 2002<sup>[35]</sup>). They also lower the costs of doing business (Box 5.5).

**Figure 5.9. Contribution of services to GDP in WB6 economies (2008-17)**

% share of GDP

### Box 5.5. The costs of regulatory barriers to trade in services

Recent OECD analysis reveals that services trade restrictions significantly affect trade by raising the costs for firms to operate in the host economy (Rouzet and Spinelli, 2016<sup>[36]</sup>). Trade costs arise both from policies that explicitly target foreign suppliers, and more generally from domestic regulation that falls short of best practice in the area of competition and rulemaking. The costs resulting from barriers to trade in services are much higher than those of trade in manufactured goods.

Trading services is costly. The studies show that policy-induced services trade costs are relatively high. Expressed as percentages of total trade value, average multilateral costs for cross-border services trade are around 57% for communication services and 54% for business services, around 60% for transport services, around 103% for insurance services, and around 255% for financial services (Figure 5.10).

**Figure 5.10. Policy-induced average costs for cross-border services trade**

% of total trade value

Source: (Benz and Jaax, 2020<sup>[37]</sup>), *The Costs of Regulatory Barriers to Trade in Services: New Estimates of Ad Valorem Tariff Equivalents*, <https://dx.doi.org/10.1787/bae97f98-en>.

StatLink  <https://doi.org/10.1787/888934253594>

Even exporting to the most liberal countries still requires compliance with regulations at a cost that corresponds to around 30% of the export value in most sectors and nearly 90% for financial services. Within the European Single Market, however, services trade costs are significantly lower – policy-induced costs of cross-border services trade are around 10% in most sectors and around 32% for financial services.

Source: (Benz and Jaax, 2020<sup>[37]</sup>), *The Costs of Regulatory Barriers to Trade in Services: New Estimates of Ad Valorem Tariff Equivalents*, <https://dx.doi.org/10.1787/bae97f98-en>.

The assessment of this sub-dimension begins with a regional study of the recent evolution of the services sectors. It then presents a typology of sectors and the degree of regulatory harmonisation in the region. A sectoral analysis then studies the horizontal measures that are included in all sectors and that hamper trade in services across the WB6. These include general business regulation, restrictions on the movement of service providers, standards for the cross-border transfer of personal data, the legal framework for public procurement and foreign investment screening. It then displays the STRI scores (for details see Box 5.1), explains sector by sector what drives the results, and provides a brief description of the most common restrictions and good practices.

### The WB6 economies continue to lower regulatory restrictiveness in their service sectors

This assessment finds a clear willingness in the WB6 to lower the degree of restrictiveness. A series of reforms has lowered the average STRI indices in the region in all the sectors analysed, and especially in the professional sectors (architecture, engineering and legal services), and the courier sector (following very recent reforms throughout the region) (Figure 5.11). These efforts, however, vary depending on the economy and the sector analysed. Kosovo, North Macedonia and Serbia have been the most active in implementing trade opening policy changes. North Macedonia was in particular active in the years 2014-2016. Serbia reformed the most in 2016-19 and in 2020 with targeted reforms in the architecture and engineering sectors. Kosovo has maintained a steady flow of reforms in the period 2014-20, with a notable highlight being the opening of its courier market in 2019. Montenegro has mainly opened up its construction, engineering and architecture sectors since 2014. Albania already had a more attractive environment in 2014, so it has shown more muted progress, with the exception of the 2015 reforms in the courier sector. It is also the economy that has improved the most from 2019 and into 2020. Finally, Bosnia and Herzegovina has seen little change in its indices over the years as a result of its slower-paced reforms. Nevertheless, an important factor is that restrictiveness has not increased in this economy in the period 2019-20 (Figure 5.11), which contrasts with the marked increases observed in OECD member states and key partners over the same period (OECD, 2021<sup>[38]</sup>).

**Figure 5.11. WB6 economies' evolution on the services trade restrictiveness index (2014-2020)**

% change

Note: negative values indicate a reduction in the restrictiveness of the economy's trade regulatory environment.

Source: (OECD, 2020<sup>[39]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

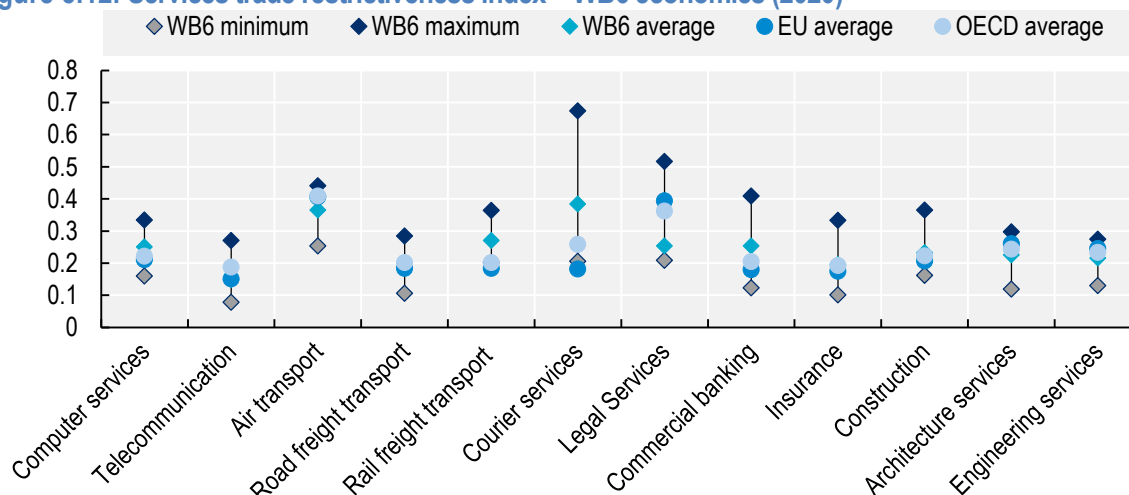

StatLink  <https://doi.org/10.1787/888934253613>

Figure 5.12 shows the maximum, minimum and average STRIs for the WB6. The courier, air transport and legal services were the most restrictive in 2020. Conversely, the telecom, insurance and architectural services were the least restrictive.

Overall, the regulatory environments of the WB6 are in the liberal range compared to the averages of OECD member states, with the minimum scores for WB6 being well below the EU and OECD averages, particularly in traditionally restrictive sectors such as legal services. The noticeably small variation between

minimums and maximums across the region suggests that sectors are relatively harmonised from the regulatory point of view, with the exception of courier services, which, in addition to being the most restrictive and far from the EU average, also shows the greatest disparity across the region. The high degree of heterogeneity here is driven by the different levels of integration of local legislation with the standards set by the EU Postal Services Directive (97/67/EC), including measures related to postal monopolies and potential preferential treatment they may get (e.g. on competition or taxes) (Figure 5.15).

**Figure 5.12. Services trade restrictiveness index – WB6 economies (2020)**

Note: (0=no restrictions, 1=fully restricted); EU: Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and therefore are not covered by STRI indices; key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

Source: (OECD, 2020<sup>[39]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934253632>

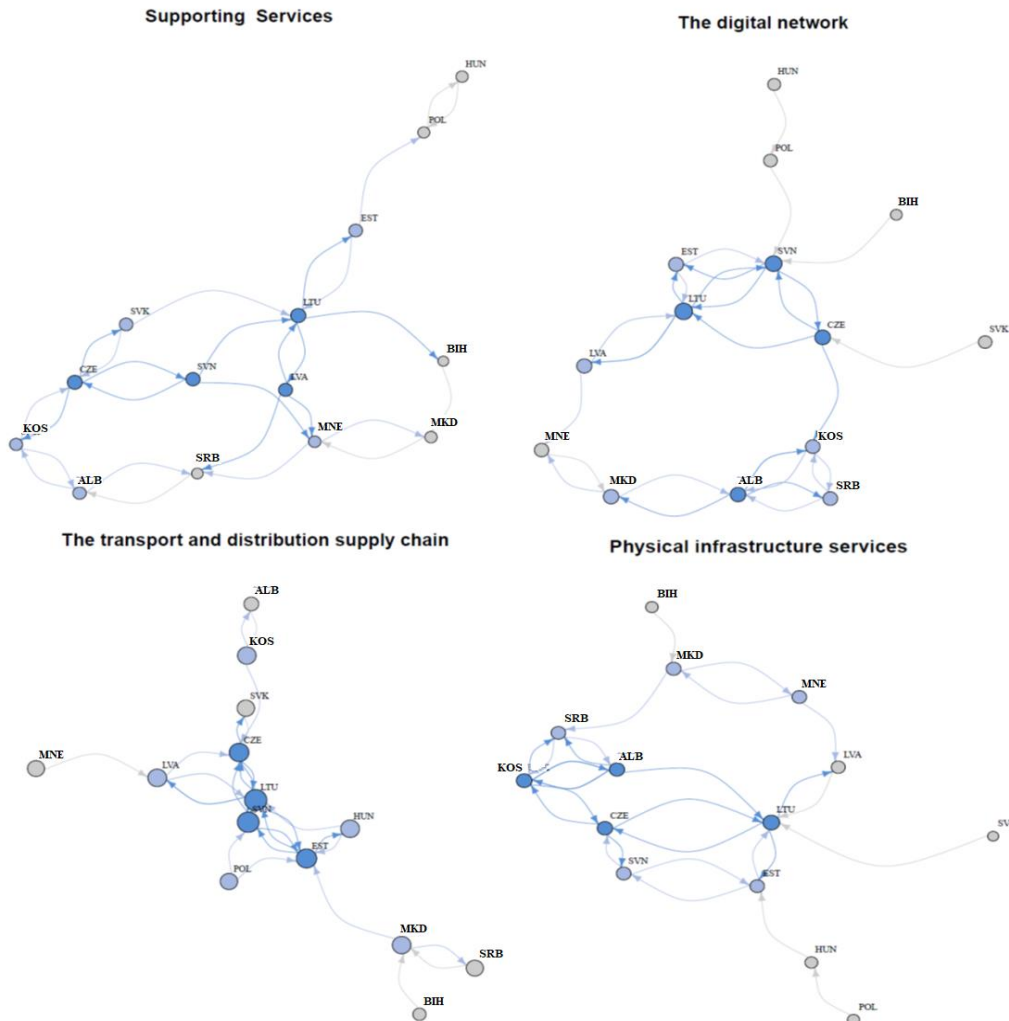

Studies of the relationship between regulatory heterogeneity and trade show that a reduction in regulatory heterogeneity across economies is associated with higher services exports; the lower the heterogeneity in the STRI score, the larger the impact. Moreover, unilateral trade liberalisation shifts trade towards economies to which the regulatory environment is more similar (Nordås et al., 2014<sup>[40]</sup>). The extent to which the regulatory frameworks of two economies diverge can be gauged through the OECD STRI Regulatory Heterogeneity Indices. The lower these indices, the more similar are the rules in force in each pair of economies.

The WB6 regulatory heterogeneity indices assess the similarity of economies' regulatory frameworks for services. For each economy and each sector, Figure 5.13 shows the share of measures for which the economies have different regulations. Although these figures vary by sector cluster, the heterogeneity indicators show there is great potential for future alignment of regulatory environments in the region. This coincides with the drive to create a common regional market harmonised with EU regulations (Box 5.6).

Most WB6 economies are already in an environment close to the CEEC states. They operate systematically in groups of the two or three closest jurisdictions in the different clusters that make up the STRI (Figure 5.13). For example, in the supporting services and digital network clusters, the heterogeneity indices indicate that six economies (except for BIH in the digital network) are more closely related to each other than to the CEECs. In the transport and distribution supply chain cluster, the results are more nuanced, but the economies operate in groups of two or three (Albania+Kosovo; Bosnia and Herzegovina+North Macedonia+Serbia). Finally, the physical infrastructure services cluster is interesting insofar as the six economies are closest to the core CEEC countries, closer than some of the more distant (from the regulatory point of view) countries such as Poland or Slovakia. This is particularly encouraging in view of the region's efforts to create a common regional market (Box 5.6).

**Figure 5.13. How harmonised are services regulations in WB6 and CEEC economies (2020)?**

OECD STRI Regulatory Heterogeneity Indices for four services clusters

Note: The size of each economy node indicates centrality and reflects the similarity of the regulations to all other economies. The shade of the nodes also reflects regulatory harmonisation among jurisdictions, with dark blue nodes indicating more central economies than those in grey. The direction of the arrows indicates the most similar economy in an economy pair, while the thickness of the lines further illustrates the degree of bilateral similarity.

### Box 5.6. Towards open trade in the Common Regional Market

The regional trade area of the CRM action plan includes the following five components: (1) cross-cutting trade measures; (2) goods; (3) services; (4) capital; and (5) people. The following key findings of the CO2021 services trade restrictiveness sub-dimension can inform the implementation of the services component:

- Significant improvements have been made to open up trade in services through the conclusion of Additional Protocol 6 to CEFTA in December 2019 and its ratification by Albania, Bosnia and Herzegovina, North Macedonia, and Serbia. Significant progress has been made in easing the restrictions on the movement of people within the CEFTA. These and subsequent efforts will significantly reduce the costs of trade in the Western Balkans 6 and pave the way to the CRM.
- The regulatory policy changes (Figure 5.8) in the six economies show clear regional willingness to open services trade. A series of reforms has lowered obstacles to trade in services in all sectors, especially in the courier sector. This contrasts with the recent rise of protectionist measures observed in OECD economies (OECD, 2021<sup>[38]</sup>).
- Analysis using the OECD heterogeneity indicators shows there is great potential for future alignment of regulatory environments in the region, which supports the objectives of the common regional market.

### ***General business regulations and barriers to the movement of people undermine openness***

While the WB6 have relatively liberal sectoral regulations, general business regulations, i.e., those that apply to all markets, are acting as a brake on the openness of the economies. For example, the acquisition or use of land and real estate by foreigners is restricted in all the WB6 economies except Kosovo. A minimum capital requirement is mandatory in all the WB6 economies except Bosnia and Herzegovina.<sup>17</sup> Registering a company in the economies tends to involve costly, cumbersome, and lengthy procedures. Only Kosovo and Serbia are within the good practice thresholds in terms of cost and length involved in registering a company.

Restrictions on the movement of people are generally also an issue in WB6 economies. Although significant progress has been made to ease the conditions for the movement of people among the CEFTA economies through the conclusion of Additional Protocol 6 to the CEFTA agreement, people from third economies (i.e. outside CEFTA and the EU) are still subject to restrictive requirements, which limits their ability to operate. These restrictions are often the result of employment preservation policies and are very common, including in OECD countries. While sometimes justified, and present in most of the EU Member States, these policies have a potentially detrimental effect on trade in services when applied more than necessary, particularly in sectors where foreign labour could bring in expertise that is lacking in the region such as computer services or the professional services. These measures often take the form of quotas, labour market tests (LMTs) or restrictions on the length of stay of foreign suppliers. Albania, Kosovo and Serbia do not apply quotas to services providers seeking to deliver services on a temporary basis, such as intra-corporate transferees, contractual service providers or independent service providers. In contrast, Bosnia and Herzegovina, Montenegro and North Macedonia have introduced quotas, but they are limited to contractual and independent service providers. In order to balance the adverse effects of quotas and LMTs on trade in services with the legitimate issues of local employment protection, Montenegro has introduced exceptions in its Law on Foreigners. These are aligned with the relevant provisions of EU legislation and are based on reciprocity or exclusion of specific occupational categories from the quota system.<sup>18</sup> In addition, the economies apply economic needs tests to foreign suppliers.<sup>19</sup> Finally, the length

of stay of foreign service providers in the WB6 region is very limited, well below international standards and disproportionately restrictive compared to the local labour protection considerations.

### Specific services sectors still have restrictions affecting trade<sup>20</sup>

As well as the regulatory measures that affect WB6 economies' trade in services across the board (described above), a number of sector-specific restrictions are maintained in the 12 sectors analysed (listed in Box 5.1).

The following analysis describes the STRI scores for the six WB6 economies, as well as the best and worst CEEC performers who conducted the STRI exercise. In addition, the figures also present the OECD Intra-EEA STRI, which introduces data on regulatory barriers affecting services trade within the European Economic Area (EEA), to highlight the lowered degree of restrictiveness within an integrated single market.

#### Transport and distribution supply chain

**Road freight transport.**<sup>21</sup> The 2020 WB6 average STRI score is 0.225 (Figure 5.14), compared to the OECD and EU averages of 0.201 and 0.184 respectively. Overall, OECD member states and STRI key partners and WB6 scores range between 0.124 and 0.624. This sector largely dominates the other freight transport sectors in the region. At the regional level, the economies have generally less restrictive sectoral regulations than the averages found in the EU and OECD member states, apart from Albania and Bosnia and Herzegovina, which maintain more restrictive environments.

**Figure 5.14. Services trade restrictiveness in road and rail freight transport (2020)**

WB6, CEEC best and worst performers, intra-EEA

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; CEEC: Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and are not covered by STRI indices. Intra-EEA = regulatory barriers affecting services trade within the European Economic Area (EEA); key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

Source: (OECD, 2020<sup>[39]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink <https://doi.org/10.1787/888934253651>

Restrictions on foreign entry are the main barriers in this sector. In all the economies except Kosovo a licence is required to operate road transport services, and licensing is conditional on economic needs. Positively, none of the WB6 economies has introduced limitations on cross-border mergers and acquisitions. In addition, Bosnia and Herzegovina, Kosovo, Montenegro, and North Macedonia have established processes and criteria for recognising foreign qualifications on a most favoured nation (MFN) basis, which is not the case for Serbia and Albania.

In road transport, barriers to competition play an important role. Montenegro and North Macedonia exempt road freight carriers' agreements from competition law and pricing guidelines or price regulation for road hauliers are found in Albania and Bosnia and Herzegovina. These measures have a negative impact on competition in this sector.

**Rail freight transport.**<sup>22</sup> The 2020 WB6 average score is 0.317, while scores for all OECD member states and STRI partners in this sector range between 0.129 and 1, and the OECD and EU averages are 0.259 and 0.209 respectively (Figure 5.14). The sector is mainly constrained by economy-wide measures, most notably on the movement of people and foreign entry. Measures included under this category are mainly related to general regulations on board members, cross border data flows, local presence requirements, and, in some cases, restrictions on access rights to the internal market. Albania subjects foreign investment in the sector to screening, only approving it if it brings net economic benefits to the economy.

Government ownership is recorded under barriers to competition and is widespread in the rail sector. Only in Albania are all major railway companies privately owned. In Bosnia and Herzegovina and Montenegro, where one of the main rail transport companies is state owned, the government can overrule the decisions of the rail regulator, with very negative impact for the whole sector. Another common restriction in this policy area, in the vertical separated market structures, is the restriction or outright prohibition in all the WB6 economies, except Albania, on transferring and/or trading infrastructure capacity. The benefits of Albania's more positive regulation are however mitigated by the existence of different types of rail agreements exempted from national competition law (a restriction also found in Montenegro).

**Air transport services.**<sup>23</sup> The STRI for this sector covers services provided through commercial establishment only.<sup>24</sup> The 2020 WB6 average is 0.421, while the scores for all OECD member states and STRI partners range between 0.165 and 0.601, and OECD and EU averages are 0.409 and 0.406 respectively (Figure 5.15).

The air transport sector is the archetype of a service industry whose legal environment is regulated by domestic laws driven by international agreement concerns. In absolute terms, the region's regulations are highly harmonised with EU standards, which could explain their relative restrictiveness compared to the best performing OECD Member States in this sector. The degree of restrictiveness in the aviation sector is explained by the balancing of strategic considerations, which are often more prone to trade protection, but not per se protectionist and trade openness considerations. However, given that freight transport in the region is dominated by road transport, especially in Kosovo, some of the measures on air transport that increase the scores of the WB6 economies may seem disproportionate to the real size of their markets.

Restrictions on foreign entry feature prominently in the results. Most WB6 economies, except for Albania and Bosnia and Herzegovina, restrict foreign equity participation in the sector to (at least) less than 50%. The lack of these restrictions in those two economies explains the difference in scores with the rest of the region. Ownership restrictions are often coupled with specific limitations on the nationality of board members and managers of air carriers. The lease of foreign aircraft with crew (wet lease) is effectively prohibited in Kosovo, North Macedonia and Serbia, whereas it is allowed in Bosnia and Herzegovina, and is allowed subject to prior approval in Albania and Montenegro. Leasing foreign aircraft without crew (dry lease) is subject to prior authorisation in all the WB6 economies, except Bosnia and Herzegovina.

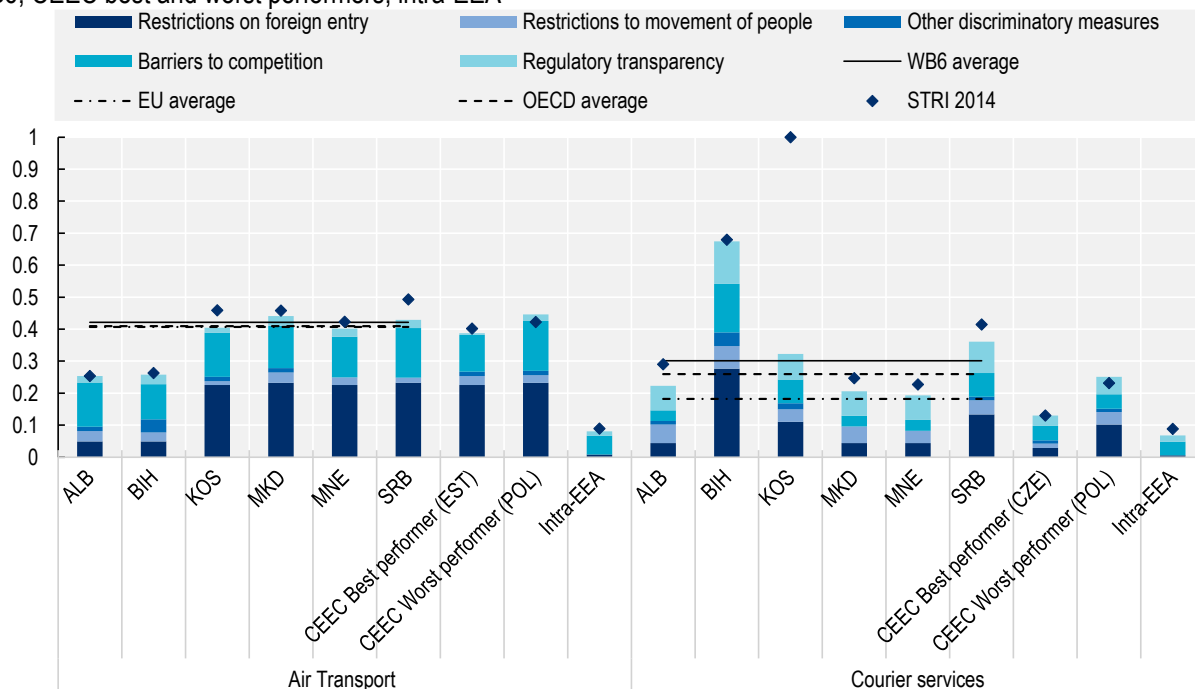

The other main category influencing restrictiveness is barriers to competition. All WB6 economies, except Bosnia and Herzegovina and North Macedonia, maintain public ownership in aviation. The maintenance

of state-owned enterprises (SOEs) in the sector is generally regarded as a restriction on trade in services as traditional national airlines normally enjoy a competitive advantage over foreign companies. Kosovo is a special case in that regard – while two SOEs exist in this sector, none of them has a fleet of aircraft. The airlines continue to work with other providers serving Pristina and to sell excursion trips. This situation is quite rare and negatively affects the STRI score in this sector. Non-competitive slot allocation is also common. All WB6 economies, except Bosnia and Herzegovina, assign slots in high demand airports based on historic rights, typically forbidding the commercial exchange of slots.

**Figure 5.15. Services trade restrictiveness in air transport and courier services (2020)**

WB6, CEEC best and worst performers, intra-EEA

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; CEEC: Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and are not covered by STRI indices. Intra-EEA = regulatory barriers affecting services trade within the European Economic Area (EEA); key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

StatLink  <https://doi.org/10.1787/888934253670>

**Courier services.**<sup>25</sup> While courier and postal services have traditionally been important means of communication, the rise in modern information and communication technologies has reduced the use of letters between individuals for this purpose. The 2020 WB6 average score is 0.301 in this sector, with scores for all OECD member states and STRI partners ranging between 0.106 and 0.881, and the OECD and EU averages at 0.259 and 0.181 respectively (Figure 5.15). The WB6 average is therefore relatively high compared to OECD member states. In consequence, special attention should be paid to this sector. It is in fact the sector that sees the greatest dispersion of results between performing and non-performing economies. However, this sector is not the most heterogeneous. This means that the degree of restrictiveness is mainly the result of a limited number of measures (Box 5.7).

### Box 5.7. Making the best of the STRI tools: Comparing courier services in Slovenia, Czech Republic and the WB6

Whilst the WB6, and Bosnia and Herzegovina in particular, have higher scores in the courier services sector than many OECD members, Slovenia and the Czech Republic both have a very open and liberal courier services market, with amongst the lowest STRI scores in the sector. The Czech Republic is the CEEC's best performer in this respect (Figure 5.14).

The Slovenian Postal Act of 1997 brought the economy's legislation in the postal sector partially in line with the EU *acquis*. Complete liberalisation of postal services was achieved with the adoption of the new Postal Services Act in April 2002 and secondary acts in 2003. Currently, courier services are Slovenia's least-restrictive STRI sector. The economy maintains only a few sector-specific restrictions: the existence of a state-owned designated postal operator and limits to the proportion of shares that can be acquired by foreign investors.

The Czech Republic has undergone a similar liberalisation process, which began in the 1990s and materialised in the Acts of 2000 and 2005. The latest piece of legislation is the June 2012 act to amend the Czech Postal Services Act. The amendments followed the latest EU developments regarding the liberalisation of the postal market and came into force in January 2013. The amendments abolished the existing monopoly held by the state-owned Česká pošta (Czech Post) on deliveries of postal items weighing up to 50g and opened the market completely to competition.

Comparing the economies using the STRI policy simulator, it appears that only a limited number of regulatory measures dictates the scoring difference between Slovenia, the Czech Republic, and the Western Balkans. This suggests that the WB6 economies could substantially reduce their restrictiveness indexes to the average levels found in the best STRI performers by focusing on lifting specific restrictions:

- In the area of *restrictions on the movement of people*, scores are largely increased by the quotas and very short durations of stay for foreign service providers. Overall, lifting limitations on movement of people could potentially decrease the WB6 courier STRI scores by a maximum of 0.052.
- In the *barriers to competition* category, Slovenia and the Czech Republic do not apply any preferential tax or subsidy treatment to the national Designated Postal Operator, unlike some of the WB6 regulatory frameworks. Lifting this restriction could potentially decrease courier STRI scores by 0.011.
- Slovenia has incorporated a specific dispute resolution system into its regulatory environment governing the postal sector. No such mechanism exists in the WB6 economies – adding one could enable the economies to lower their degree of restrictiveness in the *barriers to competition* area by 0.011.
- In its 2002 reform of the postal market, Slovenia abolished all reserved services in the sector. This regulatory change is the most significant difference with all WB6 economies. Following Slovenia's example, the removal of these restrictions could potentially reduce the score by a maximum of 0.468, depending on the economy's regulatory situation.<sup>1</sup>

1: On state monopoly in courier services (see page 9 of OECD STRI Scoring Methodology for more detailed explanations).

Restrictions on foreign entry in this sector have a substantial impact on the economies covered by the STRI. Bosnia and Herzegovina limits the proportion of shares acquired by foreign investors in publicly-controlled firms including designated postal operators (DPOs). None of the WB6 economies requires

residency for managers or board members, but Bosnia and Herzegovina and Serbia require local presence for cross-border supply.

Barriers to competition also affect the score in all economies. All the WB6 economies stipulate in their laws and regulations that the DPO should provide universal service, which can benefit the DPO in the market. Practically all the DPOs in all six economies, except North Macedonia, obtain preferential tax or subsidy treatment. However, all the economies address the issue by requiring an accounting separation between universal services and other services as well as ensuring access to postal networks on a non-discrimination basis.

Regulatory transparency includes administrative procedures, such as customs clearance, obtaining a visa, or a licence to operate, which are key to trade in postal and courier services. Most of the economies have smooth customs clearance schemes in place, such as pre-arrival processing in Bosnia and Herzegovina and Montenegro, and a de minimis regime in place in Kosovo and in North Macedonia. As to the process of obtaining a licence, all the WB6 economies have objective criteria and an appeals procedure to ensure transparency.

### Market bridging and supporting services

**Legal services.**<sup>26</sup> The 2020 WB6 average score for this sector is 0.391 (Figure 5.16), which is aligned with the EU average (0.394) but is above the OECD average (0.360). Scores for all OECD member states and STRI partners in this sector range between 0.141 and 1. The results are driven by two policy categories: restrictions on the movement of people and restrictions on foreign entry. This reflects the characteristics of the sector and the policy environment in which it operates. Legal services depend on skilled intensive labour and are subject to licensing in a number of economies.

**Figure 5.16. Services trade restrictiveness in legal services (2020)**

WB6, CEEC best and worst performers, intra-EEA

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; CEEC: Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and are not covered by STRI indices. Intra-EEA = regulatory barriers affecting services trade within the European Economic Area (EEA); key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

Source: (OECD, 2020<sup>[39]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934253689>

The movement of lawyers across borders is hindered significantly by licensing and procedures for recognition of foreign qualifications. All the WB6 economies have laws or regulations which establish a process for recognising qualifications gained abroad. Unfortunately, Kosovo is the only WB6 economy that has a temporary licensing system in place. In Bosnia and Herzegovina and Kosovo, nationality or citizenship is required to be licensed to practise domestic law in the economy. In Montenegro and North Macedonia, this is a requirement to practise both domestic and international law. In Serbia, which is the least restrictive economy in the legal services sector in the WB6 region, a foreign lawyer must be registered in the directory of lawyers and can only give oral and written legal advice and opinions related to the application of the law of their home country and international law.

All the WB6 economies, except Bosnia and Herzegovina, require foreign lawyers to pass a local examination and to practise locally before their qualifications can be recognised. All the WB6 economies except Albania and Kosovo place restrictions on advertising legal services by foreign professionals.

**Commercial banking.**<sup>27</sup> The 2020 WB6 average score is 0.239 for this sector (Figure 5.17), while OECD and EU averages are 0.205 and 0.180 respectively. Scores for all OECD member states and STRI partners in this sector range between 0.131 and 0.517.

*Restrictions on foreign entry* feature prominently in the indices. A positive outcome is the fact that none of the WB6 economies limit the foreign equity share in local banks. Trade is however tempered by Bosnia and Herzegovina and Serbia's prohibition of the establishment of foreign bank branches. Moreover, Bosnia and Herzegovina imposes more stringent requirements when granting a licence to foreign-owned banks than domestic ones. All WB6 economies except Albania and Kosovo restrict cross-border bank mergers and acquisitions. In Bosnia and Herzegovina and Serbia foreign banks must be locally established in order to provide a full range of services to residents.

**Figure 5.17. Services trade restrictiveness in commercial banking and insurance services (2020)**

WB6, CEEC best and worst performers, intra-EEA

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; CEEC: Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and are not covered by STRI indices. Intra-EEA = regulatory barriers affecting services trade within the European Economic Area (EEA); key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

Source: (OECD, 2020<sup>[39]</sup>), Services Trade Restrictiveness Index Regulatory Database, <http://oe.cd/stri-db>.

StatLink <https://doi.org/10.1787/888934253708>

*Barriers to competition* push up the scores of the economies with the highest index values. Product-level regulations – including prior approval requirements for individual financial products in Albania, Bosnia and Herzegovina, North Macedonia, and Serbia – are significant drivers of this result. Government ownership is not common in the sector, with only one of the largest commercial banks in Bosnia and Herzegovina being state-owned.

Regarding *regulatory transparency* when granting licenses, only Albania and Kosovo mandate the authorities to provide grounds for rejecting an applicant. All the WB6 economies specify a maximum time limit for deciding on a banking licence application.

**Insurance services.**<sup>28</sup> The 2020 WB6 average score is 0.231 for this sector, while the OECD and EU averages are 0.193 and 0.175 respectively (Figure 5.17). Scores for all OECD member states and STRI partners range between 0.104 and 0.565.

*Restrictions on foreign entry* feature prominently in the indices. None of the WB6 economies limit the foreign equity share in local insurance companies, but Bosnia and Herzegovina and Serbia restrict the establishment of branches of foreign insurers (for foreign reinsurer branches until the accession of Serbia to the WTO, and for foreign insurer branches four years after Serbia's accession to the WTO). Montenegro imposes supplementary prudential obligations on foreign service suppliers willing to obtain a licence to operate in the economy. These involve additional submissions, including a report on the last three years of operations, audit reports on the financial statements for the previous business year, the opinion of the home country's supervisory authority on the applicant's business and approval to establish the affiliate in Montenegro. Bosnia and Herzegovina and North Macedonia restrict cross-border bank mergers and acquisitions. In Bosnia and Herzegovina and Serbia, insurance carriers must be locally established in order to provide a full range of services to residents. Finally, Serbia requires at least one member of an insurance carrier's Board of Directors to be a resident.

*Barriers to competition* also contribute to the scores of the economies with the highest index values. Product-level regulations, including prior approval requirements for individual insurance products in all WB6 economies except Serbia are significant drivers of this result. Government ownership is observed in the sector in Bosnia and Herzegovina and Serbia.

Regarding *regulatory transparency* in the process of granting licenses, all the WB6 economies mandate the authorities to provide grounds for rejecting an applicant, and all of them specify a maximum time limit for deciding on an insurer's licence application.

### *Physical infrastructure services*

**Construction services.**<sup>29</sup> The 2020 WB6 average score is 0.242 in this sector (Figure 5.18). The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.464; the WB6 average is 0.242 while the OECD and EU averages are 0.222 and 0.207. The more elevated levels of restrictiveness in the construction sector can in part be attributed to general measures affecting all sectors of the economies. In terms of sector-specific regulations, only Bosnia and Herzegovina has limitations on foreign branches, and on cross-border mergers and acquisitions. Notably, all the WB6 economies except Kosovo place impediments on foreigners acquiring land and real estate, which typically have a direct bearing on construction services. For example, property developers cannot own real estate under construction until completion of the project.

**Figure 5.18. Services trade restrictiveness in construction services (2020)**

WB6, CEEC best and worst performers, intra-EEA

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; CEEC: Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and are not covered by STRI indices. Intra-EEA = regulatory barriers affecting services trade within the European Economic Area (EEA); key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

Source: (OECD, 2020<sup>[39]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934253727>

Bosnia and Herzegovina and Serbia maintain government ownership of their major construction firms, which are among their few *barriers to competition* for construction services, at times coupled with limitations on foreign ownership of construction firms.

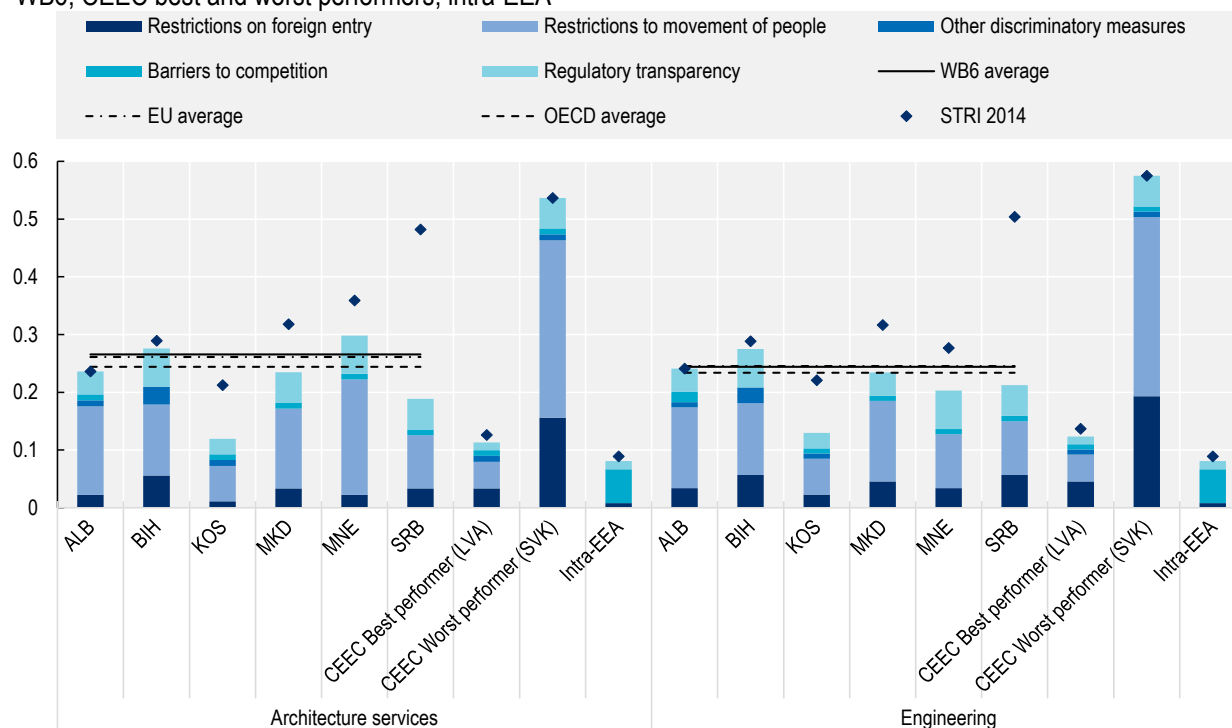

**Architecture services.**<sup>30</sup> Architecture services constitute the backbone of the construction sector, with key roles in building design and urban planning. An important feature is the regulatory complementarity between architecture, engineering, and construction services. Often, architectural and engineering activities are combined into projects offered by one company and are sometimes subsumed in the building and construction sector.

The 2020 WB6 average score is 0.266 in this sector (Figure 5.19). The 2020 scores for all OECD member states and STRI partners in this sector range between 0.113 and 0.684; the EU average is 0.260 and the OECD average is 0.244.

Architects are affected by economy-wide limitations on natural persons seeking to provide services on a temporary basis as intra-corporate transferees, contractual services suppliers, or independent services suppliers. In addition, architects are subject to issues related to licensing requirements. These include nationality and residency requirements to practise, as well as lack of recognition of foreign qualifications. All of the WB6 economies require a licence to practice architecture. Localisation requirements for professional liability insurance are in place in Serbia and North Macedonia. Other discriminatory measures can be found in regulations on public procurement, with Bosnia and Herzegovina having preferential measures for local suppliers.

**Figure 5.19. Services trade restrictiveness in architecture and engineering services (2020)**

WB6, CEEC best and worst performers, intra-EEA

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; CEEC: Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and are not covered by STRI indices. Intra-EEA = regulatory barriers affecting services trade within the European Economic Area (EEA); key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

Source: (OECD, 2020<sup>[39]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934253746>

**Engineering services.**<sup>31</sup> The 2020 scores for all OECD member states and STRI partners in this sector range between 0.118 and 0.575, the WB6 average is 0.244, while OECD and EU averages reach 0.233 and 0.245, respectively.

As in the case of architects, engineers are affected by economy-wide limitations on natural persons seeking to provide services on a temporary basis as intra-corporate transferees, contractual services suppliers, or independent services suppliers. In addition, engineers are subject to licensing restrictions. These include nationality and residency requirements to practise, as well as lack of recognition of foreign qualifications. A licence to practise engineering services is required in all of the WB6 economies. Montenegro is the only economy with a temporary licensing system in place. Laws or regulations that establish a process for recognising qualifications gained abroad are in place in all of the WB6 economies except Albania. As regards *barriers to competition*, none of the WB6 economies has restrictions on fee-setting or advertising, which has a positive effect on the STRI score.

### Digital network

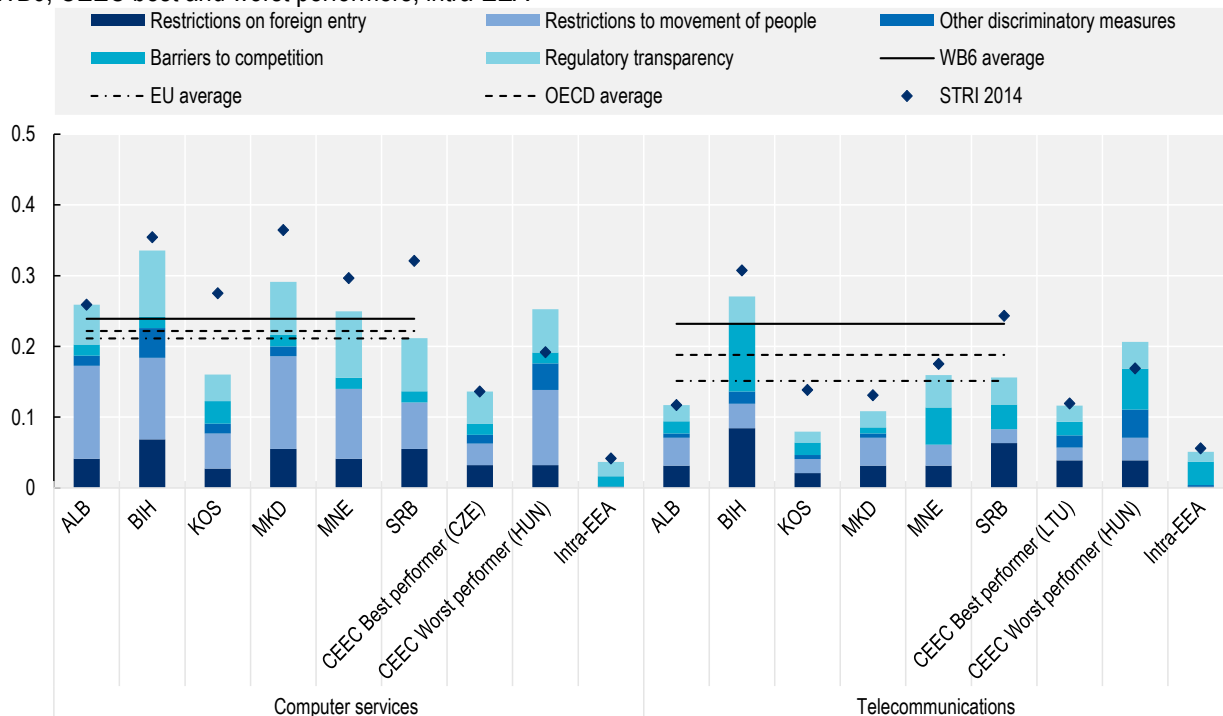

**Computer services.**<sup>32</sup> The 2020 WB6 average score is 0.239 (Figure 5.20) in this sector, while OECD and EU averages are 0.221 and 0.211, respectively. Scores for all OECD member states and STRI partners range between 0.123 and 0.448. None of the WB6 economies has increased the restrictiveness of this sector since 2014. In fact, scrutiny related to their future EU membership has led the economies to reform their regulatory frameworks. This sector is rarely regulated by sectoral legislation, with the WB6,

like most economies generally subjecting computer services to general laws that apply to the economies as a whole. Together, these factors mean that the STRI scores are better than in the previous cycle of assessments (Figure 5.11).

**Figure 5.20. Services trade restrictiveness in computer services and telecommunications (2020)**

WB6, CEEC best and worst performers, intra-EEA

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; CEEC: Bulgaria and Croatia are not OECD members nor OECD STRI partner economies and are not covered by STRI indices. Intra-EEA = regulatory barriers affecting services trade within the European Economic Area (EEA).

Source: (OECD, 2020<sup>[39]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934253765>

**Telecommunication services.**<sup>33</sup> Telecommunication services are at the core of the information society and provide the network over which other services, including computer services, audio-visual services, professional services and many more, are traded. The 2020 WB6 average score is 0.232 in this sector, while OECD and EU averages are 0.188 and 0.151 respectively (Figure 5.20). Scores for all OECD member states and STRI partners range between 0.108 and 0.682.

These results are driven by two policy areas: restrictions on foreign entry and barriers to competition. This reflects the special characteristics of this sector, as well as the policy environment in which it operates. It is a capital-intensive network industry, and its strategic importance has prompted many OECD economies to restrict foreigners from investing and operating in the sector. However, none of the WB6 economies require that at least half of the board members in telecommunications companies be nationals or oblige the majority of board members to be residents.

In a network industry, access to essential facilities and switching costs may favour incumbent firms. These market imperfections may constitute a substantial entry barrier, even in the absence of explicit foreign entry restrictions. Therefore, pro-competitive regulation is considered a trade policy issue. Lack of pro-competitive regulation is scored as a trade restricting barrier to competition in cases where an incumbent operator has significant market power. In order to ensure fair competition in the telecommunications market, it is important to have an independent regulator that is separate from interested parties. In all the WB6 economies the national regulatory authority is independent from the government. This is particularly

important as the governments of Bosnia and Herzegovina, Kosovo, and Serbia maintain state-owned enterprises in this sector.

Another positive point is that all the WB6 economies regulate termination rates for fixed and mobile line service and in all of the WB6 economies foreign operators seeking interconnection benefit from regulated termination rates on a non-discriminatory basis. In terms of foreign entry, Bosnia and Herzegovina requires commercial and local presence for companies providing cross-border telecommunication services, while Serbia imposes only a local presence requirement. This measure, although common in OECD countries, raises the operating costs of foreign service providers.

All the WB6 economies regulate interconnection. Moreover, all the economies except Bosnia and Herzegovina apply a "use-it-or-lose-it" policy to frequency bands – an important measure that prevents incumbent operators from over-holding valuable frequency licences – as well as free tradable spectrum and telecom services. Bosnia and Herzegovina is the only economy that does not assign contracts for universal services obligations on a competitive basis.

### ***The way forward for services trade restrictiveness***

In absolute terms, the region has competitive regulation, especially when compared to the averages in OECD economies or the CEECs. The region combines a number of pro-competitive legal measures while also maintaining a number of trade limitations. However, to continue their efforts, governments need to:

- **Ratify and implement CEFTA Additional Protocol 5 on trade facilitation and Additional Protocol 6 on trade in services.** This is a priority for economies that have still not fulfilled these commitments. This is important given that trade in services continues to be marked by regulations that are highly susceptible to modifications in the international normative environment.
- **Broaden efforts to open trade in services sectors.** Significant improvements have been made among the WB6 economies to open services trade through regulatory efforts and the conclusion of the CEFTA Additional Protocol 6 in December 2019. Nonetheless, the STRI analysis in this section has provided some insights into where domestic reforms could help to attract new businesses and improve competitiveness by:
  - **Easing conditions on the temporary movement of natural persons** beyond the obligation set in regional trade agreements. A starting point could be to amend limitations on the length of stay of foreign services providers from third countries, as it falls short of international best practice in most of the economies. Remaining quotas and labour market test should also be assessed.
  - **Reducing the remaining barriers to market entry and competition** in courier services (described in Box 5.7), legal services and air transport sectors. Further efforts could be made to increase competitiveness.
- **Pave the way for a regional common market with harmonised regulations** by adopting a twin-track approach: increasing regulatory homogeneity while reducing their degree of restrictiveness. Doing so would allow the WB6 economies to benefit from a revitalised post-COVID-19 trade in services. The first step would be to reduce trade restrictions identified in this study to a level significantly below an STRI score of 0.4 in sectors that maintain high levels of restrictiveness. As a second step, economies should consider harmonising the content of their legislation, including through multilateral channels such as the CEFTA regulatory databases and the OECD heterogeneity indices (Figure 5.12). Harmonised and unrestricted service regulations are associated with a strong increase in trade in services.

## E-commerce and digitally enabled services (Sub-dimension 2.3)

E-commerce can bring about significant gains for businesses and can also boost firms' process innovation (OECD, 2019<sup>[41]</sup>). In addition, it enlarges businesses' market scope, reduces operational costs at various stages of business activities and lowers barriers to entry, thus intensifying competition. E-commerce also benefits consumers by providing information on goods and services, helping them identify sellers and compare prices, while offering convenient delivery and the ability to purchase easily via a computer or mobile device (OECD, 2013<sup>[42]</sup>).

The COVID-19 crisis has accelerated the expansion of e-commerce to new businesses, new customers and new types of products. It has allowed customers to access a wider variety of products (such as groceries and other first necessities) from their homes, and businesses to maintain their operations despite containment restrictions. It is likely that some evolutions in e-commerce will be prolonged over time, such as the shift towards basic necessities. Nevertheless, some challenges remain, despite the efforts of some governments to promote e-commerce during the COVID-19 crisis, the persistence of the digital divide means that not everyone has been able to participate (OECD, 2020<sup>[43]</sup>). Regulations that are not adapted to e-commerce can create barriers for businesses. The current crisis and the new role of e-commerce for individuals and businesses have reinforced the need for policy action. For consumers, systemic challenges related to connectivity, financial inclusion, skills and trust (e.g. digital security, privacy and consumer protection) have been highlighted (OECD, 2020<sup>[44]</sup>).

An electronic commerce law ideally ensures the proper functioning of the digital market by facilitating the establishment of digital services and their free movement within the region (if co-ordinated and harmonised). Its aim should be to provide legal certainty for business and consumers by establishing harmonised rules on issues such as the transparency and information requirements for online service providers, commercial communications, electronic contracts and liability limitations for intermediary service providers. Examples of what the EU Directive on Electronic Commerce<sup>34</sup> covers include shopping, newspapers, databases, financial services, professional services (such as lawyers, doctors, accountants, and real estate agents), entertainment services, direct marketing, advertising, and internet intermediary services (such as hosting and search engines). Modern e-commerce regulations should focus on a number of key elements, such as electronic documentation and signature, online consumer protection, data protection and privacy, cyber security, intellectual property regulations and intermediary liability. On the other hand, an attractive regulatory environment should refrain from maintaining disproportionately restrictive policies such as licensing requirements for e-commerce platforms, limitations on the type of goods that can be sold online (other than for generally accepted public policy considerations), and restrictions on cross-border data flows. This sub-dimension assesses these policies in the WB6 economies. First, it analyses the content and implementation of existing legislation. Secondly, it uses the OECD Digital STRI to quantify the WB6's performance in trade in digital services by identifying the elements that restrict digital trade in different economies.

### ***E-commerce policy frameworks are in place in all of the WB6 economies***

E-commerce policy frameworks exist in all the WB6 economies, but their implementation, monitoring and evaluation vary greatly across the region (Table 5.4). The economies with the highest average score for this sub-dimension are North Macedonia and Serbia (4.0), followed by Albania and Kosovo (3.0). They demonstrate strong implementation of their e-commerce policy frameworks as well as monitoring and evaluation activities. Montenegro scores 2.5 meaning that e-commerce frameworks are adopted, and their content respects the requirements of e-commerce, but implementation is incomplete. Bosnia and Herzegovina scores 2.0: the minimum policy framework is in place, but there is a need to improve implementation activities and related action plans that are not fully effective.

**Table 5.4. Scores for Sub-dimension 2.3: E-commerce and digitally enabled services**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 2.3: E-commerce and digitally enabled services	E-commerce policy framework	3.0	2.0	3.0	4.0	2.5	4.0	3.1
	Trade in digitally enabled services restrictiveness*	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.
<b>Sub-dimension average score</b>		3.0	2.0	3.0	4.0	2.5	4.0	3.1

\* Note: Indicator has a different scoring system so results are presented in the sub-section below, not in the table.

North Macedonia, Serbia and to some extent Kosovo, have the most advanced and modern legal environments for e-commerce. Serbia and North Macedonia amended their legislation in 2019 and 2020, respectively. Kosovo has updated its law, which should come into force in 2021. North Macedonia has put a new e-commerce programme in place: the Economic Reform Programme (ERP) for 2019-2021 in North Macedonia highlights new legislation and initiatives under the competence of Ministry of Information Society and Administration (MISA) on the digital economy and e-commerce.<sup>35</sup> In October 2019, Serbia adopted the Programme and Action Plan for E-commerce Development for the period 2019-2020. Serbia is also the only economy to report on performance indicators for the e-commerce law, reported annually by its Statistical Office.

Although solid, the frameworks in these three economies are not without gaps. Serbia does not have a dedicated Online Dispute Resolution (ODR) platform for litigation linked to e-commerce. The ODR platform is a single point of entry for consumers and traders seeking to resolve their disputes out of court. To mitigate this, Serbia has focused primarily on improving the Alternative Dispute Resolution (ADR), which is a decentralised system. Currently, 13 ADR bodies are registered with the Ministry of Trade, Tourism and Telecommunications (MTTT) and their services are free of charge. Moreover, MTTT is starting to implement its Instrument for Pre-accession Assistance IPA2018 (the project will start on the 9 June 2021), which supports the process of ADR improvement through training and recommendations, as well as an IT support platform for ADR organisations.<sup>36</sup> Kosovo and North Macedonia suffer from limitations in e-payment regulations and consumer protection awareness.

Montenegro and Albania have modern e-commerce laws, updated in 2013 and 2016 respectively, but implementation and monitoring are weak. Favoured by their willingness to gradually harmonise their frameworks with the EU *acquis*, most of the elements of a comprehensive regulatory framework are in place in both economies. Regulations on data governance, online consumer protection, electronic signature and intermediary liability are in line with international best practice and harmonised with EU regulations.<sup>37</sup> The framework balances protecting individuals and consumers with limiting the costs and restrictions faced by digital businesses, especially in the area of services (Figure 5.21). With the regulatory framework largely in place in both economies, implementation remains a challenge due to their institutional capacity constraints. In the area of cyber security, modern and effective independent regulatory bodies are not yet in place. Similarly, the consumer protection regimes currently lack effective supervisory authorities to monitor compliance, raise consumer awareness of their rights and resolve e-commerce disputes.

To mitigate these issues, the Ministry for Public Administration of Montenegro is to propose a new strategy for digital transformation to the government for the period 2021-2025. In September 2020, Albania launched an action plan for e-commerce and established an inter-ministerial working group, headed by the Deputy Minister of MOFE, to draft an electronic trade strategy aimed at removing obstacles to the development of this sector.

Finally, the regulatory policy framework on e-commerce in Bosnia and Herzegovina is still in the early stages. There have not been any substantive changes in the framework since the last cycle of assessment, and very little progress has been made on implementation. The economy adopted the 2017-2021 Policy for Development of the Information Society in May 2017, but there has been no progress in adopting an economy-wide strategy or associated action plans for e-commerce.

### Digital STRI scores reveal low levels of restrictiveness

The OECD digital STRI captures cross-cutting barriers that inhibit or completely prevent firms from supplying services using electronic networks, irrespective of the sector in which they operate. The regulatory data underlying the digital STRI were extracted from the existing OECD STRI database and data collected under public laws and regulations affecting digitally enabled services. Digital STRIs are the result of aggregating the identified barriers to trade into composite indices. The rating takes into account the specific regulatory and market characteristics as well as the links and hierarchies between regulatory measures affecting digitally enabled services. WB6 economies' scores on the STRI index in the digital sector covered by the STRI project are shown in Figure 5.21.

**Figure 5.21. Digital services trade restrictiveness index: WB6 and CEEC economies**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; \*CEEC=Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia (Bulgaria, Croatia, and Romania are not OECD member states or OECD STRI Partner economies and therefore do not have calculated STRI indices); the absence of a category in the graph means that it is exempt from restrictions.

StatLink  <https://doi.org/10.1787/888934253784>

The WB6 economies' 2020 Digital STRI scores are moderate to high, ranging from 0.1 to 0.36, with an average of 0.183, compared to OECD countries which range from 0.043 to 0.488. This means that the economies of the WB6 region are much less restrictive than other economies covered by the digital STRI. Restrictions in the digital STRI sector in the WB6 are related to *infrastructure and connectivity* measures. This is the consequence of the lack of effective telecoms regulations, especially in the area of interconnection (see above). Positively, all the WB6 economies mandate interconnections for both fixed and mobile networks. Only Bosnia and Herzegovina does not regulate interconnection prices and conditions for mobile and fixed networks. Non-discriminatory Internet traffic management is mandatory in Kosovo, North Macedonia, and Serbia, but not in the other economies. Vertical separation for fixed networks, a particularly important measure, is required in all of the WB6 economies except Albania. Vertical separation for mobile networks, on the other hand, is only required in Bosnia and Herzegovina, North Macedonia, and Serbia.

No specific licences or authorisations for e-commerce activities in addition to ordinary commercial licences are required in any of the WB6 economies. This eases the establishment of electronically enabled services and makes the economies attractive to foreign suppliers. The implementation of international standards for electronic contracts and key electronic authentication measures such as recognition of electronic signatures are in place.

From the perspective of the OECD STRI, all six economies perform well in the policy area of *intellectual property rights*. In particular, none of them have introduced regulations on protection of intellectual property that treat foreigners differently to nationals.

Similarly, in terms of *payment systems*, there are no payment barriers such as discriminatory access or total prohibition for foreign providers of certain payment solutions, or a lack of enforcement of international security standards for common payment methods such as credit cards. Again, the WB6 compare well with the OECD digital STRI partner states with the lowest levels of digital restrictiveness.

### ***The way forward for e-commerce and digitally enabled services***

In absolute terms, the six Western Balkan economies have regulations in place for, but present few regulatory barriers to, digital trade. Nevertheless, e-commerce in the WB6 region still has much potential for improvement and could benefit even more from the explosion of e-commerce in the context of COVID-19. It should be borne in mind, however, that the factors limiting electronic trade may also be related to economic and social conditions that go well beyond purely regulatory frameworks, including rural-urban divides (see Agriculture policy chapter), income distribution, unequal access to education (see Education policy chapter) and an ageing society. These conditions may manifest themselves in low connectivity, lack of digital skills and low levels of trust (including security and privacy concerns) (see Digital society chapter), all of which can be addressed through policy action. The WB6 economies should therefore take into consideration the recommendations made throughout this publication. Relevant measures include targeted information campaigns, confidence-building initiatives, adult education and public-private partnerships that target the participation of low-income and rural households (OECD, 2019<sup>[41]</sup>). The economies could start by considering replicating Serbia's e-commerce good practice (see Box 13.8 Digital society chapter), by increasing the financial resources allocated to awareness campaigns, capacity building and workshops for businesses looking to launch into e-commerce.

All the economies should also strengthen their regulatory environment for e-commerce and digitally enabled services to adapt them to the new post-COVID-19 reality by considering economy-specific recommendations as follows:

- **Serbia should strengthen its Online Disputes Resolution (ODR) system for e-commerce transactions.** As a first step, Serbia should start implementing the IPA2018 project without delay in 2021, as planned, to support its ADR improvement process. As part of this a platform should be built and connected to the NCCR (National Consumer Complaint Register) to allow a consumer to submit their complaint directly online to the relevant consumer organisation. The next step should be to establish a national ODR platform based on the EU ODR system (Box 5.8), designed to resolve disputes over the online purchase of goods and services without the intervention of a national court. It should not be affiliated with any merchant, and should be impartial, approved by the authorities and enforce quality standards of fairness, transparency, efficiency and accessibility.
- **North Macedonia should adopt the draft strategy on consumer protection** and promote consumer awareness of their rights and how to exercise them in e-commerce. The strategy should address legal and regulatory gaps, particularly with regard to electronic payments. It should also ensure that consumer protection legislation does not fail to address fraudulent or deceptive practices and that it allows for dispute resolution and redress in electronic transactions. The economy can learn from the Serbian Strategy for Consumer Protection for 2019-2024 promoting trust in e-commerce and online consumers education (see Box 13.8 Digital society chapter).

- **Albania, Bosnia and Herzegovina and Kosovo should implement their legal initiatives** to resolve the shortcomings in their regulatory frameworks. Albania should implement the e-business development initiative, part of the new Business and Investment Development Strategy 2021-2027, in order to improve SMEs' competitiveness and access to markets by helping them to adopt digital solutions for e-commerce and e-business, strengthen digital capabilities and skills and ensure a sound business and regulatory environment for e-commerce. Bosnia and Herzegovina should finalise the entry into force of its Law on Electronic Communication and Electronic Media and adopt new legislation on electronic identification and trust services for electronic transactions (e-signature). Kosovo should bring into force the new Law on Electronic Identification on Trusted Services in Electronic Transactions that will replace the existing Law on Information Society Service.
- **Bosnia and Herzegovina and Montenegro should create co-ordination mechanisms for an effective monitoring and evaluation process** to improve policy revision. A first step could be to review and assess the impact of programmes on the digitisation of Montenegrin businesses in order to identify gaps in the design of regulatory measures governing e-commerce. A set of indicators for private sector ICT take-up, including e-commerce, should be developed, and regularly monitored.

#### Box 5.8. The European Online Dispute Resolution (ODR) platform

The European Online Dispute Resolution (ODR) platform is provided to make online shopping safer and fairer through access to quality dispute resolution tools. All online retailers and traders in the EU, Iceland, Liechtenstein, and Norway are obliged to provide an easily accessible link to the ODR platform and an e-mail address for the platform to contact consumers.

The EU ODR platform can be used to solve the problem directly with the trader. The platform initially acts as an intermediary between the parties in the dispute by notifying the traders of the requests. If the requested trader is willing to discuss, the platform allows the exchange of messages directly via a dashboard. This allows one to send attachments such as product photos and to schedule an online meeting. If the parties request it or if the dispute cannot be resolved amicably within 90 days, the ODR platform refers the dispute to a dispute resolution body. Although the model is mainly aimed at disputes initiated by a consumer, some European countries allow traders to file a complaint against a consumer. However, the consumer must reside in Belgium, Germany, Luxembourg, or Poland.

Source: (EUR-Lex, 2013<sup>[45]</sup>), Regulation (EU) No 524/2013 of the European Parliament and of the Council of 21 May 2013 on online dispute resolution for consumer disputes and amending Regulation (EC) No 2006/2004 and Directive 2009/22/EC (Regulation on consumer ODR); The European Online Dispute Resolution (ODR) platform, <https://ec.europa.eu/consumers/odr/main/?event=main.trader.register>.

## Conclusion

WB6 economies are generally performing well on trade policy. Since the last assessment cycle, they have made efforts to improve their trade performance by adopting trade strategies while enhancing their public-private consultation mechanisms. New evaluation and monitoring mechanisms and bodies have been created to strengthen public-private partnerships and improve business community involvement in the formulation of trade related policy.

Significant progress has been made to ease the conditions for the movement of people between the CEFTA economies through the conclusion of the Additional Protocol 6, establishing a framework for unrestricted trade in services. Once in force, companies will benefit from guaranteed market access and national treatment in key services sectors. The protocol also lays the foundations for enhanced co-operation to remove remaining barriers, such as licensing or professional qualifications, as well as the

development of regional e-commerce, all with a view to the effective creation of an integrated market based on the European model. The domestic ratification processes are underway and all CEFTA parties are expected to have completed these procedures during 2021.

Overall, the six economies have managed to reduce restrictiveness in trade in services by amending their legislation and removing some of their non-tariff barriers. However, many burdensome regulations continue to hinder trade. WB6 economies should focus on easing conditions on the temporary movement of people applied to third-country nationals outside of the scope of the preferential treatment present in regional trade agreements, which would further encourage innovation and knowledge transfer, contribute to economic growth, and promote an alignment of their legislations to facilitate the creation of an intra-regional single market in the medium term. Finally, progress has been made in recent years to improve the WB6 economies' e-commerce regulatory frameworks to meet the challenges of this growing commercial sector. At the same time, the regulations applied to digitally enabled services are very competitive in all six economies.

## Notes

<sup>1</sup> Allocative efficiency is a state of the economy in which production represents consumer preferences; in particular, every good or service is produced up to the point where the last unit provides a marginal benefit to consumers equal to the marginal cost of producing.

<sup>2</sup> CEECs: Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovak Republic, Slovenia.

<sup>3</sup> More than 55% of Montenegro's, and around 40% of Croatia's and Albania's exports.

<sup>4</sup> Institutional bodies include ministries (e.g. finance, agriculture, foreign affairs and industry), customs agencies, standardisation bodies and export promotion agencies.

<sup>5</sup> 6 July 2020, Official Gazette, protocol no. 01/3387

<sup>6</sup> Apart from the newly created NTFs the following permanent advisory bodies are in place in the WB6 economies: an Economic Council in Albania; Export Councils in Bosnia and Herzegovina (one at the state level and another one in the Republika Srpska); an Economic Council in Kosovo; an Advisory Council within the customs administration and an Economic Council in the Republic of North Macedonia; a Council for Competitiveness in Montenegro and a National Convention on the European Union in Serbia.

<sup>7</sup> Albania Economic Reform Programme (ERP) 2021-2023; Bosnia and Herzegovina Economic Reform Programme (ERP) 2021-2023; Kosovo Economic Reform Programme (ERP) 2021-2023; North Macedonia Economic Reform Programme (ERP) 2021-2023; Serbia Economic Reform Programme (ERP) 2021-2023.

<sup>8</sup> i.e. Ministries of Economy, Agriculture, Infrastructure, Industry, Customs authorities, National Standards Body, etc.

<sup>9</sup> These are mainly RIA reports or certain targeted strategies.

<sup>10</sup> This indicator does not have a scoring system attributed to it and is therefore assessed descriptively.

<sup>11</sup> Albania (2009), North Macedonia (2004), Montenegro (2010), Serbia (2013), Bosnia and Herzegovina (2015) and Kosovo (2016).

<sup>12</sup> Albania established an FTA with Turkey in 2008. Bosnia and Herzegovina has a bilateral trade agreement with Turkey which entered into force in 2003. A revised FTA with Turkey was signed in 2019, and the ratification process is underway. In June 2019, Kosovo ratified its FTA with Turkey (signed in 2013). In July 2019, Kosovo signed an Economic Cooperation Agreement with the Czech Republic and signed a Partnership, Trade and Cooperation Agreement with the United Kingdom in December 2019 (in anticipation of the United Kingdom's withdrawal from the EU-Kosovo SAA). Montenegro replaced Protocol II of the original FTA with Turkey from 2010 in June 2019, redefining the term "originating products" and methods of administrative co-operation. Additionally, Protocol I was revised in order to include additional agricultural concessions, and a new Protocol III on trade in services was concluded in 2020. North Macedonia signed an FTA with Turkey in 2000. Serbia has negotiations underway on a bilateral investment treaty with South Korea since December 2018. Discussions on a future trade agreement with the United Kingdom started in 2019.

<sup>13</sup> Trade integration with Ukraine is ongoing: North Macedonia concluded a bilateral agreement in 2001; Montenegro a Free Trade Agreement in 2012. Finally, Serbia has ongoing negotiations for a future FTA.

<sup>14</sup> With Slovakia, Iran, Canada, Morocco, Lebanon, Saudi Arabia and Iceland and ongoing negotiations with Turkey on the free trade agreement signed in 2008

<sup>15</sup> The analysis does not include Kosovo, as data are not available in 2019.

<sup>16</sup> <http://www.javninameti.gov.me/>

<sup>17</sup> Although the minimum capital requirement exists in Serbia, the amount is RSD 100, which is less than one euro.

<sup>18</sup> Law on Foreigners from 2018 and 2019 in its Article 78 defines work of a foreign national beyond the annual quota.

A temporary residence and work permit beyond the annual quota may be issued to a foreign national: 1) who carries out business activities in Montenegro under an international treaty concluded between Montenegro and other state, under the condition of reciprocity; 2) who teaches in the educational institutions in the language and script of the members of minority nations and other national minority communities; 3) a professional athlete or sports worker who works in Montenegro in accordance with the law governing sports; 4) an executive director of a company and an entrepreneur who is registered in Montenegro in accordance with the law governing the form of carrying out business activities and their registration; 5) who possesses higher education and is employed by the employer at managerial job positions; 6) who is temporarily posted as a manager, a specialist or an intern, in accordance with Article 74 of this Law; 7) for the purpose of provision of the agreed services as per Article 72 of this Law; 8) with domicile in a neighbouring country, who is employed and works in Montenegro and at least once a week returns to the place of domicile (daily migrant); 9) who is included in the implementation of development projects from the list of development projects determined by the Government, upon the proposal of the administration authority in charge of development projects, not later than until 30 November of the current year for the subsequent year.

<sup>19</sup> Bosnia and Herzegovina and North Macedonia apply economic needs tests to intra-corporate transferees, contractual service providers and independent service providers. Albania applies economic needs tests to contractual and independent service providers and Montenegro to intra-corporate transferees. Only Kosovo and Serbia do not apply economic needs tests.

<sup>20</sup> In order to facilitate comparison with OECD Member States that have undergone the Services Trade Restrictiveness Index exercise, the paragraphs below have been drafted in accordance with the methodology of the STRI project publications. The OECD Member's Country Notes, as well as the Sector Notes, are available on the STRI web page: <https://www.oecd.org/trade/topics/services-trade/>.

<sup>21</sup> Defined as ISIC (rev 4) category 4293 freight transport by road. The STRI for this sector covers commercial establishment only; cross-border trade is governed by a system of bilateral and plurilateral agreements which provide for permits, quotas and other regulations.

<sup>22</sup> Defined as ISIC code 4912. Rail transport provided over a dedicated network where the market structure may take different forms, the two most common ones being: 1) vertically integrated rail services firms owning and managing both the infrastructure and the operation of freight services; and 2) vertical separation between infrastructure management and operations.

<sup>23</sup> Defined as ISIC code 51. Air transport services are defined as passenger and freight air transport carried domestically or internationally. The partial WB6 STRI excludes domestic transport in Montenegro as there is no traffic or regulation for this.

<sup>24</sup> In light of the range of air transport subsectors, the approach in the STRI project is to focus on measures affecting carriers' transport of passengers and goods between points. Airport management and other aviation services are only relevant in so far as regulations enacted by relevant authorities can have an impact on the ability of foreign carriers to transport passengers and goods between points.

<sup>25</sup> Defined under ISIC Rev 4 code 53 as postal and courier activities.

<sup>26</sup> Defined as ISIC Rev 4 code 691, and covering advisory and representation services in domestic and international law. Where relevant measures are entered separately for each of them.

<sup>27</sup> Defined as deposit-taking, lending and payment services. Commercial banking services are traded business to business, as well as business to consumer for retail banking.

<sup>28</sup> Defined as ISIC Rev 4 code 651 and 652 and covering life insurance, property and casualty insurance, reinsurance and auxiliary services. Private health insurance and private pensions are not covered.

<sup>29</sup> Defined as ISIC Rev 4 codes 41 and 42 and covering residential and non-residential construction services, as well as construction work for civil engineering.

<sup>30</sup> Defined as ISIC Rev 4 code 711 and covers architectural services and related technical consultancy.

<sup>31</sup> Defined as ISIC Rev 4 code 711 and covers several related activities, such as engineering and integrated engineering services, and engineering related scientific and technical consulting services.

<sup>32</sup> Defined as ISIC Rev 4 code 62 and 63, covering computer programming, consultancy and related activities and information service activities.

<sup>33</sup> Defined as ISIC Rev 4 code 611 and 612), covering wired and wireless telecommunications activities.

<sup>34</sup> Directive 2000/31/EC

<sup>35</sup> Such as the Law on electronic documents, electronic identification and Trust Services (2019), the Law on Electronic Management and Electronic services (2019), the National Cyber Security Strategy and Action plan (2018-2022) and the National Operational Broadband Plan (2019-2023).

<sup>36</sup> The draft law on consumer protection (expected to enter into force in Q3 2021) will introduce novelties in the ADR system. It will be able to receive and register complaints and support the internal ADR process as a way to build on the successful implementation of the ODR solution. The proposal is to build the platform and connect it to the NCCR (National Consumer Complaint Register) – a platform that allows a consumer to submit their complaint directly online to the relevant consumer organisation.

<sup>37</sup> 'Directive on electronic commerce' 2000/31/EC

# 6

## Access to finance (Dimension 3)

---

Access to finance is crucial for the development of the private sector in all economies. Businesses must be able to access financing sources to start up, grow, diversify and expand. Moreover, well-functioning capital markets will not only support near-term recovery in the post-pandemic period, but also long-term resilience in the corporate sector. This chapter assesses policies in the six Western Balkan (WB6) economies that support private businesses' access to sources of finance. It starts by providing an overview of the assessment framework and progress since the last assessment in 2018. It then analyses three sub-dimensions considered key to access to finance. The first sub-dimension, access to bank finance, focuses on the structure of the banking industry and the legislation facilitating bank finance. The second sub-dimension, access to alternative financing sources, assesses the legal framework and the use of factoring, leasing, private equity, venture capital and business angel networks. It also examines the existence of crowdfunding and initial coin offerings. The third sub-dimension, mobilisation of long-term financing, focuses on the regulatory framework related to public-private partnerships and access to capital markets.

---

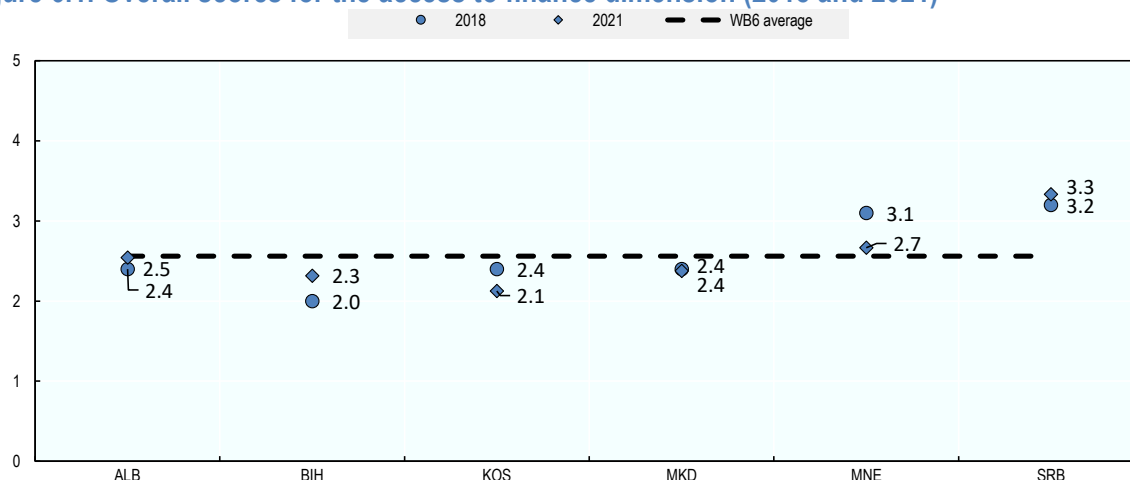

## Key findings

- **Legal and regulatory frameworks are generally well developed in the region.** All WB6 economies have recently amended their banking laws and have made progress in increasing the coverage of public and/or private credit information.
- **Bank lending continues to be the dominant source of finance for firms** and collateral requirements remain high. Despite functioning asset registers to ensure accurate and verifiable property information, high collateral requirements hinder the ability of small and growing businesses to access credit and secure loans.
- **Alternative financing sources are still in the early stage of development.** Factoring and leasing are the main alternative financing instruments used by firms; however, their financial contributions to the economy are limited.
- **There is no dedicated legislation targeting private equity investment funds, venture capital, business angels or crowdfunding** in most WB6 economies. The regulatory frameworks governing these alternative financing options remain underdeveloped and contingent upon vaguely applicable general legislation.
- **Capital markets are in place, but underdeveloped.** Initial public offerings are underutilised as a way of raising capital for the private sector. All WB6 economies have established government bonds markets, but they are shallow and illiquid.

## Comparison with the 2018 assessment

The regional average score for access to finance is 2.6, which is the same as for the 2018 assessment. All WB6 economies except Kosovo and Montenegro have made progress in the areas assessed under access to finance; however, it should be noted that due to differences in the assessment methodology, the economies' scores are not directly comparable. The WB6 economies perform best in the sub-dimension on access to bank finance, and worst in the sub-dimension on access to alternative financing sources. Overall, Serbia remains the strongest performer in this dimension, followed by Montenegro and Albania. Bosnia and Herzegovina has made the biggest progress since the last assessment followed by Serbia and Albania. Figure 6.1 summarises the performance of the WB6 economies since the last assessment.

Figure 6.1. Overall scores for the access to finance dimension (2018 and 2021)

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

### Implementation of the Competitiveness Outlook 2018 recommendations

Progress on implementing the policy recommendations made in the Competitiveness Outlook (CO) 2018 has been limited (Table 6.1). Partial progress has been made in supporting alternative financing instruments.

**Table 6.1. Implementation of the Competitiveness Outlook 2018 policy recommendations: Access to finance dimension**

Competitiveness Outlook 2021		
2018 policy recommendations	Main developments during the assessment period	Regional progress status
Complete the implementation of legal frameworks for ensuring timely payments and managing insolvency	This indicator has not been assessed in this cycle. Reduce the high collateral requirements	<ul style="list-style-type: none"> <li>None of the economies have made substantial changes regarding collateral requirements for loans.</li> <li>The majority of the WB6 economies remain well over the OECD average regarding loans requiring collateral and the amount of the loan needed as collateral.</li> </ul>	None
Support alternative financing instruments	<ul style="list-style-type: none"> <li>Most WB6 economies still lack dedicated regulatory frameworks on alternative investment funds, such as venture capital, crowdfunding and initial coin offering, with few economies planning initiatives to draft regulation on alternative financing instruments.</li> </ul>	Limited

### Introduction

A well-functioning financial system and a dynamic private sector are key catalysts for economic growth and competitiveness. Promoting better access to finance is crucial for supporting private sector development, as businesses must be able to access financing sources to start up, grow, diversify and expand. As small and medium-sized enterprises (SMEs) are more vulnerable to disruptions in local markets, business networks, and global and local supply chains, ensuring access to finance for small businesses is key to helping them better withstand and endure severe economic shocks.

Globally, domestic credit lending to the private sector stagnated and became more stringent following the 2008 financial crisis. Moreover, typical bank financing options have proved more difficult for SMEs to attain than larger firms due to higher perceived lending risks. Although all lending schemes include some form of risk, SMEs suffer from increased financial challenges and intrinsic weaknesses including limited capital, an inability to pay high interest rates and credit deficiencies that make banks cautious to extend loans. Small businesses also typically have infrastructural and intrinsic weaknesses such as inadequate or non-existent business planning, accounting practices and bookkeeping, as well as a lack of awareness and knowledge about financing options and instruments, which limits their ability to access both traditional and alternative financing options.

Addressing the challenges and needs of the private sector in accessing finance will entail enabling a more hospitable environment for private sector lending by improving collateral and insolvency schemes, enhancing risk-mitigating services, and supporting banks in extending credit facilities to businesses without credit. A lack of progress in this area will limit the ability of private sector actors to create new employment opportunities, start new businesses, and generally contribute to economic growth and development. Access to finance has implications for several other policy areas assessed in this Competitiveness Outlook; however, it is particularly relevant for the following dimensions:

- **Chapter 3. Investment policy and promotion** is relevant as green investment projects, like most infrastructure projects, provide unique advantages for investors looking for steady, long-term and inflation-linked income streams for renewable energy and energy efficiency projects, irrespective of returns on other investments. Access to finance is particularly important in the area of public-private partnerships to ensure the adequate financing of green investment projects.
- **Chapter 9. State-owned enterprises** should not be exempt from the application of general laws and regulations applicable to private companies, including notably competition rules and other market regulations. Concerning their access to finance, state-owned enterprises should not benefit from any direct or indirect state support – including implicit or explicit guarantees on commercial debt – that may confer a competitive advantage over private enterprises.
- **Chapter 12. Science, technology and innovation (STI)** related businesses rely on funding from venture capital and business angel networks to support their high upfront costs. Access to finance is particularly important for innovative businesses as investors rarely target knowledge-intensive sectors and government financing of research and development remains low.
- **Chapter 13. Digital society** is dependent on the ability of SMEs to implement better information and communication technology (ICT) infrastructure. The digitalisation of SMEs can be costly and unfeasible without proper access to financing. Government financial support programmes for ICT adoption have had little impact in the region, and difficult bank guarantee processes make digitalisation challenging.

## Assessment framework

### Structure

This chapter assesses policies related to access to finance in the WB6 economies through three broad sub-dimensions:

1. **Sub-dimension 3.1: Access to bank finance** focuses on the structure of the banking industry and the legislation facilitating access to finance. It also assesses the use of collateral and credit information and the availability of credit guarantees.
2. **Sub-dimension 3.2: Access to alternative financing sources** assesses the legal framework and the use of factoring, leasing, private equity, venture capital and business angel networks. It also

examines the existence of crowdfunding and initial coin offerings for firms operating under blockchain technology.

3. **Sub-dimension 3.3: Mobilisation of long-term financing** focuses on the regulatory framework related to public-private partnerships (PPPs). It also looks at access to capital markets, which is composed of three sub-indicators: 1) institutional investors and asset management; 2) access to stock markets; and 3) access to bond markets.

Figure 6.2 shows how the sub-dimensions and their indicators make up the access to finance dimension assessment framework. The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies’ statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more information on the methodology see the Methodology and assessment process chapter.

Note: GDP = gross domestic product.

The leaders of the WB6 economies endorsed the Common Regional Market (CRM) 2021-2024 Action Plan at the Berlin Process Summit held on 10 November 2020 in Sofia. The Action Plan is made up of targeted actions in four key areas: 1) a regional trade area; 2) a regional investment area; 3) a regional digital area; and 4) a regional industrial and innovation area (RCC, 2020<sup>[2]</sup>).

Within the goal of creating a regional trade area, the WB6 economies have committed to increasing the availability of long-term financing; expediting establishment and service supply enabled through “passporting” or a similar trade facilitation system; decreasing insurance-related costs of movement of people, goods and services in the region; and increasing the attractiveness of financial markets for investment. In terms of COVID-19 relief, the economies committed to enhancing regional co-ordination and co-operation on topics such as partial credit guarantees and the use of public financial institutions. The WB6 economies also agreed to work on upgrading the industrial base and innovation infrastructure by launching regional start-up and early-stage innovation support schemes, as well as blending public and private sector financing.

The regional trade and innovation areas of CRM 2021-24 Action Plan include several sections relevant to the access to finance sub-dimension of the CO2021: 1) financial services; 2) strengthening regional co-operation and co-ordination regarding the COVID-19 response as part of relief, recovery and resilience; and 3) regional innovation. See Box 6.6 for further information.

### ***Key methodological changes to the assessment framework***

For this edition of the Competitiveness Outlook, two sub-dimensions from the 2018 cycle (sub-dimension 1 on policy, regulatory and institutional framework and sub-dimension 2 on access to bank finance) were merged under sub-dimension 1 on access to bank finance to better capture the regulatory framework and lending conditions. Two new indicators were also added under sub-dimension 2, crowdfunding and initial coin offerings. A new sub-dimension was also added on the mobilisation of long-term financing to gather more information on long-term financing tools and the capital markets.

## **Access to finance performance and context in the WB6**

Over the past decade, and prior to the crisis triggered by the COVID-19 pandemic, access to finance was a major concern in Western Balkan economies. In 2019, one in five firms identified access to finance as a major constraint to growing their business (World Bank, 2020<sup>[3]</sup>). The outcome indicators selected for this Competitiveness Outlook are designed to assess the performance of the Western Balkan economies in creating the conditions to facilitate access to finance.

Domestic credit to the private sector as a share of GDP has remained at similar levels, around 45-48%, since 2011 in the WB6 region, and reached the CEEC-11<sup>1</sup> average in 2018 (Figure 6.3). Kosovo and North Macedonia are the only WB6 economies that saw an increase between 2012 and 2019 of around 10.6 and 3.4 percentage points, respectively; Albania recorded a decline of 6.4 percentage points. There is significant room to increase the level of financial intermediation in the region, for example the European Union (EU) average for domestic credit to the private sector was 86.6% of GDP in 2019 (100.5% in 2011).

**Figure 6.3. Domestic credit to the private sector in WB6 economies (2011-2019)**  
% of GDP

Note: No data available for North Macedonia for 2011. The data for Bosnia and Herzegovina are expressed cumulatively at the state level, based on data for the banking sectors of Republika Srpska and Federation of Bosnia and Herzegovina. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (OECD et al., 2019<sup>[4]</sup>), *World Development Indicators*, <https://datacatalog.worldbank.org/dataset/world-development-indicators>.

StatLink  <https://doi.org/10.1787/888934253803>

Gross domestic savings in the region range from around 3% in Kosovo to 20% in North Macedonia. Despite a constant increase since 2011 in all Western Balkan economies except Albania (Figure 6.4), the regional average of around 10% is almost half the CEEC-11 and OECD averages of 26% in 2019. This indicates that most Western Balkan economies have room to further increase their internal financing. Low savings rates in Albania, Bosnia and Herzegovina, Kosovo and Montenegro undermine the ability of households and individuals to absorb the economic shock related to COVID-19. Low domestic savings have also led to challenges for authorities in terms of how they absorb external shocks.

**Figure 6.4. Gross domestic savings in WB6 economies (2011-2019)**  
% of GDP

Note: CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

Source: (OECD et al., 2019<sup>[4]</sup>), *World Development Indicators*, <https://datacatalog.worldbank.org/dataset/world-development-indicators>.

StatLink  <https://doi.org/10.1787/888934253822>

There were positive signs until the COVID-19 outbreak regarding non-performing loans (NPLs), which can impinge on banks' willingness and ability to provide credit in the Western Balkans, especially to innovative businesses or younger firms with no credit history (Thomadakis, 2016<sup>[5]</sup>). NPL levels reached the pre-financial crisis level (around 5% in the WB6) in quarter 3 of 2020, following a peak of around 15% in 2013 (Figure 6.5). This shows that the action plans on NPLs implemented in the last decade have helped improve shortcomings in the credit market (OECD, 2018<sup>[6]</sup>). The potential effects of COVID-19 on NPLs should be closely monitored in the post-pandemic phase.

**Figure 6.5. Non-performing loans in the WB6 economies (2008-2020)**

% of total gross loans

Note: World Bank data are not available for Kosovo for 2008.

StatLink  <https://doi.org/10.1787/888934253841>

### Access to bank finance (Sub-dimension 3.1)

Bank finance is a major source of external finance for businesses in the region, with banks accounting for between 66% and 92% of financial sector assets; however, obtaining credit is still a significant challenge for firms in WB6 economies. If banks effectively fulfil their role as intermediaries between owners and users of funds, they ensure the more efficient allocation of financial resources to support the private sector in accessing sufficient capital to operate, expand and innovate.

WB6 economies have made progress regarding asset registers since the last assessment (see Table 6.2). For example, half have improved the accessibility of their asset registers through online searching options and increased the availability of necessary documentation through new e-services. However, WB6 economies have regressed in terms of credit information services. While collateral requirement scores remain largely unchanged since the last assessment, and continue to be well above OECD averages for the majority of WB6 economies, credit enhancement and risk mitigation could not be scored during this assessment period due to the numerous temporary credit guarantee schemes and credit lines put in place in response to the COVID-19 pandemic.

**Table 6.2. Scores for Sub-dimension 3.1: Access to bank finance**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 3.1: Access to bank finance	Banking industry	3.5	3.3	3.0	3.0	3.5	4.5	3.5
	Register	4.0	3.0	4.0	3.0	4.0	4.5	3.8
	Credit information services	4.0	3.5	4.0	4.0	2.5	5.0	3.8
	Collateral requirements	2.5	2.5	2.5	2.0	2.5	3.5	2.6
	Credit enhancement and risk mitigation	n.a.						
<b>Sub-dimension average score</b>		3.5	3.1	3.4	3.0	3.1	4.4	3.4

Note: The access to bank finance sub-dimension is not directly comparable to the 2018 assessment due to the merging of bank industry regulations, asset register and credit information indicators with the existing collateral requirement and credit enhancement and risk mitigation indicators included in the previous sub-dimension 2.

### ***The WB6 are aligning banking industry regulatory frameworks with Basel III requirements***

Establishing strong and stable banking industry regulations improves institutional supervision and risk management, which can help economies better withstand economic crises and lessen the effects of fiscal shocks. Strengthening the regulation, supervision and risk management of banks through safeguarding rules such as strong transparency, liquidity and capital bases improves the ability of an economy to absorb fiscal stresses and manage uncertainty.

Legal and regulatory frameworks in the banking industries of the regional economies are generally well developed, with all WB6 economies having recently amended their banking laws. Albania, Bosnia and Herzegovina<sup>2</sup>, and Serbia have implemented measures to encourage local currency transactions, while North Macedonia has introduced additional requirements for banks to adequately assess credit risks arising from foreign currency lending (although this does not explicitly facilitate local currency lending). Kosovo and Montenegro are euroized economies, which excludes the need for special foreign exchange capital requirements or the mandatory disclosure of foreign exchange borrowing risk.

All WB6 economies show strong alignment to Basel II<sup>3</sup> principles and are undertaking ongoing harmonisation efforts with Basel III<sup>4</sup> requirements. Most WB6 economies have implemented revised liquidity coverage and leverage ratios in line with Basel III recommendations, while several have also employed the internal capital adequacy assessment process (ICAAP),<sup>5</sup> introduced capital buffers and improved minimum capital requirements. However, implementation of the internal ratings-based approach (for credit risk)<sup>6</sup> and the advanced measurement approach (for operational risk) are still lagging in most economies.

### ***There has been progress in increasing public accessibility to asset registers***

Real estate remains the most widely relied upon form of collateral in the region as it is typically the most valuable asset owned by individuals and firms. However, using land titles as collateral is sometimes difficult in emerging economies due to the absence of well-functioning and accurate land registries and cadastres.<sup>7</sup> Verifiable and accessible registry systems give individuals and small businesses security by legally recognising and protecting their property, enabling them to use it as official collateral when seeking formal financing.

All WB6 economies have cadastral systems to register land and real estate and record value and ownership, as well as any existing pledges over the asset. In addition, Bosnia and Herzegovina is attempting to centralise and unify its currently misaligned system through a joint project with the World Bank, launched in March 2020. The project aims to support the development of a sustainable real estate registration system with harmonised land registry and cadastre records in urban areas of the Federation of Bosnia and Herzegovina (FBiH) and Republika Srpska (RS).

While Albania, Kosovo and Serbia had previously low ratios of information searches to new registrations, all three economies have made progress in increasing the accessibility of their cadastres since the last assessment. In Albania, the Registry of Security Charges has been expanded to cover the entire territory and has made all documents required for applications of cadastre services available online through the e-Albanian portal. Meanwhile, Serbia has made its real estate cadastre available to all interested parties for online searching, with data updated on a daily basis. Kosovo has also launched an online module for mortgage registration and communication with banks and non-bank financial institutions that provide credit; however, it remains in the testing phase.

### ***There has been progress in increasing public and/or private credit information coverage***

Small and growing businesses typically face challenges accessing finance due to limited information on the worthiness of their credit. Credit information services compile data on loan repayment and bankruptcy histories, among other things, to minimise information asymmetries between lenders and borrowers on default risks. Research has shown that information collected by bureaus and registries on credit history has a strong predictive influence on the likeliness of default, which greatly decreases risk for lenders (Kallberg and Udell, 2003<sup>[8]</sup>). Credit information services are either publicly owned and usually managed by the central bank, or privately owned and commonly established by financial institutions and associations.

No major changes concerning credit information services in the WB6 have occurred since 2017. All Western Balkan economies continue to have either a public or private credit information system in place, or both. North Macedonia and Bosnia and Herzegovina remain the only two WB6 economies to have both public and private credit bureaus. In Albania, where only a public credit registry exists, an attempt by the Association of Banks to expand the economy's credit information services by establishing a private credit registry could not be finalised due to legal barriers.

The coverage of both public and private credit information services continues to vary across the region (Table 6.3). While the private credit bureaus of North Macedonia and Serbia have already reached full coverage, Bosnia and Herzegovina has increased private credit registry coverage to 14% from 10.4% since the last assessment. Unlike private structures, the data from public credit information systems enable officials to adapt policies and strategies to the needs of the population. All WB6 economies have increased the coverage of their public credit registries since the last assessment, with Albania marking a notable 17.3% increase in coverage, the highest in the region. However, fewer than 45% of the adult population is covered in Kosovo, Montenegro and North Macedonia. In OECD economies, 66.2% of the adult population is covered by private and 24.5% by public credit information systems.

**Table 6.3. Coverage of public and private credit bureaus in WB6 economies (2019)**

% of adult population

	ALB	BIH	KOS	MKD	MNE	SRB	OECD
Coverage of public credit registry	56.2	47.1	41	41.7	41.4	n.a.	24.5
Coverage of private credit bureau	n.a.	14	n.a.	100	n.a.	100	66.2

### ***Collateral requirements remain high, and few firms use movable assets as collateral***

Collateral requirements for loan contracts is a common practice within financial institutions to lower interest rates for SMEs and mitigate risks stemming from other barriers, such as a lack of credit information. However, collateral requirements remain high throughout WB6 economies, hindering the ability of small and growing businesses to access credit and secure loans. According to the World Bank Enterprises Survey from 2019, Albania, Kosovo and North Macedonia demand collateral requirements on over 70% of

loans, compared to the OECD average of 58% (Figure 6.6) (World Bank, 2020<sup>[3]</sup>). While loans requiring collateral in Bosnia and Herzegovina and Montenegro are generally on par with the OECD average, only 41% of loans in Serbia require collateral (16% lower than the OECD average). However, all WB6 economies require a higher percentage of the loan in collateral than the OECD average, although Serbia requires only 13% more (Figure 6.6). All other WB6 economies require more than around 175% of the loan amount in collateral, with Kosovo imposing collateral of almost 270% of the total loan.

**Figure 6.6. Loans requiring collateral in WB6 economies, and the value of collateral (2019)**

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (World Bank, 2020<sup>[3]</sup>) *Enterprise Survey (database)*, <https://www.enterprisesurveys.org/en/enterprisesurveys>.

StatLink  <https://doi.org/10.1787/888934253860>

Although real estate remains the most common collateral for loans, most WB6 economies allow for the use of non-fixed assets such as movable assets and intangibles to secure loans. However, while most EU and OECD member states widely accept intangible assets as collateral under well-developed intellectual property structures, financial institutions in WB6 economies often opt out of using movable assets and prefer more traditional forms of collateral such as land. This may be because the economies' legal frameworks do not always provide sufficient protection for difficult valuations, ownership issues, licensing and cross-licensing issues.

### **WB6 economies enhanced their credit guarantee schemes in response to COVID-19**

SMEs often face challenges in securing bank loans and accessing sufficient credit from the formal financial system due to perceived high risks such as insufficient collateral and credit information, which limits their ability to implement economically viable projects. Credit enhancement and risk mitigation measures such as credit guarantee schemes and credit insurance provide banks surety that they will recover the value of loans in cases of default, which improves the capacity of banks to lend to SMEs and thereby alleviates the financing constraints faced by SMEs.

The WB6 economies vary in terms of the development, scope and funding of risk mitigation and credit enhancement schemes, although generally such schemes continue to be absent from the credit support landscape. Kosovo has one of the most comprehensive credit guarantee schemes in the region through its Kosovo Credit Guarantee Fund (KCGF), which has increased lending by local financial institutions to micro, small and medium-sized enterprises (MSMEs). The fund has enhanced opportunities in the industrial and agriculture sectors by covering up to 50% of the loan risk for MSMEs, which benefitted almost 3 500 businesses with EUR 75 million by the end of 2019. The KCGF follows good practice standards for credit guarantee schemes by clearly defining eligibility criteria for lending decisions in line with international lending institutions, and regularly monitoring the fund through robust *ex post* evaluation mechanisms. The KCGF became a self-sustainable organisation in 2020 and began targeting additional support at certain vulnerable markets. For example, it has provided women in business, young entrepreneurs, the

manufacturing sector and the agricultural sector with additional guarantees, and foresees providing increased financing support for renewable energy projects.

Some economies continue to have solely donor-sponsored credit guarantee schemes instead of domestic structures. For example, Albania, in partnership with the European Bank for Reconstruction and Development (EBRD), complemented its Italian-funded SME development programme, which guarantees loans of up to 60% of the loan amount, with the Albania Agribusiness Support Facility, which backs 20% of loans for Albanian agribusinesses. Montenegro still lacks a credit guarantee scheme; however, its Investment Development Fund signed a EUR 75 million agreement with the European Investment Fund under the COSME Loan Guarantee<sup>8</sup> programme in 2019 to improve SMEs' access to finance.

The COVID-19 pandemic has compelled all WB6 economies to establish initial or supplementary national credit guarantee schemes to mitigate the impact of the crisis and increase the liquidity of SMEs (Table 6.4). Montenegro and Bosnia and Herzegovina have launched new credit lines targeting SMEs, agribusinesses and manufacturing sectors, and established export and employment-oriented activities. In Montenegro, a new credit line for SMEs was established under the Investment Development Fund for up to EUR 3 million per business using a simplified procedure and low interest rate. The FBiH implemented a credit guarantee scheme worth over EUR 125 million through the FBiH Development Bank, while RS has expanded the competences of its existing guarantee fund to approve loans of up to approximately EUR 120 million.

**Table 6.4. WB6 credit guarantee schemes established in response to COVID-19**

		Beneficiaries	Coverage (EUR million)	Interest cap	Loan maturity
Albania		All enterprises	211	2.85% to 5%	2-5 years
Bosnia and Herzegovina	FBiH	SMEs and large enterprises	77 (for SMEs) 51 (for large enterprises)	n.a.	5 years
	RS	MSMEs	122	n.a.	4 years
Kosovo		MSMEs	46.5	n.a.	1 year
Montenegro		Entrepreneurs, SMEs, and large enterprises	120	1.5%	2 years
North Macedonia		MSMEs, trades and crafts	84.5	0%	2-3 years
Serbia		Self-employed, co-operatives and MSMEs	728	1M BELIBOR + 2.5 p.p. 3M EURIBOR + 3.0 p.p.	1-5 years

Note: Coverage information reflects public authority allocated funds and does not consider donor-funded schemes. Interest caps for Bosnia and Herzegovina and Kosovo are contingent on commercial bank practices. Serbia's interest cap is calculated based on the Belgrade Interbank Offered Rate (BELIBOR), which is the benchmark rate offered on dinar deposits by the BELIBOR panel.

Bosnia and Herzegovina, North Macedonia and Serbia have opened donor-based credit lines in partnership with institutions such as the EBRD, the European Investment Bank (EIB) and the Council of Europe Development Bank (CEB) to mitigate the impact of COVID-19. For instance, Serbia has been supported with a EUR 210 million credit line by the EBRD to finance banks focused on SMEs that generate positive socio-economic impact, and EUR 50 million by the CEB for banks that have requested assistance for liquidity shortages.

### ***The way forward for access to bank finance***

- **Facilitate access to traditional bank financing.** Although asset registration systems are in place in all WB6 economies, high collateral requirements impede the ability of small and growing businesses to access credit and secure loans. Fostering the use of intangible assets as collateral (while ensuring that international guidelines are followed, such as the OECD G20 principles) would ease small business access to traditional financing. Economies may also lower security interest for

non-fixed assets to encourage the use of intangibles as collateral and provide incentives for businesses to expand. Moreover, one way could be to implement regulations with fixed thresholds.

- **Transition from temporary credit guarantee schemes to permanent structures**, for those economies without existing mechanisms. The COVID-19 pandemic has compelled economies to take the first steps to initiate widespread credit guarantees and lines to both SMEs and large enterprises. By building upon the preliminary framework established during the pandemic these schemes can continue to play an important role in enabling the flow of credit to the productive sectors. Box 6.1 describes how OECD economies have supported businesses during the pandemic.

### Box 6.1. COVID-19 government financing support for businesses in OECD economies

The OECD has conducted a simulation analysis to further understand and support the design of government financial support programmes. The OECD report, *COVID-19 Government Financing Support Programmes for Businesses*, assesses whether governments should consider other ways to support businesses without incentivising further indebtedness or undermining their financial flexibility. It maps government financial support programmes in OECD economies and can serve as a guide for WB6 economies to better understand how to ensure available financing for businesses heavily affected by the pandemic, and beyond.

The report lays out recommendations on crucial components of successful government financing programmes, such as structuring support initiatives to address the specific needs of businesses and corresponding risk preferences. Many OECD economies have successfully implemented credit guarantee schemes and credit mediation schemes to address the immediate SME financing gap, while other government financing programmes have facilitated equity financing for SMEs by supporting the venture capital industry. Other financing options explored in the report include temporary collateral easing and several crisis liquidity and lending programmes for purchases in the public capital markets, mortgage and corporate bonds, and the private loan market. In addition to addressing short-term liquidity solutions, the report also covers immediate and targeted financial support to address acute insolvency risks including loan guarantees, direct loans and grants, equity investment, and the facilitation of central bank lending.

Source: (OECD, 2020<sup>[10]</sup>), *COVID-19 Government Financing Support Programmes for Businesses*, <https://www.oecd.org/daf/fin/financial-markets/COVID-19-Government-Financing-Support-Programmes-for-Businesses.pdf>.

## Access to alternative financing sources (Sub-dimension 3.2)

Economies need to develop more comprehensive financing options for businesses to support sustainable economic growth and boost the resilience of the financial sector. They should particularly target enterprises more likely to be under-served by the banking sector.

The WB6 average has improved its scores for all four comparable indicators since the last assessment (Table 6.5), with the most progress made in regulations on factoring and leasing policies. For instance, Montenegro and Kosovo both established specific regulations concerning factoring in 2018, while Republika Srpska adopted a new Law on Factoring in 2020. Four of the economies have also implemented comprehensive laws on leasing since the last assessment.

**Table 6.5. Scores for Sub-dimension 2: Access to alternative financing sources**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 3.2: Access to alternative financing sources	Factoring	3.5	3.5	3.5	2.5	4.0	4.0	3.5
	Leasing	3.5	4.0	4.0	3.5	3.5	4.0	3.8
	Private equity and venture capital	1.0	1.0	1.5	1.5	2.0	2.0	1.5
	Business angel networks	0.0	0.0	1.0	1.0	1.0	1.0	0.7
	Crowdfunding	0.0	0.0	0.0	0.5	1.0	0.0	0.3
	Blockchain – Initial coin offerings	4.0	1.0	1.0	0.5	1.0	4.0	1.9
<b>Sub-dimension average score</b>		2.0	1.6	1.8	1.6	2.1	2.5	1.9

Note: The sub-dimension average score is not directly comparable to the 2018 assessment due to the introduction of crowdfunding and initial coin offering indicators, as well as the removal of access to stock markets.

### ***Despite legislative improvements, factoring and leasing services remain underused***

Factoring and leasing are alternative asset-based financing instruments that allow small businesses to access to finance when they struggle to meet banks' collateral or credit history requirements. Unlike bank financing options, factoring enables immediate liquidity for SMEs in urgent need of cash flow to keep their businesses running or growing by bypassing traditional loan obligations that are typically inaccessible for SMEs. Due to the overall difficulty of SMEs in the region to fulfil high collateral and credit worthiness requirements, factoring and leasing can help growing businesses access asset-based financing and manage cash flow volatility.

Factoring and leasing services remain under the auspices of the central banks in each WB6 economy except North Macedonia, where it falls under the supervision of the Ministry of Finance, and Bosnia and Herzegovina, where it falls under the entity agencies.<sup>9</sup> In Serbia, the factoring law is under the auspices of the Ministry of Finance, while supervision is divided between the Ministry of Finance, which oversees factoring services performed by factoring companies, and the National Bank of Serbia, which oversees factoring services performed by banks. All WB6 economies possess legal frameworks to regulate factoring options except North Macedonia, which has no dedicated law on factoring. Montenegro and Kosovo, with assistance from the EBRD, developed dedicated laws on factoring in 2018 that cover general requirements for factoring and outline the legal treatment of factoring services. North Macedonia was also supported by the EBRD to draft amendments to existing legislation covering factoring in detail; however, the process has been postponed due to the COVID-19 pandemic. The Albanian Government has also put in place several incentives to promote the use of factoring. Despite this progress, factoring penetration remains insignificant in the region, at 1.6% of GDP compared to an average of 7.6% in EU countries (EUF, 2021<sup>[11]</sup>).

Leasing services are regulated under dedicated legislation in all economies. Legislation generally covers clear definitions and lessors' ownership rights, as well as how the process should be instigated, the steps to follow and guidance on any required involvement of third parties. The vast majority of leasing profiles in most WB6 economies is concentrated on personal and working vehicles (over 70%), followed by machinery and equipment (roughly between 15% and 40% except in North Macedonia, where work equipment accounts for less than 1%).

Although leasing options remain severely underused in the region, despite functioning legal frameworks, the use of leasing services has grown substantially over the last few years. In Serbia, at the end of 2020 total leasing assets had increased by 66.8% since 2013, reaching approximately EUR 981 million. In North Macedonia, leasing assets increased by 24.4% between 2017 and 2019 to reach around EUR 165 million. Albania has also seen a rise in leasing volumes from around ALL 5.91 million (Albanian lek, around EUR 48 000) in 2015 to ALL 8.85 million (around EUR 72 000) in 2019. However, despite these improvements, leasing volumes remain below potential in the Western Balkans at less than 1% of GDP, compared to 1.7% of GDP on average in EU countries (OECD et al., 2019<sup>[1]</sup>).

## **Most WB6 economies lack dedicated regulatory frameworks for private equity and venture capital**

Private equity and venture capital investors offer a unique opportunity for SMEs to access alternative finance options. They are particularly relevant for SMEs focused on innovative projects or technology-based businesses with strong growth potential that often face challenges in accessing traditional banking sources. Private equity and venture capital funds can provide young firms with managerial expertise and network contacts and have the unique ability to provide SMEs with large sums of long-term financing for novel products, technology or projects that have a higher risk of return. As these types of business often require significant capital rapidly to cover start-up and manufacturing costs, private equity and venture capital funds allow SMEs to be strong competitors in the market.

Private equity and venture capital investments in WB6 economies are generally in the early stages of development. While private equity and venture capital markets are virtually non-existent in Albania and Bosnia and Herzegovina, Kosovo, North Macedonia, Montenegro and Serbia are more actively using the Enterprise Innovation Fund, which is a stand-alone venture capital fund covering the Western Balkans region (see Box 6.2). Although there is no regulatory framework in Kosovo and North Macedonia, the FBiH, RS, Montenegro and Serbia regulate some aspects of private equity and venture capital investments through general legislation, which is at varying stages of development. For instance, in Montenegro the 2018 Law on Investment Funds allows private equity and venture capital groups to be established as specialised investment funds, and provides basic provisions regarding rules on the methods for determining net asset values and detailed requirements for investors.

### **Box 6.2. Venture capital fund for the Western Balkans: The Enterprise Innovation Fund**

The Enterprise Innovation Fund is an equity investment fund that constitutes Western Balkans Enterprise Development and Innovation Facility's (WB EDIF) Equity instrument pillar. It is a stand-alone venture capital fund, managed by South Central Ventures (SCV), with EUR 41.4 million available for investments in innovative SMEs in the Western Balkans. The fund focuses on early stage high-growth companies mainly in the technology sector. SCV offers seed funding of up to USD 100 000 per company, while StartLabs offers up to USD 50 000 for an equity stake of 10-15%. Eleven Ventures is based in Bulgaria, but also invests in Serbia with pre-seed funding of up to EUR 100 000 for an equity stake of 10-12%. The Enterprise Innovation Fund (ENIF) offers tickets ranging from EUR 500 000 to EUR 1.5 million of early stage and growth investments per company; Eleven Ventures also offers additional funding. All companies offer mentorship to the companies they invest in and connections to boosters, angel investors and venture capital internationally. Eleven Ventures also acts as an accelerator. By December 2020, ENIF's portfolio was composed of 28 active companies, out of which 1 is later stage, 3 are growth, 17 are start-ups and 7 are seed capital investments (for a total disbursed directly from the fund of around EUR 30 million). The focus of the SCV team has gradually shifted from intensive pipeline building towards portfolio management and the identification of exit opportunities for some of the earlier investments. In the last quarter of 2020, the ENIF team was focused primarily on monitoring portfolio companies and intensively working with those raising additional funds following the first round of investments.

Source: (World Bank, 2019<sup>[12]</sup>), *Serbia New Growth Agenda: Financing for Growth*, <https://pubdocs.worldbank.org/en/358601577293558709/SRB-CEM-Financing-for-Growth-wq.pdf>; (WB EDIF, 2019<sup>[13]</sup>), *WB EDIF Annual Report*, [http://www.wbedif.eu/wp-content/uploads/2020/05/WB\\_Edif\\_AR\\_2019.pdf](http://www.wbedif.eu/wp-content/uploads/2020/05/WB_Edif_AR_2019.pdf). (WB EDIF, forthcoming<sup>[14]</sup>), *WB EDIF 2020 Annual Report*.

Serbia has made progress in providing a clear regulatory framework for private equity and venture capital investors under the Law on Alternative Investment Funds, which came into effect in May 2020, and by-laws

enacted by the Securities Commission. The legislation covers the manner of investment and the instruments in which alternative investment funds may invest. It also covers restrictions, types and timeframes for member and shareholder subscriptions, restrictions on investment, calculation of subscriptions, and the determination of relevant costs.

### **Business angel networks are increasingly being used in WB6 economies**

Business angels, individuals with business or managerial experience who invest personal funds in enterprises at early and risky stages, are a crucial component of alternative financing sources as they provide first rounds of equity capital to SMEs (OECD, 2016<sub>[15]</sub>). Business angels are different from other types of alternative financing as they offer additional benefits to entrepreneurs and small businesses such as mentoring, business, advice and access to networks. These added benefits can be of significant help for innovative firms and start-ups and help to address financing gaps for activities and projects where traditional financing options have proven particularly difficult to attain.

Business angel networks are relatively active in Kosovo, Montenegro, North Macedonia and Serbia; however, as shown in Table 6.6, their financial contribution to the economy remains limited. The region recorded the highest number of investments (47) in 2018, representing a total value of EUR 4.6 million. North Macedonia is the only economy that recorded a constant decrease in terms of value between 2016 and 2019 (around 96%), while Montenegro recorded an increase of 2020% between 2017 and 2019. In 2019, Serbia recorded four business angel investments totalling EUR 310 000, breaking a gradually increasing trend between 2014 (EUR 1.8 million) and 2018 (EUR 2.5 million) (EBAN, 2017<sub>[16]</sub>).

**Table 6.6. Business angel activity in the Western Balkans**

	2016		2017		2018		2019	
	Total investment (EUR million)	Number of investments	Total investment (EUR million)	Number of investments	Total investment (EUR million)	Number of investments	Total investment (EUR million)	Number of investments
KOS	0.5	12	0.68	15	0.25	15	..	(15)
MKD	1.4	11	0.15	1	0.25	2	0.06	2
MNE	..	..	0.1	2	1.55	10	2.12	3
SRB	2.3	21	2.44	22	2.55	20	0.31	4
Total	4.2	44	3.37	40	4.6	47	2.49	9 (24)

Note: No business angel investments recorded in Albania and Bosnia and Herzegovina. No business angel investment recorded in Montenegro in 2016. No data on the total invested amount available for Kosovo for 2019. For 2019 for Kosovo the number of investments is an estimation.

Source: (EBAN, 2019<sub>[17]</sub>), *Statistics Compendium: European Early Stage Market Statistics*, <https://www.eban.org/wp-content/uploads/2020/12/EBAN-Statistics-Compendium-2019.pdf>; (EBAN, 2017<sub>[16]</sub>), *2017 Annual EBAN Statistics Compendium*, <http://www.eban.org/2017-annual-eban-statistics-compendium/>.

In all WB6 economies where business angel networks are active, there are no initiatives to establish legal frameworks for defining and regulating business angels. Support for business angel investment was included in Serbia's recently expired Development Strategy and Action Plan 2015-2020, but no measures have been developed since the previous assessment.

There continue to be no business angels operating in Bosnia and Herzegovina and Albania. While some small initiatives exist in Republika Srpska, such as the Innovation Centre Banja Luka, which is a full-time member of the European Business Angels Network (EBAN),<sup>10</sup> no activity could be identified over the assessment period. For the most part there are no planned initiatives to expand or develop the business angel networks in either economy.

### ***Several WB6 economies are developing laws and programmes to regulate crowdfunding***

As a relatively new form of alternative financing, crowdfunding brings together vast networks of people through social media and platforms to connect entrepreneurs with interested investors from the general public, beyond those established through venture capitalists and private institutions. Crowdfunding offers funding without traditional rigorous and unfeasible financing prerequisites, and encourages innovative ideas and initiatives that might otherwise be impossible to realise when relying solely on traditional financing methods. In addition to being a strong marketing tool, crowdfunding platforms allow investors to provide entrepreneurs with insight and information on their ideas.

Crowdfunding continues to be in the early development stages in the region, with most economies reporting no activity in this regard. None of the WB6 economies have dedicated laws concerning crowdfunding, and Montenegro remains the only economy to regulate crowdfunding activities under general financial laws, albeit with several gaps in terms of coverage. However, the development of crowdfunding regulatory frameworks and initiatives to encourage this type of financing is under way in several economies.

The National Bank of Serbia is in the process of drafting a law on crowdfunding that would regulate the conditions and manner of providing group financial services in line with the European Commission's regulation for crowdfunding service providers.<sup>11</sup> Similarly, Montenegro is in the project phase of a potential dedicated crowdfunding law under the Danube Transnational Programme; however, no concrete date had been set at the time of drafting. Kosovo and North Macedonia are also developing initiatives to encourage crowdfunding. In co-operation with the EBRD, Kosovo is developing a donation/reward-based system to support start-ups, which is expected to be launched in 2021, and the Macedonian Stock Exchange has established co-operation with a foreign crowdfunding platform, Funderbeam, to promote and guide businesses and help them become suitable for listing on the stock exchange.

### ***Initial coin offerings are nascent, with few economies regulating crypto-assets***

Policy makers have an interest in raising awareness and enhancing the uptake of initial coin offerings (ICOs) by SMEs and entrepreneurs as this may lead to overcoming longstanding size-related constraints in accessing markets and finance, higher productivity and more competitiveness (OECD, 2019<sub>[18]</sub>). More specifically, digital assets operating under the blockchain technology can offer SMEs easier access to finance and avoid cash flow issues through tools such as smart contracts that automatically enforce payment contracts, strong security benefits to protect small businesses, and resilient supply chains with transparent audit trails. ICOs, much like initial public offerings (IPOs, see below), can raise funds related to a specific project, company or asset; for example, companies looking to raise money to create a new coin, application or service may launch an ICO.

Albania has adopted dedicated legislation that specifically covers cryptocurrencies and the regulation of blockchain technology. Serbia has adopted a law governing digital assets (including virtual currencies and digital tokens) that is based on a technology-neutral approach, which means that the provisions of the law applies to all digital assets regardless of the underlying technology, including stable digital assets. Both economies have established or expanded their regulations since the last assessment, with competencies falling under their financial supervisory authorities, as well as the National Agency of Information Society in Albania. The laws in both economies regulate the issuance, purchase, selling, transfer and exchange of digital currencies. The Albanian law also regulates the financial infrastructure through which these currencies are transacted.

Albanian legislation also requires the publishing of a prospectus or white paper<sup>12</sup> for security token offerings and ICOs, and provides a clear definition of the responsibilities of the issuer. It also provides additional protection for investors by stating that the Albanian Financial Security Authority has the power to impose administrative sanctions or send cases to prosecution for breaches of the Albanian penal code. The Serbian Law on Digital Assets regulates the initial offering of digital assets and the publishing of a

white paper. It also prescribes the obligations for issuers in this process and establishes a supervision mechanism over the digital assets' issuance. Both regulations are in line with the prevention of money laundering and terrorism financing FATF<sup>13</sup> recommendations.

The central banks of Bosnia and Herzegovina, North Macedonia and Serbia have all issued public warnings on the risks associated with the use of cryptocurrencies. North Macedonia is the only WB6 economy to discourage the use of cryptocurrencies and blockchain technology. However, since 2019, when it entered the second phase of its Stabilisation and Association Agreement, residents of North Macedonia have been allowed to invest in foreign securities and foreign real estate, but they are still generally not allowed to open foreign bank accounts, except for some specific exceptions in accordance with the National Bank of the Republic of North Macedonia (NBRNM) by-law, which makes the legality of investment in crypto-assets unclear. No activity has been reported in Bosnia and Herzegovina, Kosovo, Montenegro and North Macedonia regarding initial coin offerings based on blockchain technologies.

### ***The way forward for access to alternative financing sources***

- **Support the market penetration of factoring and leasing.** Although all WB6 economies already have a legal framework, there is room to increase the contribution of factoring and leasing to the economy. This could be done by increasing awareness-raising programmes and providing incentives to smaller firms.
- **Continue efforts to build a business environment with diverse financing sources.** Given the limited success in attracting venture capital in the region, supporting crowdfunding by adopting dedicated legal frameworks could be a more feasible approach.
- **Consider reviewing business angel networks.** A comprehensive assessment of existing business angel investments could help WB6 governments better capture the requirements and needs of business angel networks. Additional policy tools could be deployed to promote further interest in such networks, including tax incentives.

### **Mobilisation of long-term financing (Sub-dimension 3.3)**

Policies to mobilise long-term savings and use them to finance infrastructure investment by long-term institutional investors can contribute to bridging the financing gap of such investments. This needs to be accompanied by the development of capital markets and appropriate financial instruments for encouraging both debt and equity financing. This section maps the legal and regulatory framework that enables governments to mobilise funds for infrastructure investments. It then assesses access to capital markets by exploring the availability of sources to mobilise long-term capital around the two main asset classes: bonds and equities.

Serbia is the most advanced economy in terms of access to capital markets (Table 6.7). All Western Balkan economies except Kosovo have achieved a similar level of development, with scores converging. Albania lags behind due to the nature of its security exchange market, and Kosovo's performance is directly linked with the absence of a stock market in the economy.

**Table 6.7. Scores for Sub-dimension 3.3: Mobilisation of long-term financing**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average	
Sub-dimension 3.3: Mobilisation of long-term financing	Access to long term financing: public-private partnerships	n.a							
	Access to capital markets	Institutional investors and asset management							
		Access to stock markets	2.5	3.0	0.0	3.5	3.5	3.5	2.7
		Access to bond markets	2.0	3.0	1.0	3.5	3.5	4.0	2.8
<b>Sub-dimension average score</b>		2.3	3.0	0.5	3.5	3.5	3.8	2.8	

***There are legal frameworks for public-private partnerships, but they are rarely used***

Access to long-term financing is key to infrastructure investment. Even before the COVID-19 crisis, expected levels of public investment based on current trends would not have been sufficient to meet the projected infrastructure needs of the Western Balkans. Governments have a central role in driving recovery and provide the bulk of infrastructure investment, and it is crucial that they mobilise long-term capital for public infrastructure investment (OECD, 2020<sup>[19]</sup>). A well-established PPP regulatory framework harmonised with EU regulations<sup>14</sup> can provide useful tools to bridge infrastructure investment gaps, while ensuring value for money without undermining fiscal sustainability.

Each WB6 economy has adopted a dedicated legal framework for PPP that enables private participation in infrastructure (PPI) projects. Montenegro was the last economy in the region to adopt a dedicated PPP law in December 2019. Albania and Montenegro's regulatory frameworks are harmonised with the EU Concessions Directive,<sup>15</sup> and although North Macedonia's current law is not fully harmonised it respects the general principles of public procurement that cover transparency, equal treatment and non-discrimination. At the time of drafting, a new PPP law for North Macedonia was in the parliamentary validation process. In Bosnia and Herzegovina, Kosovo and Serbia the provisions of the EU Concessions Directive have not yet been transposed.

All WB6 economies have a specialised government entity that facilitates PPP programmes, but only Albania and Kosovo have a dedicated PPP unit with permanent staff that operates across sectors and establishes projects – the Concession Treatment Agency (ATRAKO) in Albania and the PPP Committee supported by the Central PPP Department in Kosovo. Both units are created under the authority of the ministries of finance.

According to an external assessment conducted by the World Bank (Table 6.8), which assesses four components of PPPs, the WB6 are performing close to CEEC-11 and OECD high-income economy averages. The region performs best regarding procurement, which concerns the activities and requirements for selecting a private partner, but there is room for improvement regarding the preparatory activities that take place prior to launching the procurement process for a PPP project.

**Table 6.8. Infrastructure development in the WB6: Performance of public-private partnerships**  
(0 lowest – 100 highest scores)

	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average	CEEC-11 average	OECD high income average
Preparation	65	45	54	51	30	48	49	56	53
Procurement	86	79	72	77	60	90	77	85	76
Contract management	66	66	64	66	54	68	67	70	66

Note: CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. \*The average covers Bulgaria, Lithuania and Slovenia.

Source: Based on the (World Bank, 2020<sup>[20]</sup>), *Benchmarking Infrastructure Development 2020: Assessing Regulatory Quality to Prepare, Procure, and Manage PPPs and Traditional Public Investment in Infrastructure Projects*, <https://openknowledge.worldbank.org/handle/10986/34608>.

Despite increasing PPI activity in the Western Balkans, a limited number of new contracts have been successfully concluded. In 2019, Bosnia and Herzegovina and Kosovo saw the first PPI transactions in five years, while Serbia had the highest investment amount in the region, with commitments of EUR 346 million in the first half of 2020.

### ***Dedicated legal frameworks covering institutional investors exist, but the investment base is underdeveloped***

Savings generally reflect the disposable income of households, general economic conditions and the rate of poverty. Savings in financial institutions reflect the income of households plus the level of trust in these institutions. The lower the rate, the lower the potential liquidity that could be used by institutional investors or asset management firms for potential local investments. Savings rates are generally low in the region (30%) compared to the CEEC-11 economies (54%). Household savings within financial institutions are even lower, at 11% compared to 33% in CEEC-11 economies (Table 6.9), which limits the liquidity in the market.

All WB6 economies except Kosovo have a dedicated legal framework regulating institutional investors. In North Macedonia, the laws on securities and investment funds that govern institutional investors also regulate market manipulation and insider trading. However, they do not clearly govern voting rights, which allows for potential conflict of interest.

Montenegro made some progress in 2018 by amending the Law on Investment and the Law on Voluntary Pension Funds, which clarified conditions such as situations where institutional investors should exercise their voting rights, prevention of conflict of interest and transparency of fees. In May 2020, Albania adopted a dedicated Law on Capital Markets that regulates institutional investors.

In Serbia, the Law on Open-End Investment Funds Subject to Public Offering and the Law on Alternative Investment Funds regulate investment funds and clearly cover transparency of fees, and the Law on Capital Markets covers the prohibition rules of insider trading and market manipulation. In Bosnia and Herzegovina, the regulatory framework falls under the entities' competences. Both FBiH and RS have adopted dedicated legal frameworks on the securities market and investment funds. The legal framework is well-developed in RS and covers the conditions for institutional investors' exercise of voting rights, conflict of interest, prohibitions related to insider trading and market manipulation. Conversely, the legal framework in the FBiH does not cover provisions such as the voting rights attached to the share held on behalf of clients, transparency of fees or prohibitions related to insider trading.

**Table 6.9. Accounts and savings held with WB6 financial institutions (2017)**

### **Open active stock markets, when in place, make limited contributions to the economy**

All WB6 economies except for Kosovo have established stock or securities exchanges. The stock exchanges of Bosnia and Herzegovina, Montenegro, North Macedonia and Serbia are open to the public. Albania has an operational privately owned securities exchange, the Albanian Securities Exchange (ALSE), which was created in 2017 and trades only government debt. The securities exchange started trading securities officially in February 2018, and up to October 2019 the turnover was EUR 23.2 million (around 0.2% of GDP).

Overall, the contribution of stock markets to financing the economy is limited across the region. The low level of activity and liquidity in the stock markets is a barrier for companies that might want to use it to raise new capital. In July 2020, the Belgrade Stock Exchange registered a total turnover of securities of RSD 2 795.4 million (Serbian dinar, ~EUR 23.7 million; around 0.06% of GDP), from which turnover of shares totalled RSD 133.9 million (~EUR 1.1 million; around 0.002% of GDP). In July 2020, the Macedonian Stock Exchange registered a total turnover of securities of MKD 382 million (Macedonian denar, ~EUR 600 000; 0.01% of GDP), from which turnover of shares totalled MKD 344 million.

Both stock exchanges have joined the EBRD-supported SEE Link (Box 6.3). Conversely, the Montenegro Stock Exchange withdrew its application submitted in 2016, and its market capitalisation remains illiquid, with a turnover ratio of 1% in 2019 vs. 3% in 2017.

In Bosnia and Herzegovina, both entities have their own stock markets: the Sarajevo Stock Exchange (SASE) in the FBiH and the Banja Luka Stock Exchange (BLSE) in RS. Both stock exchanges joined the EBRD-supported SEE Link in 2017. In both entities, the contribution of capital markets to financing the economy is limited. In 2019, the SASE registered a total turnover of securities of BAM 144 million (Bosnian convertible mark, ~EUR 72 million), a 3.6% increase compared to 2018, from which the turnover of shares was BAM 136 million (~EUR 68 million; 94.4% of total securities). Over the same period, the BLSE registered a total turnover of securities of BAM 472 million (~EUR 236 million), an increase of 10.3% compared to 2018, from which the turnover of shares was BAM 76.6 million (~EUR 39.1million; 16.2% of total securities).

#### **Box 6.3. SEE Link: Connecting regional markets**

SEE Link was set up in 2014 by three regional stock exchanges, the Bulgarian Stock Exchange, the Croatian Stock Exchange and the Macedonian Stock Exchange, with the support of the EBRD. It aims to integrate regional markets using technology rather than mergers or acquisitions. It has provided investors with easier and more efficient access to markets through a local broker. Since the launch of the network, five more stock exchanges have joined, including two from Bosnia and Herzegovina, Slovenia's Ljubljana Stock Exchange, the Belgrade Stock Exchange, and the Athens Stock Exchange.

This regional collaboration among the stock exchanges could enhance stock market liquidity in the participating economies; however, challenges for market operators include the different legal and regulatory frameworks, the lack of a central securities depository link and the different currencies, which limit more intense trading activity on this platform.

Indices were introduced in 2016 and have performed well. In roughly the first six months of operation, the SEELinx index increased by 14.41% and the SEELinx EWI index by 1.98%. As of April 2021, there had been a 57.09% increase in performance for SEELinx and a 46.49% increase for SEELinx EWI, since 2016 year-on-year. The indices were originally composed of the 10 most actively traded regional companies. The number of index components increased to 18 after the Banja Luka and Sarajevo Stock Exchanges joined in 2017.

### ***Initial public offerings are underused as a way of raising capital for the private sector***

All WB6 economies with active stock markets have different listing rules for equity listings. In Montenegro, the law on capital market details how listed companies should submit their financial reports to the Capital Market Authority (CMA) on a quarterly basis. All submitted reports are publicly available on the CMA website. However, the stock market is static with no IPOs. Consequently, SMEs do not perceive it as a potential source of alternative financing (see Box 6.4 on raising awareness in OECD member states).

Regarding admission to trade, on the Belgrade Stock Exchange an issuing company may apply for one of three listing segments: prime listing, standard listing or smart listing. However, there has been only one IPO in recent decades, which involved shares of Fintel Energy being included as a prime listing. After the successful completion of the IPO, the company's stocks started trading on 20 November 2018, representing an approximate total value of RSD 755 million.

Concerning the listing of companies in North Macedonia, the law clearly details requirements for issuers and lists flexible requirements for smaller companies. The listing rules of the Macedonian Stock Exchange defines four categories under the market that represent listed securities (super listing, exchange listing, mandatory listing and listings of small joint stock companies). Only one IPO has taken place since 2018 with a value of MKD 575 million (around EUR 9.3 million), but the secondary public offering (SPO) market was slightly more active. Since 2018 there have been two SPOs of shares, representing MKD 320 million (around EUR 5.2 million).

In Bosnia and Herzegovina, the legal frameworks for capital markets are aligned in both entities. The listing procedures for companies operating in both entities are clearly defined in their respective laws on securities markets and are organised on the same regulatory principles; however, neither entity offers a separate market for low capitalisation firms.

#### **Box 6.4. Awareness-raising campaigns for capital market participation in OECD member states**

Awareness-raising campaigns aim to share knowledge and information on the benefits of accessing capital markets for SMEs through informative platforms, public seminars, conferences, IPO summits and workshops. Increasing awareness of the procedures and advantages of issuing financial products eases the process of issuing stocks or bonds for enterprises and increases the likelihood of SME participation in capital markets. Several OECD member states have successfully launched initiatives to inform SMEs about the benefits of accessing capital markets as a financing instrument for their growing businesses.

In 2012, under the National Plan for Financial Education, the Banco de Portugal, the Portuguese Securities Market Commission and the Insurance Institute of Portugal jointly launched the **Todos Contam Portal**, a platform aimed at promoting the financial education of the Portuguese population and new businesses. The portal provides information on access to finance for SMEs through the capital market, highlights the circumstances under which a new or growing company would benefit from capital market inclusion, and informs SMEs of the risks associated with this type of financing.

In Mexico, **The Bolsa Mexicana de Valores** (the Mexican Stock Exchange) has launched a digital interactive tool to inform SMEs of the costs and benefits of seeking financing through the capital market, and guides businesses through the process of listing their company on the Mexican Stock Exchange. The platform provides information on available financing instruments and equips users with registration forms, helps with implementing an effective corporate governance model and International Financial Reporting Standards, guides businesses through working with brokerage and rating firms, and provides information on maximising sales, promoting securities and securities maintenance.

The Spanish National Strategy for Financial Education has established a dedicated website, **Finanzas para Todos**, to provide educational tools to better equip entrepreneurs and SMEs with the financial literacy necessary to further SME opportunities for growth. The initiative covers the advantages of using capital markets and stock exchanges as a source of financing from both investor and business perspectives. The State Agency for SMEs in Spain regularly organises working seminars on the convenience of developing SME access to capital markets for stakeholders from academia and private and public sector institutions.

### ***WB6 economies have markets of bonds, but they are shallow and illiquid***

All WB6 economies have a regulatory framework in place for bond markets, and their scope is heterogeneous. In Albania, there are no legal restrictions with respect to the offering of bonds to the public, but in practical terms the bond market consists only of bonds issued for corporate private placement. Kosovo presents a more restrictive approach than other WB6 economies for potential investors. Only the primary market of government bonds is available and only banks can invest in these bonds. Other non-financial corporates do not have access to the bond market.

As described above, Bosnia and Herzegovina, Montenegro, North Macedonia and Serbia have active stock markets, which *de facto* broadens the scope of their corporate bond markets. In 2018, Serbia had the biggest bond market in terms of value, followed by Bosnia and Herzegovina. Conversely, in North Macedonia and Montenegro the markets remained shallow, with two and one government bonds, respectively, listed in 2018 (Table 6.10).

**Table 6.10. Number and value of bonds listed in WB economies with active stock markets (2018)**

	BIH		MNE	MKD	SRB
	FBiH	RS			
Number of government bonds listed	4	7	1	2	60
Number of corporate bonds listed	1	6	..	0	0
Value of government bonds listed (EUR million)	372	90	145	55	4 284 (+8 885 million dinar)
Value of corporate bonds listed (EUR million)	9	0.7	14	0	0
Outstanding corporate bonds to GDP (%)	..	0.259%	..	0.0094%	0%

Note: Albania and Kosovo were not included due to the nascent nature of both their capital markets. Kosovo has no stock exchange and in 2018 in Albania there was a limitation on the exchange to trade only government securities, which was removed in 2019. This made both economies unequitable for statistical comparison. In Serbia, both dinar and euro denominated bonds are listed on the Belgrade Stock Exchange, therefore the value of +8 885 represents the bonds traded only in local currency.

Source: OECD calculation based on information collected from statistical offices; (EBRD, 2020<sup>[26]</sup>), *Effectiveness and Efficiency of Debt Capital Markets – A Comparative Study*, <http://www.ebrd.com/documents/local-currency-and-cap.-markets/effectiveness-and-efficiency-of-debt-capital-markets-a-comparative-study.pdf>.

### ***The way forward for the mobilisation of long-term financing***

- **Promote access to equity capital through the stock market.** The low level of activity and liquidity in the stock market is a barrier for companies that could use it to raise new capital. To stimulate capital market development, WB6 governments could encourage listing state-owned enterprises, such as the example of the Ignitus Group in Lithuania (Box 6.5), to help obtain critical stock market size and visibility among international institutional investors. To increase the attractiveness of the domestic stock market, the WB6 governments could consider introducing a tax credit system for costs related to initial listings, as well as secondary equity offerings by already listed companies. Such a system would allow companies to deduct listings costs, including any advisory service costs, from the corporate income tax payable up to a certain amount.
- **Consider strengthening connectivity in the region.** The lack of depth in the existing stock markets and the small market sizes are limiting the potential contribution of the stock markets to the development of businesses. Strengthening the use of the SEE Link could help to increase the liquidity of the markets in the long term and would provide more certainty and security to foreign investors.

#### **Box 6.5. Listing a state-owned enterprise on the stock exchange: Ignitus Group in Lithuania**

Ignitus Group is a Lithuanian state-owned international energy company focusing on renewable energy transitions. It is one of the largest energy groups in the Baltic region. In October 2020, the previously fully state-owned group was listed on the Nasdaq Vilnius and London stock exchanges. Ignitus Group's IPO became the largest transaction in the Baltics in several decades, with EUR 450 million of primary capital raised by offering 26.9% of shares and global depository receipts to institutional and Baltic retail investors.

Ignitus Group's IPO has already proved beneficial to Baltic capital markets, with a 70% increase in Nasdaq Baltic turnover in 2020 and a doubled increase in turnover on the Nasdaq Vilnius market, making Ignitus shares the most traded and accounting for 35% of the total increase on the Vilnius stock exchange. Priority investments were given to high-quality and local investors, with approximately 9% of shares allocated to long-term investors and remaining shares going to retail and other hedge funds. The group's IPO attracted strong interest from the Baltic states as well as international Nordic, European and other international institutional investors, with the largest minority shareholder the EBRD, with a 4% ownership.

According to a statement of the Lithuanian Ministry of Finance, the attracted funds will help with the implementation of the National Energy Independence Strategy by promoting green energy production and ensuring energy security and self-sufficiency. As the Bank of Lithuania requires a prospectus for listings on the Vilnius stock exchange, in line with international best practices, Ignitus Group published a document that included information on risk factors, the offering, payment policies and corporate government strategies.

### Box 6.6. Access to finance in the Common Regional Market

The following key findings of the CO2021 access to finance, mobilisation of long-term financing sub-dimension can inform the implementation of the actions related to the regional trade and innovation components of the Common Regional Market (CRM) 2021-24 Action Plan:

- Regarding long-term financing, each economy has adopted a dedicated legal framework for PPP that enables PPI projects. Each economy also has a government body that facilitates PPP programmes.
- Access to alternative financing sources for start-ups and early-stage innovation enterprises remains underutilised in the region, with limited regulatory coverage in existing legislation. However, the use of business angel networks in WB6 economies has been increasing since 2016.

Although most WB6 economies continue to be absent from the credit support landscape, all have established or enhanced their national credit guarantee schemes in response to COVID-19, with Bosnia and Herzegovina, North Macedonia and Serbia also opening donor-based credit lines in partnership with donor institutions.

## Conclusion

Overall, the Western Balkan economies have made progress in improving access to finance. The assessment found that the legal and regulatory frameworks put in place perform relatively well, but that the region's private sectors continue to suffer from high collateral requirements imposed by the banking industry, which dominates the financial sectors.

The region's stock market and business angel networks have become slightly more active since the last assessment and the economies have made some progress in updating the legislative framework for institutional investors, crowdfunding and factoring. They have also increased asset registration.

Despite this progress, further efforts towards ensuring better access to finance will be crucial to support private sector development, especially in the post-COVID-19 recovery climate, and will likely entail the successful implementation of the recommendations set out in this chapter. The region still needs to adapt collateral requirements to the needs of businesses, while ensuring financial stability for banks. Moreover, despite an existing framework for alternative financing tools, such as factoring and leasing, WB6 governments need to take full advantage of these alternative tools.

## Notes

<sup>1</sup> The Central and Eastern European Countries (CEEC) are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>2</sup> This falls under the competence of both entities. In the Federation of Bosnia and Herzegovina (FBiH) and Republika Srpska (RS), the law on foreign exchange operations encourages local currency lending. Banks are not allowed to lend in foreign exchange to a resident, except to enable a resident legal person or entrepreneur to pay for imported goods and services. For the governance structure of Bosnia and Herzegovina please refer to (Scope and methods)

<sup>3</sup> Basel II is an international business standard developed prior to the 2008/09 crisis by the Basel Committee on Banking Supervision. It requires financial institutions to maintain enough cash reserves to cover risks incurred by operations.

<sup>4</sup> Basel III is a set of measures developed by the Basel Committee on Banking Supervision in response to the 2008/09 crisis. It has been agreed internationally and aims for a more resilient banking system. It underpins the regulatory and supervisory framework and strengthens banks' risk management.

<sup>5</sup> The Internal Capital Adequacy Assessment Process (ICAAP) allows firms to assess their capital adequacy and requires them to have appropriate risk management techniques in place. For more information: [https://www.bankingsupervision.europa.eu/ecb/pub/pdf/ssm.icaap\\_guide\\_201811.en.pdf](https://www.bankingsupervision.europa.eu/ecb/pub/pdf/ssm.icaap_guide_201811.en.pdf).

<sup>6</sup> Under ICAAP requirements a bank needs to have in place internal procedures and processes to ensure that it possesses adequate capital resources in the long term to cover all of its material risks. These processes and procedures together are known as the Internal Capital Adequacy and Assessment Process (ICAAP).

<sup>7</sup> Cadastres are defined as a comprehensive register of the real estate or real property's metes and bounds of an economy.

<sup>8</sup> For further information: [https://ec.europa.eu/growth/access-to-finance/cosme-financial-instruments\\_en](https://ec.europa.eu/growth/access-to-finance/cosme-financial-instruments_en).

<sup>9</sup> In FBiH, supervision over the performance of factoring activities is entrusted to the Banking Agency of the FBiH. In Republika Srpska supervision is divided, with the Banking Agency of Republika Srpska supervising banks performing factoring activities, and the Securities Commission supervising the factoring of companies and other factoring service providers, in accordance with the law.

<sup>10</sup> EBAN is the pan-European representative for the early stage investor community gathering over 150 member organisations in more than 50 countries. For more information see: <https://www.eban.org/>.

<sup>11</sup> EU Regulation 2020/1503 on European crowdfunding service providers for business adopted in October 2020

<sup>12</sup> A white paper is created by the founders and/or developers to guide investors with charts and technically focused information on how to address and solve issues that might be encountered in the chain.

<sup>13</sup> The Financial Action Task Force (FATF) Recommendations. As amended October 2020. The FATF Recommendations set out a comprehensive and consistent framework of measures which countries should implement in order to combat money laundering and terrorist financing, as well as the financing of proliferation of weapons of mass destruction. # 7 Tax policy (Dimension 4)

---

A well-designed tax system is the cornerstone of an economic and social environment which guarantees competitiveness, innovation, investment, entrepreneurship and prosperity. This chapter assesses tax policy in the six Western Balkan (WB6) economies. It starts with a brief assessment of progress made in implementing the main recommendations from the 2018 report. It then presents the assessment framework for the tax policy dimension and reviews the main changes, and the evolution of the economies' self-assessed scoring since the last report. The chapter then focuses on three sub-dimensions. The first, tax policy framework, explores whether tax policy fosters an environment conducive to inclusive economic growth and how its design affects revenues raised, investment and competitiveness. The second, tax administration, assesses the efficiency of the tax administrations across the region. Finally, the international co-operation sub-dimension explores the extent to which the economies have engaged with the international tax community on recent international tax trends and are co-operating with each other on common tax issues. For each sub-dimension, the chapter includes suggestions to strengthen the various tax policies and their implementation, which in turn would foster the competitiveness of the WB6 economies.

---

## Key findings

- **Most of the WB6 economies have implemented broad response packages to combat the effects of COVID-19** on their economy and citizens, in line with measures carried out in OECD countries.
- **The average tax-to-GDP ratio has increased slightly in recent years** but remains below the OECD average, suggesting there is scope to increase tax revenue.
- **The tax mix is much more dependent on taxes on goods and services and social security contributions (SSCs)** than in OECD countries. There is scope to diversify tax revenues.
- **High SSC rates place a heavy tax burden on labour income and raise the cost of labour.** This may affect labour market outcomes, especially for low-skilled and low-income workers.
- **The WB6 economies provide an investment-friendly environment** with low corporate income tax (CIT) rates and generous cost and profit-based tax incentives. But these come at a significant revenue cost; CIT revenues are below the average for OECD countries.
- **The WB6 economies tend to place a higher tax burden on labour income than on capital income.** This creates an incentive for entrepreneurs to incorporate and receive income in the form of capital income rather than labour income, reducing tax revenues and the overall progressivity of the tax system.
- **Most taxes in the region are levied at the same rate across income levels, making them non-progressive.** The impact of the tax system on reducing income inequality is thus expected to be modest. However, a low level of progressivity does not necessarily mean a poor redistribution model – public spending should be factored in to assess the full equity implications of the economies' redistributive policies.
- **Revenues from taxes on goods and services are high despite being levied on a narrow base.** Relatively high value-added tax (VAT) registration thresholds, as well as a wide range of goods and services that are taxed at a reduced VAT rate, leave scope to broaden the VAT base.
- **The informal sector in WB6 economies is large,** meaning there is significant scope to broaden the tax base by bringing more taxpayers into the tax system.
- **The WB6 economies have strengthened their use of micro-simulation models** to assess the distributive effects of tax reforms; they also use models to forecast tax revenues.
- **Tax expenditure reporting is still weak in the region.** Most WB6 economies would benefit from the publication of a regular and systematic tax expenditure report.
- **The WB6 economies have made significant efforts to strengthen their tax administrations** since the last report.
- **Tax administrations continue to lack strong procedural safeguards guaranteeing their independence** across the region.
- **The WB6 economies have strengthened their involvement with the international tax community** in recent years and have taken significant steps to align their system with current international tax trends.
- **International proposals for a global minimum tax** arising from Pillar 2 of the OECD's Tax Challenges Arising from Digitalisation tax proposals, could have a strong impact on the economies' tax systems.
- **The WB6 economies continue to implement a worldwide taxation system** for resident corporations, in contrast to the OCED trend.

- **Tax co-operation and co-ordination remains weak** amongst WB6 economies.

## Comparison with the 2018 assessment

The average scores for the WB6 economies have increased for this dimension since the last Competitiveness Outlook (CO) assessment, from 2.3 in 2018 to 3.0 in 2021. The scores for the WB6 economies are relatively similar for this dimension overall, ranging from 2.6 for Montenegro to 3.4 for Kosovo. All the economies have improved their performance, with Kosovo seeing the most significant increase, from 2.2 in 2018 to 3.4 in 2021, while the improvement for North Macedonia was more modest, from 2.4 to 2.9 (Figure 7.1).

For the first sub-dimension (tax policies), scores range from 2.0 for Montenegro and Serbia to 3.0 for Albania and North Macedonia. The average score rose from 2.0 to 2.6, driven by significant improvements in the modelling and forecasting and tax expenditure reporting indicators. For the second sub-dimension (tax administrations), the range is from 2.4 for Bosnia and Herzegovina to 4.0 for Kosovo and the average rose from 2.4 in 2018 to 3.3 in 2021 due to relatively strong performances in the independence and transparency and taxpayer services indicators.

**Figure 7.1. Overall scores for the tax policy dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Assessment methodology and process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

The Competitiveness Outlook 2018 highlighted a number of policy recommendations for the WB6 economies to strengthen tax policies and administrations in the region. They are presented in Table 7.1 along with a description of the progress made and an overall progress status ranging from none to limited, moderate or advanced.

In the last report, WB6 economies were advised to strengthen their tax administrations to improve overall tax compliance and to align their tax systems with international tax trends. Advanced progress has been made in implementing both recommendations across the region, due to the significant efforts made in

these areas. The WB6 economies also strengthened their tools to assess the effects of tax policies on the economy or plan to do so in the near future, and have made moderate progress on this recommendation.

The implementation of other recommendations has been slower. Only limited progress has been made in areas such as the design of corporate tax incentives, adjusting the balance between personal income tax (PIT) and SSCs, broadening the VAT base, bringing additional workers and businesses into the tax base, and regional co-operation. No progress has been made on the remaining recommendations, with a lack of significant efforts in those areas.

**Table 7.1. Implementation of the CO 2018 policy recommendations: Tax policy**

Competitiveness Outlook 2021		
CO 2018 policy recommendations	Main developments during the assessment period	Regional progress status
Evaluate the design of corporate tax incentives	<ul style="list-style-type: none"> <li>Albania and Serbia have reformed their corporate income tax incentives since CO 2018.</li> <li>Most of the economies implement a mix of cost and profit-based tax incentives.</li> </ul>	Limited
Analyse the combined impact of personal income tax (PIT) and SSCs on labour market outcomes	<ul style="list-style-type: none"> <li>Reforms have been modest in this area: Bosnia and Herzegovina and North Macedonia plan to introduce a progressive PIT rate schedule in the near future.</li> <li>Overall, most of the WB6 economies have high SSC rates and low PIT rates, resulting in a tax burden on labour income that is high and not progressive.</li> </ul>	Limited
Reduce the gap between taxes on labour and capital income	<ul style="list-style-type: none"> <li>All the WB6 economies place a higher tax burden on labour income than on capital income. The few reforms that have been carried out have not significantly reduced the gap.</li> </ul>	None
Broaden the VAT base	<ul style="list-style-type: none"> <li>Albania and North Macedonia raised their VAT registration thresholds, while Kosovo reduced its threshold.</li> <li>None of the WB6 economies reduced the list of goods and services taxed at a reduced VAT rate.</li> </ul>	Limited
Develop tax policy tools to assess tax systems and their economic impacts and measure the tax revenue forgone through tax expenditures	<ul style="list-style-type: none"> <li>Albania implemented a regular tax expenditure report in 2019, with North Macedonia planning to do so in 2021.</li> <li>All the economies except Kosovo, implement micro-simulation models. Albania and Montenegro started doing so in 2019.</li> </ul>	Moderate
Continue to strengthen tax administrations to improve tax collection and compliance	<ul style="list-style-type: none"> <li>The overall score for the features of tax administration sub-dimension has increased significantly since CO 2018.</li> <li>Significant reforms have taken place to improve the independence and transparency of the tax administrations and the taxpayer services offered.</li> </ul>	Advanced
Bring informal workers and businesses into the tax base	<ul style="list-style-type: none"> <li>The informal sector is estimated to be large, partly induced by the design of the tax system and its administration.</li> <li>Efforts directly targeted at reducing the informal sector remain limited.</li> </ul>	Limited
Bring international taxation rules in line with international best practice	<ul style="list-style-type: none"> <li>All economies except Kosovo have joined the Inclusive Framework on Base Erosion and Profit Shifting (BEPS) and launched a series of initiatives on BEPS minimum standards, administrative assistance and exchange of information.</li> </ul>	Advanced
Evaluate the use of worldwide tax system and implement measures to protect the domestic tax base	<ul style="list-style-type: none"> <li>All the WB6 economies currently implement a worldwide taxation system. No evaluation of the costs and benefits of such an approach has been carried out since CO2018.</li> </ul>	None
Strengthen co-ordination and co-operation among the economies in the region	<ul style="list-style-type: none"> <li>All the WB6 economies are engaged in modest regional co-operation and co-ordination.</li> <li>No wide-scale initiatives have been launched since CO 2018.</li> </ul>	Limited

## Introduction

Public finances are under stress as result of the COVID-19 outbreak and the resulting global pandemic. Governments worldwide face tremendous challenges to finance their public policies and fund their welfare system, while maintaining an environment conducive to economic recovery and inclusive growth. In this context, tax policies are even more crucial. Taxes provide governments with the revenue they need to finance public expenditures. A well-designed tax system is the cornerstone of an economic and social environment which guarantees competitiveness, innovations, investment, entrepreneurship and prosperity.

Tax systems should be designed to encourage economic growth in a sustainable and inclusive way. This implies creating rules that aim to increase prosperity and productivity among citizens, which entails managing several trade-offs. Tax reforms should find a balance between fostering equity, achieving budgetary efficiency and circumventing distortive effects, while accounting for various distributional effects. Tax and benefit policies that contribute to fostering wealth redistribution will be conducive to economic growth within each WB6 economy and across the region.

A strong tax administration is necessary to achieve a well-functioning tax system. By implementing efficient management practices and transparent institutions, governments reduce compliance costs for individuals and businesses, lower administration costs, and create trust in the tax system. All these factors optimise tax collection and positively influence tax policies as a whole.

As globalisation fosters cross-border economic activity, tax systems should incorporate well-designed and comprehensive international tax rules. A high level of international co-operation and co-ordination helps governments tackle tax avoidance and reduces mismatches between tax systems. International and regional co-operation are therefore crucial for the WB6 economies to tackle base erosion and profit shifting (BEPS) practices and strengthen administrative co-ordination.

This chapter examines the extent to which WB6 economies have established competitive tax systems. The tax dimension is linked to several other policy areas examined in this report, especially:

- **Chapter 4. Investment policy.** Well-designed investment tax incentives in a sound and non-distortive tax environment are a key part of attracting investment.
- **Chapter 8. Competition policy.** Competition is strengthened by transparent and equitable tax policies that help prevent tax avoidance that gives some firms an unfair advantage over their competitors.
- **Chapter 11. Employment policy.** Tax policies can influence choices in the labour market. Labour taxation determines the difference between the total labour costs faced by employers and the after-tax wage received by employees, thus affecting labour demand and supply decisions.
- **Chapter 12. Science, technology and innovation.** Predictable tax rates and well-designed investment incentives can encourage firms to innovate.
- **Chapter 16. Environment policy.** Tax-related incentives can help reduce the environmental impact of economic activity.
- **Chapter 19. Anti-corruption policy.** A strong tax administration with robust safeguards that ensure the transparency of its policies and agents helps fight corruption.

## Assessment framework

### Structure

The tax dimension in the 2021 Competitiveness Outlook examines the extent to which governments have established competitive tax systems. Without seeking to be exhaustive, it considers three broad sub-

dimensions which are critical to healthy fiscal environments that favour economic growth and well-being across the population:

1. **Sub-dimension 4.1: Tax policy framework** focuses on how tax policy fosters an environment conducive to inclusive economic growth, how the design of tax policy affects revenues raised and how it influences investment and competitiveness.
2. **Sub-dimension 4.2: Tax administration** focuses on the different functions of tax administrations and how effective they are in ensuring tax compliance.
3. **Sub-dimension 4.3: International co-operation** focuses on how the WB6 economies co-operate with the international tax community and implement recent international tax trends, how they deal with the digital economy from a tax perspective, and how they co-operate with other economies in the region.

The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders for this dimension. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies’ statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. Figure 7.2 shows how the sub-dimensions and their indicators make up the tax policy dimension assessment framework. For more information on the methodology, see the Assessment methodology and process chapter.

### **Key methodological changes to the assessment framework**

In contrast to other dimensions, the tax policy assessment framework has not changed significantly since the last report. For Sub-dimension 4.1, the only significant change has been the addition of the investment incentives indicator. Sub-dimension 4.2 remains identical to CO 2018. Sub-dimension 4.3 does not include qualitative or quantitative indicators. This virtually identical assessment framework means the region’s performance between the two assessments can be usefully compared.

## Tax policy performance and context in the WB6

Tax revenues have increased as a share of GDP between CO 2018 and CO 2021. In 2019, on average, tax revenues were 30.6% of GDP, which represents a significant increase from 28.0% in 2015. The regional tax-to-GDP ratio remains below the OECD average of 33.8% in 2019, a fall from 34.3% in 2015 (Figure 7.3). The difference is even larger compared to EU countries (41.1% of GDP on average in 2019) and the CEEC-11<sup>1</sup> economies (34.6%).

**Figure 7.3. Tax revenues by tax type (2019)**

Note: To calculate the OECD average tax-to-GDP ratio for 2019, 2018 data were used for Australia and Japan; the CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (OECD, 2019<sup>[1]</sup>), *Global Revenue Statistics Database*, [www.oecd.org/tax/tax-policy/global-revenue-statistics-database.htm](http://www.oecd.org/tax/tax-policy/global-revenue-statistics-database.htm); CO2021 questionnaire.

StatLink  <https://doi.org/10.1787/888934253879>

These average regional figures mask wide disparities, as both the revenue raised and the change since 2015 vary widely across the WB6 economies. Tax revenues are particularly low in Kosovo (25.9% of GDP), Albania (25.3%) and North Macedonia (25.9%), while the shares for Montenegro (35.7%), Bosnia and Herzegovina (36.3%) and Serbia (36.8%) exceed the OECD average. There are also variations in how revenues have changed since 2015. Serbia has increased its tax revenue relative to GDP by 0.6%, Albania by 1.2%, Bosnia and Herzegovina by 7%, and North Macedonia by 9.2%. In contrast the ratio fell by 0.8% in Kosovo and 1.9% in Montenegro.

The average tax mix in the Western Balkan region differs greatly from that found in OECD countries (Figure 7.4). The WB6 economies rely significantly on revenues from social security contributions and taxes on goods and services to fund their health system and public spending programmes. Together, these taxes accounted for 80.7% of total tax revenues on average in 2019, compared to the OECD average of 58.4%, the EU average of 67.9% and the CEEC average of 78.9%. The share also varies across the WB6 economies, ranging from 66.3% in Albania to 88.1% in Bosnia and Herzegovina.

Consequently, other taxes play a smaller role. Personal and corporate income taxes only account on average for 14.9% of total tax revenues in the WB6 economies, less than half the OECD average (33.5% in 2018). In some economies, such as Albania, the share is slightly higher (20.1%) but remains in broad alignment with the regional average. On average EU countries levy 29.9% of their tax revenues from these sources, and the CEEC-11 20.1%.

Most of the WB6 economies have implemented broad response packages to combat the effects of COVID-19 on their economy and citizens, in line with measures carried out in OECD countries (Box 7.1).

**Figure 7.4. Selected taxes as a share of total tax revenues (2019)**

Note: To calculate the 2019 OECD averages, 2018 data were used for Australia, Japan and Mexico; the CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

### Box 7.1. Tax policy responses to the COVID-19 outbreak

Governments worldwide have taken rapid and unprecedented actions to address the health crisis and the fall in economic activity caused by the outbreak of COVID-19. Containing and mitigating the spread of the virus has been a priority of public authorities. With containment measures in place, governments have focused on alleviating hardships while maintaining the productive capacity of the economy (OECD, 2021<sup>[2]</sup>).

As with OECD countries, the WB6 economies have implemented a number of tax policies to mitigate the effect of COVID-19 on their economy and citizens. Their response has been relatively heterogeneous. Some have mainly implemented tax administrative support measures, such as deferring tax payments. Others have implemented a wider response package, closely resembling measures implemented in OECD countries.

While the response measures varied in the region, some tax measures were implemented by most or all of the WB6 economies. They have all implemented tax filing or tax payment deferrals for some or all their major taxes. These measures were usually complemented with more flexible tax-debt repayments, including in some cases the suspension of interest for tax arrears. All of the WB6 economies have also implemented measures to reduce or exempt medical goods from VAT or custom duties, to make it easier for medical professionals and the wider public to access them. Serbia and Kosovo have largely limited their approach to these types of measures, although they also implemented a wage subsidy scheme and Kosovo implemented a public loan guarantee. scheme

Albania, Bosnia and Herzegovina, Montenegro and North Macedonia have introduced a wider range of measures. These include wage subsidy schemes, public loan guarantees or public loan schemes, direct cash transfers to households, loss carry-forward extensions, VAT reductions for certain economic sectors, and the deferral of fixed costs for households and businesses (notably rent or loan payment deferrals).

### Tax policy framework (Sub-dimension 4.1)

Tax policies aim to create a competitive tax environment conducive to inclusive economic growth, which raises sufficient tax revenues to finance public expenditure and ensures that the tax burden is shared fairly across the population. This sub-dimension analyses the tax policy frameworks in the WB6 economies. It includes four qualitative indicators to assess tax policy tools applied in WB6 economies: 1) investment incentives; 2) tax revenues; 3) modelling and forecasting; and 4) tax expenditure reporting. This section also looks at other types of taxes, the level of SSCs and the overall tax burden on labour income, the taxation of dividends and interests at the individual level, and key design features of the VAT system.

The average score for this sub-dimension is 2.6 (Table 7.2). For the investment incentives and tax revenues indicators, all of the WB6 economies have relatively similar scores, while for modelling and forecasting and tax expenditure reporting, their scores differ more widely.

**Table 7.2. Scores for Sub-dimension 4.1: Tax policy framework**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 4.1: Tax policy framework	Investment incentives	3.0	3.0	2.0	3.0	2.0	2.5	2.6
	Tax revenues	3.0	2.8	3.0	3.1	2.0	3.0	2.8

	Tax expenditure reporting	3.0	2.5	3.0	1.0	1.0	0.0	1.8
<b>Sub-dimension average score:</b>		3.0	2.9	2.8	3.0	2.0	2.0	2.6

### ***WB6 economies provide an investment friendly environment with low CIT rates and generous investment incentives, which come at a certain revenue cost***

Statutory CIT rates in the WB6 economies are low, at 11.5% on average across the region, well below the OECD average of 23.3% in 2020. Statutory rates range from Montenegro's standard rate of 9% to Albania and Serbia's rate of 15%, with Bosnia and Herzegovina, Kosovo, and North Macedonia applying a 10% rate. No major CIT rate reform has been conducted since the last report. Consequently, regional revenues from CIT only account for 1.8% of GDP on average, ranging from 1.3% of GDP in Kosovo to 2.3% in Serbia. This is below the OECD average of 3.1% in 2018. These low CIT revenues may be partly explained by the low rates and generous tax incentives, but could also be influenced by the structure of activities in the economy. The vast informal sector and high number of unincorporated small enterprises restricts the CIT tax base and could explain below-average revenues.

The WB6 economies implement a diverse set of cost and profit-based tax incentives,<sup>2</sup> but most either focus on profit-based tax incentives or implement a mix of cost and profit-based tax incentives. Serbia is the only economy to focus primarily on cost-based tax incentives. The economies' overall score for investment incentives is 2.6 (as this indicator was introduced for this assessment, no comparison is available). North Macedonia, Albania and Bosnia and Herzegovina scored 3, while Serbia scored 2.5 and, Montenegro and Kosovo scored 2.

Many of the profit-based tax incentives are focused on small and medium-sized enterprises (SMEs). In Albania, companies operating in software production/development, agricultural co-operatives, agritourism or the automotive industry are eligible for a reduced 5% CIT rate. North Macedonia also implements a simplified tax regime for micro enterprises based on annual turnover. Companies with annual turnover under MKD 3 million (EUR 48 700) are exempt from CIT and those with an income of up to MKD 6 million (EUR 97 400) may opt for a simplified tax regime with a 1% rate levied on their turnover, instead of the standard 10% levied on their profits. Kosovo also implements profit-based incentives through special turnover tax rates of 3% and 9% – the rate varies with the type of economic activity – applied to the gross income of SMEs in certain sectors with an annual turnover below EUR 50 000. In general, such size-based thresholds are not necessarily an effective way to support investment and may restrain growth by encouraging businesses to remain below the threshold to continue benefiting from the tax regime. They may also encourage SMEs to split into different companies, or deflate their revenues/inflate costs, to continue to receive preferential treatment. Reduced turnover-based rates also tend to penalise low profit margin businesses, which end up being taxed at higher rate than those with a lower turnover but higher profits. The design of size-based tax incentives therefore needs to be evaluated regularly and, possibly, could be replaced by other measures that reduce compliance costs for SMEs.

Other profit-based tax incentives focus on special economic zones. In Montenegro, companies investing in so-called underdeveloped areas can benefit from profit-based tax incentives. These companies are exempt from CIT for an eight-year period, provided the total amount of tax paid without the incentive would not exceed the EUR 200 000 threshold. In Albania, companies established in so-called areas of technology and economic development are exempted from 50% of their CIT liability for a five-year period. In North Macedonia, companies in special economic zones (referred to as Technological Industrial Development Zones) are exempt from CIT for up to 10 years.

Given the WB6 economies' low CIT rates, the policy rationale for generous investment incentives, particularly profit-based ones, is weak. Tax incentives increase the after-tax return of investments that would have occurred anyway, thereby yielding “windfall gains” for capital owners and investors. Tax incentives also increase costs for the tax administration, which has to monitor compliance with eligibility criteria. Research also shows that profit-based incentives can lead to a high redundancy of expenditure since the investment may have proceeded anyway, and that cost-based incentives are preferable (UNCTAD, 2015<sup>[3]</sup>).

### ***Tax revenues are based on social security contributions and taxes on goods and services***

The WB6 economies raise significant tax revenues from SSCs; they accounted for 28.8% of total tax revenues on average in 2019, ranging from 10.0% in Kosovo to 43.0% in Bosnia and Herzegovina. Such a heavy reliance on SSCs can raise a number of issues. On the one hand, high SSCs can support the direct funding of the welfare system, preventing the need for social welfare funds to be funded partly from general tax revenues, which would create challenges from a budget perspective. On the other hand, high SSCs distort labour markets, especially for low-skilled, low-income or informal workers. Furthermore, as SSCs are mostly levied at the same rate across income levels, they do not contribute to making the tax system more progressive. This is the case in the WB6 economies, where high SSC rates may be having adverse effects on the labour market and are levied at flat rates rather than progressive rates, as for PIT.

Social security contribution rates are high across the region. In 2020, the average SSC rate for the WB6 economies was 28.6%, above the OECD average of 26.9%. Kosovo has a very low rate compared to the regional average (10%, but with an additional voluntary contributions of up to 20%), but apart from that, rates range from 27.9% in Albania to 41.5% in the Federation of Bosnia and Herzegovina (FBiH). These high rates partly explain the high SSC revenues in the region. These averaged 9.3% of GDP in 2019, slightly above the 9.0% OECD average (in 2018). SSC revenue varies widely in the WB6 economies, ranging from 2.6% of GDP in Kosovo to 15.6% in Bosnia and Herzegovina. Furthermore, the average employee SSC rate is 19.9% in the region, while the average rate for employers is 9.5%. This balance between employer and employee SSCs is atypical by OECD standards, as OECD countries tend to place a greater burden on the employer than on employees.

Revenues from personal income tax are low in the region, partly explained by low PIT rates and high basic allowances. Montenegro has a flat PIT rate of 9%, while North Macedonia and Bosnia and Herzegovina have a flat rate of 10%. The other economies implement a progressive rate schedule, with top PIT rates of 10% in Kosovo, 15% in Serbia and 23% in Albania. Overall, these rates remain relatively low by international standards. Among OECD countries, the average top PIT rate was 42.8% in 2020. These low rates partly explain the region's low PIT revenues, which amounted to 2.7% of GDP on average in 2019, drastically below the 8.1% average in OECD countries (in 2018). PIT revenue ranges from 2% of GDP in Bosnia and Herzegovina to 3.8% in Serbia. In some of the WB6 economies, low revenues could also be partly explained by high or rising PIT basic allowances. In Albania, the basic allowance was raised in 2019 from ALL 130 000 (EUR 1 050) to ALL 150 000 (EUR 1 215). In Serbia, the basic allowance grew from 31% since 2017. In Bosnia and Herzegovina, the basic allowance in the FBiH is 31% of the average net wage, while in the Republika Srpska (RS) it is 43%. In most of the WB6 economies the tax burden on capital income is low, which creates an incentive for entrepreneurs to incorporate and receive income in the form of capital rather than salaries. This incentive is further emphasised by the high tax burden on labour income described above.

Some WB6 economies levy higher tax rates on labour income than capital income, notably due to reduced rates or exemptions on dividend payments. In Albania, labour income is taxed following a progressive PIT rate schedule of 0%, 13% and 23% rate, while most types of capital income are taxed at 15%, with dividend income taxed at 8%. In Bosnia and Herzegovina and Kosovo, PIT on labour income is mostly levied at a 10% rate. Although some types of passive income are included in the PIT tax base and taxed at 10%, dividends and income from interest are excluded from the PIT tax base. Even where PIT rates are the same as those on capital income, high SSCs levied on labour income still drive the difference (see above).

While a differentiated taxation of labour and capital income allows for more targeted tax policies, the WB6 economies could conduct a cost-benefit analysis to understand the merits of retaining this differentiated taxation and perhaps consider reducing the wedge between capital income and labour income taxes.

The imbalance between PIT and SSCs may affect labour market outcomes, especially for low-skilled, low-income or informal workers. SSCs increase the cost of employing workers and reduce workers' after-tax earnings. In general, high SSCs are an incentive to work in the informal sector, particularly when controls by tax administrations are weak. High labour taxes may also push low-productivity workers into the informal sector or unemployment. The greater the difference between total labour cost and after-tax disposable income for workers in the formal sector, the greater the incentive for employers and employees to avoid taxes by remaining or joining the informal economy. High levels of informality in turn may negatively affect productivity, growth and trust in government institutions.

Furthermore, this imbalance means taxes on labour income are less progressive, as SSCs are mostly levied at the same rate for all income levels. The WB6 economies could explore the option of rebalancing revenue from SSCs to PIT, perhaps by introducing a progressive PIT rate schedule among those with flat rates. The three WB6 economies with progressive schedules could strengthen their design to improve their wealth redistribution impact. In Albania, despite a high top rate of 23%, effective rates can be much lower:

workers earning ALL 150 000 (EUR 1 215) (the income threshold for the top PIT rate), have an effective tax rate of only 12%. In Serbia, despite a progressive rate schedule with a top PIT rate of 15%, the majority of individuals are liable for the lower 10% rate. In Kosovo, the income threshold for the top PIT rate is placed slightly above the average wage, meaning the PIT system does not target high earners effectively.

The WB6 economies also rely heavily on taxes on goods and services, which accounted for 51.9% of total tax revenues in 2019. This ratio varies widely across the region, from 20% in Serbia to 74.2% in Kosovo. Revenues from these taxes amounted to 15.9% of GDP on average, compared with 10.9% for the OECD average (in 2018), ranging from 11.7% in Albania to 19.9% in Montenegro. Value-added tax rates are close to average levels found in OECD countries: 19.0% in the region in 2020, slightly below the OECD average of 19.3%.

OECD research has found that consumption taxes, and particularly VAT, may be less distortive on the decisions of households and firms, and thus on GDP per capita, than income taxes (Johansson et al., 2008<sup>[4]</sup>). The OECD's Tax Policy Reform and Economic Growth report, which assessed the impact of four major categories of taxes on long-run GDP per capita, ranked consumption taxes as the second least damaging, after recurrent taxes on immovable property and before other property taxes and personal and corporate income taxes (OECD, 2010<sup>[5]</sup>). Furthermore, a well-designed VAT system may encourage workers and businesses to enter the formal economy. Systems based on VAT could therefore be more conducive to economic growth than systems focused on more distortive taxes, such as CIT. However, the WB6 economies could contemplate diversifying their tax resources, notably by strengthening recurrent taxes on immovable properties or environmentally related taxes.

Two factors narrow the VAT base in the WB6 economies. First, all WB6 economies have opted for a turnover-based VAT registration threshold, which is common among OECD countries but not universal. On average, the threshold is relatively high, at EUR 42 500 in 2021, ranging from EUR 18 000 in Montenegro to EUR 81 000 in Albania. A relatively high threshold may give small businesses an advantage when in competition with larger companies, while a relatively low threshold may act as a disincentive to grow or as an incentive to split activities artificially to avoid VAT. Therefore, the threshold is often the result of a trade-off between minimising compliance and administration costs and the need to avoid jeopardising revenue or distorting competition. By setting rather high VAT registration thresholds, the WB6 economies chose to concentrate their VAT administration capacities on larger businesses. As they continue to strengthen their tax administration capacity, they may consider gradually lowering registration thresholds over time.

Second, the WB6 economies have extensive lists of goods and services which are either exempt or taxed at a reduced VAT rate. All the economies except Bosnia and Herzegovina levy reduced VAT rates: 10% in Serbia, 8% in Kosovo, 7% in Montenegro, 6% in Albania and 5% in North Macedonia. While reduced VAT rates may represent good tax policy in certain cases, many of the exemptions and reduced rates in the WB6 economies are not well targeted from an equity perspective. Only Serbia, which has a relatively broad VAT base, does not have a long list of VAT exempted goods and services. For example, all the economies exempt rents on residential properties from VAT while Bosnia and Herzegovina and Montenegro exempt any activity that can be seen to be connected to the public interest. North Macedonia exempts the cross-border transport of people. Albania and Kosovo exempt newspapers, magazines and certain other types of print media. Albania exempts certain services linked to sports, services provided by dental technicians, advertisements through electronic and written media, and some printing services. Kosovo also exempts public transport. Moreover, OECD research has found that reduced rates are generally not an effective way to target low-income individuals as it may even be regressive in certain cases (OECD, n.d.<sup>[6]</sup>).

The tax burden in the WB6 economies is borne by a small number of taxpayers. Although, by its nature it is complicated to precisely estimate the size of the informal sector, it is large in the region. According to estimates by the World Bank, the informal sector in the WB6 economies accounts for around 25-35% of

both GDP and the total working population (World Bank, 2021<sup>[7]</sup>). In comparison, informality in EU Member States averages around 15-20% of GDP. North Macedonia has the lowest estimated informal sector (less than 20% of the working population), while Kosovo has the highest (more than 35%). This raises a number of tax issues: informality limits the amount of tax revenue raised, restricts the ability of the tax system to help reduce inequalities, places a drag on economic growth and creates distortions between the formal and informal economy.

There are several options available for governments attempting to reduce the size of the informal sector and bring businesses and workers into the formal economy. These options can be divided into two categories. The first concerns tax administration measures, where governments implement simplified tax regimes for certain type of individual and businesses, or target their audit capacities on taxpayers most likely to evade taxes and operate in the informal economy. For example, Kosovo has developed a special unit within its tax administration in charge of SMEs and Albania has developed an IT risk module system based on the riskiest taxpayers to guide its audit plan. The second covers tax policies that aim to reduce the disincentive to work in the formal economy, by example reducing high SSC rates on labour income or high VAT registration thresholds. Bosnia and Herzegovina plans to lower the SSC rate from 41.5% to 32.5% in 2021, which should lower the overall cost of labour and therefore increase the incentive to register in the formal economy.

### ***The WB6 economies have strengthened their use of micro-simulation models to assess the distributive effects of tax reforms on their economy***

The 2018 assessment identified the modelling and forecasting of tax revenues as an area in need of progress. Overall, the WB6 economies scored 2.3 on average for the modelling and forecasting indicator in CO 2018. The assessment found that although the economies' finance ministries maintained aggregate tax revenue forecasting models for each main tax, there was insufficient analysis of the information and a lack of micro-simulation models.

Since then, several initiatives have been carried out and good progress made, particularly in the area of micro-simulation models, with the average score for this indicator rising to 3.3. In 2018, Albania, Kosovo, and Montenegro did not use micro-simulation models at all, while Bosnia and Herzegovina, North Macedonia, and Serbia made limited use of them. Now all the WB6 economies except Kosovo are using these models. Albania and Montenegro started using them for the first time in 2019, and others have expanded their use. For example, North Macedonia developed a micro-simulation model for PIT that includes 1 million taxpayers, can carry out analysis by income groups or can estimate different type of redistributive indicator (Gini, Atkinson, etc.). Albania is also currently working with the International Monetary Fund (IMF) to develop new micro-simulation models (Box 7.2).

### ***Tax expenditures are not reported in a regular and systematic way across the region***

The last assessment identified tax expenditure reporting as an area where efforts should be strengthened. The average score was 0.7 in CO 2018, the lowest score in any indicator for the tax policy dimension. This could be explained by the lack of calculation and accounting of forgone revenues due to tax expenditures in all the WB6 economies.

The score for this indicator has increased to 1.8 on average across the WB6 economies, driven by two initiatives. Albania implemented a regular tax expenditure report in 2019, which will be issued every two years. North Macedonia is currently implementing a New Organic Budget Law, taking effect in 2021. Among other things, this law aims to instigate a regular tax expenditure report. Despite these two initiatives, the use of tax expenditure reporting remains limited in the region. Some economies, such as Montenegro, collect basic statistics on tax expenditures, but this information is not made public and only used for internal government use.

Other WB6 economies should consider publishing regular tax expenditure reports, which would increase transparency and accountability. They would allow them to monitor the use and effectiveness of tax incentives along with the tax revenue forgone (OECD, 2010<sup>[8]</sup>). These reports should identify, measure and report the cost of tax expenditures in a way that enables their monetary value to be compared with direct spending programmes (IMF, 2019<sup>[9]</sup>). The economies could also conduct cost-benefit analyses to evaluate whether specific tax incentives meet their stated objectives and, if not, whether they should be abolished or replaced.

### ***The way forward for the tax policy framework***

- **Continue COVID-19 support with targeted tax and subsidy measures, while focusing future efforts on measures to spark an economic recovery.** Most WB6 economies have implemented a broad response package to mitigate the effects of COVID-19 on the economy and its citizens, in alignment with measures carried out in OECD countries.
- **Avoid the use of generous profit-based tax incentives in a context of a low standard statutory CIT rate.** Instead, WB6 economies could shift the focus to cost-based tax incentives, which are less likely to lead to high redundancy of expenditure.
- **Weigh the advantages and disadvantages of a differentiated taxation of capital and labour income.** Policy makers could consider aligning tax rates to prevent negative spillover effects and reduce the incentive for entrepreneurs to incorporate and receive income in the form of capital rather than salaries.
- **Increase tax revenues and diversify the tax mix.** Half of the WB6 economies have relatively significant scope to increase tax revenues, as Albania, Kosovo and North Macedonia's average tax-to-GDP ratios remain far below the OECD average. Increasing revenues would help these economies finance their public spending programmes and healthcare systems. It could also strengthen their welfare state and help reach wealth redistribution objectives. Governments should also aim to diversify the tax mix by reducing their reliance on SSCs and taxes on goods and services and instead strengthening the role of corporate and personal income taxes, environmentally related taxes, and recurrent taxes on immovable property.
- **Rebalance the taxation of labour income away from high employer and employee social security contributions.** The current imbalance raises the cost of labour and consequently affects labour market outcomes, especially for low-income, low-skilled and informal workers. Shifting revenues away from SSCs and introducing progressive PIT rate schedules where necessary would help rebalance the taxation of labour income.
- **Strengthen the design and progressivity of PIT.** Some of the WB6 economies use progressive PIT rate schedules but design issues hinder their impact on wealth redistribution. These economies could analyse the distribution of the PIT burden across income levels and, if necessary, redesign their rate schedule to target high earners more effectively and provide relief for low earners.
- **Evaluate options to broaden the VAT base.** Currently, the VAT base of most WB6 economies is narrowed by high registration thresholds and extensive lists of goods and services taxed at reduced VAT rates. Broadening the VAT base, if scope exists to do so, would bring additional revenue and could increase the size of the tax base.
- **Reinforce efforts to broaden the tax base and encourage the registration of informal businesses and workers in the formal economy.** These efforts could come through both tax administration and tax policy measures. Potential measures could range from simplified tax payment and declaration regimes to targeted tax rates and threshold reductions. Furthermore, the co-ordination between different measures and their effects should be the focus of future tax reforms.

- **Expand the use of micro-simulation models to forecast tax revenues and to assess the distributive effects of tax reforms.** While the WB6 economies have greatly improved their use of micro-simulation models since the last report, efforts could be strengthened. Current models remain limited to a few specific taxes and could be expanded to the majority of taxes and used systematically when planning future tax reforms.
- **Implement regular and systematic tax expenditure reports.** Current tax expenditure reporting capacities are very limited across the region and only Albania currently produces a regular and systematic report (Table 7.2). Such reports would help the WB6 economies manage their investment tax incentives and link their management with other public spending programmes.

### Box 7.2. Albania's tools to assess the effects of tax policies on the economy

Sound policy making, especially in tax matters, requires a comprehensive set of tools to precisely forecast and estimate the effects of reforms on the economy. They allow governments to effectively quantify the impact of potential reform options in terms of revenue forecasting, distributive effects or impact assessments. Among the WB6 economies, Albania has been particularly proactive in this field in recent years, with strong initiatives in micro-simulation models and tax expenditure reporting.

#### Micro-simulation models

On top of its widespread use of macro-simulation models, Albania has expanded its use of micro-simulation models since the 2018 Competitiveness Outlook.

In 2019, the Ministry of Finance and Economy developed a set of micro-simulation models for VAT, PIT, excise and CIT. These models were created in co-operation with the World Bank. For VAT, the model is based on a supply use table from INSTAT, corrected for economic growth for 35 levels of activities and products. For PIT, the model calculates the effects of changes in tax rates for different categories of salaries. For CIT, the model includes firm-level data and can analyse revenue effects from CIT reforms across different economic sectors.

The models were expected to be first used in 2020 to forecast yearly revenues from each tax and develop the monthly distribution plan. However, due to the outbreak of COVID-19 and a significant earthquake in the country, some taxes were not paid on a regular basis, which reduced the precision of the revenue forecasting process. The process should resume in 2021. Albania is also currently working alongside the International Monetary Fund (IMF) to develop new models for VAT, PIT and CIT.

#### Tax expenditure reporting

Tax expenditure was identified in the CO 2018 as an area in need of reform for the WB6 economies. Since then, only Albania has started producing a regular and systematic tax expenditure report, although North Macedonia plans to do so in 2021.

In 2019, Albania instigated its first regular and systematic tax expenditure report. This report should be published every two years, with the next report expected in 2021. Previously, a limited set of basic tax expenditure information was published alongside the annual budget, but in an aggregated form. The information included in the report is published in the official website of the Ministry of Finance and Economy. Furthermore, the expenditure and their accounting are audited by the State Audit every year. The State Audit report is sent for approval to the Parliament, along with the Report of Budget Execution that is prepared by the Ministry of Finance and Economy.

The introduction of a regular tax expenditure report in Albania should help it to efficiently manage its newly founded set of investment incentives and other tax expenditures. This reform is welcomed and will bring Albania's public finance management system closer to international best practice.

## Tax administration (Sub-dimension 4.2)

Sound tax policies and clearly drafted legislation are not enough to guarantee competitive tax systems. The consistent and transparent implementation of tax policies and legislation through effective administration must also be a top priority for governments. Maximising tax compliance and revenue collection is not manageable without an efficient administration. Indeed, administrative capacities are part of the calculation when determining the optimal tax mix for an economy and are therefore a cornerstone of sound tax policies. From a business perspective, an efficient tax administration is important as it limits the costs of complying with tax obligations. The tax administration sub-dimension assesses the efficiency of the tax administration in the WB6 economies through five qualitative indicators: 1) functions and organisation; 2) compliance assessment and risk management; 3) independence and transparency; 4) tax filing and payment procedures; and 5) taxpayer services. Scoring the economies from 0 to 5 against these indicators can help to understand the degree to which they are building effective tax administrations.

In general, the WB6 economies have made significant efforts to strengthen their tax administrations, with the average score increasing from 2.4 in 2018 to 3.3 in 2021 (Table 7.3). Strengthening their tax administrations helps them to maintain low direct tax rates. There have been significant improvements in taxpayer services, tax filing and independence and transparency but the scores have not changed for compliance assessment and functions and organisation.

**Table 7.3. Scores for Sub-dimension 4.2: Tax administration**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 4.2: Tax administration	Functions and organisation	3.0	1.5	4.0	3.0	3.0	5.0	3.3
	Compliance assessment and risk management	3.0	3.5	4.0	3.9	3.0	3.5	3.5
	Independence and transparency	0.5	0.0	4.0	3.0	3.0	2.5	2.2
	Tax filing and payment procedures	3.0	3.3	4.0	3.3	4.0	3.5	3.5
	Taxpayer services	4.0	3.8	4.0	4.5	4.0	5.0	4.2
<b>Sub-dimension average score:</b>		2.7	2.4	4.0	3.5	3.4	3.9	3.3

### ***Functions and organisation of the tax administration have changed little overall***

The organisational structure of tax administrations is a crucial component of operational efficiency and effectiveness. One of the key factors behind an efficient tax administration is a unified administrative body which covers all taxes and all core tax administration functions.

The WB6 economies' performance in the functions and organisation indicator has been mixed. Since the 2018 assessment, Bosnia and Herzegovina, Kosovo, and Serbia have improved their score and Albania, North Macedonia and Montenegro have scored worse, leaving the average for the region unchanged at 3.3. Serbia is the best-scoring economy, with a score of 5.0.

All the WB6 economies except for Bosnia and Herzegovina have a unified tax administration body. Due to its specific political structure, Bosnia and Herzegovina's tax administration is divided, with the entities (FBiH and RS) responsible for all direct taxes, while the top level administration is responsible for indirect taxes. The other WB6 economies follow OECD good practice and have a unified body that covers all taxes and all the core tax administration functions. In all the economies, the tax administration's organisation follows a mix of a taxpayer and a functions approach. This means that its internal organisation mostly follows the different functions of a tax administration (audit, tax collection, taxpayer services, etc.), but there are also divisions targeted at specific taxpayer groups. All the WB6 tax administration bodies have a division for large taxpayers while Kosovo also has a division for SMEs. All the economies provide regular training for their tax administration officials.

### ***Tax compliance assessments follow a risk-based approach***

Being able to assess where the greatest compliance risks lie is a great tool for the efficient monitoring of tax compliance. Risk-based selection is a central part of modern compliance programmes as it allows tax administrations to make effective trade-off decisions and make the most efficient use of their scarce resources. Audit programmes should be regularly assessed and reported to ensure that operations are transparent to the wider public.

The high average score for the compliance assessment and risk management indicator (3.5) has not changed since the last report. All the economies received a score of 3 or more for this indicator. This high score is mainly due to the relatively widespread use of risk management in their tax compliance functions.

All the WB6 economies follow a risk-based approach to compliance assessment, which means that they focus on taxpayers showing certain abnormalities against a pre-determined set of risk criteria. Albania uses a monthly audit plan, 70% of which is based on recommendations from an IT risk module system. The remaining 30% is based on proposals from regional directorates. In the Federation of Bosnia and Herzegovina, an annual audit plan is developed, using a broad set of 19 criteria. In North Macedonia, the tax administration prepares a monthly tax audit plan, based on three methods: electronic risk assessment, analysis of individual cases and random audit based on a certain sample of risk activity. Some, such as Kosovo, have set up special risk divisions to manage this function. All the WB6 economies carry out similar types of audits: comprehensive audits (covering all types of tax), fiscal visits (focused on a single type of tax and fiscal year) and field verifications (focused on issues such as registration of taxpayers or use of non-cash register for businesses).

### ***Tax administrations are increasingly transparent but still lack independence***

Independence and transparency are crucial features of an efficient and well-developed tax administration. They allow the tax administration, and by extension the tax system as a whole, to be seen as a legitimate public authority with the necessary protections in place when collecting money from taxpayers. The tax system needs to ensure transparency to prevent tax administrations from being influenced by political or financial actors who may seek to evade established tax laws or take advantage of it. Implementing comprehensive policies to establish independent and transparent tax administrations represents a strong commitment by governments that they will maintain the integrity of the tax collection process.

In the last assessment, the WB6 economies scored an average of 0.3 in the independence and transparency indicator. This low score highlighted a lack of policies to ensure that their tax administrations act in an independent and transparent manner, leaving significant scope for reform. In this assessment the average score has risen to 2.2 and Kosovo is the best-scoring economy with a score of 4.0.

The establishment of independent tax administration management boards has been uneven across the region. The Montenegro Tax Administration (MTA) became an independent administrative body in 2019 (it was previously integrated into the Ministry of Finance). The head of the MTA is now nominated for a five-year period and reports to the Minister of Finance. In Serbia the Tax Administration Transformation Programme 2015-20 led to the development of an action plan for 2018-23 that foresees the creation of several permanent committees, including a committee on organisational transformation. Kosovo and North Macedonia have implemented policies to establish independent management boards for their tax administrations. In Albania and the FBiH, no steps have been taken to establish independent management boards.

All the tax administrations of the WB6 economies have rules to deal with staff abusing tax collection powers. In Bosnia and Herzegovina, North Macedonia and Serbia, employees of the tax administration are subject to disciplinary measures in cases of abuse of power. In Albania, staff abusing tax collection powers are subject to the criminal code and the law on tax procedures. In, Kosovo and Montenegro, staff have a code of ethics. All the economies also provide a protection framework for whistle-blowers.

The use of e-filing is widespread across the region

Compliance with tax obligations may be burdensome and require businesses and individuals to access a certain number of resources. This can mean high costs for taxpayers, which might be a burden on low-earners and SMEs. For that reason, streamlining and simplifying tax compliance procedures should be a central objective for tax administrations.

The WB6 economies report that filing and paying taxes is a reasonably quick and relatively simple process. Their average score for the tax filing and payment procedures indicator is 3.5, an increase from the average of 2.8 in 2018. All the economies make widespread use of e-filing. In Albania, e-filing is mandatory for all taxes. In Bosnia and Herzegovina, Kosovo, and North Macedonia e-filing is available for all major taxes but only mandatory for VAT and excise duties. In Montenegro, it is mandatory for CIT and PIT and available for all major taxes, but only to taxpayers who have purchased a EUR 110 digital certificate. In Serbia, e-filing is only mandatory for taxes paid by businesses, while individuals may choose between electronic and paper forms.

### ***WB6 economies have improved their taxpayer services since the last report***

Taxpayers need a certain level of assistance and information to meet their tax obligations and achieve voluntary compliance. Taxpayer services play a crucial role in meeting these needs. These services can take different forms, and typically include responding to in-person and telephones enquiries, providing general information, and online filing and payment systems. Tax administrations should also use surveys to gauge taxpayer satisfaction, and guarantee an easy and accessible service to taxpayers. Governments may also provide taxpayer ombudsmen.

The WB6 economies have improved their performance in the taxpayer services indicator from an average score of 1.5 in 2018 to 4.2 in 2021. All the economies obtained high scores for this indicator, ranging from 3.75 for Bosnia and Herzegovina to 5 for Serbia. Various services are at the public's disposal in all the economies, including online access to information, electronic communications with taxpayer and in-person inquiries. Each of the WB6 economies, except Albania, implements customer segmentation models to better meet taxpayer needs. In the 2018 assessment, only Albania and Kosovo had taxpayer ombudsmen. Since then, Serbia, North Macedonia and the FBiH have nominated taxpayer ombudsmen, partly explaining the increase in their scores since the last report. Kosovo, the only economy that did not conduct surveys of taxpayer's satisfaction in the last report is now conducting such surveys.

### ***The way forward for tax administration***

- **Continue efforts to strengthen tax administrations**, which would bring more taxpayers into the tax system and broaden the tax base. It could also improve tax certainty, lower the costs of compliance and enforcement, increase tax revenues, and make the tax system more efficient.
- **Develop strong procedural safeguards to guarantee the independence of tax administrations across the region.** An independent tax administration board is a crucial aspect of sound tax policy management and the WB6 economies would benefit from implementing procedural safeguards that protect these boards' independence.
- **Streamline taxpayer services and tax filing procedures further to increase tax compliance.** The WB6 economies have carried out significant efforts in this area since the last assessment and are encouraged to continue in that direction.

### International co-operation (Sub-dimension 4.3)

International and regional co-operation on tax policy is vital for addressing tax evasion and avoidance and ensuring that profits are taxed in the economies where the profit-generating activities are performed and value is created. A strong international taxation framework allows economies to protect their domestic tax base from erosion due to tax avoidance and evasion. Regional co-operation over tax matters also allows economies to learn from each other's best practices. The international tax co-operation sub-dimension considers whether the tax codes of the WB6 economies include key international tax rules. It examines whether the economies participate in international taxation frameworks and co-operate with other economies, particularly within the region. It also considers recent developments on digital taxation, in particular the OECD's Tax Challenges arising from digitalisation and its expected global minimum tax. The information in this sub-dimension is not scored, but analysed using descriptive information.

#### ***Involvement with international tax initiatives and alignment with international tax trends are increasing***

Base erosion and profit shifting arises when businesses can exploit gaps and mismatches between different tax systems. BEPS negatively affects tax revenues, the efficiency of tax systems and their ability to create a level playing field for all firms. While BEPS is a worldwide concern, it is of particular importance to developing and emerging economies whose tax legislation and administrations may struggle with the complexities of modern business. Aligning with international standards ensures a coherent and efficient application of the tax system, eliminating tax uncertainty.

The CO 2018 assessment identified co-operation with the international tax community and the implementation of international best practices as areas where the WB6 economies could strengthen their efforts. At that time, no WB6 economy had joined the Inclusive Framework on Base Erosion and Profit Shifting or the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS. The assessment also highlighted the lack of initiatives in areas such as administrative co-operation and exchange of information.

Since the last assessment, the WB6 economies have made significant efforts to align their tax systems with international best practices. North Macedonia and Serbia joined the Inclusive Framework on BEPS in 2018, followed by Albania, Bosnia and Herzegovina, and Montenegro in 2019. This led to a series of initiatives to tackle harmful tax practices (Action 5), prevention of tax treaty abuse (Action 6), country-by-country reporting (Action 13) and mutual agreement procedures (Action 14). Only Kosovo has not joined the framework but it has indicated use of the OECD Model Tax Convention as a basis for its double-tax treaties, which informally, leads to the implementation of some BEPS minimum standards. Albania, Bosnia and Herzegovina, North Macedonia and Serbia have also implemented the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS since the last assessment.

The OECD Global Forum on Transparency and Exchange of Information for Tax Purposes has developed two different international standards for the exchange of information for tax purposes: exchange of information upon request (EOIR) and automatic exchange of information (AEOI). Economies are evaluated for compliance with the EOIR standard through peer review. For the purpose of AEOI, a common reporting standard has been developed that is incorporated into the domestic law of participating jurisdictions. The Convention on Mutual Administrative Assistance in Tax Matters is also an important part of recent initiatives of the international tax community with regard to exchange of information. In 2018, only Albania had signed the Convention on Mutual Administrative Assistance in Tax Matters and the Multilateral Competent Authority Agreement for AEOI. Albania and North Macedonia had also been subject to peer review for EOIR, performed by the assessment team of the Global Forum, and both economies were found to be largely compliant. Since the 2018 assessment, there have been several notable initiatives. Bosnia and Herzegovina, North Macedonia, Montenegro and Serbia have joined the Convention on Mutual

Administrative Assistance in Tax Matters. Bosnia and Herzegovina, Montenegro and Serbia have also been subject to or have scheduled a peer review for EOIR by the OECD Global Forum. Finally, Montenegro has signed the Multilateral Competent Authority Agreement for AEOI.

In theory, there are two models for the taxation of cross-border income: 1) worldwide taxation systems, which tax corporations on their worldwide income; and 2) territorial tax systems, which only tax income that has its source in the economy. In recent decades, most OECD countries have adopted territorial tax systems although in practice most apply a combination of both systems. Pure territorial tax systems are rare as most OECD countries have adopted some form of exemption. OECD members with territorial tax systems commonly exempt most active earnings from tax if they were repatriated from subsidiaries incorporated in host countries.

The WB6 economies all have pure worldwide tax systems, in which income earned abroad by resident corporations is integrated into the domestic CIT tax base. Such systems create a heavy administrative burden for the economies implementing them. In practice, income earned abroad will have been taxed in the host economy where the income has its source under that economy's CIT (or via withholding tax for payments made directly to corporations with their tax residence in the region). The WB6 tax administrations then have to assess the difference between taxes paid abroad and the remaining domestic tax liability (if the host economy has a lower tax rate), granting a tax credit as a relief against double taxation. This administrative burden has to be balanced against potential revenue from foreign sourced income to assess whether a worldwide taxation system offers a net benefit. In practice, potential revenues are limited by the low CIT rates across the region, meaning that taxes paid at source on foreign income are very likely to be higher than those payable in the WB6 economies.

As a result, the WB6 economies are unlikely to raise enough revenue from the taxation of foreign-sourced income to justify the high administrative costs. Small open economies like the WB6 economies typically have territorial tax systems. The WB6 economies should conduct a cost-benefit analysis of the merits of their worldwide taxation systems. They could also contemplate introducing additional tax base protection measures, such as limiting of how much expense incurred to earn foreign-source income is deductible from the domestic CIT base.

### ***Digital taxation is improving but can still be strengthened***

Digital taxation has been a subject of growing importance in recent years for the international tax community. Tax systems have had to adapt in order to capture these new and growing forms of revenues, which raise challenges from a tax perspective. The WB6 economies have engaged in some initiatives in this area but could strengthen their efforts.

Only Albania implements international VAT and goods and services tax (GST) guidelines on cross-border digital services, which it has done since 2014. Although it is the only economy formally implementing these guidelines, four of the remaining five economies levy VAT on cross-border digital services using a logic similar to the destination principle (i.e. levying tax in the place where the service recipient is established, the cornerstone of international VAT/GST guidelines). Only Kosovo currently levies VAT on cross-border digital services in the place where the service provider is established. However, WB6 economies would still benefit from the implementation of international VAT/GST guidelines.

Only two of the WB6 economies integrate revenues from digital platforms into the PIT tax base; North Macedonia and Montenegro levy PIT on these revenues at their default flat tax rate. Some of the other economies are currently assessing possible actions in this area. Albania's tax administration has requested from Airbnb the list of individuals renting out properties through their platform. Once this information is obtained, it will be cross referenced with these individuals' tax returns, which should allow this income to be included in the PIT tax base in the future. The Strategic Risk Department of Serbia's tax administration carried out an analysis of tax compliance on this subject. It found that the reporting of revenues from digital

platforms was weak and that there was a low rate of tax compliance among individual taxpayers. As a result, Serbia's Tax Administration requested data from commercial banks on payments received by individuals from digital platforms. It is currently developing a risk response plan to audit these taxpayers.

The OECD's Tax Challenges Arising from Digitalisation project, especially the global minimum tax under its Pillar 2, could have a substantial impact on the WB6 economies' tax systems if consensus is reached among members of the Inclusive Framework. The GLOBE proposal intends to define a minimum taxation rate for corporate profits. Even though the final rate is subject to ongoing discussions, there is a high risk that it will be set above the current CIT rates in the region (as discussed above, the average CIT rate in the WB6 in 2020 was 11.5%, ranging from 9% to 15%). The risk is particularly acute for Montenegro (9% rate), as well as for Kosovo, North Macedonia, and Bosnia and Herzegovina (10% rate). If the minimum tax rate was set above these levels, economies would face the choice of either raising their CIT rate to the minimum tax, or risk forgoing domestically sourced tax revenues to foreign jurisdictions. This does not mean the remaining WB6 economies with a higher CIT rate would be spared. Albania and Serbia (15% CIT rate) would most probably be still affected by the GLOBE proposal.

Even if any minimum tax is set below their statutory CIT rate, it could still have an impact on their taxation of corporate profits. As discussed above, most of the WB6 economies offer generous CIT investment incentives, which may lower the effective rates on corporate profits to a level below the global minimum tax. The economies would then be faced with a similar choice, of either redesigning their investment incentives to raise their effective rates to a level above the minimum tax or risk forgoing domestically sourced tax revenues to foreign jurisdictions. They are advised to carefully assess their position on this issue and draft an action plan in response.

### ***Regional co-operation and co-ordination are modest***

The WB6 economies all carry out some form of regional co-operation and co-ordination. Albania and Kosovo work together to strengthen the functioning of their VAT and to provide training to their staff. Montenegro has concluded agreements on mutual co-operation with Bosnia and Herzegovina, Croatia, Serbia and Slovenia to exchange information and provide assistance in the detection of VAT fraud and avoidance. North Macedonia exchanges information with Albania, Bosnia and Herzegovina, Kosovo and Serbia.

The WB6 economies would benefit from greater regional tax co-ordination and tax co-operation. The intensification of co-operation efforts will help them to tackle tax avoidance and evasion in a coherent manner across the region. As the economies all face similar tax challenges, they would gain mutual benefits from intensifying their information sharing and learning together.

### ***The way forward for international co-operation***

- **Define an action plan in case of international consensus on a global minimum tax.** This could greatly affect the taxation of corporate profits in the region; the economies should define their position on this issue.
- **Continue to engage with the international tax community and implement international best practice.** The WB6 economies' strong engagement to align their system with recent international tax trends should be continued. Among other elements, automatic exchange of information could be an area of focus for future initiatives.
- **Carry out a cost-benefit analysis on the merits of retaining a worldwide taxation system for resident corporations.** Such systems are uncommon in the OECD, particularly for small open economies like the WB6. Their worldwide taxation systems may, among other issues, be incurring high administrative costs without raising significant additional revenue.

- **Foster regional co-operation and co-ordination on common tax issues within the region.** The WB6 economies face similar challenges in many areas such as tax compliance, training of tax administration staff and the exchange of information. These areas would greatly benefit from a co-ordinated regional approach.

## Conclusion

Since the 2018 Competitiveness Outlook, the WB6 economies have been strengthening their general taxation framework and tax administration. However, from a domestic and international tax policy standpoint, they continue to face major challenges which have only been deepened by the global pandemic. Taxes are levied on narrow bases, particularly VAT and CIT. SSCs are levied at high rates, imposing a heavy tax burden on labour income and restricting the use of PIT to reduce inequality. All the WB6 economies need to develop their tax policy measurement tools, such as enhanced tax revenue statistics, efficient tax rate analysis and strengthened tax expenditure reporting. They should also keep strengthening their tax administrations to achieve efficient management practices and transparent institutions. They will need to reconsider their wide variety of corporate tax benefits and take action to avoid falling victim to a tax race to the bottom. Instead, they should strengthen their tax co-operation, both within the region and more globally.

## Competition policy (Dimension 5)

---

By contributing to well-functioning markets and competitive neutrality between private firms and state-owned enterprises, as well as between domestic and foreign companies, competition policy drives productivity, encourages innovation and supports economic growth. This chapter assesses the competition policy settings, processes and institutions in the six Western Balkan (WB6) economies through an analysis of five key policy areas, four of which are qualitative, while the fifth is quantitative. The first policy area, scope of action, assesses to what degree competition authorities are invested by law with the powers to investigate and sanction anti-competitive practices. The second area, anti-competitive behaviour, reviews policies to prevent and prosecute exclusionary vertical and horizontal agreements and anti-competitive mergers. The third, probity of investigation, examines the independence and accountability of institutions that enforce competition law and the fairness of their procedures. The fourth, advocacy, looks at further actions to promote a competitive environment. A new fifth policy area, implementation, quantifies the actual enforcement and advocacy activity by competition authorities in the following major spheres of action: cartels and abuse of dominance cases, merger reviews, and advocacy initiatives. The chapter includes suggestions for enhancing policies to foster the competitiveness of the WB6 economies.

---

## Key findings

- **The legal and institutional competition frameworks of the WB6 economies are largely aligned with best international practices**, in particular with European Union (EU) competition rules. National competition authorities are independent bodies and invested by law with appropriate powers to confirm and sanction competition infringements.
- **The six competition authorities are committed to enforcing competition rules and advocate against competitive restrictions in laws and regulations**. However, they lack the necessary financial and professional resources to perform their wide range of duties in the most effective way.
- **In general, implementation of competition decisions is still insufficient, particularly for cartels**. Albania and Serbia lead the way in strengthening their enforcement records, and there are promising signs in the other jurisdictions, but the current number of decisions, and most importantly the amount of sanctions, is still limited.
- **Sanctions for infringers are not high enough to deter firms from engaging in anti-competitive conduct**. Moreover, the fight against cartels requires competition authorities to make full use of their investigative powers, including unannounced inspections of premises. Some competition authorities have not yet carried out inspections, while others have started very recently.
- **All WB6 competition authorities have engaged in competition advocacy**, which is a necessary complement to competition enforcement to avoid legal constraints and promote a competition culture. Most competition authorities in the region have sent formal opinions to policy makers to urge them to remove competition restrictions in laws and regulation. All regularly offer training activities and events to increase competition awareness among citizens, firms and institutions, and to explain the benefits of competition.

## Comparison with the 2018 assessment

There have been few changes to the scores for the competition policy dimension since the 2018 Competitiveness Outlook (CO) assessment (Figure 8.1).

The remit of competition authorities covers two pillars: enforcement and advocacy. Competition enforcement in the WB6 economies is still limited, despite an increase in the score for infringement decisions in Albania and Serbia, and some promising recent signs in other competition authorities. WB6 competition authorities are endeavouring to progress on the second pillar of competition advocacy to urge policy makers and regulators to remove competition restrictions and ensure a level playing field for firms.

Competition authorities are still limited by professional and financial resources. Officials are usually skilled and motivated, but their number is insufficient to perform all the activities of a well-functioning competition authority.

**Figure 8.1. Overall scores for the qualitative competition policy dimension (2018 and 2021)**

Note: In the present edition of the Competitiveness Outlook, a new quantitative policy area, implementation, has been introduced (see below). Given that implementation was not addressed in 2018, no comparison is possible as part of this assessment.

## Implementation of the Competitiveness Outlook 2018 recommendations

Progress on implementing the policy recommendations made in the Competitiveness Outlook 2018 has been modest overall (Table 8.1), although there are differences in implementation across economies. Moderate advances have been made in providing stakeholders with guidance on competition authorities' practices and in removing or preventing restrictions to competition in laws and regulations. There have been limited improvements in the competition law enforcement record and in the amount of financial and human resources available to competition authorities.

**Table 8.1. Implementation of the CO 2018 policy recommendations: Competition policy**

Competitiveness Outlook 2021		
2018 policy recommendations	Main developments during the assessment period	Regional progress status
Improve the competition law enforcement record further	<ul style="list-style-type: none"> <li>Competition authorities still need to strengthen their enforcement record, focusing especially on cartels, which are the most serious and harmful competition infringement.</li> </ul>	Limited
Put in place guidance for stakeholders on competition authorities' enforcement practices	<ul style="list-style-type: none"> <li>Most competition authorities have adopted and published some regulations and guidelines, for example regarding the investigative procedure, the procedure for concentrations of undertakings, the assessment of horizontal and vertical agreements, and the calculation of fines.</li> </ul>	Moderate
Ensure that competition authorities have sufficient resources	<ul style="list-style-type: none"> <li>Competition authorities still lack adequate financial and human resources to express their full potential and duly implement their enforcement powers.</li> </ul>	Limited
Give more weight to competition authorities' recommendations	<ul style="list-style-type: none"> <li>Although most competition authorities are still struggling to establish themselves as influential institutions, they are largely committed to removing or preventing restrictions to competition in laws and regulations, as well as to increasing public awareness and understanding of the benefits of competition.</li> </ul>	Moderate

## Introduction

Competition policy is at the top of the agenda in most jurisdictions in the world as it provides firms with the right conditions and incentives to perform efficiently and to innovate, which ultimately benefits consumers

and the economy. A competitive economic environment helps boost economic growth and increase living standards, thereby also helping to reduce inequality. Competition policy stimulates competitiveness by giving businesses incentives to lower their costs and reduce their prices, to better respond to customers' needs and to be more innovative. Furthermore, it motivates firms to supply internationally competitive products and services and to upgrade in global value chains.

Competition authorities tackle unlawful agreements between competitors to raise prices, as well as abusive practices by dominant firms to exclude smaller, innovative or more efficient companies from the market. At the same time, competition authorities promote a level playing field in open markets by advocating for the removal of restrictions in laws and regulations, and by prohibiting restrictive mergers.

For economies of limited size such as the WB6 economies, competition policy also plays a key role in fostering access to domestic markets by foreign and international firms, leading to increased allocative efficiency. By contributing to well-functioning markets and competitive neutrality between private firms and state-owned enterprises, as well as between domestic and foreign companies, competition policy drives productivity, encourages innovation and supports economic growth (Ospina, 2010<sup>[1]</sup>; Gutmann, 2014<sup>[2]</sup>).

Competition policy has significant interplay with other policy areas. Level playing fields and transparency attract international investors and help reduce unnecessary barriers to trade in laws and regulations. The fight against bid rigging in public procurement also contributes to corruption prevention.

In light of the above, this chapter has links to the following chapters:

- **Chapter 4. Investment policy and promotion** will benefit from the competent and predictable implementation of competition rules that apply to foreign and domestic investors alike. Competition laws that are aligned with international standards and applied according to best practices will create legal security that benefits investment decisions.
- **Chapter 5. Trade policy** and facilitation and competition policy can and should be mutually supportive. In general, trade and competition policies share the ultimate objective of achieving the efficient allocation of resources and promoting economic growth. In particular, trade liberalisation can generate competitive pressure by encouraging more domestic and foreign direct investment (Bartók and Miroudot, 2008<sup>[3]</sup>). Competitive markets also create opportunities for trade and investment and enhance the gains from trade and investment liberalisation. However, potential tensions or inconsistencies may arise when markets are not contestable, when there are barriers to entry or exit, and when important sunk costs or other market imperfections prevent foreign products or companies from reaching domestic markets.
- **Chapter 9. State-owned enterprises.** Competition policy can help ensure that state-owned enterprises (SOEs) compete on a level playing field with private companies, thus establishing a robust competition environment. Competition authorities can promote competitive neutrality by discouraging the public authority from granting selective aid to SOEs and resisting political pressure to adopt a more lenient approach when investigating SOE conduct.
- **Chapter 12. Science, technology and innovation** are facilitated by competitive environments. However, the relationship is not simple as the empirical evidence shows that moderately competitive markets innovate the most, while both monopoly and highly competitive markets show lower levels of innovation. Competition policy focuses not on making moderately competitive markets hyper-competitive, but on introducing or strengthening competition in markets where it does not work well. The inference is therefore that competition policy serves to promote innovation (Aghion, 2005<sup>[4]</sup>).
- **Chapter 19. Anti-corruption policy** and competition both focus to a large extent on public procurement markets. Competitive bidding in public procurement markets will be encouraged if the risk of corruption is low. Research generally finds an inverse relationship between competition and corruption: low levels of competition correlate with high levels of corruption (OECD, 2010<sup>[5]</sup>). Cartels

favour corruption and benefit from co-conspirators among public procurement officials. A successful anti-corruption policy will also lead to more competitive and cost-effective tender results.

## Assessment framework

### Structure

This edition of the Competitiveness Outlook is based on the same four qualitative policy areas used in the past editions and a new quantitative policy area on implementation.

The four qualitative policy areas explored in the past editions of the Competitiveness Outlook focus on the foundations of a competition policy regime: scope of action, anti-competitive behaviour, probity of investigation and advocacy. They are meant to verify whether the *de jure* characteristics of the WB6 economies are appropriate to support well-functioning and effective competition policy.

The questionnaire used for the past edition (see below) has been maintained to enable the monitoring over time of evolutions in the key policy areas:

1. **Policy area 5.1: Scope of action** explores whether the competition authority is invested by law with the power to investigate and sanction anti-competitive practices, as well as to investigate, remedy or block anti-competitive mergers. It also assesses whether the authority's budget and number of staff are adequate.
2. **Policy area 5.2: Anti-competitive behaviour** focuses on how competition policy prevents and prosecutes exclusionary vertical and horizontal agreements and anti-competitive mergers. It assesses which factors are considered when ascertaining if anti-competitive practices have taken place.
3. **Policy area 5.3: Probity of investigation** focuses on the independence and accountability of the institutions that enforce competition law. It also addresses the transparency and fairness of their procedures.
4. **Policy area 5.4: Advocacy** focuses on activities other than enforcement of competition law used to further promote a competitive environment. It explores whether market studies and reviews of new laws and regulations are conducted to highlight and prevent a distortionary impact on competition.

Unlike the other chapters, where indicators are allocated a score from one to five, the assessment of the four qualitative policy areas in the competition policy chapter is based on yes/no (coded as 1/0) answers to the 71 questions in the questionnaire listed in Annex 8.A. Competition Questionnaire. Where a response to a question is yes (coded as 1), this is referred to as an adopted criterion. Each of the five policy areas has a different number of possible criteria that can be stated as having been adopted (Table 8.2). Each policy area is assessed through data collected from the questionnaire indicators and by measuring the number of criteria adopted.

### **Key methodological changes to the assessment framework**

As discussed, the analytical framework for Competition Policy for this edition of the Competitiveness Outlook is broader than the framework applied in 2018, with a new policy area added. The new policy area investigates the actual implementation of competition rules by competition authorities in terms of infringement decisions and advocacy initiatives. The complementary set of questions enables a quantitative assessment of the extent to which competition authorities have been able to translate legal and institutional competition frameworks into actual enforcement and advocacy activity.

The new set of quantitative data has enabled meaningful comparisons and benchmarking with other jurisdictions. The questionnaire mirrors the data collected by the OECD through the General Competition Statistics (CompStats) database, which scrutinises competition agencies in 56 OECD and non-OECD jurisdictions (Box 8.1). The resulting database enables a comparison of the activity of competition authorities with similar characteristics and at an equivalent stage of development to assess the effectiveness of their programmes of work and their tools, and to monitor improvements. Over the years it will also be possible to use the evidence from past scrutiny to assess the development of enforcement and advocacy records, and it will be easier to assess the effectiveness of strategies and prioritisation choices. Competition agencies could use this tool to enhance their transparency and accountability policies.

### Box 8.1. CompStats: The OECD's General Competition Statistics database

In 2018 the OECD launched an initiative to develop a database of general statistics on competition agencies, including data on enforcement and information on advocacy initiatives. The database currently covers the period 2015-19 and data will be collected annually in the future.

The OECD publication OECD Competition Trends presents unique insights into global competition trends based on data analysis from the CompStats database. The 2021 edition provides an update on the competition enforcement trends for the competition authorities of 56 jurisdictions (OECD, 2021<sup>[6]</sup>).

The 56 jurisdictions in question include 37 OECD countries (36 OECD countries and the European Union) and 19 non-OECD economies with remarkable geographic diversity: Argentina, Brazil, Canada, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Mexico, Peru, United States (Americas); Australia, Chinese Taipei, India, Indonesia, Japan, Korea, New Zealand (Asia-Pacific); Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, European Union, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Romania, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, United Kingdom (Europe); Egypt, Israel, Kazakhstan, Russian Federation, South Africa, Turkey, Ukraine (Other).

The publication supports informed policy making and contributes to improving competition law and policy around the world by providing multi-year data on a large number of economic and legal indicators, including the number of anti-trust decisions, the sanctions imposed, the unannounced inspections performed, and activity on merger review and competition advocacy.

Source: (OECD, 2021<sup>[6]</sup>), *OECD Competition Trends 2021, Volume I: Global Competition Enforcement Update 2015-19*, <http://www.oecd.org/daf/competition/oecd-competition-trends-2021-vol1.pdf>.

## Competition policy performance and context in the WB6

The legislative frameworks for competition in the WB6 economies are in line with international good practice. Competition rules reflect EU provisions on restrictive agreements and the abuse of dominant position (Articles 101 and 102 of the Treaty on the Functioning of the European Union) and include the *ex ante* control of mergers, following the principles of the EU Merger Regulation.

The competition authorities of the six jurisdictions have appropriate powers to investigate and to sanction possible anti-trust infringements, such as restrictive horizontal and vertical agreements and exclusionary or exploitative practices by dominant firms. Moreover, their institutional setting appears good in terms of independence, accountability and procedural fairness. However, they lack adequate financial and human resources to express their full potential and implement their enforcement powers. Among the WB6, Albania is the closest to full alignment, followed by Serbia and North Macedonia. Albania, Montenegro and Serbia are fully aligned regarding the scope of action. The only economies that are fully aligned with anti-competitive behaviour and probity of investigation are Albania and Serbia (Figure 8.2).

**Figure 8.2. Competition policy scores (2021)**

Number of adopted criteria

The actual implementation of the rules through competition enforcement is generally poor. The competition authorities particularly need to strengthen their enforcement record, focusing especially on cartels as they are the most serious and harmful competition infringement. Cartel investigations require valid detection tools and the wide use of unannounced inspections. Albania and Serbia are leading the way in this area, with recent promising signs in the other jurisdictions, but the number of infringement decisions and related sanctions are still low in the region. Severe sanctions are crucial to ensure deterrence and to enhance the effectiveness of other key competition tools, such as leniency programmes and settlements. Targeting bid rigging in public procurement could be a promising area for expanding competition authorities' activity regarding cartels, particularly given the increased role played by public authorities in response to the COVID-19 crisis.

The competition authorities of the WB6 economies have performed well in the fourth policy area, competition advocacy. In particular, most are committed to removing or preventing restrictions to competition in laws and regulations, as well as to increasing public awareness and understanding of the benefits of competition.

### Scope of action (Policy area 5.1)

Proving competition infringements and drafting solid decisions requires in-depth and thorough investigations, particularly for cartels. Competition authorities should be able to collect evidence of unlawful contact between the parties and have a clear understanding of the characteristics and dynamics of the markets at stake, as well as of the effects of the alleged practices. Competition authorities are therefore usually equipped with strong powers to conduct unannounced inspections, request information and hold hearings. At the end of the investigation they need to be able to impose severe sanctions to discourage anti-competitive conduct by others. Deterrence is more effective if private enforcement enables individuals, firms and public entities harmed by an anti-trust infringement to seek compensation before the civil courts.

Competition provisions should apply to any undertakings that engage in economic activities, be they public or private, domestic or foreign, in order to guarantee competitive neutrality and equal opportunities to all market players. Competition authorities should also be able to rely on adequate and stable professional and financial resources to perform their duties.

The scope of action policy area addresses these issues by exploring the competencies of the competition authorities in terms of the scope of application of competition rules (public/private, domestic/foreign firms); their financial and human resources; their statutory powers to investigate and to sanction/remedy competition law infringements and anti-competitive mergers; and the provisions allowing private

enforcement, i.e. civil action by individuals, firms or groups of consumers seeking compensation for financial damage incurred as a result of competition law violations.

Albania, Montenegro and Serbia achieved full alignment for the scope of action policy area. Moreover, all WB6 economies except Bosnia and Herzegovina are fully aligned with the competences and private enforcement policy areas (Figure 8.3).

**Figure 8.3. Degree of alignment for scope of action (Policy area 5.1)**

Number of adopted criteria

***Powers to investigate and sanction are adequate, but professional and financial resources are limited***

The domestic competition laws of the WB6 economies ensure competitive neutrality, in that the **competences** of the competition authorities encompass any domestic or foreign undertakings (and associations of undertakings) that have or may influence domestic markets, including public undertakings and undertakings entrusted with services of general economic interest.

Competition authorities have appropriate powers to investigate and powers to sanction anti-trust infringements, as well as to review mergers and acquisitions. During an investigation, all competition authorities in the WB6 economies can compel investigated firms and third parties to provide relevant information and can perform unannounced inspections of their premises. The final decision is based on a thorough scrutiny of the collected evidence, which may include an economic analysis of the competitive effects. If anti-trust infringements are found the authorities can impose cease and desist orders and remedies and sanctions on the firms concerned. In particular, the authorities have the power to directly impose significant fines, which can be up to 10% of the aggregate turnover of the undertaking, in line with EU provisions. The only exception is Montenegro, where investigations fall under the remit of the Agency for Protection of Competition and the imposition of fines under the Misdemeanour Courts, which can conduct the relevant procedure and determine the amount of the fines.

The competition authorities can also adopt interim measures *ex officio* and based on preliminary evidence (*prima facie*) if the alleged competition breach poses a risk of serious and irreparable damage. They may also order behavioural and structural measures to eliminate harmful effects on competition, or accept and make binding commitments offered by the parties to address the competition concerns.

All domestic legal regimes also provide for leniency programmes, which grant total or partial immunity from sanctions to firms that report the existence of the agreement and submit appropriate evidence to the competition authority.

With the exception of Bosnia and Herzegovina, all WB6 competition authorities can enter into settlements with the parties under investigation for alleged anti-trust infringements, and thus close the investigations.

Regarding merger reviews, domestic competition laws provide for *ex ante* control, following the principles of the EU Merger Regulation. The competition authorities must prohibit concentrations that significantly restrict effective competition, in particular as a result of the creation or strengthening of a dominant position. They can authorise the transaction subject to structural and/or behavioural remedies – i.e. divestiture of assets and/or obligations to act or refrain from acting in a certain way – suitable to address the competition concerns.

The assessment of notified mergers must follow thorough scrutiny of the evidence, which includes an economic analysis of the restrictive effects and of possible efficiencies stemming from the concentration. For merger reviews, the competition authorities of the WB6 economies can compel merging firms and third parties to provide relevant information and may perform unannounced inspections on the premises of the parties.

To enforce competition law effectively, competition authorities need adequate financial and human resources, which is not the case for most WB6 competition authorities. According to the CompStats database, except for Albania and Serbia, the number of staff in WB6 competition authorities is lower than in other OECD and non-OECD economies (Figure 8.4). In 2019 the average total staff of the 15 competition authorities in small economies (with a population below 7.5 million) was 114, of whom 43 were working on competition (benchmark economies in Figure 8.4) (OECD, 2020<sup>[7]</sup>).

**Figure 8.4. Number of staff working on competition in WB6 competition authorities (2019)**

Note: The benchmark refers to the average of the 15 competition authorities in small economies that participated in the OECD CompStat database. See the Methodology and assessment process chapter for information on the Competitiveness Outlook assessment process.

Source: Information collected from WB6 authorities.

The budgets of competition authorities in the WB6 economies are extremely low compared to international averages. The competition authorities of Albania, Bosnia and Herzegovina, Kosovo, North Macedonia and Montenegro rely on annual budgets of between EUR 347 000 (North Macedonia) and EUR 820 000 (Montenegro), which is significantly below the average financial resources of the 15 competition authorities in small economies that participated in the OECD CompStats database (EUR 5.4 million in 2019). Only the Serbian competition authority approaches this figure (Figure 8.5).

The reasons behind the limited financial and human resources could include the low gross domestic product, the small size of the populations, the low cost of living and the young age of the institution. Nevertheless, a competition authority needs a minimum level of qualified officials to be able to fulfil its tasks, which include monitoring all sectors of the economy, conducting complex investigations, and analysing existing and draft legislation to advocate the removal of competition restrictions. Similarly, adequate economic resources are necessary to attract skilled officials and retain them over time. Many authorities are confronted with a high staff turnover, with many qualified officials trained by the authority

eventually recruited by the private sector. At the same time, effective enforcement increasingly requires the use of costly digital devices, which are often indispensable for collecting and analysing evidence. Italy has developed a way of achieving financial independence for its competition authority, which is worth considering (Box 8.2).

**Figure 8.5. Budget of WB6 competition authorities (2019)**

Million euros

Note: For Montenegro, the budget also covers the additional competence of the authority for state aid control. The benchmark refers to the average of the 15 competition authorities in small economies that participated in the OECD CompStats database. See the Methodology and assessment process chapter for information on the Competitiveness Outlook assessment process.

Source: Information collected from WB6 authorities

All WB6 economies except Bosnia and Herzegovina allow private enforcement, meaning that individuals, firms and consumers – either collectively or through consumer associations – can bring legal action to seek damages from firms that have committed anti-trust infringements.

### Box 8.2. Financial independence for the Italian competition authority

Until 2012, the financing of the Italian Competition Authority (AGCM) was based on two main sources: annual funding from the state and fees paid by companies subject to merger notification requirements.

Legislative Decree no. 1/2012 modified the AGCM's funding system, which is now based on mandatory contributions imposed on companies incorporated in Italy whose turnover exceeds a threshold of EUR 50 million. The revenues from these contributions replace all previous forms of funding. The level of contribution, originally fixed at 0.06 per thousand, has been gradually lowered by the AGCM to 0.055 per thousand. The authority's financial statements have to be approved by 30 April of the following year, and are subject to auditing by the Court of Auditors (OECD, 2014<sup>[8]</sup>).

This funding system can be regarded as an indirect recognition of the positive role played by AGCM in supporting a healthy and level competition field, which justifies the imposition of a small contribution on the largest businesses incorporated in Italy.

Importantly, the previous funding system entailed the risk of possible fluctuations in the amount of the annual budget, due to unpredictability in the number of notified mergers and levels of state funding. The new system shelters the AGCM from that risk, thus allowing for more stable and forward-looking recruitment planning.

Source: (OECD, 2016<sup>[9]</sup>), *Independence of competition authorities: from designs to practices*, [https://one.oecd.org/document/DAF/COMP/GF\(2016\)5/en/pdf](https://one.oecd.org/document/DAF/COMP/GF(2016)5/en/pdf).

### ***The way forward for scope of action***

- **Provide competition authorities with adequate and predictable financial and professional resources.** The current competition budget and the number of specialised staff appear insufficient for them to perform their duties effectively. A substantial increase in the budget of WB6 competition authorities seems necessary to align them with other comparable competition authorities. Additional financial resources would enable the authorities to recruit additional officials with appropriate competition skills, while motivating and retaining existing staff, and thus develop their potential in terms of competition enforcement and advocacy (see example in Box 8.2).
- **Co-operate internationally and carry out targeted training initiatives to successfully address the fast-moving economic environment.** Given the increasing complexity of anti-trust issues, and the frequent cross-border nature of competition infringements, the management and staff of WB6 competition authorities should have frequent opportunities to meet and share good practices with international competition experts and colleagues from other jurisdictions. International organisations such as the OECD, the International Competition Network and the United Nations Conference on Trade and Development (UNCTAD) offer valuable opportunities for this, including the OECD-GVH Regional Centre for Competition in Budapest (Box 8.3). The WB6 competition authorities are already regular participants in the centre's events and would benefit from actively continuing.

#### **Box 8.3. International co-operation on competition: OECD-GVH Regional Centre for Competition**

The OECD Competition Committee promotes the regular exchange of views and analysis on competition policy issues. The outcomes of these discussions, including submissions from economies and invited experts, are published in the Best Practice Roundtables on Competition Policy series (<https://www.oecd.org/competition/roundtables.htm>). Furthermore, every year over 100 competition authorities, international organisations and invited experts worldwide participate in the OECD Global Forum on Competition. In addition, the OECD Competition Open Day offers a unique opportunity to discuss cutting-edge topics recently addressed by the OECD Competition Committee. It is a free event open to the broad competition community and those interested in the work of the OECD on competition, including legal practitioners, economists, consultants, in-house counsel, regulators, academics and the media.

The OECD Regional Centres for Competition (RCCs) are initiatives aimed at fostering competition policy in specific regions, mainly through seminars and training programmes on competition law and policy. The OECD-GVH RCC was established in 2005 by the OECD and the Hungarian Competition Authority (GVH) and covers 18 competition authorities in Eastern and Central European. There are two other RCCs: the first is managed in co-operation with the Korean Competition Authority and is dedicated to competition authorities in the Asia-Pacific region; and the second was created in 2019 with the Peruvian Competition Authority and targets competition authorities in Latin America.

The International Competition Network provides competition authorities with a specialised yet informal venue for maintaining regular contacts and addressing practical competition concerns. Members produce work products through their involvement in flexible project-oriented and results-based working groups. They participate in working groups over the Internet and by telephone through webinars and teleseminars. Annual conferences and workshops provide opportunities to discuss working group projects and their implications for enforcement.

The UNCTAD Intergovernmental Group of Experts on Competition Law and Policy meets each year to discuss ways to improve worldwide co-operation on competition policy implementation and enhance convergence through dialogue. The United Nations Set of Principles on Competition provides the basis for intergovernmental consultations (UNCTAD, 2000<sup>[10]</sup>).

## Anti-competitive behaviour and implementation (Policy areas 5.2 and 5.5)

An appropriate legal and institutional competition framework is not enough to promote competition policy; competition authorities must make full use of their powers and engage in competition enforcement by detecting, investigating and punishing infringements. The implementation of the legal framework is necessary to address breaches and to deter possible future anti-competitive behaviour by conveying a credible message that such behaviour will be identified and severely sanctioned by the competition authority.

The Anti-competitive behaviour and Implementation policy areas together gauge the use of powers and resources in terms of decisions adopted and fines imposed for horizontal agreements, vertical agreements and exclusionary conduct. They also explore the actual activity of the competition authority on reviewing mergers.

Policy area 5.2, Anti-competitive behaviour, is a qualitative analysis that verifies to what extent competition authorities are aligned with best practices when conducting enforcement actions and using their anti-trust toolkit and powers. Figure 8.6 shows that the WB6 economies perform relatively well in terms of the number of adopted criteria. The new policy area 5.5, Implementation, is a quantitative analysis that explores how many competition decisions have been adopted by the competition authorities. The WB6 economies perform less well in this area (Figure 8.7), although there have been some recent positive signs.

### Figure 8.6. Scores for anti-competitive behaviour (Policy area 5.2)

Number of adopted criteria

**Figure 8.7. Scores for implementation (Policy area 5.5)**

Number of competition decisions (2015-2019)

Note: The data for BIH are not immediately comparable with the others because most decisions adopted by the economy's Competition Council have related to the non-opening of formal proceedings, while for other economies decisions have been taken following formal proceedings. The benchmark in the last histogram refers to the average of the 15 competition authorities in small economies that participated in the OECD CompStats database. See the Methodology and assessment process chapter for information on the Competitiveness Outlook assessment process.

### ***Enforcement and sanctions for horizontal and vertical agreements and exclusionary conduct are limited***

Despite a comprehensive legal and institutional competition framework in the six economies, the actual implementation of competition rules through enforcement is still limited (Figure 8.7). The number of enforcement decisions adopted by the competition authorities of the WB6 economies between 2015 and 2019 was generally lower than the 15 benchmark competition authorities in the small economies that participate in the OECD CompStat database (Box 8.1). Over the same period, they adopted on average 16 decisions on horizontal agreements, 4 on vertical agreements and 20 on exclusionary conduct. Only Albania stands out, with a higher number of infringement decisions than the benchmark. Bosnia and Herzegovina's figures appear high too, but most of them do not refer to actual competition enforcement, being simple decisions to reject requests by complainants.

The Albanian Competition Authority has an appreciable record of formal proceedings tackling horizontal and vertical agreements, including bid rigging in public procurement. However, the total amount of fines imposed on participants in anti-competitive agreements over the last five years was EUR 2.2 million, vs. EUR 13.5 million levied by the 15 competition authorities in smaller jurisdictions that participated in CompStats in the same period (OECD, 2020<sup>[7]</sup>).

Regarding Bosnia and Herzegovina, as noted above most decisions adopted by the economy's Competition Council have related to the non-opening of formal proceedings, with the result that the impact of competition enforcement is limited and fines are negligible. No significant fines have been imposed over the last five years for prohibited agreements. One relevant fine was imposed in 2018 for an abuse of dominance in the delivery of heating energy.

Despite a limited number of decisions, the Serbian Commission for the Protection of Competition has performed well over the last few years. It took only one decision concerning horizontal anti-competitive agreements in 2019, but in the previous four years there were nine cartel decisions, which included some cases of bid rigging in public procurement. In 2020 the commission issued five infringement decisions and imposed fines on the parties: one case related to horizontal price fixing, one to bid rigging, two cases

concerned resale price maintenance and one an abuse of dominant position. The total amount of fines imposed on parties involved in anti-competitive agreements reached a peak of EUR 3.8 million in 2018, but decreased to EUR 857 000 in 2019.

In North Macedonia, the number of decisions tackling horizontal agreements has been low, particularly in recent years. The Commission for the Protection of Competition has primarily invested its investigative resources in vertical agreements. Sanctions on cartels were negligible until 2019, when the commission imposed a fine of EUR 1.7 million on two pharmaceutical companies.

In Montenegro, the Agency for Protection of Competition adopted only four cartel decisions between 2015 and 2019, as well as two decisions on vertical agreements and three decisions on abuse of dominance. In 2019, the agency opened two vertical investigations concerning resale price maintenance violations, which is a hardcore restriction in Montenegrin competition law. As said, in Montenegro investigations fall under the remit of the Agency for Protection of Competition and the imposition of fines under the Misdemeanour Courts. The fines imposed by Misdemeanour Courts were particularly low, less than EUR 100 000 per year. The highest fines imposed were not for cartel cases, but for abuse of dominance.

In the same period, the Kosovo Competition Authority investigated a very limited number of cartels, vertical agreements and abuses of dominant position, and imposed no fines. It either found no infringements or accepted commitments and closed the cases, often noting the limited awareness of competition rules in domestic firms. However, in 2020 the authority concluded a major investigation into a horizontal agreement on prices by 13 oil companies and imposed overall sanctions of more than EUR 1 million.

### ***The effectiveness of leniency programmes and the use of unannounced inspections should be enhanced***

Several advanced competition authorities around the world use leniency applications as a key way of detecting cartels (Figure 8.8). Leniency programmes have been introduced in all WB6 economies, but have proven ineffective. Only the Serbian Commission for the Protection of Competition has received a leniency application so far, in 2018. This problem is common in most young and even some experienced competition agencies around the world. Nevertheless, the poor performance in the region is not surprising given that a pre-requisite for the effectiveness of a leniency programme is the threat of sanctions that leads cartelists to come forward and report the existence of an agreement to the competition authority. Considering the low sanctions imposed in the WB6 economies, cartelists have no real incentives to submit an application.

**Figure 8.8. Cartel decisions involving an immunity application (2019)**

% of cases involving leniency/immunity applicant

Source: OECD reproduction based on (Allen & Overy, 2020<sup>[11]</sup>), *Global Cartel Enforcement Report*, <https://www.allenoverly.com/en-gb/global/news-and-insights/global-cartel-enforcement-control>.

The use of unannounced inspections varies across the region. Unannounced inspections (also called dawn raids) of premises are a crucial investigative tool to substantiate allegations so that robust decisions can be adopted, particularly in the case of cartels. Both the Albanian Competition Authority and the Serbian Commission for the Protection of Competition make frequent use of this power. However, the other competition authorities in the region seem to be reluctant to do so, although some have recently begun. For example, the Commission for the Protection of Competition of North Macedonia carried out three dawn raids in 2019, compared to one in the previous years. The Montenegrin Agency for Protection of Competition began performing unannounced inspections for agreement cases in 2019 in the context of anti-trust proceedings on resale price maintenance. The Bosnian Competition Council and the Kosovo Competition Authority have not yet performed any dawn raids.

### ***There has been little activity regarding merger reviews across the region***

Regarding mergers, the number of Phase II investigations – i.e. the in depth analysis of a transaction that might raise competition concerns – has been insignificant or non-existent. The exception is Serbia, where the Commission for the Protection of Competition carried out eight Phase II investigations and one “gun jumping” case (failure to notify the competition authority of a merger or the implementation of all/part of the merger during mandatory waiting periods) in 2018 and 2019. The commission did not prohibit any transaction but cleared three cases by imposing remedies. Three additional Phase II merger reviews and two gun-jumping cases were also conducted in 2020. In North Macedonia, one concentration was blocked in 2017 and two were approved with remedies over the last five years. In Albania, only one concentration was investigated in-depth and eventually approved with remedies, in 2019. Another transaction was cleared with conditions and obligations in 2020. In the other jurisdictions, all mergers were unconditionally cleared in Phase I, i.e. without the need for a Phase II in-depth review.

The reason for the low activity on merger reviews in the WB6 economies, which again is not specific to the region, could be the unproblematic nature of most transactions, as many of the notified mergers concerned extra-territorial transactions that had little or no impact on the economy.

### ***The way forward for anti-competitive behaviour and implementation***

- **Prioritise boosting cartel enforcement and imposing high fines.** Cartels are the most clear-cut and undisputedly harmful competition infringements and affect every economy. The efforts of the competition authorities of the WB6 economies should be focused on detecting cartels and imposing heavy fines on infringers to deliver a strong message that firms engaging in collusion risk being severely punished. If the amount of fines sufficiently exceeds illicit gains, offences can be deterred even when the probability of paying a fine is low. The concern about fines is also a key driver of leniency applications. Increased cartel sanctions would foster the effectiveness of the leniency programme – which has been unproductive in the region so far – and further boost detection. Consistent with the changes introduced in other jurisdictions in Eastern Europe, the Agency for Protection of Competition of Montenegro could be empowered to impose fines directly. The competition authorities of the WB6 economies should also make full use of their powers to perform unannounced inspections to collect evidence, which are key for the adoption of solid decisions, particularly in the case of cartels.
- **Pay specific attention to public procurement, particularly during the COVID-19 crisis.** The competition authorities of the WB6 economies should expand their detection skills, for example by further strengthening the fight against bid rigging. Public procurement is a key sphere of action both for cartel enforcement and for competition advocacy. Bid rigging results in significant harm to the public budget and taxpayers, dampening innovation and creating inefficiencies. The WB6

competition authorities should extend their co-operation with the domestic agencies for public procurement and other procurement bodies to carefully design the procurement process so that it reduces the risks of bid rigging and detects bid-rigging conspiracies. The extensive activities carried out by the OECD in this respect will be helpful (see Box 8.4 and Figure 8.9 below).

- **Continue to participate in the OECD CompStats database.** The new additional questionnaire filled out by the WB6 economies for Policy area 5.5, Implementation, mirrors the data collected by the OECD through the CompStats database (see Box 8.1 above). This has enabled a thorough quantitative analysis of the actual enforcement activity of the WB6 competition authorities, as well as providing a benchmark for the findings against other competition authorities that share similar characteristics. The competition authorities of the WB6 economies would benefit greatly from continuing to participate in the OECD CompStats database and completing future related questionnaires.

#### Box 8.4. Initiatives undertaken by the OECD to fight bid rigging

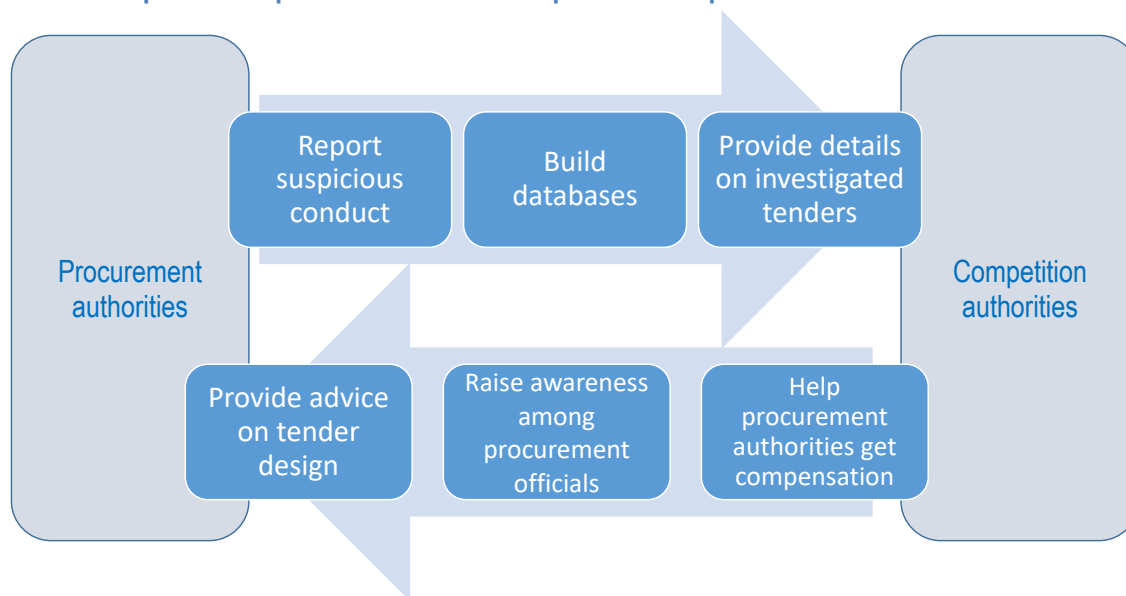

The Recommendation of the OECD Council on Fighting Bid Rigging in Public Procurement, adopted in 2012, calls for governments to assess their public procurement laws and practices at all levels of government to promote more effective procurement and reduce the risk of bid rigging in public tenders.

The OECD Guidelines on Fighting Bid Rigging in Public Procurement, which have been incorporated into the Recommendation, are designed to reduce the risks of bid rigging and detect bid-rigging conspiracies through the careful design of the procurement process.

The OECD also provides assistance through a project that assesses the main rules governing the procurement of public works and the procurement practices of major public buyers, and provides recommendations to design competitive procurement and fight bid rigging in accordance with international good practice. Training is offered to both competition and public procurement officials based on the Guidelines on Fighting Bid Rigging in Public Procurement.

Figure 8.9. Example of co-operation between competition and procurement authorities

## Probity of investigation (Policy area 5.3)

Probity of investigation plays an essential role in fair and effective law enforcement.

Companies must be safe in the knowledge that their practices conform to the applicable laws in the economies where they operate. They must also be able to interpret legal procedures correctly and to know and understand the workings of the statutory authority (or other body) that oversees them. Should they have to mount a defence in court, they need to be fully informed of the allegations against them and in good time (OECD, 2012<sup>[12]</sup>). Freedom from political influence is a prerequisite for fair and equal competition law enforcement as it helps ensure that cases are brought or dropped only on their merit (OECD, 2016<sup>[13]</sup>).

The probity of investigation policy area gauges the fairness of competition law enforcement and the degree to which competition authorities are independent and accountable. It involves three qualitative indicators: 1) independence; 2) procedural fairness; and 3) accountability (Figure 8.10). Together, these indicators assess the absence of government interference in investigations or decisions in anti-trust infringements and mergers, the rights of companies under investigation, and the transparency of the authority's actions and activities, as well as its accountability in court.

**Figure 8.10. Scores for probity of investigation (Policy area 5.3)**

Number of adopted criteria

### ***WB6 competition authorities are independent, but can be subject to political influence***

The competition authorities of the WB6 economies are independent state bodies, which means they are autonomous in their work and decision-making processes within the competencies provided by the competition law. This is consistent with good practices at international level. However, their independence does not exclude possible political influence on their effectiveness.

For example, in Kosovo the competition authority did not function between 2013 and 2016 because the members of the commission, whom are proposed by the government and approved by the parliament, had not been appointed. Kosovo's case shows that political action or lack of action can have a strong impact on competition policy.

In Bosnia and Herzegovina, the appointment and decision-making process of the members of the Competition Council are influenced by ethnic-based procedures, which risks introducing other considerations into decisions that should solely rely on a technical assessment.

### ***WB6 competition authorities are accountable before parliament***

The competition authorities must submit an activity report to parliament each year, except the Competition Council of Bosnia and Herzegovina, which submits its annual report to the Council of Ministers. The Agency

for Protection of Competition of Montenegro submits its annual report for approval both to the government and to parliament.

### ***Procedural fairness performance is generally good across the region***

The competition authorities of the WB6 economies must give notice of their decision to open formal proceedings and state the purpose of the investigation and the parties concerned, while encouraging interested third parties to come forward if they wish to take part. All final decisions regarding alleged competition infringements and mergers are published.

Prior to the adoption of a final anti-trust decision, the competition authorities must inform the parties of the relevant facts, evidence and other elements on which the decision is based, and enable them to submit a defence. The parties have the right to be heard before the board takes a final decision. At every stage of the proceedings, the parties may consult with the case team.

Likewise, if the competition authorities intend to prohibit a merger transaction, they must inform the merging parties about the evidence and conclusions on which the decision will be based and enable them to submit their remarks and possible remedies. The parties can participate in the process that leads to the determination of conditions and obligations, and can consult with the competition authority during the entire procedure.

The authorities' decisions can be appealed before administrative courts in the first instance and eventually before the high courts. In Bosnia and Herzegovina there is only one level of judicial review.

Most WB6 competition authorities have adopted and published several regulations and guidelines, including on the investigative procedure, the procedure for concentrations of undertakings, the assessment of horizontal and vertical agreements, and the calculation of fines. Bosnia and Herzegovina and Montenegro still have room for improvement.

### ***The way forward for probity of investigation***

- **Shelter competition authorities from political influence and preserve their independence.** The OECD Competition Committee has found that ensuring the requisite levels of independence, transparency and appropriate resourcing for competition agencies is an ongoing challenge. Even well-established regimes can deviate from these standards, with detrimental consequences for the quality of competition enforcement, law and policy. It is of the utmost importance that such standards are maintained.

## **Advocacy (Policy area 5.4)**

Competition may be inhibited by public policies, laws and regulations that create barriers to entry or distort incentives for firms. Some distortions are unnecessary and can be eliminated without affecting public authority policy objectives. The mandate of a competition authority should therefore extend beyond merely enforcing competition law to addressing the additional obstacles to competition. It should also participate in formulating public policies to ensure they do not adversely affect competitive market structures, business conduct or economic performance. Accordingly, the competition authority should be able to advocate for competition and contribute to public policy discussions by assessing policies against barriers to competition and flagging potential threats for competition.

The advocacy policy area considers the capacity of competition authorities to advocate for a more competitive environment at the different government levels. Such advocacy can involve reviewing new and existing regulations to identify any unnecessary distortions to competition and performing market studies

that may lead to policy recommendations on how to foster competition and make the regulatory environment more pro-competition.

All the competition authorities of the WB6 can formulate opinions and recommendations regarding economy-level or local laws or regulations that affect or may affect competition. They can also assess possible barriers to competition in economic and administrative regulations that are aimed at pursuing general economic interests. In performing this duty, they usually co-operate with the government and regulatory institutions, including public procurement agencies.

The competition authorities can conduct market studies, i.e. general inquiries in any sector of the economy, on their own initiative or following a request by parliament or other regulators, if price patterns or other circumstances suggest that competition might be restricted or distorted. The only exception is the Competition Council of Bosnia and Herzegovina, which does not have the legal power to conduct market studies.

All WB6 economies except Bosnia and Herzegovina and North Macedonia are close to be fully align in the advocacy policy area. With a score of 7.5, Albania is the closest economy followed by Montenegro and Serbia (Figure 8.11).

**Figure 8.11. Scores for advocacy (Policy area 5.4)**

Number of adopted criteria

Note: The maximum number of criteria that could be adopted is eight. See the Methodology and assessment process chapter for information on the Competitiveness Outlook assessment process.

### ***WB6 competition authorities are engaged in promoting competition***

Competition authorities can help governments eliminate barriers to competition by identifying unnecessary restraints on market activities and developing alternative, less restrictive measures that still achieve government policy objectives. Competition advocacy can establish a competition mindset and culture within an economy and strengthen the competition authority's standing and reputation.

Market studies can assess how competition in a sector or industry is functioning, detect the source of any competition problems and identify potential solutions. Competition problems include regulatory barriers to competition and demand-side factors that impair market functioning. Market studies can improve the quality and credibility of advocacy initiatives, while boosting and better orienting competition enforcement. Given that they are a versatile tool that allow the examination of a broader set of issues than simply competition enforcement, their use is growing in most jurisdictions.

The Albanian competition authority issued 25 formal opinions in 2019, which represents a substantial increase from 17 in 2018 and even lower figures in previous years. The sectors addressed by recommendations on draft regulations include water, energy, media and telecommunications. In the period

2015-2019, the Albanian competition authority concluded on average four general inquiries per year, addressing key sectors such as higher education, banking, health care and liberal professions. In 2020, the authority adopted the Competition Advocacy and Communication Strategy, which aims to increase its advocacy role.

The Competition Council of Bosnia and Herzegovina did not issue formal opinions to the government nor parliament on draft or existing laws or regulations in the period 2015-2019. However, it co-operated with public institutions on competition matters and expressed its view on industry practices that may restrict competition. Upon request by the Agency for Public Procurement, it also analysed the rules on public tenders.

The Kosovo Competition Authority has actively engaged in competition advocacy in several sectors, particularly in the last few years. It has issued opinions and recommendations to the Central Bank of Kosovo on insurance companies, to the Ministry of Health on price regulation for medicinal products and equipment, and to the Tax Administration of Kosovo on the provision of cash register equipment. In 2019, it published two market studies, one on the telecommunications sector and one on the energy sector. In 2019, it signed memoranda of understanding with several sector regulators.

The Agency for Protection of Competition of Montenegro has issued a limited number of opinions over the last five years. The main interventions have concerned the Law on Free Access to Information in 2016 and the Draft Law on Audio-visual Services in 2019. The agency signed a co-operation agreement with the Public Procurement Administration in 2015. It did not conduct any market studies.

The Commission for the Protection of Competition of North Macedonia issued seven formal opinions in 2019, including on the Law on Public Procurement and the Law on Misdemeanour. The suggestions made were implemented. In December 2014 the commission issued guidelines for detecting bid rigging in public procurement, in co-operation with the Bureau for Public Procurement. It has not conducted market studies over the last few years.

The Serbian Commission for Protection of Competition has engaged in a wide range of initiatives aimed at promoting compliance with competition principles in laws and regulations, with the number of formal opinions addressed to the government or courts more than doubling over the last few years. The initiatives include an opinion on the regulation of road hailing services and an opinion on regulatory impact assessment, both in 2018. In 2019, the commission signed a memorandum of understanding with the Public Policy Secretariat to improve the competition assessment of legislation, on the basis of the OECD's Competition Assessment Toolkit (OECD, 2019<sup>[14]</sup>). It has also conducted outreach activities to promote co-operation with other public authorities, including public procurement officials. It has performed at least three market studies per year over the last four years.

It should be highlighted that the state has a dual role as policy maker/sector regulator and supplier or purchaser of goods and services. Consequently, in markets open to competition the state also acts as a market participant and interacts with private businesses, most often indirectly, through SOEs. Governments may be tempted to grant undue advantages to SOEs or to certain domestic companies, such as a privileged market position, soft loans, outright subsidies, regulatory exemptions or tax benefits. Given the importance of SOEs in the WB6 economies, and the increased role of the state in the economy that will likely result from the COVID-19 crisis, competition authorities can make a decisive contribution to promoting competitive neutrality, which occurs when no entity operating in an economic market is subject to undue competitive advantages or disadvantages, irrespective of their ownership (state-owned or privately owned) or nationality (domestic or foreign). WB6 competition authorities have also organised a number of events aimed at developing a competition culture. For example, they have conducted workshops, training initiatives, and events for consumers, companies and public officials. They have also published educational materials through their websites or social media accounts. This activity is important to increase the standing and credibility of competition authorities and to increase awareness about the role and benefit of competition policy.

### *The way forward for advocacy*

- **Continue to advocate against competition restrictions in laws and regulations, using the OECD Competition Assessment Toolkit as a basis.** The OECD's Competition Assessment Toolkit is a practical methodology that supports competition authorities in this task. Where a detrimental impact is discovered, the toolkit helps to develop alternative ways to achieve the same objectives, with minimal harm to competition. The WB6 economies should use this toolkit to support their efforts on competition advocacy.
- **Advocate strongly for competitive neutrality to ensure that all enterprises face the same set of rules, irrespective of their ownership or nationality.** Competition authorities should discourage the government from granting selective aid to SOEs or domestic companies and resist political pressure to adopt a more lenient approach when investigating SOE conduct.
- **Use market studies to gain a better understanding of competition in key sectors and make recommendations more informed and credible. Bosnia and Herzegovina should empower its Competition Council to conduct market studies.** The Competition Council of Bosnia and Herzegovina should have the power to conduct market studies, as is the case in the other WB6 competition authorities and in most competition authorities around the world. OECD country projects can help competition authorities perform key market studies (Box 8.5).
- **Continue to conduct dedicated events to promote a competition culture.** Competition authorities need to strengthen their standing and reputation and inform policy makers and the business community about the key role played by competition in supporting economic growth and consumer welfare. Effective tools to increase competition awareness include tailor-made conferences in co-operation with other public authorities, training events and seminars addressed to the legal and business community or the judiciary, and educational materials for the general public.

#### **Box 8.5. Examples of OECD competition assessment support projects**

In 2014 the OECD launched a project in **Romania** to review construction, freight transport and food processing, in co-operation with the Romanian Competition Council. The project also provided assistance in building the competition assessment capabilities of the Romania administration, i.e. officials from the line ministries and the relevant authorities.

The OECD worked closely with **Greece** from 2012 to 2016 to assess competition laws and regulations hindering competition in several sectors, including construction, media, wholesale trade, e-commerce, chemicals and pharmaceuticals. Between July 2016 and January 2018, the OECD carried out a policy assessment in **Mexico** in the sectors of medicines and meat. In October 2016, the OECD teamed up with the Portuguese competition authority to carry out a policy assessment in **Portugal** to identify the rules and regulations hindering the efficient functioning of markets in the transportation sector and in 13 professions.

In co-operation with the UK Government, from 2018 to 2021 the OECD has been undertaking ten Competition Assessments of Laws and Regulations in the logistics sector in **Association of Southeast Asian Nations (ASEAN) countries**, based on the OECD Competition Assessment Toolkit.

In **Iceland**, following the arrival of the COVID-19 pandemic, in November 2020 the OECD and the Icelandic Competition Authority made 438 recommendations for a more flexible environment in two key sectors of the economy: construction and tourism.

The OECD has also been asked to contribute to an EU project in **Tunisia** and will conduct a peer review of competition law and policy, as well as a review of laws and regulations, in the tourism and the banking

sectors. The project started in February 2021 and builds on the success of the first OECD Competition Assessment conducted in the country in 2019, which covered wholesale and retail trade, as well as road and maritime freight transport.

## Conclusion

The competition authorities of the WB6 economies can support economic growth and a quick recovery after the COVID-19 crisis. To this end, they must establish themselves as strong, influential entities by tackling anti-trust infringements and advocating for the removal of competition restrictions in laws and regulations.

Competition enforcement is still limited, despite a positive number of infringement decisions in Albania and Serbia, and promising activities in other jurisdictions. Notably, the number of uncovered cartels is still small, and sanctions are not sufficient to ensure deterrence.

WB6 competition authorities are progressing on competition advocacy through urging policy makers and regulators to remove competition restrictions, promoting co-operation with domestic institutions, and engaging in spreading a competition culture in the business community and among the public.

Despite an appropriate competition framework, competition authorities still lack the necessary professional and financial resources to perform all their activities.

Two areas of action seem particularly promising for the near future: 1) co-operation with procurement bodies to enhance the prevention and detection of bid rigging; and 2) market studies to improve the quality and credibility of advocacy initiatives, while boosting and better orienting competition enforcement.

In the face of increasingly complex and supranational competition infringements, regional and international co-operation, as well as constant training, appear necessary to respond effectively to future challenges.

## Annex 8.A. Competition Questionnaire

Sub-Dimensions	Policy Indicators
<b>1) Competences framework</b>	1.1) Does the competition law apply also to firms located outside your jurisdiction whose behaviour directly affects competition and/or consumers in domestic markets?
	1.2) In your jurisdiction, are state-controlled firms exempt from the application of competition law when conducting commercial activities in competition with private firms?
	1.3) Annual budget of the Competition Authority (as a percentage of total annual state budget) over the last five calendar years (2015-2019)?
<b>2) Independence framework</b>	2.1) Have the government/ministers given binding directions to the competition agency on whether it should open an investigation on an alleged antitrust infringement at least once in the last five calendar years (2015-2019)?
	2.2) Have the government/ministers given binding directions to the decision-maker in your jurisdiction on whether it should close an investigation on an alleged antitrust infringement at least once in the last five calendar years (2015-2019)?
	2.3) Have the government/ministers given binding directions to the competition agency on whether it should impose/not impose (or ask a court to impose/not impose) specific remedies when closing an investigation on an alleged antitrust infringement at least once in the last five calendar years (2015-2019)?
	2.4) Have the government/ministers given binding directions to the competition agency (or other public bodies) on whether it should not undertake a market/sectoral study at least once in the last five calendar years (2015-2019)?
	2.5) Have the government/ministers overturned a decision concerning the clearance of a merger at least once in the last five calendar years (2015-2019)?
	2.6) Have the government/ministers overturned a decision concerning the prohibition of a merger at least once in the last five calendar years (2015-2019)?
<b>3) Powers to investigate framework</b>	3.1) Can your competition agency compel (or ask a court to compel) firms investigated for a possible antitrust infringement to provide information?
	3.2) Can your competition agency compel (or ask a court to compel) third parties to provide information to help an investigation on an antitrust infringement?
	3.3) Can your competition agency perform unannounced inspections/searches in the premises of firms investigated for a possible antitrust infringement aimed at gathering evidence (with or without a warrant/court authorization)?
	3.4) If yes, has your competition agency performed unannounced inspections in the premises of firms investigated for a possible antitrust infringement at least once in the last five calendar years (2015-2019)?
	3.4.1) If your competition agency has not conducted any unannounced inspections in the last two calendar years (2018-2019), please briefly list the three most important reasons for not having used this instrument and provide a short explanation for each.
	3.5) Can your competition agency compel (or ask a court to compel) merging firms to provide information to help it assess the merger?
	3.6) Can your competition agency compel (or ask a court to compel) third parties to provide information to help it assess the merger?
	3.7) Number of complaints to the Competition Authority over the last five calendar years?
<b>4) Powers to sanction / remedy framework</b>	4.1) Can your competition agency impose, or ask a court to impose, remedies or a cease and desist order on firms that have committed an antitrust infringement?
	4.2) If yes, can your competition agency impose, or ask a court to impose sanctions on firms that do not comply with remedies imposed on them with respect to an antitrust infringement they have committed?
	4.3) Can your competition agency impose, or ask a court to impose, sanctions on firms that have committed an antitrust infringement?
	4.4) Can your competition agency, or a court, accept or impose remedies on firms in order to clear a merger?
	4.5) Can your competition agency impose, or ask a court to impose, sanctions on a firm that hinders an investigation on an alleged antitrust infringement?
	4.6) If yes, have sanctions been imposed on a firm and/or individuals for hindering an investigation on an antitrust infringement at least once in the last ten calendar years (2009-2019)?
	4.7) Can your competition agency impose, or ask a court to impose, sanctions on firms and/or individuals that do not comply with a decision concerning a merger?
	4.8) Can your competition agency impose, or ask a court to impose, interim measures while performing an investigation

	of an alleged antitrust infringement because there is a concern that this may lead to irreversible damages?
	4.9) Can your competition agency, or a court, settle voluntarily with the parties investigated for an alleged antitrust infringement and thus close the investigation?
	4.10) Can your competition agency, or a court, clear a merger that raises anticompetitive concerns by negotiating/accepting remedies that address these concerns at an early stage and thus avoid to perform a more in-depth investigation?
	4.11) Number of court cases related to competition
<b>5) Mergers framework</b>	5.1) Does the decision-maker conduct an economic analysis of the competitive effects of mergers when investigating them?
	5.2) When assessing a merger can the decision-maker consider whether the merger is likely to generate efficiencies?
	5.3) Has the decision-maker blocked or cleared with remedies at least one merger in the last five calendar years (2015-2019)?
<b>6) Horizontal agreements framework</b>	6.1) Are anticompetitive horizontal agreements (including cartels) prohibited in your jurisdiction?
	6.2) Does the decision-maker conduct an economic analysis of the competitive effects of horizontal agreements when investigating them?
	6.3) When investigating an allegedly anticompetitive horizontal agreement can the decision-maker consider any efficiency this may generate?
	6.4) Have sanctions and/or remedies been imposed on at least one cartel in your jurisdiction in the <u>last five calendar years (2015-2019)</u> ?
	6.4.1) How many hard core cartel cases (i.e. cases with obvious by object infringements like price fixing or market sharing) have been closed with the finding of an infringement and with fines in the last two calendar years (2018-2019)?
	6.4.2) What was the total amount of the fines (sum of all fines in EUR) imposed in these cases?
	6.5) Have sanctions and/or remedies been imposed on at least one anticompetitive agreement that is not a cartel in your jurisdiction in the last five calendar years (2015-2019)?
	6.6) Does your jurisdiction have a leniency/immunity program for cartel participants (firms and/or individuals)?
	6.7) If yes, has the leniency program generated at least one application in the last five calendar years (2015-2019)?
<b>7) Vertical agreements framework</b>	7.1) Are anticompetitive vertical agreements prohibited in your jurisdiction?
	7.2) Does the decision-maker conduct an economic analysis of the competitive effects of vertical agreements when investigating them?
	7.3) When investigating an allegedly anticompetitive vertical agreement can the decision-maker consider any efficiency this may generate?
	7.4) Have sanctions and/or remedies been imposed on at least one anticompetitive vertical agreement in your jurisdiction in the last five calendar years (2015-2019)?
<b>8) Exclusionary conducts framework</b>	8.1) Are exclusionary conducts by dominant firms and/or by firms with substantial market power prohibited in your jurisdiction?
	8.2) Does the decision-maker take non-market-share factors (such as conditions of entry, ability of smaller firms to expand, and ability of customers to switch to smaller rivals) into account when determining dominance?
	8.3) Does the decision-maker conduct an economic analysis of the competitive effects of exclusionary conducts when investigating them?
	8.4) When investigating an allegedly exclusionary conduct can the decision-maker consider any efficiency this may generate?
	8.5) Has the decision-maker in your jurisdiction imposed sanctions and/or remedies on at least one firm for exclusionary conduct over the past five calendar years (2015-2019)?
<b>9) Advocacy framework</b>	9.1) Does your competition agency (or another public body) advocate competition at central government level?
	9.2) Does your competition agency (or another public body) advocate competition at local or regional government levels?
	9.3) Are all new public policies that may have implications for competition subject to a competition assessment in your jurisdiction?
	9.3.1) In case 9.3 has been answered with "yes", is the competition agency involved in the competition assessment?
	9.3.2) Please briefly describe the competition agency's involvement in the competition assessment: <ul style="list-style-type: none"> <li>• Does it receive all draft laws and regulations well in advance and is given sufficient time to examine and comment?</li> <li>• Is there a specialised unit/staff member in charge of the competition assessment?</li> <li>• Is there a manual/guidance for conducting the assessment and if so, please briefly describe the major steps or provide a link to the guidance, in case it is public.</li> </ul>
	9.3.3) In how many cases has the competition agency issued recommendations for change in the last two calendar years (2018-2019)? Please briefly describe two or three recommendations given.

	9.3.4) How many of the recommendations led to the recommended changes of the draft laws and regulations?
	9.3.5) If the recommendations were not followed, did the government give reasons for leaving the draft laws and recommendations unchanged?
	9.4) Can market/sectoral studies be performed in your jurisdiction?
	9.5) If yes, has at least one market/sectoral study been performed in your jurisdiction in the last five calendar years (2015-2019)?
	9.6) If a market/sectoral study identifies an obstacle or a restriction to competition caused by an existing public policy, can the study include an opinion/recommendation to the government to remove or reduce such obstacle or restriction?
	9.7) If a market/sectoral study includes an opinion/recommendation to the government concerning an obstacle or restriction to competition caused by an existing public policy, is the government required to publicly respond to this opinion/recommendation?
	9.8?) Please describe if the competition authority is providing information and/or trainings to public procurement officials on the prevention and detection of bid rigging in public procurement procedures. Briefly describe the efforts and materials, i.e. number of trainings or contacts to public procurement bodies within the last two calendar years (2018-2019), and their nature.
<b>10) Accountability framework</b>	10.1) Does your competition agency publish regularly a report on its activities?
	10.2) Are decisions that ascertain the existence of an antitrust infringement published by the relevant decision-maker?
	10.3) Are decisions that block a merger or clear a merger with remedies published by the relevant decision-maker?
	10.4) Can decisions on antitrust infringements and mergers (whether taken by a competition agency or a court) be subject to judicial review with respect to their substance?
<b>11) Procedural Fairness framework</b>	11.1) Does your competition agency provide the party/parties under investigation for an antitrust infringement with opportunities to consult with your competition agency with regard to significant legal, factual or procedural issues during the course of the investigation?
	11.2) Do parties have the right to be heard and present evidence before the imposition of any sanctions or remedies for having committed an antitrust infringement?
	11.3) Does your competition agency provide the parties under investigation for a merger with opportunities to consult with your competition agency with regard to significant legal, factual or procedural issues during the course of the investigation?
	11.4) Do parties have the right to be heard and present evidence before a decision on a merger is reached?
	11.5) Does your competition agency publish procedural guidelines or public documents explaining its investigative procedures?
	11.6) Does your competition agency publish guidelines that explain how abuses of dominance are assessed?
	11.7) Does your competition agency publish guidelines that explain how horizontal agreements are assessed?
	11.8) Does your competition agency publish guidelines that explain how vertical agreements are assessed?
	11.9) Does your competition agency publish guidelines that explain how mergers are assessed?
	11.10) Are there published administrative guidelines that explain how monetary sanctions for antitrust infringements are set by your competition agency, or recommended by it to the court?
<b>12) Private Enforcement framework</b>	12.1) Can individuals bring a legal action to seek damages from firms that have committed an antitrust infringement?
	12.2) Can firms bring a legal action to seek damages from firms that have committed an antitrust infringement?
	12.3) Can a group of consumers (either collectively or through a consumer association) bring a legal action to seek damages from firms that have committed an antitrust infringement?

# 9 State-owned enterprises (Dimension 6)

---

State-owned enterprises (SOEs) are an integral part of the Western Balkans' economic architecture. They often operate in vital sectors of the economy and deliver crucial public services, making their efficient operations decisive for broader economic and societal outcomes. Depending on whether they are profitable or loss-making, SOEs can also have significant, and sometimes unexpected, impacts on fiscal budgets. For these reasons, ensuring that SOEs operate efficiently, transparently and on a level playing field with private companies is important. This chapter assesses these aspects through four key sub-dimensions. The first, efficiency and performance through improved governance, summarises available data on the region's SOE landscape, notably sectoral distribution, employment contributions and performance. It then examines state ownership and corporate governance arrangements and how they affect SOEs' efficiency. The second sub-dimension, transparency and accountability practices, discusses SOEs' accountability to the state, the general public and minority shareholders. The third sub-dimension, ensuring a level playing field, explores how the legal treatment and financing conditions for SOEs influence the level playing field with private companies, and how they affect economic efficiency. The final sub-dimension, reforming and privatising SOEs, reviews regional trends concerning SOE reform and privatisation. Each sub-dimension section makes specific recommendations for going forward.

---

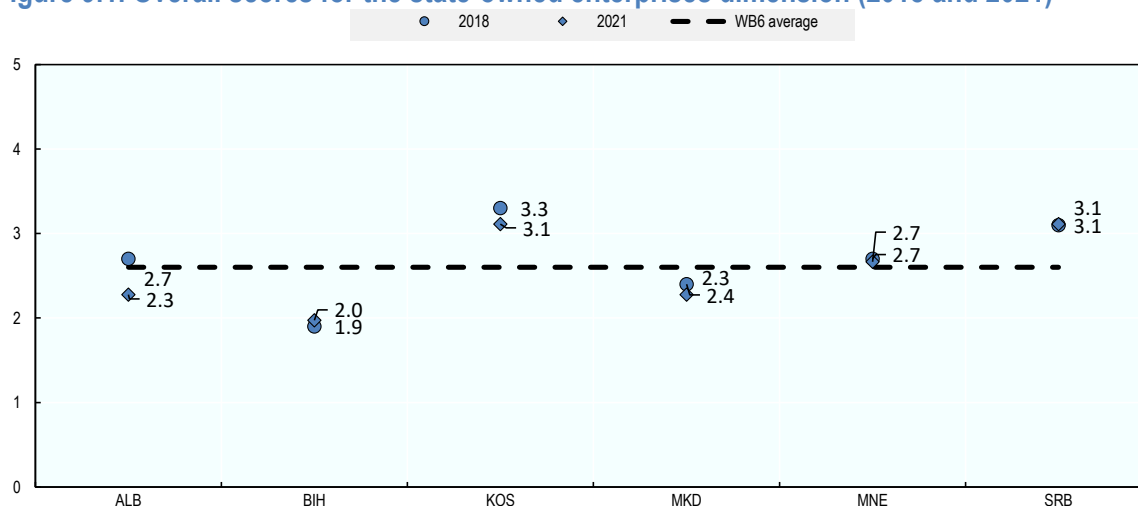

## Key findings

- **The efficiency of SOEs is key for economic development, societal well-being and healthy public finances.** The Western Balkans has over 500 SOEs, which are highly concentrated in sectors that both the general public and companies depend on for their everyday operations, including electricity and gas, water supply and sewage, transportation and telecommunications. Although performance monitoring of central SOEs is limited, external assessments point to their frequent underperformance, which often strains public budgets and contributes to the sub-optimal allocation of economic resources.
- **Most of the region’s public authorities have not developed ownership policies** outlining why the state owns companies and what it expects them to achieve, which contributes to SOEs’ often unclear or ad hoc performance objectives and limited accountability among state actors for SOE performance.
- **SOE ownership arrangements are predominantly decentralised** across the region, with several line ministries or other public bodies exercising ownership rights over distinct portfolios of SOEs. This can lead to the problematic mixing of roles on the part of state actors (e.g. ownership and regulatory roles), increase the risk for political influence over corporate decision making, and make it difficult to obtain a holistic overview of SOE performance.
- **Small steps have been taken to improve SOE board appointment processes in some of the region’s economies.** For example basic qualifications criteria have been introduced in some economies, as well as requirements for independent directors on boards. SOE board positions are nonetheless frequently perceived to be awarded based on political connections rather than purely professional qualifications. Political influence on SOE boards can trickle down to management appointments and increase the risk that corporate decisions are influenced by political factors rather than value creation.
- **SOEs are mostly subject to sound basic requirements for financial reporting, but compliance is not consistent.** In several cases financial audits have uncovered issues with the credibility of SOEs’ corporate disclosures. Non-financial reporting, particularly concerning the nature and costs of SOEs’ public service obligations (or other non-commercial objectives), is underdeveloped in the region. There is significant scope to strengthen disclosure by the state as shareholder, notably through aggregate reports that analyse the performance of all SOEs.
- **Non-state minority shareholders are an important element of the region’s SOE landscape.** This is particularly the case in Bosnia and Herzegovina, Montenegro and Serbia, where a significant number of SOEs have private minority shareholders. Across the region there is scope to improve minority shareholders’ legislated rights (applicable to all companies, including SOEs). There is also a need to engage in more targeted efforts to communicate with the minority shareholders of SOEs, be accountable to them and ensure they play an adequate role in corporate decision-making so that SOEs create value for all shareholders.
- **Across the region, the legal and regulatory treatment of most SOEs is broadly aligned with the treatment of private companies.** However, the existence of a separate legal form of “public enterprise” for some SOEs in several economies (Bosnia and Herzegovina, Montenegro, North Macedonia and Serbia) may distort the playing field with private companies. Many SOEs do not earn economically significant rates of return, which can mean that resources are allocated inefficiently (although it can also sometimes reflect public policy obligations financed by commercial revenue). This should be addressed through reforms within individual enterprises.

## Comparison with the 2018 assessment

There have been very limited changes to the scores of the six Western Balkan (WB6) economies for the state-owned enterprise policy dimension since the 2018 assessment, reflecting limited efforts by the economies' authorities to reform state ownership practices (Figure 9.1). For the most part, score changes since 2018 reflect the fact that the current iteration of the assessment has involved more in-depth information gathering at the economy level, allowing for the fine-tuning of individual economy scores.

**Figure 9.1. Overall scores for the state-owned enterprises dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Progress in implementing the policy recommendations made in the Competitiveness Outlook (CO) 2018 has been limited overall (Table 9.1), although preliminary steps have been taken to professionalise the state shareholding function in three economies (Albania, Bosnia and Herzegovina and Serbia) through proposals to establish dedicated state ownership units. However, the region's authorities have not taken any significant efforts to clarify SOEs' financial and non-financial objectives, or to strengthen accountability to the public and to SOE minority shareholders.

**Table 9.1. Implementation of the Competitiveness Outlook 2018 policy recommendations: State-owned enterprises dimension**

Competitiveness Outlook 2021		
2018 policy recommendations	Main developments during the assessment period	Regional progress status
<b>Professionalise the state ownership function as a priority in all WB6 economies</b>	<ul style="list-style-type: none"> <li>There have been no substantial reforms to date, but preliminary proposals have been made to establish central state ownership monitoring or co-ordinating entities in three economies (Albania,<sup>1</sup> Bosnia and Herzegovina and Serbia).</li> </ul>	Limited
<b>Foster clarity in financial and non-financial objectives for individual SOEs</b>	<ul style="list-style-type: none"> <li>There is no evidence that any authority has taken steps to clarify SOEs' financial and non-financial objectives for a significant proportion of SOEs.</li> <li>Reforms of individual SOEs have been undertaken in some economies, often clarifying the sources of underperformance and establishing clearer performance objectives.</li> </ul>	None
<b>Ensure governments engage in aggregate reporting on their SOEs</b>	<ul style="list-style-type: none"> <li>No additional authorities have undertaken SOE aggregate reporting since 2018.</li> <li>Kosovo remains the only economy where aggregate reports are published, with plans to publish the latest edition in 2021. Serbian authorities have undertaken various forms of public reporting on their SOEs.</li> </ul>	None
<b>Strengthen the protection of non-state investors further</b>	<ul style="list-style-type: none"> <li>Amendments to the company law in Montenegro increased requirements for independent members of company boards of directors. While not directly related to minority shareholder rights, this development could help ensure that SOE boards of directors are better equipped to make decisions in the interest of all shareholders, including minority investors.</li> <li>There is no evidence that any targeted efforts have been undertaken in the region's economies to go beyond the basic requirements of the general company law to strengthen accountability to SOEs' minority shareholders.</li> </ul>	Limited

<sup>1</sup>Note: In Albania, a proposal to establish a central state ownership agency was made by the Ministry of Finance but not agreed upon by the government.

## Introduction

Ensuring that state-owned enterprises operate efficiently, transparently and on a level playing field with private companies is key for the economic development and competitiveness of the Western Balkans. SOEs are an integral part of the region's economic architecture, often operating in systemically important sectors, such as electricity and gas, telecommunications, and public transportation, on which other businesses and the general public depend for their everyday operations. Because SOEs frequently operate the public utilities and infrastructure that most other companies rely on for their operations, their efficiency directly impacts the competitiveness of these companies, including notably the producers of tradeables. SOEs can also positively or negatively influence public finances. For example, SOE performance, and whether they provide dividends to the state, affects the capacity of public authorities to finance necessary investments, such as infrastructure and government services. If SOEs are loss-making they can place a significant strain on public finances, which can become a long-term problem if the structural sources of corporate losses are not addressed. If state ownership confers any unwarranted competitive advantages on SOEs compared to private competitors, such as direct financial support or regulatory leniency, then this can distort the level playing field with private companies and ultimately crowd out more productive firms. SOEs can also face unwarranted competitive disadvantages, such as public service obligations that are insufficiently subsidised by the state, jeopardise their commercial viability and even threaten the provision of public services.

This chapter focuses on establishing the appropriate ownership, corporate governance, legal and accountability arrangements to address some of the most prevalent reasons for poor SOE performance

and limited accountability. SOE operations have implications for several other policy areas assessed by the Competitiveness Outlook. Most notably these include:

- **Chapter 4: Investment policy and promotion.** SOEs sometimes operate in sectors of the economy that are deemed strategic or important for national security, and which therefore the authorities wish to maintain under national (non-foreign) and/or state ownership and control, such as energy or telecommunications infrastructure. The maintenance of state ownership and/or control in these sectors is often enshrined in domestic law and can limit the sectors to which inward investment can flow, or the degree of control that can be granted to foreign investors in certain undertakings. More broadly, sound SOE governance and regulation can have far-reaching impacts on an economy's overall investment attractiveness. Foreign investors need to be confident that the state as an owner of structurally important enterprises – and as a regulator of both state-owned and private corporations – will act professionally, predictably and in the interest of a healthy competitive environment.
- **Chapter 8: Competition policy.** Ensuring that SOEs compete on a level playing field with private companies is crucial to establishing a robust competition environment. Even if SOEs are not explicitly exempt from the application of competition rules, the fact that they are owned by the state can result in leniency on the part of competition authorities or courts. SOEs also often operate the network infrastructure (e.g. in the electricity and telecommunications sectors) that private companies depend upon for their operations. In cases where a market has recently been liberalised, state-owned network operators may tend to offer privileged access or conditions to SOEs rather than their private competitors.
- **Chapter 19: Anti-corruption policy.** SOEs can face particularly heightened risks of corruption given their closeness to the public administration – public officials often serve as board members – as well their frequent presence in sectors generally associated with higher corruption risk, such as mining and gas. Ensuring that SOEs are well governed, including through boards of directors that are free of excessive political influence, is crucial to reducing corruption risk. Strong transparency is also important for identifying and addressing illicit or unethical practices. Issues related to corruption risks specifically in the state-owned enterprise sector are not examined in great detail in this publication. Related guidance can be found in the OECD's Guidelines on Anti-Corruption and Integrity in State-Owned Enterprises (OECD, 2019<sup>[1]</sup>).

## Assessment framework

### Structure

This chapter assesses policies to strengthen state-owned enterprise governance in the WB6 by examining practices in four broad sub-dimensions:

1. **Sub-dimension 6.1: Efficiency and governance through improved governance** examines the extent to which state ownership decisions are guided by clear policies and efficient institutional arrangements. It also assesses the extent to which SOE boards of directors are equipped with sufficiently independent and qualified professionals to allow them to effectively oversee corporate management and make decisions in the interests of the enterprises they serve.
2. **Sub-dimension 6.2: Transparency and accountability practices** examines the extent to which SOEs are accountable to the state, to their minority shareholders and to the general public. It analyses SOE corporate disclosure and audit requirements and practices, examines minority shareholder rights and access to information, and reviews the transparency of the state as a shareholder.

3. **Sub-dimension 6.3: Ensuring a level playing field** focuses on the extent to which SOEs' legal and regulatory framework, as well as their financing conditions, impact the competitive landscape with private companies.
4. **Sub-dimension 6.4: Reforming and privatising SOEs** summarises recent SOE governance reforms and privatisation efforts.

Figure 9.2 shows how the sub-dimensions and their indicators make up the SOE dimension assessment framework. The indicators draw on the standards set forth in the OECD Guidelines on Corporate Governance of State-Owned Enterprises, which provides a blueprint for SOEs (OECD, 2015<sup>[2]</sup>).

The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. In particular, data were collected on the number of SOEs, their sectors of operation and their employment contributions to contextualise the qualitative assessment and shed light on the economic importance of SOEs. For more information on the methodology see the Assessment methodology and process chapter.

### ***Key methodological changes to the assessment framework***

Since the 2018 edition of the Competitiveness Outlook, a fourth sub-dimension has been added to gather information on recent SOE reforms and privatisation efforts. The indicators under this fourth dimension are not scored. No other methodological changes to the assessment framework have taken place.

### **State-owned enterprise performance and context in the WB6**

The purpose of improving the ownership, governance, and legal and disclosure arrangements of SOEs is to ensure that they create value for and are accountable to the general public, who are considered their ultimate owners. As well as commercial profitability, SOEs can create value for society through efficient public service delivery or other non-commercial objectives. The state as owner must clearly define how SOEs are expected to create value and allow for robust performance assessments. Value creation also implies that SOE operations should not hinder other firms from creating value, i.e. they should compete on a level playing field.

Sound state ownership and governance arrangements contribute to value creation by clarifying SOE objectives and establishing clear accountability mechanisms to achieve those objectives. A professional state owner should define clear performance objectives for SOEs, strong SOE boards should be sufficiently independent from both political influence and corporate management to ensure that corporate decisions are taken in the interest of the enterprise, and professional management should oversee the day-to-day operations that lead to performance objectives being achieved. Robust corporate disclosure underpins the accountability of boards and management to the state shareholder and the general public, and can be considered an end in itself as it reinforces the state's accountability to citizens. However, when SOEs are not governed effectively they can become vehicles for political patronage by state actors or be used by management for their own personal gain, leading to inefficiencies and low performance. Poor corporate disclosure can then make it difficult to identify and address the sources of efficiency shortcomings.

An overarching concern in the Western Balkans is the fact that most of the region's authorities do not maintain sufficient centralised data on their SOE portfolios to allow for a complete picture of their size, value, or performance. The absence of robust data on SOEs' financial and non-financial performance reflects the overall weak public accountability systems that most public authorities have established for their state portfolios. Albania, Kosovo, and North Macedonia maintain partial online lists of state-owned enterprises, but Kosovo is the only economy in the region where the authorities gather and recurrently publish financial performance data on the central government's main portfolio of SOEs. The Serbian authorities have also undertaken various forms of public reporting on their SOEs. In Albania and North Macedonia, the lists of SOEs provide basic information such as the name of each enterprise and its sector of operation, but no employment or financial performance figures.

Despite the absence of robust performance monitoring frameworks, external assessments (e.g. by international financial institutions) have shed some light on SOE performance in the region. The results of

these assessments will be discussed below, followed by an overview of the available data on the characteristics of SOEs in the region, including their sectoral distribution and employment contributions.

### ***External assessments point to the frequent underperformance of SOEs***

External assessments at both the regional and economy levels point to the frequent underperformance of many SOEs in the region. For example, an extensive analysis of firm financial statements published by the International Monetary Fund (IMF) (IMF, 2019<sup>[3]</sup>) found that surveyed SOEs in the region are consistently less efficient than their private sector peers, producing lower revenues per employee, paying higher wages and posting significantly lower profitability levels.<sup>1</sup> Another study by the European Bank for Reconstruction and Development assessed firm profitability between 2014 and 2016 and found that surveyed SOEs operating in Bosnia and Herzegovina and Serbia posted average losses amounting to approximately 0.5% of gross domestic product (GDP). SOEs in North Macedonia and Montenegro posted profits of below 0.5% of GDP, and Albania and Kosovo were not included in the analysis (EBRD, 2020<sup>[4]</sup>). The presence of insolvent and/or inactive SOEs is also not uncommon in some of the region's economies.<sup>2</sup>

When SOEs underperform they contribute to the inefficient allocation of resources in the broader economy. Given that SOEs often receive public support, for example in the form of direct subsidies or foregone dividends, their inefficiencies can also lead to additional strains on already depressed public budgets. Even in the absence of formal state guarantees for their debt or other forms of explicit public support, the state is often expected to step in to shore up failing SOEs. While such state support may be economically warranted in some circumstances – for example in the context of the economic downturn associated with the COVID-19 pandemic – in “normal” times it can contribute to inefficiencies by reducing SOEs’ incentives to undertake necessary structural improvements, while contributing to an unlevel playing field where SOEs compete in the marketplace.

SOE underperformance can stem from costly public service obligations subsidised from commercial revenue, but there is limited evidence that this is consistently the case in the WB6 economies’ SOEs. There is a significant lack of clarity in the region regarding the non-commercial objectives of SOEs, their actual cost and whether they are delivering on their objectives. It is considered good practice, as set out in the OECD Guidelines on Corporate Governance of State-Owned Enterprises (SOE Guidelines), to ensure that SOEs’ public policy objectives are clearly articulated and transparently financed from the public budget (OECD, 2015<sup>[2]</sup>). There is therefore a strong need in the region to clarify the commercial and non-commercial objectives of SOEs and to strengthen accountability among responsible public actors and SOEs to achieve these objectives.

### ***The efficient operation of SOEs is vital for economic competitiveness in the WB region***

Preliminary data on SOEs gathered in the context of this assessment reveal that SOEs are important economic actors in the WB region, representing a notable proportion of employment and often operating in systemically important sectors. This makes their efficient operations essential for broader economic competitiveness.

While the data gathered for this assessment shed some light on SOEs’ economic footprint in the region, the overview that follows can only be considered a preliminary and imperfect mapping of the region’s SOE landscape. This is because there were notable differences in the scope of data provided by the public authorities. For example, some authorities provided information on SOEs held only by the central level of government, whereas others included municipality owned companies and did not always distinguish between the two. Limitations in the comparability of data provided by the region’s authorities only serves to underscore the need to strengthen economy-level data on SOE portfolios and their performance.

The number of enterprises owned by each central-level government ranges from 18 in Kosovo to just over 150 in Serbia (Figure 9.3).<sup>3</sup> The state’s presence in the marketplace is, unsurprisingly, more pronounced

when enterprises owned by other levels of government are included: in Bosnia and Herzegovina an estimated additional 334 enterprises are owned by cantons and municipalities, while in North Macedonia an estimated 265 enterprises are owned by municipalities.<sup>4</sup> Figures on municipal SOEs were not provided for the other four economies in the context of this assessment.

**Figure 9.3. Number of central government SOEs in WB6 economies**

Note: For Bosnia and Herzegovina, the estimated number of SOEs reflects the portfolios of both the Federation of Bosnia and Herzegovina (FBiH) (53 SOEs) and Republika Srpska (RS) (24 SOEs). It is based on figures reported in (OECD, 2018<sup>[5]</sup>) as well as data provided by the Republika Srpska Share Fund in the context of the current assessment. The figure is an estimate because the data provided by the FBiH for the current assessment aggregated SOEs at all levels of government, without distinguishing between the different levels.

Source: Author's calculations based on data provided by the economy or entity authorities; (OECD, 2018<sup>[5]</sup>), *Competitiveness in Southeast Europe: A Policy Outlook 2018*, <https://doi.org/10.1787/9789264298576-en>.

Measuring SOEs' share of economic activity is difficult in the absence of comprehensive performance data, for example on SOEs' value added; however, SOEs' share of employment offers a useful measure of their role in the economy. SOEs account for a notable proportion of total employment in all Western Balkan economies, ranging from 1.6% in Albania (limited to central government SOEs) to 11% in Bosnia and Herzegovina (including SOEs at all levels of government) (Figure 9.4).<sup>5</sup> Importantly, in economies where SOE data are limited to central government entities, the employment figures mask the economic importance of public utilities, which are often owned by local governments. SOEs in OECD economies represent between 2% and 3% of total non-agricultural employment, on average (OECD, 2017<sup>[6]</sup>). However, the comparison with OECD economies is not perfect as the figures are based on different measures of employment (non-agricultural employment in the OECD and total employment in the WB6).<sup>6</sup> Nonetheless, the available data point to the overarching conclusion that SOEs are an important element in all economies of the region and probably account for a higher share of employment than SOEs in OECD economies.

Figure 9.4. SOEs' share of total employment in WB6 economies (2019)

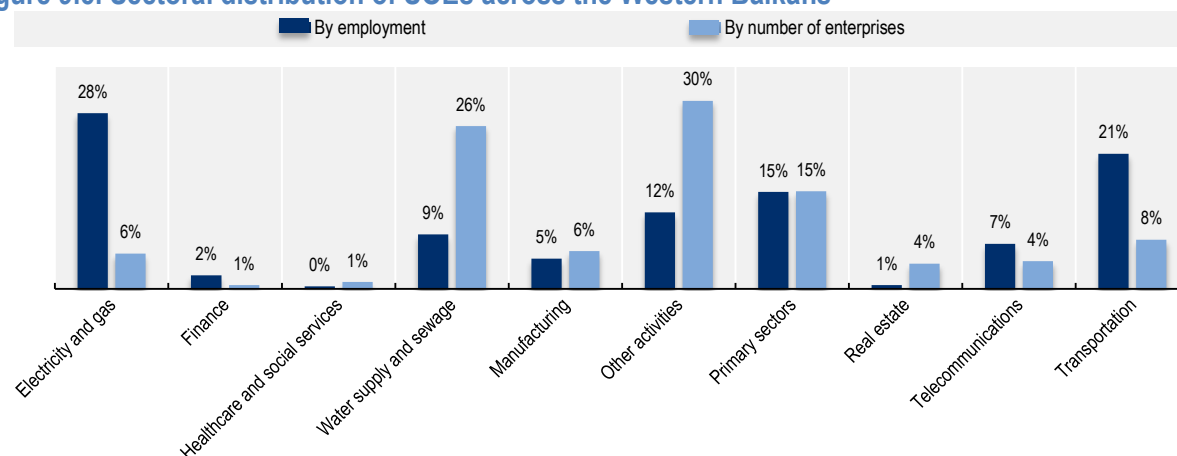

Note: Data from end-2019 or latest available.

Source: Calculations based on data provided by the economy-level or entity authorities, and employment figures from economies' statistical offices.

SOEs' presence in systemically important sectors further demonstrates their economic and societal importance. SOEs in the Western Balkans are particularly concentrated in transportation (21% of all SOEs by employment), electricity and gas (28%), and water supply and sewage (9%). SOEs are also somewhat concentrated in the primary sectors (e.g. agriculture, forestry and mining) (15%) and, to a lesser extent, in telecommunications (7%). State-owned manufacturing enterprises are also common in SOE portfolios, accounting for 5% of all SOE employees (Figure 9.5). The sectoral distribution of SOEs in the region is broadly similar to their distribution in the 40 economies (mostly OECD but also other large emerging market economies) reviewed in the OECD's recurrent data collection exercise on SOE sectors.<sup>7</sup> Some differences include the near absence of state-owned financial firms in the Western Balkans (2% of SOE employment in the WB vs. 8% in the OECD's sample area) and the higher concentration of SOEs operating in the primary sector (15% of SOE employment in the WB vs. 6% in the OECD's sample economies) (OECD, 2017<sup>[6]</sup>).

**Figure 9.5. Sectoral distribution of SOEs across the Western Balkans**

Note: SOEs' sectoral distribution is based on central government SOEs for Albania, Kosovo, Montenegro and Serbia, and includes sub-national SOEs for Bosnia and Herzegovina and North Macedonia. For Bosnia and Herzegovina, the classification of SOEs according to sector (based on the below-referenced IMF report) has been updated to align with the classification used in this regional overview.

Source: Calculations based on data provided by the authorities in the context of this assessment, except for Bosnia and Herzegovina, for which calculations are based on (IMF, 2019<sup>[7]</sup>), *State-Owned Enterprises in Bosnia and Herzegovina: Assessing Performance and Oversight*, <https://www.imf.org/en/Publications/WP/Issues/2019/09/20/State-Owned-Enterprises-in-Bosnia-and-Herzegovina-Assessing-Performance-and-Oversight-48621>.

### Efficiency and performance through improved governance (Sub-dimension 6.1)

To ensure that SOEs perform well, the state needs to develop clear performance objectives and establish appropriate ownership and governance arrangements to make shareholding entities and SOE boards of directors accountable for achieving those objectives. Good practice calls for the state ownership function to be exercised independently of other functions, including notably market regulation, to avoid unclear or conflicting objectives on the part of economic actors. This can be done through the establishment of a separate ownership agency or, when this is not possible, through a co-ordinating unit that harmonises ownership practices across the public administration. Such units can also help to professionalise and increase the efficiency of the state ownership function by centralising relevant expertise in one body and improving the monitoring of the whole SOE portfolio. To ensure that state ownership is an informed policy decision, the state should develop an ownership policy that outlines why it owns companies and what it expects those companies to achieve. The roles and responsibilities of all state actors involved in implementing the ownership policy should be clearly outlined. The state should ensure that SOE boards of directors are sufficiently qualified and independent to make decisions in the interest of achieving SOEs' clearly defined objectives. More specifically, SOE boards should be independent of any conflicts of interest – for example political or financial connections – that could jeopardise their incentives to act in the best interests of the enterprises they serve.

The Western Balkan economies achieve below-average scores in the efficiency and performance through improved governance sub-dimension (Table 9.2). This reflects the absence of ownership policies in most of the region's economies, together with predominantly decentralised ownership arrangements (albeit with some exceptions where elements of more centralised ownership decisions are in place). Although some steps have been taken to improve the professionalism and independence of SOEs' boards of directors, SOE boards in the region are widely perceived to be subject to political influence, which can undermine corporate efficiency.

**Table 9.2. Scores for Sub-dimension 6.1: Efficiency and performance through improved governance**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Efficiency and performance through improved governance	1. Clarification of ownership policy and rationales	1.5	1.0	3.0	1.5	2.0	3.0	2.0
	2. Professionalising state ownership	2.0	1.3	3.5	1.5	2.0	3.0	2.2
	3. Robust board nomination framework	2.0	1.5	3.5	2.0	2.5	2.5	2.3
	4. Promoting independent and professional boards	1.0	2.5	2.5	2.0	2.5	2.5	2.2
<b>Sub-dimension average score</b>		1.6	1.6	3.1	1.8	2.3	2.8	2.2

### ***Ownership policies and rationales are still unclear***

There have been limited policy developments to clarify ownership policies and rationales for SOEs in the region. Most WB6 public authorities have not developed a dedicated state ownership policy outlining why the state owns enterprises and what they are expected to achieve. This absence of ownership policies contributes to the often unclear objectives of SOEs and ultimately serves to weaken accountability among public shareholding entities, boards and management regarding the performance and efficiency of SOEs. However, there are small signs of progress in this domain: the Federation of Bosnia and Herzegovina (FBiH) has announced near-term plans to develop an ownership policy, and the Serbian authorities recently developed a state-ownership strategy document concerning future SOE reforms, which notably envisages the greater centralisation of state ownership responsibilities under the Ministry of Economy, as well as the development of an ownership policy.

The rationales for state ownership are also generally not clearly or consistently communicated by public authorities, which have not, for the most part, detailed why state ownership of enterprises should be chosen over private ownership. Clearly outlining the rationales that underpin state ownership is important to ensure that government ownership of commercial enterprises is an informed policy decision and not just a result of historical factors. In cases where the stated rationale(s) for government ownership are no longer present, this can support the decision to privatise or liquidate the concerned enterprises.

According to information provided in the context of this assessment, all WB6 economies identify supporting domestic economic and strategic interests as a rationale for state ownership. Montenegro and North Macedonia also identify supplying public goods and services that the market is not able to supply as a rationale, and Albania, Kosovo, and Serbia identify supporting social objectives. Albania is the only economy to consider the maintenance of enterprises in domestic (non-foreign) ownership as a rationale for state ownership. No public authorities identified the operation of natural monopolies as a rationale for state ownership (Table 9.3).

**Table 9.3. Rationales for economy ownership, as reported by WB6 authorities**

	Supporting domestic economic and strategic interests	Ensuring continued domestic ownership of enterprises	Supply public goods or services that the market cannot provide	Performing business operations in a natural monopoly situation	Supporting social objectives
Albania	√	√	√		√
Bosnia and Herzegovina	√				
Kosovo	√				√
Montenegro	√		√		
North Macedonia	√		√		
Serbia	√		√		√

Note: Responses for Bosnia and Herzegovina reflect both FBiH and RS responses.

Source: Questionnaire responses from economy-level and entity authorities in the context of this assessment.

Although these reported rationales shed some light on the possible justifications for state ownership in the region, it is often not evident how many individual SOEs, particularly those with predominantly commercial activities (e.g. those operating in competitive sectors such as manufacturing), fulfil these rationales. For example, how does maintaining a manufacturing company in state rather than private ownership support economic and strategic interests? This reflects the fact that some of the reported rationales remain very broad in scope, and that the authorities often do not subsequently define the rationales for state ownership at the level of individual enterprises. The rationales for state ownership may in some cases be gleaned from sectoral or enterprise-specific legislation, for example where public service expectations are very clearly defined, but this is generally not consistent across entire economy portfolios. Many public authority portfolios in the region include companies that remain in state ownership owing to stalled or failed privatisations, or that are insolvent, inactive and/or in the process of being liquidated. This points to a disconnect between the reported rationales for maintaining enterprises in state ownership and actual state ownership practices.

### ***Efforts to professionalise state ownership are similarly limited in the region***

Most of the region's economies have predominantly decentralised state ownership arrangements, meaning that several line ministries or other state agencies exercise shareholding rights over a distinct portfolio of SOEs. This can be problematic as it risks, among other things, conflicting or unclear objectives among state entities that are simultaneously responsible for ownership, market regulation and/or sectoral policy. A recent trend in economies around the world that are implementing good-practice reforms of state ownership arrangements is to centralise state ownership in a single agency or unit that is either tasked with undertaking the state's shareholding duties or performing a co-ordination and monitoring role among state shareholding entities (OECD, 2020<sup>[8]</sup>) (see Lithuanian example in Box 9.1).

In the Western Balkans, some elements of domestic practice diverge from the fully decentralised model of ownership, and a degree of professionalisation and co-ordination of ownership decisions has been introduced across the public administration. This is notably the case in Albania, Kosovo, and Montenegro, where a significant proportion of the state's portfolio is subject to some degree of central or co-ordinated ownership, for example through board nomination procedures that involve more than just the responsible line ministry and that are guided by whole-of-government policy documents.<sup>8</sup> In Bosnia and Herzegovina, both the FBiH and RS have announced plans to establish a central state ownership monitoring entity to be housed within each entity's prime minister's office. Similarly, Serbia's new state ownership policy foresees the establishment of a state ownership and co-ordinating body. The region's authorities could build on these preliminary steps to further strengthen central ownership institutions and professionalise the state shareholding function.

### Box 9.1. Creating a state ownership co-ordination entity in Lithuania

Similar to most Western Balkans economies, Lithuania has predominantly decentralised state ownership arrangements, with line ministries exercising shareholding functions in distinct portfolios of SOEs. In the context of these decentralised arrangements, Lithuania has taken several steps to harmonise and professionalise ownership practices across the public administration. These steps notably include the development of a whole-of-government ownership policy and the establishment of a central co-ordination and monitoring unit, the Governance Co-ordination Centre (GCC), to monitor implementation across the SOE portfolio. The GCC is housed in the Monitoring and Forecast Agency, a public institution under the purview of the Ministry of Economy.

Roles undertaken by the GCC to support more professional and accountable ownership practices include:

- Supporting SOE performance improvements by developing three-year rate-of-return targets for SOEs, which are agreed upon by the government.
- Maintaining centralised data on SOEs, including through the collection of SOEs' quarterly and yearly financial reports.
- Participating in an inter-ministerial selection commission, which also involves private recruitment agencies, to choose qualified independent members (those without significant business or personal ties to SOE management) for SOE boards of directors.
- Producing aggregate reports addressed to the public on the activities and performance of the SOE portfolio.

### ***Despite progress on board nomination frameworks, the process is seen as lacking transparency***

Preliminary steps have been taken by some WB6 governments to introduce a more robust SOE board nomination framework and ensure transparent and merit-based procedures for recruiting board members. The authorities of Albania, Kosovo and Serbia have established formal procedures for SOE board nominations that are laid out in dedicated legislative or policy documents. In Bosnia and Herzegovina, related requirements have been formalised but apply to all government appointments rather than being specific to the SOE sector. Overall, even where formal nomination procedures exist, the criteria and process for selecting individual SOE board members are widely perceived to lack transparency. Box 9.2 summarises efforts taken by the authorities of Latvia to strengthen SOE board nomination practices.

### Box 9.2. Establishing professional and independent SOE boards in Latvia

At the time of Latvia's accession to the OECD, several commercially oriented SOEs were not operating under boards of directors and were overseen directly by shareholding ministries. As part of its OECD accession process, Latvia made a pledge to establish professional boards of directors in all large commercially oriented SOEs that did not yet have boards in place. As a result, Latvia established a new SOE board nomination framework to be implemented by shareholding ministries. It undertook the following steps to establish more professional boards in SOEs:

- Adopted requirements that all shareholding ministries establish dedicated SOE board nomination committees to undertake board selection processes and make appointment recommendations to shareholding ministries. All committees were required to include a representative of the state's ownership co-ordination body, the Cross-Sectoral Co-ordination Centre (CSCC), as well as independent experts not employed by shareholding ministries.
- The CSCC developed guidelines on how SOE board candidates should be selected and subsequently assessed.
- Strengthened board member qualifications criteria, for example regarding educational level and professional experience, as well as industry expertise and/or experience managing limited liability companies.
- Introduced requirements that at least half of SOE board members are independent. Clear criteria for establishing independence include the absence of working relationships with the shareholding ministry, not having previously been a board member of the SOE or its subsidiaries, and not having been a representative of the SOE's external audit firm for the previous three years.
- Used an executive search firm to support board recruitment for Latvia's largest SOE, the state-owned electricity company, Latvenergo.

Through the establishment of this new SOE board nomination framework, Latvia was able to successfully establish boards in 12 SOEs that previously had no boards in place. These boards included independent directors, in line with the new requirements.

Source: (OECD, 2017<sup>[11]</sup>), *Note by the OECD Secretariat on Latvia's implementation of corporate governance accession review recommendations*, <https://www.oecd.org/daf/ca/OECD-Note-Latvia-Corporate-Governance-Accession.pdf>.

### ***There has been limited progress in promoting independent and professional boards***

Establishing independent and professional boards in SOEs is crucial to ensure sufficient outside oversight of corporate management and to shield SOEs from political interference. In practice, SOE boards in the region are often perceived to be operating as extensions of their ownership ministries and subject to political interference. Even in economies where SOE boards must comprise a minimum proportion of "independent" directors – which is the case to some extent in Kosovo, North Macedonia and Serbia, and will soon be the case in Montenegro following recent amendments to the company law – SOE board positions are frequently perceived to be accorded based on political or personal connections rather than purely based on merit. The resulting risk for the politicisation of SOE boards often extends to the senior management members appointed and can mean that corporate decisions, such as those related to procurement or staffing, are politically motivated rather than in the interest of corporate performance. In some cases, the state, rather than SOE boards of directors, is responsible for appointing senior management, further exacerbating the risk of political influence over corporate decisions.

### ***The way forward for efficiency and performance through improved governance***

To improve state ownership arrangements and the functioning of SOE boards of directors, WB6 authorities should consider the following steps:

- **Strengthen the institutional and policy arrangements for state ownership.** All Western Balkans economies would benefit from improvements to the institutional arrangements for state ownership and, where applicable, the development of ownership policies that outline why the government owns companies and what it expects them to achieve. Albania and Bosnia and Herzegovina should move forward with implementing proposals to create dedicated state ownership entities or co-ordination units. State ownership units should gather and maintain centralised data on the state-owned enterprise portfolio, including the number of SOEs, their sectors of operation, their employment figures and their financial statement data. Lithuania's experience in establishing a central state ownership monitoring and co-ordination entity (while maintaining predominantly decentralised ownership arrangements) is highlighted in Box 9.1 and may be useful for WB6 economies.
- **Strengthen the professionalism and independence of SOE boards of directors through transparent and merit-based nomination procedures.** Although the authorities of some WB6 economies have established formal procedures for SOE board nominations, there remains the perception across the region that SOE board appointments are often made based on political or personal connections, rather than purely professional experience and merit. The authorities in all WB6 economies should take steps to strengthen SOE board composition requirements and nominating procedures to ensure that SOE boards have sufficient expertise, as well as independence from shareholding ministries and SOE management, to effectively oversee SOE decision making in the interest of achieving well-defined corporate objectives. The authorities could consider using private recruitment agencies to support the process. The experience of Latvia in implementing new SOE board nomination procedures for its large commercial SOEs is outlined in Box 9.2.

### **Transparency and accountability practices (Sub-dimension 6.2)**

Ensuring that SOEs are accountable to the state shareholder, to other shareholders as relevant, and to the general public (the ultimate “owners” of SOEs) is key for their efficiency and performance. Once the state has established performance objectives for SOEs, the enterprises themselves should produce reliable and high-quality financial and non-financial reports that allow the state to assess how well they have achieved their objectives. SOEs' financial statements should be audited by external audit firms to ensure that these disclosures can be relied upon to present an accurate overview of SOEs' financial situation and help the state and boards identify any structural shortcomings that are holding back SOE performance. SOEs' non-financial reporting should place a particular emphasis on activities undertaken in the public interest. In addition to ensuring that the minority shareholders of SOEs have sound basic rights – such as equitable treatment and access to information – the state should also take steps to regularly communicate with minority shareholders and ensure that SOE corporate decision making considers the needs of all shareholders. The state as shareholder should also be accountable to the general public by being transparent about the enterprises that it owns and reporting to the public on the performance of the state's portfolio.

The Western Balkans region performs relatively well when compared internationally in terms of the financial reporting standards of SOEs, although there is scope for them to strengthen their compliance with applicable requirements (Table 6.4). There is limited information available on non-financial reporting, indicating that efforts should be improved in this domain. Concerning accountability towards minority shareholders and the protection of their rights, there is scope in some WB6 economies to improve basic

legislated minority shareholder rights (applicable to all company shareholders), as well as to undertake more targeted efforts to communicate with minority shareholders and involve them in SOE corporate decision making.

**Table 9.4. Scores for Sub-dimension 6.2: Transparency and accountability practices**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Transparency and accountability practices	1. Financial and non-financial reporting	2.5	2.0	3.5	2.5	3.0	3.5	2.8
	2. Auditing practices	3.0	2.5	3.0	2.5	3.0	4.0	3.0
	3. Protection of minority shareholders	3.0	3.0	3.0	3.5	3.0	3.0	3.1
<b>Sub-dimension average score</b>		2.8	2.5	3.2	2.8	3.0	3.5	3.0

### ***Financial reporting standards are sound, but non-financial reporting could be strengthened***

There are legislative provisions in all Wb6 economies that establish basic financial reporting requirements for at least a significant proportion of SOEs, usually involving the mandatory submission of financial statements to a central registry. Financial reporting requirements are often equivalent to those applicable to privately owned companies, and do not always involve reporting in line with internationally recognised standards. In Kosovo, North Macedonia and Serbia, SOEs' financial statements must also be publicly disclosed, either directly by the enterprises or by a government body such as a business registry. While there appear to be sound basic requirements for financial reporting in the region, there is significant scope to strengthen non-financial reporting requirements and practices, particularly concerning activities undertaken in the public interest.

SOEs in the Western Balkans demonstrate weak compliance with applicable reporting requirements, with recent monitoring studies in some individual economies pointing to SOEs' failure to submit required reports and/or delays in submitting them to the authorities.<sup>9</sup> Although this compliance issue may not be a pressing concern in all six economies, no governments in the region (with the exception of Kosovo) appear to undertake the systematic monitoring of SOE compliance with reporting requirements, which is necessary to identify and address any related shortcomings.

### ***Financial auditing practices are mostly supported by sound basic legislation***

In most WB6 economies, the financial auditing practices of SOEs are supported by sound basic legislation that, for example, requires external audits of financial statements for at least the largest SOEs. In practice, however, some recent external audits of large SOEs in the region have identified significant shortcomings in the soundness of their financial statements, pointing to the need to improve the quality and credibility of SOEs' corporate disclosures.<sup>10</sup> In some cases the state audit office, instead of private firms, conducts SOEs' financial statement audits. This is not considered good practice and could be indicative of broader issues related to the underdevelopment of the audit profession in the region.

### ***Protection of SOEs' minority shareholders could be improved***

The protection of SOE minority shareholders is particularly pertinent for economies where a large proportion of SOEs include non-state investors in their shareholding structure, notably Bosnia and Herzegovina, Montenegro and Serbia (Figure 9.6). Bosnia and Herzegovina has the largest absolute number of SOEs with private shareholders (46), although this figure is inflated by the inclusion of municipality-owned enterprises. Albania, Kosovo, and North Macedonia have a very small number of SOEs with private shareholders (fewer than three companies each), which means that protecting minority shareholders, although important for the broader business climate, is less of an immediate priority for state ownership policy reform. In Kosovo, only one SOE, the Trepča Mine, has non-public shareholders. This

mine was expropriated in 2016 and is 20% owned by its employees. For North Macedonia, the three enterprises reflected in Figure 9.6 do not currently have any private shareholders but are nominally listed on the economy's stock exchange.

**Figure 9.6. Estimated number of SOEs with private shareholders in WB6 economies (2019)**

Note: Although three SOEs in North Macedonia are nominally listed on the stock exchange, they currently do not have any private shareholders. For Bosnia and Herzegovina there are an estimated 34 SOEs in FBiH and 12 in RS. Data from end-2019 or latest available.

Source: Information provided by the authorities in the context of this assessment.

Ensuring that minority shareholders are treated equitably is important to ensure that SOEs create value for all shareholders and for attracting private capital to the state-owned enterprise sector. Basic minority shareholder rights, for example the right to access information and to participate in corporate decision making, such as board elections, should be enshrined in law and consistently respected. There should also be a strong degree of transparency from the state towards minority shareholders, particularly in cases where the state encourages corporate decisions that may impact SOE profitability and dividend pay-outs. This is especially relevant when the state expects SOEs to pursue objectives other than profit maximisation. Minority shareholders should be adequately informed of such expectations, both at the time of their investment and on an ongoing basis.

External assessments conducted by the World Bank in the context of its Doing Business reviews point to the presence of sound basic rights in some WB6 economies regarding basic minority shareholder protections, with Serbia the highest performer in the region, followed by North Macedonia and Bosnia and Herzegovina (Figure 9.7) (World Bank, 2020<sup>[12]</sup>). Among the three economies with the highest number of SOEs with private shareholders, Montenegro receives the lowest score regarding the extent of minority shareholder rights (three out of six). Albania and Kosovo are excluded from the index's scoring as they do not have active stock markets. The ranking presented in Figure 9.7 is based on the economies' scores for the World Bank's Doing Business review's index on the extent of shareholder rights, which examines the extent to which six shareholder rights are enshrined in law for stock-exchange listed companies.<sup>11</sup> These six rights include the right for shareholders to elect and dismiss the company's external audit, and the right for those with at least 10% of equity capital to call for a general shareholders' meeting.<sup>12</sup>

**Figure 9.7. Extent of shareholder rights for stock-exchange listed companies in the WB6 (2019)**

Note: Albania and Kosovo receive scores of 0 on this index owing to the absence of active stock exchanges.

Source: (World Bank, 2020<sup>[12]</sup>), *Doing Business 2020: Comparing Business Regulation in 190 Economies*, <https://openknowledge.worldbank.org/handle/10986/32436>.

The Doing Business review's broader index on the extent of shareholder governance, which includes the shareholder rights dimension but also assesses legal safeguards against undue board control as well as corporate transparency towards shareholders, also identifies room for improvement in the six economies, with a similar ranking to the above (Figure 9.8).

**Figure 9.8. Minority investor protections for stock-exchange listed companies in the WB6**

(0 worst – 100 best)

Note: Scores for Albania and Kosovo are negatively impacted by the score of 0 accorded for the index on extent of shareholder rights (which is one of the components comprising the index on minority investor protections).

Source: (World Bank, 2020<sup>[12]</sup>), *Doing Business 2020: Comparing Business Regulation in 190 Economies*, <https://openknowledge.worldbank.org/handle/10986/32436>.

Although SOEs in the region are not excluded from the applicability of laws intended to accord minority shareholders equal treatment, there are several risks associated with state ownership that call for targeted measures to ensure that minority shareholders are adequately informed and involved in corporate decision making. Based on information gathered for this assessment, there is limited evidence that any of the region's authorities undertake targeted efforts to mitigate these risks and strengthen transparency regarding SOE minority shareholders consistently or as a matter of state shareholding policy.

The risks associated with state ownership include the fact that the state as the dominant shareholder may exclude minority shareholders from key corporate decision making and/or make decisions not in their interest, for example decisions motivated by public policy concerns rather than based on commercial justifications. The presence of politically affiliated individuals on the boards of many SOEs in the region may exacerbate this problem. The state as a shareholder may also have privileged access to corporate information compared to private shareholders, for example through communication channels with the board of directors that omit minority shareholders. Weak rule of law in the region, coupled with the risk that state judicial systems may have a tendency to side with state shareholders, may also make it more difficult for minority shareholders to obtain adequate redress in cases where their legal rights have been violated.

The OECD SOE Guidelines outline several specific efforts that governments should take to ensure that SOE minority shareholders are treated equitably and have equal access to corporate information. These include ensuring that crucial corporate information is shared simultaneously with the state and minority shareholders, facilitating their participation in shareholder meetings, and developing an active policy of communication and consultation with all shareholders (OECD, 2015<sup>[21]</sup>). Regarding corporate transparency, particular emphasis is placed on ensuring that minority shareholders are aware of any public policy objectives that SOEs are expected to achieve. Given that public policy objectives (especially if ad hoc) are often in conflict with commercial objectives, it is important that minority shareholders are fully informed about their scope and impact on corporate profits. For example, SOEs should be sufficiently clear about public policy objectives (which would normally also be established via clear regulations) in their non-financial disclosures. These avenues for minority shareholder involvement could offer some inspiration for the WB6 authorities as they seek to improve the relationship between the state and minority shareholders.

### ***Accountability to the general public could be significantly strengthened***

There have been limited developments in the WB6 economies regarding how the state reports to the public on its activities as a shareholder, and on the performance of the SOE portfolio. Although SOEs are generally required to submit their financial statements to a central registry, very few public authorities use the information collected to undertake or publish an analysis of SOEs' financial performance at the portfolio level. The authorities of only one economy, Kosovo, recurrently publish an aggregate report on the activities and performance of SOEs. Aggregate reports can offer a useful mechanism for increased accountability and help encourage improvements in SOE performance, transparency, and governance practices (Box 9.3).

### Box 9.3. International experience in good-practice aggregate reporting

To strengthen the state shareholder's accountability to the public, many economies around the world produce publicly available aggregate reports that synthesise information about the operations and performance of the state's SOE portfolio. These reports complement SOE-specific disclosures by presenting a more holistic overview of the state's portfolio performance and a summary of the trends in ownership or governance practices, or significant changes in the state's portfolio. The OECD is currently developing a good practice guide on aggregate reporting which will contain useful guidance for policy makers looking to develop such public reports. The following elements are included in aggregate reports worldwide:

- **SOEs' financial performance and value.** This information is often presented both at the sectoral level and at the enterprise-specific level, allowing for a general overview of, for example, SOE revenue, net income and dividends distributed to the state, as well as financial metrics such as leverage ratios and rates of return on debt and equity.
- **SOE employment figures.** This can include information on, and explanations for, any substantial changes in SOE employment levels.
- **Implementation of the state's ownership policy.** This can include information on any recent changes to the state's ownership policy and the institutional roles and responsibilities for its implementation. Many countries also report on SOEs' compliance with applicable governance and disclosure standards.
- **Board composition and/or remuneration in SOEs.** Information on SOEs' board composition can include reporting on the number of board members considered "independent directors" (those without material business or personal connections to enterprise management that could constitute a conflict of interest) and/or information on gender diversity on the boards. Some countries also provide information on individual board member remuneration.
- **Costs and financing of SOEs' public policy activities.** This can include SOE-specific information on how much SOEs' public policy activities cost and how they are paid for (through the state budget or from commercial revenue). Some countries disclose the amount of state subsidies that individual SOEs have received over the preceding year.

Source: (OECD, 2018<sup>[13]</sup>), *Ownership and Governance of State-Owned Enterprises: A Compendium of National Practices*, <http://www.oecd.org/corporate/Ownership-and-Governance-of-State-Owned-Enterprises-A-Compendium-of-National-Practices.pdf>.

### ***The way forward for transparency and accountability practices***

To improve SOEs' accountability to the state, minority shareholders (as relevant) and the general public, the following steps are recommended:

- **Review all SOEs' compliance with existing disclosure requirements.** This assessment has revealed that in most of the region's economies, at least the largest SOEs are subject to strong requirements for financial reporting to a central entity. However, there are gaps in compliance in some cases, for example a significant proportion of SOEs are not reporting on time or at all. WB6 authorities are encouraged to undertake more in-depth monitoring of SOE compliance with applicable financial reporting standards to identify and address gaps in compliance. Where monitoring uncovers significant issues with the quality and credibility of SOEs' corporate disclosures (for example as a result of external audits), steps should be taken to address these issues.
- **Strengthen SOEs' non-financial reporting requirements and practices.** Special efforts should be made to ensure that SOEs report to the state shareholder(s) and to the public, in particular on

activities undertaken in the public interest. This implies complementary efforts to better define SOEs' public interest activities and to develop clearer non-financial performance objectives to assess SOEs' success in this regard.

- **Strengthen accountability to SOEs' minority shareholders.** In addition to improving basic minority shareholder rights for all companies, the state should take steps to review and improve communications with SOEs' private minority shareholders. SOEs should be accountable to, and create value for, all shareholders.
- **Produce publicly available aggregate reports on the state ownership portfolio.** In most of the region's economies there is already a mechanism in place to collect SOEs' financial statements, usually involving their submission to a central registry. The authorities could build on this process by collating and analysing SOEs' financial performance data to produce an overview of the performance of the SOE portfolio as a whole. To encourage improvements, aggregate reports could also include information on the number of SOEs that do not comply with financial (and non-financial) reporting requirements. They could also present qualitative information on SOEs' corporate governance practices, their public service activities and other information of relevance to the general public. Box 9.3 presents some elements of international experience in producing aggregate reports and highlights the type of information that such reports can include.

### Ensuring a level playing field (Sub-dimension 6.3)

To ensure a level playing field, SOEs' legal and regulatory treatment and their financial conditions should be similar to those of private enterprises. This means that SOEs should not be exempt from the application of general laws and regulations applicable to private companies, including notably competition rules and other market regulations. Concerning their financing conditions, SOEs should not benefit from any direct or indirect state support – including implicit or explicit guarantees on commercial debt – that may confer a competitive advantage over private enterprises. At the same time, SOEs should not face competitive disadvantages owing to, for example, under-compensated non-commercial objectives (e.g., providing local employment) that can jeopardise their commercial viability or otherwise lead to structural inefficiencies.

The WB6 region achieves average performance on SOEs' legal and regulatory treatment (Table 9.5), reflecting the fact that most SOEs are incorporated subject to general company law and do not benefit from many of the explicit exemptions to the laws and regulations applicable to private companies. The region underperforms on SOEs' financing conditions, reflecting the fact that many SOEs do not achieve economically significant rates of return, which amounts to below-market costs of equity capital (provided by the state).

**Table 9.5. Scores for Sub-Dimension 6.3: Ensuring a level playing field**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Ensuring a level playing field	1. Legal and regulatory treatment	3.5	2.0	4.0	3.0	3.5	3.5	3.3
	2. Access to finance	2.0	2.0	2.0	2.0	2.5	3.0	2.3
<b>Sub-dimension average score</b>		2.8	2.0	3.0	2.5	3.0	3.3	2.8

#### ***Most SOEs in WB6 economies are incorporated under company law***

Concerning SOEs' legal and regulatory treatment, a significant proportion of SOEs in WB6 economies – in many cases a majority – are incorporated as joint-stock or limited liability companies, and thus subject to the general company law that is also applicable to privately owned corporations. This establishes a sound foundation for ensuring that SOEs face similar legal and regulatory treatment to private companies, which is important for maintaining a level playing field between state and privately owned companies.

Nevertheless, in four of the six economies (all except for Albania and Kosovo, according to authorities involved in this assessment) at least some SOEs are incorporated under the distinct legal form of “public enterprise” and subject primarily to SOE-specific legislation. Maintaining SOEs under such a separate legal form introduces material operational differences between SOEs and private companies that can distort the level playing field (for example by exempting SOEs from the possibility of bankruptcy) and is not considered good practice. In general, maintaining SOEs under a separate legal regime often results in different transparency and accountability requirements, particularly compared to stock-exchange listed corporations, which are usually the “gold standard” for corporate reporting and governance practices. For example, the boards of directors of SOEs with special legal status are often not subject to corporate liability, which can greatly weaken their incentive to act purely in the interest of corporate performance. In some cases, SOEs with a separate legal status are effectively operated as arms of the public administration, increasing the risk of political interference in corporate decision making. SOEs with special legal status may also face different accounting requirements, which can, among other things, make it difficult to benchmark their performance against industry peers. The maintenance of some SOEs under a separate legal form is undertaken in Bosnia and Herzegovina, North Macedonia and Serbia, all of which have developed separate laws on public enterprises. Montenegro also maintains some SOEs under the separate legal form of public enterprise, all of which reportedly undertake public service activities, but the authorities report that most of these enterprises are owned by municipalities. In every WB6 economy there are some nuances related to this overarching trend; for example, in North Macedonia, the Law on Public Enterprises stipulates that all SOEs undertaking public interest activities must be incorporated as limited liability or joint-stock companies, but in practice several SOEs are still incorporated under the separate legal form of public enterprise. Only in Albania and Kosovo are all SOEs reportedly incorporated as joint-stock or limited liability companies operating primarily under general company law.

Concerning SOEs’ regulatory treatment, the authorities of most countries report very few explicit regulatory exemptions granted to SOEs, and generally maintain that SOEs face the same treatment as private companies in terms of taxation, competition rules, and environmental and zoning regulations. However, this assessment has found that in practice SOEs face some apparent regulatory leniency from public authorities, resulting in, for example, tax payment arrears or barriers to free competition in sectors where the state previously held a monopoly position.<sup>13</sup> External assessments confirm the existence of operational advantages granted to SOEs in some cases; for example, in a recent IMF study the authorities of Albania, Bosnia and Herzegovina and North Macedonia reported that they grant some legal preferences to SOEs (IMF, 2019<sub>[3]</sub>).

### ***Most SOEs access at least some financing on the commercial marketplace***

Many SOEs in the WB region benefit from explicit state guarantees on debt, which constitutes an operational advantage that may distort the level playing field with private companies. This being said, explicit state guarantees that distort competition are prohibited in economies subject to EU state aid rules. Even in cases where no explicit guarantees are provided, it is likely that many commercial banks perceive an implicit state guarantee – i.e. that the state will step in if an SOE is unable to service its debt – and may price their financing accordingly. Such financing conditions are by no means unique to the Western Balkan economies, with the authorities of many OECD economies considering that SOEs are likely to benefit from advantageous commercial lending conditions owing to implicit state guarantees. Few economies have established mechanisms to offset such operational privileges to maintain “competitive neutrality” (the absence of differences in the competitive landscape that stem from state ownership, regulation or activity in the market) between state-owned and private firms (OECD, 2014<sub>[14]</sub>). Other problematic financing arrangements include state recapitalisations that are not undertaken on market terms, leading to competitive distortions.

Many SOEs in the WB6 economies do not earn economically significant rates of return. It is not uncommon for SOEs to be outright loss-making, which places a significant burden on public budgets and often

channels economic resources to less efficient economic actors. Although some of the corporate inefficiencies of SOEs may stem from under-compensated public service obligations, there is no evidence that this is consistently the case, particularly given that most of the region's authorities have not clearly defined or disclosed the costs of SOEs' public service obligations or other activities undertaken "in the public interest". The OECD Guidelines on Corporate Governance of State-Owned Enterprises (SOE Guidelines) recommend that any public policy objectives that SOEs are expected to achieve should be clearly articulated and their costs transparently accounted for and funded directly from the public budget (OECD, 2015<sup>[2]</sup>).

### ***The way forward for ensuring a level playing field***

To further level the playing field with private enterprises, WB6 authorities are encouraged to consider the following measures:

- **Fully corporatise SOEs that engage in commercial activities.** While the majority of SOEs in the region are incorporated as limited liability or joint-stock companies, in most of the region's economies there remains a subset of SOEs incorporated according to separate enterprise-specific (or SOE-specific) legislation. SOEs engaged in commercial activities should, wherever possible, be incorporated according to the general company law and not face regulatory exemptions that could distort the level playing field with private companies. In cases where the authorities deem it more efficient to maintain certain SOEs under a separate legal form, the rationales for doing so should be clearly and transparently defined.
- **Improve SOEs' efficiency so that they achieve economically significant rates of return on their commercial activities.** A fundamental issue in many of the region's economies is that many SOEs do not earn economically significant rates of return, in some cases posting persistent losses. Efforts should be made to ensure that SOEs achieve minimum profitability levels on their commercial activities. This may require the clarification of SOEs' commercial and non-commercial activities, as well as structural changes within individual enterprises to improve efficiency.

## **Reforming and privatising state-owned enterprises (Sub-dimension 6.4)**

The frequent underperformance of the Western Balkans' SOEs, together with underdeveloped policy and institutional frameworks for state ownership in most WB6 economies, point to the need for substantial state ownership reforms. The presence of many SOEs for which the rationales for state ownership are not clear, or which have become insolvent, indicate the need to optimise state ownership portfolios through enterprise liquidation, restructuring and/or privatisation. This section summarises recent domestic SOE reform initiatives and sheds light on the privatisation landscape in the region. This sub-dimension is purely descriptive and is not scored.

### ***SOE reforms have been limited in the region***

No WB6 government has reported any significant state ownership reforms since the 2018 Competitiveness Outlook. Recent state ownership reforms have mostly been limited to restructuring individual SOEs that were suffering persistent losses and/or were insolvent, for example through organisational changes and/or corporate mergers. In Albania and Bosnia and Herzegovina, proposals to strengthen institutional arrangements for state ownership have been discussed by the authorities, but formal steps have not been taken to follow through on preliminary discussions. The largest legislative reform effort affecting SOEs could be considered to have taken place in Montenegro through recent amendments to the general company law, which notably introduces independence requirements for certain company boards of

directors that will apply to fully corporatised SOEs. However, no WB6 government has recently undertaken any significant policy, institutional or legislative reforms specific to state ownership.

### ***Small-scale privatisation efforts are continuing in some WB6 economies***

Small-scale privatisation efforts often involve the sale of remaining state equity in companies that had been partially privatised in earlier years. Most of the recent privatisations in the region have not involved large or systemically important SOEs. The authorities of Kosovo, and North Macedonia have had preliminary discussions about potential future privatisations of the state-owned telecommunications (Kosovo<sup>14</sup>) and railway (North Macedonia) enterprises, but no further progress has been made. The region's economies can be divided into two main groups in terms of privatisation programmes: in Albania, Bosnia and Herzegovina, Montenegro, and Serbia, privatisations have taken place with some regularity over the past decade, and in Kosovo and North Macedonia, privatisation programmes have been considerably less active.<sup>15</sup> This assessment has also uncovered individual cases of recent “failed” privatisations, for example where the authorities have been unable to identify interested or suitable investors. This underscores that many elements must be in place for a privatisation to be successful, including the political will and agreement to privatise, the presence of interested investors with sufficient capital for the purchase, and sufficiently strong corporate performance to attract purchase offers that justify relinquishing ownership.

Almost all public authorities in the region maintain state minority shareholdings (ownership shares of between 10% and 50%) in a notable number of companies. These minority shareholdings often reflect privatisation processes already initiated (through partial sales) that have either stalled or been cancelled. Based on available data, Albania, Bosnia and Herzegovina, Montenegro, and Serbia all hold state minority shareholdings in a large number of companies, ranging from 17 to 38 (see Table 9.6). In some cases, the maintenance of state minority shareholdings seems to reflect general policy inertia regarding their eventual privatisation, rather than the result of an informed decision on the part of the public authorities to maintain strategic shares in such companies. However, state minority shareholdings can also reflect temporary capital injections made to shore up private companies, or efforts to maintain some degree of strategic influence (without full control) over certain companies or within certain sectors of the economy.

**Table 9.6. Companies with state minority shareholdings in WB6 economies (2019)**

State minority shareholdings of 10-50%

Source: Data provided by economy-level or entity authorities for this assessment.

### ***The way forward for reforming and privatising SOEs***

- **Make state ownership reform a policy priority.** In most of the region's economies, state ownership reforms have been particularly limited in recent years, even though SOEs are often loss-making and represent substantial fiscal liabilities for the authorities. The authorities of all WB6 economies should make state ownership reforms, in line with this assessment's recommendations, a policy priority.
- **Review the rationales for maintaining state ownership in commercially oriented enterprises.** The rationales for state ownership should be clearly defined and regularly reviewed. This is particularly relevant for state majority shareholdings but can also be applied to state minority shareholdings. Limited information is available on why several governments in the region maintain minority state shareholdings in a large number of companies, which also reflects the broader issue

of limited state ownership policy development in the region. Going forward, governments in the region should review the benefits that existing shareholdings bring to the state and, where those benefits are not evident, reconsider their maintenance in state ownership. Such a review could complement the development of economy-level ownership policies that outline the rationales for state ownership, as recommended earlier in this assessment. Policy makers considering privatisation may find the OECD's recent guidance on privatisation practices useful (OECD, 2019<sup>[15]</sup>).

## Conclusion

Strengthening state ownership and governance arrangements in WB6 economies could significantly improve the efficiency of the region's SOEs and help ensure that they create value alongside private companies. Improving the efficiency of state portfolios – including through operational changes that increase productivity and winding down insolvent or inactive SOEs – can also have significant fiscal impact by reducing the need for excessive state support of SOEs and by ultimately increasing the level of dividends that SOEs are able to return to the state budget. Strengthening the transparency of SOEs' operations can help make those responsible for their oversight, notably state shareholding entities and SOE boards of directors, more accountable to SOEs' ultimate shareholders, the general public.

Because SOEs operate at the nexus of the public and private sectors, improving their operations often requires reforms in multiple policy areas that cannot be tackled all at once. These include public governance reforms that impact institutional arrangements for state ownership and company law reforms that relate to how boards of directors oversee management decisions. The OECD SOE Guidelines provide an aspirational standard across seven policy areas that can guide the region's authorities in implementing the state ownership reforms they consider the most pressing and relevant to their context (OECD, 2015<sup>[2]</sup>).

## Notes

<sup>1</sup> Albania and Kosovo were excluded from the IMF analysis of SOE performance owing to insufficient data availability. The IMF analysis used firm financial statements from 2014-16 where available and considered all firms with at least 25% state ownership to be SOEs, whereas OECD definitions use majority share ownership (or other means of exercising an equivalent degree of control) as the threshold to consider an enterprise an SOE. The number of SOEs included in the analysis for each economy is as follows: 8 in Bosnia and Herzegovina, 9 in Montenegro, 59 in North Macedonia and 370 in Serbia.

<sup>2</sup> For example, in Albania eight insolvent SOEs were recently merged with other SOEs, reportedly to avoid costly and lengthy insolvency procedures.

<sup>3</sup> Figures for Kosovo exclude the estimated 500+ companies in the portfolio of the Kosovo Privatisation Agency.

<sup>4</sup> In Bosnia and Herzegovina, responsibilities for state ownership policy are exercised separately by the Federation of Bosnia and Herzegovina and Republika Srpska. In the FBiH, state ownership rights are shared between the Federation, the ten cantons and municipalities.

<sup>5</sup> For Bosnia and Herzegovina, SOEs' estimated share of domestic employment is based on IMF (2019<sub>[3]</sub>). For Montenegro, North Macedonia, Kosovo and Serbia, SOEs' share of domestic employment is based on SOE employment data provided by the public authorities in the context of this assessment and total domestic employment figures reported by economies' statistical offices.

<sup>6</sup> This comparison with OECD economies' SOE sectors is only an approximation owing to differences in methodology. For example, OECD figures on SOE employment relate to their share of total non-agriculture employment, whereas figures for the Western Balkans relate to total employment. Using total non-agricultural employment would inflate SOEs' employment share in the Western Balkan economies.

<sup>7</sup> The OECD's recurrent data collection exercise on national SOE sectors has been undertaken three times since 2011, the latest edition being published in 2017 (OECD, 2017<sub>[6]</sub>). It is based on self-reporting by authorities and carried out by the OECD Working Party on State Ownership and Privatisation Practices. The dataset includes information on the number of SOEs held by the central level of government, their sectors of operation and their employment contributions.

<sup>8</sup> In Albania, for example, SOE board nominations are jointly decided by the Ministry of Finance and responsible line ministries, which mitigates the degree of decentralised decision making involving SOEs. Kosovo has centralised ownership rights over its main portfolio of 17 SOEs under the Ministry of Economy

and Finance, while many of Montenegro's SOEs are overseen by several state funds that do not exercise regulatory functions.

<sup>9</sup> For example, in Montenegro, according to monitoring by the Securities Commission, only an estimated 50% of state-owned joint-stock companies respect applicable disclosure requirements (OECD, 2018<sup>[5]</sup>). Similarly, a recent IMF assessment of SOEs in Bosnia and Herzegovina found that a significant proportion of SOEs do not make their financial statements available in a timely manner (IMF, 2019<sup>[7]</sup>).

<sup>10</sup> For example, recent state audits of Kosovo Telecom found that their financial statements did not present a fair view of their financial situation.

<sup>11</sup> The six shareholder rights examined in the Doing Business index are: 1) shareholder approval requirements for the sale of 51% of company assets; 2) the right of shareholders holding 10% of shares to call a meeting of shareholders; 3) the requirement to obtain shareholder approval for new share issuance; 4) whether existing shareholders have pre-emptive rights to purchase newly issued shares; 5) the right of shareholders to select and dismiss the external auditor; and 6) whether shareholders that hold a separate class of shares must approve any changes to the rights attached to such shares.

<sup>12</sup> Although the World Bank's extent of shareholder rights index explicitly excludes state-owned companies from its assessment, the findings are still considered relevant in the case of SOEs, as usually SOEs are not, at least explicitly, excluded from the provisions of domestic company law or listing rules applicable to corporations owned by non-state investors. For the broader "extent of shareholder governance" index, which comprises scores for "extent of shareholder rights", the World Bank does not assign a score for economies where the stock exchange does not have at least 10 listings that are not state-owned.

<sup>13</sup> An example is the case of Kosovo Telecom, which was involved in a dispute with the private mobile services operator Z-Mobile. Z-Mobile alleged that the state-owned Kosovo Telecom was not respecting its contractual responsibilities to provide access to network infrastructure. The dispute went to international arbitration, which concluded in favour of the private operator. More information on the Kosovo Telecom dispute is available here: <https://www.reuters.com/article/kosovo-telecom-court/state-owned-kosovo-telecom-may-face-bankruptcy-after-court-ruling-says-ceo-idUSL5N1EG23Y>.

<sup>14</sup> The public authority previously announced its intention to privatise Kosovo Telecom in 2019, but the privatisation has not taken place and the authorities report that the enterprise's performance will need to improve prior to privatisation to increase the company's attractiveness to potential investors.

<sup>15</sup> The Privatisation Agency of Kosovo holds administrative rights in an estimated 500+ formerly "socially-owned enterprises" for which the mandate to eventually privatise remains in place, but the authority does not currently have any announced plans to privatise any the state's "main" portfolio of 18 SOEs. The Macedonian authorities reported that they do not currently have an active privatisation programme in place and that the Macedonian Privatisation Agency was disbanded in 2005, with responsibilities for its remaining portfolio of enterprises divided among other public institutions and ministries.

# 10 Education policy (Dimension 7)

---

This chapter assesses the education policy settings, strategies, processes, and institutions in the six Western Balkan economies (WB6). After a brief overview of progress since the last Competitiveness Outlook (CO) assessment in 2018, the chapter focuses on four sub-dimensions. The first, early childhood and school education, considers the quality of pre-university education from preschool upwards. The second, teachers, looks at the selection, initial training and ongoing development and management of the teaching workforce. The third, vocational education, and training (VET) considers how this key sector is governed, and the roll out of work-based learning across the region. The final sub-dimension, tertiary education, considers the equity of access to higher education and how relevant it is to the labour market for those who do attain it. A cross-cutting sub-dimension on system governance focuses on how the WB6 economies govern and manage their education systems across the board, including strategies and policies for the improvement of their overall performance. Each of these sub-dimensions includes suggestions to improve performance in education policy and in turn foster greater labour productivity and social inclusion, key long-term drivers of competitiveness.

---

## Key findings

- **All of the WB6 economies have seen increasing coverage of early childhood education (ECE)**, with significant increases recorded in Kosovo, Montenegro, North Macedonia and Serbia. However, despite this positive trend and various efforts to increase coverage, enrolment rates in pre-primary education in the WB6 economies remain below the EU and OECD averages.
- **Most of the WB6 economies have strategies to address the quality of pre-university education.** However, they vary in the comprehensiveness, implementation and monitoring of their policy frameworks. All the WB6 economies have developed or are developing competency-based curricula and learning standards, which many are using to facilitate the examination and comparability of students' achievements.
- **The WB6 economies have made significant progress in reducing the rate of early school leaving.** However, the percentage of pupils who leave education early is still very high in Albania and Kosovo, around 10-20 percentage points (p.p.) higher than the EU and OECD averages. It is however, encouraging that these economies have seen the most significant decline in early school leavers in the region since the last Competitiveness Outlook assessment.
- **In most WB6 economies, teachers' educational attainment is lower than the EU and OECD average** as, except in Albania and Serbia, the overwhelming majority of teachers only have bachelor's degrees. Despite efforts to encourage and improve teachers' participation in professional development and important reforms, participation in professional development remains below the EU and OECD averages.
- **The WB6 economies have made progress in strengthening vocational education and training (VET) governance and work-based learning (WBL).** However, performance disparities in core literacy and numeracy skills remain high between students in VET and general programmes, and data collection and reporting on VET sectors could be improved. A significant achievement by most economies has been the introduction of dual-education systems, which has helped promote WBL opportunities.
- **Improving equity in access to higher education and the labour market relevance of higher education continue to be challenges.** Despite efforts made and policies in place, employment rates among recent graduates remain below the EU and OECD average and policies to reduce inequity have so far had mixed results.
- **All the WB6 economies, except for Bosnia and Herzegovina, have developed an education management information system (EMIS)** to centralise and facilitate the collection and management of data for various indicators across the education system. Nevertheless, data collection remains a key challenge in several areas (such as in VET and tertiary education). Furthermore, the WB6 economies do not systemically exploit the data they do collect, to analyse education policies or comprehensively report on overall progress to inform policy making.

## Comparison with the 2018 assessment

All the WB6 economies have improved their scores for the education policy dimension since the last assessment (Figure 10.1). The regional average score increased from 2.5 in 2018 to 3 in 2021. The strongest improvements were registered in Albania, Kosovo and Serbia.

**Figure 10.1. Overall scores for the education policy dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators and restructuring of sub-dimensions. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Since the last Competitiveness Outlook assessment, the WB6 economies have made progress in introducing dual education models into their education systems, thereby promoting and strengthening work-based learning schemes. More moderate progress has been made regarding the promotion of participation in ECE and regarding efforts to increase the attractiveness of the teaching profession and incentivise the professional development of teachers (Table 10.1).

**Table 10.1. Implementation of the CO 2018 policy recommendations: Education policy**

Competitiveness Outlook 2021		
2018 policy recommendations	Main developments during the assessment period	Regional progress status
Increase expenditure on primary and secondary education	<ul style="list-style-type: none"> <li>Public spending on education in general in the WB6 economies remains below the EU and OECD average, and there has been no internationally recorded consistent increase in public spending on education (relative to GDP) since the last assessment.</li> </ul>	Limited
Stimulate participation in ECE, for example by improving provision and affordability	<ul style="list-style-type: none"> <li>Despite strong measures in some WB6 economies (particularly Kosovo and Montenegro) to develop ECE and encourage participation, enrolment rates in pre-primary education, while increasing, remain below the EU and OECD averages.</li> </ul>	Moderate
Invest more in improving the attractiveness of the teaching profession and the participation of teachers in professional development programmes	<ul style="list-style-type: none"> <li>The WB6 economies have made moderate progress in improving the attractiveness of the teaching profession. Most economies have made efforts to improve working conditions of teachers, all have raised salaries,<sup>1</sup> and some have also strengthened recruitment standards.</li> <li>All the WB6 economies have made efforts to incentivise professional development of teachers, but the average participation of teachers in professional development remains below the EU and OECD average</li> </ul>	Moderate

Competitiveness Outlook 2021		
2018 policy recommendations	Main developments during the assessment period	Regional progress status
	(although this is not the case in all WB6 economies).	
Promote and strengthen work-based learning schemes like apprenticeships or internships	<ul style="list-style-type: none"> <li>Most WB6 economies (Albania, Kosovo, Montenegro, North Macedonia, and Serbia) have introduced, or are in the process of piloting, models for dual education, allowing students to undergo professional practices in parallel with their in-school education. This is a significant development as it systematises work-based learning in certain education programmes.</li> </ul>	Advanced
Make efforts to reduce skills mismatches	<ul style="list-style-type: none"> <li>Limited progress has been made in this area: The labour market relevance of higher education remains a significant challenge and employment rates of recent graduates are below the EU and OECD average.</li> </ul>	Limited

1: Data not available for Kosovo.

## Introduction

Education is foundational for an economy's competitiveness as it forms the basis of its human capital and allows individuals to develop the skills needed to adapt to changes in the labour market. Theories of economic growth have pointed to education and human capital as key determinants of long-term growth (OECD, 2010<sup>[1]</sup>). This is particularly relevant in the context of the COVID-19 pandemic, as a well-educated and skilled workforce is a key pillar of an economy's resilience (OECD, 2020<sup>[2]</sup>).

Strong and inclusive education systems are essential for the development of the WB6 economies. A qualified workforce is indispensable for an economy's integration into global value chains and production processes, and is a boost to labour productivity and therefore overall competitiveness. As a vector of social inclusion, education is also essential for ensuring social cohesion. This is particularly important in the WB6 economies, which see differences in performance among students based on criteria such as gender, ethnic minority origin and geography (OECD, 2020<sup>[3]</sup>). The 2018 Programme for International Student Assessment (PISA) suggests that the WB6 economies also continue to have a large share of students who complete school without achieving the minimum levels of literacy and numeracy needed to succeed in work and life. However, the region is making efforts to align with EU education standards, which is helping drive reforms that promise to improve learning outcomes and better equip individuals with the skills and competencies needed to succeed in the changing world of work.

This chapter looks at the policies and strategies the WB6 economies have adopted to improve their education systems, assesses their progress in implementing the previous Competitiveness Outlook recommendations and provides policy advice based on the new education policy assessment framework. Education policy is closely related to other policy areas addressed in this publication, in particular:

- **Chapter 4. Investment policy and promotion.** Domestic and foreign direct investment (FDI), depends on a skilled local workforce in the key sectors attracting investment.
- **Chapter 5. Trade policy.** Integrating the WB6 economies with dynamic global value chains generates both opportunities and risks for education systems.
- **Chapter 11. Employment policy.** Employment is influenced by the quality of the labour force, which is largely determined by the education system. Employment rates are very closely related to education levels and unemployment predominantly affects the poorly educated. Higher levels of educational attainment, on the other hand, bring substantial returns, such as higher employment rates and relative earnings (OECD, 2020<sup>[2]</sup>).
- **Chapter 12. Science, technology and innovation.** Research and innovation are key to improving the allocation of scarce resources and identifying new solutions to social and economic challenges. These sectors need highly educated and trained professionals to act as scientists, technicians and

innovators. An education system that allows individuals to develop their talents and skills is a prerequisite for a highly qualified workforce of science, technology, and innovation professionals.

- **Chapter 13. Digital society.** Information and communication technology is profoundly and rapidly transforming the world of work and society more broadly. Education must play a key role in allowing individuals to adapt to a rapidly evolving labour market and world around them. Digital technologies have also become the bedrock of many education systems as a result of the COVID-19 pandemic, and their use will certainly be more widespread and integrated in the future.
- **Chapter 18. Tourism policy.** An economy's cultural, historical and natural resources can all attract foreign and domestic visitors and support economic activity. A qualified workforce is a cornerstone of an effective tourism policy, as many of the sectors that benefit from and support tourism (such as hospitality, culture and overall tourism management) are dependent on vocational education and training to provide specialised and well-trained workers.

## Assessment framework

### Structure

This chapter assesses policies to improve education in the WB6 by assessing four broad sub-dimensions:

1. **Sub-dimension 7.1: Early childhood and school education<sup>1</sup>** assesses the access and availability of early childhood education (ISCED level 0 under the international standardised classification of education), as a foundation for early development of key competencies for lifelong learning. It also assesses the instruction systems and quality assurance mechanisms of schools in the WB6 economies. Finally, it assesses efforts to tackle early school leaving.
2. **Sub-dimension 7.2: Teachers** assesses the teaching workforce of the WB6 economies, by looking at progress made in strengthening initial teacher education (ITE) accreditation criteria and selection processes, as well as efforts to improve continuing professional development of teachers.
3. **Sub-dimension 7.3: Vocational education and training** looks at efforts to make improvements to the governance systems for VET in the WB6 economies, as well as the promotion and strengthening of work-based learning as a key driver of students' skill development.
4. **Sub-dimension 7.4: Tertiary education** assesses the WB6 economies' progress in ensuring greater equity in access to tertiary education for students coming from disadvantaged groups or backgrounds. It also assesses efforts to improve labour market relevance and outcomes of tertiary education in the WB6 economies through making higher education more competitive and ensuring its quality and synchronisation with labour market needs.
5. **Cross-cutting sub-dimension: System governance** assesses the WB6 economies' efforts to improve the overall holistic management of their education systems, through the introduction and development of data management systems and strengthening of policy monitoring, as well as the development of qualifications frameworks.

The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. Figure 10.2 shows how these sub-dimensions and indicators make up the assessment framework. For more information, see the Methodology and assessment process chapter.

The leaders of the WB6 endorsed the Common Regional Market (CRM) 2021-2024 Action Plan (AP) at the Berlin Process Summit held on 10 November 2020 in Sofia. The Action Plan is made up of targeted actions in four key areas: 1) a regional trade area; 2) a regional investment area; 3) a regional digital area; and 4) a regional industrial and innovation area.

In the regional trade area, the WB6 economies commit to closely align rules and regulations with the core principles governing the EU Internal Market based on the “four freedoms”, enabling goods, services, capital and people to move more freely across the region. Mobility of students and researchers is a key component of the free movement of people. The findings in the tertiary education sub-dimension can inform the implementation of the actions under this component (see Box 10.4).

### **Key methodological changes to the assessment framework**

The assessment framework for the education policy dimension has changed slightly from the previous assessment cycle. The framework was re-arranged to include four sub-dimensions instead of three. The previous assessment cycle's first sub-dimension, access to and participation in high quality education, was divided into two sub-dimensions (early childhood and school education, and teachers) in order to better cover and expand on these key policy areas. A cross-cutting sub-dimension on system governance has also been added.

## Education performance and context in the WB6

High standards of education and competencies have many benefits for an economy and society. While education is not the only factor determining productivity, it plays an important role in skill formation and the availability of skills in the labour market. (OECD, 2019<sup>[4]</sup>). Growth in an economy or sector can come either from increased employment or more efficient work, i.e. improved labour productivity. Figure 10.3 shows that labour productivity, as measured by GDP per person employed, was lower in the WB6 economies than the CEEC-11,<sup>2</sup> EU or OECD averages between 2015 and 2019. On average, the Western Balkan economies' GDP per person employed was only 46% of the OECD average in 2019.

**Figure 10.3. GDP per person employed (2015-19)**

Constant 2017 PPP USD

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia. All WB6 and CEEC-11 averages in this chapter have been calculated as simple averages.

Source: (ILO, 2020<sup>[5]</sup>), ILOSTAT database, [ilostat.ilo.org](https://ilostat.ilo.org).

StatLink  <https://doi.org/10.1787/888934253917>

Educational attainment is frequently used as a measure of human capital and thus as a proxy for the skills available in the labour force. Figure 10.4 shows levels of educational attainment in the working-age population (aged 15 and over) by gender. The share of tertiary-educated individuals in the WB6 economies is 9 percentage points (p.p.) below the EU average. However, except in Albania, women in the WB6 economies, as in the EU, are more likely to have a tertiary degree than their male peers. This gender gap is most pronounced in Kosovo, where 42.4% of women had a tertiary education, but only 19% of men.

**Figure 10.4. Highest educational attainment by gender (2019)**

% of working-age population 15 years old and over

Note: Data based on labour force surveys. In Albania, 21.4%/13.3% of female/male respondents did not specify their level of education. EU average calculated as a simple average by the author. On average across the EU, 0.46% of respondents did not specify their level of education. Level of education refers to the highest level completed, classified according to the 2011 International Standard Classification of Education (ISCED). Primary and lower secondary education refers to ISCED levels 1-2; upper secondary or post-secondary non-tertiary education to ISCED levels 3-4; and tertiary education to ISCED levels 5-8.

Source: (ILO, 2020<sup>[5]</sup>), ILOSTAT database, [ilostat.ilo.org](https://ilostat.ilo.org).

StatLink  <https://doi.org/10.1787/888934253936>

All the WB6 economies participated in the 2018 PISA. The results found that they all have room to improve the quality of their education as the mean scores of 15-year-old students were well below the OECD averages (Figure 10.5). The results also revealed important disparities in learning outcomes. Across the WB6 economies, the differences in science, reading and mathematics performance between girls and boys are more pronounced than in the average OECD country. For example, in reading, girls in the WB6 economies outperformed boys by 35.1 score points on average, compared with a gap of only 29.7 score points on average in OECD countries. Most strikingly, in North Macedonia girls outperformed boys in reading by 51.6 points, the fourth highest gender gap across all the 77 countries and economies with available data that participated in the 2018 PISA.

**Figure 10.5. PISA 2018 performance in science, reading and mathematics by gender**

Mean scores

Source: (OECD, 2020<sup>[6]</sup>), PISA 2018 database, [www.oecd.org/pisa/data/2018database](http://www.oecd.org/pisa/data/2018database).

StatLink  <https://doi.org/10.1787/888934253955>

The PISA assessment has a scale of proficiency levels for the different subject domains. All students should be expected to attain Level 2 by the time they leave compulsory education, as this is considered the baseline level of proficiency required to participate fully in society. Students who score below Level 2 are defined by PISA as “low performers”. Figure 10.6 shows that the WB6 economies have a larger share of such low performing students than the OECD average. On average across the WB6 economies in 2018, around one in two students did not attain Level 2 in each of the three domains (science, reading and mathematics) – a much higher share than the average for OECD countries, of about one in five students.

**Figure 10.6. PISA 2018 low achievers in science, reading and mathematics by gender**

% of students scoring below Level 2

Source: (OECD, 2020<sup>[6]</sup>), PISA 2018 database, [www.oecd.org/pisa/data/2018database](http://www.oecd.org/pisa/data/2018database).

## Early childhood and school education (Sub-dimension 7.1)

Early childhood education (ECE) spans a critical window for a child's development which sets the foundation for later success in school, career, and life (UNICEF, 2019<sup>[7]</sup>; European Commission, 2013<sup>[8]</sup>). The benefits of ECE for individual children depends on the quality of provision but high-quality services have been shown to support children's social and emotional well-being, reduce their risks of dropping out of school and even contribute to better learning and employment outcomes later in life (UNICEF, 2019<sup>[7]</sup>; OECD, 2017<sup>[9]</sup>). Children from disadvantaged families stand to benefit the most from high-quality ECE and the return on investment from interventions during the early years are more significant than those that occur later on (OECD, 2017<sup>[9]</sup>). Moreover, children's participation in ECE offer greater opportunities for mothers and other caregivers to participate in the workforce, increasing household earnings and breaking cycles of intergenerational poverty (UNICEF, 2019<sup>[7]</sup>; OECD, 2017<sup>[9]</sup>).

Strong instructional systems hold schools accountable for educational quality and provided feedback to help improve teaching and learning practices (OECD, 2013<sup>[10]</sup>). Achieving this requires identifying areas of poor performance and providing additional resources to support the most disadvantaged schools and students. To improve overall learning outcomes, instructional systems should be highly coherent, with the curriculum, learning standards and student assessments all clearly aligned (Tucker, 2016<sup>[11]</sup>).

Preventing early school leaving is also key to ensuring the good functioning of the education system as individuals who leave education and training before completing upper secondary school, and who no longer participate in formal learning processes, face increased risks of unemployment, social exclusion, poverty and poor health (European Commission, 2019<sup>[12]</sup>).

The WB6 economies scored an average of 3 for this sub-dimension. Overall, Bosnia and Herzegovina and North Macedonia scored lower than the other economies in the region. However, all the WB6 economies could make more effort to strengthen their instructional systems (where Kosovo and Montenegro also have significant room for improvement) and ECE policies (Table 4.3. Scores for Sub-dimension 1.1: Investment policy framework).

**Table 10.2. Scores for Sub-dimension 7.1: Early childhood and school education**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 7.1: Early childhood and school education	Early childhood education	3.0	2.0	3.5	2.5	3.5	2.5	2.8
	Instructional system	4.0	2.5	2.5	2.5	2.0	4.0	2.9
	Prevention of early school leaving	3.0	2.0	4.5	2.0	4.0	4.0	3.3
<b>Sub-dimension average score</b>		3.3	2.2	3.7	2.3	3.2	3.5	3.0

### ***The WB6 economies have strengthened their early childhood education policies***

Although enrolment in pre-primary education (ISCED 02) has increased in the six Western Balkan economies, it remains on average around 40 percentage points below the EU and OECD averages, ranging from 25% in Bosnia and Herzegovina to 76% in Albania (Figure 10.7).

**Figure 10.7. Gross enrolment ratio, pre-primary (ISCED 02), both sexes (2018)**

Note: Data for Bosnia and Herzegovina as of 2019 due to unavailability of 2018 data. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934253993>

Implementing ECE policies, such as increasing coverage and reducing reliance on donor funding, remain key challenges for the sector. On average, the WB6 economies achieved a score of 2.8 for the early childhood education indicator, ranging from 2.0 (Bosnia and Herzegovina) to 3.5 (Kosovo and Montenegro). The WB6 economies scoring over 3.0 for this indicator (Kosovo and Montenegro) have distinguished themselves by having more ambitious policies for improving access to ECE via strong financial support for covering participation costs for parents in general, and socio-economically vulnerable groups in particular. However, as in all other WB6 economies, donor-funded initiatives continue to play a very important role in delivering ECE in both these economies.

All the economies have a strategic and legal framework in place addressing ECE and since the last Competitiveness Outlook assessment, several have also introduced ECE curriculum frameworks, promising to help improve the quality of ECE provision. In 2018, Albania introduced a new competency-based pre-school curriculum framework, which aligns with contemporary child development theories and practice, and Bosnia and Herzegovina introduced curriculum guidelines based on learning outcomes to help ensure continuity in children's transition from ECE to primary education. Also in 2018, Serbia introduced a new preschool curriculum framework that aims to support the well-being of young children and promote continuity between pre-school and primary education, while the government in North Macedonia adopted the Education Strategy 2018-25 and its corresponding action plan, which sets out activities to improve the quality and equity of ECE (although it does not connect the goals and curricula of ECE with those at primary school level). Montenegro has general curriculum guidelines in place to ensure continuity in children's transition from ECE to primary education. Curriculum frameworks in Kosovo are more specific, as the Early Childhood Education and Development and Early Childhood Development and Learning Standards describe clear expectations for child behaviour and performance in different areas of development and early learning. All the economies also have professional requirements and standards for ECE staff, which aim to ensure the quality of service delivery. ECE participation in Bosnia and Herzegovina is particularly low for the region, and is hampered by a number of factors, such as challenges with municipal financing and low parental awareness about the importance of ECE. The inconsistent design and implementation of ECE policies across the different entities and cantons further exacerbates these challenges, despite efforts to harmonise ECE quality and delivery (notably through the 2007 Framework Law on Preschool Care and Education in Bosnia and Herzegovina, and the state-level Platform for the Development of Preschool Education for 2017-22).

Despite the potential benefits of lowering the starting age of compulsory education to include one year of ECE, pre-primary education (ISCED 02) is still not compulsory in Albania, Bosnia and Herzegovina,<sup>3</sup> Montenegro and North Macedonia. Kosovo aims to make pre-primary education compulsory through the adoption of a new law on early childhood education, which is expected by the end of the year.

### ***Policies and measures to improve instructional systems vary widely across the region***

On average, the WB6 economies achieve a score of 2.9 for the instructional system indicator, with most WB6 economies scoring between 2.0 (Montenegro) and 2.5 (Bosnia and Herzegovina, Kosovo, and North Macedonia). Albania and Serbia score far higher, lifting the regional average for this indicator, mainly thanks to a more comprehensive strategic vision for the education sector and better-developed school performance monitoring, with targeted supports to schools and school leaders.

All the WB6 economies have strategies which set out a vision for improving the quality of pre-university education, but they differ in their scope, accompanying action plans and the monitoring of their implementation. For example the recently expired strategies of Albania and Serbia (both ended in 2020) comprehensively covered all sectors of pre-university education. Their implementation plans included clear goals and implementation timelines for measurable and budgeted actions, while also allocating responsibilities between the different actors involved. In both economies, the implementation of the strategies has also benefitted from monitoring and evaluation, in Albania by an external expert organisation (UNICEF), and both economies are preparing new comprehensive long-term education strategies at the time of writing.

While Kosovo's Quality Assurance Strategy for Pre-University Education 2016-20 possesses similar characteristics (clear and measurable targets, allocations of responsibilities, a budget and timeline for proposed activities), neither its implementation, nor Kosovo's instructional system as a whole, has been evaluated comprehensively. North Macedonia's Comprehensive Education Strategy 2018-25 and its action plan set out objectives and activities for improving educational quality and inclusion, but they do not define clear budgets or monitoring processes (OECD, 2019<sup>[14]</sup>).

In Bosnia and Herzegovina and Montenegro, approaches to improving the quality of education have been more fragmented. Montenegro lacks an overarching strategy that establishes a coherent vision for the school system and instead has multiple strategies, which cover different time periods, topics and levels of education.<sup>4</sup> However, despite this rather fragmented approach, its administrative laws establish clear regulations around the curriculum, assessment, and evaluations. In Bosnia and Herzegovina, significant differences among education authorities contribute to fragmented education policies and resource inefficiencies. There is a Framework Law for Primary and Secondary Education, which requires the various education authorities to co-ordinate and align policies with EU standards and principles but there is no comprehensive state-level education strategy for the school sector. Instead, the Federation of Bosnia and Herzegovina (FBiH) and some individual cantons have policies regarding instructional quality and equity but only the Republika Srpska (RS) has prepared a comprehensive strategic document focused specifically on education.<sup>5</sup>

To improve the quality of education and their instructional systems, Albania and Kosovo have developed and rolled out a competency-based curriculum and corresponding learning standards to all grade levels, while Montenegro, North Macedonia and Serbia are in the process of doing so. In Bosnia and Herzegovina, an important achievement since the last Competitiveness Outlook assessment has been the introduction of the Common Core Curriculum based on learning outcomes, which sets out a model for competent education authorities to modernise their own curricula. However, the extent to which the education authorities have aligned and implemented their curricula to the Common Core varies.

External assessments of student learning, at the state or international level, yield results that can help evaluate the performance of education systems on a regular basis. In addition to growing participation in

international assessments, most WB6 education systems also implement or are developing external assessments or examinations to help determine the extent to which students in their economy are achieving core competencies and learning standards.

Comprehensive school evaluations, engaging school leaders and providing additional resources to support the most disadvantaged schools and students, can strengthen the overall quality of instructional systems and improve educational equity. All the WB6 economies have legal frameworks regulating school evaluations based on defined set of performance indicators, but they differ in the scope of indicators used, the methods used to evaluate schools externally and how the results of evaluations are used, including for additional support to low-performing schools (see the Competitiveness Outlook 2021 profiles of the different economies for more information).

Since the last assessment, Albania and Serbia have undertaken significant reforms to their school quality evaluations. In Albania, the education ministry's Quality Assurance Agency is now reviewing the School Performance Card (a set of indicators used to rank individual schools) to ensure this data reflects contextual factors and is relevant to instructional quality. Albania has also established the Centre for School Leadership, which aims to support the preparation and professional development of school leaders. In Serbia, school quality standards were revised in 2017-18 to ensure that all students receive a good quality education. These standards are supported by a strong school evaluation framework that includes both self-evaluation and external evaluations, modelled on inspection systems found in other European countries. Serbia also has policies to provide additional support to low-performing schools (e.g. through expert assistance or small grants), although they remain in the pilot phase due to resource limitations.

### ***Early school leaving rates have fallen across the region***

All the WB6 economies have taken measures to reduce early school leaving, leading to an average score of 3.3 for the prevention of early school leaving indicator. Between 2013 and 2018, the share of students leaving school without an upper secondary education has declined in all WB6 economies (Figure 10.8). The greatest reductions have been observed in Albania (13.2 p.p.), Kosovo (8.8 p.p.), and North Macedonia (4.3 p.p.), but despite this, their early school leaver rates still stood above the WB6 average of 8.5% in 2018. In contrast, the shares of early school leavers in Montenegro (4.6%), Bosnia and Herzegovina (5.4%) and Serbia (6.8) are below the CEEC-11 (8.4%) and EU (10.5%) averages.

**Figure 10.8. Percentage of early school leavers (2013 and 2018)**

% of 18-24 year-olds with at most lower secondary education (ISCED 2) who were not in further education or training

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Eurostat, n.d.<sup>[15]</sup>), *Candidate countries and potential candidates' database*, <https://ec.europa.eu/eurostat/web/enlargement-countries/data/database>; (Eurostat, n.d.<sup>[16]</sup>), *Education and training database*, <https://ec.europa.eu/eurostat/web/education-and-training/data/database>.

StatLink  <https://doi.org/10.1787/888934254012>

Data for North Macedonia and Serbia show significant differences in the extent of early school leaving in cities and rural areas, unlike in EU countries on average (Table 10.3). However, while the early school leaving rate in Serbia was much higher in rural areas than in cities, as with the CEEC average, the opposite is the case in North Macedonia.

**Table 10.3. Early school leavers by degree of urbanisation (2019)**

% of 18-24 year-olds with at most lower secondary education (ISCED 2) who were not in further education or training

	Total	Cities	Towns and suburbs	Rural areas
MKD	7.1	9.2	6.1	6.3
SRB	6.6	3.2	7.3	9.3
CEEC-11 average	8.3	4.5	9.9	11.2
EU average	10.3	9.4	11.3	10.6

Note: Data for Albania, Bosnia and Herzegovina, Kosovo, and Montenegro are not available. The CEEC-11 are the 11 Central and Eastern European countries joining the EU: Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia. EU includes all EU Member States in 2019. The degree of urbanisation is based on the share of local population living in urban clusters and in urban centres and classifies Local Administrative Units into three types of area: 1) cities (densely populated areas where at least 50% of the population lives in urban centres); 2) towns and suburbs (intermediate density with less than 50% of the population living in rural grid cells and less than 50% of the population in urban centres); and 3) rural areas (thinly populated areas where more than 50% of the population lives in rural grid cells).

Source: (Eurostat, n.d.<sup>[15]</sup>), *Candidate countries and potential candidates' database*, <https://ec.europa.eu/eurostat/web/enlargement-countries/data/database>; (Eurostat, n.d.<sup>[16]</sup>), *Education and training database*, <https://ec.europa.eu/eurostat/web/education-and-training/data/database>.

All the WB6 economies address early school leaving in their education strategies and have legal requirements aimed at keeping students in formal education and training pathways. However, there are differences in the extent to which measures to prevent early school leaving are budgeted and implemented, as well as how the relevant data are collected and analysed to identify the specific factors that contribute to early school leaving in each economy.

Kosovo, Montenegro and Serbia have performed particularly well in policies addressing early school leaving, as they all have budgeted activities to reduce and prevent early school leaving in a high-level strategic document, and implement measures that target at-risk learners to help keep them in school. Moreover, these three economies have recently improved their monitoring systems to better identify students at risk of early school leaving, with partial support from international donors. In 2017, Kosovo introduced an Early Warning System of Abandonment in its education management information system (EMIS), while Montenegro refined its indicators to more closely monitor student attendance and eventual abandonment. Serbia has recently developed indicators for monitoring the accessibility of institutions and identifying children who need additional support. All three economies also provide career guidance activities at both primary and secondary level, to help connect students with education and training programmes that align with their skills and interests.

Albania, which scores slightly below the regional average for this indicator, also implements some measures to prevent early school leaving. In 2017, the Ministry of Education, Sports and Youth conducted a study and identified several factors that contributed to Albania's high rates of school abandonment. Donor agencies have supported Albania to develop indicators and collect data to better monitor students at risk of early school leaving and in July 2019, Albania published a manual for monitoring children outside education institutions and at risk of dropping out of school, with support from UNICEF. However, career guidance activities in Albania only seem to be offered by higher education institutions, although there are efforts under way to introduce them at the secondary school level.

Bosnia and Herzegovina and North Macedonia achieve a score of 2 for this indicator. North Macedonia's Comprehensive Education Strategy and the Inclusion of Out-of-School Children project propose measures that could help reduce early school leaving and allocate responsibilities for implementation. However, these efforts appear to be largely supported by donor funding, with no evaluations of their implementation and effectiveness, or whether implementation is taking place within the planned timeline. North Macedonia collects only a limited range of data to monitor this issue and better understand the factors contributing to young people leaving education or training early. Bosnia and Herzegovina has no state-level strategy or policy that explicitly addresses early school leaving, as the entities and cantons have sole responsibility for such policies. However, the Ministry of Civil Affairs adopted the Recommendations for Inclusive Education in Bosnia and Herzegovina in 2019, which calls for measures and activities aimed at retaining students in the education system. The individual authorities collect their own data to monitor early school leaving and the FBiH has studied this issue in depth, finding that Roma children are especially vulnerable to leaving school early. However, the data available are limited and collected using inconsistent definitions across jurisdictions, making it difficult to accurately report on this issue, understand the contributing factors, and implement early interventions at the student and school level. North Macedonia has also made efforts to reduce the early school leaving rate of Roma children, who are particularly vulnerable, by engaging mediators to help bring students back to school or prevent them from leaving school.

### ***The way forward for early childhood and school education***

- **Continue efforts to increase ECE coverage by making it more affordable and accessible.** Albania, Bosnia and Herzegovina, Montenegro, and North Macedonia could aim to make pre-primary education compulsory, as Serbia has done, and Kosovo aims to do.
- **Improve the affordability of ECE by linking prices to household income.** The WB6 economies could follow the example of Norway (Box 10.1) and limit the price of ECE to a percentage of the family's income, with the government financing costs that exceed this threshold.
- **Reduce dependence on donor assistance for financing ECE infrastructure and accessibility.** This could be achieved through making ECE funding a regular part of public spending on education, as well as by engaging the private sector.

### Box 10.1. Early childhood education funding in Norway

Norway has two types of ECE settings: kindergartens (*barnehage*) and family child care (*familiebarnehage*), which can be managed publicly or privately. More than 98% of children enrolled in ECE attend kindergartens and less than 2% are in family child care. Kindergartens in Norway are integrated pedagogical settings providing ECE for children aged 0-5.

Both publicly and privately managed ECE settings in Norway are mostly funded by public sources. Only 15% of Norway's total expenditure on early childhood education and care (ECEC) comes from private sources, including fees paid by parents/guardians. Both national and municipal governments in Norway have made efforts to expand access and support equality of participation, particularly for low-income and minority-language families through fee reductions and legal entitlements, as part of the kindergarten reform 2004-09. This was achieved through increased public funding, which reduced parental contributions to operating costs. Nationally, there is a maximum price (for all children) of NOK 3 040 (EUR 304) monthly (adjusted in August 2019).

To better target low-income families, a regulation was introduced in 2015 stating that the maximum annual fee shall not exceed 6% of the family income. If the fee does exceed this, the excess is covered by the state rather than by municipalities (as used to be the case). The national regulations also stipulate lower fees for siblings with reductions of 30% of the annual fee for the second child and 50% for the third child.

Municipalities are responsible for ensuring that these regulations are applied by all kindergartens (both public and private) and for compensating private providers for the reduced fees. Although participation among minority-language children continues to be lower than for all children, the gap is closing. In 2018, according to national authorities, 83% of minority-language children aged 1-5 attended ECEC, an increase of 2.5 percentage points compared to 2017. For all children, the participation rate was 92%.

- Ensure that policy frameworks for improving pre-university education have measurable and budgeted objectives, and that they are regularly monitored.** Some good practice examples can be taken from the strategies of Albania and Serbia, and also from Ireland's Action Plan for Education (Box 10.2). Recent OECD education policy reviews provide insights into how the economies' education systems could improve the focus and effectiveness of strategic documents. Kosovo should pay particular attention to these criteria as it develops its new education strategy post 2021 and Montenegro could consider developing an overarching education strategy to synchronise the objectives of various policy documents that exist for different levels of education. Bosnia and Herzegovina could also consider drafting a state-level framework strategy for pre-university education, with the goal of aligning education policies with EU standards and principles.

### Box 10.2. Ireland’s indicator framework for the Action Plan for Education 2018

Ireland’s Action Plan for Education 2018 accompanies the economy’s national education strategy for 2016-19, setting out priorities and actions that the Department of Education and Skills and its technical agencies should undertake during the year. The action plan clearly aligns each action and sub-action to the economy’s five main goals for improving the quality of its education system. Each goal is associated with a list of actions and a set of indicators that are used to measure progress. For example, the first goal – “improve the learning experience and the success of learners” – identifies six objectives, followed by indicators, as in the table below.

Objectives	Indicators
1.2 Deliver a “step change” in the development of critical skills, knowledge and competencies to provide the foundations for participation in work and society	Increase the percentage of students taking higher-level maths at the end of Junior Cycle: 60% by 2020
	Increase the proportion of students performing at Level 5 or above for reading in PISA: 12% by 2020
	Decrease the proportion of students performing below Level 2 for science in PISA: < 10 by 2025
	Increase the proportion of students performing at Level 5 or above for mathematics in PISA: 13% by 2020
1.6 Enable learners to communicate effectively and improve their standards of competency in languages	Percentage of candidates presenting a foreign language at the Junior Certificate/ Cycle Examination: 100% by 2026, 92% by 2022
	Students studying a foreign language as part of their HE course: Support 20% of all HE students to study a foreign language as part of their course (2026)
	Students doing Erasmus +: 4 100 HE students (2018/19)

Source: extracted from (Maghnouj et al., 2019<sup>[19]</sup>) *OECD Reviews of Evaluation and Assessment in Education: Serbia*, <https://doi.org/10.1787/225350d9-en>; (Government of Ireland, 2018<sup>[20]</sup>), *Action Plan for Education 2018*, [www.gov.ie/en/collectio/d3b2f1-action-plan-for-education-2018/](http://www.gov.ie/en/collectio/d3b2f1-action-plan-for-education-2018/).

## Teachers (Sub-dimension 7.2)

Coherent and comprehensive systems of initial teacher education (ITE) can better prepare teachers to deliver high-quality instruction and help all students reach their full potential (OECD, 2019<sup>[21]</sup>). Such systems aim to attract and select the best candidates into teacher education, helping to raise the profession’s status and contributing to a high-quality teaching workforce. While initial education provides an important foundation for new teachers, continuous staff development helps to improve the quality of the workforce and retain effective staff over time. Professional development must enable teachers to refresh and broaden their knowledge and practice throughout their careers. To this end, many OECD and EU countries have used teacher standards to develop management systems that provide teachers with clear feedback on their performance and connect them with relevant training and support (OECD, 2019<sup>[21]</sup>; OECD, 2013<sup>[10]</sup>). When combined with a differentiated career structure, this can create incentives for teachers to develop their skills and help accelerate system-wide improvement by directing the most experienced teachers towards mentorship and leadership roles.

The WB6 economies scored an average of 2.7 for this sub-dimension, with Albania, Montenegro and Serbia scoring above the regional average. However, performances remain uneven with Serbia scoring

the regional average for the ITE indicator but well above it in the professional management and development of teachers indicator, showing it has room to strengthen its ITE policies (Table 10.4).

**Table 10.4. Scores for Sub-dimension 7.2: Teachers**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 7.2: Teachers	Initial teacher education and selection	3.5	1.5	2.0	2.5	3.0	2.5	2.5
	Professional management and development	3.5	1.5	2.5	2.5	3.5	4.0	2.9
<b>Sub-dimension average score</b>		3.5	1.5	2.3	2.5	3.3	3.3	2.7

### ***Entry and accreditation standards for initial teacher education could be strengthened***

On average the WB6 economies achieved a score of 2.5 for the initial teacher education indicator, ranging from 3.5 for Albania to 1.5 for Bosnia and Herzegovina. Across the region, only Albania and North Macedonia have minimum entry requirements for selecting ITE candidates. All ITE candidates in Albania must have a minimum grade point average of 7.5 out of 10. In North Macedonia, the Law on Higher Educational Institutions for Teaching Education Staff in Preschool Education, Primary and Secondary Education, sets minimum entry requirements (based on State Matura results), but its policies have not been implemented because of insufficient human and financial resources. Placement quotas (a common feature of all tertiary programmes in North Macedonia) are very large for ITE, meaning nearly everyone who applies for a place is accepted (OECD, 2019<sup>[14]</sup>). In the four other WB6 economies, higher education institutions (HEIs) have full autonomy over entry requirements for ITE candidates.

In Albania and Serbia, all primary and secondary school teachers are required to have a master's degree (ISCED 7), while in North Macedonia and Montenegro they are required to have achieved at least a bachelor's degree (ISCED 6). In Bosnia and Herzegovina specific qualification requirements for teachers vary across entities and cantons, but all future teachers must have at least a bachelor's degree and attend study programmes to gain pedagogical knowledge and teaching qualifications. In Kosovo, by-laws establish minimum educational requirements for teachers in each level of education and subject area.

The OECD's 2018 PISA assessment asked school principals how many of the teachers in their school were fully certified by an appropriate authority and had attained at least a master's degree. Figure 10.9 shows that that on average, 26.4% of surveyed school principals in the Western Balkans reported that teachers in their school had at least a master's degree, a much lower share than the CEEC (70.6%), EU (54%) and OECD averages (44.6%).<sup>6</sup>

**Figure 10.9. Teacher qualifications (PISA 2018)**

Based on principals' reports

Note: Certified teachers are those licensed to teach in a school based on the standards defined by national or local institutions. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (OECD, 2020<sup>[6]</sup>), *PISA 2018 database*, [www.oecd.org/pisa/data/2018database](http://www.oecd.org/pisa/data/2018database).

StatLink  <https://doi.org/10.1787/888934254031>

Statistical data provided by Western Balkan education ministries and/or statistical offices for this Competitiveness Outlook assessment show that, in 2019, the share of teachers with at least a master's degree was much higher (i.e. teachers had higher qualification levels), in Albania and Serbia (since, as mentioned above, this is a requirement in these economies) than in the other Western Balkan economies with available data (Figure 10.10).<sup>7</sup>

**Figure 10.10. Teachers with a bachelor's or master's or higher degree (2019)**

Note: For Bosnia and Herzegovina, data only available for Republika Srpska (BIH-RS). Data for Kosovo not available.

Source: Data provided by WB6 statistical offices for this assessment.

The quality of ITE programmes and minimum entry requirements typically vary by individual institutions across most WB6 economies. Accreditation processes that set specific requirements for ITE programmes can ensure that all new teachers receive adequate preparation for their job. Of the WB6 economies, only Kosovo and Montenegro accredit ITE programmes based on professional teacher standards, which provide a common reference point for what "good" teaching is and how it is demonstrated. In Albania, Bosnia and Herzegovina, and North Macedonia, there are no programme-specific accreditation criteria for ITE programmes so ITE providers do not have to demonstrate how their programmes help candidates

develop the specific competencies needed to teach. One positive development in Serbia has been the revision of its national accreditation standards in 2019, establishing a minimum duration for the initial practicum component<sup>8</sup> of ITE programmes. Regardless of accreditation requirements, teacher candidates in all WB6 economies have to complete some form of practical classroom experience under the supervision of a mentor teacher and pass a professional examination before being able to teach as fully certified teachers.

### **Almost all the WB6 economies have made strong progress in improving professional development opportunities for teachers**

While improvements to ITE can help improve the quality of future teachers, governments must also ensure that practising teachers are supported and encouraged to develop throughout their careers. According to data from the 2018 PISA assessment, teacher participation in professional development programmes in the WB6 economies is around 10% lower on average than the EU, OECD and CEEC averages. However, it varies widely across the region, with teachers in some economies (Albania, Montenegro and Serbia) having participation equal to or even higher than the EU, OECD and CEEC average (Figure 10.11).

**Figure 10.11. Participation of teaching staff in professional development (PISA 2018)**

Teaching staff who attended a programme of professional development during the last three months

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (OECD, 2020<sup>[6]</sup>), PISA 2018 database, [www.oecd.org/pisa/data/2018database](http://www.oecd.org/pisa/data/2018database).

StatLink  <https://doi.org/10.1787/888934254050>

The WB6 economies scored an average of 2.9 for the professional management and development of teachers indicator, ranging from 1.5 (Bosnia and Herzegovina) to 4.0 (Serbia). All the WB6 economies except Bosnia and Herzegovina made moderate to strong progress in implementing the previous assessment's recommendations on improving professional development opportunities and structures for teachers. In particular, North Macedonia created a model for the career development and promotion of teachers in primary and secondary education with its Law on Teachers and Professional Associates in Primary and Secondary Schools, adopted in 2019.

The improvement of teachers' professional development is a recognised policy objective in all the WB6 economies. Albania and North Macedonia have included this objective in their respective education strategies, while Kosovo, Montenegro and Serbia have dedicated strategies or regulations for the improvement of teacher professional development and management frameworks. To encourage participation in professional development, all WB6 economies have models for teacher career

advancement. These models often include different professional categories and promotions that are based on years of experience and rewarded with salary increases. However, only some of the WB6 economies (Kosovo, Montenegro, North Macedonia and Serbia) have aligned teachers' career structures with differentiated professional standards and offer incentives that encourage teachers to develop higher levels of competency and take on more advanced teaching roles.

All the WB6 economies legally require teachers to participate in training and professional development activities. They all regularly assess teachers' professional development needs, often based on survey results or government priorities. However, decisions about the types of professional development offered are not systematically informed by the results of teacher appraisal processes. Most WB6 economies have some form of accreditation process for professional development providers, except Bosnia and Herzegovina.<sup>9</sup> Kosovo and Montenegro are the only economies which require teachers to regularly renew their teaching licences and certificates (every five years), which can be a significant motivator for participation in professional development as it is valued in the renewal process.

### ***The way forward for teachers***

- **Build strong accreditation criteria for initial teacher education (ITE) programmes**, tailored specifically to ITE and the requirements of the teaching profession. The economies that lack such criteria (Albania, Bosnia and Herzegovina, and North Macedonia) should develop criteria that are tailored to the teaching profession and demonstrate how programmes prepare candidates to work in schools.
- **Ensure that teachers have clear, progressive career structures**, with differentiated competencies based on categories or ranks that are associated with appropriate rewards to incentive teachers to advance up the career ladder. Currently, only Kosovo, North Macedonia and Serbia have such frameworks. Albania and Bosnia and Herzegovina should develop criteria to help guide teachers' professional development, while Montenegro should align its standards with the existing categories and ranks of teachers in its education system.
- **Provide adequate support and incentives for teachers' continuing professional development**. Such support might include increasing funding for professional development activities, while incentives might include making professional development an integral and mandatory part of the career advancement process or leading to salary increases (see Box 10.3 for examples from Georgia and Italy). Introducing a regular renewal of licences, as is the case in Kosovo and Montenegro, can also motivate teachers to participate in professional development.

### Box 10.3. Encouraging and funding teachers' professional development in Georgia and Italy

The Teacher Professional Development Scheme in Georgia is a key component of the overarching Teacher Recruitment, Evaluation, Professional Development, and Career Advancement Scheme (2015). The scheme offers Georgian teachers career advancement opportunities through differentiation of teacher status: practitioner, senior teacher, leading teacher and mentor. All in-service and new teachers are expected to pass a certifying examination to gain the status of a senior teacher. Teachers are required to participate in a number of mandatory and optional professional development activities to earn credits and thus maintain or enhance their status.

One main constituent of the scheme, introduced in 2016, is an increased number of optional activities replacing mandatory activities for teachers. This gives teachers more flexibility to tailor their professional development based on their needs and interests. Teachers also have a financial incentive to improve their status through participation in professional development activities, as they receive higher salaries based on their status advancement. The programme also stands out by offering teachers the opportunity for self-reflection through self-evaluation, including designing an individual work plan, self-assessment of performance and identifying their professional development needs.

The Italian government is focusing on school-level autonomy as a key lever for educational improvement. Reflecting this orientation, in-service professional development provisions at the school level, and chosen by teachers, are a key feature of the Good School reform (*La Buona Scuola*), introduced in 2015. The reform has made in-service training mandatory, permanent and structural.

These provisions were designed in response to the low participation of Italian teachers in professional development activities. First, the Italian government made a large financial investment (EUR 1.5 billion) exclusively for training in areas of system skills (school autonomy, evaluation and innovative teaching) and 21<sup>st</sup> century skills (such as digital skills, schoolwork schemes) and skills for inclusive education. Second, the programme stands out for its tailored approach and the scope it offers teachers to participate in professional development according to their needs. This is done by providing teachers a sum of EUR 500 per year on their "Teachers Card" to participate in training activities or purchase resources (books, conference tickets, etc.). It also offers a matching processes to align training offers with training demands using a digital platform.

## Vocational education and training (Sub-dimension 7.3)

In addition to the basic competencies learnt in general education programmes, vocational education and training systems play a major role in supplying occupation-specific skills in both quickly expanding economic fields, and in traditional trades – and are therefore fundamental to improving competitiveness. However, the governance of VET is inherently complex, as it covers a range of programmes offered at either upper secondary or post-secondary levels of education (ISCED 3-5) and involves co-ordinating tasks and responsibilities both horizontally across governance levels and vertically between national and local authorities (Bergseng, 2019<sup>[24]</sup>). Effective VET governance also demands strong engagement with social partners and reliable data to develop programmes and determine the number of study and/or training places to balance the supply and demand for skills.

Work-based learning is a key component of VET systems, as it provides a powerful way for learners to acquire professional skills and the key competencies needed for working life. Its effectiveness in easing school-to-work transitions and meeting labour market demand is increasingly recognised internationally (OECD, 2018<sup>[25]</sup>; UNESCO, 2018<sup>[26]</sup>). However, engaging students, employers, social partners and education and training systems in these learning processes remains a significant challenge for many economies around the world, and especially in the Western Balkans, where the transition from centrally planned economies means private sector partnership with state education systems are a relatively new tradition. Such partnerships between VET providers and businesses are critical to the success of WBL models.

Overall, the WB6 economies scored an average of 3.1 for the VET sub-dimension, an improvement over the previous assessment score of 2.2, and reflecting substantial progress in nearly all of them.. Performance across both indicators in this edition of the CO is similar for all WB6 economies, with the notable exception of Montenegro and North Macedonia, which perform slightly better in the VET governance indicator (Table 10.5).

**Table 10.5. Scores for Sub-dimension 7.3: Vocational education and training**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 7.3: Vocational education and training	VET governance	3.5	2.0	3.0	4.0	4.0	3.5	3.3
	Work-based learning	3.0	2.0	3.5	3.0	3.0	3.0	2.9
<b>Sub-dimension average score</b>		3.3	2.0	3.3	3.5	3.5	3.3	3.1

***The WB6 economies have strengthened their VET policy frameworks but inequalities with general education remain high***

Students in the WB6 economies have a higher average enrolment rate in VET programmes than the OECD and EU averages. Data from PISA 2018 finds that students enrolled in VET programmes in the WB6 economies, as is common in many countries, tend to have lower average performance in core literacy and numeracy skills than those in general programmes (Figure 10.12). Strengthening VET governance and improving VET curricula is thus key to reducing disparities in learning outcomes between VET and general students. Such measures can also help ensure that VET students are equipped with the core knowledge and skills needed for success in work and life.

**Figure 10.12. PISA 2018 low achieving students and education programmes**

Differences in performance between students in upper-secondary education

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (OECD, 2020<sup>[6]</sup>), *PISA 2018 database*, [www.oecd.org/pisa/data/2018database](http://www.oecd.org/pisa/data/2018database).

StatLink  <https://doi.org/10.1787/888934254069>

On average, the WB6 economies scored 3.3 for the VET governance indicator. Nearly all the WB6 economies have strategic frameworks for the development of VET, as well as bodies responsible for the development, management and evaluation of VET programmes. In Bosnia and Herzegovina, a new state-level strategic document on improving VET has been adopted in January 2021. This is an important development, as there has been no state-level VET strategy since the previous one expired in 2013. Legal and regulatory frameworks in all the WB6 economies ensure that responsibilities between the different bodies responsible for VET (ministries, VET agencies, VET providers, etc.) are well defined. Furthermore, these frameworks typically establish quality standards and regulations for VET programmes in nearly all the WB6 economies (except for FBiH in Bosnia and Herzegovina).

While all the economies have bodies responsible for accrediting education programmes, Bosnia and Herzegovina lacks a formal accreditation process for VET programmes in both entities. Nevertheless, Bosnia and Herzegovina has some measure of programme quality control, as new VET providers must undergo an approval process and are subject to regular inspections in both entities (the RS also has quality standards and regulations for VET providers in place), as in the other WB6 economies. The competent authorities (i.e. VET agencies, education ministries and education providers) in Albania, Kosovo, Montenegro, North Macedonia and Serbia involve social partners, and most notably employers, in the elaboration of VET-related policy and curriculum materials, but in Bosnia and Herzegovina, their involvement varies across entities and cantons, being most developed in the RS.<sup>10</sup>

Data collection on completion rates of VET courses and employment rates of recent graduates remains very variable across the WB6 economies, but no economy collects robust data on all relevant indicators for VET development.<sup>11</sup> For example, North Macedonia is the only economy to report on the earnings of VET graduates, an important indicator for measuring socio-economic outcomes and to help students make informed decisions about their future pathways. Data collection in Bosnia and Herzegovina is uneven, with very limited data at the state level on the number of VET schools, students and programmes. However, some entities and cantons do collect information on the completion and employment rates of VET graduates. The economies that did best in this indicator (Montenegro and North Macedonia), not only collect such data but also ensure it is analysed and used to shape VET policy and career guidance.

### ***All of the WB6 economies are developing work-based learning policies***

The WB6 economies scored an average of 2.9 in the work-based learning indicator, with scores ranging from 2 (Bosnia and Herzegovina) to 3.5 (Kosovo). While all WB6 economies see the development of WBL as an important part of their education policy frameworks, there are differences in the level of support, in terms of promotion, stakeholder engagement and monitoring. Several WB6 economies (Albania, Kosovo, Montenegro and North Macedonia) are rolling out pilot projects to develop dual education, and Serbia has created a legal framework for dual education through the adoption of a dedicated law allowing students in secondary education to undertake their studies in parallel with gaining professional experience.

All the WB6 economies run broad public awareness campaigns to promote WBL to social partners and students. Social partners are involved in the selection of candidates and there are systems for matchmaking, ensuring that students are allocated to WBL experiences based on established criteria. However, these systems differ in their scope across the economies. Albania, Kosovo and Serbia have dedicated career placement services that help match students with WBL experiences, and some economies have online portals listing WBL opportunities (Kosovo and the RS in Bosnia and Herzegovina), while others rely on public awareness campaigns to match students with WBL providers. Incentives to employers to offer WBL places is one area for improvement, as only Montenegro and North Macedonia currently provide or plan to provide some form of financial incentive to employers who engage in WBL.

All the WB6 economies would benefit from improving their data collection on WBL programmes to support their development, by expanding their range of monitoring indicators and using relevant data to inform policy making. Bosnia and Herzegovina (except for the RS) and North Macedonia do not yet have a data collection system in place to report on key WBL indicators,<sup>12</sup> while Serbia is planning to deploy one. None of the economies that do collect these data report on all the key indicators that are usually used by OECD countries with mature WBL systems. Kosovo aims to establish a central office for collecting data on WBL, which would help improve monitoring of the sector and inform policy decisions.

### ***The way forward for vocational education and training***

- **Ensure that students in VET develop core literacy and numeracy skills by supporting strong VET accreditation standards** including these core skills. This would reduce the gap with students enrolled in general education and ensure that VET students can adapt to changes in the labour market. Bosnia and Herzegovina should work to create a VET accreditation authority, either at the state level, to ensure harmonisation between standards in the entities, or at the entity level. The other WB6 economies should continue to support their accreditation authorities and ensure they have the resources they need.
- **Continue efforts to incorporate WBL into VET programmes**, as this can provide learners with valuable on-the-job experience and opportunities to develop the competencies needed for success in further studies or work. Attention should also be paid to ensuring that vocational teachers are aware of recent developments in the professional practice of their respective fields.
- **Collect comprehensive data on the VET sector** and use this information to align programmes with labour market needs and strengthen career guidance.

### **Tertiary education (Sub-dimension 7.4)**

Higher education contributes to competitiveness and inclusive growth by strengthening human capital, research and development and innovation. In most economies, individuals with a tertiary education (ISCED 5-8) often have better labour market outcomes than those with lower levels of education. To align the supply and demand for higher education graduates, economies need reliable labour market information and must be able to communicate this information to learners and adapt flexibly to changing needs. This

is especially important for the WB6 economies as they suffer from “brain drain”, where skilled young people seek opportunities abroad, in part due to mismatches between tertiary education programmes and labour market needs, presenting a risk to economic competitiveness.

Around the world, educational attainment and access to tertiary education have greatly improved over the past half-century. Disparities in the participation and completion of tertiary education have consequences for competitiveness since fewer individuals are able to benefit from the economic and social mobility often associated with having a tertiary education degree. Equitable higher education systems thus ensure that access to tertiary education depends on individuals’ abilities, efforts and interests – rather than their personal and social circumstances, such as socio-economic status, gender, ethnicity, age or disability (OECD, 2019<sup>[27]</sup>).

The WB6 economies scored an average of 2.8 for this sub-dimension, showing that, although there are examples of good practice, there is still room for improvement in addressing these key areas for the competitiveness of the WB6 education systems (Table 10.6).

**Table 10.6. Scores for Sub-dimension 7.4: Tertiary education**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 7.4: Tertiary education	Equity in access to higher education	2.5	2.5	2.5	2.5	2.0	2.5	2.4
	Labour market relevance and outcomes	3.5	3.0	3.0	3.5	3.5	2.5	3.2
<b>Sub-dimension average score</b>		3.0	2.8	2.8	3.0	2.8	2.5	2.8

### ***Access to higher education remains highly inequitable in the WB6 economies***

The WB6 economies scored an average of 2.4 in the equity in access to higher education indicator, with all the economies scoring 2.5, except Montenegro, which scored 2. This shows that the whole region has room for improvement in ensuring equitable access to higher education, mainly by developing more effective support measures and ensuring more comprehensive data collection to better understand the root causes of this inequality.

All the WB6 economies have enshrined equitable access to higher education in their legal frameworks and ensuring it is a key objective of all the higher education strategies in the region. All the economies have some measures in place, such as scholarships, tuition fee exemptions, quotas for students meeting certain criteria and other support measures. However, their effectiveness in helping students from socio-economically disadvantaged groups to access and complete higher education is debatable. For instance, some scholarships are awarded based solely on academic merit, and do not always take into account difficulties that students from disadvantaged or marginalised backgrounds may face. In Montenegro, scholarships are awarded to the winners of academic competitions, which may benefit students who were already on track to access higher education, rather than those who may need additional support. Albania is the only WB6 economy that has put in place a quota system for students facing economic and social difficulties to access higher education, providing them a 50% reduction in tuition fees. The RS is drafting legislation that would allow the government to directly allocate tuition fees to HEIs for each student enrolled. The change aims to encourage them to adjust admission policies and increase the number of students from lower socio-economic background in order to obtain more funding. Apart from this planned initiative, no WB6 economy has created incentives to encourage HEIs to enrol students from disadvantaged backgrounds to improve equity.

The collection and analysis of data to help understand the causes of inequality in access to higher education is another area where all the WB6 economies could improve. Although they all collect some form of data such as enrolment and completion rates based on gender or ethnic background, none have analysed this data to identify associations between individual factors and participation in higher education.

### **All the WB6 economies have taken steps to improve the market relevance of their tertiary education systems**

Another key challenge for the WB6 economies is in improving the labour market relevance of tertiary education. The employment rates of young people and young graduates in the region remains significantly below the EU and CEEC-11 averages (Figure 10.13), showing the need to reinforce policies to better connect higher education with the labour market and improve the employability of graduates.

**Figure 10.13. Employment rates of recent graduates in the EU and WB6 economies (2008 and 2019)**  
Employment rates of recent graduates (aged 20-34) not in education and training (%)

Note: Recent graduates refers to those with an upper secondary, post-secondary non-tertiary or tertiary education (ISCED 3-8) who have graduated within 1-3 years. Data for Albania, Bosnia and Herzegovina, and Kosovo are not available. CEEC-11 average calculated based on individual statistics for Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Eurostat, 2020<sup>[28]</sup>), *Employment rates of young people not in education and training by sex, educational attainment level and years since completion of highest level of education*, [https://ec.europa.eu/eurostat/web/products-datasets/-/edat\\_lfse\\_24](https://ec.europa.eu/eurostat/web/products-datasets/-/edat_lfse_24).

StatLink  <https://doi.org/10.1787/888934254088>

The WB6 economies scored an average of 3.2 in the labour market relevance and outcomes indicator, with scores ranging from 2.5 (Serbia) to 3.5 (Albania, Montenegro and North Macedonia). All the WB6 economies see improving the employability of graduates by increasing the labour market relevance of their tertiary education as a priority, and have integrated this objective into their policy frameworks.

The WB6 economies have all also taken steps to promote the internationalisation of tertiary education, through mechanisms such as funding and promoting mobility and participation in the EU's Erasmus+ programme, either as members (Serbia and North Macedonia) or partners (the other WB6 economies). To improve the quality assurance of higher education, they have all established independent quality assurance agencies to certify and review higher education curricula and adapt them to labour market needs.

All the WB6 economies collect some form of data relevant to assessing the labour market relevance of education. However, as with the other indicators in this dimension, data collection remains uneven and could benefit from broadening the range of information collected. For example, Albania and Kosovo do not collect data on labour market outcomes by field of study, a key indicator for measuring labour market relevance.

### ***The way forward for tertiary education***

- **Analyse data related to inequity in access to higher education** in order to better identify and understand the root causes of inequity, such as socio-economic or ethnic minority background, gender and other factors and how they relate to students' chances at accessing and succeeding in higher education.
- **Create incentives for higher education institutions to improve equity** in higher education through support measures such as scholarships or tuition fee exemptions. Inspiration could be taken from the planned initiative in the RS to give HEIs an incentive to increase the number of students from lower socio-economic backgrounds.
- **Broaden the range of data collection related to labour market outcomes** to help understand the extent and causes of skills mismatches between education and the labour market. The WB6 economies should also undertake regular analysis and monitoring of these data to inform policy making.

#### **Box 10.4. Student and researcher mobility in the Common Regional Market**

The regional trade area part of the Common Regional Market (2021-24) Action Plan (CRM AP) includes five components: 1) cross-cutting trade measures; 2) goods; 3) services; 4) capital; and 5) people. The following key findings of the CO2021 tertiary education sub-dimension can inform the implementation of the actions related to the people component:

- Encouraging mobility of students and researchers (regional actions 1 and 2 of priority area 5.1 of the CRM AP) depends on aligning qualifications frameworks between the WB6 education systems. An important step towards this is the alignment and referencing of qualifications frameworks to the EQF, which only four of the WB6 economies (Kosovo, Montenegro, North Macedonia and Serbia) have completed fully.
- The Action Plan aims to guarantee the right to study across the WB6 economies through a Framework Agreement on Access to Study. A good practice example can be taken from the Nordic countries (Denmark, Finland, Iceland, Norway and Sweden), who signed an Agreement on Admission to Higher Education in 1996. This agreement guarantees applicants domiciled in one of the parties the right to apply to public higher education courses in the other parties and be considered as though they were a domestic applicant (European Commission, 2018<sup>[29]</sup>). To facilitate intelligibility of qualifications and education systems, the Nordic-Baltic manual, developed in 2016, can also serve as an example. It features a table which facilitates the comparison of qualifications in the Nordic countries mentioned, as well as in Estonia, Latvia and Lithuania (NORRIC, n.d.<sup>[30]</sup>).
- According to the Action Plan, regional integration of education systems is expected to be driven by deeper integration into the European Higher Education Area, namely the membership of all WB6 quality assurance agencies in the European Association for Quality Assurance in Higher Education (ENQA) and registration with the European Quality Assurance Register for Higher Education (EQAR). Currently, none of the WB6 economies' accreditation agencies are members of the ENQA<sup>1</sup> nor registered with the EQAR. However, except for Kosovo and Serbia, all are governmental members of the EQAR. It will be essential to further integrate higher education accreditation agencies into these institutions by improving their governance practices and alignment with ENQA requirements in order to harmonise regional qualifications standards.
- None of the tertiary education systems in the WB6 economies, except Montenegro, allow for portability of public study grants for studies conducted abroad (Eurostat, 2020<sup>[28]</sup>), which provides a significant financing challenge for students wishing to undertake their studies within

the European Higher Education Area. This also poses an equity challenge, as the students who will find this barrier most significant will be those from socio-economically disadvantaged backgrounds. Along with creating new incentives for encouraging equity, as suggested in the tertiary education sub-dimension, the WB6 economies should ensure the portability of financial support measures within the European Higher Education Area, both for short term (credit mobility) and long-term (degree mobility) studies abroad.

1: From 2014 to 2019 the Kosovo Accreditation Agency had the status of member, but it was suspended due to lack of compliance with ENQA's governance standards (ESG) following a review by ENQA in 2019. Serbia's National Entity for Accreditation and Quality Assurance had the status of member since 2013 (through a predecessor institution), but was downgraded to an affiliate in 2020 due to insufficient compliance with the ESG following ENQA's review.

## System governance (cross-cutting sub-dimension)

Governing complex and multi-level education systems requires governance models that balance responsiveness to local diversity with the ability to ensure key objectives at the system level (Burns, 2016<sup>[33]</sup>). Governments set the overall framework that determines the organisation and structure of their education system (e.g. years of compulsory education, students' age of entry in school, grade levels, courses offered, teachers' qualifications, etc.), who is allowed to provide compulsory education (public and/or private actors), and what mechanisms are in place to finance education. Governments also set goals for the overall system, as well as the standards by which providers are held accountable.

The WB6 economies scored an average of 3.3 for this cross-cutting dimension on system governance, ranging from 1.5 (Bosnia and Herzegovina) to 4 (Kosovo and North Macedonia). Except for Bosnia and Herzegovina,<sup>13</sup> all the WB6 economies have strategies and legal frameworks in place to improve the governance of the education system – for more information, see Early childhood and school education (Sub-dimension 7.1). The differences in scoring arise mainly from differences in data collection systems to support monitoring of the education system's performance and the implementation and evaluation of policies within individual economies, as well as the internationalisation of qualification frameworks. Bosnia and Herzegovina's low score in this dimension is mainly a result of challenges to policy co-ordination, fragmentation of responsibilities and a lack of overall vision for education system governance (Table 10.7).

**Table 10.7. Scores for cross-cutting sub-dimension: System governance**

	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Cross-cutting sub-dimension: System governance	3.5	1.5	4.0	4.0	3.5	3.5	3.3

In terms of data collection, with the exception of Bosnia and Herzegovina,<sup>14</sup> all the WB6 economies have developed an education management information system (EMIS) to centralise data collection and report on the performance, in line with international data definitions and methods. Albania is currently developing a new EMIS and Kosovo and Serbia are making efforts to improve and modernise their existing systems. So far, Albania is the only WB6 economy to have developed an economy-wide external assessment system to measure student achievement. This tool provides valuable information about the quality of teaching and learning for system monitoring. North Macedonia and Serbia have plans to develop such systems as well.

The WB6 economies also differ in the adaptation of their education qualification frameworks to recognised international frameworks. This is important for international comparability and relevance of education systems, which can boost worker and learner mobility and thus competitiveness. While Kosovo, Montenegro, North Macedonia and Serbia have aligned their frameworks with the EU's European Qualifications Framework (EQF), Albania and Bosnia and Herzegovina have yet to finalise this process.

### ***The way forward for system governance***

- **Develop system-wide standardised assessments** with the primary purpose of measuring student performance. Currently, only Albania has fully developed such an assessment, although Serbia has piloted one. Those economies which are not in the process of developing one (Bosnia and Herzegovina, Kosovo, and Montenegro) should consider this policy measure as a means to increase the reliability of student assessments and collect information about learning processes within their economy-specific contexts. Unlike standardised examinations, these assessments would not have stakes for students, but serve exclusively as a monitoring and evaluation tool.
- **Develop a well-functioning, modern and comprehensive data collection system, facilitated by an EMIS.** This would facilitate reporting to the EU and allow the region to benchmark performance against international peers. Those economies which do not yet have plans to modernise their EMIS (Montenegro and North Macedonia) should look to broaden the range of data collection and indicator monitoring in order to cover all key indicators related to tackling the policy challenges mentioned in this chapter. Bosnia and Herzegovina should look to implement a harmonised EMIS. While not necessarily state-wide or centralised system, it should enable data interoperability between the systems used by entities and cantons, in order to give an idea of state-level performance.
- **Encourage analytical research to identify the root causes of key education challenges** (such as inequity, skills mismatches with the labour market, etc.) based on regular monitoring of educational data. The results of this research should be used to inform policy making and to propose potential solutions to identified issues.

## **Conclusion**

Since the last Competitiveness Outlook assessment, all the WB6 economies have made progress in creating more inclusive and competitive education systems, especially prior to the COVID-19 pandemic. Significant achievements include the reduction in early school leavers and the implementation of more work-based practical experience and the development of VET programmes. The region nevertheless faces key challenges, chief among them being the labour market relevance of education systems, especially at the higher education level, and data collection and management. The recommendations included in this chapter should serve as guidance to help tackle these key challenges, among others, and help the WB6 economies on their path to creating high-quality education systems that contribute to a more qualified workforce and more competitive economies.

## Notes

<sup>1</sup> ECE (ISCED level 0) covers all forms of early childhood programmes that have an intentional education component - such as preschools, kindergartens and day-care centres – designed to foster learning and emotional and social development in children. Pre-primary programmes (ISCED 02) are generally offered to children from the age of three until the age of primary school entry. However, in some economies it is not always easy to establish the boundaries between pre-primary and ISCED 01 provision (early childhood educational development) that is more focused on basic childcare, health and nutrition and can be less structured.

<sup>2</sup> The 11 Central and Eastern European countries (CEEC-11) joining the European Union: Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>3</sup> The Framework Law on Preschool Education in Bosnia and Herzegovina made the year prior to primary school compulsory. Most cantons in the Federation of Bosnia and Herzegovina (FBiH) and BD have implemented a compulsory year of pre-primary and it is optional in the Republika Srpska (RS).

<sup>4</sup> For example, there are separate strategies for general and vocational education at the secondary level, both of which cover 2015-20, in addition to strategies on inclusive education (2019-25) and supporting talented students (2020-22).

<sup>5</sup> The Strategy of Education Development for Pre-university Education 2016-2021.

<sup>6</sup> The PISA data cover schools with 15-year-old students so this may include VET schools where the rules about teacher education requirements could be slightly different from general primary and secondary education.

<sup>7</sup> In Serbia, the law does stipulate that teachers must have a master's degree. However, the difference in numbers could be explained by the fact that when school principals filled in the PISA questionnaire, they may not have taken into account the fact that the law recognises that a 4-year degree obtained before 2005 is the equivalent of a master's degree, and hence reported a lower number of teachers with such a degree.

<sup>8</sup> Under the 2019 revised accreditation standards, the teacher practicum must be at least 90 hours per year in the second, third and fourth years of the programme. In the fifth year of the programme, the teaching practicum is at least 180 hours and 6 ECTS.

<sup>9</sup> Although not universally present in BiH, the RS and some cantons do have processes for accreditation of professional development providers.

<sup>10</sup> In the RS, the Chamber of Commerce, the Union of Employers' Associations and the Employment Bureau are engaged in VET policy within the entity and surveys are conducted annually to understand skills demand, whereas the level of engagement in FBiH varies depending on the different cantons. The Framework Law on VET requires the formation of tripartite advisory councils, comprising representatives of employers, trade unions and competent education authorities at the levels of cantons, entities, the District of Brcko and at state level. Not all FBiH cantons have formed such councils but they are expected to do so.

<sup>11</sup> The CO 2021 assessment framework defines the following as key indicators for monitoring VET and WBL performance and outcomes: completion rates of VET programmes, employment rates of recent VET graduates, number of learners who are hired after completing a WBL opportunity or apprenticeship, earnings of VET graduates.

<sup>12</sup> Apart from the WBL-related indicators mentioned above, other relevant indicators include the type, location and duration of WBL opportunities, attendance rates, resulting skill gains, demographics of participants, and academic credits / wages earned.

<sup>13</sup> The RS has an education strategy setting out the entity's education policy from 2016 to 2021, but there are no strategies for the FBiH, its cantons, or at the state level.

<sup>14</sup> The RS and some cantons have their own data systems that serve the same function as an EMIS but there is no state-level EMIS.

# 11 Employment policy (Dimension 8)

---

Employment is central for economic development and social inclusion. This chapter aims to assess the employment regulatory framework and policies, and the institutional capacity to implement them, in the six Western Balkan economies (WB6). It explores whether they are likely to enhance the quantity and quality of employment, promote skills development, and allow labour market participation for all, including vulnerable groups and minorities. It considers four sub-dimensions. The first considers the labour market governance system, including the resourcing of inspectorates and efforts to reduce informal employment. The second, skills, looks at mismatches between the supply and demand for skills and the policies in place to identify and address mismatches. The job quality sub-dimension assesses the quality of earnings and policies to ensure men and women have equal access to high-quality jobs. The final sub-dimension considers activation policies, and the work of public employment services to implement the mutual obligation framework and active labour market programmes aimed at reducing unemployment and inactivity. Each sub-dimension provides recommendations for the way forward across the region.

---

## Key findings

- **Employment rates have risen but are still below the averages for the European Union (EU), Central and Eastern European (CEEC) and OECD economies.** Rates of temporary employment, self-employment and informal employment are comparatively high, and unemployment rates are very high, well above the EU, CEEC and OECD averages. Job retention schemes have limited the impact of the COVID-19 pandemic on employment in many of the WB6 economies, but the informally employed have been negatively affected.
- **Economies vary in the alignment of their employment frameworks with the EU *acquis*.** Some economies have increased labour market flexibility and improved regulatory frameworks for non-standard forms of work. The regulatory frameworks for occupational health and safety have been improved, although they still have a long way to go. Implementing the frameworks has proven to be the most challenging aspect. Labour inspectorates still generally have limited capacity, and tackling informal employment remains a key challenge. Some economies have started to improve inter-agency co-operation and work methods.
- **Workplace representation and collective bargaining remain weak**, with some variation across economies. Tripartism plays a more important role in regulating employment-related issues, with the economic and social councils consulted about key issues, such as the minimum wage. However, tripartite social dialogue could be improved, and the capacity of the economic and social councils strengthened. No assessments have been done of the impact of the minimum wage level on either informal employment or poverty reduction.
- **High unemployment rates are combined with skills shortages.** Most economies have made significant progress in analysing skills mismatches and have started to set up strategies to reduce them. Recent improvements have been made to help young people gain work experience. Nevertheless, overall, the education system is failing to produce the skills employers need, school-to-work transition mechanisms are poor, participation in upskilling and skills adaptation activities among both the employed and unemployed is low, and emigration exacerbates skills shortages and skills gaps.
- **Participation of adults in job-related learning activities is below the EU average.** The low skill levels of older adults will hinder their employment opportunities when conditions improve. Adult learning initiatives consist mainly of systems to recognise and validate prior learning and some small-scale measures for the low-skilled and unemployed.
- **Women's employment and activity rates have risen significantly** but remain below the EU and OECD averages. Female employment is particularly low in Bosnia and Herzegovina and Kosovo. Low activity rates significantly increase the numbers at risk of poverty.
- **The capacities of the region's public employment services (PESs) have improved**, with the introduction of tools to profile the unemployed and individual job seekers' action plans. Improvements have also been made in targeted active labour market programmes (ALMPs), although vulnerable groups and minority groups are still less well covered. Co-operation with local social services has improved but social services have limited capacity. Unemployment benefits and means-tested minimum income schemes are not very generous and job-search requirements are not well implemented. Low PES budgets for staff and ALMPs limit the effectiveness of activation policies.

## Comparison with the 2018 assessment

On average, the WB6 economies have achieved higher scores for this dimension in the 2021 assessment than they did in 2018 (Figure 11.1). However, progress has been uneven. While North Macedonia and Montenegro have made the most noticeable improvement, Kosovo and Bosnia and Herzegovina have made no progress. These two economies recorded the lowest scores in the 2021 assessment.

Figure 11.1. Overall scores for the employment policy dimension (2018 and 2021)

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Progress on implementing the policy recommendations made in the CO 2018 has been moderate overall (Table 11.1). The main advances have been in improving the regulatory framework and applied methods, while improvements to institutional capacities in terms of staffing and sustainable budgets have been limited. There are wide differences in implementation across the economies.

Table 11.1. Implementation of the CO 2018 policy recommendations: Employment policy

Competitiveness Outlook 2021		
2018 policy recommendations	Main developments during the assessment period	Regional progress status
<b>Fully implement measures set out in strategies and action plans</b>	Implementation of strategies and action plans varies considerably among economies in the region and across policy fields. Significant improvements have been made in promoting female employment and reducing youth unemployment and rates of those not in employment, education, and training (NEET). Low female employment and very high youth unemployment remain key challenges in Bosnia and Herzegovina and Kosovo. There was limited improvement in implementing action plans for labour market inclusion of vulnerable groups and minorities.	Moderate to advanced
<b>Strengthen the capacities of social partners, in particular workers' organisations</b>	There is no or little evidence of much improvement.	None to limited
<b>Continue to tackle informal employment</b>	There is no evidence of significant improvement yet, although some economies have started to set up dedicated and encompassing strategies (e.g., Kosovo). Implementation of these strategies remains challenging. Some economies have improved the transparency and working methods of labour inspectorates (e.g., Albania, Montenegro and Serbia). However, the overall capacities of labour inspectorates have not improved much.	Limited
<b>Improve activation policies and create an effective institutional setup</b>	Important progress has been made in the design and targeting of ALMPs. However, budgets spent on ALMPs remain very low (particularly in Kosovo) given the level of unemployment and long-term unemployment. PES staff's caseloads are still too high when dealing with vulnerable groups, especially in Bosnia and Herzegovina, Kosovo, and Serbia. Some vulnerable groups are not well represented among participants. There has been no (significant) progress in terms of budgets and little to moderate progress in linking social and employment policies.	Moderate
<b>Strengthen the capacity and infrastructure of public employment services (PES)</b>	Significant progress has been made in strengthening PES's working methods. Labour market information systems have been improved. No or little progress has been made to increase the number of PES staff or to reduce counsellors' caseloads. Little improvement has been made to employer services.	Moderate
<b>Improve skills matching and ensure that training measures are effective</b>	Important improvements have been made in the design of tracer studies in some economies (Albania and Serbia) and the conduct of skills needs surveys. The measuring of skills mismatches has been improved (in Albania, Montenegro, North Macedonia and Serbia) or is underway. Workplace-based training modules have been introduced into vocational education and training (VET) curricula and the promotion of internships improved in some economies (e.g. Montenegro, North Macedonia and Serbia).	Moderate
<b>Improve job quality by targeting the factors that affect earnings, job security and the quality of the working environment</b>	There have been few improvements to labour productivity except in Bosnia and Herzegovina. There has also been little improvement in monitoring working conditions and accidents at work. However, progress has been made in developing and implementing occupational health and safety at work frameworks.	Limited

## Introduction

The quality and inclusiveness of employment should be central policy priorities, as much as job creation, while resilience and adaptability are important for good economic and labour market performance in a changing world of work (OECD, 2018<sup>[1]</sup>). This calls for policies and institutions that protect workers and foster inclusiveness but also allow workers and firms to adapt to technological change, increase productivity, and reach good and sustainable outcomes. The key outcomes targeted by the employment policy dimension are an increase in the employment rate and a reduction in unemployment. Skilled workers

are a key asset for competitiveness and technological development and are essential to attracting investment into the region (OECD, 2019<sup>[2]</sup>).

Other policy areas also have an important impact on employment. Policies geared toward improving competitiveness and modernising economies increase labour productivity and are thus the basis for increasing wages and purchasing power. This links the employment chapter to some of the following chapters in this publication:

- **Chapter 7. Tax policy.** Tax policies and the social protection system can create incentives for people to work in the formal economy and move from informal to formal employment and can also encourage investment in lifelong learning, which benefits the economy as a whole.
- **Chapter 9. State-owned enterprises.** Differences between wages in state-owned enterprises and the private sector have an impact on labour allocation and potential skills shortages in the private sector.
- **Chapter 10. Education policy.** Education is central to providing the workforce with the skills in demand in the labour market as well as allowing economies to modernise and advance digitalisation, innovate and grow. In turn, well-educated workers have better employment and working conditions. There is a danger that skilled workers will move abroad if they cannot find attractive employment opportunities and career prospects in the region. Conversely, ties with the diaspora in the areas of research, investment and entrepreneurship have the potential for valuable knowledge transfer.
- **Chapter 14. Transport policy.** Transport investment has the potential to reduce employment barriers, particularly for women in rural areas.
- **Chapters 15 and 16. Energy policy and environment policy.** These policies, and policies for greening the economy, require the development and adaptation of relevant technical and cross-cutting skills.
- **Chapter 18. Tourism policy.** The tourism sector is labour-intensive so tourism strategies have an impact on employment.
- **Chapter 19. Anti-corruption policy.** Anti-corruption measures may help to reduce informal employment.

From an employment perspective, sector policies need to strike a balance between tapping into the potential for additional employment opportunities (e.g., in rural areas), and addressing employment conditions. The efficient provision of social and health services and the close co-operation between employment and social policy actors is key for bringing vulnerable groups into the labour market. The provision of childcare and elderly care services is a precondition for promoting female employment.

## Assessment framework

### *Structure*

This chapter assesses policies related to employment in the WB6 in four broad sub-dimensions:

1. **Sub-dimension 8.1: Labour market governance** measures whether there is a co-ordinated, strategic government approach to labour standards, and to what extent it has been implemented. It considers the range of policies, norms, laws, regulations, institutions, and processes that influence the demand and supply of labour as well as employment quality, covering the regulatory framework, labour inspectorates, employment policy framework, and social dialogue and tripartism.
2. **Sub-dimension 8.2: Skills** assesses whether there is a co-ordinated, strategic government approach to skills development, and to what extent it has been implemented so that the incentives

are in place to reduce skills gaps and encourage upskilling and skills adaptation, focusing on reducing skills mismatches and adult learning.

3. **Sub-dimension 8.3: Job quality** assesses the policy approach to quality earnings, including wage setting mechanisms, and social security contributions and taxes. It looks at whether they strike a balance between providing decent pay, social protection, and incentives for formal employment (OECD, 2018<sup>[1]</sup>). It also considers whether there are policy mechanisms to promote female employment and how effective they are.
4. **Sub-dimension 8.4: Activation policies** looks at the policy, legal and institutional arrangements for activation policies, which aim to bring more people into the labour force and into jobs (OECD, n.d.<sup>[3]</sup>). It considers the economies' public employment services, mutual obligation frameworks, and active labour market programmes.
5. **Two crosscutting sub-dimensions: Informality and brain drain** have been included as separate indicators in the questionnaire, and are being dealt with in this chapter across the sub-dimensions where relevant. **Informal employment** may take various forms. It generally includes employment in unregistered enterprises, and employment in registered enterprises but which is not registered or only partly declared for the purposes of income tax and social security contributions, and thus contributes less to state revenues than it should. Informal workplaces may be unsafe and unhealthy, employment conditions may be below legal or collectively agreed minimum standards, workers may participate less in lifelong learning, and may be badly protected against illness, unemployment, and old age (pensions). **Brain drain** may be a result of high net emigration of skilled labour causing skill shortages and hindering economic development. While it is important to understand which factors push workers to work abroad it is equally important to know who returned, how return migration is managed and more generally how the transmission of skills is organised and what policies are in place to reap benefits from emigration (Moon and Shin, 2018<sup>[4]</sup>).

Figure 11.2 shows how the sub-dimensions, and their indicators, make up the employment policy dimension assessment framework. The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as virtual interviews undertaken with relevant non-government stakeholders for this sub-dimension. Alongside these qualitative inputs, quantitative data on relevant indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more information, see the Assessment methodology and process chapter.

The leaders of the WB6 endorsed the Common Regional Market (CRM) 2021-2024 Action Plan (AP) at the Berlin Process Summit held on 10 November 2020 in Sofia. The action plan is made up of targeted actions in four key areas: 1) a regional trade area; 2) a regional investment area; 3) a regional digital area; and 4) a regional industrial and innovation area.

In the regional trade area, the WB6 economies commit to closely align rules and regulations with the core principles governing the EU Internal Market, based on the “four freedoms”: enabling goods, services, capital and people to move more freely across the region. The action plan includes measures to 1) enable mobility for students, researchers and professors; 2) introduce freedom of movement on the basis of IDs within the WB6 economies; 3) to remove work permits for intracompany transfers and contractual service providers; and 4) enable the portability of social rights. These measures have also been central for the EU since the Treaty of Rome in 1958. The findings of this employment policy assessment can inform the implementation of the actions in this plan. Box 11.2 assesses the current regional migration situation, while Box 11.6 looks at progress in human capital development and fighting brain drain, another objective of the action plan.

### ***Key methodological changes to the assessment framework***

There have been some major changes to the assessment framework since the 2018 assessment. Two cross-cutting policy areas have been introduced: informal employment and brain drain. The social economy sub-dimension has been removed due to unavailability of data. To better align with the 2018 OECD Jobs Strategy, a new skills sub-dimension has been added. The adult learning qualitative indicator now includes the old employee trainings indicator and the continuing education and training indicator of the 2018 education dimension. The qualitative indicators in the former activation policies sub-dimension have changed focus and been renamed to align better with the OECD Activation Policy Framework (OECD, 2015<sup>[5]</sup>). The old employment framework indicator has been changed to regulatory framework. The former skills gap analysis indicator has been integrated into the skills mismatch indicator.

## **Employment performance and context in the WB6**

Employment has generally risen between 2015 and 2019; average employment rates for the region rose by 4.6 percentage points (p.p.) and unemployment fell by -7.9 p.p. before the COVID-19 pandemic.<sup>1</sup> Nevertheless, the employment rate remains markedly below the EU, CEEC-11<sup>2</sup> and OECD averages and unemployment was still very high in the WB6 compared to EU and OECD economies in 2019 (Figure 11.3). The inactivity rate is also high in the region (32%) and is worryingly high in Bosnia and Herzegovina and Kosovo.

The impact of the COVID-19 pandemic on employment, unemployment and inactivity varied quite significantly across WB6 economies. Figure 11.4 shows how employment rates changed between the third quarter of 2019 and the third quarter of 2020 for five WB economies for which data are available, and the EU. In Albania, North Macedonia, and Serbia, the impact of COVID-19 was similar to the EU average.

**Figure 11.3. Employment and unemployment rates among 15-64 year-olds (2019)**

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934254126>

The WB6 economies have introduced job retention schemes, employment incentives and access to more generous welfare benefits in order to mitigate the labour market impact of the pandemic Box 11.1. Job retention schemes have been widely used in the EU to contain unemployment. In most EU economies face-to-face services were suspended during the first lockdown and taken up thereafter and as a consequence digitalisation has been accelerated (Duell, 2020<sup>[11]</sup>).

### Box 11.1. Action by the WB6 economies to reduce the impact of COVID-19 on the labour market

In **Albania**, registered unemployment rose by 30% between March and September 2020. About 32% of registered jobseekers applied for unemployment benefits over this period and the number of benefit recipients increased by 50%. Unemployment risks have been significantly higher for the low-skilled; those performing trade, services and elementary occupations; and the informally employed. This led to an increase in the number of economic aid recipients by 19% between March and September 2020.

In **Bosnia and Herzegovina**, registered employment fell by 2.2% in 2020 Q2 compared to 2019 Q2. In July 2020, registered unemployment had risen by 4.7% compared to the previous year. The International Labour Organization (ILO) estimates that the pandemic constitutes an employment risk for 88% of informal workers (ILO, 2020<sup>[12]</sup>). Job retention measures were put in place to mitigate the impact of the crisis on workers.

In **Kosovo**, employment rates fell significantly between the first and second quarters of 2020 but bounced back in the third quarter. Changes in the employment rate had a bigger impact on inactivity than on unemployment according to the Labour Force Survey (LFS) (ASK, 2021<sup>[13]</sup>). However, the number of registered jobseekers increased by over 50%, due to expected unemployment and welfare benefits linked to COVID-19. Support was also provided to private sector companies for each employee on their payroll for March and April 2020. Firms also received a subsidy for each new employee hired on a minimum one-year contract during the crisis. A scheme for regularising informal employed has been set up.

In **Montenegro**, the number of registered unemployed in September 2020 was 28.8% higher than in September 2019, while the number of unemployed increased by 10.7% over the same period according to LFS data (MONSTAT, 2021<sup>[14]</sup>). Between January and September 2020, the number of registered vacancies fell by 32.2%.

In **North Macedonia**, the number of unemployed fell by 5.5% between the third quarter 2019 and the third quarter 2020 but inactivity increased. A short-time work scheme has been set up with the support of the World Bank to cope with the labour market impact of the pandemic.

In **Serbia**, the COVID-19 pandemic has had only limited effects on the labour market so far. The crisis mainly hit the informally employed. Among the formally employed a rise in unemployment was avoided and the number of LFS unemployed even continued to fall (by 5.3% between the third quarter of 2019 and the third quarter 2020), although the decrease was slower than the previous year. The introduction of a job preservation scheme by the Ministry of Finance has had a positive impact. It takes the form of a wage subsidy scheme (at the level of minimum wages from March to May, and half the minimum wage thereafter) for micro and small and medium-sized enterprises (MSMEs) affected by the pandemic.<sup>1</sup> Take up of this measure was very high, covering roughly half of the employed, although workers on non-standard forms of employment have mostly not been covered by this measure.

1: The only criterion was that companies did not cut employment by more than 10% (CEVES / World Bank, 2020<sup>[15]</sup>; Government of Serbia, 2021<sup>[16]</sup>).

## Labour market governance (Sub-dimension 8.1)

Effective labour market governance is paramount to ensuring high-quality jobs as well as developing flexible, socially inclusive, and proactive labour markets. Strong governance, clear directions, and independent regulation and enforcement help ensure labour markets are responsive and also give strong signals to investors. The scores for the four qualitative indicators under this sub-dimension vary quite substantially from one economy to the other, with scores ranging between 1.8 and 3.3 (Table 11.2). North Macedonia and Montenegro have achieved the highest scores, both scoring above average across the board for the sub-dimension. Kosovo and Bosnia and Herzegovina have the lowest scores for all indicators, particularly for regulatory frameworks and tripartism and social dialogue in Kosovo, and for employment policy frameworks in Bosnia and Herzegovina.

**Table 11.2. Scores for Sub-dimension 8.1: Labour market governance**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 8.1: Labour market governance	Regulatory framework	3.0	2.0	1.5	3.0	3.0	2.5	2.5
	Labour inspectorates	3.0	2.0	2.0	3.0	3.5	3.0	2.8
	Employment policy framework	2.5	1.8	2.0	3.5	3.0	3.5	2.7
	Tripartism and social dialogue	2.5	2.5	1.5	3.5	2.5	2.5	2.5
<b>Sub-dimension average score</b>		2.8	2.1	1.8	3.3	3.0	2.9	2.6

### ***Regulatory frameworks have improved but full implementation is challenging***

Regulating employment and working conditions is key to ensuring high-quality jobs, which in turn protects workers, reduces incentives to work abroad and helps economies move up the value chain. Improving the quality of the work environment also helps people to prolong their working lives, which is particularly important where populations are rapidly ageing. Employment regulations encompass regulations on health and safety at work, working time, paid holidays, formal labour contracts and non-standard forms of employment.

The WB6 economies have started to adapt their regulatory frameworks to the EU *acquis*, although progress has been uneven. The economies have mostly advanced in some thematic areas but not all, with further progress planned.<sup>3</sup> In Serbia, most of the legislative framework governing the labour market has been aligned with the *acquis*. The Law on Safety and Health at Work is, for the most part, harmonised with EU directives, with recent amendments made on temporary agency work and posting of workers to align with EU legislation. Progress has also been significant in Montenegro and North Macedonia. In Montenegro, the latest changes have increased labour market flexibility and improved labour standards for workers in certain areas, temporary agency work, working time, protection of pregnant workers and parental leave, and regulations of collective dismissals. In North Macedonia recent changes have addressed dismissal rules to allow companies flexibility to adapt employment to the market situation, protect workers from unfair dismissal and increased the re-employment chances of dismissed workers.

Bosnia and Herzegovina does not have a state-level programme for the adoption of the *acquis*, nor has it established adequate horizontal and vertical mechanisms to ensure alignment with EU directives is done properly (EC, 2019<sub>[19]</sub>). The two entities – the Federation of Bosnia and Herzegovina (FBiH) and the Republika Srpska (RS) – have started to harmonise their labour laws with the EU *acquis*.<sup>4</sup> Progress has been slow in Kosovo (where the relevant draft laws had not been adopted at the time of writing). All the WB6 economies need to identify and address the remaining gaps in their employment regulatory frameworks.

Improving working conditions is a key challenge. For example, the sixth Eurofound survey on working conditions, conducted in 2015, found that 44% of respondents in Albania, 32% in North Macedonia, 30% in Serbia and 23% in Montenegro were not very or not at all satisfied with their working conditions,

compared to only 12% of respondents in the EU (Eurofound, 2016<sup>[20]</sup>). Posture-related health risks were particularly high in Albania and North Macedonia, well above the risk in EU economies (Eurofound, 2017<sup>[21]</sup>).<sup>5</sup> The results of the seventh survey, which was still in progress at the time of writing, will shed light on recent improvements. Long working hours and weekend working feature in some of the economies, according to Eurostat LFS data. Some economies have progressed in the area of working time regulation: Montenegro has made improvements to its transparent working conditions, part-time work, work-life balance (i.e., working from home), aligning overtime hours with EU standards, take-up of annual leave, and protection for pregnant workers and workers on parental leave (Karanovic and Partners, 2020<sup>[22]</sup>).

Accidents at work mainly occur in the mining, manufacturing and construction industries. The WB6 economies have generally made progress in the area of occupational health and safety. Most of Serbia's health and safety regulation is aligned with the EU *acquis*, Albania has made significant progress, and the FBiH adopted a new law on occupational health and safety in 2020. Kosovo has also made some progress in this area. In addition to the regulatory framework, healthy working environments can be promoted through policies to prevent and address work-related health and safety risks (OECD, 2018<sup>[1]</sup>). The WB6 economies need to make significant efforts in this area.

Adequate employment protection for regular workers can promote labour market resilience by preserving job matches that are at risk of being suppressed. However, excessively strict protection risks becoming counterproductive by increasing incentives for the use of temporary contracts. The challenge for public policy is to design employment protection that strikes the right balance between preserving viable jobs and avoiding labour market segmentation (OECD, 2018<sup>[1]</sup>). While short-term or casual employment contracts and platform work may bring advantages, including flexibility for both employers and workers, they raise concerns around job quality, improper use of such contracts, fair competition among firms and the sustainability of social protection systems.

Since the last Competitiveness Outlook assessment, for which data was collected in 2017, Montenegro and North Macedonia have made significant progress in increasing labour market flexibility, while protecting specific categories of workers, protecting workers from unfair dismissal (in North Macedonia) and improving working conditions in specific areas. In the FBiH, amendments to the labour law in 2016 reduced rigidities in hiring procedures and have eased dismissals. In contrast, no progress was made in Kosovo, which in 2016 had the least employment protection for fixed-term contracts in the region and a wide gap to the protection level of permanent contracts (OECD, 2016<sup>[23]</sup>). Some workers in non-standard forms of work are not fully protected by labour regulations, e.g., they are not entitled to annual leave,<sup>6</sup> increasing the incentive to employ workers on non-standard contracts. As a result, more than half of workers in Kosovo are on temporary contracts and more than one-fifth are self-employed (the vast majority being solo self-employed or helping family members). On average across the WB6 economies, the self-employed accounted for 23.1% of workers in Q2 2019, much higher than the EU average of 15.3% (in 2018). Those on temporary contracts accounted for 21.9% compared with the OECD average of 11.8% and the EU average of 13.6% in 2019.<sup>7</sup> There are no specific regulations for employment conditions and social security coverage for gig workers in the region.

### ***Little progress has been made in reducing informal employment***

As the self-employed are not registered, self-employment contributes to the informal economy. Informal employment can also occur through not declaring employees, or by declaring only part of their hours worked and wages (envelope wages). Informal employment fosters inequalities and increases the risk of poverty both in work and after workers exit the labour market as they are less well covered by the social protection system. A high share of informal employment also contributes to persistent low productivity and poor investment in people. Informal employment weakens the tax base and the social protection system, threatening public finances. Combatting informal employment calls for tax and social security contribution

policies that reduce incentives for informal employment and support the transition from informal to formal employment.

Survey results and assessments in the WB6 economies suggest that informal employment rates range from 18% (Serbia) to 37% (Albania). These data need to be compared with caution, as the informal economy and informal employment are by definition difficult to assess and the economies use different data sources and surveys. Some economies have carried out ad hoc surveys on informal employment (e.g., in Montenegro in 2014), and most have included a question in their labour force survey (not available in Kosovo). Nevertheless, a look into the structure of informal employment gives interesting insights. Across the region, informality is particularly high in the agricultural and construction sectors and some service sectors (e.g., household services, social services, and hospitality). In Kosovo, informal employment is also prevalent in the manufacturing sector, according to a previous study.<sup>8</sup> The largest share of informal workers in the region is the solo self-employed. Women also often work as unpaid family members. Informal work is often more widespread among young workers who have found the school-to-work transition difficult as well as among older workers. Informal workers are typically low-skilled (for details see economy profiles) (ILO, 2020<sub>[12]</sub>).<sup>9</sup>

The WB6 economies overall have made little progress in tackling informal employment, although some relevant measures have recently been introduced. The FBiH has introduced a requirement for employers to keep daily records of workers and people engaged at work to help detect envelope wages. Serbia implemented a law in 2019 to simplify the employment of seasonal workers in certain activities (e.g., agriculture) and introducing a new type of contract, which makes it easier to register these workers for social insurance and taxes. The objective is to reduce informal employment and the initial results from the labour inspectorates seem promising. In order to raise awareness among employers, Serbia uses a name and shame approach; each week the ministry publishes two lists on its website: one naming employers which have employed informal workers and another naming workers who have engaged in informal activity.

To make significant progress in fighting informality, the WB6 will need to grow and generate demand for workers in the formal labour market. Studies across EU Member States have shown that informal employment is higher in those economies with lower levels of GDP per capita and fewer modern institutions, higher levels of public sector corruption and low trust in authorities, and less effective social transfer systems (EC, 2020<sub>[24]</sub>).

### ***Labour inspectorates lack the resources needed to regulate effectively***

A well-functioning labour inspectorate is required to ensure effective compliance with the law and is thus an essential part of labour regulation and the fight against informal employment. Labour inspection is a labour-intensive task, and, although not expensive, does require many well-trained inspectors in order to function optimally. Labour inspectorates are often plagued by internal problems including too few inspectors, poorly paid staff, lack of training and capacity, lack of resources, and vulnerability to corruption (ILO, 2013<sub>[25]</sub>).

Labour inspectorates in the region still have insufficient staff in light of the high levels of informality, the large number of small companies, and the fact that company mechanisms to ensure compliance with occupational health and safety (OHS) rules are often weakly implemented. For example, although required by law, OHS councils at company level are often not established or operational. In Albania and Serbia, the number of workers per labour inspector exceeds the ILO maximum recommendation for industrial market economies (10 000 workers, compared to 12 600 in Albania, and around 12 000 in Serbia in 2019). In contrast, inspectors in Germany have a caseload of around 6 000 workers and they are concerned only with the detection of informal and illegal employment, as there are dedicated inspectorates dealing with OHS issues (General Customs Directorate of Germany, n.d.<sub>[26]</sub>). In addition to high caseloads in the WB6, guidelines are often not clear and inspectors not well trained. Although improvements have been made to training (e.g., in Albania with the support of the ILO, and Montenegro), there are no curricula or certification

procedures. To reduce corruption, some economies have implemented a rotating system of labour inspectors (e.g., across cities in Montenegro or for on-the-spot visits in Serbia). Inspectorates also suffer from out-of-date equipment.

Good inter-agency co-operation, with IT systems that allow effective information sharing between institutions, increases the effectiveness of labour inspectorates. The WB6 economies have started to improve their inter-institutional co-ordination, although implementation varies across the region. Montenegro has a horizontal co-ordination mechanism, bringing together other units from the administration for inspection affairs, the tax authority, police administration (border police and the sector for foreigners) and local municipality institutions (communal inspection and police). In contrast, in North Macedonia, a lack of inter-agency co-operation is limiting the effectiveness of its inspectorates. File and information sharing between agencies may be challenging and require a unified IT system. For instance, in Serbia, labour inspectors have access to some data which were entered into the unified IT system e-Inspector from other inspections but reporting through this system is not yet available or adjusted to the needs of the labour inspectorate.

Transparency and monitoring of the work of labour inspectorates also increase trust and efficiency. Some economies have made improvements to processes: in North Macedonia, a new Law on Inspection Supervision, enacted in early 2019, created a new legal basis for risk-based inspections and introduced good practices (e.g., warnings and grace periods for infractions, use of checklists, and risk criteria) to increase transparency.

Child labour remains a challenge in the WB6 economies. All, except Bosnia and Herzegovina, have a legal framework to set the minimum working age but progress in detecting, fining and preventing child labour has been poor. Nevertheless, some economies have made some progress. For instance, Albania issued a new practical guide for labour inspectors in 2020 on identifying and controlling forms of child labour and responding appropriately.<sup>10</sup> Serbia has also developed guidelines through participation in the project Engagement and Support at the National Level to Reduce Appearance of Child Labour, which started in 2016, while 70% of inspectors have received related training.

### ***Employment policy frameworks are becoming more comprehensive***

Labour market segmentation, high inequalities, high unemployment, and high inactivity rates in the WB6 economies call for a comprehensive employment policy framework (OECD, 2018<sup>[1]</sup>; OECD, 2019<sup>[2]</sup>). The economies have made some progress in employment policy, with a focus on improving frameworks for public employment services (PES) and active labour market policies (ALMPs) – see Activation policies (Sub-dimension 8.4). They have adopted employment strategies and related action plans, except in in the FBiH where the employment strategy for 2018-21 had not been adopted by the parliament at the time of writing.

Employment strategies may include a few measures for minority groups such as Roma, Ashkali and Egyptian communities and other vulnerable groups (e.g., women in rural areas, as is the case in Kosovo). In many cases, activities to improve the labour market integration of vulnerable groups come through projects financed by international donors or organisations. Rendering these policy approaches sustainable by introducing them into mainstream policy and scaling them up remains a challenge. The implementation of related strategies on poverty reduction and integration of Roma and other minorities has generally been slow.

Little progress has been made to integrate people with disabilities, and the number of participants in targeted measures are generally low. Albania has recently made progress in this area, however. Its Employment Promotion Law of 1995 introduced quotas and levies for the employment of people with disabilities by public and private employers, but the levies have never been enforced. In December 2018 Albania adopted the Employment Promotion Law which set up an employment fund for the employment

and skills development of people with disabilities. Some progress has also been made in the use of a management information system for disabled beneficiaries, which is still in the pilot phase (EC, 2019<sub>[27]</sub>).

Employment strategies have become more comprehensive by including skills development, for example in Montenegro. Other policy areas affecting employment include those targeting the informal economy and youth employment. To improve their comprehensiveness further, they should strengthen links to policies on tax, social protection systems (including pension reforms), promoting entrepreneurship and innovation, and digital skills, and support to companies to make productivity and efficiency improvements. All these policy areas directly affect employment and working conditions. Improvements have been made in monitoring the implementation of employment policies although monitoring reports are often not publicly available, administrative, and labour force survey data not fully exploited, and rigorous programme evaluations often missing.

### ***The frameworks are in place for tripartism and social dialogue but partners lack capacity***

Tripartism and social dialogue are part of the mechanisms for setting labour standards in modern economies and are the pillars of industrial democracy (Eurofound, 2020<sub>[28]</sub>). Well-designed collective bargaining systems can promote labour market stability by facilitating adjustments in wages and working time. This can be achieved through the effective co-ordination of bargaining outcomes across firms and industries and by allowing firms enough flexibility to align wages with productivity (OECD, 2017<sub>[29]</sub>; OECD, 2018<sub>[30]</sub>). Labour relations should be sufficiently well developed to adapt to emerging challenges, including non-standard forms of work, economic restructuring and challenges related to the future of work (OECD, 2017<sub>[29]</sub>; OECD, 2018<sub>[30]</sub>; OECD, 2019<sub>[31]</sub>; OECD, 2018<sub>[11]</sub>).

The WB6 economies generally have frameworks for collective bargaining, but social partners often lack the capacity to regulate this important part of the economy. Union density is low in most WB6 economies and few companies are affiliated to employers' organisations. Sectoral collective bargaining is not well developed among private sector employers, with collective agreements more common in the public sector. Company-level agreements are often not recorded by domestic institutions. The share of employees covered by collective agreements was 25% in Albania (in 2017), 24-29% in North Macedonia and 30% in Serbia, compared to the OECD average of 33% in 2014 and the EU average of 60% (Ladjevac, 2017<sub>[32]</sub>; Danaj, 2019<sub>[33]</sub>; OECD, 2019<sub>[31]</sub>). There is little information on other labour standards fixed in collective agreements as compared to the average of the economy. According to the Albanian Government, most collective bargaining agreements are concluded in the public sector, often without agreeing higher labour standards than those set by law.<sup>11</sup> In Kosovo, trade union presence in the private sector is mainly limited to former public/socially owned enterprises (Shaipi, 2017<sub>[34]</sub>). Although most economies have a legal framework for workplace representation, implementation seems to be weak. In general, there is little information available on labour relations at the workplace.

All the WB6 economies have a framework for tripartite social dialogue and have established tripartite economic and social councils composed of representatives of the government and social partners. The main role of a tripartite council should be to link the government's agenda with those of economic actors on the ground (employers and workers) and so facilitate participatory policy making (ILO, n.d.<sub>[35]</sub>). Tripartite social dialogue is particularly important in a context where collective bargaining is weak. Councils may agree on general collective agreements (although negotiations have often failed in recent years) and they are generally consulted over minimum wages. They may also be consulted when setting taxes and social security contributions (e.g., in the FBiH) and on amendments to regulatory frameworks.

While there is evidence that consultation happens, procedures are not systematically implemented in all cases. Many working groups on different themes have been set up but may only meet on an ad hoc basis. Even where they meet regularly (as in Kosovo), their influence often remains limited. In some economies, such as Kosovo, local level tripartite consultation structures have been set up. One reason for their lack of

influence is the fact that the councils do not generally have a dedicated budget for analyses and studies and get no technical support (ILO, 2019<sup>[36]</sup>; Ladjevac, 2017<sup>[32]</sup>). Progress on strengthening bilateral and tripartite social dialogue structures has been slow, but strategies have been set up and support is being received from the ILO (e.g., in North Macedonia).

The regulatory framework for the labour market also includes the migration policy framework. The assessment of the regulatory and policy framework in CO2021 included emigration addressed through the cross-cutting sub-dimension of brain drain – see e.g., Skills (Sub-dimension 8.2). Easing labour migration within the region (Box 11.2) and regulating conditions for commuters would certainly help to reduce labour market imbalances and skills mismatches within the region and to bundle resources in the area of higher education and research. In other regions setting up a framework for free movement of labour has been on the agenda for many years.

### Box 11.2. Easing migration in the Common Regional Market

The following key findings of the CO2021 labour market and governance sub-dimension can inform progress on the actions under the CRM Action Plan component on the movement of people.

- Migration within the region is difficult to measure, especially if short-term stays and commuting are considered. In 2015, around 23% of emigrants had chosen to move to another economy in the region (Oruč, 2021<sup>[37]</sup>). Intra-region migration was lowest for emigrants from Albania, Serbia, and North Macedonia (5-12% of emigrants) but ranged between 50% and 66% for Bosnia and Herzegovina and Montenegro (intra-region migration could not be measured for Kosovo). Serbia has attracted the most migrants from the region.
- Intra-regional migration patterns have been shaped by historical ties, differences in labour market prospects, typical rural-urban migration, and economic structure (e.g., demand for seasonal workers in the tourism industry). Another importance driver has been universities and study; in particular, Serbian universities have attracted students from Bosnia and Herzegovina and Montenegro (Leitner, 2021<sup>[38]</sup>).
- Intra-regional migration is still hindered by existing rules, such as continuing visa requirements for movement between Bosnia and Herzegovina and Kosovo, and no progress has been made. Some economies, such as Serbia, have started to align labour legislation on the posting of workers with EU legislation, although the EU directive has not yet been fully achieved (Djuric and Todorovic, 2019<sup>[39]</sup>). Some economies have set up agreements on the portability of social rights, e.g., between Albania and North Macedonia and Albania and Kosovo (signed in 2015) (Government of Albania, 2019<sup>[40]</sup>). Albania's National Strategy on Migration and Action Plan 2019-22 envisions designing and implementing skills transfer programmes on the basis of sectoral skills.

### *The way forward for labour market governance*

- **Continue to align labour laws and occupation health and safety regulations with EU directives.** Identify the remaining gaps with regard to the EU legislative framework. In those economies which do not yet have a strategy for implementing OHS measures, they will need to develop a strategy document, implement preventive measures, and strengthen worker representation for OHS related issues at company level.
- **Develop the regulatory framework for non-standard forms of employment** for which no regulation is in place or amend existing regulations to strike a balance between flexibility and protection of the employed as well as coverage by the social protection system (including self-employment, temporary agency work, platform work, etc.).

- **Reduce incentives for informal employment** and ease the transition from informal to formal employment. One approach could be to ease registration for seasonal workers, as Serbia is already doing, or to subsidise social security contributions for some workers, such as household and care workers employed by private households. Taxes could be adapted to make the transition from informal to formal employment easier, reducing non-wage labour costs, especially for low-wage earners. Awareness-raising activities among employers and workers are also important, as in the example from the Netherlands (Box 11.4). The OECD and ILO (2019<sup>[36]</sup>) recommend supporting the transition to formal employment and the formalisation of enterprises through subsidising social security contributions. More specific measures could include support for social security contributions for some employees. For instance, France has a voucher system supporting social security contributions for household and care workers (Box 11.3). Social security contributions for workers from vulnerable groups who are otherwise likely to be informally employed could also be subsidised for a fixed period, as is done in Portugal (Düll et al., 2018<sup>[41]</sup>). The OECD Jobs Strategy also recommends reducing non-wage labour costs, especially for low earners (OECD, 2018<sup>[1]</sup>).

### Box 11.3. The Universal Service Employment Voucher (Chèque emploi service universel - CESU) in France

One major objective of this voucher is to assist in the fight against undeclared work in these services. The CESU was launched in 2006 as part of a plan for the development of personal services and replaces the service employment voucher (CES) set up in 1994 (which was limited to traditional personal services e.g., housework, childcare in the home or care for the elderly). It includes simplified registration procedures as well as a pre-financed CESU voucher, which is totally or partially prepaid by a company, local authority etc., and used by the service user/employer to pay a personal household service worker.

The CESU also enables users to receive a tax benefit, which was extended to non-taxable active persons from 2007 and to the inactive from 2017. The list of services eligible for tax reduction has also broadened to include small maintenance tasks, garden work, study help and ICT or administrative assistance.

The Court of Auditors estimated in 2014 that 153 000 full-time equivalent jobs were created between 2003 and 2012. Another study by the Ministry of Labour shows an increase in employment in personal and household services by 250 000 between 2005 and 2015. The CESU contributed to this increase, although there has been no dedicated impact assessment of the measure. As a job creation measure, the instrument is expensive but its impact on undeclared work is significant. According to different assessments undeclared work declined by 30% between 1996 and 2015.

### Box 11.4. Combating undeclared work in the cleaning sector in the Netherlands

The Netherlands is estimated to have around 14 000 cleaning companies, with the sector growing each year. This has led to increased competition, and recent evidence has shown increased fraud and exploitation (e.g., workers being paid less than the minimum wage and working unpaid hours) within the sector. The labour inspectorate decided to tackle this issue by raising awareness among hiring companies of their responsibility to hire cleaning companies who behave ethically towards their employees, and thereby put pressure on cleaning companies within the sector to change their behaviour.

The Chain Approach initiative began in 2013 and is ongoing. It involves a two-fold strategy: awareness raising among businesses who hire cleaning companies and a prevention strategy focused on changing attitudes to undeclared work in the sector. The inspectorate communicates through regular consultations with companies (e.g., with directors of fast-food chains), press releases and social media. Companies are told that cleaning companies need to fulfil a 10-item checklist, available on the web (with items such as paying tax and complying with minimum labour standards). Companies are also told about fines. The inspectorate also conducts on-the-spot visits and if infringements are found, they maintain contact with the companies to discuss how to progress.

As a result, more workplace inspections in relevant companies have been carried out, and companies are using the checklist. Companies have tightened their internal hiring conditions and adapted contracts, for instance allowing termination if exploitation is discovered). Following 398 site inspections, 32 cleaning companies in 144 locations have been banned, 22 companies in 69 locations have been replaced and 76 of the sites inspected have changed their cleaning to in-house.

Source: (EC, 2020<sup>[24]</sup>), *What works when tackling undeclared work? Realities in Member States*, <https://ec.europa.eu/social/main.jsp?langId=en&catId=1298&furtherNews=yes&newsId=9740>.

- **Continue to exchange practices to combat undeclared work** with other economies in the region. The European Platform tackling undeclared work could serve as an example. The platform enhances co-operation between EU economies. It brings together relevant authorities and actors involved in fighting undeclared work (EC, n.d.<sup>[46]</sup>).
- **Strengthen the institutional capacities of labour inspectorates.** This involves increasing the number of inspectors, providing clear guidelines, improving work organisation, increasing transparency to avoid corruption, providing training (including on child labour), and increasing resources for onsite visits. It would also be advisable to modernise their equipment, including hardware and software. Economies should also improve the monitoring of labour inspectorates and increase transparency (e.g., through databases recording all inspections, infringements, and fines); implement preventive measures (e.g., awareness-raising activities, information on risk prevention in the workplace, training OHS councils as well as managers, line managers and staff); and impose effective fines where there are clear infringements of the law.
- **Continue to strengthen social dialogue at branch and company level** and increase the capacity of the social and economic councils, so that they have technical support, can carry out their own analysis and meet regularly. Economic councils should be equipped with basic resources to conduct labour market and sector analysis, as happens in France, for example (Arkwright et al., 2020<sup>[47]</sup>), and a number of other European economies.
- **Facilitate the free movement of labour among the Western Balkan economies.** Implement the measures set out in the Action Plan for creating a Common Regional Market. See Box 11.5 for examples of how this has been achieved in other regions.

### Box 11.5. Examples of free movement of labour in regional common markets

- The EU has established a comprehensive free movement of labour regime. No residence permit is required for intra-EU migrants, although they may need to prove they have enough resources and do not become a burden on member states during the first five years of stay. The Bologna Process seeks to create a transparent and harmonised higher education framework, removing regulatory barriers to the movement of students (EC, n.d.<sup>[48]</sup>). Programmes have also been introduced to support mobility among students, researchers and professors (e.g., Erasmus, Leonardo da Vinci programmes). Although social protection systems are not harmonised within the EU, migration barriers have been removed over time by the increasing portability of social rights. Regulating social contributions to social security schemes and taxation for cross-border commuters received specific attention early in the EU integration process.
- Another example of regional labour migration management comes from the Southern American Common Market (MERCOSUR)<sup>12</sup> created in 1991. MERCOSUR citizens, as well as nationals of Bolivia and Chile, get an automatic visa and the freedom to work and live within the territory of the state parties. The Mercosur Residence Agreement, adopted in 2002, was an important step towards addressing intra-regional migration. There are essentially no conditions on a temporary stay, but a means-of-livelihood requirement for a permanent stay (OECD, 2016<sup>[49]</sup>). A Multilateral Social Security Agreement was signed in 2005.
- Since 1989, the Caribbean Community and Common Market (CARICOM)<sup>13</sup> has gradually extended intra-regional freedom of movement to various categories of persons, and free movement of community nationals is permitted. A CARICOM Agreement on Social Security has been signed.
- More recently, the Pacific Alliance of four South American states (Chile, Colombia, Mexico, and Peru), was established through the Lima Declaration of 2011 to promote a common market and free movement of people (Alianza del Pacífico, n.d.<sup>[50]</sup>). Visa requirements for members of the Pacific Alliance were removed. Working groups have been established addressing the issues of youth employment, child labour, labour migration and social security systems.

### Skills (Sub-dimension 8.2)

Skills governance is concerned with providing the skills needed by the labour market while also permitting individuals to pursue their aspirations, exploit their potential and help them progress their careers. Reducing skills mismatches can make the economy more productive by overcoming skills shortages and gaps and can also make labour markets more inclusive by reducing unemployment and offering good-quality jobs. Key challenges are managing the school-to-work transition and enabling skills development throughout people's working lives.

The WB6 economies have achieved quite varied scores in the skills sub-dimension (Table 11.3). While Albania, Montenegro, North Macedonia and Serbia have made significant progress in measuring skills mismatches and designing measures to reduce them, Bosnia and Herzegovina and Kosovo have made limited progress. Likewise, the first group of economies have made greater advances in setting up and implementing adult learning strategies compared to the second group.

**Table 11.3. Scores for Sub-dimension 8.2**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 8.2: Skills	Skills mismatch	3.0	1.3	1.0	3.0	3.5	3.5	2.6
	Adult learning	2.5	0.8	1.0	2.5	2.5	2.0	1.9
<b>Sub-dimension average score</b>		2.8	1.1	1.0	2.8	3.0	2.8	2.2

***Skills gaps and mismatches are being identified but more efforts are needed to resolve them***

Greater skills increase employment rates quite significantly and reduce the risk of being unemployed in the Western Balkans (Table 11.4). Across the WB6 economies, a low skills level is associated with poor employment conditions and in-work poverty (EC, 2019<sup>[51]</sup>). Low-educated individuals are also more likely to be inactive, compared to those who are medium or highly educated.

**Table 11.4. Average regional employment and unemployment rate by educational level (2015 and 2019 Q2)**

Education level	Employment rate (%)		Unemployment rate (%)	
	2015	2019 (Q2)	2015	2019 (Q2)
Low	31.8	37.1	19.8	12.6
Medium	49.5	57.0	23.3	14.5
High	68.8	76.7	17.1	11.2

Note: Unemployment rates for 2019 Q2 are preliminary. Low educated refer to ISCED level 0-2, medium educated to ISCED level 3-4 and high educated to ISCED level 5-8.

Source: (WIIW / World Bank, 2020<sup>[52]</sup>) *Western Balkans Labor Market Trends 2020*, <https://wiiw.ac.at/western-balkans-labor-market-trends-2020-dlp-5300.pdf>.

Skills mismatches refer to situations in which the skills offered by workers and job seekers do not match the skills employers need. Mismatches reduce the potential productivity of individual workers and of companies as a whole. The WB6 labour markets are marked by significant skills mismatches, with high unemployment rates coexisting with skill shortages. Emigration is aggravating the situation, as skilled labour leaves the economies (Box 11.6).

Skills shortages and skills gaps<sup>14</sup> are also the result of poor quality training and education, using curricula that are not adapted to employers' needs. It has become evident that regional curricula are not sufficiently developing workplace-related skills. Insufficient adaptation of curricula to changing economic structures and technological development is another reason for skills gaps.

### Box 11.6. Tackling brain drain in the Common Regional Market

Human capital development and fighting brain drain is one of the objectives of the Common Regional Market Action Plan 2021-24. The plan foresees the creation of a Regional Diaspora Knowledge Transfer Initiative to tap into the potential of the region's diaspora and encourage brain circulation. The following key findings of the CO 2021 skills sub-dimension can inform actions under this component.

Some economies have started to develop policies to mitigate the negative effects of emigration on the labour market in terms of skills shortages and foregone development potential.

- The Serbian Government has adopted the Strategy on Economic Migration of the Republic of Serbia 2021-27. Its aims are to improve the economic and social environment to slow down the departure of the working-age population, strengthen ties with the diaspora, encourage returning and circular migration, and attract foreigners with a range of educational attainment.
- In North Macedonia, the government adopted a national strategy for co-operation with the diaspora in 2019 (Government of North Macedonia, 2019<sup>[53]</sup>).
- Albania has adopted a new law and a National Strategy for Diaspora (2018-20). The strategy focuses on boosting the diaspora's engagement in its development and facilitating investments.

Source: Government responses to OECD questionnaire; Also see Albania profile, North Macedonia profile and Serbia profile.

The results of the World Bank's STEP skills measurement employer survey in Albania, Bosnia and Herzegovina, Kosovo, North Macedonia, and Serbia between 2015 and 2017 point to significant skills gaps and skills shortages (World Bank, 2018<sup>[54]</sup>). On average, 69% of employers in these five economies stated that they faced difficulties in recruiting workers for non-routine jobs due to lack of skills or experience, with employers in North Macedonia and Kosovo reporting the greatest difficulties. Overall, 57% of employers reported difficulties in hiring workers for routine jobs.<sup>15</sup> Deficits in the education system and an underperforming continuing training system in the Western Balkan economies are reducing the employability of the working age population and creating these skills shortages, which are preventing companies from growing. In addition, a horizontal skills mismatch, meaning that people tend to choose study fields that are not high in demand instead of enrolling in study fields for which there is demand, is leading to both unemployment and skill shortages.

The WB6 economies have made progress in measuring skills mismatches, using Labour Force Survey (LFS) data to calculate indicators for over- and under-qualification, with support from the European Training Foundation (ETF). This is an important knowledge basis for effective skills governance. While good practices are being implemented (Box 11.7), more needs to be done to develop regular monitoring of education outcomes. This should include information on graduate employment, use of skills in the workplace, difficulties encountered by job seekers, and strategies used to find employment.

### Box 11.7. Measuring skills gaps in WB6 economies

Some Western Balkan economies have introduced tools to measure skills gaps and mismatches, have carried out studies into short and long-term skills needs and have improved their labour market monitoring system. Examples include:

1. **Employability tracer studies:** Since 2017, Albania has traced the employability of all vocational education and training (VET) graduates (both secondary VET students and trainees) through an annual tracer study conducted by the National Agency for Employment and Skills (NAES).<sup>1</sup> North Macedonia conducted its first trader study of VET and higher education graduates in 2014/15 (Mojsoska-Blazevski, 2017<sup>[55]</sup>).<sup>2</sup> Serbia ran a pilot graduate tracer study in 2018 (ETF, 2019<sup>[56]</sup>). Montenegro plans to introduce a tracer study.
2. **Skills needs surveys:** Some economies have made progress implementing skills surveys among employers. North Macedonia uses its survey of employers' skills needs for one-year forecasting at occupational level.
3. **Labour market information system:** Montenegro's employment agency conducts detailed annual supply and demand analysis, covering all levels, sectors, and municipalities. This is one of the elements needed to create enrolment policies for secondary and tertiary education institutions. Relevant data include vacancies by qualification, the length of time of seeking employment, persons without work experience by sector, the number of pupils and students completing secondary and tertiary education, the number of registered unemployed with no qualifications, the duration of unemployment etc.
4. **Skills needs and foresight studies:** Chambers of commerce and social partners, particularly employer associations, conduct various analyses (e.g., in Montenegro and North Macedonia) and provide the education sector with recommendations on future qualification needs.
5. **Labour market forecasts** are carried out by labour ministries in some economies (e.g., North Macedonia).

1: The results indicate that, in 2019, 52% of 2018 graduates were employed and 12% were concurrently working and studying, for a total employment rate of 64%. (Jorgoni, 2019<sup>[57]</sup>).

2: Less than half of all employed VET graduates (45%) reported that the knowledge and skills they acquired during the education process are well utilised in their current job.

Source: Government responses to OECD questionnaire.

Labour market information and skills anticipation need to be used effectively by the relevant institutions, such as VET actors, PESs, education ministries and higher education institutions. There is much room for improvement in this regard. Some economies are taking steps to improve skills governance – for instance, the RS in Bosnia and Herzegovina adopted a new law in 2020 to include employers in the management board of public universities. The Republika Srpska, Serbia and North Macedonia, which has created an Occupational Outlook, are improving vocational and career counselling (ILO, 2018<sup>[58]</sup>). In parts of the region, structures to bring together relevant institutions have been set up, such as local councils for education and employment in the RS, and sector commissions and councils in Montenegro and Serbia.

The transition from education to work still poses a major challenge in the region. According to the STEP survey, 35% of firms in the five participating economies reported that insufficient workers' experience was a major or severe obstacle for business expansion (WIIW / World Bank, 2020<sup>[52]</sup>). On the supply side, unemployment rates reflect young people's difficulties in finding stable employment. Although youth unemployment (among 15-24 year-olds) fell by 36% between 2015 and the second quarter of 2019 across the region, it remains tremendously high, and well above the OECD, EU and CEEC-11 averages (Figure 11.5). Pathways to employment are often marked by unstable employment conditions. For

example, in Kosovo, entering the labour market through informal employment is widespread, with more than half (54.8%) of employed young people having a temporary employment contract (Government of Kosovo, 2017<sup>[59]</sup>).

**Figure 11.5. Youth unemployment rates in the WB6 (2015 and 2019)**  
15-24 year-olds

Note: Youth unemployment rate data for Albania, Bosnia and Herzegovina and Kosovo as well as WB6 average refer to the second quarter of 2019, as these are the latest available data. The unemployment rate data for Bosnia and Herzegovina in 2015 refer to the 15+ age group. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: Youth unemployment rates: (Eurostat, n.d.<sup>[60]</sup>), *Labour Force Survey* for EU, Montenegro, North Macedonia, Serbia; (WIW / World Bank, 2020<sup>[52]</sup>), *Western Balkans Labor Market Trends 2020* for Albania, Bosnia and Herzegovina and Kosovo; (OECD, n.d.<sup>[10]</sup>), *Labour Force Statistics* for OECD average. Unemployment rates (15-64): (Eurostat, n.d.<sup>[60]</sup>), *Labour Force Survey* for EU, Montenegro, North Macedonia, Serbia; (Instat, 2020<sup>[7]</sup>), *Women and Men in Albania 2020* for Albania; (ASK, 2020<sup>[8]</sup>), *Labor Force Survey in Kosovo, 2019*; (BHAS, 2019<sup>[9]</sup>), *Labour Force Survey 2019*.

StatLink  <https://doi.org/10.1787/888934254145>

Most worryingly, the share of young people not in employment, education, or training (NEET) in the region is still well above the EU and OECD average (Figure 11.6).

WB6 economies succeeded in reducing the NEET rate between 2015 and 2018 or 2019, as did EU and OECD economies on average. Bosnia and Herzegovina, North Macedonia, and Serbia made the most progress in reducing the NEET rate. Discouragement among young men and women, high drop-out rates and an unsupportive learning environment, poor job-search skills, and childcare roles among young women may explain the high NEET rates.

The WB6 economies have continued their efforts to reduce youth unemployment and NEET rates and smooth the school-to-work transition. For instance, North Macedonia has been implementing the Youth Guarantee scheme, in line with EU practice (EC, n.d.<sup>[61]</sup>).

Inexperience and skills gaps do not just lead to youth unemployment but also to vertical skills mismatches, i.e., individuals' first work experience may be in jobs requiring much lower educational attainment than they have. Serbia has made progress in this area: its National Employment Service set up a new programme called My First Salary, which began in the second half of 2020. Private sector employers, and especially those from disadvantaged municipalities are given priority for inclusion in the programme. Under the programme, the National Employment Service pays a monthly cash benefit of RSD 20 000 (EUR 170) to young people with secondary education, and RSD 24 000 to those with higher education, and also pays a contribution in the case of injuries at work and occupational diseases for people included in this

programme. It plans to include 10 000 young people during 2020 and 2021 (Government of Serbia, 2020<sup>[62]</sup>).

**Figure 11.6. Young people not in employment, education or training (2015 and 2019)**

Share of 15-24 year-old age group

Note: Data for Albania, Bosnia and Herzegovina, and Kosovo as well as WB6 average refer to 2018 instead of 2019, as these are the latest available data. Data for OECD average refers to the unweighted average of age groups 15-19 and age group 20-24. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Eurostat, n.d.<sup>[61]</sup>), *Labour Force Survey for EU, Montenegro, North Macedonia, Serbia*; (WIIW / World Bank, 2020<sup>[52]</sup>), *Western Balkans Labor Market Trends 2020* for Albania, Bosnia and Herzegovina, and Kosovo; (OECD, 2021<sup>[63]</sup>), *Youth not in employment, education, or training (NEET) (indicator)*, doi: 10.1787/72d1033a-en (accessed on 03 March 2021).

StatLink  <https://doi.org/10.1787/888934254164>

Over-education among high-skilled and university graduates may result from the unattractiveness of the VET system for young people and their parents and the greater attractiveness of the higher education system. Work-based learning, such as apprenticeships and internships, is a key approach pursued in OECD economies to tackle skills mismatch (OECD, n.d.<sup>[64]</sup>; OECD, 2018<sup>[11]</sup>). Albania, Montenegro, North Macedonia and Serbia have recently introduced workplace-based training modules into their VET and tertiary education curricula. However, students cannot always complete their workplace-based professional practice modules; for example, it was reported that in Albania it was not possible to find enough work-based training opportunities in companies.

### **Adult learning will be key to closing skills gaps and increasing competitiveness**

As companies respond to more volatile markets and shorter product cycles, individuals will need to adapt their skills and change jobs more frequently during their working lives. Adult learning is therefore central to a lifelong learning approach. It involves not just formal classes in training institutions or universities, but also non-formal and informal learning in workplaces (OECD, 2019<sup>[2]</sup>). Employee training helps to foster the competitiveness of businesses and enhance labour productivity, as well as improving individuals' experience of work (ETF, 2014<sup>[65]</sup>).

Participation of workers in continuing training in the region is below the EU average. According to data from the Adult Education Survey, last conducted in 2016, the share of adults participating in job-related non-formal education and training was only 5.0% in Bosnia and Herzegovina, 6.1% in Albania, 9.9% in North Macedonia and 14.1% in Serbia – all far below the EU average of 35.3% (Eurostat, 2021<sup>[66]</sup>). Younger adults and highly educated workers tend to participate more often.

Developing an efficient and quality adult education system remains a key challenge. The WB6 economies have started to set up or strengthen their adult learning frameworks. Although strategies for adult education have been adopted, implementation seems to be weak in some economies or they are outdated (for example in Kosovo). Although there are small budgets for training measures for the unemployed, education ministries may lack a targeted budget for adult education (as in Montenegro). Measures to provide financial incentives for participating in continuing training are lacking. Measures in some OECD economies might offer inspiration. Some have introduced individual learning accounts (OECD, 2019<sup>[67]</sup>), put in place infrastructure to guide adults as they upgrade their skills (such as Portugal's Qualifica Centres), or implemented programmes to increase the skills of low-skilled adults and supported companies to do so (OECD, 2019<sup>[68]</sup>).

One important approach is the validation and recognition of prior non-formal learning. Some economies have started to set up validation and certification processes for adult learning (e.g., Albania and the RS in Bosnia and Herzegovina, while in North Macedonia a system is being set up). Evidence from some EU economies, such as Portugal, shows that linking upskilling measures to validation and recognition of prior learning increases their effectiveness (Düll et al., 2018<sup>[41]</sup>). In the RS, the law also foresees that employers may organise various forms of training and additional training for the employed to adjust to the market demands and changes, and to the new technological and work processes.

Some economies, such as Montenegro and North Macedonia, have made progress in awareness-raising activities. For instance, Montenegro organises the Adult Education and Learning Day Conference and publishes relevant material, including flyers and a guide to the non-formal education system. One challenge is to better connect all parties involved: the policy makers, other ministries, local governments, social partners, employers, media representatives and non-government organisations (NGOs).<sup>16</sup> North Macedonia has also made progress in increasing transparency about adult education providers. In October 2017, the Adult Education Centre in North Macedonia officially launched a newly developed web platform of certified adult education providers and training programmes (Eurydice, n.d.<sup>[69]</sup>).

Reaching low-educated and older workers is a particular challenge, since they have often not developed their learning skills over their lifetimes. These workers are also more likely to be employed in companies with low productivity and in small enterprises, which are less likely to offer continuing training. More efforts are needed to increase participation among prime age and older workers, as well those who are low educated, vulnerable groups and the self-employed. A range of OECD economies have developed programmes exclusively targeting these groups, e.g. the Chèque Formation in Wallonia, Belgium; Profi!Lehre and Weiter!Bilden in Austria; the Consortium for HRD Ability Magnified Program (CHAMP) in Korea, the Industry Skills Fund in Australia and the Formação-Ação in Portugal (OECD, 2019<sup>[2]</sup>).

Remedial education aims to make labour markets more inclusive and open up employment opportunities for low-skilled adults. Kosovo is developing some learning programmes for remedial education (Grades 6-9) and adult education programmes within the VET schools, supported by international donors (Haxhikadrija, Mustafa and Loxha, 2019<sup>[70]</sup>). It is offering programmes like "Literacy for women and girls" for women from Romani, Ashkali and Egyptian (RAE) communities. One challenge is to scale up these types of programmes and to ensure sustainable financing.

### ***The way forward for skills***

- **Provide adequate financial incentives to employers to offer continuing education** to help companies adapt to technological change. These could target low-skilled, prime age and older workers and SMEs (Box 11.8). This should be combined with awareness-raising activities targeted at employees and employers to pursue continuing training.
- **Include internships in university curricula** to continue to develop and implement dual vocational training formats.

- **Improve vocational guidance for both young people and adults.** Plans could also include counselling activities for employers as well as employees, in particular for SMEs. A good example to follow would be France, where every individual has the right to information, advice and career guidance support. To put this right into action, the government launched the Advice for Professional Evolution (*Conseil en Évolution Professionnelle*) in 2014, offering free and personalised services (OECD, 2019<sup>[31]</sup>).
- **Develop a framework for the recognition of prior learning combined with activities to increase skills.** The economies which already have such a system in place should link recognition processes to upskilling measures.
- **Scale up remedial education measures for low-educated adults.** In Kosovo, the whole education and training infrastructure should be used, including VET institutions, in order to provide remedial education and vocational skills to adults, as also recommended by ETF (2019<sup>[71]</sup>).
- **Use the skills anticipation system to guide young people, adult workers and the unemployed** in retraining and upskilling activities. Skills anticipation and labour market information systems should provide information about the current labour market and expected changes, for instance with implementation of the Green Agenda, particularly for coal-related work. The information on skills in demand and tracer studies can also be used to adapt the curricula of VET, university, and adult education programmes. Trainers can be trained in adult education and vocational rehabilitation on skills in demand and on adult learning pedagogy.
- **Monitor the employability of VET and university graduates** (as some WB6 economies already do through tracer studies) and adapt curricula and teaching methods accordingly. Offer modular training courses to close skills gaps.

### Box 11.8. Financial incentives for workplace training

In **Belgium (Flanders)**, the SME Wallet (*KMO-portefeuille*) programme offers specific incentives to encourage SMEs to train their employees. It targets SMEs exclusively and is designed to help them grow and become more competitive through investment in skills. The SME Wallet covers 30-40% of training costs, depending on the size of the enterprise. SMEs can apply for subsidies online. Employers determine their own training needs, and there is no targeting element. A recent impact assessment determined that participating firms achieved higher growth than a control group.

**Finland** has a financial incentive that goes hand-in-hand with building the capacity of companies to identify their training needs and deliver training. The Joint Purchase Training (*Yhteishankintakoulutus*) supports employers who want to retrain existing staff or set up training programmes for newly recruited staff. Offered by the PES, it supports employers to define their training needs, select candidates for training and find an education provider to deliver the tailored training. The PES also part-finances the training.

In **Ireland**, in 2017, Springboard+ (a programme originally conceived for the unemployed population which offers free courses leading to qualification) was extended to the self-employed who want to increase their skills in certain sectors.

Source: (OECD, 2017<sup>[29]</sup>), *Financial Incentives for Steering Education and Training*, <https://dx.doi.org/10.1787/9789264272415-en>, (OECD, 2019<sup>[2]</sup>), *OECD Skills Strategy 2019: Skills to Shape a Better Future*, <https://doi.org/10.1787/9789264313835>; (OECD, 2019<sup>[72]</sup>), *Employment Outlook: The Future of Work*, <https://dx.doi.org/10.1787/9ee00155-en>.

### Job quality (Sub-dimension 8.3)

The focus of this sub-dimension is on earnings quality, including non-wage elements that offer protection from labour market risks. Earnings are one of the three key dimensions of job quality (OECD, 2014<sup>[73]</sup>; Cazes, Hijzen and Saint-Martin, 2015<sup>[74]</sup>), with the other two being labour market security and the quality of the working environment – see Labour market governance (Sub-dimension 8.1). Good jobs should be equally available for men and women. Therefore, this sub-dimension also looks at gender inequality and policies to promote female employment.

Most WB6 economies receive only low scores for quality earnings (Table 11.5). In general, the WB6 economies score better for their policies to promote female employment, particularly North Macedonia.

**Table 11.5. Scores for Sub-dimension 8.3**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 8.3: Job quality	Quality earnings	2.0	1.0	1.0	3.0	2.0	2.0	1.8
	Policies to promote female employment	3.5	2.8	2.0	4.0	3.0	2.5	3.0
Sub-dimension average score		2.8	1.9	1.5	3.5	2.5	2.3	2.4

#### ***Despite mechanisms to set minimum wages, average wages and low labour productivity remain key challenges***

Quality of earnings relate to competitive wages, which set the right incentives to formally employ workers so that they are covered by social protection and set incentives for increasing productivity and workforce development. Very low wage levels are associated with a risk of the economy becoming trapped in a low wage-low productivity vicious circle (OECD, 2018<sup>[1]</sup>). Low wage levels and poor career perspectives also increase the incentives for skilled workers to leave the country and work abroad, which in turn creates skills shortages. Widespread informality implies that large parts of the workforce are effectively beyond the reach of government policies and do not have access to social insurance or regulatory protection. Good quality earnings are associated with a more productive economy and make it more attractive for employers to invest in human capital. Policy options include setting the statutory minimum wage at a moderate level in order to raise wages at the bottom of the ladder, while avoiding pricing low-skilled workers out of jobs (OECD, 2018<sup>[1]</sup>).

Although economic and social councils should be involved in fixing the minimum wage, in the WB6 economies their role is mostly limited to consultation and the decision is often taken unilaterally by the government. Sometimes they may not even be consulted, as happened with the increase in the minimum wage in 2020 in Albania. In Serbia, the government only steps in when the social economic council cannot agree the level of the minimum wage (this happened in 2018, 2019 and 2020). In 2018, Albania, North Macedonia and Serbia had the highest ratio of monthly minimum wage to monthly average gross wage; the ratio was higher than in Bulgaria and Croatia, for which comparable information was available. The ratio was lower in Montenegro and Kosovo (Table 11.6). Measured in purchasing power parity (PPP) terms, the minimum wage was lowest in Albania and Kosovo in 2018.

**Table 11.6. Minimum and gross average wages in the Western Balkans, Bulgaria and Croatia (2018)**

	Monthly gross minimum wages, EUR (ER)	Monthly gross minimum wages, EUR (PPP)	Average monthly gross wage (EUR)	Ratio of minimum wage: average gross wage (2018)	Change in minimum: average gross wage ratio since 2015 (p.p.)
ALB	181	358	397	0.46	0.00
BIH	-	-	724	-	-
KOS	170	334	558	0.30	-0.11
MKD	279	576	579	0.48	0.06
MNE	288	514	766	0.38	-0.02
SRB	285	530	580	0.49	0.03
BGR	261	517	586	0.45	0.04
HRV	462	681	1139	0.41	0.03

Note: Data for Bosnia and Herzegovina refer to 2017 Q2. p.p. = percentage points; PPP = purchasing power parity;

Source: (wiiw Databases, 2021<sup>[75]</sup>) The Jobs Gateway in South East Europe, <https://data.wiiw.ac.at/seejobsgateway.html>; based on data provided by statistical offices and Eurostat.

No comparable data for 2019 and 2020 are available. In 2019, Albania increased the minimum wage to EUR 213 (48% of the average gross monthly wage).<sup>17</sup> In 2020 the minimum wage in the RS in Bosnia and Herzegovina was fixed at EUR 266. A comparison of the ratio of minimum wages to mean monthly gross earnings found that in 2019 the ratio was highest in Albania, followed by Serbia and Montenegro (Eurostat, 2021<sup>[76]</sup>).<sup>18</sup>

In-work poverty is caused by low wages as well as low work intensity, in particular among vulnerable groups. The self-employed are often more likely to be at risk of poverty.<sup>19</sup> There are no policies and measures in place to reduce taxes or social security contributions for low wage earners.

It would be advisable for WB6 economies to carry out a study of the potential impact of the minimum wage on informality on the one hand, and its potential to prevent poverty in low-wage sectors and occupations on the other.

One main challenge is to increase productivity. Between 2015 and Q2 of 2019 (the latest quarter for which comparative data are available), labour productivity has been rather volatile with no or limited improvements over time, except in Bosnia and Herzegovina (Figure 11.7).

**Figure 11.7. Annual change in labour productivity (2015-19)**

Note: Labour productivity is defined as the ratio of labour to GDP at 2010 reference prices per person employed (LFS), growth in %.

Source: (wiiw Databases, 2021<sup>[75]</sup>) The Jobs Gateway in South East Europe, <https://data.wiiw.ac.at/seejobsgateway.html>; based on data provided by statistical offices and Eurostat; WIIW / World Bank (2020<sup>[52]</sup>), *Western Balkans Labor Market Trends 2020*.

StatLink  <https://doi.org/10.1787/888934254183>

Another issue is the wage difference between the public and the private sector in some of the Western Balkan economies. For example, in Bosnia and Herzegovina, the public sector offers higher wages and better working conditions than the private sector. Likewise, in Kosovo, the highest wages were paid by publicly owned enterprises, while the lowest wages were in the private sector.<sup>20</sup> This makes it harder for the private sector to attract workers. The average gender wage gap was 16% in the region in 2014.<sup>21</sup> The largest wage gap was in craft and related occupations (Suta et al., 2021<sub>[77]</sub>).

### **Women's economic activity has increased substantially, but the gender employment gap remains wide**

Gender inequality is not only bad for labour market inclusiveness but also harms economic performance. Conversely, there is evidence that greater gender equality increases economic growth (EIGE, 2017<sub>[78]</sub>). Policies to promote female employment are therefore crucial. Enhanced educational outcomes for women, increased female labour force participation, and improved career development opportunities contribute to better economic performance and higher living standards. A recent study commissioned by the Regional Cooperation Council (RCC) as part of a wider Women Economic Empowerment agenda, based on the European Institute for Gender Equality (EIGE) methodology, showed that continuing to increase employment among women and narrowing the employment gap would increase GDP (Suta et al., 2021<sub>[77]</sub>).<sup>22</sup>

Despite rising in all WB6 economies since 2015, the average employment rate among women was still 21.8 percentage points below the EU average, 23 p.p. below the CEEC-11 average, and 19.1 p.p. below the OECD average in 2019 (Figure 11.8). The gender employment gap – the percentage-point difference between men and women's employment rates – was higher on average for the WB6 economies (18.6 p.p.) than the EU average (10.3 p.p.), the CEEC-11 average (9.8 p.p.) and the OECD average (14.9 p.p.). On average, the gender employment gap widened in the WB6 economies between 2015 and 2019, driven mainly by increased gaps in Kosovo and Montenegro. Over that period, the gender employment gap only narrowed in Albania and Serbia, where employment among women rose faster than among men. More recently, between 2019 Q2 and 2020 Q2, the gender employment gap among 20-65 year-olds has narrowed across both the WB region and the EU. Between the first and second quarter of 2020, employment rates in the WB6 economies fell by 3.3 p.p. for men on average and 0.9 p.p. for women (Suta et al., 2021<sub>[77]</sub>).

**Figure 11.8. Gender employment gaps in the WB6 (2015 and 2019)**

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934254202>

Women's employment rates in 2019 were highest in Albania and Serbia, and lowest in Kosovo. The women empowerment index (WEI) provides a more nuanced picture of gender inequality in the labour market. In addition to the gender employment gap, this indicator includes the share of women in middle and senior management, the female labour force participation rate, the female unemployment rate, and the share of female employees in full-time employment. In 2019, the average WEI score for the WB6 economies was 52.4 out of 100 while the EU average was 80. In the region, the highest scores were achieved by Albania (outperforming several Southern European economies) and Montenegro. Bosnia and Herzegovina (45.9) and Kosovo (27.4) scored the lowest among the WB6 and EU economies (Suta et al., 2021). Four of the WB6 economies have calculated their gender equality index following the EIGE methodology, which also includes other dimensions, such as money, knowledge, time spent in care activities, power and access to services. North Macedonia received the highest score (62) in the region, followed by Albania (60.4), Serbia (55.8) and Montenegro (55). Bosnia and Herzegovina and Kosovo did not take part. The 2019 EU average is 67.4.

There are a number of reasons for women's comparatively low employment, including gender stereotypes, a lack of affordable and high-quality child care and elderly care, and inflexible working time arrangements (World Bank, 2017<sup>[79]</sup>; Haxhikadrija, Mustafa and Loxha, 2019<sup>[70]</sup>; Centre for Equality and Gender Equality, 2016<sup>[80]</sup>; NALED, 2019<sup>[81]</sup>).<sup>23</sup> Differences in labour market outcomes are also related to occupational segregation, lack of access to finance and entrepreneurship support, discrimination in recruitment and career progression, and lower retirement ages in several WB6 economies. In Kosovo, generous maternity leave regulations may discourage employers from employing women. Educational attainment is also decisive for women's labour market participation and gender employment gaps are smallest among the well-educated (WIIW / World Bank, 2020<sup>[52]</sup>). Conversely, the gaps are largest among the low educated, while low-educated women also work more often as unpaid family members than their male peers.

WB6 economies have set up co-ordination mechanisms to tackle gender inequality in a comprehensive way and have strategies for gender equality in place. Women make up an increasing share of university graduates, and women even outnumber men among recent university graduates, for example in Albania (Instat, 2020<sup>[71]</sup>). Young women already account for a larger share of students and graduates in science, technology, engineering, and mathematics (STEM) subjects than in many EU economies (including in engineering and computer sciences), but computer sciences and engineering remain more typical choices for young men (RCC, 2020<sup>[82]</sup>). Some WB6 economies have made progress in providing gender-sensitive vocational guidance. North Macedonia has made progress in the gender-sensitive revision of schoolbooks and the Ministry of Education and Science awards scholarships to female university students studying bio-technical, technical-technological, natural-mathematical, IT, chemistry, physics, mathematics and medical sciences. Some WB6 economies, such as North Macedonia, have made progress in revising legislation to avoid gender discrimination, but there is a general lack of transparency about the implementation of the regulatory framework.

The main targeted measures to promote female employment have been in the area of active labour market programmes, although they are mostly small in scale. Specific programmes include promoting employment among single mothers in Albania, self-employment and female entrepreneurship schemes in Bosnia and Herzegovina, measures targeted at women aged 40 and older in FBiH, and measures for women with three or more children and other hard-to-place women in Kosovo. Women are in general well represented among participants of mainstream ALMPs, except for start-up support measures. Progress has been made in training labour office staff on gender equality issues in Albania.<sup>24</sup> Another area where recent, but generally limited, progress has been made is in entrepreneurship programmes, implemented by the public employment services and other institutions. However, programmes have been small in scale; for instance, in Albania, little progress has been observed (OECD et al., 2019<sup>[83]</sup>).

### ***The way forward for quality jobs***

- **Conduct regular analyses of earnings structures** covering earnings by gender, sectors, educational level and occupation; non-wage labour costs (like social security contributions); the share of recipients of minimum wages; and the development of the low-wage sector by gender. Monitoring of labour market data should be improved and include data on in-work poverty. Increasing the quality of earnings will mean raising the productivity of companies so wider monitoring should also include labour productivity.
- **Assess the impact of the minimum wage on both poverty reduction and informal employment.** One example to follow could be Germany's Minimum Wage Commission which is composed of two members from the scientific community in a consultative role, as well as three representatives of the trade unions and three representatives of employers who have voting rights, and a chair appointed by the government on the basis of suggestions made by the social partners. Its mandate is to constantly evaluate the impact of the minimum wage on the protection of workers, conditions of competition, employment in certain industries and regions, and on productivity. The commission presents the results of its evaluation to the Federal Government in a report together with its resolution every other year on the level of the minimum wage (Mindestlohn Kommission, n.d.<sup>[84]</sup>).
- **Increase access to affordable and high-quality childcare as well as support for elderly care.** International experience shows that labour market participation rates of women depend on availability of childcare and after-school care (OECD, 2016<sup>[85]</sup>).
- **Take steps to reduce gender stereotypes in education and the workplace**, including implementing the regulatory framework on non-discrimination, conducting awareness-raising activities, and adapting vocational guidance to attract more women into ICT and engineering and more men into occupations like education and care. Kosovo should make its maternity leave law less generous so as to reduce barriers to employment of young women. All the economies should promote entrepreneurship among women, including access to training, counselling and follow-up, and financing.

### **Activation policies (Sub-dimension 8.4)**

The goal of an effective activation policy for jobseekers and other disadvantaged groups is to bring more people into the labour force and into jobs. This requires in particular ensuring that people have the motivation and incentives to seek employment; increasing people's employability and helping them to find suitable employment; expanding employment opportunities for jobseekers and people outside the labour force; and managing the implementation of activation policy through efficient labour market institutions (OECD, n.d.<sup>[3]</sup>). Activation policies need to balance and combine different types of activities, including counselling jobseekers and employers; implementing active labour market programmes (ALMPs); and designing welfare benefits so that they increase matching efficiency, provide protection against poverty, while setting work incentives in the mutual obligations framework, which induces setting job-search requirements, rules for accepting suitable work, obligation to participate in ALMPs if needed and rules on sanctions.

WB6 economies score better for their public employment services (PESs) and ALMPs than for their mutual obligations frameworks (Table 11.7).

**Table 11.7. Scores for Sub-dimension 8.4**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 8.4: Activation policies	Public employment services	3.5	2.5	2.5	3.5	3.5	3.5	3.2
	Mutual obligations framework	2.0	2.5	1.5	3.5	3.0	2.5	2.5
	Active labour market programmes	3.5	2.3	2.0	3.5	3.5	3.0	3.0
<b>Sub-dimension average score</b>		3.0	2.4	2.0	3.5	3.3	3.0	2.9

***The governance and service delivery of public employment services have improved, but they remain under-resourced***

Public employment services are the main institutions involved in activation policies. PES staff capacity in the WB6 economies has improved in recent years, but staff caseloads, i.e., the number of registered unemployed people per counsellor, are still high or very high (Table 11.8). In France and Germany, by comparison, counsellors' caseloads of hard-to-place jobseekers are much lower, at around 70 jobseekers per employment counsellor, while overall caseloads may range between 100 and 350, depending on the degree to which jobseekers need individual guidance and how autonomous they are at using self-help guidance tools (OECD, 2015<sup>[5]</sup>; Manoudi et al., 2014<sup>[86]</sup>; Pôle emploi France, n.d.<sup>[87]</sup>). In the WB6, PES staff are receiving training on implementing new work methods, ALMPs and dealing with specific target groups. However, high caseloads may hinder them from effectively implementing counselling and job placement services.

**Table 11.8. Caseloads for PES counsellors (2019)**

Number of registered jobseekers per counsellor

	ALB	BIH-RS	KOS	MKD	MNE	SRB
Caseload	300	> 1000	769	400	556	827

Source: Assessment on the basis of administrative data received by the PES in the economies; no data are available for FBiH.

Following EU and OECD good practice, PESs in the WB6 economies have introduced or are in the process of developing profiling tools to categorise jobseekers into three main groups: 1) autonomous and easy-to-place jobseekers; 2) jobseekers with a medium level of employment barriers; and 3) hard-to-place jobseekers. The last category are quite likely to be predominant, since many registered jobseekers have low skills and/or are long-term unemployed. The WB6 PESs have also introduced the creation of individual action plans and follow-ups; however, very high caseloads in the majority of PESs limit their effectiveness, as counsellors are unlikely to have sufficient time for in-depth interviews, counselling and timely and regular follow-up activities. PESs have also modernised their IT systems to make their labour intermediation and case handling more effective or have at least started to do so.

Despite recent improvements in the WB6 economies, the high rate of long-term unemployment remains a key challenge for labour market policies (Table 11.9). Rates are well above the EU and CEEC-11 averages.

**Table 11.9. Incidence of long-term unemployment (2015 and 2019)**

Long-term unemployed as % of all unemployed

	ALB	BIH	KOS	MKD	MNE	SRB	WB6	EU-28	CEEC-11
2015	66	81.7	72.1	81.6	76.8	59.7	72	48.2	43.6
2019	64.3	76	69.1	71.7	79	50.3	66.3	40.1	37.1

Note: Table shows the share who have been unemployed for more than one year as a percentage of all unemployed (15–74-year-olds). Data are for 2019 Q2 for ALB, BIH, KOS and the WB6 average. The CEEC-11 are the 11 Central and Eastern European countries joining the EU: Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: Eurostat (n.d.<sup>[6]</sup>), *Labour Force Survey*, <https://ec.europa.eu/eurostat/web/main/data/database>; WIIW / World Bank (2020<sup>[52]</sup>), *Western Balkans Labor Market Trends 2020* for Albania, Bosnia and Herzegovina, and Kosovo.

Collecting vacancies and building trust with employers is challenging, particularly as the region's PESs have many hard-to-place jobseekers on their registries. They need to increase their active efforts to collect vacancies and to provide services to employers. A common approach in European economies is to identify growth sectors at the national or regional level and to contact employers active in these sectors (ILO, 2016<sup>[88]</sup>). Other PESs explicitly target their individualised services at SMEs (Oberholzner, 2018<sup>[89]</sup>). In Slovenia, small and micro-enterprises that lack human resources (HR) management professionals and experience can get personal assistance from advisors, while companies with HR management resources and experience are asked to use the portal for employers.

***Jobseekers have mutual obligations for receiving benefits although monitoring is limited***

Moderately generous and comprehensive social benefits strengthen the effectiveness of activation policies. Effective social safety nets alleviate concerns about job security among the employed, with important consequences for worker well-being. Adequate unemployment insurance and other social benefits – including sickness, disability, lone parent, and social assistance benefits – enhance job quality by effectively insuring workers against losing their jobs and giving them time to find a new one. However, unemployment and other social benefits can also create disincentives to finding work in the shortest possible timeframe. Therefore, a well-designed mutual obligation framework is decisive in preventing benefits from creating disincentives to work (OECD, 2018<sup>[1]</sup>). Mutual obligation principles link the generosity of unemployment benefits and social assistance with requirements on beneficiaries to look for work and accept suitable offers, while imposing sanctions on those who do not comply (Langenbacher, 2015<sup>[90]</sup>).

Unemployment benefits in the WB6 economies do not provide generous income replacements. Some economies do not link the level of unemployment benefits to previous earnings (e.g., in Albania the unemployment benefit is set at 50% of the minimum wage), which contradicts good practice in OECD and EU economies. This may facilitate processes at the PES, but it does not create a strong incentive to engage in formal employment and limits matching efficiency. On the other hand, older unemployed people with a long work history are able to receive benefits for a long period and there is a risk of unemployment benefits being misused as a route to early retirement. This contradicts OECD recommendations on reducing incentives for early retirement and eliminating early retirement elements in unemployment benefit schemes (OECD, n.d.<sup>[91]</sup>).

In general, able-bodied social assistance recipients have to register at the PES and actively search for work, otherwise they get sanctioned, as is the case in Kosovo, for instance. Electronic data management and information exchange systems have been established but monitoring and follow-up on job-search activities may be weak. In the Federation of Bosnia and Herzegovina and Serbia, there is still an incentive to register at the PES in order to be covered by health insurance. While this may represent an opportunity to reach out to the inactive population, often no such follow-up is made. Overall, WB6 economies have improved co-operation with social services at the local level (e.g., in Serbia and North Macedonia, see Box 11.9), however, poor institutional capacity for providing encompassing social services limits the effectiveness of co-operation.

### Box 11.9. Co-operation between social services and employment services to integrate vulnerable groups into the labour market in North Macedonia

Since 2019, the Centre for Social Work and the Employment Centre have co-operated to put together individual employment plans to map out beneficiaries' participation in active employment measures and job seeking. Counsellors from the two centres communicate regularly on the outcomes of activities and meet as needed, at least once a month. They perform joint assessment of the needs and the employability level of all registered unemployed persons or beneficiaries from one household, with the aim of identifying the most employable person and including that person in the active employment measures and services, taking into account their age, educational attainment, previous work experience, professional qualifications, acquired skills, the job demand in the labour market, and whether there are no obstacles to participation in the active employment measures and other circumstances.

Source: (Government of North Macedonia, 2019<sup>[92]</sup>), *Economic Reform Programme 2019-2021*, [https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/north\\_macedonia\\_erp\\_2019-2021.pdf](https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/north_macedonia_erp_2019-2021.pdf); (EC, 2019<sup>[93]</sup>), "Economic Reform Programme of North Macedonia (2019-2021): Commission assessment", <https://data.consilium.europa.eu/doc/document/ST-8545-2019-INIT/en/pdf>; information received from the government.

Well-targeted, permanent in-work benefits can be effective at making work pay. In-work benefits supplement low wages with welfare benefits. If well designed they create an incentive to take up low-paid work (OECD, 2018<sup>[11]</sup>). In-work benefits are only implemented in Albania among the WB6 economies. Supported by the World Bank, a reform of social assistance (economic aid) was rolled out across Albania at the beginning of 2018, introducing in-work benefits, by extending social assistance eligibility to people in low-paid employment, receiving a modest income from household agricultural activity in rural areas, or in receipt of other forms of social protection benefits (such as pensions or disability benefits). While the introduction of in-work benefits corresponds to international good practice (Immervoll and Scarpetta, 2012<sup>[94]</sup>), the level of social assistance, currently less than one-third of the minimum wage, remains low (Jorgoni, 2019<sup>[57]</sup>).

#### **Active labour market programmes are very under-resourced**

Active labour market programmes can play a constructive role in finding people employment when used judiciously. Thorough evaluations of ALMPs across OECD economies indicate that the record is mixed, but also that well-designed and targeted measures can increase the employability of jobseekers and their employment opportunities in a cost-effective manner (OECD, 2015<sup>[5]</sup>).

The WB6 economies have improved the design of their measures and introduced targeted programmes but the most vulnerable groups are still under-served. Expenditures on ALMPs as a percentage of GDP have been low, limiting their potential impact on the region's very high unemployment rates: 0.27% in the RS, 0.08% in Kosovo and 0.19% in North Macedonia in 2019; 0.08% in Serbia in 2017. Considering that unemployment rates are nearly three times the OECD average, these expenditures are not adequate. In 2017, about 5.5% of unemployed people participated in an ALMP in Albania, around 6% in Bosnia and Herzegovina, 10.2% in Kosovo.

In comparison, on average in 2018, OECD economies spent 0.36% of GDP on ALMPs (including employment incentives, training measures, job creation measures/public works, start-up incentives, vocational rehabilitation and sheltered workshops). This rises to 0.46% if placement services, counselling and PES administration are included (OECD, n.d.<sup>[10]</sup>). In the EU, expenditure on ALMPs (without counselling) ranged from 0.03% of GDP in Romania to 1.39% in Denmark (EC, 2020<sup>[95]</sup>).

### *The way forward for activation policies*

- **Continue to strengthen the capacities of PESs** by enhancing the number of employment counsellors, and offering digital and self-help services for those who are ready to help place themselves. Train staff so that they become gender sensitive, have a deep understanding of the employment barriers faced by hard-to-place jobseekers, and identify the work capacity of people with disabilities in co-operation with relevant institutions and occupational doctors.
- **Regularly monitor PES activities and outcomes** and publish the results, systematically differentiating outcomes (i.e., employment) by degree of disadvantage. Thorough evaluations of ALMPs and their impact on different target groups should be conducted by an external evaluator.
- **Continue to develop services for employers** and to proactively collect vacancies. These services could include organising job fairs, meeting regularly with local employers, cold calling employers, and following up with employers who recruited hard-to-place jobseekers.
- **Continue efforts to increase the employment of vulnerable groups**, by developing integrated approaches for the delivery of social and employment services and allocating relevant budgets to improve the labour market integration of the most vulnerable groups (e.g. Roma communities, women in rural areas). This requires close co-operation with other key stakeholders at central and local levels in order to reach those who have become inactive and support those in informal work to transition to formal employment.
- **Continue to strengthen the role of PESs in increasing skills among jobseekers and workers threatened by industrial restructuring.** Scale up training programmes leading to certification and increase the budget for ALMPs accordingly. Develop adult vocational guidance for adults. This could be done by PESs in co-operation with other relevant institutions.
- **Revise the design of unemployment benefits (where relevant)** to link them to previous earnings and avoid them being used as a pathway to early retirement. Where relevant reform health insurance schemes to avoid people only registering with the PES to get health care coverage. Where relevant, reform social assistance schemes to improve targeting and create incentives to take up work.
- **Co-operate with other PESs within the region in the area of labour intermediation.** Within the EU, the European Network of Employment Services (EURES) provides placement services.
- **Support skilled workers who gained experience abroad and are returning** to find good work conditions and living conditions. Co-operate with relevant actors to facilitate labour market integration of returning emigrants.
- **Intensify the exchange of experience and benchmarking of PESs within the region.** In the EU the European PES Network, supported by the European Commission, is very active and produces reports and survey-based studies on work methods, strategies and measures of PESs, and working groups and webinars are organised on pressing issues. It organises bench learning and mutual learning events and peer reviews with the support of the European Commission (EC, n.d.<sup>[96]</sup>). These are key activities enshrined in the open co-ordination among EU Member States in the area of employment.

## Conclusion

Labour market outcomes have improved with increased employment and reduced unemployment among both men and women. However, employment rates in the region are still below OECD and EU averages and unemployment rates are significantly higher. Job quality has not improved significantly: informality remains high and duality still characterises some labour markets, while working conditions are improving only slowly. Limited progress has been made in including the most vulnerable groups and minorities in the

labour market. Labour laws, occupational health and safety regulatory frameworks and the design of employment policy strategies have improved. However, major efforts are needed to improve implementation and to strengthen the institutional capacities of relevant actors. The capacity of social partners to regulate employment and working conditions remains weak. Employment policies would benefit from being more encompassing and better linked to competitiveness strategies, tax policies, social policies, and education policies. Tackling skills gaps and skills shortages will be paramount for economic development. This calls for further improvements in the education system as well as progress in the school-to-work transition and adult learning.

## Notes

<sup>1</sup> (WIIW / World Bank, 2020<sup>[52]</sup>) for 2015 employment rate data, and for unemployment rate (population aged 15+, 2015, 2019Q2).

<sup>2</sup> The 11 Central and Eastern European countries (CEECs) which have joined the European Union: Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>3</sup> These include issues such as working time, pregnant women, workers' rights in case of mergers and acquisitions, and some health and safety issues in Federation of Bosnia and Herzegovina and the preparation of a draft law on maternity and parental leave in Kosovo.

<sup>4</sup> E.g. the Federation of Bosnia and Herzegovina has started harmonising domestic legislation with EU directives, mainly in the area of working time, pregnant women, workers' rights in case of mergers and acquisitions, and some health and safety issues.

<sup>5</sup> Except for Romania which was between Albania and North Macedonia.

<sup>6</sup> According to Article 10 of the Labour Law, a contract for a specified task may not be longer than 120 days within a year.

<sup>7</sup> The latest available comparative data for the WB6 are from (WIIW / World Bank, 2020<sup>[52]</sup>); OECD and EU average are from the LFS database (OECD, n.d.<sup>[97]</sup>).

<sup>8</sup> According to a MLSW Report, developed within the EU-funded project "Support to Labour Inspectorate for fighting against undeclared work". Information provided by the government.

<sup>9</sup> According to the Statistical Office of the Republic of Serbia (2021), informal employed includes the employed in unregistered companies, the employed in registered companies but without formal contract and without paying social and pension contributions, as well as unpaid family workers, (Statistical Office of the Republic of Serbia, 2021<sup>[99]</sup>)

<sup>10</sup> The related framework of the project Measures to Protect Children from Trafficking, Exploitation for Work and Unsafe Migration is funded by the governments of Italy, Germany and France.

<sup>11</sup> Government response to the questionnaire.

<sup>12</sup> Argentina, Brazil, Paraguay, Uruguay and the Bolivarian Republic of Venezuela. Associate members are Bolivia, Chile, Colombia, Ecuador and Peru.

<sup>13</sup> Antigua and Barbuda, Bahamas, Barbados, Belize, Dominica, Grenada, Guyana, Haiti, Jamaica, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, and Trinidad and Tobago. Associate members are Anguilla, Bermuda, British Virgin Islands, Cayman Islands, and the Turks and Caicos Islands.

<sup>14</sup> Skills shortages occur when the demand for a particular skill or set of skills exceeds the supply of those available with that skill. Skills gaps occur when workers do not have the right skills required for competent job performance.

<sup>15</sup> Non-routine jobs refer to managers, professionals and higher-level technicians, whose job descriptions usually contain non-routine cognitive and socio-emotional tasks. This corresponds to Type A occupations in the STEP methodology. Routine jobs refer to all other occupations, which are Type B occupations in the STEP methodology. This methodology was slightly adapted.

<sup>16</sup> Information provided by Montenegro.

<sup>17</sup> SEE Jobs Gateway, based on data provided by statistical offices and Eurostat. (WIIW / World Bank, 2020<sup>[52]</sup>)

<sup>18</sup> In 2019, among the 17 EU countries which have a minimum wage, the average ratio of minimum to mean monthly gross earnings in the business economy was 45.1%, while it was 55.5% in Albania. This was higher than in any of the EU countries, where the highest ratio was 52.5%, in Slovenia. It was 48.8% in Serbia and 45.2% in Montenegro. There were no data for North Macedonia, Kosovo and Bosnia and Herzegovina. In the industry, construction and services sectors, the ratio in the three WB economies is lower, but it remains markedly above the EU average in Albania (Eurostat, 2021<sup>[76]</sup>).

<sup>19</sup> As shown in the profiles of the WB6 economies prepared by the European Social Policy Network of the European Commission (EC, 2019<sup>[100]</sup>).

<sup>20</sup> The highest average gross wages in 2018 were: EUR 843 in the electricity, gas, steam and air conditioning supply sector; EUR 717 in information and communication; and EUR 639 in mining and quarrying. The lowest was in agriculture, forestry and fishing (EUR 256) (ASK, 2019<sup>[98]</sup>).

<sup>21</sup> There are no comparable updated data on gender wage gaps, although there is more recent evidence for some WB6 economies; see economy profiles for details.

<sup>22</sup> According to an earlier study, the EU is expected to improve its GDP per capita over 2015-30 by between 0.8% (slow scenario, by reducing the gap by up to 13 p.p.) and 1.5% (rapid scenario; reducing the gap by 20 p.p.) (EIGE, 2017<sup>[78]</sup>).

<sup>23</sup> Information on the RS provided by the RS authorities.

<sup>24</sup> Government response to questionnaire.

# 12 Science, technology and innovation (Dimension 9)

---

An effective institutional and policy context for science, technology and innovation (STI) is essential to boost the knowledge economy. For the small open economies of the Western Balkans, STI activities play an important role in the region's path to EU accession and are viewed as key for regional integration. This chapter assesses the STI policy framework and support structure in the six Western Balkan (WB6) economies. After a brief analysis of overall STI trends and performance in the region, the chapter explores three sub-dimensions considered instrumental to the development of sustainable and impactful STI policies and processes. The first, governance of domestic STI systems, reviews the strategic and regulatory framework for STI, including key strategies, institutional set-up and co-ordination, as well as international collaboration and alignment with EU good practice. The second sub-dimension, public research systems, analyses the governance of the public scientific research sector, funding approaches and human resource capacity to foster academic research excellence. The third sub-dimension, business-academia collaboration, assesses the policy framework that supports integration between scientific research and the private sector, which is critical for technology transfer, successful commercialisation, and the economic impact of STI. The chapter concludes with a set of recommendations to further enhance STI policy development and implementation.

---

## Key findings

- **Most WB6 economies have a comprehensive STI strategic framework in place** or are in the process of renewing their framework. However, effective implementation is sometimes hindered by limited co-ordination and a lack of policy prioritisation and impact evaluation. Smart specialisation strategies have been adopted in Montenegro, North Macedonia and Serbia, and are being prepared in the other economies.
- **Overall research and development (R&D) expenditure in WB6 economies remains well below regional peers and the EU target.** Although domestic funding is increasing, many critical policy initiatives and programmes continue to rely heavily on international donor support.
- **Some economies operate or are setting up an innovation fund** as a key vehicle for implementing STI policy. The funds in North Macedonia and Serbia are the largest in scope and size and implement STI financial schemes in line with international best practice.
- **A weak track record of enforcing intellectual property protection (IPP),** coupled with low awareness of intellectual property (IP) rights and use, impedes STI development.
- **All economies are embedded in and connected to European and international research networks;** however, these linkages do not always produce the desired scientific outputs. International research collaboration is growing, albeit from low levels. Regional integration of STI, however, remains limited and lacks a systematic approach.
- **Public research remains systemically underfunded,** while the available funds are not used optimally, resulting in subdued research outputs and outcomes. Some economies, notably Serbia, have taken steps to reform the funding model for research by introducing a stronger focus on performance and competitive project-based funding.
- **Human capital remains below potential** amid weak funding, limited development opportunities and few incentives to seek the commercialisation of research. Some economies are increasingly promoting young researchers and linkages with their diaspora to tackle falling numbers of researchers and accelerating brain drain.
- **Linkages between academic research and industry remain nascent,** and a clear strategic policy approach is lacking. As a result, private sector investment in R&D has remained low. All economies have experimented with financial incentives for business-academia collaboration, but non-financial incentives are virtually non-existent. Where voucher schemes are available, they are underfunded, while sophisticated competitive co-operative grants are only available in Serbia and are being introduced in North Macedonia. All economies have expanded institutional support for collaboration; however, the support infrastructure is often provided in the form of incubators for start-ups.

## Comparison with the 2018 assessment

The WB6 region has made some progress in the science, technology and innovation dimension, albeit mostly from a relatively low base (Figure 12.1). While the economies that already had an emerging STI framework and policies in place in the 2018 assessment (Montenegro, North Macedonia, and Serbia) have further consolidated and expanded policy measures, the gap has widened for those positioned at the lower end of the performance review. This suggests an increasing tendency towards a two-speed development of STI policy within the Western Balkans, which – unless effectively addressed in the short to medium term – will intensify disparities across the region.

Figure 12.1. Overall scores for the science, technology and innovation dimension (2018 and 2021)

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Assessment methodology and process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Progress on implementing the policy recommendations made in the Competitiveness Outlook (CO) 2018 has been moderate overall (Table 12.1), although some economies have pursued STI policy reform more proactively than others. At a regional level, moderate progress has been made in areas such as making available financial STI support schemes, creating better linkages between academia and industry, introducing technology diffusion and absorption policies, integrating the diaspora and improving statistical data collection in STI, whilst only limited progress has been made in reforming procurement policies to incentivise STI.

Table 12.1. Implementation of the CO 2018 policy recommendations: Science, technology and innovation dimension

Competitiveness Outlook 2021		
CO 2018 policy recommendations	Main developments during the assessment period	Regional progress status
Increase and consolidate financial support for research and development	<ul style="list-style-type: none"> <li>All economies have increased the budget for STI; however, gross domestic expenditure on research and development (GERD) remains significantly lower than peer economies.</li> <li>Some economies, notably Montenegro and Serbia, have reformed their financing approaches for scientific research and have announced a significant increase in funding for STI in the coming years.</li> <li>Serbia established a dedicated Science Fund in 2019 that provides financial support to foster research activities.</li> <li>In North Macedonia and Serbia, the activities of the respective innovation funds are increasingly funded through domestic budget allocations.</li> </ul>	Moderate
Place more emphasis on technology diffusion and absorption policies	<ul style="list-style-type: none"> <li>Serbia has put in place a Technology Extension Facility and North Macedonia launched a grant scheme to support technology extension in 2018.</li> </ul>	Moderate
Use procurement to encourage innovation	<ul style="list-style-type: none"> <li>Serbia has introduced an element of support for innovation in its 2019 Public Procurement Law.</li> </ul>	Limited
Develop a structured approach to creating links between business and	<ul style="list-style-type: none"> <li>The Serbian Innovation Fund offers a variety of financial support schemes to support collaboration.</li> </ul>	Moderate

academia	<ul style="list-style-type: none"> <li>• Institutional support structures, primarily in the form of science and technology parks and centres of excellence, have advanced in most economies.</li> </ul>	
Make better use of the WB economies' highly educated diaspora and tackle brain drain	<ul style="list-style-type: none"> <li>• The STI framework in most economies makes reference to leveraging connections with diaspora communities.</li> <li>• Only Serbia has implemented a dedicated finance scheme to foster such linkages through the Science Fund, while Albania is exploring a digital platform for ideas exchange.</li> </ul>	Moderate
Improve the creation of STI-related statistics to enable the development of evidence-based policies	<ul style="list-style-type: none"> <li>• In 2020, Montenegro participated in the European Innovation Scoreboard for the first time, joining North Macedonia and Serbia.</li> <li>• In other economies, STI-related statistics remain highly limited.</li> </ul>	Moderate

## Introduction

Effective STI policies, processes and organisations, which define the institutional and policy context for science, technology and innovation, are essential aspects of the toolbox available to policy makers to boost the knowledge economy. STI policy spans the entire innovation value chain, ranging from the creation of fundamental knowledge in basic and applied sciences and technology to the transfer of knowledge to the economic sphere to foster product, process and organisational innovation. STI policies, if designed well, provide the strategic framework for embracing the knowledge economy, embed targeted financial and human capacity-building measures for research and innovation, and incentivise the exchange of knowledge between the public and the private sector, thereby ultimately facilitating the commercialisation of innovation and increasing productivity.

The outbreak of COVID-19 has highlighted another benefit of a well-functioning and modern STI system. Science, technology and innovation have proven essential in the global response to the pandemic and will be vital to support recovery and strengthen economic resilience and competitiveness in the long term.

STI policy is closely intertwined with other policy dimensions covered by the Competitiveness Outlook 2021. Most notably these include:

- **Chapter 4. Investment policy and promotion** aims to facilitate foreign direct investment (FDI), which can generate significant and instrumental grassroots investment and investment in knowledge-intensive sectors. Economies demonstrating strong STI-enabling ecosystems are more attractive to international investors, who can leverage their investment with existing local infrastructure and skills.
- **Chapter 5. Trade policy** and STI reinforce each other, as STI increases local productivity and provides a competitive edge.
- **Chapter 6. Access to finance** remains a key obstacle to private sector innovation. Conventional funding is often ill suited for innovative firms, but alternative finance instruments such as venture capital or business angel investments remain at an early stage of development.
- **Chapter 10. Education policy** is essential for building a knowledge economy as successful STI systems rely heavily on human capital.
- **Chapter 8. Employment policy** can support and attract human resources for research and innovation, strongly affected by brain drain in the region.
- **Chapter 13. Digital society** is important as effective digital communication and information infrastructure are the main enabling tools for fostering “open science”, while e-commerce and e-business facilitate firm innovation.

## Assessment framework

### Structure

This chapter assesses policies to develop science, technology and innovation in the WB6 through three broad sub-dimensions:

1. **Sub-dimension 9.1: STI system** focuses on the overarching strategic framework for STI. It assesses the comprehensiveness and relevance of STI strategies and how they are implemented.
2. **Sub-dimension 9.2: Public research system** focuses on the governance of public scientific research and how well policies ensure academic excellence. It examines how public research is funded and assesses policy approaches to foster human resource capacity.
3. **Sub-dimension 9.3: Business-academia collaboration** focuses on the collaboration framework and analyses how policies encourage technology transfer, commercialisation and co-operation between academia and the business community. It also examines the support mechanisms, both financial and others, available to encourage science-industry collaboration, and how the institutional support infrastructure encourages such linkages.

Figure 12.2 shows how the sub-dimensions and their indicators make up the STI dimension assessment framework. The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more information on the methodology see the Assessment methodology and process chapter.

**Figure 12.2. Science, technology and innovation dimension assessment framework**

<b>Quantitative Indicators</b> <ol style="list-style-type: none"> <li>1. Gross domestic expenditure on R&amp;D (% of GDP)</li> <li>2. Gross domestic expenditure on R&amp;D by source of funds (% of GDP)</li> <li>3. Volume of international competitive research grants (e.g., Horizon 2020, Eureka, WBEDIF)</li> <li>4. Number of projects receiving international competitive research grants</li> </ol>	<b>Quantitative Indicators</b> <ol style="list-style-type: none"> <li>5. Number of researchers, per million population</li> <li>6. Government budget appropriations or outlays on R&amp;D (% of GDP)</li> </ol>	<b>Quantitative Indicators</b> <ol style="list-style-type: none"> <li>7. Total amount of financial support for business-academia collaboration</li> <li>8. Charges for use of IP receipts</li> </ol>

Note: GDP = gross domestic product; IP=intellectual property.

For the small open economies of the Western Balkans, the opportunities of STI activities go beyond just economic impact; research and innovation play an important role in the region's path to EU accession and are viewed as key for regional integration. Against this background, the leaders of the WB6 endorsed the Common Regional Market 2021-2024 Action Plan (AP) at the Berlin Process Summit held on 10 November 2020 in Sofia. The AP sets out a roadmap towards deeper regional and European integration. It is made up of targeted actions in four key areas: (1) a regional trade area; (2) a regional investment area; (3) a regional digital area; and (4) a regional industrial and innovation area. The findings of this CO assessment can inform the implementation of the actions under the “regional innovation area” (Box 12.3).

### **Key methodological changes to the assessment framework**

The methodology for this dimension has changed substantially since the last Competitiveness Outlook, with the number of sub-dimensions reduced from five to three. Most notably, the sub-dimension on innovation in firms has been removed, reflecting the strong focus on policies that enable research excellence as a prerequisite for the knowledge economy, and the shift away from a focus on start-up innovation. Firm innovation continues to feature strongly in the OECD SME Policy Index (OECD, 2019<sup>[11]</sup>).

Several aspects of the previous CO assessment framework have been consolidated in the new methodology. Sub-dimensions 9.1 and 9.3 remain largely unchanged, whereas sub-dimension 9.2 now also includes all aspects related to human resource capacity, which had previously been covered in a separate sub-dimension.

In this edition, the qualitative data collected through the assessment framework has also facilitated the WB6 economies' participation in the EC-OECD STIP Compass database (Box 12.1).

#### **Box 12.1. STIP Compass: International database on science, technology, and innovation policy**

The Science, Technology and Innovation Policy (STIP) Compass is a joint initiative of the European Commission (EC) and the OECD that aims to bring together quantitative and qualitative data on domestic trends in STI policy in one place. The STIP Compass portal supports the continuous monitoring and analysis of economies' STI policies and provides a platform for policy research and advice to support government officials, analysts and scholars.

STIP Compass data are gathered through responses to the EC-OECD STI Policy survey, sent every two years to government officials working on STI policies. The CO 2021 STI dimension's assessment framework and indicators include several policy areas that feature in the 2019 edition of the survey:

**Sub-dimension 9.1: STI system** includes a number of policy themes from the EC-OECD survey, including part of the “Governance” area, such as an STI plan or strategy, horizontal policy co-ordination and international STI governance policy. It also partially reflects the survey's “Emerging trends in STI policy” module.

**Sub-dimension 9.2: Public research system** incorporates indicators based on different policy themes from two areas of the survey: “Public research system”, which focuses on research infrastructure, financing, and structural changes; and “Human resources for research and innovation”, which includes themes of research careers and international mobility.

**Sub-dimension 9.3: Business-academia collaboration** partially reflects the policy area “Science-industry knowledge transfer and sharing”, including collaborative research and innovation and intersectoral mobility themes.

## Science, technology and innovation performance and context in the WB6

Reliable statistical data on key areas of STI are still scarce in some WB6 economies, which limits a comprehensive analysis of the state of play of science, technology and innovation across the region. Only North Macedonia and Serbia regularly participate in the European Innovation Scoreboard, with Montenegro having joined for the first time in 2020.

The latest scoreboard assessment for the participating WB6 economies is not particularly positive. All three economies rank near the bottom, with Montenegro and North Macedonia categorised as “modest innovators” (ahead of Romania and Ukraine), which means that their performance is less than 50% of the EU average. Serbia is categorised as a “moderate innovator”, with its relative performance between 50 and 95% of the EU average. Although there are significant gaps with the European average, the 2020 edition of the innovation scoreboard also emphasises that significant improvements have been made since the previous annual assessment, suggesting that capacity for innovation is gradually increasing in the three economies (EC, 2020<sup>[3]</sup>).

Spending on R&D as a percentage of GDP (GERD) remains low in all six economies (Figure 12.3) and is well below the EU target of 3%. Even when compared with the CEEC,<sup>1</sup> gaps remain significant. Despite a stronger focus on STI in recent years, an increase in spending is only evident in Serbia. In 2018, average R&D investment was only 0.5% of GDP in the region, compared to 1.15% in the CEEC and 1.62% in the EU.

**Figure 12.3. Gross domestic expenditure on R&D (GERD) (2013 and 2018)**

% of GDP

Note: Data for Albania and Kosovo are unavailable. EU and CEEC-11 averages are calculated as simple averages. EU average includes 27 EU Member States. CEEC-11=Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

Source: (UIS, 2021<sup>[4]</sup>), *Science Technology and Innovation Database*, <http://data.uis.unesco.org/>; (Eurostat, 2020<sup>[5]</sup>), “Gross domestic expenditure on R&D (GERD) at national and regional level”, <https://ec.europa.eu/eurostat/data/database>.

StatLink  <https://doi.org/10.1787/888934254221>

R&D investment in the Western Balkans continues to be driven by the public sector, with activities concentrated in public centres and institutes, higher education institutions (HEIs), and government agencies. Company investment in research is only slowly gaining pace. Across the region, public sector investment (government and HEI) accounted for around two-thirds (65%) of overall GERD in 2017, compared to around one-third (37%) in the CEEC region. In contrast, private sector investment in R&D was around 20% on average across the region, which is less than half the CEEC average (Figure 12.4). This suggests an overall low capacity of firms in the Western Balkans to innovate, and limited appetite to invest in risky R&D.

**Figure 12.4. Funding sources for research and development (2017)**

Note: Data for Albania and Kosovo are unavailable. CEEC-11=Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. HEI=higher education institutions.

Source: (UIS, 2021<sup>[4]</sup>), *Science Technology and Innovation Database*, <http://data.uis.unesco.org/>.

StatLink  <https://doi.org/10.1787/888934254240>

Research output and quality remain subdued in the WB region, with the six economies significantly lagging behind CEEC peers for patent applications. Very few patents granted by the European Patent Office (EPO) or the United States Patent and Trademark Office (USPTO) originate in any of the WB6 (Table 12.2). Of the patent applications made to the EPO from the region (just over 100 between 2010 and 2019), fewer than half were granted, which suggests substantial shortcomings in the quality of research (EPO, n.d.<sup>[6]</sup>).

**Table 12.2. Patents granted, WB region and CEEC averages (2019)**

Number of patents	EPO	USPTO	CEEC-11 average EPO	CEEC-11 average USPTO
ALB	0	1	61	121.9
BIH	0	3	61	121.9
MKD	1	0	61	121.9
MNE	0	1	61	121.9
SRB	6	27	61	121.9

Note: Data for Kosovo are unavailable. CEEC-11=Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. EPO: European Patent Office; USPTO: United States Patent and Trademark Office

Source: (EPO, n.d.<sup>[6]</sup>), *Patent statistics*, <https://www.epo.org/about-us/annual-reports-statistics/statistics.html#data>; (USPTO, 2019<sup>[7]</sup>), *Patent count by country of origin and type 2019*, [https://www.uspto.gov/web/offices/ac/ido/oeip/taf/st\\_co\\_19.htm](https://www.uspto.gov/web/offices/ac/ido/oeip/taf/st_co_19.htm).

Figure 12.5 suggests that monetary returns on patents remain negligible. Receipts for the foreign use of domestic IP are less than half the CEEC average and significantly below the EU average. The gap in payments for foreign IP is also substantial, suggesting a low technology absorption and diffusion capacity of the Western Balkan economies compared to the EU. However, the gap with the CEEC region is narrowing.

**Figure 12.5. Charges for the use of intellectual property, receipts and payments (2015 and 2019)**  
% of GDP

Note: Receipts include domestic inventions owed to foreign clients, payments include use of foreign inventions. EU average includes 27 EU Member States. CEEC-11=Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

Source: (World Bank, n.d.<sup>[8]</sup>), *World Bank Development Indicators*, <https://data.worldbank.org/>.

StatLink  <https://doi.org/10.1787/888934254259>

The WB economies are predominately service-oriented, and the limited ability of the region to innovate and leverage its innovation potential is evident when looking at high value-added exports. The share of knowledge-intensive service exports can be a robust indication of an economy's capacity to export services with a high level of value added, notably resulting from innovation, and to successfully take part in knowledge-intensive global value chains. Data for the economies participating in the European Innovation Scoreboard suggest that the WB region is catching up with, or exceeds in the case of Serbia, the performance of the CEEC region (Figure 12.6). This is mainly linked to the increasing importance of the information and communication technology (ICT) sector in the Serbian economy, with ICT service exports accounting for over 17% of total service exports in 2017, compared to 12.7% in the EU (World Bank, n.d.<sup>[8]</sup>). However, comparing the region's performance to the European average highlights the overall relatively weak performance in STI.

**Figure 12.6. Knowledge-intensive service exports, European Innovation Scoreboard (2020)**

Note: Data indicate normalised performance of economies in 2019 relative to that of the EU in 2012. Data are unavailable for Albania, Bosnia and Herzegovina and Kosovo. EU average includes 27 EU Member States. CEEC-11=Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934254278>

The following sections analyse in more detail the policy tools available to the Western Balkan economies to unlock their innovation potential and move towards a knowledge economy.

### STI system (Sub-dimension 9.1)

Science, technology and innovation is an inherently interdisciplinary area that covers a broad set of policy areas, including science and education, economic development, industrial policy and entrepreneurship. This makes the governance of STI complex as it requires a comprehensive strategic framework, clearly mandated implementation bodies, and attentive and consensus-driven cross-cutting co-ordination to ensure effective and impactful implementation. If poorly designed, the policy framework may create overlapping, insufficiently financed or even contradicting support measures, and leave gaps where support may be most needed. In the STI system sub-dimension, these aspects are assessed by looking at domestic STI strategies, including the overall strategic framework, its scope and implementation status, as well as the presence of a smart specialisation strategy. In addition, the sub-dimension includes a review of institutional frameworks, including implementation mechanisms such as innovation or science and technology agencies, the mandate and operational capacity of such bodies, and horizontal policy co-ordination efforts. The regulatory framework in which the STI system is embedded, including regulations on intellectual property protection, is also assessed.

Taking into account the increasingly important international dimension of STI, the analysis also includes policies and initiatives that support international collaboration, and further reflects on economies' capacity to implement effective STI policies by looking at the alignment of domestic STI priorities with EU STI policies. It also explores ways of incorporating EU good practice into domestic policies.

Across the STI dimension, the WB6 achieves the highest average score (2.4) for the STI system sub-dimension (Table 12.3). This score, however, remains relatively low, since relevant policies and mechanisms are formally in place in Serbia, Montenegro and North Macedonia, but remain nascent in the remaining three economies. Implementation of these policies in most WB6 economies is still at an early stage, and the full impact of the policy frameworks will only become evident in the years to come.

**Table 12.3. Scores for Sub-dimension 9.1: STI system**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
STI system	STI strategy	2.8	1.3	1.3	2.5	3.5	3.5	2.5
	Institutional framework	1.8	1.2	1.5	2.8	2.5	4.0	2.3
	Regulatory framework	2.0	1.3	2.0	2.0	2.0	3.0	2.1
	International collaboration	1.8	2.0	2.0	2.5	2.8	3.0	2.3
	Alignment with EU STI policies	2.5	2.5	2.0	3.3	3.5	3.5	2.9
<b>Sub-dimension average score</b>		2.2	1.7	1.8	2.6	2.9	3.4	2.4

### ***STI policy frameworks are comprehensive and strategic in most economies, but implementation varies***

Innovation is a key driver of productivity, growth and well-being, and plays an important role in helping address core public policy challenges (OECD, 2015<sup>[9]</sup>). However, seizing the full potential of innovation remains a challenge for many economies. Therefore, an economy-level STI strategy that covers areas such as fostering academic excellence in basic and applied science, technology transfer, commercialisation, firm innovation and business-academia collaboration is essential for policy makers to harness innovation.

The need for a comprehensive domestic STI strategy has been increasingly recognised by most WB6 economies. Albania, Montenegro and Serbia have approved STI strategies that include clear objectives,

action plans, key performance indicators and some level of monitoring and evaluation mechanisms. The strategies were designed following public consultations and reflect, to varying extents, feedback from relevant stakeholders. Since the last assessment, Albania also adopted the National Strategy of Scientific Research, Technology, and Innovation (2017-2022). The STI policy frameworks in Albania, Montenegro and Serbia include strategic cross-cutting themes related to brain drain, although key policy measures to tackle this increasingly evident trend are scarce. Some strategies also address elements of digitalisation, climate change and artificial intelligence, but only Serbia has adopted a dedicated strategy (in 2019) to address and develop artificial intelligence more comprehensively. For the other three WB economies, North Macedonia's strategic framework expired in 2020 and a renewed strategy is still under preparation. In Bosnia and Herzegovina, the complex governance structure means that STI policy making predominately falls under the responsibility of the entities and/or cantons, which results in an incomplete and fragmented policy framework. In Kosovo, where STI is governed through numerous high-level strategic frameworks, no progress has been made in developing a clearly defined STI strategy.

Good progress has been made by some economies in developing smart specialisation strategies (Box 12.2). Montenegro adopted such a strategy in 2019, followed by Serbia in 2020. Similar strategies are expected to be adopted in Albania and North Macedonia in 2021, which will further boost the STI framework in these economies. All economies have received support from the European Commission's Joint Research Centre to prepare their smart specialisation strategies and have greatly benefitted from its experience.

### Box 12.2. Smart specialisation in the Western Balkans

Smart specialisation considers the assets and resources available in economies, as well as their specific socio-economic challenges, and aims to identify competitive advantages and opportunities for growth. Smart specialisation leverages industrial, education and innovation policies to address a small number of priority sectors and technologies relevant for knowledge-based investment.

The concept of smart specialisation is still relatively new to economic development theory and was first initiated by the European Union. The smart specialisation process includes an in-depth feasibility assessment to identify and target the most competitive industries with innovation potential to accelerate economic growth.

Despite its huge potential, smart specialisation cannot be an alternative to a broader STI framework, but rather complements robust, holistic and impactful innovation policy actions.

Smart specialisation strategies as a tool in the EU accession process

The EU's strategy for the Western Balkans defines how smart specialisation can be used to boost entrepreneurship and innovation across the region. In 2017, the heads of government of all WB6 economies endorsed the Multi-annual Action Plan for a Regional Economic Area in WB. This encompasses economic development strategies based on knowledge and innovation and builds on EU experiences of smart specialisation.

Smart specialisation remains at an early stage in the region. However, with support from the European Commission's Joint Research Centre, which provides policy advice, methodological guidance, and implementation support, it is increasingly becoming a priority in the STI frameworks of the WB6.

Montenegro was the first non-EU economy to adopt a smart specialisation strategy. Key areas identified include energy and sustainable environment, agriculture and food value chains, and sustainable and health tourism, with ICT as a horizontal priority. Serbia adopted its smart specialisation strategy in February 2020, with priority sectors including computer programming and ICT, agriculture (including high tech agriculture and agri-food production), machines and manufacturing systems (including Industry 4.0) and creative industries (including audio-visual production and smart packaging).

The smart specialisation process in both economies has mobilised over 1 600 stakeholders, including 450 representatives of the private sector involved in the entrepreneurial discovery process. In addition, 80 public administration representatives have been trained to build capacity and engagement.

Source: (EC, n.d.<sup>[10]</sup>), *Smart Specialisation Platform*, <https://s3platform.jrc.ec.europa.eu/>; (OECD, 2019<sup>[11]</sup>), *SME Policy Index: Western Balkans and Turkey 2019: Assessing the Implementation of the Small Business Act for Europe*, <https://doi.org/10.1787/g2g9fa9a-en>.

### ***The institutional framework for STI policy implementation varies significantly across the region***

Inter-ministerial co-ordination remains weak in most economies, with significant impact on outcomes and efficiency of policy implementation. Serbia remains the top performer in this regard, with its Innovation Fund, operational since 2011, continuing to be a key vehicle for innovation policy implementation. It also established a Science Fund in 2019. In North Macedonia, support for the Fund for Innovation and Technological Development has increased substantially in recent years, but operational capacity remains below potential. In Montenegro, the Council for Innovation and Smart Specialisation, established in 2019, oversees the implementation of innovation policies, and the creation of a dedicated Innovation Fund is in the final planning stage. Albania lacks a clear co-ordination and implementation body, and its budget is insufficient. As a result, the Albanian SME Agency and the National Research Agency have been slow to implement comprehensive STI-related policy measures. Kosovo and Bosnia and Herzegovina have no dedicated agencies in place to support the implementation of STI policy. The Scientific Innovation Council of Kosovo oversees some aspects of STI policy, and there are plans in Republika Srpska to establish an Innovation and Science Fund.

### ***Legal and regulatory frameworks are mostly in place, but could be better enforced***

STI is embedded in a solid legal and regulatory framework in all economies except Bosnia and Herzegovina, where only Republika Srpska and three cantons within the Federation of Bosnia and Herzegovina (FBiH) have adopted a legal framework (the FBiH science law has been pending adoption for several years). Montenegro and Serbia have put forward dedicated laws regulating the public financing of scientific or innovation activities, which provide the legal foundation for the Serbian Science Fund and forthcoming Innovation Fund in Montenegro, as well as a modern STI-enabling legal framework. However, despite some ambitious measures outlined in these laws, legal frameworks have not always been fully implemented.

Regarding intellectual property protection (IPP), nearly all economies have implemented reforms to align their IPP framework with the EU *acquis* since the last assessment. The European Commission's annual progress reports for the WB6 economies identified significant shortcomings in enforcing IPP, which has led the economies to raise awareness of the importance of patenting. Some economies, such as Kosovo, have strengthened the capacity of their IPP enforcement offices. However, further action will be needed to educate the research and business community about IP rights, build capacity and fully enforce international standards and practices.

### **The region is well connected with international networks, and regional integration is gaining momentum**

International collaboration is recognised in most domestic STI strategic frameworks. Most economies provide financial support for participation in international conferences and fairs, as well as scholarships to mobilise international research co-operation, although these remain at a low level and are often not focused on identified priority areas. In addition, the region benefits from access to a diverse set of European and global research networks, including EURAXESS<sup>2</sup> (except Kosovo) and Eureka,<sup>3</sup> which Serbia, Montenegro and North Macedonia have joined as full members, while Albania and Bosnia and Herzegovina continue to maintain national information points. In line with their strategic frameworks, some economies, such as Albania and Serbia, are also increasingly focusing on outreach and collaboration with their diaspora (Box 12.5).

As a result, the number of international co-publications has grown substantially in the last decade, even outperforming some European peers (Figure 12.7). While this is encouraging, it remains unclear whether collaboration is predominately intra-regional or based on European or global co-operation.

**Figure 12.7. International co-publications originating from the WB6 (2013-2019)**

% of all publications

Note: Data for Kosovo are unavailable. Document ratio whose affiliation includes more than one economy address. EU average includes 27 EU Member States. CEEC-11=Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

Source: (SciMago, 2020<sup>[11]</sup>), *SciMago Journal and Country Rank*, <https://www.scimagojr.com/countryrank.php?region=Eastern%20Europe&year=2019>.

StatLink  <https://doi.org/10.1787/888934254297>

All six Western Balkan economies participate in and have received financial support from the EU's Horizon 2020 Programme.<sup>4</sup> However, the scope of activities under the framework varies significantly. Overall, the region has participated in over 706 research projects as part of Horizon 2020, receiving total funding of more than EUR 146.9 million. Serbia continues to attract the most projects (413) and overall funding (EUR 116.2 million in total); however, other economies, notably Kosovo and Montenegro, have picked up in recent years amid targeted measures to raise awareness about the programme and help with project applications (EC, n.d.<sup>[12]</sup>).

The need for deeper regional integration and research collaboration has been recognised in the economies and has gained traction in recent years. In 2017, the Montenegrin Government launched an initiative to establish the South East European International Institute for Sustainable Technologies (SEEIIST), which provides an important opportunity for intensified regional research integration. The need for a more regional approach to STI also prominently featured in the joint Action Plan for a Common Regional Market (Box 12.3).

### **Alignment with EU STI policies remains a priority for all six economies**

The WB6 economies have committed to the priorities of the European Research Area:<sup>5</sup> 1) effective national research systems; 2) transnational co-operation and competition; 3) an open labour market for researchers; 4) gender equality in research; 5) circulation of scientific knowledge; and 6) international collaboration (EC, n.d.<sup>[13]</sup>). All economies except Kosovo participate in the European Strategy Forum on Research Infrastructures (ESFRI). Serbia adopted a national ESFRI Research Infrastructure Roadmap in 2018, and Montenegro revised its current roadmap in 2019. The research infrastructure roadmap in North Macedonia remains at the drafting stage, and in Bosnia and Herzegovina, only Republika Srpska has adopted a roadmap, while Albania has not started the preparation of a roadmap to date.

All economies are committed to open science, and open access initiatives are underway across the region. In 2019, nearly half of all publications were provided as open access resources (in line with the EU average), and up from less than one-third in 2010 (SCImago, 2020<sup>[11]</sup>).

#### **Box 12.3. Towards regional innovation in the Common Regional Market**

The following key findings of the CO 2021 STI system sub-dimension can inform implementation of the “regional innovation area” in the Common Regional Market (CRM) 2021-2024 Action Plan:

- There is no strategic approach in place to increase the regional integration of domestic STI systems, although some best-practice sharing exists, especially in areas related to STI implementation bodies such as innovation funds.
- As the design and implementation of smart specialisation strategies progresses, opportunities are increasing for knowledge exchange and the sharing of lessons learnt, particularly through collaboration with the EC’s Joint Research Centre.
- Despite the potential opportunities, economies’ research infrastructure roadmaps continue to focus on domestic levels or European Strategy Forum on Research Infrastructures initiatives, without considering a regional approach to research infrastructure.

### **The way forward for the STI system**

STI systems have advanced in most economies, but further efforts are needed to consolidate policy measures and ensure effective implementation. Policy makers should consider the following:

- **Complete the strategic framework.** In the economies with an advanced STI framework (Montenegro, Serbia, and to a lesser extent Albania and North Macedonia), the focus should be on enhancing implementation and monitoring and evaluating relevant policy measures. These economies should also prioritise the full adoption of smart specialisation strategies and ensure that they are well embedded in the broader STI framework. Bosnia and Herzegovina and Kosovo should focus on completing their strategic frameworks for STI.
- **Increase implementation capacity and co-ordination.** Increased ministerial co-ordination will ensure the smooth implementation of STI policies and the consolidation of financial support (see Box 12.4 for an example from Japan). Implementation agencies should be given clearly defined mandates to avoid overlap, and capacity building should be secured to ensure the mirroring of international best practice. Increasing the state budget allocation is positive but not sufficient, as it is important to first design efficient and effective policies.
- **Integrate STI policy development regionally, in line with the CRM action plan.** Regional integration is key to the long-term economic success of the region. Economies should identify further scope for collaboration, for example by creating cross-regional research infrastructure,

through the cross-fertilisation of policy design and implementation, and by strengthening regional co-operation in international platforms.

- **Strengthen IPP enforcement.** The weak enforcement of intellectual property remains a major obstacle to STI development across the region. Efforts are needed to raise awareness of IPP, provide technical and financial support to facilitate patent applications, and build the capacity of enforcement agencies.

#### Box 12.4. Co-ordinating innovation policy in Japan

Innovation has been a core driver of Japan's economic resurgence and sustainable growth. Under the auspice of the Prime Minister and Ministry of State for Science and Technology, Japan's Council for Science, Technology and Innovation oversees the planning and co-ordination of comprehensive basic science, technology and innovation policies, taking a bird's eye view of Japan's entire science and technology landscape. As a result, Japan's STI policy framework is based on three overarching pillars: 1) strategic formulation of overall governmental science and technology budget; 2) the Cross-ministerial Strategic Innovation Promotion Program (SIP); and 3) the programme on Impulsing Paradigm Change through Disruptive Technologies (ImPACT).

The Japanese government established the Cross-ministerial Strategic Innovation Promotion Programme (SIP) in 2014, spearheaded by the Council for Science, Technology and Innovation. Its aim was for the council to lead science, technology and innovation beyond the framework of government ministries and traditional disciplines. The SIP identified 11 themes addressing the most important social problems facing Japan, as well as contributing to the resurgence of the Japanese economy. Each research project is led by an experienced team who are responsible for end-to-end focused research and development, facilitating co-ordination among government, industry and academic entities, supporting their projects from basic research to practical application and commercialisation, and ultimately to a clear exit strategy.

The key features of the SIP programme include:

- projects selected by the Council for Science, Technology and Innovation based on competitive advantage and potential to address critical social needs
- cross-ministerial, multidisciplinary initiatives
- promotion of focused, end-to-end research and development, from basic research to practical application and commercialisation
- intellectual property management system facilitating strategic corporate use of research results.

The SIP programme has selected programme directors (PDs) to be responsible for each of the 11 individual programmes making up this government initiative. This strong, centralised implementation structure of the SIP has been vital for effective co-ordination between ministries and among industry, academia and government agencies.

## Public research system (Sub-dimension 9.2)

Research excellence provides the basis for knowledge creation and is fundamental for economies transitioning to a knowledge economy. Research and development can occur both in the public and private sector; however, typically public HEIs and public sector research and development institutes (RDIs) account for the overwhelming majority of R&D capacity in emerging economies. The management and

performance assessment approach of HEIs and RDIs, and the mode of financing scientific research, are therefore critical aspects of the STI policy framework. Targeted measures to attract and retain academic researchers, particularly in areas of strategic importance, are also essential to strengthen human capital in research to produce high-quality scientific output.<sup>6</sup>

The public research system sub-dimension assesses these aspects based on the institutional structure for public research and through an analysis of the governance of HEIs and RDIs, including quality assurance and performance assessment. It assesses the impact of public research funding on research excellence and analyses approaches to funding scientific research. It also explores the available policy initiatives to strengthen human resources for research and innovation.

Overall performance in this sub-dimension is low, with an average score of 2.0. Serbia leads the way, followed by North Macedonia. Bosnia and Herzegovina and Kosovo continue to rank very low, with an average score of just above 1.0. This reflects the limited overall availability of funding for public sector research and the level of scientific output (Table 12.4).

**Table 12.4. Scores for Sub-dimension 9.2: Public research system**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Public research system	Institutional structure of the public research system	1.5	1.3	1.5	2.3	2.5	2.5	1.9
	Public research funding	2.0	1.3	1.5	1.8	1.8	3.3	2.0
	Human resources for research and innovation	2.3	1.0	1.0	3.3	2.5	3.0	2.2
<b>Sub-dimension average score</b>		1.9	1.2	1.3	2.5	2.3	2.9	2.0

### ***Institutional structures are moving towards public research quality assurance***

The volume and quality of academic research in the Western Balkans remain low. Although scientific output has increased in the past decade in all economies, the productivity of researchers still underperforms many European peers. Efforts have been made to increase the quality and integrity of research outputs, although overall support for research excellence remains limited.

HEIs and RDIs in the WB6 are typically governed by a law on higher education or on research activities and are subject to regular reporting that is usually strongly focused on teaching. Independent evaluation is starting to be introduced in some economies, but overall remains ad hoc and without clear evidence of having a substantive impact on performance or approaches to research. In Bosnia and Herzegovina, research activities are further constrained amid fragmented competences within the institutional structure, while there is no comprehensive cross-entity accreditation system in place. Nevertheless, an increasing focus on creating quality assurance by fostering academic integrity in scientific research has become evident across the region. For instance, Montenegro's participation in the World Bank's Higher Education and Research for Innovation and Competitiveness (HERIC) project has led to reforms of the quality assurance system and the adoption of the Law on Academic Integrity in 2019. Similar efforts have been made in Albania and North Macedonia, where new agencies have been created to monitor quality in higher education. In all WB6 economies, HEI and RDIs benefit from a fair level of autonomy, with governments holding a minority representation (if any) in public universities. While this approach aims to ensure independent and transparent research, it limits governments' ability to introduce a strategic approach to public research in line with a domestic STI framework.

As mentioned above, all economies except Kosovo participate in EURAXESS, with HEIs and RDIs across the region having adopted its human resource strategy for researchers, which aims to harmonise human resource policies with the principles of the EURAXESS Charter and Code of Conduct.

### **Public research remains chronically underfunded**

In most developed economies, public research funding consists of a combination of institutional “block” funding and competitive research grants. While block funding ensures funding security and long-term planning, competitive research grants can be used as a strategic policy tool to encourage impact-oriented research and prioritisation of areas of strategic importance (OECD, 2016<sup>[16]</sup>).

As discussed above, investment in R&D remains very low in the WB6 economies. However, an increased focus of public spending on scientific research has become evident in recent years, albeit often from very low levels, underlining the growing importance of this sector for governments across the region. In all economies except Serbia, where public research funding has traditionally been project-based, research is predominantly dependent on institutional block funding, with small-scale competitive research grants available for research-associated activities. In most economies, R&D is mainly performed in HEIs. These receive most of their public funding for teaching, with often extremely low levels of funding specifically allocated for R&D activities. Funding for teaching is typically based on numbers of enrolled students, but the methodology for awarding funding for R&D is not always clear.

Montenegro and Serbia have taken significant steps to reform their funding models for public research in recent years. In line with its revised legal framework and conclusions from the HERIC project, Montenegro adopted a new performance-based financing model for the University of Montenegro in 2018, which introduced more competitive funding schemes. In Serbia, the new legal framework envisages a clear shift towards performance-based institutional funding combined with targeted competitive grants available through the Science Fund. In North Macedonia, similar efforts to reform public research funding are under consideration following a feasibility study conducted during the previous CO assessment cycle.

### **Human resources in R&D are increasingly lost through brain drain**

The number of researchers (per 1 million inhabitants) steadily increased across all WB6 economies between 2013 and 2018, doubling in Bosnia and Herzegovina and growing at 18% on average in Montenegro, North Macedonia and Serbia. Nevertheless, significant discrepancies remain within the region, with the number of researchers (proportionally) the highest in Serbia and by far the lowest in Bosnia and Herzegovina (UIS, 2021<sup>[4]</sup>). All are well below the EU and CEEC-11 average (Figure 12.8). In addition, numbers have recently stagnated or even declined in some economies, suggesting increasing brain drain from the scientific research sector, which is becoming particularly evident in key areas such as medical and health (EC, 2020<sup>[17]</sup>).

**Figure 12.8. Number of researchers per million population (2013-18)**

Note: CEEC-11=Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovak Republic and Slovenia. EU average includes all EU Member States in 2013-20 period. Data for Albania and Kosovo are unavailable.

Source: (UIS, 2021<sup>[4]</sup>), *Science Technology and Innovation Database*, <http://data.uis.unesco.org/>.

StatLink  <https://doi.org/10.1787/888934254316>

All economies provide some level of support for research mobility, participation in conferences and research networks, and scholarships; however, these measures are often scattered and limited in scope and scale due to funding constraints. In addition, the focus of postgraduate programmes continues to be on teaching. Some economies offer technical support to help researchers complete patent applications and write proposals, as well as improve other technical skills, although these are often untargeted. All economies also participate in the Marie Skłodowska-Curie Actions (MSCA),<sup>7</sup> but with mixed results. As outlined in Table 12.5, Serbian researchers have benefitted most from the MSCA, having been awarded over EUR 7.7 million since 2014. In contrast, only three researchers from Kosovo have participated.

**Table 12.5. WB6 participation in the Marie Skłodowska-Curie Actions (2014-2020)**

	ALB	BIH	KOS	MKD	MNE	SRB
Number of researchers funded by MSCA	32	41	3	30	12	246
EU budget awarded (EUR million)	0.08	0.98	n.a.	0.28	0.08	7.76

Fostering research excellence is embedded as a strategic focus in the STI frameworks in Montenegro, North Macedonia and Serbia, which have taken steps to increase the attractiveness of research as a profession in recent years. Montenegro implemented a dedicated reform programme to increase human capital between 2018 and 2020, while North Macedonia has launched an initiative to support gender mainstreaming in the sector and is championing young researchers. In Serbia, the newly established Science Fund provides dedicated programmes to foster research excellence. Increasingly, economies are exploring opportunities to leverage their diaspora by facilitating exchange or joint research collaboration. For instance, in Albania there are plans to set up a digital platform to circulate research ideas, whereas in Serbia the Science Fund has launched a dedicated programme to facilitate collaboration with the diaspora (Box 12.5).

### Box 12.5. Integrating the diaspora into domestic scientific research activities

The international migration of skilled labour has long been considered an obstacle to economic development and building innovation capacity in the economies of origin. However, more recently the concept of turning “brain drain” into “brain gain” through more pro-active engagement with the skilled diaspora has gained momentum.

The resources that diaspora communities have are multi-dimensional, typically ranging from skills, knowledge and ideas to cultural capital, finance, and trade opportunities, and are therefore considered as important vehicles for development, particularly in transferring human capital and increasing innovation.

#### **The diaspora as a tool for the Western Balkans’ long-term economic prosperity**

For the Western Balkans, integrating its wide diaspora community can help unleash the region’s potential in STI. A good example is the Serbian Diaspora Collaboration Programme, launched by the recently established Science Fund in 2019. The programme provides financing to local RDIs to develop research collaborations with the Serbian diaspora and build their human resource capacity through short-term visits of researchers from Serbia to diaspora experts.

The aim of the programme is to establish scientific co-operation and knowledge exchange and widen the collaborative network between researchers from Serbia and their counterparts abroad. The programme supports basic and applied research in all research areas, without pre-defined priority topics. Within this framework, a pilot programme, Vouchers for Knowledge Exchange, was launched in

2020. As part of this programme, 92 projects were awarded almost EUR 800 000 (up to EUR 10 000 per project). The programme involved the Serbian diaspora across 22 countries, ranging from EU Member States to Australia, The People’s Republic of China and the United States. The vast majority of approved projects were submitted by Serbian HEIs and covered areas such as natural science, technology, engineering and medical science.

### ***The way forward for the public research system***

Public research requires significantly more and better funding to fully exploit the region’s potential for research excellence. Policy makers should consider the following:

- **Introduce a more balanced and strategic approach for public sector research funding, with a stronger emphasis on research outputs.** Economies should consider performance-based institutional funding coupled with regular self-assessments and external evaluations of public research institutions. Governments can encourage research in areas of strategic importance linked to business needs if they combine performance-based institutional funding with competitive project-based funding designed in line with international best practices (in particular regarding international peer review and independent expert selection bodies).
- **Promote scientific research as an attractive profession to develop human capital and counteract brain drain.** Public research systems across all WB6 economies require significant investment to create an attractive environment that fosters research excellence. Efforts are needed to increase the reputation of research and recognise it as an important profession, including through creating more opportunities for mobility.
- **Leverage diaspora linkages.** All WB6 economies have diaspora communities across the globe. The economies could leverage the expertise of these communities, including at the regional level, and encourage the transfer of knowledge through targeted internationalisation policies and financial support schemes (Box 12.5).

### **Business-academia collaboration (Sub-dimension 9.3)**

A strong partnership between the private sector and academia helps accelerate the value creation of innovation. Knowledge is created by researchers and adapted by industry, which develops practical applications in the shape of products and services. To optimise this process, research is ideally demand-driven and under constant review by the business community, which provides feedback on its viability for commercialisation. However, in reality, this approach implies several challenges. For example, academics may not have the time or knowledge to engage effectively with the business community, or they may not be sufficiently encouraged by their organisations to collaborate. Equally, while a researcher’s priority may be to publish, businesses may be more focused on protecting IP as this enables commercialisation. Academics may further want to focus on meaningful research with societal benefits, while the business community may prioritise financial returns over the impact on society. For these reasons, the co-creation of innovations between business and academia is often subdued and requires involvement from policy makers. Through a “triple helix” approach, governments can gain valuable insights into the obstacles preventing full collaboration, which will help them design supportive measures to incentivise the transfer of knowledge and commercialisation (OECD, 2013<sup>[21]</sup>).

The business-academia collaboration sub-dimension analyses collaboration promotion frameworks and the availability and scope of incentives for business-academia collaboration. These incentives include

innovation vouchers, competitive co-operative grants, tax, and procurement incentives; and non-financial incentives such as opportunities for professional exchanges with the business community, and evaluation of research and legislative incentives for commercialisation. This sub-dimension also assesses institutional support for business-academia collaboration by looking at the support infrastructure for business innovation and partnerships. Beyond incubators and accelerators, which typically cater to the needs of start-ups, this assessment includes science and technology parks (STPs), technology transfer offices and centres of excellence, which provide space and services for both researchers and the business community.

Overall, performance in this sub-dimension remains below potential for all WB6 economies due to the lack of targeted policies in this area. The average score shown in the Table 12.6. is just 1.6, which is the lowest for the entire STI dimension. As elsewhere, Serbia ranks the highest in this sub-dimension due to its comprehensive set of financial incentives and solid institutional support structure. It is followed by North Macedonia and Montenegro, with the remaining economies ranking at the lower end of the scoring.

**Table 12.6. Scores for Sub-dimension 9.3: Business-academia collaboration**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Business-academia collaboration	Collaboration promotion framework	1.3	0.8	0.0	2.8	3.0	3.0	1.8
	Financial incentives for business-academia collaboration	1.0	1.0	1.0	2.8	2.0	3.3	1.9
	Non-financial incentives for business-academia collaboration	0.5	0.0	0.5	1.0	1.0	2.0	0.8
	Institutional support for business-academia collaboration	1.5	1.8	1.3	1.8	2.0	3.5	2.0
<b>Sub-dimension average score</b>		1.1	0.9	0.7	2.1	2.0	3.0	1.6

***The collaboration framework is weak, and academic research is rarely linked to business needs***

Support for business-academia partnerships must be carefully structured and implemented to overcome the barriers identified above. It should also aim to facilitate communication and co-operation and combine the market knowledge of entrepreneurs with the technology from academia.

Increasing ties between academia and the business community is recognised as a strategic priority for STI development across the region, but the overall collaboration promotion framework remains weak in most economies and is largely limited to awareness-raising activities. As a result, joint research by academia and the business community remains limited, as evidenced, for instance, by the low level of public-private co-publications in Montenegro and Serbia, which remains well below the EU average, according to the EU's Innovation Scoreboard (EC, 2020<sup>[3]</sup>).<sup>8</sup> Going forward, and aligned with the objectives of the respective STI frameworks, efforts are likely to focus on increasing financial measures to encourage collaboration and commercialisation, as well as strengthening the institutional support structure.

***Financial incentives for collaboration are mostly limited in scope, size and predictability***

Many economies have been experimenting with financial incentives to foster innovation, although these often do not have a specific focus on collaboration between academia and industry. Small-scale innovation voucher schemes may support businesses to undertake initial exploratory projects with RDIs and test collaboration at a minimal risk. In contrast, co-operative grants provide more substantial support and usually require a rigorous selection process based on technological merit and commercialisation potential.

Among the WB6 economies, Serbia has the most comprehensive financing scheme to support business-academia collaboration. Its Innovation Fund has provided collaborative grants for joint technological projects since 2016, complemented by an innovation voucher scheme in 2017. Previously, in 2015 a technology transfer facility was established. In North Macedonia, the Fund for Innovation and

Technological Development plans to develop a dedicated co-operative grant instrument. In Montenegro, a programme for funding innovative projects was successfully implemented between 2018 and 2020. In Republika Srpska, a small-scale programme is currently being piloted for promoting technology transfer and absorption and raising awareness of the potential of business-academia collaboration. In Albania and Kosovo, financial support has at times been made available through small-scale voucher schemes, although these predominately supported firm innovation. Many of these schemes in the WB6 economies have been dependent on donor funding, although the Serbian Innovation Fund and to a lesser extent North Macedonia's fund are increasingly co-financed domestically.

No economy implements specific procurement practices to encourage joint business-academia activities; however, the new Procurement Law in Serbia, adopted in 2019, introduces some elements of support for innovation. Tax incentives, where available, focus on ICT and other equipment to stimulate innovation. Only in Montenegro and Serbia do the governments offer tax breaks for businesses that employ qualified researchers.

### ***Non-financial incentives for collaboration remain scattered***

The aforementioned support to provide scholarships and mobility schemes does not usually focus on fostering exchange with the private sector, and measures such as entrepreneurial leave of absence are non-existent. There is also no evidence of a systemic approach to evaluate researchers' performance based on private sector collaboration, which provides few incentives to actively seek partnerships. Finally, IP legislation does not favour collaboration or the commercialisation of research, as royalty splits and IP ownership between the individual researcher and the organisation obtaining a patent are not sufficiently nuanced.

### ***An institutional support structure is emerging, but focuses on start-ups***

Some progress has been made in expanding institutional support for businesses-academia collaboration. However, there is often no systemic approach and efforts collide with broader policy measures to create an innovation ecosystem focusing on start-ups. Further efforts are needed to leverage the existing infrastructure to stimulate joint collaboration.

Serbia has the most advanced infrastructure in place among WB6 economies, notably through a strong network of science and technology parks (STPs). The number of centres of excellence has also expanded in recent years. In Montenegro, construction of its flagship STP in Podgorica is expected to be completed in 2021, and in North Macedonia a feasibility study for STP construction has been finalised. A number of STPs operate or are planned throughout Bosnia and Herzegovina, but these serve predominately as start-up incubators. However, the establishment of a competence centre for quality assurance in Mostar in 2019, with support from private investment from Slovenia, is a welcome step. In Kosovo, the support infrastructure is limited to a number of innovation centres. Among these, the Innovation Centre Kosovo has been instrumental in building the local start-up ecosystem. Increasing attention is also being given to the establishment of technology transfer offices, although their operational capacity remains limited. In Albania, efforts are underway to create a technology transfer office with EU support, while North Macedonia established such an office in 2018. In Montenegro, a technology transfer office was established as part of the new Centre of Excellence for Research and Innovation at the University of Montenegro.

### ***The way forward for business-academia collaboration***

A more strategic approach is needed to encourage business-academia collaboration. Policy makers should consider the following:

- **Identify bottlenecks in the framework for business-academia collaboration.** A thorough analysis of the key obstacles, including financial support, the IP framework, evaluation criteria for

researcher mobility schemes and the tax regime, should result in an action plan to systematically address shortcomings in the promotion framework for business-academia collaboration.

- **Raise awareness and communicate more about the opportunities of business-academia collaboration.** For instance, a platform could be provided through STPs for exchange and communication between researchers and the business community. This would help all parties to better understand different needs and requirements and identify opportunities for more collaboration.
- **Develop more focused and well-funded financial incentives.** Voucher schemes are under-used across most economies in the region and often focus more on broader innovation than specifically on collaboration between researchers and the industry. If coupled with awareness raising, targeted voucher schemes could serve as an effective tool to encourage firms to seek co-operation with academic researchers, as long as they are implemented consistently (not just as one-off events) and in line with international good practice.
- **Introduce collaborative grants in economies where voucher schemes have been tested.** As a follow-up, economies could consider introducing higher value co-operative grants (see Box 12.6 for an example from Israel). These should be implemented in line with international practice and follow clear assessment criteria that include international peer review and independent selection bodies. This will require significant operational capacity. In economies where such collaborative grants are already available, the focus should be on monitoring and evaluation, with adjustments made, when applicable, to maximise impact.
- **Leverage the increasing support infrastructure.** Governments should rationalise investments in large-scale infrastructure such as STPs and ensure that they serve as an effective platform to create linkages between research and businesses, rather than just incubators. Small-scale competency centres and well-staffed and experienced technology transfer offices, or a more regional approach to STPs, may be more cost efficient.

#### Box 12.6. Enabling business-academia collaboration through Israel's Magnet programme

With the objective of stimulating greater co-operation between public sector research and the business community, Israel launched the large-scale Magnet programme to support pre-competitive R&D. The goal of the programme is to assist the development of generic technologies in areas in which Israeli industries may have a competitive advantage.

The programme is aimed at Israeli companies that are interested in developing innovative technologies which can be the basis for the advanced generation of products, and Israeli academic scientific or technological research groups seeking to promote applied research as part of a consortium with industry and to study market needs.

Magnet provides grants for R&D collaboration, thereby providing opportunities for businesses to collaborate either with peers or with academia. Magnet also specifically supports infrastructure technologies which enable the distribution of knowledge and co-operation between companies operating in the same field which otherwise may be difficult to achieve. Grants are provided for up to two-thirds of the costs of enterprises and up to 80% of the costs of scientific research contribution over a period of three years. The average funding per project is about USD 5-6 million.

In order to apply for funding under the programme, members of the consortia have to sign an agreement, part of which promises all parties the rights to the intellectual property created by the consortium, and create a legal entity. Funding decisions are made by the Magnet Committee, taking into consideration criteria such as the level of co-operation between academia and industry, level of innovation of the proposed technology, market size and benefits to the local economy, amongst others. The simplicity of management and a competitive approach, as well as emphasis on co-operation, make this programme a very good example for strengthening R&D cooperation between academia and industry in Western Balkan economies.

## Conclusion

The region is beginning to catch up with EU and CEEC peers in STI policy development, although significant discrepancies among the economies remain. All economies have recognised the economic importance of creating an innovation-enabling environment; however, policy measures are often focused on short-term impacts instead of creating the foundations of a knowledge economy. STI continues to be underfunded, although all governments have increased budget allocations in recent years, which is a promising sign.

Some economies, notably Montenegro and Serbia, have adopted international good practice in STI policy making in recent years. If implemented thoroughly and provided with sufficient financial resources and operational capacity, impact is expected to become evident in the medium term. Although an adequate policy framework has been in place for several years in Montenegro, renewed commitment is required to maintain momentum. In contrast, Albania, Bosnia and Herzegovina and Kosovo will need to significantly step-up efforts to create an environment conducive to STI.

Providing sufficient financial support for research and human capital development, as well as leveraging regional and European integration, will be critical for the long-term prospects of STI in the Western Balkans. However, if the region manages to successfully unlock the full potential of science, technology and innovation, this field can become a key vehicle for long-term economic prosperity and help to tackle brain drain.

## Notes

<sup>1</sup> The Central and Eastern European Countries (CEEC) are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>2</sup> EURAXESS - Researchers in Motion is a pan-European initiative delivering information and support services to professional researchers, backed by the EU, member states and associated countries. It supports researcher mobility and career development and enhances scientific collaboration. (<https://euraxess.ec.europa.eu/>)

<sup>3</sup> Eureka is the largest intergovernmental network for cooperation in R&D and innovation in the world. It is present in over 45 economies, where it provides access to public funding, promotes collaboration and innovation or offers advice, through various programmes (such as EUREKA Clusters, Globalstars, InvestHorizon). (<https://www.eurekanetwork.org/>)

<sup>4</sup> Horizon 2020 is the EU's biggest framework programme for research and innovation. It provides funding for multi-national collaboration projects as well as for individual researchers, and supports SMEs with a special funding instrument. (<https://ec.europa.eu/programmes/horizon2020/en/what-horizon-2020>; <https://www.euneighbours.eu/en/east/stay-informed/projects/horizon-2020>)

<sup>5</sup> European Research Area (ERA) is the ambition to create a unified research area open to the world, based on the EU Internal Market, that enables free circulation of researchers, scientific knowledge and technology. ([https://ec.europa.eu/info/research-and-innovation/strategy/era\\_en](https://ec.europa.eu/info/research-and-innovation/strategy/era_en))

<sup>6</sup> Scientific output is defined as number of documents published in a given year.

<sup>7</sup> Marie Skłodowska-Curie Actions (MSCA) is an EU programme which provides grants to support research careers and encourages transnational, intersectoral and interdisciplinary mobility. (<https://ec.europa.eu/programmes/horizon2020/en/h2020-section/marie-sklodowska-curie-actions>; [https://ec.europa.eu/research/mariecurieactions/msca-actions\\_en](https://ec.europa.eu/research/mariecurieactions/msca-actions_en))

<sup>8</sup> Montenegro had a score of 22.41 relative to the EU average in 2012, whereas Serbia had a score of 23.62.

# 13 Digital society (Dimension 10)

---

The six Western Balkan economies (WB6) have long recognised the significance of the digital economy and society for strengthening ties and co-operation within the region and increasing convergence with the European Union. This chapter reviews their progress through five sub-dimensions: 1) access, which explores government policies and initiatives to enable network infrastructure investment and broadband services take-up and to increase data accessibility; 2) use, which asks whether governments have planned and implemented programmes to develop a user-centric digital government and to help businesses achieve a digital transformation; 3) skills, which examines whether governments are implementing policies to nurture a digitally skilled workforce and to support the growing ICT sector to underpin the development of the digital economy; 4) society, which asks whether governments have planned and implemented programmes to reduce the digital divide and create an inclusive society through digital technologies; and 5) trust, which examines the economies' frameworks and how they are being implemented to protect data and privacy, build trust in e-commerce and ensure cybersecurity through effective digital risk management systems. Each sub-dimension section makes specific recommendations for increasing the capacity and efficiency of systems for developing the digital society in the Western Balkans.

---

## Key findings

- **Albania, Kosovo, North Macedonia, Montenegro and Serbia have put together economy-wide broadband plans and significant donor financing to develop rural broadband infrastructure.** These donor-supported projects promise to connect every household and every public building with high-speed Internet, even in the most remote areas, in the next two to four years. Moreover, these five economies are making legal and regulatory reforms to enable private sector investments and cost reduction in network deployment.
- **All the WB6 governments are in the process of transforming their public administration into a user-centric public service through digital technologies, but progress has been stronger in Albania, Serbia, Montenegro and North Macedonia.** The economies are also making progress in promoting public sector data accessibility and transparency. However, the digital literacy of the population in some WB6 economies is still low (Albania, Bosnia and Herzegovina, Kosovo, and North Macedonia), increasing the risk of a growing digital divide as over-the-counter services are replaced with online services.
- **All the economies recognise digital skills as a key competence in their education policies, but only Serbia has adopted a Digital Skills Strategy to close the skills gap.** Their governments have incorporated information technology (IT) subjects in education and training systems, but they are not co-operating sufficiently with the industry on curricula design. The COVID-19 crisis has exposed shortcomings in schools' information and communication (ICT) equipment, distance-learning platforms and IT training for teachers. Some of the WB governments (Kosovo, North Macedonia and Serbia) have responded quickly to improve the situation, but more efforts are needed.
- **All WB6 economies, except Serbia, provide insufficient support for business digitalisation and ICT sector growth.** While all the governments have implemented some legal reforms to improve e-commerce and e-business frameworks, only Serbia has implemented effective programmes to promote e-commerce and support the IT industry.
- **All the economies have legal frameworks in place for data protection and privacy, but enforcement is weak.** Although Kosovo, North Macedonia and Serbia have improved their alignment with the European Union's General Data Protection Regulation (GDPR), the WB economies have not ensured sufficient resources and executive power to the competent authorities to implement the framework, build public sector capacities and enforce compliance.
- **The WB6 economies now include measures to protect consumers using e-commerce in their legislation, but their legal frameworks are underdeveloped and opportunities for consumer education are limited.** The competent authorities for consumer protection in the WB6 do not sufficiently supervise and report on e-commerce. Only Serbia is implementing an operational programme for online consumer protection that advises citizens on their rights in e-commerce and how to exercise them.
- **All the WB6 economies are gradually aligning with the EU cybersecurity framework, but insufficient budgetary allocations continue to slow down progress.** All of the economies except Bosnia and Herzegovina have a cybersecurity strategy in place and an economy-wide computer emergency response team (CERT), but lack sufficient human and financial resources for implementation. There are few activities to raise awareness of digital security risks in the public and private sector.

## Comparison with the 2018 assessment

Since the last assessment, Serbia and Montenegro have made progress on developing the digital economy and society (Figure 13.1). Kosovo and North Macedonia have not made any notable improvement between 2018 and 2021. Bosnia and Herzegovina's score is essentially unchanged, but still the lowest of all the assessed economies. Albania's overall score has decreased slightly since 2018, mainly due to an observed slowdown in the trust sub-dimension, in ICT sector support and private sector ICT adoption, but it is still above the WB6 average.

**Figure 13.1. Overall scores for digital society dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Assessment methodology and process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

The previous assessment – the 2018 Competitiveness Outlook (OECD, 2018<sub>[1]</sub>) – made several recommendations to the WB6 economies for accelerating the implementation of their digital society policies (Table 13.1). Some progress has been made in introducing e-learning platforms and providing computers for students, mainly as a response to the COVID-19 crisis. However, low availability of high-speed Internet connections in schools and limited IT training for teachers remain key impediments to digital skills development. The skills gap continues to impact the labour market, deter business digitalisation, and slow down ICT sector growth. Progress has been strongest in reforming e-commerce frameworks, but support for digitalisation of small and medium-sized enterprises (SMEs) is still insufficient. Improvement has been more incremental in expanding broadband infrastructure and developing e-services for citizens, and support to allow underprivileged groups to benefit from the digital economy is weak. Monitoring and evaluation of digital inclusion is still underdeveloped. Although alignment of data protection frameworks with EU regulations is progressing, implementation is slow, while public sector capacities are still limited.

**Table 13.1. Implementation of the CO 2018 policy recommendations: Digital society**

Competitiveness Outlook 2021		
2018 Policy recommendations	Main developments during the assessment period	Regional progress status
Enhance the use of ICT for teaching and learning, as well as for developing e-skills for students and professionals.	<ul style="list-style-type: none"> <li>• There is low use of ICTs in education and teachers are poorly-trained or tech-shy.</li> <li>• North Macedonia is implementing a massive teachers' training programme to enhance digital competencies for 25 000 teachers.</li> <li>• The skills gap is still large and co-ordination with the labour market in curricula design is limited.</li> <li>• The COVID-19 crisis forced WB governments to introduce distance learning tools for all education levels. Kosovo and Republika Srpska (RS) provided laptops to underprivileged students, Serbia and North Macedonia introduced learning management systems.</li> <li>• Rural broadband connectivity projects have been launched in all WB economies except Bosnia and Herzegovina. The "Connected Schools" project in Serbia will connect every school in the coming years.</li> <li>• Montenegro is the only WB economy that adopted a Digital Competence Framework in 2020 and is approaching the EU average computer-to-student ratio.</li> <li>• Serbia is the only economy with a Digital Skills Strategy</li> <li>• Serbia and Kosovo are implementing widespread digital skill training for the unemployed and women.</li> </ul>	Moderate
Prioritise the inclusion of underprivileged groups in digital strategies.	<ul style="list-style-type: none"> <li>• All WB6 economies except Bosnia and Herzegovina have adopted e-accessibility requirements for public sector websites, but implementation is limited.</li> <li>• Digital government strategies promote replacing over-the-counter services with e-services, but only Albania provides hands-on support for e-applications to citizens</li> <li>• Digital agendas and education strategies consider underprivileged groups in principle, but limited activities are funded.</li> <li>• Broadband development policies and programmes promise to connect every household and public building in remote areas, but are still in the initial phase.</li> </ul>	Limited
Take steps to systematically respect privacy and data protection (PDP), especially in social media.	<ul style="list-style-type: none"> <li>• Only three economies (Kosovo, North Macedonia and Serbia) have updated their PDP frameworks to align with the GDPR, but regulations and implementation are still pending.</li> <li>• PDP authorities continue to suffer from understaffing and challenges to their executive power and capacity to enforce the framework in the majority of the economies.</li> <li>• Limited resources (or none) hinder public sector capacity-building activities on data protection and privacy.</li> </ul>	Limited
Promote the adoption of digital technology by SMEs.	<ul style="list-style-type: none"> <li>• Serbia and Montenegro are the only economies implementing programmes for digitalising SMEs, but Serbia's is having more impact.</li> <li>• Only three economies (Montenegro, North Macedonia and Serbia) and the RS have updated their e-commerce frameworks.</li> <li>• Some tax relief schemes are in place for purchasing software/hardware in Kosovo, North Macedonia and Serbia.</li> </ul>	Limited

## Introduction

Digital technologies and large-scale data flows fundamentally change how people live and work, interact with one another, participate in the economy, and engage with the government (OECD, 2019<sup>[21]</sup>). Digital society policies promote the exploitation of opportunities offered by digitalisation and are cross-cutting and diverse by nature. The variety of digital technologies already used in production, or coming in the near future (e.g., the Internet of Things and advanced robotics, industrial biotechnology, 3D printing, new materials and nanotechnology), are bringing about the "next production revolution". And as they transform

production and distribution of goods and services, they have far-reaching consequences for productivity, skills, income distribution, well-being and the environment (OECD, 2017<sup>[3]</sup>).

The WB6 have long recognised the significance of the digital economy and society for the region, for strengthening ties and co-operation within the region and increasing convergence with the European Union (EU) – ultimately making the Western Balkans fit for the Digital Age. The EU is supporting these efforts by including the Digital Agenda for the Western Balkans as one of the flagships of its strategy for the WB6 (European Commission, 2018<sup>[4]</sup>). The agenda describes the joint venture between the European Commission and the six Western Balkan economies to invest in broadband connectivity (i.e. deploying broadband infrastructure across the region through a total of EUR 30 million in EU grants under the Western Balkan Investment Framework); increase cybersecurity, trust and the digitalisation of industry; strengthen the digital economy and society; and boost research and innovation (European Commission, 2018<sup>[5]</sup>).

More recently, the leaders of the WB6 endorsed the Common Regional Market (CRM) 2021-2024 Action Plan (AP) at the Berlin Process Summit on 10 November 2020 in Sofia. This action plan is to be implemented by the end of 2024 and includes commitments to implement actions in the priority Regional Digital Area. This will become the region's steppingstone for its integration into the pan-European digital area. But as the European Commission is determined to make this decade Europe's "Digital Decade", setting ambitious targets for 2030 to empower businesses and people in a human-centred, sustainable and more prosperous digital future, the WB6 need to accelerate their efforts if they are to catch up, perhaps more than in any other policy domain, to seize the opportunities lying ahead (European Commission, 2021<sup>[6]</sup>).

This policy domain spans from electronic communications and broadband infrastructure to digital security, and from digitalisation of public administration and services, education, and businesses, to the empowerment of citizens with digital skills and the promotion of the ICT sector to enable innovation and employment opportunities. As digital trends penetrate every policy domain to some extent, the digital society chapter links with almost every other chapter. The closest links are with the following chapter themes:

- **Chapter 10. Education policy** promotes digital skills development and the integration of digital technologies for enhanced teaching and learning at all levels of the education system. It also exploits and depends on information systems and digital tools to provide synchronous (live) and asynchronous (recorded) online learning and life-long learning opportunities. Education policy can shape the outcomes of the digital transformation and ensure that benefits are equally shared among and within countries' populations (OECD, 2019<sup>[7]</sup>).
- **Chapter 11. Employment policy** seeks to minimise the gap between skills developed during education and those demanded by employers. The digital economy adds another consideration for employment policy makers, as digital skills, on top of any other expertise needed for a job, can help workers easily adapt to a digitalised workplace. Workers without these skills are most likely to bear the costs of digital transformation (OECD, 2019<sup>[7]</sup>). In the near future, 90% of jobs will require some level of digital skills (European Commission, 2016<sup>[8]</sup>).
- **Chapter 12. Science, technology and innovation** drive growth and digitalisation is the most significant vector of innovation in firms, science, and governments. In 2015, at the OECD Ministerial Meeting in Daejeon (Korea), the ministers from OECD countries and partner economies recognised that digital technologies are revolutionising science, technology and innovation (STI) (OECD, 2020<sup>[9]</sup>). But the digitalisation of STI creates short- and long-term policy challenges, creating the need to align innovation policies with digital society policies.
- **Chapter 19. Anti-corruption policy** is strongly linked to the process of digitalising public administration as it enhances transparency and accountability (OECD, 2019<sup>[2]</sup>). Open data policies can allow for increased public engagement and improve public governance.

## Assessment framework

### Structure

This chapter assesses digital society policies in the WB6 through five broad sub-dimensions:

1. **Sub-dimension 10.1: Access** assesses the implementation of high-quality broadband infrastructure and the respective policy framework; analyses whether a regulatory framework is in place to ensure a level playing field in the ICT sector to promote competition and infrastructure investments; and examines whether a framework for data accessibility is in place.
2. **Sub-dimension 10.2: Use** analyses digital government policy development and implementation to assess the digital transformation of governments and the public sector. It also examines private sector ICT adoption to assess how policies promote the use of digital technologies as a growth enabler in firms.
3. **Sub-dimension 10.3: Jobs** explores how digital skills for students are promoted to equip them to benefit from digitalisation and contribute to the digital economy. It also examines whether a policy framework for digital skills for adults is in place and supports lifelong learning systems effectively and overall labour market adaptability. It measures the coherence of policies for ICT sector promotion, their implementation and their outcomes.
4. **Sub-dimension 10.4: Society** evaluates whether a digital inclusion framework has been adopted to overcome the exclusion of socio-economically marginalised groups. It also assesses if targeted policy actions have been implemented and monitored and adjusted in order to adapt technological developments and their impact on socio-economic groups.
5. **Sub-dimension 10.5: Trust** looks at whether the policy framework for privacy protection is based on a robust regulatory and enforcement framework that sufficiently adapts to ever-evolving threats to personal privacy. It also assesses whether a legislative and institutional framework is in place to protect consumers in e-commerce and examines whether an economy-wide framework for digital security risk management has been adopted and implemented to mitigate risks and increase trust in the digital environment, thus fostering the uptake of digital services.

All five sub-dimensions are based on the OECD's Going Digital Integrated Policy Framework (see Box 13.1). The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. Figure 13.2 shows how sub-dimensions and their indicators that make up the digital society dimension assessment framework. For more information on the methodology, see the Assessment methodology and process chapter.

Figure 13.2. Digital society dimension assessment framework

Digital society dimension				
<b>Outcome indicators</b> 1. Fixed broadband penetration 2. Percentage of individuals with basic or above basic overall digital skills 3. ICT task intensive jobs as % of total employment				
Sub-dimension 10.1 Access	Sub-dimension 10.2 Use	Sub-dimension 10.3 Jobs	Sub-dimension 10.4 Society	Sub-dimension 10.5 Trust
<b>Qualitative indicators</b> 1. Broadband infrastructure 2. Regulatory policy framework 3. Data accessibility	<b>Qualitative indicators</b> 4. Digital government 5. Private sector ICT adoption	<b>Qualitative indicators</b> 6. Digital skills for students 7. Digital skills for adults 8. ICT sector promotion	<b>Qualitative indicators</b> 9. Digital inclusion policy	<b>Qualitative indicators</b> 10. Privacy protections 11. Consumer protection in e-commerce 12. Digital security risk management
<b>Quantitative indicators</b> 1. Fibre broadband connections per 100 inhabitants. 2. Mobile broadband connections per 100 inhabitants 3. Households with computer access at home 4. Households with Internet access at home	<b>Quantitative indicators</b> 4. Internet users as a share of individuals 5. Share of firms making e-commerce sales in past 12 months 6. Share of individuals using the Internet to connect with public authorities	<b>Quantitative indicators</b> 7. Computer-to-student ratio 8. Schools connected to the Internet 9. Households without Internet access at home due to high access costs	<b>Quantitative indicators</b> 12. Enterprises that defined or reviewed their ICT security policy in the last 24 months
<b>OECD Instruments</b> <i>Going Digital Integrated Policy Framework</i> Policy dimension "Access"	<b>OECD Instruments</b> <i>Going Digital Integrated Policy Framework</i> Policy dimension "Use"	<b>OECD Instruments</b> <i>Going Digital Integrated Policy Framework</i> Policy dimension "Jobs"	<b>OECD Instruments</b> <i>Going Digital Integrated Policy Framework</i> Policy dimension "Society"	<b>OECD Instruments</b> <i>Going Digital Integrated Policy Framework</i> Policy dimension "Trust"

The CRM Action Plan (mentioned above) is made up of targeted actions in four key areas: 1) a regional trade area; 2) a regional investment area; 3) a regional digital area; and 4) a regional industrial and innovation area.

In the regional digital area, the WB6 economies commit to closely align rules and regulations with the core principles governing the pan-European digital area by providing broadband access to all, aligning with EU Digital Single Market, reducing roaming costs, promoting digital upskilling, and reskilling, improving data protection, privacy and mutual recognition of trust services across the region.

The regional digital area of the CRM 2021-24 AP includes the following four components: 1) digital infrastructure and connectivity; 2) digital skills and competence; 3) digital economy in the era of new ICT technologies; and 4) trust and security. The findings in this chapter on the access, jobs, use and trust sub-dimensions can inform the implementation of these four components (Box 13.3, Box 13.6, Box 13.8 and Box 13.12).

### Key methodological changes to the assessment framework

Since the 2018 assessment, several changes have been introduced to the assessment framework (Figure 13.2). The 2021 assessment now mirrors the OECD's Going Digital Integrated Policy Framework (Box 13.1) and includes five sub-dimensions instead of the four in the CO 2018. New indicators have been included, such as data accessibility and digital government, while other previously examined indicators, such as digital strategy, e-health strategy, e-commerce law and e-authentication framework, are now assessed as integral parts of sub-dimensions such as *use* and *trust*. Thus, the 2021 assessment distinguishes between *access* and *use* of digital technologies, splitting the previously merged sub-dimension into two. It also splits the *digital empowerment* sub-dimension in CO 2018 into the *use* and *society* sub-dimensions, where *society* is mainly focused on digital inclusion. Finally, *e-commerce and e-business*, topics of the third sub-dimension in the previous assessment, are now examined under the *use* and the *jobs* sub-dimensions, where the uptake of e-commerce is a measure of firms' digitalisation and a driver that accelerates ICT sector growth and increases its contribution to the digital economy.

#### Box 13.1. The OECD's Going Digital Integrated Policy Framework

The digital society dimension's assessment framework mirrors policy dimensions of the OECD Going Digital Integrated Policy Framework, developed by the OECD as a key output of the OECD Going Digital project, and published in February 2020:

**Sub-dimension 1: Access** reflects the framework's *Access* policy dimension which demonstrates the importance of access to high-quality communication networks and services at competitive prices as foundation of digital transformation.

**Sub-dimension 2: Use** is based on the *Use* policy dimension of the framework. It emphasises the significance of widespread and effective use of digital technologies and data for development of a digital society.

**Sub-dimension 3: Jobs** mirrors the framework's *Job* dimension, which suggests that policies in place should assure that digital transformation leads towards creating more and better jobs.

**Sub-dimension 4: Society** is based on the *Society* dimension of the framework, according to which digital transformation needs to work for inclusive societies.

**Sub-dimension 5: Trust** reflects the framework's *Trust* policy dimension. It highlights the necessity for the actors of digital transformation (governments, individuals, businesses...) to be confident that engaging in digital environment brings more benefits than downsides, in order to fully embrace and benefit from digital society.

### Digital society performance and context in the WB6

Outcome indicators play a key role in examining the effects of policies and they provide vital information for policy makers to evaluate the effectiveness of existing policies and the need to design new ones. The outcome indicators selected for the Digital Society dimension (Figure 13.2) are designed to shed light on the WB6 economies' performance in terms of broadband development and digital literacy of the population and to indicate the demand for highly skilled ICT professionals in the labour market. This section draws on those outcome indicators.

The assessment indicates that WB economies are still lagging behind EU and OECD economies in fixed broadband penetration, which refers to the number of broadband subscriptions per 100 inhabitants,

including households and enterprises (Figure 13.3). Montenegro is most advanced, while Albania has the lowest penetration of broadband subscriptions in the region. This indicator demonstrates that although broadband development policies have supported (or at least enabled) a steady increase in broadband penetration since 2017, in most cases, the trend is not steep enough to reduce the gap with more developed countries.<sup>1</sup> The Regional Cooperation Council has encouraged the Western Balkan economies to collect data on the new Digital Economy and Society Index (DESI) indicators,<sup>2</sup> which offer additional information on broadband connectivity. For example, the Broadband Competence Office in North Macedonia reports that in 2019, although fixed broadband take-up (i.e., percentage of households with broadband connections) was 70.9%, close to the EU average (77.6%), fast broadband take-up in households was only 21.6%, significantly lagging behind the EU average (48.7%).

**Figure 13.3. Fixed broadband penetration (2017-19)**

Note: OECD and EU averages are calculated as simple averages. EU includes all EU Member States in 2013-2020 period. CEEC-11 countries are Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia, and Slovenia.

StatLink  <https://doi.org/10.1787/888934254335>

The WB6 economies' performance on digital skills development among the population varies significantly (Figure 13.4). Although digital literacy has increased in Montenegro and Serbia since 2018, closely following the CEEC-11 economies,<sup>3</sup> the other WB6 economies have not yet put in place policies and programmes to close the digital skills gap effectively, allowing the digital divide to grow and depriving the population of the opportunity to seize the benefits of digitalisation.

WB6 industry stakeholders agree that skilled ICT professionals are in high demand in the region to support ICT sector growth and firms' digitalisation. They also highlight the digital skills' gap between education and training systems and labour market needs. Data on the percentage of ICT specialists employed as a total of all employed in the WB6 are only available for Montenegro, North Macedonia and Serbia. Data for those three economies show that Serbia has the highest share of ICT professionals, amounting to 2.6% of total employed persons in 2019, while North Macedonia follows with 1.9% and Montenegro with 1.8%. In comparison, the CEEC-11 and EU averages were 3.6% and 3.9% respectively.

**Figure 13.4. Percentage of individuals with basic or above basic overall digital skills (2016-19)**

Note: EU includes all EU Member States during the 2013-20 period. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia. Data for 2018 are unavailable.

### Access (Sub-dimension 10.1)

High-quality access to communications networks and services at competitive prices is fundamental for the digital transformation and similarly, access to data is vital as a driver of economic activity and innovation (OECD, 2019<sup>[2]</sup>). The EU's Digital Strategy notes that "European technological sovereignty starts from ensuring the integrity and resilience of our data infrastructure, networks and communications" (European Commission, 2020<sup>[14]</sup>). Thus, public policies for access and the underlying legal and regulatory framework ensure that continued investment in communication networks and increased uptake of broadband services underpin the adoption of digital technologies, including cloud computing, Internet of Things, artificial intelligence and more.

Overall, four of the six WB economies (Albania, Montenegro, North Macedonia and Serbia) are performing well in this sub-dimension, with Kosovo following closely behind. Bosnia and Herzegovina is still working on the improvement of its policy and regulatory framework for increasing access (Table 4.3. Scores for Sub-dimension 1.1: Investment policy framework). Most of the progress made during this assessment period can be traced back to the adoption and implementation of programmes that support rural broadband development in all economies except Bosnia and Herzegovina. The assessment also indicates that the WB6 economies are still in the initial phase of preparing and implementing a data accessibility framework to support data openness and transparency, lowering the overall scores in this dimension.

**Table 13.2. Scores for Sub-dimension 10.1: Access**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 10.1: Access	Broadband infrastructure	3.5	2.0	3.5	3.5	3.5	3.5	3.3
	ICT regulatory policy framework	3.5	2.0	2.5	3.5	3.5	2.5	2.9
	Data accessibility	2.5	1.5	2.5	3.0	2.5	3.0	2.5
<b>Sub-dimension average score</b>		3.2	1.8	2.8	3.3	3.2	3.0	2.9

## Broadband infrastructure development is supported by plans to invest in rural area networks

As more people and businesses go online, developing reliable, high-quality broadband infrastructure underpins an economy's digital transformation. Extending broadband infrastructure to rural areas is essential to guarantee universal access and to provide all citizens with the opportunity to benefit from the digital economy. This section assesses whether an effective broadband infrastructure policy framework is in place and how it promotes private sector investments in high-speed communications infrastructure and accelerates the uptake of broadband services.

All WB6 economies have made progress in broadband take-up since 2018, as reflected in the data for internet access in households (Figure 13.5). Kosovo had the highest household access in the region in 2020 (96%), exceeding the EU average (91%). The other WB economies are closely following the performance of the CEEC-11, except for Bosnia and Herzegovina, which is falling behind (73% in 2020).

Figure 13.5. Internet access in WB6 households (2017-20)

Note: The EU average represents data for EU-28 for the period 2017-19 and the EU-27 estimate for 2020. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Eurostat, 2020<sup>[15]</sup>), "Households - level of internet access",

[https://ec.europa.eu/eurostat/databrowser/view/isoc\\_ci\\_in\\_h/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/isoc_ci_in_h/default/table?lang=en).

StatLink  <https://doi.org/10.1787/888934254373>

Internet access via a mobile (smart) phone is also higher in Kosovo (79%) than in the other Western Balkan economies and was above the EU average (73%) in 2019 (Figure 13.6). This could be linked to Kosovo having the youngest population in Europe, who increasingly depends on mobile devices. Use of mobile phones for Internet access is the lowest in Bosnia and Herzegovina and Serbia, the only economies below the CEEC-11 average.

Positively, all Western Balkan economies except Bosnia and Herzegovina have adopted a strategy or broadband development plan going to 2023 or beyond, and are already implementing it. They have leveraged donor support from the Western Balkan Investment Framework (WBIF),<sup>4</sup> the European Bank for Reconstruction and Development (EBRD), or the World Bank through grants for feasibility studies to identify appropriate models of rural broadband development, and through multi-million euro loans to co-finance private sector investment in underserved areas. Legislative reforms are also underway in these five Western Balkan economies to improve the framework for facilitating network infrastructure investment, to align state-aid rules with the EU framework for rapid development of broadband networks, and to reduce the cost of these deployments (e.g., by drafting the law to transpose the Broadband Cost Reduction Directive 2014/61/EU). Bosnia and Herzegovina is in the process of finalising its broadband strategy, which was drafted with contributions from competent bodies from all levels of the government and can be expected for adoption in 2021.

**Figure 13.6. Internet access by individuals via mobile/smart phones (2017-2019)**

Note: EU includes all EU Member States in the 2013-20 period. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Eurostat, 2019<sup>[16]</sup>), "Individuals - mobile internet access",

[https://ec.europa.eu/eurostat/databrowser/view/isoc\\_ci\\_im\\_i/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/isoc_ci_im_i/default/table?lang=en)

StatLink  <https://doi.org/10.1787/888934254392>

Broadband infrastructure mapping has also progressed in the WB6. The same five economies have implemented the initial infrastructure mapping phase activities and are gradually adding layers of information over georeferenced applications. Bosnia and Herzegovina, on the other hand, is yet to make a broadband mapping application available to relevant stakeholders. The WB6 are also jointly implementing the Digital Balkan Highway project, with support from the World Bank, to investigate whether it is possible to improve regional interconnectivity and increase access to the Internet by establishing a regional broadband Internet infrastructure over the transmission grids of state-owned energy companies.

### ***The ICT regulatory policy framework is coming into line with the EU Electronic Communications Code***

The ICT regulatory policy framework plays a pivotal role in maximising the benefits of the digital transformation for the economy and society. Regulation can enable investment in infrastructure, promote innovation, and safeguard competition and consumer protection, if carefully applied (OECD, 2012<sup>[17]</sup>). This assessment measures whether an ICT regulatory policy framework has been adopted and implemented and whether its impact on society and economy is monitored.

Three out of the six WB economies (Albania, Montenegro and North Macedonia) are performing well on this indicator, having completed alignment with the EU 2009 regulatory framework and now implementing it. The other three have not yet updated their legislation to ensure financial and operational independence of their telecommunications' regulatory authorities, which continue to be financed from the state budget. The WB6 economies signed a regional roaming agreement in April 2019, which entered into force in July 2019. Since then the economies have gradually implemented cost reductions on roaming charges within the region, with calls becoming up to eight times cheaper and costs for data dropping on average from EUR 3 per megabyte to EUR 0.20. The agreement leads to the creation of a roaming free region by 1 July 2021 and dialogue has already started with the EU on reducing WB-EU roaming charges. WB citizens pay four times more than EU citizens for the same service due to these roaming costs, a significant burden that cannot be traced to market conditions.

The majority of the WB6 have made improvements to the existing framework to enable investment in communications networks and quality services. For example, Albania (in 2016) and North Macedonia (in 2019) updated their laws on electronic communications to transpose the EU Cost Reduction Directive (i.e., Directive 2014/61/EU on measures to reduce the cost of deploying high-speed electronic communications

networks). Others, like Kosovo, Montenegro, and Serbia, have prepared a new draft of the law to implement cost reductions, due for adoption in 2021.

The WB6 are progressing at different speeds towards their alignment with the EU Electronic Communications Code (EECC) (Directive (EU) 2018/1972). The EECC promotes 5G rollouts and co-investment in very high-capacity networks. It also aims to the separate incumbent operators in distinct wholesale and retail arms, and covers Internet-based services (not previously covered by electronic communications regulation) and improved spectrum management. It is complemented by various directives and regulations, including the e-Privacy Directive, the Telecoms Single Market Regulation, the Roaming Regulation, and the Radio Spectrum Decision. All WB6 economies are looking into further adaptation of their legal and regulatory framework on electronic communications to align with the key elements of the EECC. Serbia and Bosnia and Herzegovina are both preparing a new draft law on electronic communications that will improve their frameworks' alignment with the EECC, although it is still uncertain whether it will completely align with the 2009 regulatory framework.

5G development in WB economies is in the initial phase, but governments in the region are starting to prepare for future 5G rollouts. For example, Montenegro adopted a new radio frequency plan in 2020 to implement the decisions of the World Radio Communication conference (WRC-19). Both Albania and North Macedonia have included 5G rollout targets in their economy-wide broadband plans. Albania has put forward a 5G Strategy (i.e., a roadmap document by the line ministry) to set the process in motion, particularly in freeing up the low-band spectrum for 5G. It issued a test license to one operator in 2019. Serbia has already issued pilot 5G licenses and launched the first test base stations. It also signed an agreement with Bulgaria and Greece to test a 5G cross-border corridor. Kosovo recently started to connect communications towers with fibre optics and 5G-ready equipment. Bosnia and Herzegovina was the last economy in the region to award 4G licences (in March 2019), so the 5G roadmap is expected to take longer than in the other WB6 economies.

The WB6 telecoms regulators are well staffed, collect data regularly and publish reports on the electronic communications market. Three of the six economies (Montenegro, North Macedonia, and Serbia) implement regulatory impact assessments (RIAs) for new regulatory proposals and publish results online. However, implementation of RIAs on all policy and legislative proposals is not effectively systematised in the WB6. North Macedonia is the only economy with an online Unique National Electronic Registry of Regulations (ENER), where all RIA processes are published. Albania has adopted an "RIA light" system and although some progress has been made in enforcing the obligation for RIAs in line ministries, its implementation is slow. Kosovo and Bosnia and Herzegovina are not yet conducting RIAs and their capacities in the field remain low. The implementation of external evaluations and reviews of the stock of significant regulations against clearly defined policy goals is not yet systematic in the Western Balkan region.

### ***Implementation of data accessibility frameworks is in the initial phase***

Data exchanged across communications networks are important sources of economic and social value, as well as drivers of innovation. Policy makers should maximise individuals and firms' ability to access and share data, while also protecting digital security and privacy of data subjects through a well-designed overarching legal framework. This assessment measures whether a framework promoting data accessibility has been adopted and designed in such a way as to maximise its positive economic and social effects.

The WB6 economies have made progress in setting up a basic policy framework to promote data accessibility and openness since 2018. The WB6 are all implementing economy-wide action plans stemming from their commitments under the Open Government Partnership (OGP) Initiative. These action plans have led to the development of data accessibility policies, which along with the Public Administration Reform Strategies implemented in the region, promote the adoption of basic legislation on public sector

data transparency, re-use, online publication in machine readable formats, as well as data licensing. Each of the WB6 economies is moving forward at a different pace in implementing the necessary legal and regulatory framework. North Macedonia and Serbia are the only two economies in the region to have implemented an initial alignment with the Public Sector Information (PSI) Directive (2013/37/EU) on open data and the re-use of public sector information. However, only Albania has prepared a draft law to align with the new Open Data Directive (EU) 2019/1024 that replaced the PSI Directive in July 2019. This new law on open data is expected for adoption in 2021.

Serbia adopted a new law on e-government in 2018, promoting data re-use in machine readable formats, as well as an extensive set of bylaws and regulations that lay down rules on formats and registers and the operation of the Open Data Portal. North Macedonia, implementing a Transparency Strategy and an Open Data strategy, adopted a new law on the use of public sector data, amended the law on free access to information and introduced relevant rulebooks. Albania also has a policy document on open data in place, and while the dissolution of the Ministry of State for Innovation and Public Administration in September 2017 greatly affected continuity of implementation of its 2016-2018 OGP action plan (Vurmo, 2019<sup>[18]</sup>), a new 2020-2022 plan has been developed. Montenegro prepared a new draft law on access to public sector information in 2019, but the law was still pending adoption at the end of 2020. However, the previous amendment of the law from 2017 has already created the basic conditions for data re-use and the obligation for public sector institutions to publish their data in machine readable formats on the open data portal. A basic open data framework is in place in Kosovo, which performed an Open Data Readiness assessment in 2018 to identify and improve shortcomings in relevant legislation and regulations. Positively, a focal point for open data is designated for every ministry in Kosovo to co-ordinate relevant activities.

Bosnia and Herzegovina, on the other hand, has not yet adopted a policy or legal framework on data accessibility at the state level to align with the EU *acquis*. Some progress was recently made in creating obligations for public sector institutions to publish their data online. The Agency for Statistics of Bosnia and Herzegovina was the first institution to demonstrate practical compliance, publishing datasets in machine readable formats on its website. The Public Procurement Office is the next in line. It should be noted that at the entity level, Republika Srpska (RS) has included data accessibility and re-use and obligations for public sector institutions in the recently adopted e-Government Strategy for RS 2020-2022.

All Western Balkan economies, except Bosnia and Herzegovina, have established economy-wide Open Data Portals, including an increasing number of public sector data sets. However, awareness, human capacities and demand for open data are still insufficient. There is also limited understanding of data formats and data licensing in the public sector. The existing frameworks are not stimulating public-private partnerships for data innovation, but nonetheless, Montenegro was the first economy in the region to organise an Open Data Hackathon to stimulate data innovation (Box 13.2).

### Box 13.2. Montenegro's open data hackathon

The open data Hackathon, "Make it accessible and useful", was organised on the 5th of October 2019 by the EU-funded project Odeon – Open Data for European Open Innovation in the framework of the Infofest 2019 Conference in Montenegro. The topic of the competition was the design of innovative applications that create added value from available open data sets for the benefit of the public administration, the business community, and citizens. Six teams participated in the hackathon, contributing their ideas.

Although this was a small-scale competition on open data innovation, it was the first time such an event was organised in Montenegro. The event was an excellent opportunity to showcase how public-private partnerships could be created to design applications based on open data sets, demonstrating how bright entrepreneurial minds can develop new products and services, generating value for the global economy.

Note: The Odeon project is co-funded by the European Regional Development Fund (ERDF) under the INTERREG Mediterranean Program 2014-2020. It is implemented by 10 partners from 7 economies (Italy, Montenegro, Croatia, Slovenia, Greece, Spain, France).

Source: (Odeon, 2019<sup>[19]</sup>), News, <https://odeon.interreg-med.eu/pi/news-events/news/detail/actualites/hackathon-open-data-idea-presentations-in-budva-montenegro/>.

### Box 13.3. Towards regional digital infrastructure and connectivity in the Common Regional Market

The following key findings of the CO2021 access sub-dimension can inform the implementation of the Common Regional Market Action Plan 2021-24 actions related to the digital infrastructure and connectivity component:

- All the WB economies except Bosnia and Herzegovina are implementing digital strategies or broadband development plans and have launched rural broadband development projects with multi-million euro donor support that promise high speed connectivity to all households and public buildings in the next period. The legal and regulatory framework in these economies has been improved significantly to support private sector investments in network infrastructure. A broadband strategy in Bosnia and Herzegovina is also being prepared.
- 5G development in WB economies is in the initial phase, but governments in the region are starting to prepare for future 5G rollouts. Albania and North Macedonia have included 5G rollout targets in their broadband plans, and Albania issued a first pilot license. Serbia has already issued 5G pilot licences and Montenegro has already adopted a new radio frequency plan in 2020 to prepare for 5G. Kosovo recently started to lay down 5G-ready equipment and fibre connections between towers. Bosnia and Herzegovina is the last economy in the region to award 4G licences (in March 2019), so a 5G roadmap is not yet planned.
- The WB6 have made progress in the implementation of the Regional Roaming Agreement since July 2019, moving closer to the creation of a roaming free region by 1 July 2021. Roaming data traffic is already increasing across the region, and roaming costs have seen significant reductions, of between 83% and 96%, as of the end of 2020.

### The way forward for access

- **Complete the alignment of the ICT policy regulatory framework with the EU Electronic Communications Code.** All Western Balkan economies should continue reforms to create an enabling broadband investment framework that facilitates rapid, cost-efficient co-deployment of broadband network infrastructure. They should also continue efforts to finalise and implement the roadmap on WB6-EU roaming charges reduction, as part of the CRM Action Plan 2021-24 (Box 13.3). Bosnia and Herzegovina, Kosovo, and Serbia should accelerate the adoption of the new law on electronic communications to complete alignment with the EU 2009 regulatory framework and to ensure financial and operational independence of the regulatory authority. Bosnia and Herzegovina need to accelerate the adoption of the broadband strategy and to complete the broadband mapping exercise. Serbia should also accelerate the adoption of the Law on Broadband to create an enabling investment environment.
- **Improve the legal framework on data accessibility and strengthen the demand for open data innovation through inclusive co-creation processes.** All WB economies need to prepare and complete their alignment with the Open Data Directive (EU 2019/1024) to improve re-use and openness of public sector information. It is vital that the WB6 allocate sufficient resources for public sector capacity building on data formats and data licensing. It is also critical that the economies stimulate the development of public-private partnerships on open data innovation to demonstrate the benefits of data openness through e-services and applications and to increase the demand for additional open data sets.

### Use (Sub-dimension 10.2)

The rapid integration of digital technologies is transforming today's societies and economies, but creates a large challenge for governments – requiring a genuine revolution in the way they work, organise themselves, interact and provide services to citizens and firms (OECD, 2019<sub>[20]</sub>). But to realise the full potential of digital technologies for competitiveness and productivity growth, firms also need to transform. The EU's Digital Strategy notes that the growing scale and complexity of investment needed for digital transformation (in systems, skills, business processes, etc.) make the endeavour particularly difficult for non-frontier firms, such as SMEs in less digital-intensive sectors (European Commission, 2020<sub>[14]</sub>). This sub-dimension assesses WB6 policies and progress on digitalising government services and transforming businesses through digital technologies.

Overall, the WB6 economies perform moderately in this sub-dimension, although Serbia and Montenegro are moving significantly faster than the other economies (Table 13.3). The assessment indicates that the WB6 perform best in the digital government indicator, as the implementation of public administration reform strategies increases the digitalisation of government systems and the proliferation of e-services. On the other hand, four out of the six economies (i.e., Albania, Bosnia and Herzegovina, Kosovo, and North Macedonia) are performing poorly in private sector ICT adoption, which lowers the overall scores in this dimension. This can be traced back to the absence of programmes to support the digitalisation of companies, on top of legal framework inefficiencies that slow down the adoption of e-commerce and e-business practices.

**Table 13.3. Scores for Sub-dimension 10.2: Use**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 10.2: Use	Digital government	3.5	2.0	2.0	2.5	3.5	3.5	2.8
	Private sector ICT adoption	1.5	1.5	1.5	1.5	2.5	3.5	2.0
<b>Sub-dimension average score</b>		2.5	1.8	1.8	2.0	3.0	3.5	2.4

## ***Digital government is transforming public sector services in the region***

Digital government strategies deal holistically with the incorporation of digital technology and tools into public sector functions, prioritising a “user-driven approach to design develop, deliver and monitor public policies and services centred around people and user needs” (OECD, 2019<sup>[2]</sup>). This assessment measures how policy frameworks promote public sector digitalisation and examines what progress has been achieved in respective legal and regulatory reforms to improve public service delivery, increase people’s engagement, and enhance transparency and accountability.

Albania, Montenegro and Serbia are making headway in digital government, with North Macedonia following closely behind. According to the UN e-Government Survey for 2020, Serbia ranks 58<sup>th</sup> and Albania ranks 59<sup>th</sup> out of 193 nations on the EGDI<sup>5</sup> (e-Government development) composite index, while North Macedonia (72<sup>nd</sup>) and Montenegro (75<sup>th</sup>) are a little further behind. In the same survey, Albania scores the highest in the region on the Online Service Index (OSI) that assesses the e-government portal, followed by Serbia and North Macedonia. Albania also ranks 36<sup>th</sup> in the E-Participation Index (EPI), followed by North Macedonia (38<sup>th</sup>) and Serbia (41<sup>st</sup>).

All the WB6 economies, except Bosnia and Herzegovina, are implementing Public Administration Reform Strategies (PARS) action plans and have improved the alignment of their interoperability frameworks with the European Interoperability Framework (EIF). Albania, Montenegro, North Macedonia and Serbia have achieved advanced implementation of their PARS action plans promoting reforms that aim to transform the government into a user-centric public service through digital technologies. They have improved e-services and the government service bus (i.e., the information system used by public sector institutions to exchange data) that connects to the central electronic population registers. New laws on e-government and e-services have been adopted in Serbia (2018), North Macedonia (2019) and Montenegro (2020), along with relevant secondary legislation. All economies, except Bosnia and Herzegovina, have aligned their e-identification and e-document legislation with the eIDAS Regulation on electronic identification, authentication, and trust services (EU 910/2014). Additional reforms are already planned in their respective PARS action plans for the coming period. Stepping-up as a front-runner in the region, Serbia also adopted the Artificial Intelligence (AI) Strategy in December 2019 and the action plan in June 2020, aiming to investigate the integration of AI technologies in e-government services. Positively, in August 2019, North Macedonia and Serbia signed an agreement on mutual acceptance of electronic documents.

The digitalisation of the public administration in Bosnia and Herzegovina has progressed unevenly, due to its complex governance system. A positive step was the adoption of the Strategic Framework for Public Administration Reform (PAR SF) 2018-2022 by the state and the two entity governments (completed in 2020 with the adoption by the government of the RS). However, the action plan has not yet been adopted at any level, putting implementation on hold. In the meantime, the RS government is implementing its own policy and recently adopted a new e-Government Strategy for 2019-2022, which is not yet budgeted. The Federal Ministry of Justice, at the Federation of Bosnia and Herzegovina (FBiH) entity level, has been tasked with collaborating with the cantons to harmonise legislation for the civil service and to draft a rulebook on internal organisation of the entity’s government. Despite the adoption of the PAR SF, economy-wide implementation of reforms and service digitalisation is hampered by the lack of political ownership and co-ordination among different levels of the government.

Western Balkan governments have established horizontal co-ordination mechanisms for digital government, while Albania (see Box 13.4), Kosovo and Serbia have dedicated public bodies that manage data centres and e-government systems for the public sector. Serbia has recently launched a unique high-capacity data centre in Kragujevac to enable the next revolution in digital government (Box 13.5). Nonetheless, monitoring e-government indicators continues to be weak, although prescribed by the framework, and data is rarely available online.

Albania, Montenegro, North Macedonia and Serbia have created single-sign-on e-government portals and are constantly increasing the number of e-services, though at different levels of sophistication. The development of an e-government portal is still in the initial phase in Kosovo, and it is yet to be implemented in Bosnia and Herzegovina, where e-services are offered only at the entity level in Republika Srpska. These two economies are still a long way from achieving a fully digital government, and the need for increased co-operation and support in building the capacities of public officials for developing and maintaining e-services is still high. Nonetheless, citizens' engagement with e-government services has been boosted during the COVID-19 pandemic and WB6 governments have exploited existing and new e-services to connect with the population under these emergency conditions. But while participation is on the rise, it remains below the CEEC-11 and EU averages (Figure 13.7).

**Figure 13.7. Rate of Internet use when interacting with public authorities (2017-20)**

Note: EU average is for the EU-28 for 2017-19 and EU-27 for 2020. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

#### Box 13.4. Co-ordinating a whole-of-government digital transformation in Albania

The National Agency for Information Society (NAIS) is the core institution in Albania for the digitalisation of the government and its services to citizens, businesses and public sector employees. It is responsible for co-ordinating government work in the information and communication technology (ICT) area and the e-services government portal (e-Albania.al). NAIS promotes new technologies, connecting systems to the Governmental Interoperability Platform, drafts strategies and policy implementation plans for e-Government and the Information Society. It is the co-ordinating regulatory authority, responsible for the state databases and electronic signature services in Albania.

Since 2017, based on the Decision on the Reorganisation of the National Agency for Information Society, the information technology (IT) staff of line ministries and institutions have been placed under the organisational chart of NAIS, although they are physically working in the premises of those institution. Their role is to support the employees of the institutions in their daily IT activities, namely in using the IT systems and tools for public administration and managing the e-services provided by their institution. This close co-ordination mechanism has directly connected centralised NAIS staff to all decentralised IT staff around the country, enabled service standardisation and increased the quality of e-services.

NAIS is primarily state funded and employs more than 330 employees, of which more than 90% are highly skilled technical staff. The main challenge that they face is modernising the legal and regulatory framework and changing public officials' mindsets while they attempt to redesign and reform public administration processes through ICT. The top-level government and high-ranking public officials have been strong supporters of online services and digitalisation. In 2018, NAIS prioritised the list of ICT projects needed to improve the e-government infrastructure in Albania and during 2019, approximately 30 systems were either created or upgraded in collaboration with the respective institutions. By mid-2020, more than 139 institutions have access to the e-Signed Documents Circulation System and 53 institutions are connected to the Government Interoperability Platform. By the end of 2020, 1 021 e-services were available to citizens and businesses through the E-Albania Portal.

### Box 13.5. A high-capacity data centre in Serbia promoting AI in digital government

On 18 December 2020, the Prime Minister of Serbia, Ana Brnabić, inaugurated the State Data Centre in Kragujevac, which represents an infrastructural milestone in e-government and ICT development in Serbia. Serbia is opening a new chapter, making unprecedented data storage and high computing capacities available, in a facility unique to Central and South Eastern Europe. With a capital investment of EUR 30 million for the construction of the state data centre, the government will work with domestic and global partners, from the private sector and academia, to investigate AI integration in digital government and e-services and will support data innovation demonstrating its commitment to improving public administration services in order to simplify the daily lives of citizens and businesses in the digital economy.

The data centre in Kragujevac has a capacity of approximately 1 200 rack rooms distributed across two facilities, with a total footprint of 14 000 square metres and is designed to host mission-critical servers and computer systems. The Office for IT and eGovernment (ITE) has signed MoUs with major global companies and will also make the services of the state data centre available to commercial users, science, and technology parks and start-ups. The ITE will work to establish an AI platform based on high-performance computers and, together with NVIDIA, will develop a special capacity improvement plan for building one of the fastest AI supercomputers in Southeast Europe. NVIDIA has agreed to provide additional support to start-up companies, including training and applied AI knowledge, as well as joint research in order to create additional value.

Source: (Government of the Republic of Serbia, 2020<sup>[22]</sup>), *Construction of State Data Centre in Kragujevac goes as planned*, <https://www.srbija.gov.rs/vest/en/157502/construction-of-state-data-centre-in-kragujevac-goes-as-planned.php>.

### ***Private sector adoption is not well supported in the majority of WB6 economies***

Incorporating digital tools and processes into business practices is essential to increase productivity, access new markets and remain competitive within increasingly digital markets. This section assesses whether a well-designed policy framework to promote private sector ICT adoption is in place and is being implemented in the WB6.

Only two Western Balkan economies, Montenegro and Serbia, have adopted policies to support private sector ICT adoption. Albania, and Kosovo mention firms' digitalisation in their broader policies, such as the Digital Agenda 2020, but no linked programmes or measures are being implemented. North Macedonia, in the absence of an overarching ICT policy, uses the Innovation Strategy and Fund that mainly target start-ups or firms with innovation investment plans. Tax relief schemes for the purchase of ICT equipment and software have been adopted by Kosovo, North Macedonia and Serbia. Despite the significance of a

comprehensive e-commerce framework as a driver for private sector ICT adoption, some of the WB6 governments (like Albania, Bosnia and Herzegovina -excluding the RS entity, and Kosovo) have not yet updated their legal frameworks to support the regulated use of e-commerce and have not designed e-commerce support programmes for SMEs. Republika Srpska amended its e-commerce law in 2016 and created a one-stop-shop e-registration service for businesses, while its Chamber of Commerce offers webinars on e-commerce. Kosovo is implementing an EU-funded IPA II project<sup>6</sup> that aims to reduce the barriers to the practical implementation of e-commerce, like online payment security and discouraging banking sector practices (e.g., fees for international online payment transactions with credit cards) (TEB JSC, 2021<sup>[23]</sup>). The situation is reflected in the share of WB6 enterprises doing e-sales, which is lower than the EU and CEEC-11 averages in all economies, except Serbia (Figure 13.8).

Serbia is the single economy in the region to have achieved notable impact in this domain. The government is supporting e-traders, and helping to reduce the grey economy from e-sales on social media platforms through the Programme for e-Commerce Development. It is also financing consulting services for digitalisation and equipment purchases through the IT Industry Strategy. The Center for Digital Transformation (CDT) was established in 2018 as a service unit for business digitalisation. It is implementing the GIZ<sup>7</sup>-funded MSMEs 2019-2020 Digital Transformation Support Programme, which was intensified during 2020 to address the adverse effect of the COVID-19 pandemic on micro, small and medium-sized enterprises (MSMEs) through two emergency support programs, SPEED 1.0 and 2.0. This programme has supported more than 700 companies so far, in Serbia and the RS in Bosnia and Herzegovina.

**Figure 13.8. Share of enterprises offering online sales (2018-20)**

Note: EU average is EU-28 for 2017-19 and EU-27 for 2020. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: INSTAT (ALB), ASK (KOS), (Eurostat, 2020<sup>[24]</sup>), "E-commerce sales",

[https://ec.europa.eu/eurostat/databrowser/view/isoc\\_ec\\_eseln2/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/isoc_ec_eseln2/default/table?lang=en).

StatLink  <https://doi.org/10.1787/888934254430>

Montenegro, on the other hand, despite adopting the Strategy for the Development of MSMEs 2018-2022, has seen slow progress in promoting business digitalisation and e-commerce. The Ministry of Economy's Programme for Improving the Competitiveness of the Economy includes a special budget line for business digitalisation in 2020 that can finance just over 60 companies. A similar business digitalisation programme in 2018 received only 10 applicants (MEK, 2018<sup>[25]</sup>). This reveals a pattern of limited effectiveness and impact of such programmes, explained by a combination of factors such as low resource allocation, demanding application and project management procedures and misalignment with actual market needs. North Macedonia faced a similar situation with its Support for Digital Transformation in SMEs project, funded by the Ministry of Economy under the Programme for SMEs Competitiveness and implemented by MASIT (the Chamber of Commerce for ICTs), as only 13 companies applied.

### Box 13.6. Towards a digital economy in the Common Regional Market

The following key findings of the CO2021 sub-dimension on use can inform the implementation of the Common Regional Market (CRM) Action Plan 2021-24 actions related to the digital economy in the era of new ICT technologies component:

- The majority of the WB6 economies have improved digital government and e-services development. They have established central e-government portals and are increasing the number of e-services offered to citizens and businesses. They have also improved alignment with the EU Interoperability framework and created e-government systems to exchange data between public sector institutions.
- The majority of the WB6 economies have e-commerce legislation in place, but at least three need to complete these frameworks with regulations and improve e-payment systems.
- Only Montenegro and Serbia have adopted policies that support SMEs' digitalisation. Serbia is the only economy that is implementing a budgeted programme promoting e-commerce, providing financial support, and mentoring for e-traders. On the other hand, Montenegro's SMEs digitalisation programme is having limited impact (like similar projects in other economies during the previous assessment).
- Serbia is the only economy in the region to have adopted an artificial intelligence (AI) strategy to investigate integration of AI in digital government. It has recently established a second state data centre in Kragujevac that will be used to promote AI and high-performance computing (HPC) projects and investments.

### *The way forward for use*

- **Increase resources for government digitalisation and systematise the monitoring of digital government indicators to inform policy making.** All the WB6 economies should continue reforms to create high-quality fully transactional e-services and ensure sufficient funds to implement action plans. Public sector training is particularly important for digital government and should not be neglected in budget allocations. The remaining obstacles to frameworks on e-signatures should be removed in Albania, Bosnia and Herzegovina, Kosovo, and North Macedonia. Bosnia and Herzegovina should also intensify efforts to align with the EU Interoperability Directive (EU) 2016/797 to ensure compatibility of information systems and processes within its territory and with EU Member States.
- **Improve the legal framework for e-commerce and e-business.** While the WB6 economies continue their reforms, Albania, and especially Bosnia and Herzegovina and Kosovo, need to improve their legislation on e-commerce and to reduce bottlenecks in e-payment systems and courier services.
- **Scale up programmes to support SMEs' digitalisation and boost the take up of e-commerce.** The WB6 governments should improve the design of their support programmes and increase budgetary allocations to have a widespread impact on all industry sectors. Chambers of commerce could help assess the type of support needed and propose appropriate financial schemes to make them more attractive to companies (e.g. subsidies for equipment and digitalisation consulting services, tax relief, social security incentives to hire ICT specialists and train staff). The governments could consider the example of Serbia's Center for Digital Transformation (CDT) and MSMEs 2019-2020 Digital Transformation Support Programme or they could review Ireland's successful "Digital Online Trading Voucher" programme (Box 13.7) to design new e-commerce voucher schemes or improve their existing ones.

### Box 13.7. A Digital Online Trading Voucher programme from Ireland

Back in 2014, the Irish government estimated that despite the increasing trend towards online spending, only 23% of small Irish businesses were engaged in any meaningful way in e-commerce sales, and the share was even lower among businesses employing under 10 people. The government recognised the urgency of ensuring that domestic businesses understood that over 70% of e-sales made in Ireland took place in overseas markets and encouraging them and supporting them to adjust to this digital reality. In order to support this goal, the National Digital Strategy, focused on getting more businesses trading online. To this end, the Department of Communications, Climate Action & Environment (DCCAE) launched a Trading Online Voucher Scheme and teamed up with the Local Enterprise Offices (LEO) to deliver this to Irish business. The scheme started with approximately EUR 3 million funding per annum. The scheme is now funded by the Department of Enterprise, Trade and Employment (DETE).

Micro-enterprises in Ireland can get a EUR 2 500 voucher for developing sales on line and access free online training. The vouchers can be used to co-finance up to 50% (initially the scheme offered a 90% funding rate) of costs for third-party services and IT consultation, development or upgrade of an e-commerce website; implementation of online payments or booking systems; purchase of Internet-related software; app development (or multiplatform webpages); development and implementation of a digital marketing strategy; training and skills development specifically to establish and manage an online trading activities; subscription costs to low-cost online retail platform solutions to quickly establish a retailing presence online; purchase of online advertising and purchase of professional photography for e-sales. Following approval of their application, a successful applicant can engage suppliers and, upon completion of the work, submit a request for payment to the LEO in line with the terms and conditions of their voucher.

In the context of COVID-19, the scheme has received unprecedented demand that prompted the government to expand the funding made available to this scheme. By June 2020, the total budget made available reached EUR 20 million, providing approximately 7 700 vouchers in 2020 to small businesses, compared to 1 200 in 2019. At the end of April 2020, the government also launched a EUR 2 million scheme to help retailers in Ireland with a physical store and more than 10 employees to boost their digital presence.

## Jobs (Sub-dimension 10.3)

Economies' preparedness to seize the benefits of a digital world largely depends on the skills of their populations and a comprehensive set of skills-related policies, reflecting the range of policies on digitalisation. Digital technologies profoundly change jobs and the workplace, as well as the skills people need to remain in employment (OECD, 2019<sup>[7]</sup>). This makes lifelong learning critical and calls for policies that provide high-quality education and training for all and ensure that education and training systems are well aligned with labour market needs. It is also essential to promote a dynamic, competitive, and innovative ICT sector to stimulate job growth and encourage adequate labour market flexibility.

Overall, the WB6 economies perform moderately on the jobs sub-dimension (Table 13.4). Although Serbia is making headway in digital skills development and ICT sector support, the assessment indicates that the other five economies are weak in ensuring digital skills align with labour market needs and ICT sector

promotion policies. Despite the cross-cutting recognition of the contribution of the ICT sector to the economy, only Kosovo and Serbia have specific policies in place to support the ICT industry, and only Serbia has put together the right mix of instruments to have an impact.

**Table 13.4. Scores for Sub-dimension 10.3: Jobs**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average

	Digital skills for adults	2.0	1.5	2.5	2.0	2.5	2.5	2.2
	ICT sector promotion	2.0	1.5	2.5	2.0	2.0	3.5	2.3
<b>Sub-dimension average score</b>		2.0	1.7	2.3	2.2	2.5	3.0	2.3

### ***Students' digital skills are hindered by insufficient connectivity and equipment***

Digital skills are a fundamental aspect of the digital economy – it is vital that students leave school with the basic skills needed to navigate digital environments and to innovate in a digital world. The COVID-19 crisis has forced education systems to depend more on ICTs and online teaching methods and forcing Western Balkan governments to respond to the rising demand for technical infrastructure and policies that maximise the effectiveness of online learning (OECD, 2020<sup>[28]</sup>). This section assesses whether a policy framework promoting digital skills for students has been adopted that equips them to benefit from and contribute to the digital economy.

The WB6 have made uneven progress in developing digital skills for students since 2018. While all economies have set-up basic frameworks that recognise digital skills as a key competence, how this is translated into education practice differs significantly. While Montenegro and Serbia are making headway and North Macedonia is not far behind, the other three economies (Albania, Bosnia and Herzegovina, and Kosovo) have not yet made notable progress in digital skills' development and fine-tuning their curricula to labour market needs. Montenegro is the only Western Balkan economy to have adopted a Digital Competence Framework (DCF), effective since September 2020, in alignment with the European DCF. Serbia, on the other hand, is the only economy to have adopted a Digital Skills Strategy (2020-2024), although a budgeted action plan is still pending. The new Education strategy 2025 in North Macedonia and the Higher Education Strategy in Montenegro promote the integration of ICTs and digital teaching material in schools and curricula design tuned to the needs of the labour market. Albania also recognises digital skills as one of seven key competencies in its National Pre-University Curriculum Framework. Kosovo's Strategic Plan for Education (KESP) 2017-2021 promotes the integration of ICTs in schools, but does not directly address digital skills development.

Bosnia and Herzegovina (at the state level) has adopted Guidelines for the Common Core Curricula in BiH. These recognise digital skills as a key competence and will guide digital competences in the economy's education systems until 2030, in accordance with the European DCF. However, due to the complexity of the education governance system in this economy, with 14 line ministries at different levels of the government, harmonisation of digital skills development is highly challenging. Republika Srpska, however, adopted a new framework law on Vocational Education and Training (VET) during 2019 that delineates digital skills development for VET students.

IT subjects are taught in Western Balkan schools from primary to secondary levels, but only Montenegro, North Macedonia and Serbia can claim a coherent approach to digital skills' development across all levels of the education system. Weak technical and human resources in schools still challenge the development of digital skills in the majority of the WB6. The COVID-19 experience has exposed disparities between private and public schools, and urban and rural areas in terms of Internet connectivity speeds, availability of functional computers and portable electronic devices (e.g., laptops and tablets), as well as teachers' digital competency and readiness to employ e-learning technologies.

But the crisis has also propelled developments in this field. For example, since September 2020 North Macedonia has been implementing a massive programme to enhance the digital competencies of 25 000 teachers. Serbia is implementing the Connected Schools project to connect all schools to high-speed Internet through the Serbian Academic Network –AMRES or through WLAN technologies by the end of 2021, and has delivered 10 000 laptops to classrooms. Both economies introduced learning management systems and e-learning platforms into schools, along with software tools, during 2020. The Republika Srpska entity government has provided IT equipment to VET schools and computers to 1 000 primary school students in 20 underdeveloped municipalities. Kosovo provided EUR 160 000 worth of equipment to schools in 12 municipalities and is developing a data centre for Education and Research and a platform for videoconferencing.

Despite efforts to improve technical resources, schools' connectivity to the Internet remains low in Bosnia and Herzegovina, Kosovo and Albania (in Albania, only 25% of schools have access to the Internet). On a positive note, all schools in Montenegro have access to the Internet and the computer-to-student ratio (1:10) is the highest in the region and approaching the EU average (1:7). In Serbia, 92% of schools are connected with broadband speeds above 10Mbps, while the figures in North Macedonia are 80.7% of primary and 93.6% of secondary schools. In Republika Srpska, the computer-to-student ratio is higher in primary schools (1:5) than in secondary schools (1:14), and while 100% of high schools are connected, only 14% of remotely located primary schools have access to the Internet. However, rural broadband development programmes in the WB6 promise to connect every school with broadband Internet in the next two or three years.

In general, monitoring indicators on digital skills for students are not well systematised in the WB6 and data are not regularly published on online databases. Montenegro is the only economy that conducts external evaluations of the teaching process and progress towards digital skills development, and coordinates follow-up activities (including teacher training, modernisation of equipment and methods, preparation of digital textbooks, etc.).

### ***The adult digital skills gap persists, constraining the rise of the digital economy***

The OECD estimates that 14% of jobs (on average across OECD member countries) face a high risk of being automated and as many as 32% of jobs are expected to undergo substantial changes in the digital age. Governments must help individuals develop the right skills through an effective lifelong learning system; one that quickly responds to labour market needs (OECD, 2019<sup>[7]</sup>). This section assesses whether a framework promoting digital skills for adults is in place to help workers adapt to shifting skills' needs and evolving work environments.

Kosovo, Montenegro and Serbia are intensifying efforts in this domain. Serbia is developing a strong framework for adults (workers and marginalised groups), with its Digital Skills Strategy starting in 2021. Although local coalitions for digital skills are not yet in place to ensure stakeholder participation in curricula development, Sector Skills Councils were established in 2018 to reduce skills mismatches. The National Employment Service launched an IT requalification programme that offers specialist IT training for 778 participants in various cities in Serbia during 2018. The government also adopted the Programme for Enhancing Women in ICT 2019-2020 to increase digital and online entrepreneurship competencies for women in rural areas.

Montenegro has adopted an Adult Education Plan 2019-2022 and a VET strategy to 2021, allocating around EUR 8 million for implementing the strategy (including a EUR 6 million loan from the European Investment Bank). In Kosovo, while the education policy (KESP 2017-2021) makes no specific reference to digital skills, the Employment Agency manages eight Vocational Training Centres (VTC) in seven regions that offer ICT training to the unemployed. It is currently implementing a EUR 3 million IPA 2017 project to train 1 500 men and women in advanced programming skills and to assess their follow-up employability in the local ICT market. The government is also implementing the Youth Online and Upward

(YOU) Programme under the Kosovo Digital Economy (KODE) project, to train 2 000 young people in digital and soft skills.

Progress is slower in Albania, Bosnia and Herzegovina, and North Macedonia. In Albania, digital skills are not prioritised in the Employment and Skills Strategy 2019–2022 or the ongoing VET system reform based on a law from 2017. In North Macedonia, the implementation of the Education Strategy 2018-2025 is not sufficiently co-ordinated with industry stakeholders. Nonetheless, the Adult Education Centre and the Employment Agency offer IT programmes, such as one for unemployed young people that covers both introductory and advanced IT training. In Bosnia and Herzegovina there is no economy-wide framework for digital skills for adults; in the RS entity, 100 unemployed university graduates attended the first IT adult training programme in 2019. The Bit Alliance (the Association of ICT companies) maintains a portal aggregating IT education providers and organises the CoderDojo Free Programming School, (already implemented in 11 cities in Bosnia and Herzegovina).

Recently, under the pressure created during the COVID-19 pandemic, the use of distance learning platforms has been incorporated in some adult training programmes. Companies in the WB6 economies are increasingly providing training opportunities to their employees. According to the European Training Foundation, 67.5% of IT companies in Bosnia and Herzegovina rely on in-house training and 9% of IT companies are providing various adult training courses (ETF, 2019<sup>[29]</sup>). According to Eurostat, 16% of enterprises from all sectors in Bosnia and Herzegovina provided ICT training to upskill their employees in 2019, which is similar to the CEEC-11 average (17%), while the respective share of enterprises in Serbia (29%) and Montenegro (24%) exceeded both the CEEC-11 and the EU (20%) average (Figure 13.9).

**Figure 13.9. Share of enterprises training their staff in ICT skills (2018-20)**

Note: Data for Albania and Kosovo are unavailable. EU average is EU-28 for 2017-19 and EU-27 for 2020. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia

Source: Eurostat (2020<sup>[30]</sup>), "Enterprises that provided training to develop/upgrade ICT skills of their personnel", [https://ec.europa.eu/eurostat/databrowser/view/isoc\\_ske\\_itn2/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/isoc_ske_itn2/default/table?lang=en).

StatLink  <https://doi.org/10.1787/888934254449>

However, the mismatch between the skills provided by the education and training systems and those needed by the labour market continues to reduce the impact of WB digitalisation policies. There is insufficient co-operation with industry stakeholders on curricula design (particularly in terms of learning outcomes), except for Serbia, where specific measures are planned to improve it (e.g. the planned establishment of local coalitions for digital skills and the existing Sector Skills Councils). In Kosovo, the ICT Industry Association STIKK has repeatedly signalled the poor quality of digital competencies and IT skills acquired through the education system, as well as the deficit of skilled workers in 83% of companies (STIKK, 2019<sup>[31]</sup>). Industry stakeholders in North Macedonia and Montenegro paint a similar picture. Finally, quality control of adult education remains insufficient, while statistical data, evidence and analysis on adult education are relatively weak.

### ***ICT sector support is not effective***

The ICT sector in North Macedonia, Montenegro and Serbia accounted for 4-5% of GDP in 2017. Despite this relatively small share, it is increasing, and could make a relatively large contribution to growth and productivity performance by growing more rapidly than the rest of the economy. The OECD estimates that 42% of all jobs created between 2006 and 2016 across the OECD were in highly digital-intensive sectors (OECD, 2019<sup>[2]</sup>). This section measures whether a coherent framework to promote the ICT sector exists and to what extent it is implemented and evaluated.

Only Kosovo and Serbia have dedicated policies or programmes to directly support the growth of the ICT sector. The ICT sector in Serbia enjoys constant export growth and salaries more than twice as high as any other sector. In clear recognition of its contribution to the economy, the Serbian Government has provided sufficient resources and high-level co-ordination by the Office of the Prime Minister to implement the IT Industry Strategy 2020 and is currently preparing a follow up strategy. Kosovo has also adopted an IT Strategy 2020. However, its implementation has been slowed down by limited financial resources and low prioritisation. The Innovation Centre Kosovo (ICK) was established back in 2012 to support entrepreneurship, innovation and commercial business development with a focus on ICT start-ups, leveraging financial support from the Norwegian and Swedish governments. During the period 2018-19, the ICK financed 220 companies with a total of EUR 1.8 million. Positively, 61% of IT companies in Kosovo work in international markets.

Montenegro has adopted the first Smart Specialisation Strategy (S3) in the region, which highlights ICT as a cross-cutting priority and includes the flagship initiative Digital Montenegro, promoting digitalisation of businesses and ICT-related innovation. However, the Montenegrin ICT Association at the Chamber of Commerce points out that the ICT sector has not been supported to underpin this ambitious initiative and suffers from the absence of a dedicated government institution to refer to, since three line ministries implement digitalisation policies. In North Macedonia, the COVID-19 crisis has further postponed the preparation of an economy-wide ICT strategy. In Bosnia and Herzegovina, the Bit Alliance (association of ICT companies) takes initiatives and implements projects to strengthen the IT industry in the absence of relevant government initiatives. The Bit Alliance has adopted the IT Manifesto as a model strategy for the development of the IT industry. This defines the three most significant pillars for the further development of the industry as education, legislation and the economy, in line with the EU 2020 Strategy (Bit Alliance, 2019<sup>[32]</sup>).

Positively, ICT sector companies in Albania, Kosovo, and Serbia benefit from tax relief (e.g., profit tax rate reduced to 5% in Albania, and VAT reduced to 8% for ICTs in Kosovo). Also, in all WB6 economies, except Bosnia and Herzegovina, the ICT industry benefits from horizontal co-funded programmes for the industry, such as competitiveness or innovation funds, start-up support (e.g., through incubators, hubs, and tech-parks) and research and development grants. The communications subsector is also indirectly supported through broadband development programmes in these five economies. But support to the IT subsector is not sufficient to underpin the economies' agendas for digital transformation.

Western Balkan industry stakeholders consulted for this assessment report that finding or training highly skilled ICT professionals is difficult and retaining them is even harder, since brain drain heavily affects this industry. Tax incentives and social security relief have not been provided to help retain talent. In most WB6 economies, IT companies suffer from limited access to finance and are not sufficiently specialised or differentiated in terms of technologies, target industries (vertical specialisation) and specific functional areas (horizontal specialisation), which limits their competitiveness.

### Box 13.8. Towards a regional skills and competence framework in the Common Regional Market

The following key findings from the CO2021 jobs sub-dimension can inform implementation of the Common Regional Market Action Plan 2021-24 actions related to the digital skills and competences component:

- Only Serbia has adopted a Digital Skills Strategy and implementation is starting in 2021. The other WB economies include references to digital skills in education sector strategies, but mainly focus on ICT integration in education systems.
- Only Serbia and North Macedonia have introduced Learning Management Systems that include a platform for e-learning, software tools for students and teachers and learning resources. All economies introduced some e-learning platforms in education and training systems during 2020, as an emergency response to the COVID-19 crisis, but the creation of digital content is not adequately systematised in the region.

### *The way forward for jobs*

- **Adopt a common digital competence (CDC) framework for students and a CDC framework for ICT professionals and involve the ICT industry in curriculum design to reduce the skills gap.** WB6 governments should prioritise measures to empower citizens, equip students and up-skill workers with the digital skills necessary for seizing the opportunities and reaping the benefits of digital transformation. Gradual transition from basic to advanced skills should be carefully designed for the education system. Closer co-operation with ICT industry stakeholders should be embedded into curricula design, especially for VET education and training and life-long learning programmes. WB6 governments can benefit significantly from regional initiatives on digital upskilling (Box 13.9).
- **Design dedicated policies and programmes to help the ICT industry grow and in turn boost the digitalisation of the economy.** WB6 governments need to invest in empowering the domestic ICT industry to find, train and retain talent through favourable social security or taxation regimes. The industry also needs support to strengthen exports and technology transfer and to gradually re-brand the domestic ICT industry from an outsourcing destination to an innovation hub. Serbia's positive example could be followed, focusing on IT industry promotion policies that align with the digital agenda in each economy.

### Box 13.9. A regional working group on digital upskilling in the Western Balkans

According to the Regional Cooperation Council (RCC), the Western Balkan Digital Economy and Society Index (DESI) for 2019 shows that while around 80% of the citizens are active Internet users (at least once a week), approaching the EU average (85%), knowledge of basic digital skills in the WB6 remains below the EU average (58%) for all economies except Serbia (67%), ranging from 50% in Montenegro to 32% in Kosovo.

In an attempt to close the digital skills gap in the Western Balkan economies, the RCC created a Regional Working Group (RWG) on Digital Skills to open a regional dialogue on the challenges of digitalisation, upskilling and digital literacy. The newly established RWG is tasked to support economies to develop digital skills strategies and to regularly review the needs and challenges in implementing them. The first RWG meeting was held in April 2020 and was attended by representatives of Western Balkan governments, agencies, academia, and the European Commission, as well as representatives from international organisations dealing with digital skills.

Source: (RCC, 2020<sup>[33]</sup>), *RCC initiates regional working group on digital upskilling in the Western Balkans*, <https://www.rcc.int/news/620/rcc-initiates-regional-working-group-on-digital-upskilling-in-the-western-balkans>.

## Society (Sub-dimension 10.4)

The EU's digital strategy encourages the development of “technology that works for the people”, meaning that the digital transition should put people first and make a real difference to their lives, by creating opportunities for all (European Commission, 2020<sup>[14]</sup>). As digitalisation increases, it becomes increasingly important that governments find the right policy mix to reduce the use gap between those with high versus low education levels, and empower everyone with skills to thrive and trust in a digital world (OECD, 2019<sup>[2]</sup>).

Overall, only two economies, Serbia and Albania, have improved their performance on the society sub-dimension since 2018 (previously assessed as e-inclusion) (Table 13.5). Some of the other four economies have made small improvements in their frameworks but have not advanced their enforcement and implementation significantly.

**Table 13.5. Scores for Sub-dimension 10.4: Society**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 10.4: Society	Digital inclusion	2.5	1.5	1.5	1.5	2.0	3.5	2.1
<b>Sub-dimension average score</b>		2.5	1.5	1.5	1.5	2.0	3.5	2.1

### ***Digital inclusion is not systematically reviewed***

Digital transformation promises benefits and opportunities, but also creates inclusiveness challenges. Governments need to put together policies to reduce digital divides and include everyone in the digital society – notably women, the elderly, low-income individuals, remotely located communities and marginalised groups. This section assesses if policies are being implemented to achieve digital inclusion, and how progress is being monitored to inform policy design and programme adjustments.

Digital agendas and information society policies implemented in the WB6 build on digital inclusion principles. The rural broadband development programmes recently launched in five WB economies, except Bosna and Herzegovina, promise to connect every household with high-speed Internet, ensuring inclusive access in terms of network availability. The WB6 are also deploying, though at varying speeds, public administration digitalisation and e-government services to gradually replace over-the-counter services. Albania, Montenegro, North Macedonia and Serbia are implementing e-government service bus systems

that enable data exchanges between public sector bodies and e-services without document collection by citizens. In this process, governments and public authorities need to ensure that nobody is left behind. Notably, Albania provides assistance to all those who are unable to apply online for e-services from trained employees at local Post Offices or ADISA<sup>8</sup> counters. Serbia has planned specific regulations for digital inclusion under its education reform, such as the regulation for Resource Centres for Assistive Technologies (supporting schools in inclusive education) and the instructions for the development of teaching materials in line with universal design principles to ensure accessibility, inclusiveness and usability of materials for teachers and students by accommodating gender, race, ethnicity, age, stature, disability and learning preference.

E-consultation portals for legislative and policy proposals have been created and are gradually being used in all WB6 economies to enable inclusive decision-making processes through digital technologies. Albania and Serbia, and Kosovo and North Macedonia to a lesser degree, are creating registries and Multi-user Information Systems (MIS) for social services (e.g., economic aid and disability payments, registries of persons with disabilities and other marginalised groups, registries for domestic violence, etc.).

Obligations for the web presentation of public sector bodies in line with international e-accessibility standards were enacted in 2018 in North Macedonia and Serbia, and in 2019 in Albania, with some evidence of practical implementation. Montenegro updated its framework in 2020 with a new Rulebook on e-Accessibility standards, which includes e-accessibility requirements for ICT products and services – the first in the WB6. Kosovo has not yet adopted e-accessibility standards for public bodies' websites and Bosnia and Herzegovina has an outdated state law from 2009 that was never enforced.

The WB6 are implementing some projects to improve digital inclusion for marginalised groups. Serbia is implementing the Programme for Enhancing Women in ICT (in rural areas), as well as donor-funded projects in the field of online safety, protection from digital violence and support to increase digital literacy among vulnerable groups of the population.<sup>9</sup> Donor-funded or civil society projects for women in the digital economy are also available in Bosnia and Herzegovina, Kosovo and North Macedonia, where the Innovation Fund also provides grants for companies that minimise social exclusion through technological solutions. The Ministry of Justice and Human and Minority Rights in Montenegro has provided free training and certification testing for the Roma population, campaigns for persons with disabilities, etc. Positively, the number of households that does not access the Internet due to lack of skills is decreasing across the WB6 (Figure 13.10). In Serbia and Kosovo, the share of total households with no Internet skills was 2% in 2019, lower than the EU average (4%). Lack of Internet access at home due to the high cost of access has also been steadily decreasing in the WB6. In 2019, the share of households without internet access due to high costs was close to the EU average (2%) in all economies, except Montenegro, where it was estimated around 8% (Figure 13.11).

Serbia is the only economy that provides strong co-ordination for implementing the digital inclusion framework at the highest level and across government bodies, through the Social Inclusion and Poverty Reduction Unit (SIPRU). The SIPRU publishes a Report on Digital Inclusion every four years, but despite their efforts, monitoring is insufficiently systematised and is dispersed across government bodies implementing respective programmes, which is also the case in all WB6 economies.

### The way forward for society

- **Adopt accessibility requirements in public procurement procedures for ICT products and services.** Bosnia and Herzegovina and Kosovo need to adopt and enforce e-accessibility requirements, while all WB6 economies except Montenegro need to complete their frameworks to include accessibility requirements in public procurement for ICT products and services and to create corresponding certification schemes. WB governments could consider how the Swedish government is approaching the implementation of ICT accessibility standards in public procurement (Box 13.10).
- **Systematise indicator monitoring for digital inclusion.** Western Balkan governments should create a dedicated public sector body to oversee, co-ordinate and monitor the various activities on digital inclusion, following the model of the Social Inclusion and

Poverty Reduction Unit (SIPRU) in Serbia. All WB6 governments need to create public databases that provide access to regularly collected data and analysis of digital inclusion.

### Box 13.10. Working for digital inclusion in procurement in Sweden

The COVID-19 crisis has tested our societies' response to implementing digital accessibility of public goods and services. It has highlighted how people with disabilities could have been so much more included in education, work, healthcare and making everyday life work, if governments had improved their use of tools for accessibility in public procurement of ICT. According to G3ict's DARE Index 2020, only 46% of 105 countries surveyed are in the process of implementing policies on accessibility of ICT products and services in public procurement.

In January 2021, about 100 individuals from the public sector, disability rights organisations and industry joined a roundtable on digital accessibility and universal design in procurement organised by The Swedish Disability Rights Federation, G3ict, Microsoft, and the European Disability Forum, to discuss sustainable strategies to systematically include digital accessibility in all procurement procedures.

Accessibility requirements are mandatory in the Swedish Public Procurement Act, implemented after receiving a special recommendation from the UN in 2014 to systematically set requirements for accessibility in all agreements on public procurement. The Swedish national procurement strategy emphasises universal design and accessibility, but many organisations still find it difficult to specify accessibility requirements in procurement of ICT products and services, among others. For this reason the Swedish Public Procurement Agency provides tools and support for the whole procurement process, including how to follow up accessibility requirements. They also welcome questions via their online forum where they answer questions on how to apply standards like the EN 301 549 accessibility standard developed to support EC rules that add accessibility criteria to the public procurement of ICT products and services and the EN 17161:2019 standard on accessibility following a Design for All approach in products, goods and services.

Note: Sweden transposed the EU Procurement Directive (2014/24/EU) on 1st January 2017, which requires that the requirements defined in other EU Acts, such as the Web Accessibility Directive (EU 2016/2102) or the European Accessibility Act (EEA) ((EU) 2019/882) on the accessibility requirements for products and services, are used in public procurement procedures. Member states need to comply with the EEA by 28 June 2022 and complete its implementation by 2025.

Make Digital Inclusion in Procurement a Habit in Sweden*, <https://g3ict.org/blogs/time-to-act-make-digital-inclusion-in-procurement-a-habit-in-sweden>.

## Trust (Sub-dimension 10.5)

Trust in the digital economy and society is critical for reaping the benefits of digitalisation. The COVID-19 crisis has demonstrated the importance of digital technologies for business continuity, both in the public and the private sector. It has also moved more consumers online and challenged the balance between data protection rights and public health protection. Digital infrastructures had to be rapidly scaled-up and processes had to be adjusted, creating opportunities that malicious actors leverage for their purposes. Thus, increased e-commerce activity has come with more reports of unfair, misleading and fraudulent commercial practices online, making the elderly and low-income consumers more vulnerable (OECD, 2020<sup>[38]</sup>). Under these circumstances, preparedness is key and there is a need for proactive policies to ensure trust and improve digital security (OECD, 2020<sup>[39]</sup>).

Overall, WB6 economies perform moderately on the trust sub-dimension (Table 13.6). All six economies have at least some relevant policies and a basic legal framework being implemented. However, lower scores in this assessment than in 2018 indicate that some economies need to improve their alignment with EU and international frameworks and ensure their implementation to address today's challenges in terms of data and privacy protection, online consumer protection and digital security. The majority of WB6 governments have not allocated sufficient resources for implementing existing frameworks, and more importantly they have not implemented awareness-raising campaigns to help citizens and business understand the risks and how to manage them.

**Table 13.6. Scores for Sub-dimension 10.5: Trust**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 10.5: Trust	Privacy protections	2.5	2.0	2.0	2.5	2.0	2.5	2.3
	Consumer protection in e-commerce	2.0	1.5	2.5	2.0	2.0	2.5	2.1
	Digital security risk management	2.0	1.5	2.0	2.0	3.0	3.0	2.3
<b>Sub-dimension average score</b>		2.2	1.7	2.2	2.2	2.3	2.7	2.2

### ***Privacy and data protection frameworks are not sufficiently enforced***

The growing volume of personal data collected, analysed and exchanged has created new risks to people's privacy that call for comprehensive and agile policy and regulatory frameworks on data and privacy protections. This section assesses whether the policy and regulatory framework for data protection and privacy is in place and examines if competent authorities have the resources to implement it.

All WB6 economies have personal data protection (PDP) frameworks in place, but the majority have not improved their enforcement significantly since 2018. The assessment suggests that the WB6 economies have not sufficiently instilled a culture of data privacy and access-to-information mindsets in the public sector. Only three economies in the region have updated their existing PDP frameworks to align with the General Data Protection Regulation (EU 2016/679): Serbia in 2018, Kosovo in 2019 and North Macedonia in 2020. Albania and Montenegro have started preparations for a new law, while Bosnia and Herzegovina drafted a new PDP law in 2018, but has not adopted it yet. The government of the RS is preparing a law on information security that will also cover digital privacy issues at the entity level.

However, even in the three most advanced economies, the main difference between the GDPR and the new PDP legislation lies in the the penal policy, which remains mild in comparison to the stringent penal policy and extremely high fines introduced by the GDPR. The new PDP law in Serbia (applied in the second half of 2019) and the secondary legislation adopted in the course of 2019 and 2020 are in line with the principles and rules envisaged by the GDPR. However, the new law does not cover rules on video surveillance and processing of biometric data, which are important aspects of data processing (RCC, 2020<sub>[40]</sub>). Sectoral or special laws and regulations governing data processing activities in Serbia require harmonisation with the new PDP law. In Kosovo, by-laws deriving from the new law (such as allowing fines to be imposed) and sub-normative acts for certification criteria and procedures for data controllers and processors, are pending. North Macedonia's new law will only come into force in August 2021, after an 18-month transition period. The new law is aligned with the GDPR, but further harmonisation of existing special or sectoral legislation is required.

Serbia has partially aligned its new PDP law with the EU Police Directive (EU 2016/680) on the protection of natural persons with regard to the automatic processing of personal data by competent authorities. It is also the only WB economy to have ratified the 2018 Council of Europe (CoE) Protocol amending the Convention for the Protection of Individuals with regard to Automatic Processing of Personal Data (CETS No.223).<sup>10</sup> Bosnia and Herzegovina and North Macedonia have signed the protocol, and Albania is preparing relevant legislation.

All WB6 economies face difficulties enforcing their existing PDP frameworks. The competent authorities (PDP agencies or commissioners) for supervising enforcement and implementing compliance inspections lack staff and resources for internal training and public sector capacity building. In Albania, Kosovo, Montenegro and Serbia, the responsibilities of these authorities extend to supervising the framework for access to public information. The assessment shows that the majority of public officials are not prepared to fully respect the right to access public information. In some cases, the lack of political commitment exacerbates the situation. In Kosovo, for example, a PDP Commissioner has not been appointed for more than three years, which means that there is practically no institutional mechanism in place to perform inspections. In Serbia, the Commissioner's annual report was considered by the National Assembly in 2018, for the first time since 2014. Certain conclusions to strengthen the enforcement of the framework were adopted, although are yet to be implemented.

The COVID-19 crisis has further exposed challenges of limited awareness of PDP rights and obligations, with authorities struggling to find the right balance between health protections and respecting the confidentiality of personal health data and the right to the private life of citizens. For example, measures on personal data disclosure taken by public institutions in Montenegro to address the COVID-19 pandemic have raised questions by civil society organisations on disproportionality (AZLP, 2020<sup>[41]</sup>). In this context, the Information and Data Protection (IDP) Commissioner in Albania strengthened the personal data protection framework by adopting three guidelines in 2020.

### ***Consumers have limited opportunities to learn about their rights in e-commerce***

The absence of direct contact in online commerce makes a predictable and trustworthy e-commerce marketplace all the more important. In this context, the role of consumer protection authorities becomes essential and creates a need to strengthen policies and capacities for consumer protection in e-commerce (OECD, 2016<sup>[42]</sup>). This section assesses if policies or programmes are in place and whether they adequately educate online consumers on their rights and how to exercise them.

The majority of the WB6 economies have not sufficiently updated their frameworks to promote consumer protection in e-commerce. Serbia is the only economy that has demonstrated commitment to improve the alignment of its consumer protection framework with international practices and to prioritise consumer awareness. The UNCTAD B2C e-Commerce Index 2020<sup>11</sup> includes Serbia, North Macedonia and Bosnia and Herzegovina in the top-10 transition economies. Serbia ranks 43<sup>rd</sup> out of 152 economies (excluding Kosovo), followed by North Macedonia (52<sup>nd</sup>), Bosnia and Herzegovina (70<sup>th</sup>), Montenegro (78<sup>th</sup>) and Albania (86<sup>th</sup>) (UNCTAD, 2020<sup>[43]</sup>).

All WB economies (except Bosnia and Herzegovina) have adopted policies or programmes for consumer protection that include some measures for e-commerce, but implementation is slow. The laws on consumer protection have been updated to increase alignment with the EU Directive on consumer rights (2011/83/EU) in Albania (2013), Kosovo (2018), Montenegro (2019) and Serbia (2018), as well as in the RS in Bosnia and Herzegovina (2017). Albanian legislation is being updated to reduce the cost of shipping and to transpose the EU regulation on cross-border parcel delivery services (2018/644/EU), which is expected around June 2021. Montenegro is also working on subsequent secondary legislation and two relevant regulations were adopted in 2020. On the other hand, although North Macedonia prepared a new draft of the Law on Consumer Protection in 2019, it has not been adopted. Legislation at the state level in Bosnia and Herzegovina is outdated, and the government of the FBiH has not yet adopted a relevant framework. E-commerce legislation is in place in all WB6 economies and in line with the e-Commerce Directive (2000/31/EC). However, only North Macedonia, Serbia and the RS have updated their legislation since 2017 to further improve their alignment with the EU *acquis*.

All the WB6 economies apart from Bosnia and Herzegovina have tasked their consumer protection authorities with enforcing the framework and monitoring consumer protection in e-commerce, but data collection is poor. The consumer protection authorities in the five economies publish monitoring reports,

but few include information on e-commerce complaints, either because data are insufficiently monitored or because complaints on e-commerce are infrequent. Positively, the Ministry of Trade and Industry in Kosovo published a report in 2020 that includes data on online shopping complaints. The situation is different in Bosnia and Herzegovina, where the Ombudsman for Consumer Protection and Market Surveillance Agency of Bosnia and Herzegovina operates under the consumer protection law of 2006, which does not address e-commerce transactions.

WB6 citizens' online shopping culture is changing and trust is increasing with gradual improvement of e-payment systems, but e-commerce is still low in the region compared to the EU average. In 2019, the share of the population that had made Internet purchases in the previous 12 months was 34% in Serbia, 30% in Kosovo, 29% in North Macedonia, 23% in Bosnia and Herzegovina, 16% in Montenegro and 7% in Albania. All of these are much lower than the EU average of 63% (Eurostat, 2021<sup>[44]</sup>). WB6 governments provide limited opportunities for consumer education in e-commerce. Although their frameworks foresee awareness-raising activities, resources to implement them are limited. Serbia is an exception, launching a good practice initiative that could be replicated in the region (Box 13.11).

### Box 13.11. Promoting trust in e-commerce and online consumer education in Serbia

Serbia has demonstrated commitment to improving consumer protection in e-commerce through its Strategy for Consumer Protection for 2019-2024 and Programme for the Development of e-Commerce (2019-2020). These aim to address obstacles to e-commerce growth (e.g., strengthening consumer confidence in online shopping, empowering e-traders, improving logistics flows, promoting electronic payment, etc.).

A platform for e-commerce, the *'Smart and Safe'* platform, has been created offering information and web services for consumers on a dedicated portal hosted by the Ministry of Trade, Tourism and Telecommunications (MTTT). A public awareness campaign was also implemented to boost consumers' trust in e-commerce, promoting e-banking and card payments. The platform includes a guide for consumers in e-commerce and tips for e-traders (<https://pametnoibezbedno.gov.rs/elektronska-trgovina>) and the "eShop fast, easy and simple" video campaign (<https://pametnoibezbedno.gov.rs/video/4>).

Serbia has also leveraged donor funding to build public sector capacities for consumer protection. An example is the twinning project Further Development of Consumer Protection in Serbia, jointly funded by the EU and the Republic of Serbia to the tune of EUR 1.425 million, and implemented from 2017 to 2019. The project supported the transfer of expertise on consumer protection from the Ministry of the National Development of the Republic of Hungary and the Regional Development Agency Senec-Pezinok of Slovakia.

## **Digital security risk management is slowly coming into line with the EU cybersecurity framework**

Digital security threats are growing in number and sophistication, pushing governments to adopt digital security risk management policies that strengthen digital security and ensure that all stakeholders understand the risks and how to manage them (OECD, 2015<sup>[47]</sup>). This section examines whether the WB6 have established comprehensive cybersecurity strategies and allocated sufficient resources to protect critical infrastructure and sensitive data.

All WB6 economies have ratified the CoE Convention on Cybercrime (CETS No.185) and all, apart from Bosnia and Herzegovina, have a cybersecurity strategy in place and are implementing it. However, Kosovo has not updated its strategy beyond 2019 and North Macedonia has not fully budgeted its action plan since 2018. Republika Srpska (RS) in Bosnia and Herzegovina is preparing a cybersecurity strategy at the entity level. Kosovo, Montenegro, North Macedonia and Serbia have each established a dedicated cybersecurity council or body to provide cross-cutting co-ordination for implementing the strategy and overall data collection. However, relevant reports are not publicly available in any economy. Overall, monitoring of digital security and risk management awareness activities among public and private sector stakeholders are weak in the WB6, which is reflected in the low share of enterprises that have created an ICT security policy in the last two years (Figure 13.12).

**Figure 13.12. Enterprises that have defined or reviewed their ICT security policy in the last 24 months (2015 and 2019)**

Note: No data are available for Albania and Kosovo. EU includes all EU Member States in the 2013-20 period. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Eurostat, 2019<sup>[48]</sup>), "Security policy: measures, risks and staff awareness",

[https://ec.europa.eu/eurostat/databrowser/view/isoc\\_cisce\\_ra/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/isoc_cisce_ra/default/table?lang=en)

StatLink  <https://doi.org/10.1787/888934254506>

The majority of WB6 economies have made progress in aligning with the eIDAS Regulation on electronic identification, authentication, and trust services (EU 910/2014). Serbia adopted a new law on e-identification and trusted services in 2017 and has completed the regulations needed for full alignment with the eIDAS Regulation. North Macedonia and Montenegro adopted new legislation in 2019 and Kosovo followed in 2020, but subsequent regulations in the economy are still pending. Albania adopted a new law in 2015, but full transposition of eIDAS is planned in 2021. Relevant legislation in Bosnia and Herzegovina is based on an outdated e-signature law from 2006 that was never implemented. However, in October 2019, the Office for the Supervision and Accreditation of Certifiers in Bosnia and Herzegovina registered the first trust service provider to introduce qualified electronic signatures in the economy. In the Republika Srpska, updated legislation on eID is already being implemented and relevant bylaws are in place.

The WB6 economies are also in the process of aligning their laws with the Network and Information Security (NIS) Directive on security of network and information systems (EU 2016/1148). New laws on information security or cyber security have been adopted in Albania, Montenegro, North Macedonia and Serbia, although each economy has a different harmonisation pathway for completing the alignment. Kosovo is also preparing a relevant new law. In Bosnia and Herzegovina, the state government is planning to draft relevant legislation, while the entity government in Republika Srpska is already preparing a new Law on Information Security in line with the NIS Directive, to replace the existing law from 2011. Since 2018, Albania, Kosovo, Montenegro and Serbia have all adopted legislation identifying critical infrastructure, further improving their alignment with the EU framework.

The WB6 have established economy-wide computer emergency response teams (CERTs), in line with the NIS Directive, though most are significantly understaffed and only marginally operational. In Kosovo and North Macedonia they are operating with only two staff members each. Montenegro's CIRT.ME, Albania's AL-CSIRT (an integral part of the National Authority on Electronic Certification and Cyber Security; AKCESK) and the Serbian NCERT have recently increased their staff to six or seven employees. Bosnia and Herzegovina has not established a CERT at the state level, but an entity-level CERT is operating in the RS. The WB6, except Serbia, have not made satisfactory progress in creating additional public and private computer security incident response teams (CSIRTs). In Serbia, in contrast, 13 additional special CERTs have been created. In most WB6 economies, CERTs depend significantly on donor-funded projects for capacity building and international co-operation, which is critical in this line of activity, although Serbia is stronger than the other economies in technology transfer and tools for digital security risk management. Positively, Albania (AL-CSIRT), Kosovo (KOS-CERT) and North Macedonia (MKD-CIRT) have signed an MoU on co-operation, which is a step towards implementing the CRM Action Plan (Box 13.12).

### Box 13.12. Towards a common regional approach to digital trust and security

The following key findings of the CO2021 sub-dimension on trust can inform implementation of the Common Regional Market (CRM) Action Plan 2021-24 actions on the CRM trust and security component:

- Three WB economies (Kosovo, North Macedonia and Serbia) have aligned their frameworks on data protection with the EU GDPR (EU 2016/679) and the other three WB economies (Albania, Bosnia and Herzegovina, and Montenegro) are preparing to follow, but in most cases secondary legislation and full harmonisation are pending.
- Competent authorities for data protection and privacy in the majority of the WB6 have limited human resources and power to supervise and enforce the frameworks.
- The WB6 economies (except Bosnia and Herzegovina) have a cybersecurity strategy and legislation in place and are gradually aligning with the NIS Directive (EU 2016/1148). These five economies have established an economy-wide CERT team for incident response. However, budgetary allocations for action plans and CERT technical and human resources are limited in the majority of WB economies.
- The majority of WB governments have updated legislation on e-identification to align with the eIDAS Regulation (EU 910/2014), but further work is needed in some WB economies to complete the alignment, adopt regulations and improve implementation of e-signature schemes. Mutual recognition of e-identification schemes across the region has not been promoted.

### *The way forward for trust*

- **Complete alignment with the EU General Data Protection Regulation and ensure stronger enforcement of the framework.** Albania, Bosnia and Herzegovina, and Montenegro need to accelerate the adoption of new legislation on data protection and privacy, aligning with the GDPR (EU 2016/679). Kosovo, North Macedonia and Serbia should prioritise the harmonisation of sectoral legislation and improve regulatory compliance to complete alignment with the GDPR. All WB6 economies need to ensure that authorities supervising implementation of the data protection and access to public information framework have sufficient human and financial resources to fulfil their enhanced responsibilities. WB governments also need to guarantee the authorities' executive power and capacity to enforce compliance by public and private sector entities. An adequate

budget is also vital to build the capacity of public officials to cultivate a new data privacy and transparency culture.

- **Complete the framework on consumer protection in e-commerce and provide opportunities for consumers to learn about their rights and how to exercise them.** Bosnia and Herzegovina and North Macedonia need to accelerate the adoption of a consumer protection policy or programme that includes protection in e-commerce and a law on consumer protection that aligns with the EU framework. Albania, Kosovo and Montenegro need to continue legislative improvements to remove any obstacles to e-commerce take-up. All economies need to ensure that consumer protection legislation addresses fraudulent or misleading practices, privacy issues, dispute resolution, and redress in e-commerce transactions. They also need to increase efforts to monitor online consumer protection indicators and to implement awareness-raising campaigns such as Serbia's (Box 13.11), to educate consumers and build trust in e-commerce.
- **Strengthen human and technical capacities for cybersecurity and complete alignment with the NIS Directive on information systems and networks security.** Bosnia and Herzegovina and Kosovo need to adopt new policies on cybersecurity that go beyond 2021 and accelerate the adoption of legislation aligned with the NIS Directive (EU 2016/1148), including also the definition of critical infrastructure. Bosnia and Herzegovina needs to increase efforts to establish a CERT to start international co-operation on incident response management. Kosovo and North Macedonia need to increase the human and financial resources of their CERTs, while all economies need to invest in public sector capacity building to strengthen cybersecurity and improve digital security risk management capabilities.

## Conclusion

The WB economies have made strides in promoting broadband development and digital government to underpin the digital economy. They have continued on their path to EU integration by aligning – to varying degrees – their legal and regulatory frameworks on interoperability, e-identification, e-commerce, e-accessibility, data protection, and cybersecurity. They have also laid the foundations for data accessibility, openness and transparency by setting out and harmonising legal frameworks.

However, weaknesses remain. Support for SME digitalisation and ICT sector growth is underfunded. Lack of co-ordination with industry stakeholders on digital skills development is hindering the closure of the skills gap. Digital inclusion programmes and awareness-raising activities for building trust in the digital economy are also poorly supported.

The successful implementation of the digital society and economy in the WB6 is closely tied to implementing the recommendations put forward in this chapter. Achieving greater digital literacy for the population; improving access to high-speed Internet, data and digital technologies for individuals and businesses; and leveraging regional co-operation will ultimately help increase integration with the global digital economy.

## Notes

<sup>1</sup> It should be noted, however, that this indicator is affected by the average number of people in a household, which may be higher in some of the WB6 (e.g. in Kosovo) than in EU Member States, leading to fewer subscriptions as a percentage of the population. A more careful look into the data behind this indicator may also find that WB6 subscriptions often offer much lower data speeds on average than those in the EU Member States.

<sup>2</sup> The Digital Economy and Society Index (DESI) is a composite index that summarises relevant indicators on Europe's digital performance, under the EU's digital strategy Shaping EU's Digital Future. Data for the EU average retrieved from <https://digital-agenda-data.eu/charts/analyse-one-indicator-and-compare-countries>.

<sup>3</sup> The 11 Central and Eastern European countries (CEECs) which have joined the European Union: Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>4</sup> An initiative funded by the European Union <https://www.wbif.eu/>.

<sup>5</sup> The EGDI, which assesses e-government development at the economy level, is a composite index based on the weighted average of three normalised indices: the Telecommunications Infrastructure Index (TII) based on ITU data, the Human Capital Index (HCI) based on UNESCO data, and the Online Service Index

(OSI) based on data from an independent Online Service Questionnaire (OSQ), conducted by UNDESA, and a Member State Questionnaire (MSQ).

# 14 Transport policy (Dimension 11)

---

The Western Balkans is a strategic region with excellent potential for transit traffic. A well-developed, sustainable, efficient, interoperable and integrated transport network could be a driver of closer co-operation with neighbouring European Union (EU) economies, leading to a single European and more competitive transport market. This chapter assesses the transport policy framework in the six Western Balkan (WB6) economies. It starts with a brief overview of the transport competitiveness of each economy, including performance on various global indicators, and then focuses on the three sub-dimensions that contribute to overall transport performance. The first sub-dimension, planning, measures the extent to which an orderly, coherent, consistent and transparent process is in place for developing transport policy and infrastructure. The second sub-dimension, governance and regulation, determines how well transport infrastructure and networks are regulated and operated, with a focus on rail, road, aviation, inland waterways and maritime transport. The third sub-dimension, sustainability, measures progress towards resource efficiency, environmental protection, reducing health impacts and increasing road safety. The chapter includes suggestions for enhancing policies in each of these sub-dimensions in order to improve transport performance and foster the competitiveness of the WB6 economies.

---

## Key findings

- **Since the last Competitiveness Outlook (CO) assessment in 2018, the Transport Community Permanent Secretariat (TCPS) has been established with the aim of deepening the integration of the Western Balkans' transport markets into the EU market.** The TCPS will help WB6 economies adopt and implement EU legislation in the area of transport regarding common standards, network efficiency, and quality of service offered to citizens and businesses. Its headquarters have been in Belgrade, Serbia since 2019, operating under the Transport Community Treaty (TCT). The Ministerial Council of the TCPS endorsed regional action plans for roads, railways, road safety and transport facilitation in October 2020.
- **Five of the WB6 economies have developed long-term transport strategies, while Serbia is currently in the procurement process for developing its new strategy.** The development of these strategies is mainly funded by international financial institutions (IFIs). A remaining challenge, also noted in the previous CO assessment, is that most of the economies' transport-related strategies lack corresponding monitoring and implementation plans.
- **Only Albania and Serbia have well-developed project prioritisation tools.** The other WB6 economies still have weak secondary legislation on project identification, selection and prioritisation, which impacts the effective spending of funds.
- **A key achievement regarding transport facilitation is the opening of a one-stop shop on Corridor X in July 2019 at the road border crossing point between North Macedonia and Serbia.** This form of cross-border co-operation could have positive effects by reducing long queues and waiting times, and could facilitate regional traffic.
- **Rail regulatory reforms have continued to a certain extent,** promoting harmonisation with the EU *acquis* and the TCT; however, the rail market is not yet fully opened, and more efforts are needed to align this area with the TCT.
- **The WB6 economies have achieved better results in improving road safety** and reducing the total number of road fatalities in the period 2017-2019 (10%) than Central and Eastern European countries (CEEC) (3%), the EU (3%) and the OECD (7%).
- **An asset management system is still in the early phases of development,** with most economies (Albania, Bosnia and Herzegovina, Montenegro, North Macedonia, Serbia) taking steps mainly related to the road sector, and some in the rail sector.
- **The environmental sustainability of the transport sector is partially covered through various strategies.** However, there is no single tool to monitor the implementation of recommended actions and measures at various locations.
- **Combined transport, as a transport mode which has the best cost efficiency, decreases environmental pollution, and increases co-operation between freight forwarding network companies, is underdeveloped in the region.** However, there have been positive movements in Albania, Bosnia and Herzegovina, Montenegro and Serbia, which participated in the Integrating Multimodal Connections in Adriatic-Ionian Region project (2018-20) jointly with Croatia, Greece, Italy and Slovenia. This project provided an incentives programme for intermodality in Serbia.

## Comparison with the 2018 assessment

Albania, Montenegro and Serbia have improved their scores for transport policy since the previous CO assessment; however, performance in Bosnia and Herzegovina and Kosovo is below the WB6 regional average (Figure 14.1). It is important to note that transport policy scores between the 2018 and 2021 assessment cycles are not directly comparable due to the upgrade of the assessment framework.

Figure 14.1. Overall scores for the transport policy dimension (2018 and 2021)

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition and removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Progress on implementing the policy recommendations made in the CO 2018 has been limited overall (Table 14.1), although there has been some progress regarding transport policy making, partial alignment with the EU *acquis* and transport facilitation.

**Table 14.1. Implementation of the CO 2018 policy recommendations: Transport policy**

Competitiveness Outlook 2021		
2018 Policy recommendations	Main developments during the assessment period	Regional progress status
Strengthen the effectiveness of the new transport strategies and the project selection process	<ul style="list-style-type: none"> <li>Albania adopted a new tool in 2020 for project selection and prioritisation and a financial information system. Together these will lead to the controlled spending of state funds allocated for transport infrastructure.</li> <li>Serbia adopted a new tool for project selection and prioritisation in 2019 that includes affordability, project implementation framework and <i>ex post</i> assessment.</li> </ul>	Limited to moderate
Complete transport market reforms	<ul style="list-style-type: none"> <li>Rail markets are mainly liberalised for local operators in all WB6 economies, while full liberalisation is expected once all regional economies become EU members.</li> </ul>	Limited to moderate
Address the drivers of logistics performance, which is key to enabling trade competitiveness, in a co-ordinated way	<ul style="list-style-type: none"> <li>There is no defined regional approach to drivers of logistics performance. Some regional economies have developed internal logistics strategies (e.g. Albania and Serbia) and decided on the locations of new intermodal terminals.</li> <li>A new intermodal terminal in Belgrade (Serbia), Batajnica, is under construction. Serbia is also preparing four additional projects connected with the inland ports of Bogojevo, Prahovo, Sremska Mitrovica and Belgrade, all of which involve the construction of intermodal terminals within the ports. The Port of Belgrade is envisaged to be developed as a dry port to be used for the most important sea ports in neighbouring economies.</li> <li>An intermodal terminal near Skopje (North Macedonia), Trubarevo, is planned, with the government in the phase of engaging a designer.</li> <li>Logistics and combined transport are still not well co-ordinated with other transport modes. There have been no visible developments during the assessment period, except in Serbia where an incentives programme for shifting freight to intermodal transport was launched in 2018.</li> </ul>	Limited to moderate
Make the resilience of key transport infrastructure assets a policy priority	<ul style="list-style-type: none"> <li>Most WB6 economies have made early development steps to establish an asset management system for roads (the newly developed bridge management system in North Macedonia, tendered in 2019, will be a component of the road asset management system). Efforts regarding other transport modes do not exist or are in the early planning phase.</li> </ul>	Limited
Integrate key aspects of sustainability such as environmental quality into transport strategies	<ul style="list-style-type: none"> <li>Environmental sustainability in the transport sector is partially covered through various strategies, but there is no single tool to monitor the implementation of recommended actions and measures at various locations.</li> <li>The TCPS is currently developing a Sustainable and Smart Strategy for the Western Balkans.</li> <li>Albania is drafting a new Transport Sector Strategy 2021-2026 based on the EU's Sustainable and Smart Mobility Strategy.</li> </ul>	Limited to moderate

## Introduction

The Western Balkans is a strategic region with excellent potential for transit traffic. A well-developed, sustainable, efficient, interoperable and integrated transport network could be a driver of closer co-operation with neighbouring EU economies, leading to a single European and more competitive transport market.

Connectivity is seen as a platform that boosts the competitiveness of the region, opens policy dialogue and strengthens bilateral and multilateral co-operation in the region.

The Western Balkans clearly still needs considerable investment in transport infrastructure to be in line with Trans-European Transport Network (TEN-T) standards. As a first step, the policy framework needs to be brought into line with the EU *acquis* and the Transport Community Treaty (TCT) (EUR-Lex, 2017<sup>[1]</sup>), following the recommendations made in this chapter.

The transport dimension has close links with other dimensions assessed in this publication:

- **Chapter 4. Investment policy and promotion.** Transport infrastructure investment can be a key trigger for better connectivity by helping improve access to remote and abandoned areas and to international markets. Properly planned investment policy in transport infrastructure could lead to better quality transport, and thus increase the region's attractiveness.
- **Chapter 5. Trade policy** focuses on trade facilitation, which depends mainly on the physical infrastructure of transport, traffic management, and customs and border crossing points, as well as customs clearance processes, etc. Trade performance could be boosted once infrastructure is well developed; therefore, policy makers should integrate the vision of the transport dimension into trade policy plans.
- **Chapter 7. Tax policy** focuses on establishing an efficient system of taxes and charges, including for transport infrastructure and transportation services. Taxes should be based on the marginal social costs approach (including health, environment, accidents, congestion) to maximise social welfare.
- **Chapter 12. Science, technology and innovation** can be important for developing innovative methods for greener transport infrastructure, developing an efficient transportation system and providing better user experience. The average fuel consumption of the car fleet has decreased at the EU level (Faberi et al., 2015<sup>[2]</sup>) thanks to the progress achieved with new cars. This trend should be supported by policy makers.
- **Chapter 13. Digital society** focuses on digitalising transport services to boost the quality of living conditions for people. Digital tools and systems also facilitate the data collection used for transport planning, and therefore impact the spending of funds.
- **Chapter 15. Energy policy.** Transport is one of the key polluters, thus energy policy approaches targeting energy savings and emissions in the transport sector are essential. Inefficient fuel consumption leads to higher levels of pollution, which increases the costs to society and to the environment.
- **Chapter 16. Environment policy** focuses on reducing emissions across the region, for example through adequate transport policies with sufficient rules on fuel and car models. Environmental policy is also directly related to impact assessments regarding the construction or reconstruction of transport infrastructure.
- **Chapter 18. Tourism policy.** Transport infrastructure is important for connecting tourists to destinations, and facilitating internal movement between attractions, accommodation and commercial services. Better connectivity, including greater transport infrastructure capacities and faster border crossing points, could boost the development of tourism.

## Assessment framework

### Structure

This chapter assesses transport policies in the WB6 through three broad sub-dimensions:

1. **Sub-dimension 11.1: Planning** assesses whether the transport dimension vision has set clear and measurable objectives. It covers all transport modes equally, including allocated budgets of actions and measures, a responsible agency for implementation, and timelines for implementation.
2. **Sub-dimension 11.2: Governance and regulation** assesses whether stable, transparent, and sustainable measures are in place to facilitate and attract investment, as well as the operation of safe, interoperable, reliable and efficient transport. It also assesses the level of harmonisation of regional legislation with the EU *acquis* and the TCT as a base for the development of regional and single European transport markets.

3. **Sub-dimension 11.3: Sustainability** assesses the challenges that WB6 economies face in reducing road fatalities, promoting the development of environmentally sustainable transport infrastructure and ensuring long-term competitiveness.

Figure 14.2 shows how the sub-dimensions and their indicators make up the transport policy dimension assessment framework. The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies’ statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment.

**Figure 14.2. Transport policy dimension assessment framework**

Air traffic trends</li> </ol>	<b>Quantitative indicators</b> <ol style="list-style-type: none"> <li>4. Road safety trends</li> <li>5. Transport-related CO2 emissions</li> </ol>

The leaders of the WB6 economies endorsed the Common Regional Market 2021-2024 Action Plan (CRM 2021-24 AP) at the Berlin Process Summit held on 10 November 2020 in Sofia. The Action Plan is made up of targeted actions in four key areas: 1) regional trade; 2) regional investment; 3) regional digitalisation; and 4) regional industrial and innovation activities.

In the regional trade area, the WB6 economies have committed to closely aligning rules and regulations with the core principles governing the EU internal market based on the “four freedoms” of enabling goods, services, capital and people to move more freely across the region. The regional trade part of the CRM 2021-24 AP includes five components: 1) cross-cutting trade measures; 2) goods; 3) services; 4) capital; and 5) people. The key findings of the CO 2021 transport policy dimension can inform the implementation of the actions under the relevant components of the Common Regional Market Action Plan (Box 14.1).

### **Key methodological changes to the assessment framework**

Since the previous CO 2018 assessment the list of qualitative and quantitative indicators has expanded. Qualitative indicators under sub-dimension 11.2 were extended to include IWW and maritime market regulation. Quantitative indicators were also upgraded. Additionally, the qualitative analysis was adjusted for almost all levels and indicators to reflect remaining challenges noted in the previous CO assessment. The description was also upgraded to be consistent with the findings of the previous CO assessment.

## Transport policy performance and context in the WB6

The overview of transport policy in the WB6 economies is assessed against the following outcome indicators for transport performance: the Logistics Performance Index (LPI), the Global Competitiveness Index (GCI) and the DHL Global Connectedness Index (DHLGCI).

The World Bank's LPI is a multi-dimensional assessment and international benchmarking tool focused on trade facilitation (World Bank, 2020<sup>[3]</sup>). It is based on a survey of port operators, shippers and freight forwarders and produces a composite index that reflects questionnaire responses. The LPI is oriented towards assessing the transport of manufactured goods rather than bulk commodities and is more applicable to high-value goods.

The five WB6 economies for which data are available perform below the Central and Eastern European countries (CEEC-11), OECD and EU averages on the LPI (Figure 14.3). Over the period 2016-18, LPI average scores were the same as during the previous CO assessment, between 2.5 and 3, with Serbia receiving a marginally higher score than its neighbours.

**Figure 14.3. WB6 Logistic Performance Index scores (2016-2018)**

Note: Data for Kosovo not available. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. OECD and EU averages are calculated as simple averages.

StatLink  <https://doi.org/10.1787/888934254525>

Like the LPI, the World Economic Forum's GCI measures perceptions rather than actual performance (WEF, 2019<sup>[4]</sup>). The GCI is based on unique data from the Executive Opinion Survey, which surveys top business executives in all participating economies. Figure 14.4 shows the most recent score for the five participating WB6 economies in the infrastructure domain, the most relevant of the 12 pillars of competitiveness covered by the index. Serbia receives the highest score for the overall GCI, while Serbia and Montenegro receive the highest scores for transport infrastructure, although these are still below the CEEC-11, EU and OECD averages.

**Figure 14.4. WB6 Global Competitiveness Index scores (2019)**

Note: Data for Kosovo not available. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. OECD and EU averages are calculated as simple averages.

StatLink  <https://doi.org/10.1787/888934254544>

The DHLGCI is an output indicator that assesses the integration of economies in global trade flows (DHL, 2019<sup>[5]</sup>). It identifies four specific categories of flow: 1) trade flows (products and services); 2) investment flows (capital); 3) information flows; and 4) people flows. “Depth” refers to the size of an economy’s international flows compared to a relevant measure of the size of its domestic economy. It reflects the importance of pervasive interactions with the rest of world. “Breadth” measures how closely an economy’s distribution of international flows with its partner economies matches the global distribution of the same flows in the opposite direction. The five WB6 economies covered by the index fare well for their economic internationalisation (depth) but less so for trade diversification (breadth), given their small size (Figure 14.5).

**Figure 14.5. WB6 DHL Global Connectedness Index scores (2019)**

Note: Data for Kosovo not available. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. OECD and EU averages are calculated as simple averages. OECD and EU averages are calculated as simple averages.

StatLink  <https://doi.org/10.1787/888934254563>

The multi-dimensional approach to assessing competitiveness through outcome indicators mentioned above provides a mixed picture. The average top performer is Serbia, but there is still a performance gap between the WB6 economies and the CEEC-11/EU/OECD averages.

Outcome indicators also suffer from year-on-year variations due to external factors, as well as infrastructure quality and regulatory changes. In order to fully assess transport competitiveness these indicators need to be used in conjunction with an analysis of what determines competitiveness across all transport sectors, as provided in the next section.

## Planning (Sub-dimension 11.1)

Transport planning involves actions and measures designed to ensure that there is sufficient investment in the transport sector to achieve broader economy-wide development goals. Transport planning can only be effective if followed by a transport policy that targets socio-economic welfare and a competitive transport market. Without a clear and transparent transport planning pathway the region risks jeopardising value-for-money investments in transport infrastructure, which affects costs, quality and sustainability.

Regional action plans for roads, railways, road safety and transport facilitation were endorsed by the Ministerial Council of the TCPS<sup>1</sup> in October 2020. Their concrete aims are safer roads, reduced waiting time at borders and common crossing points, reliable and modern railways, and roads of the future with integrated green and digital elements. Additionally, the TCPS is currently developing a Sustainable and Smart Strategy for the Western Balkans, expected to be adopted by the WB6 economies during 2021. This will be the foundation of a regional transport system that strives for a green and digital transformation and that is more resilient to future crises (for more information on the WB6 commitments to and recommendations for deepening regional transport integration, see Box 14.1).

Some of the WB6 economies are more advanced than others in developing their transport visions and strategies, including high-level identification and prioritisation processes (Table 14.2). Albania and Serbia have the highest average score in this sub-dimension, which is significantly above the other four economies. This is due to well-developed project prioritisation processes and stronger performance in the implementation and procurement indicator compared to the other WB6 economies. However, monitoring of transport strategies in all WB6 economies needs to be improved. All WB6 economies have shown limited progress in improving their asset management practices, translating into a low score for this indicator.

**Table 14.2. Scores for Sub-dimension 11.1: Planning**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 11.1: Planning	Transport vision	4.0	2.0	2.0	2.5	2.5	3.5	2.8
	Transport project selection	4.5	0.8	1.0	2.5	2.5	4.0	2.6
	Implementation and procurement	3.0	2.0	2.0	2.5	2.5	4.0	2.7
	Asset management	1.5	1.0	1.0	1.5	0.0	1.5	1.1
<b>Sub-dimension average score</b>		3.3	1.5	1.5	2.3	1.9	3.3	2.3

### ***Transport visions could be updated and monitored more systematically***

Economies need a clear and coherent transport vision to ensure that the sector contributes to the overall economy-wide vision and aspirations. Each part of the transport network contributes to economic development, but the benefits of a transport system as a whole are greater than the sum of its parts.

Two WB6 economies, Montenegro and North Macedonia, have adopted new transport strategies since the last CO assessment (Table 14.3) that have included efforts to align with international best practice and the TCT. At the time of writing, Albania had secured financial support from the EU to develop a Transport Sector Strategy and related action plan for 2021-2026, which is expected to be finalised by mid-2021, and Serbia was in the final procurement stage to engage a consultant to develop its strategy for the period 2022-2030.

**Table 14.3. WB6 economies' transport strategies**

	Current transport strategies	Period covered by the strategy	Validity	Availability of monitoring report for strategy implementation
ALB	Transport Sector Strategy	2016-2020 2021-2026	Expired Drafting	Yes
BIH	Framework Transport Strategy of Bosnia and Herzegovina	2016-2030	Valid	Partially (only in Republika Srpska)
KOS	Sectorial Strategy for Multimodal Transport	2015-2025	Valid	No
MKD	National Strategy for the Transport Sector	2018-2030	Valid	Yes*
MNE	Transport Development Strategy of Montenegro	2019-2035	Valid	Yes**
SRB	Plan of Rail, Road, Inland Waterway, Air and Intermodal Transport Development	2015-2020	Expired	No
	Draft Transport Strategy of the Republic of Serbia*** National Transport Strategy	2016-2025 2022-2030	n/a Procurement process ongoing	

\*Note: At the time of writing the first monitoring report (which should be updated annually) of the National Strategy for the Transport Sector for the period 2018-2020 was being approved by the government, and is not yet publicly available.

\*\*Note: Monitoring of the strategy will be conducted by the co-ordination body of the Ministry of Transport and Maritime Affairs as prescribed in the strategy, but at the time of writing there was no monitoring report available.

\*\*\*Note: Not approved by Parliament. Since the last CO assessment, Serbia has continued to follow its Plan of Rail, Road, Inland Waterway, Air and Intermodal Transport Development 2015-2020. A new strategy for 2022-2030 is in the last stage of the procurement process.

It is difficult to evaluate the impact and effectiveness of these strategies as there is no consistency of monitoring at the regional level, and most are neither developed nor monitored consistently. The strategies appear to focus mainly on removing physical bottlenecks and harmonising legislation with EU standards, but they are weak on sustainable transport development, digitalisation and intelligent transport systems. It will not be enough to simply remove bottlenecks to improve the competitiveness of the region as a single market, it will also be important to promote the development of sustainable transport modes such as combined transport and railways for freight, and active modes of transport for passengers. The growing demand for road freight is critical to enhancing competitiveness (Figure 14.6), as it shows an increase in traffic and presents a challenging trend for long-term sustainability. Harmonisation with EU standards and the TCT will accelerate following the integration of the WB6 economies into the Single European Transport Area.

**Figure 14.6. Evolution of road freight transport volumes**

Index of tonne-km transported by road: 2011=100

Note: Data for Albania only available for 2011, 2012 and 2013. Data for Kosovo not available.

StatLink  <https://doi.org/10.1787/888934254582>

At the time of writing, the TCPS was developing the Transport Community Information System – Transport Observatory. Its architecture is expected to be finalised during 2021 and will define a data collection mechanism, including identifying data sources. The methodology for data analysis and performance monitoring, including key performance indicators,<sup>2</sup> outputs and statistical reporting to fulfil TCT reporting duties, will also be finalised. Existing and future information systems will be assessed and utilised, such as the Galileo Green Lane mobile solution (EUSPA, 2020<sup>[7]</sup>) (developed by the European Global Navigation Satellite System Agency), the TENtec information system (European Commission, 2021<sup>[8]</sup>) (set up by the European Commission to co-ordinate and support the TEN-T), and the Corridor Performance Measurement and Monitoring System (Isik et al., 2018<sup>[9]</sup>), which is expected to be developed by the World Bank.

### Box 14.1. Towards smoother regional mobility in the Common Regional Market

The following key findings of the CO 2021 transport policy dimension can inform the implementation of the actions under the relevant components of the Common Regional Market Action Plan:

- A key achievement in transport facilitation since the last CO assessment is the opening of a one-stop shop on Corridor X at the road border crossing point between North Macedonia and Serbia in July 2019.
- Due to COVID-19, all regional economies have introduced green lane measures on the major corridors for the transport of emergency goods. These require that freight vehicles and drivers should be treated in a non-discriminatory manner. Passing through these green lane border crossings (including any checks and screenings) should not exceed 15 minutes, and procedures should be minimised and streamlined.
- Transport facilitation needs to remain a key priority for the WB6 economies. Key measures for economies include:
  - Implementing one-stop shops.
  - Improving and upgrading existing information and communication technology (ICT) infrastructure.
  - Constructing or modernising infrastructure to remove physical and technical barriers and to increase capacities at border crossing points and common crossing points.
  - Building capacity to improve performance efficiency.

### ***Transport project selection could be more transparent***

The transport project selection indicator measures the extent to which transport projects are identified, prioritised, and selected consistently, realistically and rigorously. There is limited transparency regarding the project selection process in the WB6 region, which should become a greater focus for economies, even though some (Albania and Serbia) have developed good prioritisation tools since the CO 2018 assessment. With a well-developed and transparent project prioritisation process, WB6 economies can ensure the integrity of the transportation system and increase predictability in the planning and decision-making process. A systematic approach will also increase the influence and involvement of local communities in the decision-making process.

On average, the WB6 economies achieve a score of 2.6 for transport project selection, which is significantly higher than the last CO assessment (Table 14.2). Four economies have advanced their systems, with Albania (score of 4.5) and Serbia (score of 4.0) developing very good project prioritisation tools (Box 14.2). There are no reports available on these recently applied tools, but their effectiveness is expected to be

visible during the next CO assessment. Bosnia and Herzegovina has the lowest score (0.8) in the region as it still has not developed a national project selection system.

In the context of the Western Balkan Investment Framework (WBIF), WB6 economies have continued to follow an established high-level project selection process through national investment committees (NICs), as promoted by the European Commission (European Commission, 2015<sub>[10]</sub>). NICs are responsible for setting up and managing the single project pipeline (SPP) and programming financial sources. NICs only cover projects financed by the EU and related IFIs, whereas SPPs also cover projects financed by bilateral funds, such as in Serbia. However, as project financing has been further diversified since the last CO assessment, some infrastructure projects that have a large impact on the transport network were excluded from the SPP and went ahead without NIC approval. A notable example is the construction of several motorways and railways within the region using other bilateral funds (e.g. from China, Russia, the United States and Azerbaijan).

Most capital transport investment projects funded through the WBIF are subject to a cost-benefit analysis (CBA) that includes a rigorous assessment of IFIs or other bodies (e.g. Joint Assistance to Support Projects in European Regions – JASPERS<sup>3</sup>). The European Commission's Guide to Cost-Benefit Analysis of Investment Projects is used for these projects (European Commission, 2014<sub>[11]</sub>). For all other projects, a CBA is provided if required by local legislation, but does not appear to have ever led to the cancellation of an investment. Economy-wide guidelines for CBA only exist in Serbia for road transport, but they are outdated and require updating or redeveloping. There are some very good examples of how local projects have been assessed and CBA utilised, but in general capacity building is needed in this area as it is one of the most important elements of project selection.

### ***Implementation and procurement lack a systematic approach***

A rigorous process for implementation and procurement is the logical continuation of a coherent planning and systematic prioritisation process to help meet planned outcomes and spend budgets efficiently.

On average, the WB6 economies achieve a score of 2.7 for the implementation and procurement indicator, ranging from 2.0 for Bosnia and Herzegovina and Kosovo to 4.0 for Serbia (Table 14.2). All transport infrastructure projects funded at least partly by the government are subject to domestic procurement laws in all WB6 economies, but there are some cases where the Practical Guide to contract procedures for EC external actions has been applied. However, the WB6 economies still lack a systematic approach to the procurement of large transport projects, such as following dedicated guidelines, despite efforts to attract private investors to the region and to accelerate infrastructure investment.

Since the last CO assessment there have been several design and construction activities related to the Indicative extension of the TEN-T to WB region transport network,<sup>4</sup> notably new road and railway corridors, the rehabilitation of existing roads and railways, ports, and the construction and upgrade of intermodal terminals and airports.

Experiences of investment through public-private partnerships (PPP) vary across the region. Many concession attempts have failed as the economies have not properly assessed the potential (e.g. traffic demand) of the given asset. Concession attempts have also failed due to the lack of cost-effective offers, such as the concession for motorway section Doboj-Vukosavlje (Corridor Vc). Albania has the most active transport PPPs among the WB6 economies, with the amendments to the Law on Concession (2019) prescribing the unification of award procedures for road concessions/PPPs with all other concession/PPP procedures. It is good to note that Serbia is the first WB6 economy in which concession is a legally mandatory way to obtain the right to become a port operator.

### ***Transport infrastructure asset management is in the early stages of development***

Some WB economies have attempted to develop a transport infrastructure asset management<sup>5</sup> system, mainly for road transport, within the last two decades, but such systems are generally still underdeveloped in the region. On average, WB6 economies scored 1.1 for this indicator, with scores ranging from 0.0 for Montenegro to 1.5 for Albania, North Macedonia and Serbia (Table 14.2). The main obstacles to an effective asset management system are the legal framework, implementation capacities, and funds for frequent and costly updates. Consequently, transport infrastructure assets are not properly operated or maintained, which limits their long-term usefulness.

Developments to date have mainly been in the road sector, followed by the railway sector. For example, North Macedonia has begun using the Road Asset Management System (RAMS), while the bridge asset management system was being developed at the time of writing and will be part of RAMS. Some efforts have been made in the last 15 years in Bosnia and Herzegovina to establish an asset management system, as presented in the Preparation of Maintenance Plans 2018-2022 for Road/Rail TEN-T indicative extensions to the WB6, but they have not been successful (CONNECTA, 2018<sub>[12]</sub>). However, Bosnia and Herzegovina (Republika Srpska) has established an asset management system for highways through an ongoing project to implement a full RAMS by the end of 2022.

### ***The way forward for planning***

- **Ensure regional action plans and the Sustainable and Smart Strategy for the WB6, developed by the TCPS and endorsed by the Ministerial Council, are fully transposed into local legislation and implemented following the defined timeframe.** The concrete aims of the regional plans (for roads, railways, road safety and transport facilitation) are safer roads, reduced waiting times at border and common crossing points, reliable and modern railways, and roads of the future with integrated green and digital elements. The development of the Sustainable and Smart Strategy for the WB6 is ongoing, expected to be adopted by the WB6 economies by summer 2021, and will be a driver of the upgrade and development of national sustainable transport strategies.
- **Develop a tool for project identification, selection, prioritisation and implementation, and apply it to all transport projects.** WB6 economies could use the tools developed in Albania and Serbia, which introduced well-developed systems in 2019/20 and are now beginning their implementation (Box 14.2).
- **Develop domestic CBA guidelines specific to the WB6 economies.** It is very important for each economy to develop its own CBA guidelines with accompanying technical instructions. The guidance needs to be updated at least every two years. A good example is the United Kingdom's Transport Analysis Guidance,<sup>6</sup> which provides information on the role of transport modelling and transport project appraisal tailored to the UK market. To ensure consistency in the discount rates used for similar projects in the same economy, a benchmark is needed for all technical and economic parameters, including the financial and economic discount rate in domestic guidance documents. The rate needs to be applied consistently in project appraisals across the economy. Empirical research needs to be conducted to generate input data to calculate externalities.

- **Accelerate the development of an asset management system for all transport infrastructure, and ensure it is in line with the domestic inventory system.** Developing sound asset management practices<sup>7</sup> enables economies to collect data and to manage and analyse conditions across all transport modes. Data can be used to optimise transport sector maintenance strategies and justify maintenance budgets by directing funds to areas with the greatest return on investment. Performance-based maintenance contracts are already implemented, though not extensively, in some WB6 economies such as Albania, Bosnia and Herzegovina and Serbia (CONNECTA, 2018<sub>[12]</sub>). These are an essential component of a road asset management system and, if well-developed, lead to predefined good road conditions at relatively low cost. The quality of transport infrastructure affects an economy's investment attractiveness and signals whether it is a good market for foreign direct investment.

#### Box 14.2. Effective tools to manage transport projects in Albania and Serbia

Albania and Serbia are the only two economies in the WB region with a sound tool for transport project identification, selection, prioritisation and implementation.

In 2018, **Albania** adopted the Decision on Public Investment Management Procedures. For the purpose of budget planning on investment expenditure, the projects are divided into two groups: 1) capital administrative expenditure on equipment, furniture, computers, IT, etc; and 2) expenditure on investment projects, including capital expenditure on infrastructure such as new constructions, reconstructions, rehabilitation with design costs, expropriation costs, purchase of larger technological equipment, implementation of works and supervision; and capital expenditure for capacity development, including research projects, technical assistance and capacity building.

The following project management cycle is applied:

1. Project identification based on an analysis of the public's needs.
2. Project evaluation and preparation, including an evaluation of the economic and financial justification.
3. Project approval and financing.
4. Project implementation.
5. Monitoring of project implementation, which should ensure that project activities are in line with planned activities.
6. Evaluation and audit, including implementation-related reporting and financial audit through the project performance indicators.
7. The following steps are applied based on the project cycle presented above:
8. Identify the project idea based on an analysis of public needs.
9. Review the draft idea (project management team leader and responsible authorities).
10. Prepare detailed project and evaluation, and a shortlist of alternatives.
11. Submit investment project proposal to the ministry responsible for investment projects.
12. Review the proposal (Council of Ministers).
13. Final approval, after the approval of investment projects within the annual budget.

As per Decision No. 290 of 11 April 2020, a financial management information system has been installed in every spending unit, including in all ministries, and is integrated into various departments to be used for all steps in the project management cycle.

In **Serbia**, the procedure for project identification, analysis of relevance, pre-selection, funding, implementation and monitoring is clear and publicly available, and co-ordinated through the Ministry of Finance. This procedure was adopted in 2019 through the Rulebook on the Management of Capital Projects.

The prioritisation process, which is applied to all projects, applies a CBA, an environmental and social impact analysis, and a safety assessment, among other things. Once the project is approved for financing there is a special procedure, similar to the one in Albania, that forms the preparation of a plan for project implementation. During project implementation there are specific procedure forms for reporting. One type of report is the interim report for the presentation of the current project status, which covers the activities carried out and the plan to execute the remaining project activities. At the end of the project, a final report needs to be developed. Development of "Public Investment Management Information System - PIMIS" software is underway. This activity should improve the efficiency of a single record of capital projects.

There are three categories of project: 1) less than EUR 5 million; 2) between EUR 5 and 25 million; and 3) over EUR 25 million. *Ex post* monitoring is conducted for the third category three years after completion, which is a significant improvement on local legislation.

## Governance and regulation (Sub-dimension 11.2)

Governance drives the performance of the transport sector. The appropriate governance of transport infrastructure ensures the development of a safe, efficient and interoperable transport market. Transport planning requires governance of the ownership and management of transport infrastructure assets, regardless of whether the ownership is public or private. Well-governed transport infrastructure assets fulfil domestic goals related to welfare and profit.

The governance and regulation sub-dimension comprises four qualitative indicators to analyse progress in rail, aviation, road, and IWW and maritime transport regulation reforms (Table 14.4). Due to the complexity of assessing rules and the coexistence of regulations at different levels, as well as the lack of applicability to all economies, the indicator scores for road market regulation and IWW and maritime transport regulation have not been calculated. Although not scored, these indicators are discussed in the text to assess achievements in these sectors.

Governance and regulation is the sub-dimension within the transport policy dimension in which the WB6 economies perform the best on average. Within this sub-dimension, the WB6 economies performed the best in the aviation regulation indicator, translating overall good advancement in harmonising the sector with key EU regulations and international good practices. Slight stagnation has been noticed regarding reforms in railway market regulation since the last CO assessment, with only Serbia and Montenegro scoring above the regional average for this indicator due to more advanced levels in applying approved reforms.

**Table 14.4. Scores for Sub-dimension 11.2: Governance and regulation**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 11.2: Governance and regulation	Rail regulation	1.5	1.3	1.5	1.5	3.5	3.5	2.1
	Aviation regulation	3.5	2.5	1.5	3.5	3.0	4.0	3.0
	Road market regulation	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.
	IWW and maritime market regulation	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.
<b>Sub-dimension average score</b>		2.5	1.9	1.5	2.5	3.3	3.8	2.6

### ***Rail regulation is gradually opening markets***

The rail regulation indicator assesses progress in implementing strategies for rail reforms, which are crucial for the common rail market and harmonisation with EU rail policies. The most important reforms are related to market liberalisation, the interoperability of the rail network and safety. The WB6 rail market is mostly liberalised, but only for domestic operators, with many regional economies expecting to fully open their rail markets once they join the EU.

On average, the WB6 economies achieved a score of 2.1 for the rail regulation indicator, ranging between 1.3 for Bosnia and Herzegovina and 3.5 for Montenegro and Serbia (Table 14.4). Since the last CO assessment, the WB6 economies have made moderate progress in opening their rail markets. The most recent regional rail plan is driven by the TCPS, and all WB6 economies participated in the endorsement process of the Action Plan for Rail for the period 2020-2023 (TCPS, 2020<sub>[17]</sub>). This action plan covers rail market opening; passenger rights; governance; interoperability; cross-border and common crossing operation; and the modernisation of the rail network with clear deadlines for signing, transposition and implementation. Serbia has the highest number of private operators (ten).

Rail infrastructure is currently being modernised (e.g. rail Route 4 through Serbia and Montenegro between Belgrade and Bar, Corridor Vc in Bosnia and Herzegovina) or built (e.g. Corridor VIII in North Macedonia, doubling and modernising rail Corridor X through Serbia) (European Commission, 2015<sub>[18]</sub>). Corridor X is the backbone of the railway network and requires immediate modernisation to revive rail transit through the region. Corridor Vc and Route 4 have to be upgraded to link central European countries with the Adriatic Sea.

Figure 14.7 shows the level of rail network utilisation in the Western Balkans between 2017 and 2019. It is clear that the best performer in terms of rail network utilisation (transported tonnes per km of rail track) is Bosnia and Herzegovina (a 56% share of the EU average rail network utilisation) followed by Serbia (44%). The biggest increase in rail network utilisation, both for passengers and freight, was in Kosovo. Negative trends were noticed in Montenegro for the freight rail network and in Serbia for passenger rail network utilisation.

It is expected that rail will become more attractive once the works are completed and all reforms are fully implemented – for example the Interoperability Directive (EUR-Lex, 2016<sub>[19]</sub>) and the Rail Freight Corridor Regulation (EUR-Lex, 2010<sub>[20]</sub>).

**Figure 14.7. Rail network utilisation in the Western Balkans (2017-19)**

% change over 2017-19 and share of EU average

Note: A passenger-kilometre or tonne-kilometre is the unit of measurement representing the transport of one passenger/tonne by a defined mode of transport (road, rail, air, sea, inland waterways, etc.) over one kilometre.

Source: Input provided by the government as part of the quantitative questionnaire (CO2021); Statistical data retrieved from WB6 statistical offices.

StatLink  <https://doi.org/10.1787/888934254601>

### **Aviation regulatory reforms could be accelerated to match growth in the sector**

The aviation regulation indicator assesses the WB6 economies' regulatory harmonisation with EU legislation, including on cross-border co-operation, performance schemes, safety promotion and the transparent regulation of airports to promote more efficient aviation services in the WB6 economies. The Single European Sky is part of the European Common Aviation Area Agreement signed in 2006. As parties to this agreement, the WB6 economies are committed to aligning some of their aviation regulation with the EU *acquis* in exchange for full access to the single European aviation market.

The average regional score for this indicator (3.0) is the highest average score among all scored indicators. At the economy level, Serbia has the highest score (4.0) and Kosovo the lowest (1.5). The process of transposing EU policies into domestic legislation continues to progress in the region. Bosnia and Herzegovina's Air Navigation Services Agency took over responsibility for the air traffic control of its skies in December 2019 from Croatia, Montenegro and Serbia, which had undertaken air traffic control in Bosnia and Herzegovina since 1992. This means that all charges will now be paid directly to Bosnia and Herzegovina, which will lead to revenue that could increase financial capacities and fund human resources. The Airport Charges Directive (EUR-Lex, n.d.<sup>[21]</sup>) has not yet been transposed and implemented in all WB6 economies.

Growth has been significant in this transport mode in the period 2017-19 for the WB6 region compared to the EU and world averages (Figure 14.8). Given this growth, as well as its projected importance, it is important that all six economies continue regulatory reforms and bring the governance of the aviation sector closer to European standards and international best practice.

Figure 14.8. Air traffic trends in the WB6 region (2017-19)

Note: Data for Bosnia and Herzegovina are for the period 2016-2018.

### **Road market regulation continues to be harmonised**

The road market regulation indicator assesses the standards and framework conditions in place in WB6 economies for the creation of a Single European Transport Area. The long-term goals for the region are to open road markets through a well-developed system with effective border control, harmonised employment conditions in the road transport profession, cabotage rules to guarantee equal market access opportunities and reduce empty runs, road user charges, and social and safety standards that follow the latest EU standards.

Given the complexity of assessing these rules, and the coexistence of regulations at different levels, this assessment does not provide a score for the road market regulation indicator.

The most recent regional road plans are driven by the TCPS, with all WB6 economies having participated in the endorsement process of the Road Action Plan for 2020-2023 (TCPS, 2020<sup>[24]</sup>). This plan covers the road maintenance system, intelligent transport system deployment, road transport climate resilience, and enhancing regional co-operation and experience exchange with clear deadlines for preparation and implementation.

Overall, the WB6 economies continue to progress on this indicator by aligning parts of their rules with the EU *acquis* regarding working hours, safety standards and the licencing of truck drivers. All WB6 economies (except for Kosovo) continue to participate in the European Conference of Ministers of Transport's multilateral quota system, which enables hauliers to undertake an unlimited number of multilateral freight operations in 43 participating European economies (ITF, 2014<sup>[25]</sup>). This is a complementary system for non-EU Member States, as access to the international road haulage market is regulated in the EU by regulation 1072/2009 (EUR-Lex, 2009<sup>[26]</sup>).

As in the last CO assessment, data collection continues to be an obstacle for promoting an efficient and safe road network, and the WB6 economies have not yet fully developed their data collection systems to monitor the road transport market. The transparency of data is still low and data exchange between key stakeholders could be improved.

### ***IWW and maritime market regulation is in the early stages***

The IWW and maritime market regulation indicator measures progress in implementing strategies for IWW and maritime reforms in the applicable economies.

This regulation is in the early stages of preparation. Albania's project on Enhancing the Development of the Albanian Maritime Sector through Technical Assistance and Increased Partnership,<sup>8</sup> funded by IFIs, is expected to provide a baseline assessment of the institutional and financial set-up of the maritime transport sector. It will also develop the institutional and legal framework to support maritime sector development, based on the Norwegian experience as a leading maritime country. The framework in Serbia on market access to port services and the financial transparency of ports, developed and adopted before the adoption of EU regulation 2017/352 (EUR-Lex, 2017<sub>[27]</sub>), was already in line with EU regulation. Considerable efforts have been made in recent years in Serbia on IWW and maritime market regulation, including privatising port operators and creating incentives for combined transport. In Montenegro, the government adopted the Rulebook on Internal Organisation and Systematisation of the Ministry of Transport and Maritime Affairs in April 2019, which established the Directorate for Maritime Transport and Inland Navigation and the Directorate for the Application of Standards to Protect the Sea from Pollution and Inland Waterways. There are still no specific incentives in the region for shifting to the use of IWW and maritime transport due to a lack of relevant actions which should be driven through strategies and secondary legislation. Even though these modes can offer benefits in terms of competitiveness in size, cost, environmental performance and safety, allocated funds for incentives are an obstacle and often budgets for such types of incentives are transferred to some items with shortfalls in the budget. In this regard, the project "Grendel – Green and efficient Danube fleet", financed by the EU, could serve as an efficient tool for defining the appropriate and harmonised State Aid scheme to enable incentives in this regard. In most applicable economies there is no roadmap for institutionalisation or a policy and operational framework.

Monitoring indicators to assess the performance of all transport modes either do not exist, are not properly established or are not properly updated. Missing indicators include average user costs, travel time and reliability satisfaction levels, value of assets, market research and customer feedback, quality of user information, and audit programmes. Regular data surveys are neither planned soundly (including the purpose, level of data needed and budget allocated) nor conducted regularly. Surveys that have been conducted have only been for the purposes of specific projects and not for general transport infrastructure assessment and planning. Therefore, the basis for a quality assessment of transport network performance is lacking.

### ***The way forward for governance and regulation***

- **Accelerate the transposition and implementation of the EU *acquis* and aim to fully align with the TCT.** Updating the legislation will be a challenge for all WB6 economies and will require human, financial and technical capacities to ensure effective transposition and implementation.
- **Consider a corridor approach wherever possible throughout the region.** Such an approach can only be considered through well-organised bilateral and multilateral co-operation. Co-operation and exchange of good practice among WB6 economies needs to be enhanced and intensified and should take place regularly. Such regular regional discussion would help pave the way for a single and competitive regional transport market.
- **Continue efforts to fully liberalise the rail market.** Liberalisation of the rail market in the region could significantly boost competitiveness. Once the market is liberalised, passengers will see service level improvement and there will be a sizable impact on the long-distance rail freight market for operators and investors.
- **Establish programmes and provide regular data surveys to assess the performance of all transport modes.** Missing transport performance indicators include average user costs, travel time

satisfactory level reliability, value of assets, market research and customer feedback, quality of user information and audit programmes.

## Sustainability (Sub-dimension 11.3)

Sustainable transport plays an important role in policy formulation in OECD countries due to environmental concerns and sustainability objectives (OECD, 2012<sup>[28]</sup>). The promotion and development of sustainable transport is directly linked with environmental protection and climate impact (addressed in all transport modes), economic efficiency (competitive market) and social progress (improved safety, quality of life). While increasing transport demand boosts economic growth, it can have an adverse effect on the environment and safety, which are directly related to quality of life and market competitiveness. Therefore, the development of sustainable transport modes with better logistics would lower costs and deliver reliable services through faster, safer and more efficient transport.

The regional average score for the sustainability sub-dimension is much lower than for the other two transport policy sub-dimensions (Table 14.5), showing that there is significant room for improvement across all indicators in all WB6 economies. Of the three indicators assessed, road safety is the most advanced, while combined transport has seemingly been neglected in most WB6 economies and is still in its infancy at the regional level. The development and implementation of sustainable transport strategies (and the integration of sustainability objectives into existing policies) also shows room for improvement across the region.

**Table 14.5. Scores for Sub-dimension 11.3: Sustainability**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 11.3: Sustainability	Road safety strategy	1.5	1.3	1.5	1.5	2.5	2.5	1.8
	Environmental sustainability strategy	1.5	0.5	1.5	0.5	1.5	1.5	1.2
	Combined transport strategy	1.5	0.5	0.5	0.5	0.5	2.5	1.0
<b>Sub-dimension average score</b>		1.5	0.8	1.2	0.8	1.5	2.2	1.3

### ***Road safety strategy updates are held back by resource constraints***

The road safety strategy indicator measures progress in implementing strategies for road safety. An effective road safety strategy should create safer transport infrastructure, better road safety management, and protect road users.

On average, the WB6 economies score 1.8 for the road safety strategy indicator, ranging between 1.3 for Bosnia and Herzegovina and 2.5 for Montenegro and Serbia (Table 14.5). The most recent regional road safety plans have been driven by the TCPS, with all WB6 economies participating in the endorsement process of the Road Safety Action Plan for the period 2020-2023 (TCPS, 2020<sup>[29]</sup>). This plan covers actions related to road safety management, promotion of safer infrastructure and protection of road users, and enhanced co-operation and exchange of experience with clearly defined implementation guidelines and supporting parties. Financial and organisational limitations mean that some WB6 economies (e.g. Serbia) have not succeeded in developing a new road safety strategy to replace one that has expired.

Reports monitoring the implementation of road safety strategies are rare in the region (they exist in Albania,<sup>9</sup> Republika Srpska and Montenegro). Without them, new strategies cannot draw on or rectify the issues revealed in the monitoring. There are Road Safety Agencies in Serbia and Republika Srpska, but systems for road safety audits and inspections are only beginning to be developed in the region. Most economies rely on IFI support and there is a lack of locally developed primary and secondary legislation in most of the region (apart from Republika Srpska and Serbia) to promote safer infrastructure. The region

also lacks appropriate staffing and funding for some key activities such as education, awareness campaigns, development of road safety co-ordination bodies in local communities, and the development and upgrade of road safety databases.

Despite the lack of updated road safety strategies and established road safety agencies in the region there have been good results on road safety. The WB6 average decrease in the number of fatalities over 2010-20 was higher than the CEEC-11, EU and OECD averages (Figure 14.9). Three economies have met or nearly met the goal of the EU's Policy Orientation on Road Safety 2011-2020 to reduce road fatalities by 50% between 2010 and 2020 – Kosovo has achieved a 53.7% decrease, and Montenegro (49.5%) and Albania (48.6%) have nearly achieved the goal. The total number of fatalities per 100 000 inhabitants in the WB6 region was almost the same as the CEEC-11 average in 2019, but still much higher than the EU and OECD averages.

**Figure 14.9. Road safety trends (2010-2020)**

Note: OECD data for 2010, 2017 and 2019 do not include following countries: Canada, Colombia, Luxembourg, Mexico, Switzerland. Traffic accident data for 2020 are not available for Bosnia and Herzegovina, Montenegro, North Macedonia, CEEC-11, EU and OECD.

Source: Inputs provided by the government as part of the quantitative questionnaire (CO2021); Statistical data retrieved from WB6 statistical offices.

StatLink  <https://doi.org/10.1787/888934254639>

### ***Environmental strategies for transport are underdeveloped***

The WB6 economies' CO<sub>2</sub> emissions from transport, when measured in tonnes of CO<sub>2</sub> per capita, are lower than CEEC-11, EU and OECD averages (the bars in Figure 14.10). However, when measured in tonnes per GDP using purchasing power parity, their performance is worse (blue line in Figure 14.10). Serbia has the highest emissions per capita, while Albania has the lowest. CO<sub>2</sub> emissions illustrate the direct dependence of the region on fossil fuels.

Figure 14.10. CO<sub>2</sub> emission from transport

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia. PPP = purchasing power parity.

Source: (IEA, 2020<sub>[30]</sub>), *CO<sub>2</sub> Emissions from Fuel Combustion: Overview*, <https://www.iea.org/reports/co2-emissions-from-fuel-combustion-overview>.

StatLink  <https://doi.org/10.1787/888934254658>

The environmental sustainability strategy indicator measures how strategies plan to green transport activities and transport infrastructure. It also assesses the level of legislation and measures introduced to reduce energy consumption in transport services, increase the share of electrical transport through electricity recuperation, facilitate cycling, and reduce carbon dioxide (CO<sub>2</sub>) emissions without compromising on efficiency and mobility.

On average the WB6 economies score 1.2 for this indicator, with scores ranging between 0.5 (Bosnia and Herzegovina and North Macedonia) and 1.5 (all other regional economies) (Table 14.5). Environmental sustainability in the transport sector is partially covered through various strategies, action plans, and primary and secondary legislation, but there is no single mechanism to assess implementation of the recommended actions and measures.

The economies' legislation contains targets such as a reduction of the noise impact from transport to the levels recommended by the World Health Organisation/EU in Albania; the promotion of bio-fuels and other renewable fuels in Bosnia and Herzegovina; and a modal shift from road, reduction of greenhouse gas (GHG) emissions, vehicle labelling for emissions, carbon footprint calculators and eco-driving in North Macedonia. By 2030, GHG emissions levels should be reduced by 30% compared to baseline 1990 levels in Montenegro, and in Serbia there are incentives for purchasing new electric vehicles. The first e-mobility pathway at the economy level is also under development in Serbia, funded by the World Bank, and is expected to be finalised in 2021.

Since the last CO assessment, climate resilience design guidelines for public enterprises for roads have been developed in North Macedonia and Serbia, in co-operation with the World Bank. These guidelines will help economies to better understand the impact of climate change on roads and enable appropriate, timely and properly prioritised investment decisions.

### ***Combined transport is still not prioritised***

The combined transport strategy indicator measures whether WB6 economies are developing and implementing integrated logistics strategies that can promote a corridor approach and intermodal solutions. Most WB6 economies still do not consider combined transport a priority and are still not planning to develop stand-alone strategies or to institutionalise this mode of transport. On average, the WB6 economies score

1.0 for this indicator, ranging from 0.5 for Bosnia and Herzegovina, Kosovo, Montenegro, and North Macedonia to 1.5 for Albania and 2.5 for Serbia (Table 14.5).

Reforms in this area have generally been slow; however, Albania finalised its Intermodal Transport Strategy in early 2021, while in Serbia the new multimodal transport strategy Five-year Action Roll-on Plan is under development and expected to be finalised later in 2021.

The first rail freight corridor (the Alpine-Western Balkan Rail Freight Corridor<sup>10</sup> through Austria, Slovenia, Croatia, Serbia and Bulgaria) started operating in January 2020 and will increase competitiveness regarding the modal shift to rail.

There is a signed construction contract for the multimodal terminal, Batajnica, near Belgrade, and an ongoing procurement process for developing an intermodal terminal, Trubarevo, near Skopje.

### ***The way forward for sustainability***

- **Ensure that road safety remains a key priority.** Monitoring reports for implementing road safety strategies need to be upgraded/developed in all WB6 economies. The monitoring results of existing road safety strategies, including lessons learnt, should be used to update the framework when developing new strategies. Impact assessments of new strategies should also be carried out. Road Safety Agencies need to be established (except in Serbia) with the appropriate staffing and funding resources to undertake the activities defined in the related action plans. All WB6 economies should strive to secure the newly defined goal of the EU's Vision Zero strategy for 2050, which has also set an intermediate goal for 2021-2030 of halving the number of road fatalities (European Commission, 2019<sup>[31]</sup>). Bosnia and Herzegovina, North Macedonia and Serbia should aim to compensate for poor results from the previous decade and exceed the goal of reducing road fatalities by 50% in this decade. Public awareness and education activities should be strengthened, and innovative funding ideas in the road safety sector should be promoted (Box 14.3).
- **Develop roll-out strategies for electric vehicle charging infrastructure.** Serbia is already working on the development pathway for e-mobility, and other WB6 economies should follow this good regional example (e.g., Albania is incorporating e-mobility in its new transport strategy for 2021-2026, which is in the development phase). This is important for the region's decarbonisation trends and for the goal of net-zero GHG emissions by 2050, which is an objective defined by the European Green Deal (European Commission, n.d.<sup>[32]</sup>) and in line with the EU's commitment to global climate action under the Paris Agreement (European Commission, n.d.<sup>[33]</sup>).
- **Maintain transport facilitation as a key priority for WB6 economies.** Implementing the following measures will be a key trigger for increasing the competitiveness and connectivity of WB6 economies, and drive deeper integration with the European market:
  - Create one-stop shops (OSSs) at border crossing points; improve and upgrade existing ICT infrastructure; construct or modernise infrastructure to remove physical and technical barriers and to increase capacities at border crossing points and common crossing points; build capacity with the purpose of improving performance efficiency.
  - Good examples in the region could be used as inspiration, for example North Macedonia and Serbia have recently introduced a well-developed OSS system and in 2021 finalised project documentation for implementing a pilot project for an electronic queuing management system (see also Estonia example in Box 14.4). However, interest in this project is currently low, but with the project documentation ready it can be used as soon as a party is ready to pursue implementation.
- **Develop stand-alone combined transport strategies where relevant** (i.e., Bosnia and Herzegovina, Kosovo, Montenegro and North Macedonia). The timely development of a combined transport framework in the entire WB6 region could generate substantial benefits for

economies. Such strategies promote sustainable transport by shifting freight transport from roads, which is not considered an environmentally friendly mode of transport, to other more sustainable modes. Combined transport is also a cost-saving shipping resource that can leave more time and resources for shipping companies to conduct new business. Therefore, incentives for shifting freight to combined transport are needed, such as Serbia's incentives programme introduced in 2018.

- **Develop integrated environment and transport action plans.** Such plans should integrate existing and new indicators to measure sustainability in transport policy. A good example is the Transport and Environment Reporting Mechanism<sup>11</sup> developed by the European Environmental Agency, which prescribes indicators for measuring the environmental performance of transport in the EU. Another example is the UK's Emission Factor Toolkit, which helps local authorities assess local air quality (Box 14.5).

### Box 14.3. Innovative ideas in road safety: Road safety social impact bonds, Montenegro

In 2018, the United Nations Development Program (UNDP) in Montenegro, in co-operation with the key domestic players in road safety, developed the idea of road safety social impact bonds as an innovative and alternative performance-based public financial instrument that shifts the policy framework from inputs and outputs to outcomes and value-for-money. This innovative idea involves the private sector investing in road safety improvements to strengthen sustainability together with the public sector. The public partner commits to paying the outcome payments to the investor if (and only if) the predefined and measurable social goals are met. This idea has great potential to help other economies in the region (and beyond) replicate and scale-up the model.

Source: (UNDP Montenegro, 2014<sup>[34]</sup>), *Rethinking Road Safety in Montenegro*, <https://www.me.undp.org/content/montenegro/en/home/projects/RoadSafety.html>.

### Box 14.4. Electronic queuing management system at border crossing points in Estonia

The electronic queuing management system (e-QMS) is a transport facilitation mechanism designed to convert physical queues into virtual queues at border control points (BCPs) through an IT application. It was implemented in 2011 in Estonia.

The e-QMS system process contains four main steps: 1) pre-registration; 2) virtual queuing, 3) physical queuing; and 4) BCP check-in. Pre-registration can be undertaken via a web portal, text message or kiosk. A vehicle can wait virtually until the booked time when it has to appear physically in the waiting area, which is where the vehicle arrives to physically queue before being called for further BCP check-in procedures. The waiting area could be located close to or far from the BCP.

The benefits of the e-QMS are:

- Time savings through shorter waiting times, especially for heavy goods vehicles.
- More streamlined operations on site and increased performance by border agencies.
- Reduced truck queue lengths.
- Increased capacity throughput at BCPs.
- More secure cargo and improved trade and logistics performances.
- Enhanced road safety and less air and environment pollution.
- Increased economic activity around cross-border regions.

Source: (Estonia Border, n.d.<sup>[35]</sup>), *Go Swift, Queue Management Service*, <https://www.estonianborder.eu/yphis/borderQueueInfo.action>.

### Box 14.5. Emissions Factor Toolkit, United Kingdom

The Emissions Factor Toolkit (EFT) was published by the UK's Department for Environment, Food and Rural Affairs (DEFRA) in 2020. It assists local authorities in carrying out reviews and assessments of local air quality as part of their duties under the Environment Act 1995.

The EFT allows users to calculate road vehicle pollutant emission rates for nitrogen oxide (NO<sub>x</sub>), PM<sub>10</sub>, PM<sub>2.5</sub> and CO<sub>2</sub> for a specified year, road type, vehicle speed and vehicle fleet composition. The EFT is updated periodically due to changes in underlying data such as vehicle fleet composition and emissions factors. CO<sub>2</sub> emission rates can also be calculated for petrol, diesel and alternative fuelled vehicles.

The EFT can be downloaded from DEFRA's website. It provides emission rates for 2018 through to 2030, and considers composition fleet data for motorways, urban and rural roads, fleet composition based on European emission standards, scaling factors reflecting improvements in the quality of fuels, and some degree of retrofitting and technology conversions into the national fleet.

Source: (DEFRA, 2020<sup>[36]</sup>), *Emissions Factors Toolkit*, <https://laqm.defra.gov.uk/review-and-assessment/tools/emissions-factors-toolkit.html>.

## Conclusion

The WB6 economies have made moderate progress towards improving regional transport competitiveness. New regional action plans, if effectively implemented, will make transport infrastructure more useful, thereby improving regional competitiveness. The recently approved well-developed project selection frameworks created by some regional economies (Albania and Serbia) should serve as a good example for other economies and ensure that limited budgets are spent on investments that generate the greatest benefits for society. Governance and regulation are sufficiently developed to accelerate harmonisation with EU rules. The level of reduction in road fatalities in the WB6 reveals very good progress in comparison with the CEEC-11, EU and OECD averages.

However, there are still challenges for the region's transport sector. There is not yet synergy between strategies and action plans for infrastructure development, asset management systems, environmental sustainability and combined transport performance. Systems to monitor the implementation of strategies and action plans need to be improved and lessons learned should be applied during strategy updates. There is no programme for a comprehensive data collection system, including performance indicators; when developed this needs to be regularly conducted. Human resources and financial capacity need to be built for the effective implementation of approved policies and strategies.

# 15 Energy policy (Dimension 12)

---

The competitiveness of any economy is heavily influenced by its energy policies. This chapter investigates the energy policies in the six Western Balkan economies (WB6) and analyses to what extent their energy markets follow international good practices to optimise their efficiency and competitiveness. It does so by assessing three sub-dimensions. The first, governance and regulation, focuses on how the energy markets are governed and whether policy is conducive for establishing efficient and competitive energy markets. The second explores how stable and secure the energy supply is, whether it is diversified, and how it promotes sustainable energy. The third sub-dimension analyses how energy markets are operated, whether competition is used to promote efficient allocation of energy resources, and the degree of regional integration of the WB6 energy markets. A cross-cutting dimension, energy incentives and subsidies, explores whether such measures embody hidden and long-term costs which distort competitiveness. For each sub-dimension, the chapter includes suggestions to strengthen energy policies and their implementation, which in turn will foster the competitiveness of the WB6 economies and lead to climate-resilient energy sectors.

---

## Key findings

- **The WB6 have advanced legislative frameworks that transpose a significant share of the EU's Third Energy Package.** These frameworks are supplemented by a large number of policies that conform with international good practices. However, implementation has significant room for improvement and key policy documents urgently need to be updated. For the most part this issue is currently being tackled by the WB6 as they are drafting their new National Energy and Climate Plans.
- **There has been significant progress in deploying EU-style organised markets in energy.** Most recently, Albania, Kosovo and Montenegro have established power exchanges.
- **WB6 economies differ in the quality of their markets and their associated frameworks, including across the main forms of energy within an economy.**
- **Some of the fundamentals of competitive energy markets are still missing in some WB6 economies.** These include unbundling of key natural monopolies – i.e., transmission system operators and distribution system operators – and lack of third-party access to key energy infrastructure.
- **Renewable energy and energy efficiency are both in their early stages across the WB6 region.** Aside from hydropower generation, renewable energy's share in energy generation remains low and the WB6 economies' approaches to subsidising and assigning new renewable energy projects need to be improved.
- **Energy efficiency is slowly being improved as building certifications are rolled out across the WB6.** However, funding is scarce and often limited to public buildings. Moreover, strategies for industrial energy efficiency are often lacking, and the legislative framework for energy efficiency labelling of products is patchy.
- **Regional market integration and market coupling amongst the WB6 economies and with their European neighbours remain largely absent.** However, increased use of joint co-ordinated auctions for interconnector capacity is a positive step forward.
- **Human resources in key public entities involved in regulating energy markets lack technical capacity,** especially for energy efficiency.
- **Subsidies continue to distort markets in the region.** The continued subsidisation of fossil fuels is particularly counterproductive to economies' goals of reducing greenhouse gas emissions and governments' financial support for renewable energy and energy efficiency.

## Comparison with the 2018 assessment

The WB6 have made significant progress in reforming their energy policies since 2018, and most of the foundations for a competitive energy market have been laid. Accordingly, the average regional score has progressed from 1.9 just three years ago to 3.0 (Figure 15.1). However, further improvement is needed. The legislative framework needs to be finalised, and the WB6 economies need to begin implementing this legislation in order to truly establish a competitive and integrated energy market across the region.

**Figure 15.1. Overall scores for the energy policy dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the restructuring of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

The previous assessment suggested several recommendations that would, if implemented, see the WB6's energy sectors be driven by competition and in turn help to support the overall competitiveness of the economy. While progress has been made, in some economies more than others, a significant share of the recommendations remains to be implemented (Table 15.1). A major reason for this slowdown in progress is certainly the global COVID-19 pandemic, but significant internal roadblocks such as lack of political will to undertake certain reforms and resistance by energy sector stakeholders are also playing their part. The deployment of organised markets, lack of liquidity, and market integration and coupling remain the most significant challenges for most energy sectors in the WB6 region. Nonetheless, the WB6 energy sector remains vibrant and offers much potential.

Table 15.1. Implementation of the CO 2018 policy recommendations: Energy policy

Competitiveness Outlook 2021		
2018 Policy recommendations	Main developments during the assessment period	Regional progress status
Remain committed to reforming national and regional energy markets.	<ul style="list-style-type: none"> <li>The WB6 continue to bring their energy sector framework into line with their international commitments associated with their Energy Community membership and EU accession aspirations.</li> <li>For most WB6 economies (Albania, Bosnia and Herzegovina, Kosovo, North Macedonia and Montenegro), the functional and operational deployment of organised markets remains outstanding and the WB6 are still at the early stages of regional market integration and coupling (i.e. only Serbia has an operational day-ahead market while all but Serbia use the joint auctioning allocation of capacity platform SEE CAO).</li> </ul>	Moderate
Adopt and implement urgently, the EU Third Energy Package with compliant primary and secondary legislation.	<ul style="list-style-type: none"> <li>All WB6 economies have made progress in transposing the EU Third Energy Package as can be seen by comparing the transposition assessment of the Energy Community Secretariat in 2020 to that of 2018.</li> <li>Similarly, overall implementation has increased as shown by the Energy Community Secretariat's assessments (Energy Community Secretariat, 2018<sup>[1]</sup>) (Energy Community Secretariat, 2020<sup>[2]</sup>).</li> <li>However, neither the transposition nor implementation of the Third Energy Package is complete.</li> </ul>	Moderate
Ensure that energy policy strategies and action plans set-out measurable objectives and outcomes.	<ul style="list-style-type: none"> <li>The WB6 economies have developed various policies with measurable objectives, including energy strategies, national renewable energy action plans, and national energy efficiency plans.</li> <li>However, most of these strategies and plans provide guidance until 2020 and thus need to be updated.</li> <li>The WB6 are all drafting National Energy and Climate Plans—although they are at different stages of the process, with Serbia's being the furthest from completion (Energy Community Secretariat, 2021<sup>[3]</sup>).</li> </ul>	Advanced
Implement energy policy fully, including action plans and strategies.	<ul style="list-style-type: none"> <li>The WB6 have made progress since the last Competitiveness Outlook but most policies and action plans have only partially been implemented, as delays have hampered progress.</li> <li>Some of the identified infrastructure projects have also experienced delays.</li> <li>Several WB6 economies are unlikely to achieve their renewable target for 2020, signifying that not all National Renewable Action Plans have been implemented as expected.</li> </ul>	Moderate
Strengthen administrative and institutional capacity and provide additional resources.	<ul style="list-style-type: none"> <li>There remains a need to endow energy regulators with additional human resources.</li> <li>Across the entire WB6 there is a significant shortage of staff competent in tackling issues like renewable energy and energy efficiency.</li> </ul>	Limited

## Introduction

Primary energy consumption in the WB6 stood at 72 megajoules (MJ) per capita in 2018—versus 129 in the European Union (EU) and 108 in the CEEC-11<sup>1</sup> (Eurostat, 2021<sup>[4]</sup>; Eurostat, 2021<sup>[5]</sup>). Energy plays a pivotal role in almost any economic activity. Accordingly, the competitiveness of the entire economy is heavily influenced by its energy market. If an energy market is efficient and competitive with regard to price formation and allocation, and if the energy is provided in a stable, predictable and secure manner, economic activities will be more competitive. Conversely, if a market is distorted, has market barriers, or provides an unstable supply, the cost of energy and thus the cost for any subsequent economic output in the value chain will be higher and therefore less competitive on an international basis.

Given the centrality of energy to overall competitiveness, this chapter investigates the WB6 energy policies and analyses to what extent their energy markets employ international good practices to optimise their efficiency and competitiveness. Energy policy typically addresses five overarching objectives: energy

market structure, energy security, environmental and climate considerations, competitiveness, and economic development. These objectives are particularly relevant for the WB6 economies, as they are in transition from monopoly-driven closed-off markets with ageing infrastructure to EU-style organised and integrated energy markets with new legislative frameworks and modernised infrastructure.

Given the breadth and depth of the impact of energy on the operation of the economy, this chapter is closely linked to several other chapters in this report. The most pertinent links are:

- **Chapters 4 and 6. Investment policy and promotion and access to finance.** There is a need for substantial financial investment in the energy sector, particularly for the deployment of renewable energy and energy efficiency.
- **Chapter 5. Trade policy.** Changes in the energy sector will have an impact on any economic activity, and thus also on economies' competitive positions on the international market.
- **Chapter 14. Transport policy.** Energy is the key input for various modes of transportation. As such, it is also related to the transport sector's level of greenhouse gas emissions.
- **Chapter 16. Environment policy.** Energy is a key contributor to greenhouse gas emissions. Therefore, policies on greenhouse gas emissions, greenhouse gas pricing and renewable energy are all highly relevant to energy policy.

## Assessment framework

### Structure

This chapter assesses policies related to energy in the WB6 by assessing three broad sub-dimensions and one cross-cutting sub-dimension:

1. **Sub-dimension 12.1: Governance and regulation** focuses on how the energy markets are governed and guided by policy makers, and whether policy is informative and conducive to establishing an efficient and competitive energy market.
2. **Sub-dimension 12.2: Security of energy supply** focuses on how stable and secure the energy supply is and thus how susceptible the WB6 economies are to supply disruption. This sub-dimension also investigates the extent to which the energy supply is diversified, and how it promotes sustainable energy supply and efficient consumption in preparation for becoming a climate-resilient energy sector.
3. **Sub-dimension 12.3: Energy markets** focuses on how energy markets are operated and to what extent competition is used to promote efficient allocation of energy resources. Moreover, given the size of markets and the positive forces of international trade in promoting efficiency, this sub-dimension also investigates to what extent the WB6 energy markets are coupled and integrated, and thus open to international competition.
4. **Cross-cutting sub-dimension: Energy incentives and subsidies** focuses on the scale of subsidisation and cross-subsidisation in the energy sector and the extent to which they distort competition and fairness in the market.

The assessments for these sub-dimensions were carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. Figure 15.2 shows how the sub-dimensions and their indicators make up the energy policy dimension assessment framework. For more information on the methodology see the Assessment methodology and process chapter.

### **Key methodological changes to the assessment framework**

There have been two main changes to the methodology in the Competitiveness Outlook 2021. The first main change is a restructuring of the sub-dimensions and what they cover—various topics have been merged and indicators have been moved.

Moreover, this latest assessment is more focused on the energy markets' organisation and the energy sources covered. The assessment foregoes an in-depth analysis of oil and oil products' markets in WB6 economies. This does not mean that oil and oil products are not relevant for the WB6 economies' competitiveness, nor that these markets are in perfect alignment with international good practices and standards, but rather that the oil markets are globally integrated. In other words, the analysis has instead focused on markets that are largely still absent and are more driven by economy-specific or regional factors—such as electricity and natural gas markets.

### **Energy performance and context in the WB6**

Overall, the WB6 economies have made strong progress towards introducing legislative frameworks that reflect international good practice. The Energy Community (Box 15.1) estimates that WB6 transposition of the EU's Third Energy Package (Box 15.2) rose from 48% in 2018 to 55% in 2020 (Figure 15.3). The Third Energy Package is the international good practice benchmark for WB6 economies. Its importance stems from several factors. First, the EU is the largest integrated energy market bordering the WB6 region. Second, all of the WB6 economies are Energy Community members and thus have committed themselves to transposing the Third Energy Package. Finally, many of the WB6 economies are in the process of negotiating their entry into the EU, which also requires them to transpose the Third Energy Package.

### Box 15.1. The Energy Community

The Energy Community is an international organisation operating as an international regulatory entity that brings together the European Union (EU) and its neighbouring market, including the WB6 economies, under one unifying legislative and regulatory framework in support of a widely integrated energy market.

The Energy Community was established in 2005 and consists of a variety of bodies which are governed by the Energy Community's Council of Ministers and supported by a Secretariat. The Energy Community's operational sphere encompasses the entire EU and all the WB6 economies, as well as Ukraine, Moldova and Georgia, with Norway and Turkey participating as Observers.

The Energy Community *acquis*, which contracting parties need to transpose and implement, largely consists of the EU's Third Energy Package and a significant number of associated Network Codes.

In its role as a permanent body within the Energy Community structure, the Energy Community Secretariat continuously monitors and assesses the state of the energy markets within the Energy Community. It offers in-depth analysis to the public as well as support to contracting parties in transposing and implementing the Energy Community *acquis*. To this end, the Energy Community Secretariat's work on the WB6 economies' energy markets is an invaluable source of information for this chapter.

Figure 15.3. WB6 progress on transposing the EU's Third Energy Package (2018-20)

Note: Please note that the WB6 score reflects the unweighted economy score provided by the Energy Community.

Source: (Energy Community Secretariat, 2018<sup>[1]</sup>), 2018 Implementation Report, <https://www.energy-community.org/implementation/IR2020/IR2018.html>; (Energy Community Secretariat, 2020<sup>[2]</sup>), 2020 Implementation Report, [https://www.energy-community.org/dam/jcr:0af3b17a-3759-4a23-a2ef-3134784e217c/EnC\\_IR2020.pdf](https://www.energy-community.org/dam/jcr:0af3b17a-3759-4a23-a2ef-3134784e217c/EnC_IR2020.pdf).

StatLink  <https://doi.org/10.1787/888934254677>

However, despite these positive developments, businesses' perceptions of the energy sector in the region, and thus its impact on the competitiveness of the economies, remain negative. While the percentage of surveyed firms experiencing energy outages has gone down since 2013, it remains high, at just under 50% (World Bank, 2021<sup>[6]</sup>) (Figure 15.4). Moreover, the share of surveyed companies that identify electricity as a major constraint has increased by 10 percentage points (World Bank, 2021<sup>[6]</sup>) (Figure 15.5).

The rising share of surveyed companies that perceive energy to be a major constraint is driven by a variety of factors—for example, the share of industries that rely on energy as a major input is growing, as is the number of companies facing rising electricity prices. Another factor is likely the constraints imposed by the difference between the energy market legislation and how the market actually operates. This factor can

also be seen in the Energy Community's rating of the WB6's implementation of the Third Energy Package. The Energy Community perceives the implementation of the Third Energy Package in the WB6 to be at 56% (Energy Community Secretariat, 2020<sup>[2]</sup>), which has risen from 46% in 2018 (Energy Community Secretariat, 2018<sup>[1]</sup>).

**Figure 15.4. Share of WB6 firms experiencing electrical outages (2013 and 2019)**

StatLink  <https://doi.org/10.1787/888934254715>

Overall, the WB6 have solid legislative frameworks in place. Although these frameworks are not complete and need to be further developed, they do represent a good base for a competitive energy market. Accordingly, the focus should now be on implementing these frameworks, and on reducing the negative impact of energy outages and constraints on the WB6 economies by improving the quality of the energy supply.

## Governance and regulation (Sub-dimension 12.1)

The governance and regulation sub-dimension analyses to what extent the WB6 economies have the necessary framework to establish competitive energy markets and to foster their growth in the long run. More precisely, the sector's governance and regulation provide the backbone for energy sector

development, influencing the climate for investment and security of returns. In markets that have strong governance, clear directions and independent regulation, the energy sector responds to market signals and is more likely to lead to sustainable and efficient outcomes driven by competition (OECD, 2001<sup>[7]</sup>).

The Western Balkans as a region has made tremendous progress on governance and regulation. The sub-dimension regional score has risen from 2.2 in the last Competitiveness Outlook to 3.1. Leading the region are North Macedonia and Albania, which have strong legislative and policy frameworks in place as well as strong independent regulators (Table 4.3. Scores for Sub-dimension 1.1: Investment policy framework). Nonetheless, there remains room for improvement within each of the indicators across the Western Balkans, with Bosnia and Herzegovina holding the greatest potential for improvement—in particular as in some sectors Bosnia and Herzegovina (particularly the Federation of Bosnia and Herzegovina) is not even compliant with the Second Energy Package.

**Table 15.2. Scores for sub-dimension 12.1: Governance and regulation**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 12.1 Governance and regulation	Energy policy, legal and institutional framework	3.0	2.0	3.5	3.5	3.5	3.5	3.2
	Energy regulator	4.0	1.5	3.0	4.0	4.0	3.5	3.3
	Management of energy infrastructure	3.5	1.5	3.5	3.5	2.0	3.0	2.8
<b>Sub-dimension average score</b>		<b>3.5</b>	<b>1.7</b>	<b>3.3</b>	<b>3.7</b>	<b>3.2</b>	<b>3.3</b>	<b>3.1</b>

### ***Energy policy and legislative frameworks are progressing well and should now be fully implemented***

A comprehensive policy framework, supported by strong primary and secondary legislation as well as efficient institutions, sets the goals for economies. Furthermore, it sends strong signals to investors about the stability of returns on their investments. This indicator measures and analyses the extent to which the WB6 economies have designed and implemented a primary framework that promotes competition and efficiency in the energy market based on international good practices.

Overall the WB6 economies have a strong foundation; many have extensive legislative and policy frameworks in place that mirror those of the European Union. This in large part means that WB6 economies follow the EU principles of an organised market, employing competitive price formation—with equal opportunities and without discrimination, and ensuring sustainability and transparency of the market in meeting future energy needs. However, not all of the Third Energy Package has been transposed, and less of it has been implemented. For example, Bosnia and Herzegovina (with a score of 2.0; Table 4.3. Scores for Sub-dimension 1.1: Investment policy framework) is largely behind the rest of the WB6, operating some of its natural gas market segments based on an out-of-date legislative framework.

While most of the WB6 economies have extensive energy policy frameworks in place, in most cases these are only valid until 2020, and therefore need to be updated to reflect current international good practice. To this end, it should be noted that all WB6 economies, while at different stages, are working on drafting new policy based on the latest standards in the National Energy and Climate Plans<sup>2</sup> (Energy Community Secretariat, 2021<sup>[3]</sup>).

### Box 15.2. The EU Third Energy Package

In 2007, the European Commission proposed a new legislative package, the Third Energy Package, in an effort to further enhance and harmonise the EU's Energy Union and internal energy market. This package entered into force in September 2009 and consisted of several important directives and regulations.<sup>1</sup>

The Third Energy Package largely rests on four pillars: 1) transparency; 2) non-discrimination; 3) a strong, independent national regulator; and 4) sustainability. Together, these pillars represent EU best practice and aim to establish a fair and level playing field for competitive energy markets that seek to optimise scarce resources. For example, the first two pillars drive the need for unbundling the transmission and distribution system, combined with guaranteed, non-discriminatory and open access to those networks to all users backed by transparent rules and prices. Without such unbundling requirements and third-party access, it is very possible that the system operators, which are natural monopolies, could prohibit market entry and lead to sub-optimal market outcomes.

In addition to these pillars, the Third Energy Package also seeks to enhance international co-operation within the EU by establishing an international regulatory agency (the Agency for the Co-operation of Energy Regulators, ACER) and promoting regional integration. Regulation (EC) No 714/2009 contains clauses that open and allow for further regulation to be drafted to enhance harmonisation in the form of network codes.

In 2019, the EU introduced the Clean Energy Package which supplements and in part replaces the Third Energy Package. That is, while the Clean Energy Package retains the key legislative aspects of the Third Energy Package, it expands measures for sustainability and green energy growth, as well as consumer rights and protections. Despite this, the Third Energy Package remains a good starting point for all of the WB6 economies as many of its key pillars have so far not been introduced or implemented in their entirety in the region. Aligning with it is also a requirement for the WB6 economies as members of the Energy Community, whose *acquis* reflects most of the Third Energy Package. Moreover, with many WB6 economies aspiring to become EU members, the transposition and implementation of the Third Energy Package and subsequent Clean Energy Package are accession requirements. To conclude, the Third Energy Package provides for the implementation of international best practice on competitive markets, and is also a firm requirement for the Western Balkan economies.

1: Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC; Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC; Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003; Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005; Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Co-operation of Energy Regulators.

### **Energy regulators could be more independent financially and politically**

Energy regulation is a key aspect for an economy's competitiveness. The responsibility of the energy regulator is to provide clear and transparent implementation and enforcement of the energy sector rules, without prejudice or favouritism. To do so, the regulator must be fully independent from any other state enterprise, and its functions and responsibilities must be clearly defined with full accountability. If the regulator is able to carry out its functions independently and without prejudice, the investor climate is significantly improved by greater stability. Accordingly, this indicator assesses the extent to which WB6 economies' energy regulators conform with international good practice in terms of independence and endowment of powers and resources.

The WB6 economies have strong institutional frameworks for their energy sectors, reflected in the overall strength of their independent regulators. In principle, the WB6 regulators follow the standards for independent regulators set out in the European Union Third Energy Package. To this end, they are equipped with sufficient powers and resources to act as key market enforcers.

However, there are some common shortcomings when comparing the WB6 energy regulators to their counterparts in the EU. First, the energy regulators of Kosovo and North Macedonia are not as strongly financially independent as they could be. In the case of Kosovo, the energy regulator's budget is a line item in the government accounts, rather than an independent account held by the regulator. Moreover, in some WB6 economies, energy regulators' salaries are bound to public salary schemes or conditions, which limits their ability to retain key staff in a competitive sector where technical staff are highly priced.

Furthermore, the regulators in North Macedonia and Serbia have expressed a need for additional staff going forward—although additional staff for all WB6 regulators would be recommended. The additional staff are needed to maintain current output levels as the regulators are taking on an increasing number of roles and responsibilities. There are also some issues surrounding the selection of the commissioners, i.e. the governing bodies of a regulator. Some economies have failed to fill all the positions on the board of commissioners. In Kosovo, for example, there are currently three vacant positions, meaning the regulator's governing body lacks a quorum to make decisions. In other cases, such as Bosnia and Herzegovina, Kosovo, Montenegro and North Macedonia, the selection of commissioners is either unnecessarily complex and lengthy, or is open to political influence, as the shortlisting of candidates for parliament approval is done by government, and there are limited requirements for who the government nominates. Moreover, in Serbia the regulator is limited in its ability to define its internal structure - requiring approval from parliament.

### ***Infrastructure management is outdated***

Energy security and reliability of supply are closely linked, and both require dependable and efficient energy infrastructure. Energy infrastructure includes all parts of the energy system—from fuel production and generation to transmission and distribution. This indicator assesses whether or not the WB6 economies have a clear vision for rehabilitating, maintaining and expanding their infrastructure.

Unlike the regulators' shortcomings, for the most part the WB6 policies on infrastructure management closely reflect the practices of the European Union. That is, Most WB6 economies have extensive policy documents that guide the expansion of infrastructure, with the Ten-Year-Network Development Plans produced by the distribution and transmission system operators of electricity and natural gas being particularly important.

However, the WB6 economies continue to use existing approaches to generation infrastructure, often still relying on coal (Figure 15.7), which they plan to continue to rely on in the future as a key source for electricity generation. This situation is aggravated by the sluggish expansion of infrastructure for diversifying energy sources. Moreover, WB6 asset management often reflects a rather basic approach to asset capturing and maintenance planning using simple software tracking tools.

Another key issue related to infrastructure is the quantity of losses in the distribution of electricity. All WB6 economies have very high distribution losses—ranging from nearly 35% in Albania to around 10% in Bosnia and Herzegovina. These are well above the EU and CEEC-11 averages of 6.7% and 5.2% respectively (Figure 15.6). These losses are detrimental to the WB6's economic competitiveness as they represent cost and risk to companies. The WB6 need to tackle the issue from two angles. The first angle, technical losses, reflects the need for infrastructure improvements. The WB6 distribution systems require sizeable medium to long-term investment for modernising and refurbishing existing infrastructure and building new infrastructure. In this respect, medium to long-term planning is key, including plans for the recovery of funds necessary to carry out the investment. Addressing the second problem of non-technical

losses will require a mixture of infrastructure investment and improvement in customers' payment morale and reduction of energy theft.

**Figure 15.6. Distribution losses as a share of injected electricity (2018)**

Note: This figure shows the distribution losses as a percentage of injected electricity into the distribution grid. EU average is EU-28 but excluding Bulgaria and Romania. CEEC-11 average includes Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia, but excludes Bulgaria and Romania.

### **The way forward for governance and regulation**

- **Complete the transposition and implementation of the Third Energy Package.** This is essential as it will ensure that WB6 economies have a comprehensive legislative and policy framework for the energy sector. The Third Energy Package still reflects in many ways the international good practices to establish and stimulate a competitive energy market, even though it has now been replaced in the EU by the Clean Energy Package (Box 15.2).
- **Strengthen the regulators, including their independence, their powers and their resources.** Specifically, the following issues should be tackled:
  - **Improve the selection of commissions** and reduce government influence in the selection process. The improvements should aim to reduce the timeframe of the selection process and thus ensure that the regulator's governing body has a decision-making quorum—this is particularly relevant for Kosovo.
  - **Strengthen the WB6 regulators' power to set salaries.**
  - **Increase staffing levels, especially of technical staff**, to continue to operate at current, or even higher levels of quality despite expanding roles, requirements, and responsibilities for regulators.
- **Invest further across the entire WB6 region to achieve four key goals:** 1) replacing ageing infrastructure; 2) diversifying supply and sources/routes; 3) increasing interconnections; and 4) strengthening the climate resilience of the energy sector. These investments would go a long way towards increasing the stability, security and efficiency of infrastructure, and would promote competition by establishing the physical flows that create opportunities for trade flows.
- **Reduce distribution losses.** This will require investment accompanied by legislative changes and enforcement that increase the cost of illicit consumption of energy.

## Security of energy supply (Sub-dimension 12.2)

Security of supply is essential for steady economic activity. The uninterrupted supply of energy allows for planning and cost minimisation across all sectors, while the absence of steady supply increases operational costs and reduces competitiveness. Supply security can be split into two elements:

1. **The supply security of energy:** whether or not WB6 economies are in a position to provide an adequate supply of energy for day-to-day consumption of the entire economy, are prepared for supply distribution or demand emergencies, and are seeking to diversify the energy mix and supply of energy.
2. **The long-run sustainability of the energy sector:** including the development of renewable energy sources and improving energy efficiency to simultaneously increase the viability of an economy while also increasing its resilience to and co-operation on climate change. Given the mounting pressure on non-renewable energy sources globally, and the reliance of many economies on a single source of energy, the benefits of diversifying the energy mix through renewables and curbing demand growth through energy efficiency have enormous potential to improve the competitiveness of the energy sector. While the development of sustainable energy also faces challenges, mainly due to insufficient global market development, governments are encouraged to prioritise this policy direction in the face of climate change.

The WB6 economies have made significant progress in this sub-dimension since the last CO assessment, with the score rising from around 1.8 to 2.9. The improvement in the score reflects the implementation of policies to guarantee energy supply security. This includes the increased diversification and expansion of the natural gas supply, increasing renewable generation, and the deployment of energy efficiency measures (Table 15.3). However, despite advances, and almost uniformly across the WB6, there remains significant room for improvement in the area of renewable energy penetration and energy efficiency improvement. Nonetheless, North Macedonia is leading the region as it has consistently implemented frameworks and policies in line with international standards and practices.

**Table 15.3. Scores for sub-dimension 12.2: Security of energy supply**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 12.2: Security of energy supply	Natural gas supply framework	2.0	3.0	1.5	3.5	2.0	2.0	2.3
	Electricity supply framework	4.0	3.0	3.5	3.5	3.0	3.0	3.3
	Renewable energy policy	3.5	2.5	3.5	4.0	3.0	3.5	3.3
	Energy efficiency policy	2.0	2.0	2.5	3.5	2.5	3.0	2.6
<b>Sub-dimension average score</b>		2.9	2.6	2.8	3.6	2.6	2.9	2.9

### ***The natural gas supply framework exposes the WB6 to single-supplier and supply-route risks***

The natural gas supply framework indicator assesses to what extent the WB6 economies are prepared to overcome emergencies or diversify their energy mix to include natural gas in order to ensure a continuous energy supply to customers. Failure to provide this steady supply could have detrimental effects on the competitiveness of these economies.

When considering the natural gas supply framework, it should first be highlighted that in the WB6 economies natural gas accounts for a considerably smaller share of the primary energy consumption mix than in their European Union, CEEC-11 and regional counterparts (Figure 15.7).

Figure 15.7. The WB6 energy mix compared with the EU and CEEC-11 (2018)

Note: Energy mix reflects primary consumption excluding geothermal and net imported or net exported electricity. CEEC-11=Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

Source: Eurostat (2021<sup>[4]</sup>), *Complete Energy Balance*, <https://ec.europa.eu/eurostat/web/energy/data/database/>.

StatLink  <https://doi.org/10.1787/888934254753>

This is due in large part to the fact that Kosovo and Montenegro do not have a natural gas market at all (Figure 15.8), and Albania has been only recently connected to an international natural gas pipeline via the Trans-Adriatic Pipeline.<sup>3</sup>

Figure 15.8. The WB6 energy mix (2018)

StatLink  <https://doi.org/10.1787/888934254772>

Given the limited natural gas penetration and spread of markets in the WB6, it is no surprise that the legislative framework for natural gas and associated markets is not as well-developed as for electricity in the region. Furthermore, those WB6 economies that do have natural gas markets are almost exclusively sourcing their gas from Russia and often via a single import route, with Serbia building an alternative import route for Russian natural gas. Albania is the only WB6 economy not to receive its natural gas from Russia, obtaining it from Azerbaijan instead. Consequently, the region is very exposed to single-supplier and supply-route risks. Moreover, Bosnia and Herzegovina and Serbia's natural gas supplies continue to be oil-indexed, even though this is not in line with EU good practice, as it disconnects the natural gas pricing from supply and demand market realities.<sup>4</sup>

Given the low natural gas share in the energy mix, and the substantial level of oil and coal consumption, there is further room to expand natural gas as a substitute for other fossil fuels, thereby diversifying the energy mix while lowering greenhouse gas emissions. However, the environmental and security benefits

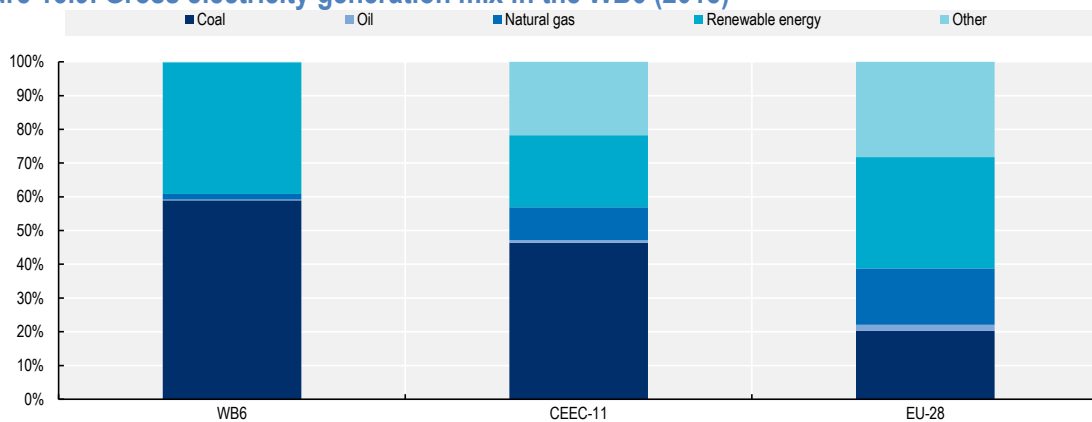

of expanding the natural gas market should be carefully weighed against the cost of the additional infrastructure required to do so. A possible outcome of this consideration could be to skip investing in natural gas infrastructure and instead concentrate on renewable energy and energy efficiency measures instead.

### ***The electricity supply framework is well-advanced but over-reliant on coal***

A reliable electricity supply is vital for any well-functioning economy. Communication infrastructure, as well as industrial and service sectors, all depend on reliable and efficient electricity systems. The electricity supply framework assesses the extent to which governments have designed policy, legal, and institutional frameworks to ensure the delivery of a reliable and efficient electricity supply in a timely manner.

The WB6 economies have well-advanced legislative frameworks, and most have some form of emergency plan or strategies in place and have undertaken stress tests. However, several gaps remain. The WB6's electricity generation mix is dominated by coal, which accounted for over 50% of gross generated electricity in 2018 (Figure 15.9). Moreover, the WB6 region appears to be planning to continue relying on coal-fired generation, with new generation capacity planned, both to meet growing demand and to replace ageing capacity. This is particularly challenging as WB6 economies are, as part of the Berlin process formulated in the Sofia Declaration (Berlin Process, 2020<sup>[11]</sup>), committed to the transition to a low-carbon electricity sector. However, the policies of expanding coal generation are often old, and in most circumstances, based on information provided by WB6 governments, it appears that they will not materialise.

**Figure 15.9. Gross electricity generation mix in the WB6 (2018)**

### ***Renewable energy policy has scope to move beyond hydro generation***

Renewable energy development should be one of the key areas of energy policy in all economies. Increasing renewable energy has several benefits. For one, it strengthens energy security as it is a local source of energy, diversifies the local energy mix and helps reduce reliance on imported energy. For another, once established, the low marginal cost of renewable generation compared to fossil fuel generation capacity can put downward pressures on energy prices. Finally, increasing renewable generation has the potential to lower greenhouse gas emissions and other air pollutants, which in turn would improve the quality of life in WB6 economies and support the sustainability and climate resilience of the energy sector. It is an essential element for most economies to reach their COP21 commitments. However, as a relatively new global supply, renewable energy sources face significant challenges.

The renewable energy policy indicator assesses to what extent the WB6 economies have a clear strategic vision for renewable energy development, backed by a legal and regulatory framework. These are mostly in place in the WB6 in the form of National Renewable Energy Action Plans, as well as strong institutions and support mechanisms for their implementation.

Renewable energy accounted for nearly 40% of the WB6's generated electricity in 2018, yet nearly all of this was derived from hydro generation, which has been an energy source in the WB6 for many years now (Eurostat, 2021<sup>[4]</sup>). Hydro generation continues to dominate renewables despite the great potential for wind and solar generation, whose combined potential in the WB6 region as a whole could be three times the size of the remaining hydro potential (IRENA, 2019, p. Table 3.1<sup>[12]</sup>). Thus, renewable generation other than hydro is still very much in its infancy. The WB6 economies urgently need to support the expansion of renewable generation by establishing a supportive and sustainable environment—most notably with regards to pricing and grid integration.

One tool for increasing the attractiveness of renewable energy generation is the Guarantee of Origin certificate. These are provided to renewable generators who can sell them on to consumers who would like to certify that their consumption originates from renewable energy. These certificates also represent an additional income source for renewable generators as they allow them to capture customers paying higher margins. Many WB6 economies are in the process of deploying such certification systems, but with the exception of Serbia, they are not yet fully operational in most economies.<sup>5</sup> The legislation governing the certificates reflects the EU's Third Energy Package, which permits economies to forgo issuing the certificates to generators who receive public aid, which many economies have opted to do. It should be stressed that in its Clean Energy Package, the EU reformulated the clause to require certificates to be issued to subsidised generation, although income from the certificates needs to be accounted for in the subsidy.

### ***Energy efficiency is still in its early stages in the WB6***

Energy efficiency is an economy's "hidden fuel", providing significant potential for curbing demand growth and redirecting energy consumption. Accordingly, the energy efficiency policy indicator assesses to what extent the WB6 economies are in a position to undertake the necessary investments, based on whether or not they have competitive energy efficiency markets, a clear policy direction, strong legislation, and modern building codes.

While the WB6 economies do have extensive energy efficiency policies in place—such as National Energy Efficiency Action Plans – the legislative framework is patchy.<sup>6</sup> This is particularly true for energy efficiency labelling of products for which North Macedonia has the most extensive Third Energy Package-compliant legislative framework, and Albania and Bosnia and Herzegovina have the least compliant frameworks (Energy Community Secretariat, 2020<sup>[2]</sup>). Moreover, while the legislative framework is mostly in place for the energy efficiency performance of buildings, the certification of buildings is in the early stages, and the focus is mainly on new builds at the moment. In part, the slow uptake of energy efficiency provisions could be due to limited funding, as the funds that are available seem to be almost exclusively focused on the energy performance of public buildings. Energy efficiency audit requirements are in the process of being deployed across the WB6, in line with Article 8 of the Energy Efficiency Directive. However, progress is being slowed down by a lack of trained and certified auditors. In general, there is a significant shortage of technical staff in public institutions that deal with energy efficiency.

### ***The way forward for security of energy supply***

- **Increase the stability of energy supply** by enhancing the policies tackling supply emergencies and implementing existing energy (supply) strategies more rapidly as projects are falling behind schedule. While some of the WB6 economies plan to continue to rely primarily on coal-fired power

generation to help ensure energy supply security, with the increasing need for energy sectors to minimise their carbon emissions, it would be advisable for these economies to look to renewable sources instead—in combination with the possible introduction of some form of greenhouse gas pricing. Finally, key infrastructure investment is needed to reduce the WB6 electricity distribution losses, which impose additional costs on the competitiveness of the WB6 economies.

- **Pursue a policy of increased renewable generation as the primary source of supply growth.** This will be particularly important should carbon border taxes be introduced, as is currently being discussed in the European Union, since this would mean that energy-intensive economic sectors would be increasingly uncompetitive. This can be achieved as follows:
  - **Improve the value-added proposition of renewable energy projects** by implementing, in line with international standards, competitive assignment of renewable projects (e.g., auctions) and by adjusting support schemes from feed-in tariffs to feed-in premiums or contract-for-differences (Box 15.3). These changes should build investors' confidence as the new approaches imply increased sustainability in the market due to their competitive nature and alignment with market realities.
  - **Develop and deploy Guarantee of Origin certificates.** This will primarily involve establishing or designating a platform where stakeholders, such as renewable generators and consumers, request the issuing, registration and eventual transfer and calculation of certificates.
- **Prioritise the increased implementation of energy efficiency.** Doing so will help reduce energy price rises and climate impacts on consumption, and thus also support the overall economy in becoming more efficient and competitive. The following steps can improve energy efficiency:
  - **Improve national strategies** to provide more economic sectors with detailed guidance on energy efficiency requirements.
  - **Finalise the legislative base for energy efficiency** to include requirements for industrial and commercial enterprises, energy product labelling, and certification of energy performance for buildings. The operational deployment of energy efficiency audit requirements for industry should be accelerated—including the training and certification of auditors, and all economic entities should be encouraged to undertake energy audits.
  - **Transpose and implement the European Union's Clean Energy Package** (Box 15.2). This package reflects the EU's latest best efforts for promoting a clean and sustainable energy sector, with a focus on energy efficiency.
  - **Increase the human resource capacity of public entities.** Many of the WB6 economies have a significant shortage of key staff to tackle energy efficiency, which is hampering progress. If they have not done so already, all WB6 economies should establish and equip energy efficiency agencies.
  - **Increase the availability and coverage of energy efficiency funding**—including for private endeavours—to accelerate energy efficiency measures across society. The widening of the financial support base can take different forms, from cheaper loans tied to energy efficiency requirements to direct financial support, such as tax credits, etc.
  - **Increase public acceptance through public information campaigns** on the need for and benefits of energy conservation.

### Box 15.3. A new approach to subsidising renewable energy

Feed-in tariffs were the dominant form of financial support for renewables within the EU at the beginning of the 21<sup>st</sup> century. In this system, power plant operators receive a fixed payment for each unit of electricity generated independent of the electricity market price (Banja et al., 2017, p. 15<sub>[13]</sub>).

Feed-in tariff schemes offer several advantages, but mainly they insulate new market entrants from market price risks, which lowers their capital costs and enables private investment. The simplicity of feed-in tariffs makes them suitable for markets with a large number of non-commercial participants such as households or local community-based initiatives (Council of European Energy Regulators, 2018, p. 12<sub>[14]</sub>).

However, feed-in tariff schemes exclude producers from actively participating in the market, which hinders efforts to develop large, flexible and liquid electricity markets as the share of renewable energy grows. This limits growth to certain technologies and sizes of installations, and creates difficulties in setting and adjusting appropriate tariff levels (European Commission, 2014, pp. 12-13<sub>[15]</sub>). The latter has been a problem especially as costs of renewable generators have fallen rapidly in recent years.

The European Commission suggests switching from feed-in tariff to feed-in premium schemes (European Commission, 2013<sub>[16]</sub>). In these, plant operators sell the electricity generated directly on the electricity market and earn an additional payment on top of the electricity market price. This is received as a fixed payment or one adapted to changing market prices, thereby limiting price risks for plant operators, as well as the risks of providing windfall profits (Banja et al. 2018). Feed-in premium schemes are beneficial because they force renewable energy producers to find a seller on the market. They also ensure that renewable energy operators are exposed to market signals. A well-designed premium scheme can limit costs and drive innovation by using a competitive process to allocate support. Such schemes also include automatic and predictable adjustments to cost calculations, which give investors the information and confidence necessary to invest (European Commission, 2013, p. 8<sub>[16]</sub>).

The European Commission suggests using a feed-in premium scheme in combination with the following good practice recommendations (European Commission, 2013<sub>[16]</sub>):

- Do not pay premiums for production in hours where the system price is negative or above the level of remuneration deemed necessary.
- Assign renewable project and associated premiums using competitive allocation mechanisms such as auctions.
- Make planned volume-based premium reductions for new installations dependent on when they are approved, connected or commissioned.
- Conduct regular, planned and inclusive reviews of premiums for new installations.

However, the Council of European Energy Regulators reports that in 2016/17, 17 of the 27 European Union member countries still used some form of feed-in tariff, although mainly for small projects, while around 16 used feed-in premiums, including to complement feed-in tariffs (Council of European Energy Regulators, 2018<sub>[14]</sub>).

For further and more detailed exploration of renewable energy subsidies and best practice please see the sources below. Meanwhile, for more information on the different renewable support schemes employed across Europe please see <http://www.res-legal.eu/home/> and for an overview of auctions and outcomes (including databases on auctions) see <http://aures2project.eu/>.

## Energy markets (Sub-dimension 12.3)

Energy markets provide a platform for energy trade and can range widely in size, type and level of competitiveness. Differences in energy markets are influenced by all the afore-mentioned aspects of the energy sector, including governance, legislation, regulation, energy mix, and infrastructure.

Overall, a sub-optimal market stifles competition and leads to inefficiency through prices that do not reflect the true scarcity of an energy product. This ultimately results in inadequate investment signals and sub-optimal energy consumption.

The average score for the WB region has risen from 1.9 in the last Competitiveness Outlook to 3.0 (Figure 15.1), as the WB6's energy markets have improved with increased liberalisation, price deregulation on the wholesale level, and deployment of power exchanges. Albania and North Macedonia are leading the regional scores in part due to their efforts to deploy an organised market and efforts to increase regional integration (Table 15.4). Meanwhile, Kosovo and Montenegro are prime examples of improvement in the area of the unbundling of, and third-party access to, their energy markets. However, there remain significant hurdles in the region with regard to unbundling within and third-party access to natural gas markets—in particular in Serbia and Bosnia and Herzegovina—and room for improvement in the deployment of organised markets. Moreover, regional integration and market coupling are largely absent.

**Table 15.4. Scores for sub-dimension 12.3: Energy markets**

<b>Sub-dimension average score</b>		3.3	1.8	3.0	3.7	3.2	2.8	3.0

### ***Energy markets are moving towards international good practice***

Market operations are an essential cornerstone of market development and integration as they account for the physical implementation and operation of the market. The efficient implementation of physical markets is, together with non-discriminatory treatment of market participants, a necessary precondition for efficiency gains through an economy's own internal market, as well as through regional integration. The latter is especially relevant for the WB6 economies, as integrating their relatively small energy markets regionally and with their EU neighbours could allow them to reap the benefits of competitive energy markets. Accordingly, the market operation indicator assesses the state of the physical markets in the WB6 economies, including how efficient they are and to what extent they encourage competition.

The WB6 economies have made good progress on this indicator—most markets have been partially liberalised, and prices are increasingly being deregulated. However, some market segments remain regulated, in particular the retail markets, where consumers are captured by dominant market incumbents—often under the umbrella of universal suppliers<sup>7</sup> whose position as sole supplier is reinforced by the lack of competition. Nonetheless, it is positive to note that more economies have deployed organised wholesale markets. The most recent economies to do so are Albania, Kosovo and Montenegro, which have all set up power exchanges,<sup>8</sup> although they have yet to start operating. North Macedonia has nominated the market operator and is working on deploying the organised (wholesale) market, but is very much in the early stages. In addition, state law does not cover the operational deployment of an organised market so deployment is subject to the adoption of a new law. However, there are several market segments in the WB6 economies that still lack working organised marketplaces. These are urgently needed as their absence is a significant barrier to market integration and coupling.

### ***Unbundling and third-party access are also approaching international good practice***

Unbundling the operations of different parts of the energy sector is one of the key requirements for competitive markets. This means that companies that operate electricity and heat generation, electricity or gas transmission and electricity, gas, or heat distribution should be managed and operated by separate entities. This separation is necessary in order to avoid vertical integration and minimise monopolistic behaviour. Transmission and distribution networks are natural monopolies, providing opportunities to limit third-party access if the same entity owns and operates both the network and generation. Markets with fully integrated operators and lack of third-party access tend to distort fair competition; thus, unbundling in combination with full third-party access to the network is a prerequisite for a competitive market. This indicator assesses the extent to which these key natural monopolies are unbundled and grant access to infrastructure in line with international good practice.

The WB6 region is nearing full implementation of international good practice on unbundling. This is also true for allowing non-discriminatory third-party access to natural monopoly-owned infrastructures. Most WB6 economies have the legislative basis for unbundling, in line with the EU's Third Energy Package (apart for some market segments in Bosnia and Herzegovina). Albania is a particularly positive example, as, after many years of having had a bundled electricity distribution company, it is making progress in conjunction with an international donor project to unbundle the company. Most recently, the distribution system operator has been legally unbundled, but functional unbundling is yet to be completed. Meanwhile, Bosnia and Herzegovina and Serbia are lagging behind, particularly with regard to natural gas, where unbundling and third-party access are lacking. Bosnia and Herzegovina has not even started unbundling; whereas in Serbia progress has been made towards legal unbundling, but functional unbundling is not in place yet.

### ***Regional market integration is making slower progress***

The regional market integration indicator assesses to what extent markets can be and are efficiently integrated and coupled. Market integration and its benefits are based on two pillars:

1. **Harmonised regulations within the region.** These allow for the faster, more efficient development of energy trade and the integration of several economies into a common shared market. Prices in these regional markets respond to various supply and demand forces, often resulting in more competitive prices and a larger variety of market products—while simultaneously lowering supply risk.
2. **Improved and co-ordinated interconnection management.** A co-ordinated network and interconnection reliability are paramount for transferring trade flows to consumers in the most efficient way possible on a regional level. Networks with high congestion and poor reliability are unable to operate a highly competitive market with a large number of transitions and heavy flows. Alternatively, when congestion and reliability are properly managed, markets are able to respond by providing fast responses and higher quantities, and thus also competitive prices.

Progress towards regional integration is limited. The Energy Community Secretariat found that the transmission networks of the Energy Community Contracting Parties—including the WB6 economies—are more strongly interconnected than those of the majority of EU Member States (Energy Community Secretariat, 2021, p. 85<sub>[17]</sub>). However, it noted that although market integration in the WB6 area is not hindered by the lack of interconnectors, it is limited by inefficiencies arising from the absence of short-term co-ordinated capacity calculation and an efficient mechanism for allocation and use (Energy Community Secretariat, 2021, p. 85<sub>[17]</sub>). Moreover, despite various international projects, market coupling remains absent. However, this is in part due to the absence of working organised markets in most WB6 economies until very recently.

### ***The way forward for energy markets***

- **Seek to expand the competition-driven efficiency gains of an organised energy market.** In particular:
  - **Continue the liberalisation and price-deregulation of the wholesale and retail market.** WB6 economies need to eliminate existing market barriers. Moreover, in some cases due to lack of competition, the balancing market is also still regulated. Accordingly, as markets are deregulated and liberalised, the WB6 economies need to devise and implement strategies that promote market entry, liquidity, and, ultimately, competition.
  - **Deploy and operationalise organised energy markets.**
- **Unbundle key natural monopolies**, such as the transmission system operators and distribution system operators. Separating these entities from vertically integrated energy companies is essential to create a level playing field for all generators and suppliers.
- **Prioritise non-discriminatory third-party access** to the market on a functional level. Together with unbundling, non-discriminatory third-party access is crucial for promoting market entry and participation, and thus also competition and efficiency of markets—particularly for international flows, given the small size of most WB6 energy markets.
- **Enhance regional co-operation and move towards eventual market integration and coupling.** Specifically this requires improvements to the optimised and co-ordinated allocation of cross-border interconnections; better regional market coupling, so that there is a regional price response and anchoring; reducing regional barriers, including recognising licences from other economies; and accommodating regional market coupling by promoting cross-border trading activities. These steps should help ease market variations and fluctuations, while simultaneously safeguarding the market against manipulation by dominant energy entities in a specific market.

### **Energy incentives and subsidies (cross-cutting sub-dimension)**

Subsidisation and cross-subsidisation in the WB6 energy sectors is a cross-cutting sub-dimension assessed in this edition of the Competitiveness Outlook, though it is not scored. Given the nature of subsidisation and cross-subsidisation, this sub-dimension does not have any specific indicators that can be considered. While broadly speaking there is subsidisation of primary energy, conversion of energy, and consumption, the subsidisation that occurs within these areas and across them can take many forms. The absence of a score also reflects the fact that every economy has some form of subsidisation in place, often to protect consumers or to encourage the development of a new market segment such as renewable energy or implementation of energy efficiency measures. Thus, the presence of subsidisation is not always negative, making scoring it a difficult and very subjective task. This section therefore explores the presence of subsidisation outside of common norms and analyses their potential distortive impact on market equilibrium.

Subsidisation is an essential tool for directing energy policy and the energy market, since it can help support fragile or nascent energy sources. However, any subsidisation, whether direct or indirect, does distort the market away from the competition-driven optimal equilibrium created between price-driven supply and demand. Therefore, subsidisation needs to be carefully designed and, in many cases, limited to certain conditions (e.g., on time, form or size). Failure to do so will lead to a sector that distorts either consumption or supply to the point where the market deviates from its long-term equilibrium. This deviation tends to be associated with increased hidden and long-term costs, which in turn lower the competitiveness of the entire economy.

### ***Significant levels of subsidisation across the WB6 are distorting the market***

One main area of concern for subsidisation in the WB6 energy market is the systemic subsidisation of coal-fired power generation across most of the region. Miljević (2020<sup>[18]</sup>) estimates that taken together, Bosnia and Herzegovina, Kosovo, Montenegro, North Macedonia, and Serbia provided EUR 72.71 million in direct subsidies to coal and lignite electricity producers in 2019. However, it should be noted that this level of subsidisation has been significantly reduced from the nearly EUR 165 million provided in 2015. Overall, this subsidisation distorts the energy market in the WB6 by artificially increasing the economic viability of coal-fired generation and lowering energy prices. Furthermore, this subsidisation is counterproductive to the region's aim of reducing carbon emissions and of subsidising renewable energy and energy efficiency, since it increases the financial support required to make renewable energy or energy efficiency viable.

Another concern is the market distortion arising from the blanket use of universal suppliers to supply small consumers, and exclusive generation contracts between generators and universal suppliers. The functional impact of these two practices is a reduction in market liquidity and thus a weakening of the economic forces that drive efficiency in a competitive energy market to lower prices. Moreover, the use of universal suppliers to supply all households and small consumers is often associated with low prices—possibly below market prices—which then have to be offset by higher prices for industrial consumers or through state subsidisation. This can also take the form of regulated retail prices that do not reflect market prices. Overall, lower prices push household, small industrial, and commercial consumer demand above the optimal level, and the cost of this distortion is carried in one way or another by the economy. Ultimately, these practices introduce inefficiencies into the market that negatively affect economic competitiveness.

Another form of subsidisation in the WB6 region is differentiation of payment for electricity consumption, in particular for public entities. In Albania, Kosovo and Serbia the different payments approach for public entities has largely resulted in transferring the cost of their electricity consumption to wider society. This means these entities' consumption is distorted from their efficient level, and the cost of this deviation is carried by society.

Albania demonstrates yet another subsidisation practice present in the WB6 – the existence of outstanding payments between non-energy sector stakeholders and energy stakeholders, outstanding payments among energy stakeholders, as well as outstanding payments owed by energy stakeholders to the government. These outstanding payments are a form of subsidisation as they imply that the costs associated with their activities are not paid and thus that the entities had lower operational costs than other non-state entities. This in turn leads to distorted demand and sub-optimal market outcomes.

Also of particular interest are exemptions in Bosnia and Herzegovina and Kosovo for renewable generators to bear full responsibility for their electricity imbalances.<sup>9</sup> Taking Kosovo as an example, the legislation governing renewable energy stipulates that renewable generators need only pay 25% of their imbalance cost. While in general financial support is seen as necessary for aiding renewable generation growth, this particular subsidisation approach encourages renewable generators to forgo good forecasting practices to the extent where imbalances become greater. These increased imbalances create a security of supply risk, and avoidable extra costs that end up being carried by society or specific groups of consumers in a non-transparent manner.

A final form of subsidy in the WB6 is the use of congestion revenues for reducing transmission tariffs. In essence, international trade flows are subsidising domestic consumers. Since regional integration is a key consideration for the WB6 energy markets and their liquidity, congestion revenues should, in line with EU good practices, be used to increase or maintain cross-border interconnection capacity and to reduce regional or national congestions. However, the use of revenue to reduce transmission tariffs is not prohibited by EU regulations.<sup>10</sup>

### ***The way forward for energy incentives***

Overall, the WB6 should strive to keep market interventions to a minimum—in particular subsidies. Of course, certain types of subsidies are inevitable, such as those for vulnerable customers and renewable energy generation, or those in places where markets fail to consider long-run externalities. However, beyond those exceptional circumstances, money spent on subsidisation largely distorts markets that inevitably costs society both directly in terms of the value of the subsidisation and indirectly through the loss of efficiency in market-driven outcomes. Therefore, the WB6 economies should:

- **Eliminate the subsidisation of fossil fuels—in particular coal and coal-fired generation.** This is particularly important given the rise of climate pressures on energy markets and the associated subsidisation of renewable energy. While both are supported simultaneously, subsidising coal is counterproductive to the subsidisation scheme for renewable energy as it increases the need for financial support for renewables.
- **Undertake an extensive information campaign** which highlights the need to reduce subsidies—including large-scale or blanket subsidies for consumers.

### **Conclusion**

Overall, the WB6 economies have made good progress in establishing the foundations for competitive energy markets by developing extensive legislation, regulation and policy frameworks. The focus now needs to be on implementing and deploying these frameworks. This includes measures to ensure non-discriminatory access to the markets, promotion of competition—including reducing the dominance of incumbents—and perhaps most importantly, deploying organised markets together with the promotion of regional integration and coupling. Overall, these measures will ensure that markets are driven by competition, and thus will lead to the most cost-effective approach to energy in the WB6. This in turn would support the wider competitiveness of the economies in general, given the importance of energy in any value chain.

Improvements in energy supply security have been slow and renewable energy deployment and energy efficiency improvements are still very much in their early stages. Tackling these will help ensure access to a stable, quality supply of energy on a business level, while diversifying energy sources and supply options on the macro level. Finally, the WB6 economies are only at the beginning of creating a sustainable energy sector.

## Notes

<sup>1</sup> The 11 Central and Eastern European countries (CEECs) joining the European Union: Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>2</sup> Under EU Regulation 2018/1999 on the Governance of the Energy Union and Climate Action, all EU Member States are required to draft a National Energy Climate Plan (NECP) every two years. The NECPs are integrated plans that require co-ordinated government planning and should cover five areas: 1) Energy efficiency; 2) renewable energy; 3) Greenhouse gas emissions (reduction); 4) interconnections, and 5) research and innovation. The drafting requirement was extended to the Energy Community Contracting Parties—including WB6 economies – through the adoption of Ministerial Council Recommendation 2018/1/MC-EnC. For more information please see [https://ec.europa.eu/energy/topics/energy-strategy/national-energy-climate-plans\\_en](https://ec.europa.eu/energy/topics/energy-strategy/national-energy-climate-plans_en) and <https://www.energy-community.org/regionalinitiatives/NECP.html>.

<sup>3</sup> The Trans Adriatic Pipeline (TAP) connects Italy, Albania, and Greece to the Trans-Anatolian Natural Gas Pipeline so that supplies from Azerbaijan can be transported via Turkey and Georgia to these economies. The TAP started commercial operations on 15 November 2020. For more information see <https://www.tap-ag.com>. It should be stressed that prior to TAP, Albania did have some domestic natural gas supply and consumption. According to Instat (Instat, 2021<sup>[24]</sup>) natural gas consumption accounted for around 2% of primary energy consumption. This share is expected to rise now that TAP has started commercial operations.

<sup>4</sup> Oil indexation was once the dominant pricing format for natural gas in Europe. This largely reflected that at the time, natural gas spot markets were not liquid enough to provide good price signals. Moreover, natural gas was competing with oil consumption in power generation and heating and oil indexation was a good approach to ensure that natural gas was competitive with the main alternative fuel. Oil indexation is often also justified due to natural gas being a by-product of oil exploration or by natural gas investment competing with oil for capital investment. However, oil indexation implies that in the current market situation the natural gas price does not reflect the supply and demand realities which are largely now disconnected from oil, both in terms of alternative demand and on the production side. Furthermore, Europe has a variety of liquid natural gas spot markets that offer good pricing and indexation points, especially considering the interconnected nature of Europe's natural gas markets. There is an extensive literature on the benefits and drawbacks of natural gas being priced via oil indexation; this endnote only scratches the surface. Some examples of the literature are: (Dubreuil, Gergely Molnar and Jeon, 2020<sup>[19]</sup>), (European Commission, 2015<sup>[20]</sup>), (Melling, A.J. (2010), Natural gas pricing and its future- Europe as the battleground, 2010<sup>[22]</sup>), (IEA, 2020<sup>[21]</sup>), and (Stern, 2007<sup>[23]</sup>).

<sup>5</sup> A Guarantee of Origin certificates mechanism is operational in Serbia. The Serbian transmission system operator is the issuing body and has been a member of the Association of Issuing Bodies (AIB) since September 2019. In November 2020, the Serbian transmission system operator connected to AIB HUB, which allows exchange (import and export) of Guarantee of Origin certificates between Serbia and other AIB members.

<sup>6</sup> It should be stressed that in the context of the Berlin Process the WB6 economies have committed to “Prioritise energy efficiency and improve it in all sectors” (Berlin Process, 2020<sup>[11]</sup>).

<sup>7</sup> As per EU regulation 2019/944 Article 27, a universal supplier is a designated entity charged with the duty to make sure that all households (and if applicable small enterprises) have access to electricity at specified quality at competitive, easily and clearly comparable transparent and non-discriminatory prices.

<sup>8</sup> A power exchange, also referred to as an energy exchange, is a multi-layered system operated by a market operator that facilitates the trading/exchange of energy between third party buyers and sellers. Such markets can include wholesale markets with day-ahead, intraday and futures markets.

<sup>9</sup> Imbalances refer to the difference between the nominated versus actual consumed, generated or supplied electricity. More precisely, EU regulation 2019/943 Whereas (15) defines imbalances to be the “difference between the allocated volume and the final position in the market”. Furthermore, Article 5 of the same regulation states that “all market participants shall be responsible for the imbalances they cause in the system”. For more information please see (Emissions-EUETS.com, 2021<sup>[25]</sup>).

<sup>10</sup> See EU Regulation 714/2009, Article 16, Paragraph 6.

# 16 Environment policy (Dimension 13)

---

This chapter assesses the quality of legal and policy frameworks for the environment, and the extent of their implementation, in the six Western Balkan economies (WB6). The chapter analyses three sub-dimensions built around the OECD Green Growth Indicator framework, the European Commission's EU *acquis* indicators and the United Nations Sustainable Development Goal indicators. The first sub-dimension, resource productivity, assesses how policies facilitate efficient material resource use in production and waste generation and the extent to which they combat climate change. The second sub-dimension, natural asset base, examines to what extent the economies' natural assets are being preserved for future generations. The third sub-dimension, environmental quality of life, assesses the impact of environmental conditions and risks on people's quality of life and well-being.

---

## Key findings

- **Climate change adaptation measures are gradually being introduced across the region, though climate change mitigation efforts need to be scaled up.** Major climate-related risks are being identified throughout the region but renewable energy targets and schemes are lacking.
- **Air pollution remains one of the main environmental challenges in the region, with PM<sub>2.5</sub> levels two to three times above the maximum limits recommended by the World Health Organization. However, some progress has been achieved** thanks to relatively well-developed legislative frameworks, local air quality plans, upgraded monitoring systems and awareness-raising activities.
- **All WB6 economies have adopted policy frameworks for biodiversity conservation.** Plans for endangered species and protected areas have also been adopted in most WB6 economies. Nevertheless, biodiversity and forestry monitoring systems and public inventories are rarely in place, which impedes proper implementation.
- **The groundwork for the freshwater management legislative framework has been done** in most assessed economies. However, international co-ordination of transboundary river basins has primarily been driven by donors rather than WB6 economies. Although all assessed economies have a legal framework for planning and managing hydropower plants (the main source of renewable energy in the region), in practice mandatory environmental impact assessments have largely been circumvented.
- **Water supply and sanitation systems remain inadequate.** Investments are ongoing but water service fees remain too low to cover or complement the infrastructural investment costs and water supply services. Moreover, insufficient institutional capacities and poor co-ordination among responsible local authorities impede implementation of water management measures.
- **There have been no major changes to land-use frameworks** in most assessed economies, except for North Macedonia. Progress has been observed in Albania, the Republika Srpska (RS) in Bosnia and Herzegovina, and Kosovo, where municipal development plans are being prepared together with local municipalities to foster sustainable territorial development and rational land use.
- **Recycling rates of municipal waste remain extremely low** across the region. They are less than 5% for all economies except for Albania (18.5%) and significantly lower than in the European Union (47%). Some actions have been undertaken on waste management and to develop a circular economy. However, there are no specific policy frameworks. Serbia is the only economy to have adopted a circular economy roadmap.
- **Industrial waste management frameworks could improve further** and the policy and legislative bases for soil protection are almost non-existent. Progress on identifying contaminated areas has only been recorded in Kosovo and Montenegro.
- **Unregulated burning and illegal dumping of waste** is still prevalent in the region, posing problems to the environment and public health through groundwater, soil and air pollution. Some projects are being implemented to clean up and combat illegal landfills, but progress has been limited.

## Comparison with the 2018 assessment

Since the last assessment, the six Western Balkan (WB6) economies have slightly improved their scores in the environment policy dimension (Figure 16.1). While the situation in Bosnia and Herzegovina<sup>1</sup> has improved, its score is still the lowest of all the assessed economies. Montenegro and North Macedonia have made the most progress between 2018 and 2021 and rank first and second respectively in the Western Balkan region for environment policy.

**Figure 16.1. Overall scores for the environment policy dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition of new sub-dimensions and relevant qualitative indicators, and removal of some sub-dimensions and qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

There has been only limited progress overall on implementing the policy recommendations made in the CO 2018 (Table 16.1), although there are large differences in implementation across economies. Moderate advances have been made in accelerating the transition to a low-carbon economy, but improvements in defining clear roles and responsibilities at local levels, strengthening natural asset management, and institutionalising the collection of key environmental data are limited.

Table 16.1. Implementation of the CO 2018 policy recommendations: Environment policy

Competitiveness Outlook 2021		
CO 2018 policy recommendations	Main developments during the assessment period	Regional progress status
Integrate environmental considerations and international commitments into the main economic and sectoral policies	<ul style="list-style-type: none"> <li>Progress has been achieved in harmonising legislation with the EU <i>acquis</i>, in particular air quality and industrial risks and accidents.</li> <li>Very little progress has been achieved in translating multilateral environmental agreements into relevant policy frameworks, such as the UN Convention to Combat Desertification.</li> </ul>	Limited
Accelerate the transition to a low-carbon and circular economy	<ul style="list-style-type: none"> <li>Climate change goals have been integrated into energy strategies in Bosnia and Herzegovina and North Macedonia and in the transport strategy in Albania.</li> <li>Serbia has developed a roadmap for circular economy commitments and Albania and North Macedonia are preparing documents that will include a circular economy framework.</li> <li>Some actions have been taken, such as improving recycling rates of packaging waste and introducing extended producer responsibility in some WB6 economies (North Macedonia, Republika Srpska in Bosnia and Herzegovina, and Serbia).</li> <li>The current energy mix is still highly dependent on fossil fuels and only a few renewable energy targets have been set.</li> </ul>	Moderate
Increase the use of economic instruments to incorporate environmental costs and benefits into budgets	<ul style="list-style-type: none"> <li>Although the polluter pays principle is legislated, it is still not applied effectively.</li> <li>Coal is still subsidised in some WB6 economies (Kosovo, Serbia) and renewable support schemes remain weak.</li> <li>Across the WB6, waste disposal and water tariffs are too low to cover service costs (including infrastructure construction and maintenance). Projects remain largely dependent on donor funding.</li> </ul>	None
Define clear roles and responsibilities in the institutional frameworks for environmentally sustainable development to strengthen policy implementation, enforcement and compliance	<ul style="list-style-type: none"> <li>Poor domestic co-ordination among water-related public institutions is hampering proper policy implementation (including international projects).</li> <li>Forestry legal and policy frameworks are in place, but local forest management human and financial capacities are insufficient which limits proper enforcement and compliance (especially for tree logging and forest fires).</li> <li>In terms of land use, Albania, Kosovo and the Republika Srpska in Bosnia and Herzegovina are preparing municipal land development plans together with local municipalities, which aim to foster sustainable territorial development and rational land use.</li> </ul>	Limited
Improve framework conditions for green investment and innovation	<ul style="list-style-type: none"> <li>Measures to provide incentives for businesses to adopt greener technologies remain sporadic and are still largely lacking in the region.</li> <li>One exception is Serbia's recently adopted roadmap for a circular economy which encourages industry to innovate, increases market opportunities for production through circular business models, creates new jobs and improves the business climate while preserving the environment.</li> <li>For more please see sub-dimension 1.3 on green investment in the investment chapter (Dimension 1).</li> </ul>	Limited
Strengthen natural asset management	<ul style="list-style-type: none"> <li>Implementation of water management strategies has been limited. Donors have driven the international co-ordination of transboundary river basins, but efforts are hampered by poor domestic as well as intraregional co-ordination.</li> <li>Local authorities' resources are limited for capacity building and to strengthen forest management and law enforcement. National forest inventories are lacking in Bosnia and Herzegovina, Kosovo and North Macedonia.</li> <li>No major changes were recorded to land-use legislative and policy frameworks (except some progress in the legislation of North Macedonia).</li> </ul>	None
Institutionalise the collection of key environmental statistics, and policy monitoring and evaluation activities	<ul style="list-style-type: none"> <li>Overall, there is insufficient timely and accurate data for the government to design and monitor progress in implementing environmental policies.</li> <li>Progress has been made in monitoring and collecting data on air quality and biodiversity (new monitoring stations and improved information systems) in most WB6 economies.</li> <li>Data and projections for water demand in the agriculture and industry (including energy) sectors and from households are not available and consequently do not guide decisions about handling competing uses.</li> <li>Progress in collecting key forestry statistics has been made in Montenegro and Serbia. Land-use data are still largely lacking across the region.</li> </ul>	Limited

## Introduction

Climate change is increasingly affecting people's lives, disrupting economies and transforming ecosystems. Considering the Western Balkans' vulnerability to the impacts of climate change, building resilience to natural disasters and other environment-related risks will be necessary for the region's economic growth and people's well-being. To develop and maintain their competitiveness (especially in the long run), the WB6 economies need to pursue green growth, i.e., sustaining economic growth while safeguarding their natural assets to maintain the environmental services on which their citizens' well-being depends. By aiming to achieve the net-zero goal for greenhouse gas emissions and mainstreaming environmental considerations into all areas of policy, including by adopting a circular economy, the WB6 can increase their efficiency and competitiveness, spurring green innovation, new markets and jobs. Current business models need to adapt to account for climate change, resource bottlenecks, air and water pollution, and irreversible biodiversity loss (OECD, 2017<sup>[1]</sup>).

The Competitiveness Outlook's environment policy dimension assesses the WB6's key environmental characteristics, and their policies to protect natural resources and facilitate their sustainable use. Policies that affect the environment are cross-cutting, meaning that policy design and implementation need to be well integrated into key economic and sectoral policies – both vertically (international, central, local) and horizontally (inter-sectoral and across line ministries) – including energy, transport, agriculture, and health. Therefore, this chapter is related to all other dimensions in the Competitiveness Outlook, but has strongest links to the following:

- **Chapter 4. Investment policy and promotion** is key to enabling an economy to establish a specific environment that is conducive to scaling up green investments to support green growth.
- **Chapter 7. Tax policy** can offer incentives for adopting environment-friendly technologies and discouraging harmful practices.
- **Chapter 14. Transport policy** is an essential component for reducing emissions across the region through sustainable transport frameworks, containing adequate rules and options for green fuel and car models. Environment policy is also directly related to the impact assessment for constructing transport infrastructure.
- **Chapter 15. Energy policy** and power generation have impacts on air, water and land and account for large shares of WB6 economies' greenhouse gas emissions. Hence, energy policy frameworks need to be fully aligned with climate change objectives, and policies supporting energy efficiency and renewable energy sources need to be implemented.
- **Chapters 17 and 18. Agriculture and tourism** depend on high-quality natural assets and are particularly vulnerable to the negative effects of air, land, and water pollution as well as climate change – for instance ambient air pollution can reduce crop yields, and litter can deter tourists. In turn, these sectors also use natural resources and can be sources of local and transboundary pollution; their activities must therefore be managed to minimise any negative environmental impacts.

## Assessment framework

### Structure

This chapter examines policies to facilitate greener growth in the WB6 by assessing three broad sub-dimensions:

1. **Sub-dimension 13.1: Resource productivity** assesses how policies facilitate efficient material resource use in production and waste generation and the extent to which they combat climate change.
2. **Sub-dimension 13.2: Natural asset base** focuses on the extent to which natural assets are being preserved and managed for the economy and future generations (especially freshwater, biodiversity, forestry and land).
3. **Sub-dimension 13.3: Environmental quality of life** examines how environmental conditions affect people's health and quality of life by measuring air pollution frameworks, water supply and sanitation systems, and industrial waste management.

The three sub-dimensions are based on the OECD Green Growth Indicator framework (Box 16.1) and indicators are also directly linked to the United Nations Sustainable Development Goals. The OECD supports the United Nations in ensuring the success of the 2030 Agenda for Sustainable Development by bringing together its existing knowledge, and its unique tools for monitoring performance. Figure 16.2 shows how the sub-dimensions and their indicators make up the environment policy dimension assessment framework.

The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more information on the methodology see the Assessment methodology and process chapter.

#### Box 16.1. Green Growth Indicator Framework

The CO environment dimension's assessment framework is based on the OECD Green Growth Indicator (GGI) framework, developed by the OECD in the 1990s (last updated in 2017).

**Sub-dimension 13.1: Resource productivity** corresponds to GGI area 1. "Environmental and resource productivity - How productive is the economy in using natural capital? Indicates whether economic growth is becoming greener with more efficient use of natural capital and to capture aspects of production which are rarely quantified in economic models and accounting frameworks."

**Sub-dimension 13.2: Natural asset base** corresponds to GGI area 2. "Natural asset base - Are we preserving the natural asset base of our economy? Indicates the risks to growth from a declining natural asset base."

**Sub-dimension 13.3: Environmental quality of life** corresponds to GGI area 3. "Environmental dimension of quality of life – How does environmental quality interact with people's health and lives? Indicates how environmental conditions affect the quality of life and wellbeing of people."

The overall assessment also considers GGI area 4. "Economic opportunities and policy responses – are policies effective in delivering green growth? Indicates the effectiveness of policies in delivering green growth and describe the societal responses needed to secure business and employment opportunities." It also assesses whether tools to complement environmental policies are in place and how efficiently and effectively they are implemented.

By using the GGI framework, this assessment leverages the decades of work at an international level to assess the environment in a way that is internationally comparable and joins over 130 green growth publications in OECD and partner economies.

Goal 6: Ensure availability and sustainable management of water and sanitation for all.

The leaders of the WB6 endorsed the Common Regional Market (CRM) 2021-2024 Action Plan (AP) at the Berlin Process Summit held on 10 November 2020 in Sofia. The Action Plan is made up of targeted actions in four key areas: 1) a regional trade area; 2) a regional investment area; 3) a regional digital area; and 4) a regional industrial and innovation area.

The regional industrial and innovation area includes a component on green and circular economy value chains (Priority 8.4). As part of this area, the WB6 economies commit to closely transform their industrial sectors, shape their value chains and prepare them for the realities of today and the challenges of tomorrow. The findings in the resource productivity sub-dimension, and in particular the circular economy indicator, can inform the implementation of the actions under this component (Box 16.3).

### **Key methodological changes to the assessment framework**

The CO 2021 environment policy dimension assessment framework has been slightly redesigned and restructured since the 2018 edition. It now 1) includes the key priorities of the EU Green Deal (European

Commission, 2019<sup>[3]</sup>), such as the increasing importance of a circular economy; and 2) places a stronger focus on measures to build resilience to climate change-related natural disasters, which present a growing challenge for the WB6. The sub-dimension on “policies for green growth”, present in the 2018 assessment, has been removed and integrated into the three other sub-dimensions.

## Environment policy performance and context in the WB6

Outcome indicators assess the performance of overall framework conditions for enabling businesses to be competitive while taking environmental concerns into account. The WB6 lack data for measuring outcome indicators such as environmentally adjusted economic productivity (carbon, water or material productivity). Moreover, greenhouse gas (GHG) inventories have not been conducted by the WB6 during the assessment period. Instead, the composition of value added between economic sectors (Figure 16.3) sets the broader context for looking at green growth, as economic sectors use natural capital and pollute in different ways. The industry sector includes energy, mining, and construction – as such, it is the most resource-intensive economic sector. The agriculture sector uses significant amounts of land and water, and agricultural inputs may be a source of pollution. The service sector is the least resource intensive.

Services contribute the greatest share of value added in the WB6 economies, accounting on average for about 52% of gross domestic product (GDP) (Figure 16.3). However, this share is smaller than in the OECD and CEEC-11,<sup>2</sup> where services contribute about 70% and 58% respectively on average. Industry contributes about 23% to value added in the WB6, as in OECD and EU countries. Agriculture’s share in the six economies accounts for 8.5% on average, ranging between 5.6% in Bosnia and Herzegovina to 18.5% in Albania. This is significantly larger than OECD and CEEC-11 averages, which are each at about 1.4% and 2.7% respectively.

**Figure 16.3. Composition of value added by economic sector (2019)**

StatLink  <https://doi.org/10.1787/888934254810>

Air quality is still a predominant concern in the region, with pollution levels ranking among the highest in Europe – see Environmental quality of life (Sub-dimension 13.3) and Figure 16.12. These levels are of even greater concern in the context of the COVID-19 pandemic. Exposure to ambient and indoor air pollution increases the risk of cardiovascular, respiratory and developmental diseases, as well as premature death, thus making individuals even more vulnerable to COVID-19 (OECD, 2020<sup>[5]</sup>). Moreover, non-OECD, non-EU European economies, including the WB6, are among the most susceptible to changes in crop yields caused by air pollution, especially wheat, with a model predicting yield decreases of up to 20% by 2060 (OECD, 2016<sup>[6]</sup>). Given that agriculture accounts for a considerably larger portion of the WB6 economies than in the OECD, these economies could be particularly vulnerable to the negative effects of air pollution.

### Resource productivity (Sub-dimension 13.1)

This first sub-dimension assesses whether policies facilitate efficient material resource use in production and waste generation and the extent to which they address climate change goals. A high level of resource productivity safeguards the environment by reducing the amount of resources an economic activity requires and thereby lessening the associated environmental impacts; it also improves resource security and strengthens economic competitiveness (OECD, 2016<sup>[7]</sup>). Three qualitative indicators are used to assess resource productivity in the six WB economies. These explore the existence and degree of implementation of frameworks for: 1) climate change adaptation and mitigation; 2) a circular economy; and 3) municipal solid waste management (Table 16.2).

Performance across all WB6 economies is similar for the resource productivity sub-dimension (Table 16.2), although Montenegro has made the most progress since the previous assessment. On average, the six economies score 2.0 overall, indicating that relevant policy frameworks have been adopted. Nevertheless, they have considerable potential for using their available natural resources more productively. Climate change mitigation and adaptation as well as municipal solid waste management are equally advanced with overall scores of 2.3, indicating that policy frameworks are in place, challenges have been identified and implementation has begun. However, circular economy initiatives are still at an early stage of development, and although some actions have been taken, policy frameworks are still largely lacking throughout the region.

**Table 16.2. Scores for Sub-dimension 13.1: Resource productivity**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 13.1: Resource productivity	Climate change mitigation and adaptation	2.0	2.0	2.0	2.5	3.5	2.0	2.3
	Circular economy framework	1.0	1.5	1.0	1.0	1.0	2.0	1.3
	Municipal solid waste management framework	2.5	1.5	2.5	2.5	2.5	2.5	2.3
<b>Sub-dimension average score</b>		1.8	1.7	1.8	2.0	2.3	2.2	2.0

### ***Climate change adaptation legal and policy frameworks are gradually being introduced***

Electricity generation and heat production account for the majority of carbon dioxide (CO<sub>2</sub>) emissions in the six economies – ranging from 61.4% in Montenegro to almost 75% in Kosovo (Box 16.4) – followed by the transport sector, which accounts for around 18% on average. The exception is Albania, where 60% of its CO<sub>2</sub> emissions come from transport, as almost 100% of its electricity generation comes from hydropower.

**Figure 16.4. CO<sub>2</sub> emissions by sector (transport, electricity and heat production)**% of total CO<sub>2</sub> emissions

StatLink  <https://doi.org/10.1787/888934254829>

Climate change adaptation legal and policy frameworks are being gradually introduced across the six economies, while climate change mitigation efforts need to be stepped up. Albania (2021), Montenegro (2019), and Serbia (2021) have recently adopted laws on climate change which establish the institutional frameworks and rules for monitoring, reporting and verifying greenhouse gas (GHG) emissions. While Bosnia and Herzegovina (BIH), Montenegro and North Macedonia already had climate change strategies in place, Albania and Kosovo have adopted climate change strategies and related action plans on mitigation and adaptation since the last assessment. This leaves Serbia as the only economy that has not adopted a long-term strategy that encompasses energy and climate targets, although it was developing the integrated National Energy and Climate Plan (NECP) at the time of drafting.<sup>3</sup> Climate change goals have been integrated into sectoral strategies in Albania (transport), Bosnia and Herzegovina (energy), and North Macedonia (energy). North Macedonia was preparing a long-term strategy on Climate Action to 2050 at the time of drafting and is the first contracting party under the Energy Community to integrate the pillars of energy and climate into its national energy strategy (European Commission, 2020<sup>[9]</sup>). Further alignment is needed by Bosnia and Herzegovina and Kosovo (especially with regards to transport, industry and agriculture policies). No systematic monitoring and evaluation of the strategies are conducted in Bosnia and Herzegovina or Kosovo, while Albania and Serbia plan to do so under their recently adopted laws on climate change.

Apart from Kosovo, all WB6 economies are Non-Annex I signatories to the UN Framework Convention on Climate Change (UNFCCC) and its Paris Agreement and are also parties to the Kyoto Protocol. As requested by the Paris Agreement, the five economies have submitted their Nationally Determined Contributions (NDCs), which are currently being updated. All five economies have to submit regular reports in the form of national communications and Biennial Update Reports to the UNFCCC. Nevertheless, the frequency of these reports varies considerably among the economies (UNFCCC, n.d.<sup>[10]</sup>).<sup>4</sup> As for Kosovo, its Energy and Climate Plan (2021-2030), which was being developed at the time of drafting, should set GHG emission reduction targets.

In general, the transition to renewables has been progressing very slowly in the region. While Albania's new Law on Climate Change sets a 32% renewable energy target by 2030, North Macedonia has revised its original 28% renewable energy target downwards to 23.9% of gross final energy consumption. As in

the last assessment, most of the renewable energy produced in the region comes from hydroelectricity, despite the great untapped potential for renewable energy in all the economies, especially solar and wind (see Energy policy chapter).

Major climate-related risks have been identified in Bosnia and Herzegovina, Kosovo and North Macedonia as well as to some extent in Albania and Serbia.<sup>5</sup> In Montenegro, the Ministry of the Interior is currently preparing a disaster risk assessment which will cover major climate change-related risks. The WB6 have also undertaken actions related to water-related disasters, and floods in particular. Some flood risk management measures have been implemented through the regional project Adaptation to Climate Change through Transboundary Flood Risk Management in the Western Balkans (2016-2020).<sup>6</sup> However, other natural disasters, such as earthquakes, have not been taken as much into consideration in the region.

### ***Circular economy frameworks remain underdeveloped in the region***

Limited progress has been achieved in developing circular economy frameworks in all WB6 economies except for Serbia. With an average of 1.3, scores for the circular economy framework are the lowest for all indicators in the environment policy dimension (Table 16.2).

In all six economies except Montenegro, waste generation per capita remains below the EU and OECD averages (Figure 16.5). Nevertheless, very little has been done to decrease the amount of waste and volumes are increasing constantly. Recycling rates for municipal waste in all six economies also remain extremely low (Figure 16.6). Albania recycles around 18.5% of its municipal waste, which is the highest rate in the WB6 region, but still significantly lower than the European Union average (47%). All other assessed economies recycle less than 5% of their municipal waste, and the rest is largely landfilled. Only a few recycling centres exist, although new recycling yards and sorting plants are being constructed throughout the region. Some progress has been achieved since the last assessment: North Macedonia has increased the recycling rate of its packaging waste, the RS in BiH has established a packaging waste management system and introduced extended producer responsibility, and Serbia has a new regulation for reducing packaging waste (2014-2020). According to relevant authorities, the recycling industry is currently gaining momentum in Kosovo as the private sector takes advantage of a lucrative opportunity for exporting secondary material within the region and to several EU Member States. In addition, awareness-raising activities on recycling are organised in schools throughout the WB6, though on a rather ad-hoc basis.

In 2020, Serbia was the first WB6 economy to have prepared a roadmap for a circular economy, which it aims to harmonise with EU recommendations (Box 16.2). North Macedonia is preparing a new Law on Waste, which should promote the circular economy and the use of secondary raw materials, in line with the EU *acquis* in this area. The Albanian government also plans to revise its legislative framework in this area, such as through the new law on extended producer responsibility, which is slated for adoption during 2021 and which will promote a circular economy. The legislative framework in all other economies is being developed, although the topic of circular economy is mostly covered indirectly in different strategies.

The findings of this assessment are also relevant for the WB6 economies' implementation of the Common Regional Market Action Plan, which includes a component on green and circular economy value chains (Box 16.3).

### Box 16.2. Serbia's roadmap for a circular economy

A Special Working Group for a Circular Economy (CE) within the Ministry of Environmental Protection developed a Roadmap for a Circular Economy in Serbia in April 2020. This important guiding document outlines courses of action for the transition from a linear to circular economy in Serbia. It is modelled on similar documents developed in EU countries, such as Finland, France, the Netherlands, Slovenia and Spain. In order to be fully aligned with the EU's newly adopted documents (the Green Deal and the new Circular Economy Action Plan), this initial document will be harmonised with EU recommendations. The working group will undertake a range of activities for this purpose, including developing an updated Circular Economy Roadmap 2.0.

The aim of the roadmap is to initiate a dialogue between decision makers and representatives of industry, academia and civil society in order to encourage industry to innovate, increase market opportunities for production through circular business models, create new jobs and improve business while preserving the environment. It aims to encourage the whole of society to adopt radical changes in their attitudes towards resource limits. The roadmap is accompanied by a communication plan that contains measures to raise public awareness on CE and whose main goal is to inform and involve as many actors as possible and thus achieve broad social consensus for implementation.

The key drivers for developing the roadmap are grouped into four main areas:

- 1) **Economic:** boosting competitiveness, market development, (horizontal) economic diversification and development, and application of new business models and new technologies.
- 2) **Political:** regional positioning, creating a national political consensus, pursuing the EU accession process and implementing various international obligations on environmental protection and climate change.
- 3) **Environmental:** reducing waste, reducing GHG emissions, conserving natural resources, and improving energy independence and the use of renewable energy.
- 4) **Social:** improving social welfare, improving consumer rights, decreasing household budgets, improving people's health and creating green jobs.

Source: (Government of Serbia, 2020<sup>[13]</sup>), *Roadmap for a Circular Economy*, <https://www.ekologija.gov.rs/sites/default/files/2021-01/mapa-puta-za-cirkularnu-ekonomiju-u-srbiji.pdf>.

### Box 16.3. Towards green and circular economies in the Common Regional Market

The regional industrial and innovation area of Common Regional Market (CRM) 2021-2024 Action Plan includes a component on green and circular economy value chains (Priority 8.4). The following key findings of the CO 2021 resource productivity sub-dimension, and in particular the circular economy indicator, can inform the implementation of the actions under this component:

- With the adoption of its Roadmap for a Circular Economy in 2020, Serbia is the first economy in the region to prepare such a document, in line with its EU commitments.
- In all other economies, circular economy, sustainable production, and consumption standards are not yet established.
- Albania and North Macedonia are in the process of preparing documents to promote a circular economy framework.
- The legislative framework in other economies is being developed, although the topic of circular economy is mostly covered indirectly in different strategies and thus not supported by proper implementation.
- Some specific actions have been taken in some economies, such as improving recycling rates of packaging waste and introducing extended producer responsibility mechanisms. Implementation remains limited otherwise.

### ***Municipal solid waste strategies are in place and starting to be implemented***

Municipal solid waste management safeguards the environment and public health. All six economies have strategies that lay out objectives for municipal solid waste management, and implementation has begun. Since the last assessment, Albania has adopted two waste management strategies<sup>7</sup> (in 2019 and 2020) and laws and strategies are being revised in Kosovo, Montenegro and Serbia to transpose the relevant EU directives. Serbia's implementation is quite advanced thanks to its good institutional capacity and strong co-ordination with local authorities. However, although mechanisms for monitoring implementation or targets are envisaged in the strategies, they are largely lacking in all assessed economies.

Across the WB6, waste disposal tariffs are too low to cover the costs of municipal waste collection, let alone the costs of infrastructure construction or maintenance. Consequently, waste collection and treatment infrastructure remains largely dependent on donor funds, which impedes regular maintenance (Eunomia, 2017<sup>[14]</sup>). In a positive move, Albania has developed a new methodology to calculate waste management costs, which has improved its waste service.

Primary waste selection is almost non-existent throughout the region and there is no systematically organised separate collection, sorting or recycling of municipal waste. Nevertheless, waste separation at source has been slowly introduced since the last assessment in certain municipalities in Kosovo and Montenegro, and the RS in BIH has introduced "green islands" for the separate collection of waste in public areas. Moreover, there has been large-scale investment in new waste treatment facilities in Albania and Serbia.

The continued prevalence of unregulated burning and illegal dumping of waste in the region poses threats to the environment and public health through groundwater, soil and air pollution (UNECE, 2019<sup>[15]</sup>). Although all assessed economies have sanctions and mechanisms to report these practices in their legal frameworks, implementation has been weak. Some actions are underway to improve the situation: civil society organisations have been mapping illegal dumpsites across BIH and Montenegro; projects to clean up and combat illegal landfills have been implemented in Kosovo and Serbia; illegal dumpsites are being closed in BIH; and Albania's Waste Management Plan foresees replacing illegal dumpsites with 10 regional controlled landfill sites by 2028.

### **The way forward for resource productivity**

- **Improve waste management by enforcing measures to separate and reduce waste and increase recycling and recovery in line with circular economy principles.** The WB6 economies should strengthen their legal and policy frameworks for a circular economy in line with EU regulations. Serbia's Roadmap for a Circular Economy could serve as a model (Box 16.2). Governments need to step up enforcement efforts and strengthen co-operation with local governments to improve waste management.
- **Put in place educational and awareness raising activities for waste prevention, separate collection, waste reduction and recycling.** Public awareness and support are key factors in changing behaviour and thus for the success of waste policies. Good practice from OECD countries might serve as inspiration (Box 16.4).

#### **Box 16.4. Municipal waste management: public information and awareness raising in the OECD**

Educating young people can be a key pathway to raising public awareness. Several OECD countries have established environmental education initiatives. For example, Colombia's Communication and Environmental Agenda (2010-14) fostered educational projects on the environment across all school levels. Israel has a Green Education Project and also provides grants for "green schools" that promote resource efficiency and the separate collection of waste streams.

Poland's Ministry of Environment organised awareness campaigns such as "Don't Litter Your Conscience", which uses the character of a priest to tell parishioners to separate recyclable waste and not burn household waste in their gardens or dump it illegally. Campaigns and activities to address illegal dumping are carried out in Hungary, where the Ministry for Agriculture supports the "TsSzedd!" ("Pick up!") Campaign to raise awareness of sound waste management practices.

Civil society organisations can also play an important role in promoting public awareness. "Let's do it! My Estonia" is an independently organised annual day of community activities, including litter clean-up. In Slovenia, about 200 000 volunteers worked together in 2010 for "Let's clean Slovenia in one day", involving activities to clean up litter and illegal waste sites matched with environmental education.

Some OECD countries work via local government. In Israel, for example, the Ministry of Environmental Protection funds municipal activities for environmental education and awareness raising, and the country's 2010 Recycling Action Plan acknowledges the need for further actions to raise public awareness and change behaviour towards separate collection.

Working with business, including producer responsibility organisations (PROs), can play an important role in fostering public awareness of recycling. In Korea, voluntary agreements with business include activities to raise public awareness on waste reduction and recycling; the country's PROs spend between 1% and 5% of their profits on information and awareness campaigns.

Source: (OECD, 2019<sup>[16]</sup>), *Waste Management and the Circular Economy in Selected OECD Countries: Evidence from Environmental Performance Reviews*, <https://doi.org/10.1787/9789264309395-en>.

- **Establish a regional Green Start-up Network based on existing domestic start-up programmes.** As recommended in the CRM Action Plan (2021-2024); (Box 16.3), this network should identify key circular and green business opportunities and boost business networking. Good practice from the Interreg Europe Green Start-up Support (GRESS) project, financed by the EU, could serve as a good example for a WB6 green regional network (Box 16.5).

### Box 16.5. Green start-up support

The shift towards a low-carbon economy offers many business opportunities. The EU Small Business Act highlighted that the EU and Member States should enable small and medium-sized enterprises (SMEs) to exploit these opportunities. The objective of the Green Start-up Support (GRESS) project is to improve SMEs' competitiveness by strengthening capacities for the formation of sustainable and competitive start-ups and spin-offs within the green economy.

The partners (Bulgaria, Greece, Italy, Norway and Poland) apply a policy-learning process involving five steps: 1) mapping the status of green growth in each region; 2) scanning and exchanging experience and identifying good practice for mutual learning; 3) assessing and ranking relevant practices through peer assessments in Regional Stakeholder Groups; 4) generating ideas on policy interventions with interregional knowledge transfer; and 5) developing and monitoring regional action plans.

The resulting policies are envisaged to improve awareness of the opportunities for SMEs in the green and blue economy, increase the number of participants and improve the quality of training programmes for green start-ups, attract more SMEs to participate and succeed in public procurement for green products and services, improve SMEs' access to risk capital outside the local region, make cities and regions more attractive for young entrepreneurs in green sectors, launch incentive schemes for green start-ups, enhance the performance of ecosystems, and increase the number of competitive start-ups and spin-offs within the green economy and improve their chances of survival.

## Natural asset base (Sub-dimension 13.2)

This sub-dimension assesses the extent to which the natural asset base is being preserved for economic activity and for future generations. Safeguarding the quantity and quality of water, forest and biodiversity resources protects current and future public health and the livelihoods that depend on them. This entails effective management of resource supply and demand as well as balancing competing uses. Three qualitative indicators assess the presence and implementation of management frameworks for: 1) freshwater; 2) biodiversity and forests; and 3) land use.

On average, the WB6 economies achieved a score of 2.1 for the natural asset base sub-dimension (Table 16.3), signifying that the relevant policy frameworks are mostly adopted. Across these economies, biodiversity and forestry policies are the most advanced and implementation is beginning, but inventories and monitoring programmes are still lacking. Little progress has been achieved on land-use management frameworks and implementation is slow.

**Table 16.3. Scores for Sub-dimension 13.2: Natural asset base**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 13.2: Natural asset base	Freshwater management	2.5	2.0	2.0	2.0	2.0	2.0	2.1
	Biodiversity and forestry framework	2.5	1.5	2.5	3.0	3.0	2.0	2.4

### ***Freshwater management frameworks are hampered by poor co-ordination***

The Western Balkans are home to rich, diverse and interconnected transboundary freshwater resources, from the karstic regions of the Dinaric Alps and the Adriatic coast to the Danube, Drin and Vardar river basins and the ancient lakes of Ohrid, Prespa and Skadar. However, water resources are distributed

unevenly across the region (Figure 16.7) and are used differently by the assessed economies. In contrast to most OECD countries, where agriculture uses the largest share of water resources, in Albania, BIH, Kosovo and Montenegro, households account for the largest share (Figure 16.8). In Serbia, the industrial sector accounted for 75% of total freshwater abstractions in 2017, mainly for cooling purposes in electric power generation. Anthropogenic pressures on water resources, including water pollution resulting from insufficiently treated industrial and municipal wastewater, still raise key concerns in this area. Moreover, the lack of data and projections on water demand from agriculture, industry (including energy) and households in all assessed economies complicates decisions on handling competing uses now or in the future.

**Figure 16.7. Renewable internal freshwater resources per capita (2017)**

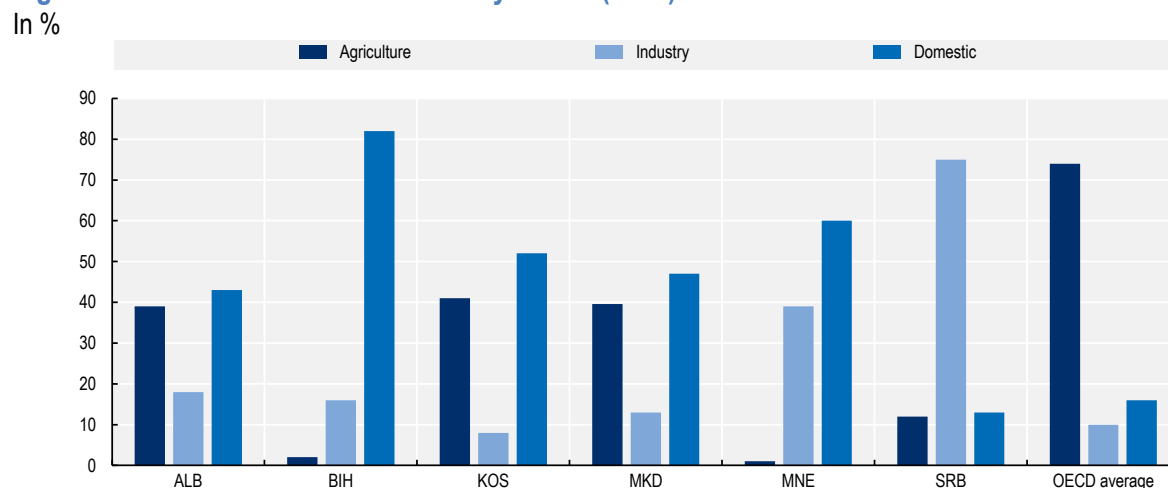

Note: Latest data available for each economy (2018-2020). EU data is from 2017.

StatLink  <https://doi.org/10.1787/888934254905>

The groundwork for the freshwater management legislative framework has been done in most of the assessed economies. Albania and North Macedonia have adopted new laws and strategies, though there

have been no major changes to the frameworks in BiH, Montenegro and Serbia. Kosovo's framework is still only partially developed and efforts need to be stepped up to complete it. Implementation has been rather limited throughout the region. Some positive developments have been noted in Montenegro, which has signed the new EU-Instrument for Pre-Accession Assistance (IPA) project on Support to the implementation and monitoring of water management. Kosovo has created reservoirs to improve drinking water supply, but their safety management is inadequate, especially in light of water stress resulting from climate change (European Commission, 2020<sup>[9]</sup>). Moreover, monitoring and evaluation mechanisms are largely lacking, except in Serbia which conducts annual water status monitoring.

The planning and management of hydropower plants, including a requirement for a detailed environmental impact assessment (EIA), are regulated by law in all assessed economies. However, the legal procedures have been largely circumvented in all six economies, in particular for mini hydropower plants. In practice, there are too many cases in which licences for hydropower plants are given before an EIA report is issued or without taking the EIA report into account. This problem is particularly important in Albania, as most of its nationally produced electricity comes from hydropower.

Donors have driven the international co-ordination of transboundary river basins,<sup>8</sup> but efforts are hampered by poor domestic co-ordination among water-related public institutions. River basin management systems involving co-operation with neighbouring economies have been developed since the last assessment in Albania, BiH, Kosovo and North Macedonia.

### ***Biodiversity and forestry frameworks are in place but laws are not properly enforced and inventories are mostly lacking***

The Western Balkan's richly varied geography is mirrored in the diversity of its flora and fauna. Moreover, the region's forests serve as valuable sources of income (timber and other forest products, agroforestry, and recreation) and reservoirs of biodiversity, which also provides social benefits. Forests in the WB6 cover a larger share of territory than in the average OECD country (Figure 16.9), with Montenegro being the most forest-rich economy, accounting for 61.5% of its territory. However, human pressures are major threats to protecting biodiversity and maintaining forestry resources, and include illegal logging, tourism, urbanisation, hydropower, pollution, illegal waste, as well as forest fires, climate change and invasive species.

Strong biodiversity and forestry frameworks are key to overcoming these challenges and conserving the region's ecosystems. All assessed economies have adopted policy frameworks for biodiversity conservation. North Macedonia adopted its National Biodiversity Strategy in 2018 and was drafting a new Law on Nature at the time of writing. Biodiversity frameworks are also being updated in Kosovo, the Federation of Bosnia and Herzegovina (FBiH) and Serbia. Since the last assessment a new Law on Forests (2020) and Forest Policy Document (2018) have been adopted in Albania and a Forest Management Programme was adopted in Montenegro in 2019.

**Figure 16.9. Forest area in the Western Balkans (2018)**

% of total land area

Source: Data based on responses to Environmental Policy questionnaires sent by domestic authorities and (World Bank, 2018<sub>[19]</sub>), "Forest area" (dataset), <https://data.worldbank.org/indicator/AG.LND.FRST.ZS?locations=OE>.

StatLink  <https://doi.org/10.1787/888934254924>

Biodiversity is monitored annually in Albania, whose government has developed a national biodiversity platform, which is currently the largest aggregator of primary biodiversity data in the economy. It also monitored annually in Montenegro through direct co-operation with institutions responsible for different thematic areas as prescribed by the Law on Nature Protection. Information is also collected in Kosovo (biodiversity indicators, including conservation status of threatened species and habitats) and Serbia (indicators on biodiversity, forestry, hunting and fishing, as well as sustainable use of natural resources) by their respective statistical offices. North Macedonia plans to establish a monitoring system under the biodiversity strategy. Entities in BIH lack the capacity to establish their own monitoring systems as stipulated in their respective laws on nature protection (UNECE, 2019<sub>[15]</sub>). Moreover, up-to-date forest inventories are lacking in BIH, Kosovo and North Macedonia. Forest inventories exist in Albania (completed in 2021) and in Montenegro, and Serbia's Second National Forest Inventory is expected to be completed by 2022. Even when forestry legal and policy frameworks are in place, local forest management capacity and enforcement are insufficient. Illegal logging and forest fires are legally regulated in all assessed economies; however, sanctions are rarely enforced.

Implementation of biodiversity and forestry strategies has been rather limited since the last assessment, in particular because of poor co-ordination among the relevant bodies at central and local levels. Nevertheless, Albania, both entities of BIH, Kosovo and North Macedonia have adopted plans for the protection of endangered species and fauna, as well as proclaiming new protected areas. Most economies have also established information systems for nature protection.

All WB6 economies (except Kosovo due to its status), are parties to the Convention on Biological Diversity (CBD), an international treaty with 196 parties. The CBD includes the 20 Aichi Biodiversity Targets, which address five strategic goals. Aichi Target 11 states that by 2020, at least 17% of a party's terrestrial territory should be designated as protected areas.<sup>9</sup> Progress towards this target has been made in almost all assessed economies (Figure 16.10), but only Albania has managed to exceed the 17% target, reaching 18.5% in 2020 despite having one of the lowest levels in 2014. With over 10% of their land area designated as protected, Kosovo, Montenegro and North Macedonia have also made significant progress.

**Figure 16.10. Terrestrial protected areas (2014 and 2020)**

% of total land area

StatLink  <https://doi.org/10.1787/888934254943>

### ***Land-use frameworks could be more coherent and better developed***

In addition to the above-average share of land covered by forests, agricultural land (especially arable and permanent cropland) accounts for a larger share of the territory in the assessed WB6 economies than it does in OECD economies (Figure 16.11). This trend has been slowly decreasing in recent years, with the most pronounced example being Montenegro (down from 38% in 2012 to 18.5% in 2016).

**Figure 16.11. Agricultural land (2012 and 2016)**

% of total land area

StatLink  <https://doi.org/10.1787/888934254962>

Land-use frameworks have changed little in most assessed economies since the last Competitiveness Outlook, except for North Macedonia. Major developments have been noted in North Macedonia's legislative framework with the adoption of a new Law on Urban Planning (2020), and the upcoming Law on Spatial Planning and National Spatial Plan (expected in 2021). Serbia has a relatively well-developed land-use framework, a new Spatial Plan for the period 2021-35 is being prepared and monitoring is in place. In all other economies legislative frameworks are still underdeveloped, and little progress has been achieved on the policy side. Montenegro has adopted a new Spatial Plan and Kosovo is updating relevant strategies which will indirectly regulate land use.

Some projects on agricultural land consolidation<sup>10</sup> exist in Kosovo, and Serbia is in the process of establishing a domestic soil monitoring programme. Albania, Kosovo and the RS in BiH are preparing municipal land development plans together with local municipalities, which aim to ensure sustainable territorial development and rational land use. The fact that key indicators of land-use management are not collected regularly (except for agricultural, forest and other semi-natural land in Serbia), or georeferenced or harmonised across public bodies, is holding back proper implementation. Also, outdated building codes and illegal construction remain important challenges in the region, especially in Albania in light of the economy's vulnerability to geophysical hazards, such as earthquakes. The Western Balkan region is threatened by multiple hazards; the 2020 floods in Kosovo and Serbia and the 2019 earthquake that hit Albania highlighted the weaknesses of land-use frameworks and systems.

### ***The way forward for the natural asset base***

- **Design and implement effective, efficient, and inclusive freshwater policy responses to water challenges.** The WB6 should ensure the proper collection of data and projections on water demanded from different economic sectors to guide decisions on water use. The OECD Toolkit for Water Policies and Governance – especially Turkey's data collection example – is a good source of advice on this matter (Box 16.6).

#### **Box 16.6. The OECD Toolkit for Water Policies and Governance**

The OECD Toolkit for Water Policies and Governance was launched in March 2021 to support better water policies for better lives across governments and stakeholders in OECD member and non-member economies. It compiles policies, governance arrangements and related tools that facilitate the design and implementation of water management practices in line with the OECD Council Recommendation on Water. The recommendation was unanimously adopted by the OECD Council in December 2016 and puts forward an international standard with high-level policy guidance on a range of topics relevant for the management of water resources and delivery of water services.

The toolkit highlights good practices and recommendations on the following areas: 1) general water policy, 2) managing water quantity, 3) improving water quality, 4) managing water risks and disasters, 5) ensuring good water governance, 6) ensuring sustainable finance, investment and pricing for water and water services, and 7) pricing instruments for water management services.

For instance, the toolkit provides policies and tools implemented in different countries on using data and information to guide policy, which is currently lacking in the WB6. Relevant data on water resources and water services is the basis for tailored water governance strategies, measurement of results and indications of possible bottlenecks. Production and exchange of information is also vital to building trust and a shared vision among responsible authorities and stakeholders. National statistical offices have a key role in generating such data and/or harmonising metrics to allow comparability across units and time. Sub-national levels of government and regional/local development agencies also have an important role to play in collecting and using data to inform the water policy process.

In 2013, **Turkey** created an online National Water Information System (NWIS) that compiles nationwide data on water quality and quantity, allocation regimes and water-related risks. The NWIS shows water data at basin level and aims to encourage all water-related actors to be active stakeholders in data production. Furthermore, the NWIS helps identify data gaps and duplications and gathers data, maps, statistics, and policy documents on nine modules: environmental infrastructure, basin management, climate change, groundwater, surface water, water quality, drought, floods and water allocation.

Source: (OECD, 2021<sup>[22]</sup>), *Toolkit for Water Policies and Governance: Converging Towards the OECD Council Recommendation on Water*, <https://doi.org/10.1787/ed1a7936-en>.

- **Enforce close regional co-operation at the river basin level to protect and manage water**, bringing together all interests upstream and downstream. A joint approach to the diverse and interconnected transboundary freshwater resources in the WB6 is still in its infancy and the main river basin management projects are donor driven. All EU Member States have used a river basin approach for water management since the adoption of the EU Water Framework Directive, which establishes a legal framework to protect and enhance the status of aquatic ecosystems, prevent their deterioration and ensure long-term, sustainable use of water resources. The International Commission for the Protection of the Danube River (ICPDR), which implements the EU Water Framework Directive, could be a model for other river basins in the region (Box 16.7).
- **Develop a comprehensive land-use policy framework to ensure effective land-use planning, preserve land and foster resilience** to hydro-meteorological and geophysical hazards. To achieve this, the WB6 should focus on establishing an all-inclusive land-use policy framework focusing on modernising the building codes, updating seismic hazard maps and combatting unregulated and illegal building activities by enforcing the cadastre.

### Box 16.7. The International Commission for the Protection of the Danube River (ICPDR)

The International Commission for the Protection of the Danube River (ICPDR) works to ensure the sustainable and equitable use of waters in the Danube River Basin. The work of the ICPDR is based on the Danube River Protection Convention (DRPC), the major legal instrument for co-operation and transboundary water management in the Danube River Basin. In 2000, the ICPDR contracting parties nominated the ICPDR as the platform for the implementation of all transboundary aspects of the EU Water Framework Directive (WFD).

#### The goals of the ICPDR

Three key elements of the ICPDR's management plans provide the three pillars of action that are needed for the Danube to achieve:

- a Cleaner Danube – this means reducing pollution from settlements, industry and agriculture;
- a Healthier Danube – this means protecting rivers as ecosystems that provide a living environment for aquatic animals and plants, as well as services for people such as drinking water and recreation;
- a Safer Danube – this means a safer environment for people to live without the fear of major flood damage.

#### Of the many challenges faced by the ICPDR, the highest priorities remain:

- Organic substance pollution
- Nutrient pollution

- Hazardous substance pollution
- Hydromorphological alterations
- Flood risk management.

Source: (International Commission for the Protection of the Danube Rive, 2020<sup>[23]</sup>), webpage, <https://www.icpdr.org/main>.

### Environmental quality of life (Sub-dimension 13.3)

The third sub-dimension assesses how environmental conditions affect people's health and quality of life. Three qualitative indicators assess the environmental quality of life in the WB6 economies: 1) the air quality framework; 2) the water supply and sanitation system; and 3) industrial waste management. Air pollution is a very serious environmental threat, resulting in premature deaths, increased respiratory disease and lower crop yields. The absence of high-quality water supplies and sanitation can increase health costs and decrease labour productivity. Finally, poorly managed industrial waste can result in contaminated land, with serious repercussions for human and natural health.

On average overall, the WB6 economies score 2.3 for this sub-dimension (Table 16.4), indicating that policy frameworks for air quality, water supply and sanitation and industrial waste management have mostly been adopted. The economies, especially Montenegro and North Macedonia, have made the most progress in developing frameworks for air quality, which is one of the most pressing issues in the region. Industrial waste management frameworks and implementation are still lagging behind.

**Table 16.4. Scores for Sub-dimension 13.3: Environmental quality of life**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 13.3: Environmental quality of life	1. Air quality framework	2.0	2.0	2.5	3.5	3.5	2.5	2.7
	2. Water supply and sanitation system	2.0	2.0	2.5	1.5	2.5	3.0	2.3
	3. Industrial waste management	1.5	1.5	1.5	2.0	2.5	2.0	1.8
<b>Sub-dimension average score</b>		1.8	1.8	2.2	2.3	2.8	2.5	2.3

#### ***Air pollution levels remain high, but action is being taken***

Air quality is still a major concern in the region, with concentrations of air pollutants such as fine particulate matter (PM<sub>2.5</sub>) ranking among the highest in Europe. PM<sub>2.5</sub> is the air pollutant posing the greatest risk to health globally, affecting more people than any other pollutant. With an average concentration of 25.77 µg/m<sup>3</sup> in 2019 for the six economies, the exposure of these economies' populations to PM<sub>2.5</sub> is two to three times higher than the WHO recommended highest levels of 10 µg/m<sup>3</sup>. It is also much higher than OECD and CEEC-11 values (Figure 16.12). However, promisingly, since 2014, PM<sub>2.5</sub> levels have been slowly decreasing in all economies in the region.<sup>11</sup> Across the region, power generation, heating, industry, and transport are the main sources of air pollution. The problem is exacerbated in winter, when air pollution increases due to solid fuel heating (using coal as a low-cost source of energy). Some of the WB6 economies plan to continue to rely primarily on coal-fired power generation to supply growing energy consumption, and to expand their existing coal fleet, while continuing to subsidise coal (Kosovo and Serbia in particular). Uncontrolled pollution, notably from outdated thermal power plants, calls for urgent action. In 2016, 16 coal-fired thermal power plants in the WB6 emitted more sulphur dioxide than all of the 250 plants in the EU combined (Balkan Green Foundation, 2016<sup>[24]</sup>).

**Figure 16.12. Annual mean population exposure to PM<sub>2.5</sub> air pollution (2014-19)**Micrograms per cubic metre (µg/m<sup>3</sup>)

Note: PM<sub>2.5</sub> – fine particulate matter. Data for Kosovo only available until 2015. CEEC-11=Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934254981>

Nevertheless, with an average of 2.7 for the air quality framework indicator (Table 16.4), the six assessed economies have made considerable progress in developing their frameworks and harmonising their legislation with the EU *acquis* (such as Directive 2008/50/EC on ambient air quality). Since the last assessment, Albania's main law on the protection of ambient air quality has come into force (in 2018) and Albania, Kosovo, Montenegro, North Macedonia and Serbia have all adopted policy frameworks with clearly defined objectives for air quality management. Meanwhile, the Swedish Environmental Protection Agency Programme on improving air quality and air quality management in Bosnia and Herzegovina (2017-2021) aims to build the capacity of the key government institutions to manage air quality and improve air quality data collection. Local air quality plans, urgently needed for areas in which pollutant levels regularly exceed health guidelines, have been developed in North Macedonia and Serbia and are being prepared in Albania (started in 2021) and Kosovo (envisaged for the 2020-2025 period).

Implementation varies across the assessed economies. Implementation in Montenegro and North Macedonia is relatively advanced with several programmes in place for reducing air pollution and raising public awareness of air quality improvements. An air protection programme is being developed in Serbia and is expected to align Serbia's practices with EU directives.<sup>12</sup> Ad-hoc measures are taken when pollution limit values are exceeded in Albania and BIH. However, Kosovo has not yet implemented most measures in its air management strategy. For instance, the 2018 ban on the use of coal for heating in public buildings was not backed up by any financial support and consequently has not seen any meaningful implementation.

The fact that air quality frameworks do not stipulate clear obligations for polluters in the assessed economies impedes the efficiency of responses. In the EU, best available techniques for a range of industrial processes and emission rates must be taken into account by industry. They can also serve as a good basis for the WB6 (Box 16.8).

Air quality is monitored regularly across the region by permanent air quality monitoring stations and information on air quality is mostly made available promptly. The exception is Albania, where all stations have been turned off due to a lack of funding (European Commission, 2020<sup>[27]</sup>). Since the last assessment, North Macedonia has been working on establishing a national environmental information system to gather environmental data in one central database. Montenegro has re-established reporting on air pollutant

emissions and provided all missing data for the period 2011-18, which will help in measuring the effect of air quality measures on actual emission levels. In Kosovo, a new action plan for air quality monitoring is under development with international support. Although air monitoring has improved in BIH, it is not well co-ordinated, with different methodologies used by different entities, which means there are no air quality data for the entire economy.

### Box 16.8. The EU's Best Available Technique Reference Documents (BREFs)

The BREFs are a series of reference documents covering, as far as practical, the industrial activities listed in Annex 1 to the EU's integrated pollution prevention and control (IPPC) Directive. They provide descriptions of a range of industrial processes and their respective operating conditions and emission rates. Member States are required to take these documents into account when determining best available techniques generally or in specific cases under the directive. They can also serve as a good basis for potential candidates.

The BREFs were developed to exchange information between industrial sectors and non-government organisations (NGOs) in different Member States and the European Integrated Pollution Prevention and Control Bureau (IPCC/EIPPCB).

Non exhaustively, these documents cover:

- common waste gas treatment in the chemical sector
- emissions from storage
- ferrous metals processing industry
- industrial cooling systems
- large combustion plants
- refining of mineral oil and gas
- waste incineration and treatment.

Source: (EEA, n.d.<sup>[28]</sup>), *EU Best Available Techniques Reference Documents (BREFs)*, <https://www.eea.europa.eu/themes/air/links/guidance-and-tools/eu-best-available-technology-reference>.

### ***Water supply and sanitation strategies are in place but need sustainable funding***

Access to an improved water source (e.g., household connection, public standpipe or protected dug well) is nearly universal in all assessed economies (all over 95%). A smaller share of the population is connected to sewage systems: 35% in BIH, 51% in Albania and 58% in Serbia (UNECE, 2019<sup>[15]</sup>). Far fewer people are connected to wastewater treatment facilities, with the average for the WB6 around 6.5%, which is significantly lower than the EU average of 86%. However, this share varies from 58.4% in Montenegro to 1% in Kosovo (Figure 16.13). Moreover, water pollution and water losses from the system are key challenges. The losses range between 33% in Serbia to almost 60% in Bosnia and Herzegovina, Kosovo, and North Macedonia, often due to outdated water supply networks. Despite these statistics, only the government of North Macedonia has started to take action to decrease these losses. In addition, infrastructure is often made of hazardous material – such as asbestos in BIH.

**Figure 16.13. Population connected to wastewater treatment facilities (2018)**

Note: Data for Bosnia and Herzegovina are the simple average of FBiH and RS. There are no wastewater treatment plants in the Brcko District. No data available for Croatia. CEEC-11=Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

Source: Data based on responses to Environmental Policy Questionnaires sent by domestic authorities and statistical offices and (OECD, 2018<sup>[29]</sup>), *Wastewater treatment*, [https://stats.oecd.org/Index.aspx?DataSetCode=WATER\\_TREAT](https://stats.oecd.org/Index.aspx?DataSetCode=WATER_TREAT).

StatLink  <https://doi.org/10.1787/888934255000>

The water supply and sanitation legislative framework is almost fully aligned (95%) with the EU *acquis* in Montenegro and North Macedonia.<sup>13</sup> Serbia needs to make significant efforts to further align its legislation with the EU *acquis* and to strengthen administrative capacity, in particular for monitoring, enforcement and inter-institutional co-ordination (European Commission, 2020<sup>[9]</sup>). Kosovo's policy framework has been complemented with a new strategic plan for regional water companies (2018) and Albania's legislative and policy frameworks were being updated at the time of drafting with the preparation of the Law on Water Supply and Sewerage Sector and a new strategy.<sup>14</sup> No major changes have been recorded in Bosnia and Herzegovina, but the Water and Sanitation Infrastructure Project (WATSAN) implemented in both entities will harmonise the water supply and sanitation frameworks with EU legislation.<sup>15</sup>

Water supply and sanitation infrastructure projects have been implemented since the last assessment, with new wastewater treatment plants (WWTP) being constructed in all assessed economies. WWTPs are also planned in Belgrade and Skopje where a lack of plants means that all wastewater is discharged untreated into rivers. However, water supply and sanitation infrastructure projects are still largely dependent on donor funding throughout the assessed economies, and water tariffs are too low to cover service costs. The long-term affordability of new infrastructure maintenance under these conditions appears doubtful. For instance, although eight new plants were built in Albania in 2016, the lack of finance and limited technical capacities rendered three of them idle, and their long-term operational arrangements are unclear (UNECE, 2019<sup>[15]</sup>).

### ***Industrial waste management frameworks could be strengthened further***

Little progress has been achieved on the industrial waste management framework. Across the assessed economies, laws and strategies on waste management also regulate the management of industrial waste. As regards managing and controlling industrial risks and accidents, the EU Seveso-III Directive (2012/18/EU) has been fully transposed into legislation in Kosovo, Montenegro, and North Macedonia, and partially in Albania (European Commission, 2020<sup>[9]</sup>). Alignment with most of the EU *acquis* is at an early stage in Serbia, including on the Industrial Emissions Directive. However, Serbia adopted its long-awaited national emission reduction plan in 2020 and established a database strengthening the monitoring of Seveso III operators (European Commission, 2020<sup>[9]</sup>).

In terms of chemicals, North Macedonia, Serbia, and the RS in BiH have an official register of chemicals on the market, as well as classification, packaging and labelling rules. Kosovo and Montenegro are working on establishing a domestic chemical register. By law, any chemicals produced in or imported into Albania need to be registered on an electronic chemical register, but the register has not yet been established. Pollutant Release and Transfer Register (PRTR) systems have been established in Albania, North Macedonia and Serbia. The PRTR Protocol has been ratified by Montenegro but the register has not yet been set up. Kosovo and the FBiH and RS in BiH have established their registers but they are still not fully operational. No hazardous waste disposal facilities exist in any of the assessed economies and waste must be exported for treatment. A project is being implemented for this in Kosovo, but it has been stalled for the past two years.<sup>16</sup>

There is no policy or legislative basis for soil protection in any of the assessed economies, except for Serbia, which recently established a national soil monitoring programme. Serbia has also established reporting on contaminated sites in 2020 through the cadastre of contaminated sites information system as part of the environmental information system. Provisions for soil protection will also be included in the amendments to the Law of Environment of North Macedonia, which was in the process of being adopted by the government at the time of drafting. Developments on identifying contaminated areas have only been recorded in Kosovo and Montenegro, with the former starting a World Bank-financed project to clean up contaminated areas.

### ***The way forward for environmental quality of life***

- **Improve air quality by decreasing dependence on fossil fuels in the energy mix, upgrading household heating systems, reducing transport emissions, and decreasing emissions from industry.**
- **Phase out coal subsidies and decarbonise the energy sector, and introduce incentives that support renewable integration.** This will be particularly important if the EU moves to introduce a carbon border tax (currently being discussed), as this would make energy-intensive economic sectors increasingly uncompetitive. For more information, see the Energy policy chapter.
- **Include measures to prevent air emissions from industry** more regularly in the environmental permits for industrial facilities. These could follow those described in the EU Best Available Technique Reference Documents (Box 16.8).
- **Promote sustainable transport options:** modernise the bus fleet (low-emitting buses), and influence private vehicle purchasing and renewal decisions through ecological vehicle taxes which vary according to vehicle age and level of CO<sub>2</sub> emissions. France's bonus-malus scheme could be a good model to follow, which imposes a fee on vehicles with high CO<sub>2</sub> emissions or fuel consumption and provides a rebate for vehicles with low CO<sub>2</sub> emissions or fuel consumption (Box 16.9).

### Box 16.9. Feebate schemes to incentivise low-carbon vehicles

Feebates, also called bonus-malus schemes, levy a sliding scale of fees (excise taxes) on products (or activities) with above-average emissions, and a sliding scale of rebates (subsidies) for products (or activities) with below-average emissions. By encouraging consumers to shift to less polluting vehicles to benefit from the rebate and avoid the tax, they have been shown to substantially encourage the uptake of motor vehicles with lower CO<sub>2</sub> emissions – e.g., in France (D’Haultfœuille, Givord and Boutin, 2014<sup>[30]</sup>). The strength of the incentives to reduce emissions depends on the amount by which feebates make low-carbon products cheaper than high-carbon products. Feebates are typically designed to be revenue-neutral – the fees collected on carbon-intensive products are used to subsidise the cleaner alternatives – even if in fact they have sometimes turned out to be more costly than intended (Teusch and Braathen, 2019<sup>[31]</sup>). They generally do not raise government revenues that could be used for other purposes, including redistribution. However, the fact that feebates provide both carrots (i.e., the rebate) and sticks (i.e., the fee) may increase the public acceptability of this instrument.

Governments can complement these instruments with carbon price trajectories that provide guidance to consumers and producers without the need to raise carbon prices immediately when the economy has yet to recover from the crisis. Design challenges vary by instrument and may include agreeing a reasonable strike price, setting a credible baseline against which to measure emissions reductions and defining emission intensity standards for a wide range of products.

- **Increase the number of wastewater treatment plants and reassess the fee structure so that fees cover the service costs.** Enforce the implementation of the water-user and polluter pays principles<sup>17</sup> for all water users and dischargers, paying attention to vulnerable social groups. Ensure regular maintenance of the existing WWS network.
- **Introduce land-use management and soil protection legislative and policy frameworks.** There are almost no relevant frameworks in the region and processes remain ad-hoc. Given the environmental importance of soil protection in most economies of the region, it is important to introduce a comprehensive policy framework for identifying, characterising and remediating contaminated sites. This should be backed up by concrete guidelines to facilitate the process of further land identification and its clean-up. Economies could follow the approach taken by Israel (Box 16.10).

### Box 16.10. Cleaning up contaminated sites in Israel

Contaminated land has been discovered in hundreds of industrial, commercial and agricultural areas in Israel. These areas include several sites where hazardous waste was buried before the hazardous waste management site at Ramat Hovav was established. Such sites affect soil and water, with groundwater contamination found at 30% of sites.

Steps have been taken to develop a comprehensive framework for the identification, characterisation and remediation of contaminated sites. In 2000, the MoEP formulated a policy for cleaning up contaminated land and prepared several guidelines to facilitate the process. These documents included preliminary clean-up targets for 100 pollutants to serve as a basis for land remediation and guidelines on planning and implementing soil site characterisation, as well as guidelines for remediating contaminated soil at petrol stations. In 2009, the MoEP identified the 20 most severely polluted sites and began remediation measures. For example, EUR 42 million was allocated for remediating the

hazardous waste treatment site at Ramat Hovav, which included a closed landfill, sedimentation and evaporation ponds, and temporary storage areas.

Since addressing past pollution will probably take decades, immediate actions focused on immediate risks, such as at Ramat Hovav, and monitoring other sites for potential contamination. A comprehensive framework for rehabilitation efforts was developed. It framework included instruments to carry out soil surveys on land suspected to be polluted (within the framework of building permits and real estate transactions, and state-owned land leasing agreements), with contamination and clean-up status recorded in the land registry. A database of contaminated and potentially contaminated sites (which includes state-owned land, such as army bases, defence industry sites, government-owned companies, as well as privately owned contaminated areas) was created. A risk-based methodology for soil and groundwater, approved in 2011, has enabled better risk assessment procedures.

## Conclusion

The environmental legislative framework is relatively well advanced in the Western Balkan economies; progress has been made to transpose EU environmental directives and adopt missing legislation on climate change and on managing water, biodiversity, and forestry. However, the challenge now lies in implementing key measures. Air pollution, unregulated and illegal dumping of waste and the lack of wastewater treatment remain the most pressing challenges in the region. Poor co-ordination mechanisms among central, regional and local authorities and lack of human and financial resources are hampering proper implementation, while the lack of environmental monitoring systems, national inventories and statistics is hindering evidence-based policy making.

Long-term economic competitiveness and social development depends on fostering growth while safeguarding natural assets which provide vital resources and environmental services. Despite some progress, a sufficiently coherent policy framework to grow and boost competitiveness in an environmentally sustainable way is still lacking in all six Western Balkans economies. Successful green growth in the region is closely tied to the implementation of the recommendations put forward in this chapter, as well as in the other chapters relevant to environmental policy.

## Notes

<sup>1</sup> In Bosnia and Herzegovina, competences for environment and climate change rest with the two entities, and Brčko District. In the FBiH, the competence is shared between the Federation and the ten cantons. At the state level, the Ministry of Foreign Trade and Economic Relations (MOFTER) BiH is responsible for defining policies and basic principles, co-ordinating activities and consolidating entity plans with those of international institutions in the area of energy, agriculture, protection of environment and use of natural resources and tourism. Entity level institutions are responsible for strategic framework, policy setting, data exchange and reporting.

<sup>2</sup> The 11 Central and Eastern European countries (CEECs) joining the European Union: Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>3</sup> The NECP will define targets in the field of renewable energy sources, energy efficiency and GHG emissions reductions to 2030, and with a long-term vision to 2050. The NECP is prepared through the IPA 2017 project Further Development of Energy Planning Capacity, which started in February 2021.

<sup>4</sup> North Macedonia in particular hasn't submitted national communications since 2014 and Albania hasn't submitted any Biennial Update Reports.

<sup>5</sup> In Albania, climate-related risks are partly identified in the UNFCCC report and a Disaster Risk Reduction strategy is being prepared. Serbia has a programme for disaster risk management but climate change policies are not sufficiently reflected in it. More information in the Albania and Serbia profiles.

<sup>6</sup> The project focuses on the development of integrated water resource management and implementation of adaptation strategies in the Drin River Basin, covering the following economies: Albania, Kosovo, Republic of North Macedonia and Montenegro. It is implemented by GIZ. The main objective is to mitigate the impacts of climate change by focusing on flooding and drought risk management as well as strengthening regional co-operation as it pertains to the management of water resources.

<sup>7</sup> The Waste Management Strategy (WMS) with the related Waste Management Plan (WMP) (2020-2035) and the National Sectorial Plan for Solid Waste Management (NSPSWM) (2019-2035).

<sup>8</sup> For instance, the West Balkans Drina River Basin Management project is led by the World Bank and aims at managing the transboundary Drina River Basin (2016-2021) between Bosnia and Herzegovina, Montenegro and Serbia. The World Bank is also providing technical assistance for improving the effectiveness of the joint flood management by the economies co-operating in the Sava River basin (Bosnia and Herzegovina, Montenegro, Serbia).

<sup>9</sup> Aichi Target 11 also covers marine protected areas. Limited progress has been achieved in Albania, with 3% of its marine areas protected (the target being 6% by 2020). No marine protected areas have been established in Montenegro (the target being 10% by 2020 but research is currently underway into three potential marine protected areas (Platamuni, Katic and Stari Ulcinj). No data are available for Bosnia and Herzegovina, but the authorities report that the Aichi Biodiversity Targets have not been achieved.

<sup>10</sup> The current agricultural land consolidation project, Strengthening Spatial Planning and Land Management (SSPLM), involves 21 cadastral zones and 10 municipalities. It aims to provide technical

assistance for the preparation of municipal land development plans, and is to be finalised by the end of 2021.

<sup>11</sup> Data are unavailable for Kosovo beyond 2015.

<sup>12</sup> Supported by an EU-funded project, Serbia was developing the Air Protection Programme and Action Plan at the time of drafting (to be finalised in 2021). This programme is expected to provide a basis for further developing and adopting bylaws and the continued implementation of EU legislation in the field of air protection.

<sup>13</sup> The legislative framework in North Macedonia was amended in 2017 with the adoption of the Law on Setting the Prices for Water Services, which represents the main legal act in this area and is almost fully aligned (95%) with the EU *acquis*. In addition to this legislative change, in 2017 the government conducted a National Water Study on an investment framework for the implementation of projects for water supply and wastewater treatment, in accordance with the requirements of the relevant EU Directives.

<sup>14</sup> Although the legislative and policy framework in Albania is not fully aligned with the EU *acquis* in the area of wastewater management, monitoring mechanisms are envisaged, the responsible institution has been assigned and concrete objectives, budget, measures and a timeline have been set.

<sup>15</sup> The overall objectives of WATSAN (to be finalised by the end of 2021) are to improve the living conditions of the population, secure adequate hygiene in water supply and sanitation, and implement environmental protection measures, in line with the obligations of EU accession and harmonisation with EU legislation, in particular the Water Framework Directive, Drinking Water Directive and Urban Waste Water Directive.

<sup>16</sup> The government had planned to build a central disposal facility for hazardous waste in 2018 in the municipality of Fushe Kosove/Kosovo Polje. It organised several rounds of consultations with citizens, but agreement to build the facility could not be reached. See Kosovo economy profile.

<sup>17</sup> The polluter pays principle is a basic principle of all European environmental policies. It is specifically referred to in the EU Water Framework Directive (WFD), which establishes clear requirements concerning financing for water management in EU Member States. The polluter pays principle states that those who pollute should bear the costs of preventing damage to human health or the environment.

# 17 Agriculture policy (Dimension 14)

---

Agriculture is a key pillar of the Western Balkan economies, providing a significant share of total employment, and is one of the three most important sectors in terms of contribution to GDP. With this in mind, this chapter assesses the performance of agriculture policies in the six Western Balkan economies (WB6), looking at four sub-dimensions. The first, agro-food system capacity focuses on rural infrastructure capacity (particularly irrigation) and the role of skills and education in productive, sustainable and competitive agriculture. The second sub-dimension looks at the effectiveness of agro-food system regulations in safeguarding public safety and the environment in two areas: inputs and crop products, and natural resources such as land and water. The third, agricultural support systems, covers the policy, governance and instruments in the agricultural sector. Finally, the agricultural innovation system sub-dimension considers innovation and extension services – key tools in an economy’s path towards productive and sustainable agriculture. Each sub-dimension provides recommendations for the way forward.

---

## Key findings

- **All the WB6 economies have undertaken sizeable investments in road infrastructure over the last decade.** They continue to support rural infrastructure projects such as sewage systems, electricity and gas supply, and broadband Internet, which are some of the key preconditions for a competitive agriculture sector.
- **Investment in irrigation systems is increasing,** but limited progress has been made to improve irrigation efficiency and sustainability, or to monitor soil erosion, drainage, and soil moisture.
- **Implementation of the Instrument for Pre-Accession Assistance for Rural Development (IPARD) programme continues to improve** among the accredited economies (Albania, Montenegro, North Macedonia and Serbia), and IPARD disbursement authorities are increasing their administrative capacity. However, the criteria for IPARD funding and national budget subsidies are not fully harmonised.
- **Bosnia and Herzegovina and Kosovo continue to prepare for full accreditation of their IPARD payment agency and appropriate reforms.** More effort is needed to finalise land parcel identification systems (LPIS) and other relevant criteria for IPARD accreditation in these two economies.
- **Common market organisation (CMO) legislation and reforms should be further enhanced** by all six economies.
- **Agricultural education and training are still underfinanced** and the number of agriculture students continues to fall. Domestic strategies either fail to address agricultural education or, if they do address it, measures are not yet implemented.
- **Weak inter-sectoral co-operation between agricultural and other relevant institutions (environment, education)** is holding back the performance of the sector and slowing down reforms.
- **Capacity for monitoring and evaluation is limited.** All six economies have made some effort to improve and create a system of evidence-based policies, but their efforts need to be increased significantly.
- **Investment in agricultural research projects remains poor** and agriculture extension services are patchy in both scope and quality.

## Comparison with the 2018 assessment

The WB6 have continued with the reforms to their agriculture policies and increased the investments and efforts in this respect. They have slightly improved their scores since 2018. Montenegro and North Macedonia have made the most progress (Figure 17.1).

Figure 17.1. Overall scores for the agriculture policy dimension (2018 and 2021)

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

Implementation of the 2018 recommendations has been limited overall (Table 17.1), especially defining clear roles and responsibilities at local levels, strengthening natural asset management and institutionalising the collection of key environmental data.

Table 17.1. Implementation of the CO 2018 policy recommendations: Agriculture policy

Competitiveness Outlook 2021		
CO 2018 policy recommendations	Main developments during the assessment period	Regional progress status
<b>Strengthen inter-sectorial co-operation</b>	<ul style="list-style-type: none"> <li>Limited efforts have been made overall and formal mechanisms for inter-sectorial co-operation are still missing.</li> </ul>	Limited
<b>Reorient agricultural producer support towards better productivity and sustainability objectives</b>	<ul style="list-style-type: none"> <li>The IPARD-accredited economies have implemented the decoupling of measures.</li> <li>As of 2021, domestic agriculture and rural development strategies have increased and diversified the economic support measures oriented towards competitiveness and productivity.</li> </ul>	Moderate
<b>Fully implement farmland consolidation plans</b>	<ul style="list-style-type: none"> <li>Farmland consolidation plans have been partially implemented but full consolidation is still a long way off.</li> <li>Progress has been made in Albania, Montenegro, North Macedonia and Serbia, but farmland consolidation is still an open issue in Bosnia and Herzegovina and Kosovo.</li> </ul>	Moderate
<b>Enhance the quality and impact of the agricultural innovation system</b>	<ul style="list-style-type: none"> <li>In Albania, Kosovo, Montenegro and Serbia, investment in research and development (R&amp;D) in agriculture have increased. Bosnia and Herzegovina and North Macedonia still have very limited support for innovation in agriculture.</li> </ul>	Limited
<b>Enhance environmental objectives across agricultural policy frameworks</b>	<ul style="list-style-type: none"> <li>Environmental objectives have been widely introduced into agriculture policy frameworks.</li> <li>A few of the WB6 economies have introduced agri-environment measures but implementation is still limited.</li> </ul>	Limited
<b>Strengthen policy analysis to better inform policy development</b>	<ul style="list-style-type: none"> <li>Moderate efforts to improve policy analysis and establish efficient monitoring systems have been made.</li> <li>Awareness of the importance of evidence-based policies has increased.</li> </ul>	Moderate

## Introduction

Agriculture is a significant pillar of the Western Balkan economies. It provides an important share of total employment, and is one of the few sectors with the potential for competitiveness on the global market. Agriculture is a heavily subsidised economic activity, and is the main source of income for almost 40% of the total population in the WB6 economies.

Further analysis of this dimension reveals important links to other policy areas; thus, an inter-sectoral approach and good co-ordination will be crucial for creating sustainable policy mechanisms that boost the productivity and competitiveness of the agriculture sector. These include the following challenges within the specific policy areas:

- **Chapter 5. Trade policy.** Agriculture and trade are highly interdependent. Over the past decade, international agro-food markets have undergone some significant changes, which have brought them closer together. Since 2000, agri-food trade has grown strongly as world markets have responded to a more rules-based trading environment, lower tariffs and reduced trade-distorting producer support (OECD, 2019<sup>[1]</sup>). But agri-food trade is not only growing, it is also becoming global. A growing share of agri-food trade takes place in global value chains (GVCs) that link agri-food sectors with other sectors of the economy around the world (OECD, 2020<sup>[2]</sup>). Since agri-food products in GVCs may cross borders several times before reaching final consumers, their costs can be increased by uncontrolled non-tariff measures such as those related to laws or requirements such as sanitary and phytosanitary measures (SPS), technical barriers to trade and customs procedures (OECD, 2019<sup>[1]</sup>).
- **Chapter 10. Education policy.** Education policy in all six Western Balkan economies is the responsibility of the relevant education ministries while the agriculture education framework is based on national agriculture and rural development strategies. The strategies foresee a number of measures that address barriers to agriculture development, but no specific measures have been dedicated to improving agricultural education and training. Meanwhile the number of agriculture students is falling across the region while the labour market lacks a skilled and trained workforce.
- **Chapter 11. Employment policy.** Agriculture students have very limited contact with the real labour market during their studies. There are no mechanisms to support part-time employment while studying; such mechanisms could potentially overcome the supply-demand imbalance in the market. The seasonal agricultural workforce faces a number of difficulties registering their part-time employment and receiving social benefits due to inappropriate legal frameworks.
- **Chapter 12. Science, technology and innovation.** Agriculture is not a dynamic field for applied science and research in WB6 economies. Research is largely dependent on donor-funded projects, while national funding for research is extremely limited, meaning projects tend to be *ad hoc*. Over the past two decades, all six economies have seriously neglected the need to secure permanent funding to maintain existing research infrastructure and facilities, as well as to develop and adopt new methodologies.
- **Chapter 16. Environment policy.** Efforts to regulate natural resources have been limited, especially effective measures to stop the loss of agricultural land and more efficient inspection and control mechanisms. Agri-environment measures are to be implemented through agriculture support mechanisms. However, inter-sectoral co-operation with environment ministries will need to be a priority to ensure the sustainable use of natural resources.

## Assessment framework

### Structure

This chapter assesses agricultural policies in the WB6 economies by assessing four broad sub-dimensions:

1. **Sub-dimension 14.1: Agro-food system capacity** focuses on the role of rural infrastructure, irrigation and education. It describes the policy reforms undertaken and achievements in facilitating productive, sustainable and competitive agriculture.
2. **Sub-dimension 14.2: Agro-food system regulation** assesses how effectively regulations safeguard public safety and how burdensome they are for farmers and agri-businesses to comply with in two areas: products, such as inputs (fertiliser and pesticides) and crops; and natural resources, such as land and water.
3. **Sub-dimension 14.3: Agricultural support system.** This focuses on the policy, governance and instruments supporting the agricultural sector. The various ways this support is delivered has different implications for agricultural production, trade and incomes.
4. **Sub-dimension 14.4: Agricultural innovation system** considers the agricultural research and innovation system as a key tool in the path towards productive and sustainable agriculture, improving the economic, environmental and social performance of the agri-food sector.

Figure 17.2 shows how the sub-dimensions and their indicators make up the agricultural policy dimension assessment framework.

**Figure 17.2. Agriculture policy dimension assessment framework**

Agriculture policy dimension

Share of producers and agri-business adopting an innovation</li> </ol>

		prohibitions by commodity 17. Tax rates in agriculture which differ from standard tax rates	
--	--	--	--

The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as face-to-face interviews with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies’ statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more information, see the Methodology and assessment process chapter.

### **Key methodological changes to the assessment framework**

There have been no significant methodological changes to the agricultural policy assessment framework since the 2018 Competitiveness Outlook. Few changes have been made to either the quantitative or qualitative questionnaires. The qualitative questionnaire has adopted more specific questions in each of the sub-dimensions about the process of developing, implementing and monitoring agriculture policies, as well as the impact of domestic and IPARD agriculture support measures.

## **Agricultural policy performance and context in the WB6**

Agriculture traditionally plays an essential employment role, being the prevalent activity of the WB6 economies’ rural population. The sector’s contribution to gross domestic product (GDP) is much higher than in the OECD, EU and Central and Eastern European economies (CEEC-11)<sup>1</sup> (Figure 17.3). However, its contribution fell during 2016-19 in all of the assessed economies, by an average of 2.46%. The greatest decline was in Kosovo, where agriculture’s share of total GDP fell by 3.53% (from 10.45% in 2016 to 6.91% in 2019). The smallest declines were in Bosnia and Herzegovina and Serbia, both around 0.7% over the three years.

**Figure 17.3. Share of agriculture value added (2016-19)**

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: World Bank national accounts data, and OECD national accounts data files, retrieved from: <https://data.worldbank.org/>.

StatLink  <https://doi.org/10.1787/888934255019>

Agriculture’s share of employment varies across the region (Figure 17.4). It is very significant in Albania, where it is the largest employer and accounted for 36% of jobs in 2019, but relatively moderate in Kosovo

and Montenegro, where its share was around 7%. In Bosnia and Herzegovina, North Macedonia, and Serbia agriculture accounts for around 15% of employment. In comparison, the share is 9% across the CEEC-11, while in the OECD and EU economies it is 4% on average.

**Figure 17.4. Share of employment in agriculture (2016-20)**

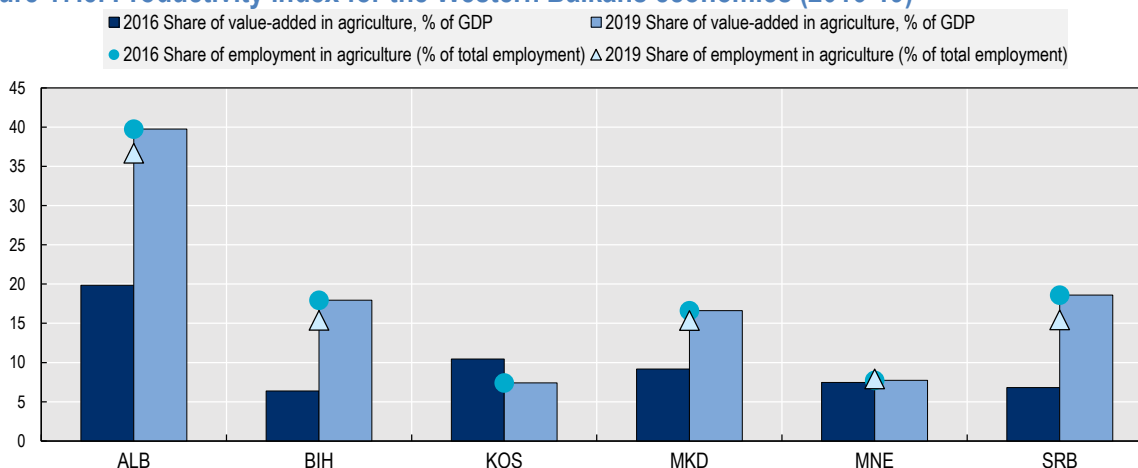

Note: The CEEC-11 are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934255038>

As illustrated in Figure 17.5, agricultural productivity has increased between 2016 and 2019 in all WB6 economies. Montenegro had the highest relative agricultural labour productivity of the WB6 economies in 2019: its ratio of total agricultural employment to share of GDP was 1.22. In comparison, the figure was 3.40 on average for OECD countries, 2.60 for the EU and 3.33 for the CEEC.

## Agro-food system capacity (Sub-dimension 14.1)

The agro-food system capacity sub-dimension focuses on 1) the role of rural infrastructure capacity; 2) irrigation policy framework; and 3) skills and education in facilitating productive, sustainable and competitive agriculture.

As Table 17.2 shows, the average score across all six economies is 2.8 with Bosnia and Herzegovina having made the least progress while Albania, Montenegro and North Macedonia have performed most strongly. All of the economies have prioritised irrigation and education, two areas critical to the competitiveness of the agriculture sector.

**Table 17.2. Scores for Sub-dimension 14.1: Agro-food system capacity**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 14.1	Rural infrastructure policy	3.5	1.0	3.5	4.0	3.5	2.0	2.9
Agro-food system capacity	Irrigation policy framework	3.0	2.0	2.0	2.8	3.5	3.0	2.7
	Agricultural education system	3.0	1.5	3.3	2.5	3.0	2.5	2.6
<b>Sub-dimension average score</b>		3.2	1.5	2.9	3.1	3.3	2.5	2.8

### ***A rural infrastructure policy framework is in place in all six economies***

As infrastructure connects the economic system which allows factors of production, goods and information to move across people and markets, it plays an important role in decisions about investment in economic activity.

The economies' agriculture and rural development strategies have been updated, setting comprehensive priorities for the rural infrastructure policy framework. Among the top priorities for rural infrastructure are the construction and rehabilitation of local roads, irrigation systems, and digitalisation as preconditions for increasing agricultural productivity and competitiveness. The digital transformation of agriculture and of the economies more broadly has significantly increased the amount of agricultural data of commercial significance. The enhanced ability of agri-food stakeholders to access, share and use agricultural data is reshaping competition in the sector. At the farm level, agricultural data can be analysed to generate information and actionable insights that support producers' decision making and help them to better manage their operations. This includes using agricultural inputs more precisely and adapting to pests, weather and climate. The increasing availability of data is also changing business models, fostering new types of vertical collaboration (for example, between machinery equipment and digital software providers), and providing increased opportunities to tailor products and services for farmers (Jouanjean et al., 2020<sup>[3]</sup>)

All six economies recognise the digital transformation of agriculture as a prerequisite for its development. Kosovo is making great efforts to improve its digital infrastructure in rural areas. Under the Digital Economy Project (KODE) 2018-23, supported with USD 25 million from the World Bank, more than 200 villages (will get a broadband connection by 2023. Most of Kosovo's rural areas are therefore expected to benefit from broadband Internet access within the next five years. This will give farmers access to increased digitalisation opportunities (market information systems, weather/climate data for preventive measures, online promotion/sales, etc). In November 2020, Serbia started implementing its last-mile broadband project, aimed at rural households that were not targeted for network expansion by a commercial operator in the next three years. Funded by the European Bank for Reconstruction and Development (EBRD), the project will support the deployment of last-mile fibre broadband that will connect the existing fibre backbone to 600 schools located in white zones (without access to broadband) in rural areas. This will improve living conditions in rural areas by providing better access to information and know-how, improved education for students, and allow new farmers to improve their skills. The project is part of a larger initiative and is the first of two phases; the second phase, targeting approximately 900 schools, is planned for 2021/22 as a separate project.

### ***Investment in irrigation is increasing but policy progress is limited***

Irrigation infrastructure is regarded as a high priority for boosting productivity and stabilising agricultural production in the six economies. However, only limited progress has been made in developing irrigation

policies to improve the efficiency and sustainability of irrigation, or instruments to measure soil erosion, drainage and soil moisture.

In 2018, Albania prepared a new irrigation and drainage strategy for 2019-31. Under this strategy, the Water Resource Management Agency was established, two river basin management plans were adopted in 2020 and three other plans are being prepared and should be finalised in early 2022. Montenegro is currently implementing its strategy for water management, including irrigation, for 2018-35. With the support of the Food and Agriculture Organization (FAO), North Macedonia is planning to prepare its irrigation and drainage strategy for 2021-31, which will set the future direction for the national irrigation system to increase water use on an efficient and rational basis.

Investment in new irrigation systems continues in all WB6 economies. North Macedonia continues to implement its Irrigation Project (2019), with EUR 80 million of funding from the German Development Bank KfW and EUR 7 million in EU funding through the Instrument for Pre Accession Assistance (IPA) projects. Investment in water management systems is being carried out in accordance with the Plan for Investment in Water Management Infrastructure for the Period 2015-25, which aims to increase the potential irrigated area by about 32 000 ha. In Bosnia and Herzegovina, the Irrigation Development Project 2013-20 has been financed by a World Bank loan of USD 40 million.

Water management remains an open question, as economies are still struggling to find the best irrigation water management model. Most of the water user organisations proposed as a model by the World Bank in the region have failed to assume the role intended for them. In North Macedonia, some of these organisations have been transformed into legally independent co-operatives, while in Albania and Kosovo, although irrigation water management has been transferred to the local level, the system continues to face considerable inefficiency and financial losses.

### ***Agricultural education systems are not providing the skills the sector needs***

Agricultural education and training remain underfinanced and the number of agriculture students in the WB6 economies continues to fall. All of the economies' agriculture and rural development strategies see education and training as an important area for development, but few measures are envisaged. In addition, there is a lack of inter-sectoral co-operation between the agriculture and education ministries. The integration between vocational education and the training system is also weak and the curricula offer little scope to practise the skills learned, despite this being a crucial component of agricultural work. Montenegro has been the first to make efforts to improve the integration of vocational education. In December 2019 it prepared the Strategy for the Development of Vocational Education in Montenegro (2020-2024) with an action plan for 2020-22.

Although the agriculture sector largely employs the working poor and low-skilled workers, vocational education and training services do not reach rural areas, where education levels are generally lower than urban areas and where most of the population of the region currently resides.

Qualified and professional agricultural workers who are ready to meet the challenges of new production technologies are in constant demand. For this reason, all of the WB6 economies face a pressing need to reorganise their agriculture education system, using the resources available, and to create sustainable links between the education institutions and the labour market.

Too many people still work in agriculture in the WB6 economies. Further reforms towards making it a more skill- and capital-intensive sector will release a lot of workers. Their integration into the labour market will demand a number of policies (medium- and long-term measures) that will support the reallocation of the agricultural workforce into new sectors, possibly in diversified rural economies or green initiatives.

Most of the economies lack any monitoring and evaluation of their agriculture education systems. Serbia has been the first to begin developing an evaluation mechanism. In March 2020, the national system for

assessment of the education and its outcomes was established as an education management information system, based on the Strategy for Education Development in Serbia 2012-20. The first results are expected in 2021, and the information gathered will help the future planning and implementation of agricultural education programmes.

### ***The way forward for agro-food system capacity***

- **Increase investment and improve the implementation of rural infrastructure policy.** Rural infrastructure policies are crucial to improving the competitiveness and productivity of the agriculture sector. There is a continuing need to improve rural infrastructure and increase the take up of current programmes. Support schemes need to be boosted by increasing the funds allocated and increasing support to the rural infrastructure projects implemented by local self-governments and other stakeholders.
- **Continue investing in irrigation infrastructure.** Irrigation and drainage are crucial to agriculture and can double, or even triple, yields for some crops. Current irrigation investment strategies need to be implemented as planned. Combined with the planned road infrastructure investment, this will improve the competitiveness of all six economies' agricultural products.
- **Improve irrigation water management.** Increasing funding for the maintenance of the existing irrigation network and the new areas being developed will be a priority. Without effective and efficient water management, the planned investments in irrigation will not be maintained and the system will not be sustainable. Economies could draw on the system implemented in the Emilia-Romagna region in Italy to optimise their irrigation water management (Box 17.1).
- **Ensure the skills taught in agricultural education meet labour market needs.** This will help students find practical work during their studies and after graduation. Accountability and certification mechanisms will need to improve to keep pace with labour market demand for the development of new know-how.

#### **Box 17.1. Using information technology for agricultural water management in Emilia-Romagna, Italy**

IRRINET is an irrigation IT system which advises farmers on efficient water management. The web service was developed with public funding by the Canale Emiliano Romagnolo (CER), a water consortium located in the Emilia-Romagna region

Emilia-Romagna is a leading Italian agricultural region with more than 84 000 farms, and about 1 million ha of farmland. About 33% of the farms have some irrigated land, making it increasingly important to use the water as efficiently as possible. Water scarcity and droughts are increasing in the region and climate change is expected to worsen the situation, reducing the amount of water available for agriculture. After the 2012 and 2013 drought events, the Emilia-Romagna regional authority put pressure on farmers to use water more efficiently, introducing new criteria for water resources governance and management and developing and adopting innovative techniques that can enable farmers to improve their overall economic and sustainable production, such as water scheduling.

IRRINET processes meteorological (rain and evapotranspiration), soil and crop information, to calculate the so-called water balance for individual crops, allowing farmers to know how much water is actually needed so they can reduce usage without reducing the quality of the crop. IRRINET is available free to farmers in Emilia-Romagna and currently provides more than 12 000 farms with daily irrigation scheduling via a web interface, text messaging or an app. This supports the efficient use of water resources in the sector. In 2017 it was estimated the service allowed about 90 million m<sup>3</sup> of water to be saved in the region each year – 20% of the total agricultural demand – without reducing yields. In the long term, IRRINET can optimise the use of water resources and sustain agricultural production, especially in dry years.

Source: (Climate ADAPT, 2019<sup>[4]</sup>), *IRRINET: IT irrigation system for agricultural water management in Emilia-Romagna, Italy*, <https://climate-adapt.eea.europa.eu/metadata/case-studies/irinet-it-irrigation-system-for-agricultural-water-management-in-emilia-romagna-italy>.

## Agro-food system regulation (Sub-dimension 14.2)

The second sub-dimension assesses the regulations covering two main areas: natural resources such as land and water; and inputs, such as crops and fertiliser and pesticides. Regulations for natural resources are central to ensuring their long-term sustainable use, determining access to and use of land, water and biodiversity resources. Regulations for products and inputs aim to protect human, animal and plant health, and can also affect natural resource use.

Overall, the WB6 average score for this sub-dimension is 2.9 (Table 17.3). Serbia has the highest score, for natural resource regulations, at 3.6, with Albania and Montenegro close behind. Montenegro and North Macedonia have the highest score for regulations on products.

**Table 17.3. Scores for Sub-dimension 14.2: Agro-food system regulation**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 14.2:	Natural resources regulations	3.5	2.5	2.0	3.0	3.5	3.6	3.0
Agro-food system regulation	Product regulations	2.5	2.0	2.6	3.5	3.5	3.0	2.9
<b>Sub-dimension average score</b>		3.0	2.3	2.3	3.3	3.5	3.3	2.9

### ***Natural resource regulations are hampered by limited land information systems***

Efforts to regulate natural resources have been limited, especially when it comes to creating effective measures that will stop the loss of agricultural land and improve the implementation of legislation by providing more efficient mechanisms of inspection/control. Inconsistent cadastral information and the lack of implementation of property rights legislation are holding most of the WB6 economies back from improving their natural resources regulations.

Land parcel identification systems (LPIS) are an important tool for planning, implementing and monitoring agricultural support. It is an element of the Farm register (FR) and works as a spatial representation of areas utilized by agricultural households. Serbia is prioritising land consolidation to improve agriculture competitiveness. As part of its Serbia 2025 programme, it is allocating an additional EUR 70 million to land consolidation processes based on the Strategy for Rural Development 2014-24.

### ***Product regulations are harmonised with the EU, but better management of fertilisers and pesticides is needed***

The regulations on seeds and propagation material are aligned with EU directives and protocols, including consistent monitoring and evaluation on a quarterly basis following EU guidelines. The regulations cover

agricultural production, environmental protection and consumer health. Managing regulations for seeds and propagation material requires co-ordination between government agencies, as well as clear divisions of responsibilities and mandates. In 2018, Kosovo prepared a new Draft Law on Seeds as part of the Italian-Kosovo EU twinning project, but it is still awaiting further legal procedures for approval.

The use of fertilisers and pesticides requires proper management, inspection and control at all levels. The WB6 governments need to improve their efforts in this area. In Albania, the new Law on Fertiliser Products was approved in 2020 and harmonises the EU rules for production, registration, trade, import, export, use, quality control, traceability, information, advertising and inspection of activities related to fertiliser products, as well as the organisation and operation of the relevant structures.

### ***The way forward for agro-food system regulation***

- **Enhance the land consolidation process.** The land consolidation process is crucial for improved productivity. Continued implementation of consolidation policies using different approaches to increase the average farm size will significantly boost productivity.
- **Enhance agricultural land management policies.** The full establishment of a functional and operational land parcel identification system (LPIS) is crucial. LPIS are one of the preconditions for the accreditation of new IPARD measures and offer strong tools for planning, implementing and monitoring agricultural support policy.
- **Ensure continuous improvement of the regulations on fertilisers and pesticides.** Appropriate management of fertilisers and pesticides will reduce their long-term negative impact on farming, and promote the sustainable use of natural resources. Box 17.2 provides an example from Denmark on how policies can achieve this.

#### **Box 17.2. Managing the biodiversity impacts of fertiliser and pesticide use in Denmark**

Major increases in the use of pesticides were leading to a serious decline in Denmark's farmland wildlife at the beginning of the 1980s. For example, wild plant diversity decreased by 60% between 1970 and 1990 (PAN Europe, 2005<sup>[5]</sup>). Denmark has a long history of implementing policies to reduce pesticide use, accompanied by quantitative targets. The first pesticide reduction plan was introduced in 1986 to protect groundwater that is consumed directly without any purification treatment. Since then, pesticides have been banned when it is proved that they have affected groundwater used for drinking (MIM and MFVM, 2013<sup>[6]</sup>). Consequently, only around 80 types of active substances are permitted in Denmark, compared to 3-400 in many other EU Member States (Coll and Wajnberg, 2017<sup>[7]</sup>)

Along with tightening approval procedures, there are regulations requiring mandatory spraying certificates for professional users, mandatory spraying journals and mandatory buffer zones around water courses, lakes and public water supplies (Pedersen and Nielsen, 2017<sup>[8]</sup>). Under the Pesticide Leaching Assessment Programme, authorised pesticides are applied to six representative test fields followed by intensive monitoring to determine if there is evidence of the pesticides, or their metabolites, leaching into groundwater. As a result of this programme, a small number of previously authorised pesticides have had their authorisations withdrawn in Denmark, and in some other cases the conditions of use have been modified (EC, 2017<sup>[9]</sup>).

Source: (Sud, 2020<sup>[10]</sup>), "Managing the biodiversity impacts of fertiliser and pesticide use: Overview and insights from trends and policies across selected OECD countries", <https://dx.doi.org/10.1787/63942249-en>.

## Agricultural support system (Sub-dimension 14.3)

The third sub-dimension assesses the policies, instruments and organisation of agricultural support systems. The way in which economies provide support to farmers is arguably as important as the total level of that support. In that respect, this sub-dimension analyses the large portfolio of measures available to governments.

As Table 17.4 shows the average score for the WB6 economies in this sub-dimension is 2.7, which suggests limited progress. Montenegro and Serbia, the two economies that are already in the EU negotiation process, are the most advanced in the region. In contrast, Bosnia and Herzegovina and Kosovo are the only two economies whose IPARD support schemes are still not accredited and who therefore score the lowest.

**Table 17.4. Scores for Sub-dimension 14.3: Agricultural support system**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 14.3:	Agricultural policy framework	3.0	3.0	2.5	3.1	3.5	3.5	3.1
Agricultural support system	Domestic producer support	3.0	2.0	2.0	2.2	3.5	3.0	2.6
	Agricultural trade policy	2.5	2.0	2.0	3.0	4.0	3.0	2.8
	Agricultural tax regime	2.5	1.5	2.0	1.4	3.5	3.0	2.3
	Sanitary and phytosanitary measures	3.0	2.0	2.0	1.4	3.0	4.0	2.6
<b>Sub-dimension average score</b>		2.8	2.1	2.1	2.2	3.5	3.3	2.7

### ***Agriculture policy frameworks are fairly well harmonised with EU policies***

The region's agriculture support policies are based on national strategies and programmes which are harmonised overall with the EU Common Agricultural Policy (CAP) and the seven-year period for its implementation. These documents outline the strategic interventions needed to develop the agriculture sector and rural areas so they can meet the challenges of the EU single market requirements. The planning processes in all six economies involve long consultation exercises and discussions using participatory mechanisms so that all types of stakeholders can help to define the measures. All of the strategies include performance indicators (such as real economic growth in the sector, increased labour productivity in agriculture and processing, full compliance of formal agriculture holdings with EU standards, increased average farm sizes, increased export to import ratios, and the creation of new jobs). However, monitoring and evaluation mechanisms are limited. The agriculture support policy framework mainly consists of IPARD and domestic support measures.

Even though it has not yet started the EU negotiation process, North Macedonia's agriculture policy framework is the best organised of the six economies. Its support system is both functional and in line with the procedures and support system envisaged in the CAP. Albania, Montenegro, North Macedonia and Serbia implement IPARD measures through an accredited payment agency. Bosnia and Herzegovina and Kosovo still lack the administration mechanisms that would make them eligible for IPARD funding.

### ***Domestic producer support instruments are in line with IPARD, but the criteria are not harmonised***

All the economies provide direct payments to farmers. They are mainly based on land area, head of livestock and agricultural products sold and are the main income support instruments for agricultural producers. The support is based on income subsidies and non-production criteria. These income supplements largely determine the profitability of agriculture in most sub-sectors and represent a major element supporting the choice of agriculture as a profession.

Albania's domestic support instruments are aligned with IPARD support and funding measures and it has made substantial progress in natural disaster mitigation and preventative measures. Although no measures similar to the CAP agri-environmental indicators are in place yet, draft measures are being formulated. Domestic support to agriculture in Kosovo remains underfunded, reaching EUR 49.6 million in 2019, including direct payments and investments in rural development. While Kosovo's Ministry of Agriculture, Forestry and Rural Development (MAFRD) continued to subsidise farmers through direct crop payments based on the area cultivated, it has not introduced any cross-compliance measures.

Besides the fact that the criteria for domestic support measures are much easier to meet than for IPARD, there has been little monitoring to evaluate cross-compliance.

### ***Trade policies follow EU principles, but tariff and non-tariff barriers remain significant in some economies***

Agricultural trade is quite liberal as most economies in the region are World Trade Organization (WTO) members, or at least largely comply with its policies. Most of the economies apply some preferential tariffs on agricultural products originating from the EU, the Central European Free Trade Agreement (CEFTA), the European Free Trade Association (EFTA) and Turkey. The regulations on customs tariffs are adopted on an annual basis. In 2019, Kosovo increased its tariffs on goods originating from Bosnia and Herzegovina and Serbia to 100%. In April 2020, the tariffs were lifted and replaced by gradual trade reciprocity measures, which were subsequently abolished by the new Government of Kosovo in June 2020. Such tariffs seriously jeopardise the position of consumers in Kosovo and provoke retaliatory tariff and non-tariff barriers for the few Kosovo agricultural exporters trying to penetrate the regional market (Gap Institute, 2019<sub>[11]</sub>).<sup>2</sup>

Laws on common market organisations (CMOs) is still pending in all economies in the region, even though CMOs are designed to manage production and trade in order to ensure steady incomes for farmers and a continued supply for consumers. CMOs represent the main pillar of the Common Agriculture Policy (CAP) and its framework for market support measures. This is a requirement for full alignment with the European Union (EU) *acquis*.

### ***Farmers enjoy a highly preferential agricultural tax regime***

The taxation system in all economies remains unified and applies few taxes to farmers. In most cases, value-added tax (VAT) for agriculture products is levied at a reduced rate. This reduction covers agricultural machinery and inputs such as seeds and seedlings. In Bosnia and Herzegovina the specific agricultural products attracting a reduced rate are decided at the entity level. Both entities can choose to defer their tax regime rates annually based on analysis by their finance and agriculture ministries.

Taxes on agriculture land are paid by the hectare. There are some exclusions for farms planted with permanent crops. For example, in Albania, orchards and vineyards are exempt from tax for the first five years after planting.<sup>3</sup>

### ***Sanitary and phytosanitary frameworks partly comply with EU and international standards***

All assistance to the agri-food sector requires the right interventions both in terms of specific measures and the overall government approach. To modernise the agri-food sector and foster rural development, while preparing the sector for the increasingly challenging environment posed by modern value chains, food safety standards and climate change, government policies and spending need to provide the right incentives for farmers and rural entrepreneurs. The sector must also be managed in alignment with EU policies, which requires significant changes in public sector support for agriculture, forestry, food security

and rural development. Perhaps the greatest issue is that both food safety and veterinary services continue to face capacity limitations in technical support, training and policy.

Even though Albania is a member of a number of international organisations for plant and animal health and has functional national contact points for each organisation, it has not transferred a lot of know-how and has made little progress in bringing its national SPS framework in line with international guidelines. It has a food safety, phytosanitary and veterinary network reference laboratory, but the law does not require the accreditation of tests. Only a limited number of food safety tests are internationally certified, preventing the recognition of these procedures abroad. Phytosanitary tests are partly recognised and a process for their recognition by CEFTA members is ongoing.

Most of the WB6 economies lack a comprehensive veterinary disease monitoring and control system that is in line with EU legislation and the World Organisation for Animal Health requirements. North Macedonia has made the most progress in these areas, followed by Serbia. However, there is a lack of in-service training and education programmes for field veterinarians in all six economies.

To improve the collection and disposal of animal by-products, Kosovo has been granted EU funding for a new, fully equipped rendering plant. Despite having been built two years ago, the plant is still not operational. The MAFRD was obliged to launch a call for tenders and select a management company for the plant. Collection will only be able to start in 2021.

A phytosanitary information system (PIS) for plant health and plant protection products contributes to better communication, co-ordination, transparency and more efficient functioning of all stakeholders involved in the phytosanitary sector. PISs are in the early phases of development in all the economies. The greatest progress has been made in North Macedonia where the Macedonian Phytosanitary Directorate within the Ministry of Agriculture, Forestry and Water Economy has designed, developed and implemented PIS administration and controls for plant health and pesticides. Currently, an official control module is being developed to upgrade the import, export, re-export and transit activities by including additional data for further risk analysis and the preparation of reports.

### ***The way forward for the agricultural support system***

- **Meet the preconditions for and increase capacity to facilitate IPARD funding.** As part of the harmonisation with the EU CAP, the economies need to make further efforts to accelerate the process of accreditation of new IPARD measures.
- **Adopt and implement common market organisation legislation** as part of the introduction of cross-compliance measures, especially among those economies that have not prepared them.
- **Continue to upgrade SPS systems in line with EU requirements.** Further efforts to implement integrated food control systems should be a priority. All the WB6 economies still need to establish functioning rendering plants for the disposal of animal by-products in order to complete their animal monitoring and control systems. In the phytosanitary sector, establishing and further strengthening of technical plant protection services is a priority for the implementation of pest monitoring and integrated pest management.
- **Speed up the process of establishing reference laboratories.** The economies need to increase the accreditation of laboratory methods used in hygiene, veterinary and phytosanitary controls. The reference laboratories will improve overall food safety and phytosanitary controls, increasing the competitiveness of the agriculture sector overall.
- **Strengthen institutional co-ordination and harmonise standards and criteria for support measures.** Harmonising the criteria used for IPARD and domestic support measures will help farmers transform the region's agriculture towards integration with the EU.

## Agricultural innovation system (Sub-dimension 14.4)

The agricultural innovation framework spans public, private and higher education institutions, along with extension services, and creates the underlying knowledge needed for innovation in products, processes, marketing and organisation. Agricultural innovation priorities range from crops, livestock and fisheries to sustainable resource use and climate change. This sub-dimension assesses how well the agricultural innovation framework, supported by international co-operation, is helping the development of new knowledge in agriculture.

As Table 17.5 shows, almost all economies in the region face the same challenges of underfinanced innovation projects and extension services of limited efficiency. The average score is 2.6, with North Macedonia the most advanced, followed by Serbia and Montenegro. The other three economies are at early stages of development in this area.

**Table 17.5. Scores for Sub-dimension 14.4: Agricultural innovation system**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 14.4: Agricultural innovation system	Agricultural research and development framework	2.0	2.0	2.5	3.1	2.5	3.0	2.5
	Agricultural extension services framework	2.0	2.0	2.5	3.2	3.5	3.0	2.7
<b>Sub-dimension average score</b>		2.0	2.0	2.5	3.2	3.0	3.0	2.6

### ***Research and innovation policy is underfinanced and limited in all economies***

All the WB6 economies continue to neglect agricultural science and research. In a context of digitalisation and global market trends, agricultural innovation systems are essential to increasing competitiveness in world markets. Currently, all the economies have strategic documents covering innovation and the application of science. The strategies identify some key points regarding agricultural research and aim to increase the number of applied projects between research institutes and farmers, improving production technology and producers' competitiveness. Despite this, public spending on research and innovation was still below 1% of GDP in 2019, compared to 2.19% on average in the EU, even though in most of the economies they are prioritised as part of the agriculture budget.

Apart from the work of public institutes, none of the economies in the region have dynamic applied science and research fields. Research is largely dependent on donor-funded projects, while the national budget for such projects is extremely limited, which restricts projects to an ad hoc basis only.

Montenegro and Serbia have seen the greatest increase in agricultural research budgets over the last three years. In Montenegro 16% of research projects funded by the national budget were in the agriculture sector, while in Serbia support for agriculture research rose by 8%.<sup>4</sup>

Overall innovation, with a stress on sustainability, is a priority of the Smart Specialisation Strategy, a concept associated with European cohesion policy. Montenegro is the first non-EU country to have adopted a Smart Specialisation Strategy, in 2019 (S3.me, 2019<sub>[12]</sub>). The strategy hopes to see Montenegro recognised for, among other things, agricultural innovation and sustainability, preservation of tradition in rural areas, and the development of a food value chain for authentic Montenegrin products.

### ***Agriculture extension services lack human and financial resources***

Extension services are the main source of information, education and training for the majority of producers in the WB region. They either are organised as agencies with a special mandate from the government or as part of the relevant ministry.

The national, state-owned extension services have a long tradition of support of agriculture in all the WB6 economies, except for Albania,<sup>5</sup> where extension services were only introduced in the mid 1990s.

At present, the public agricultural extension services are strongly focused on production techniques, and only partly able to cover farm management, markets and marketing, regional rural development and the promotion of producer organisations. Extension services should be further diversified to meet market demand and farmers' needs.

Extension services in all WB6 economies are provided free of charge or at low cost, but each advisor serves a significant number of farmers which limits the scope and quality of the services they can provide. Almost all extension service agencies in the region lack the human and financial capacities to improve their performance in the field. Only in Kosovo are extension services widely available and very competitive due to the number of donor-supported projects and high awareness among farmers of their role. In 2019, 13 private companies were licensed to perform advisory activities. Approximately 300 agriculture and rural development advisors have been certified, and another 100 are expected to be certified by the end of 2020.

The introduction of private advisors into the extension network is a reform process in the WB6 economies. The smooth transformation of the existing state-owned system will take some effort and dedication. It will also require mechanisms for planning, standardisation, access, evaluation and continuing support for the development of services.

### ***The way forward for the agricultural innovation system***

- **Increase funding for and implement national scientific research strategies.** Increase the investments in research, in line with market demand, and stimulate links between producers and researchers while supporting innovation projects in targeted agricultural sub-sectors.
- **The current extension services need to be further supported** by increasing advisors' know-how through continuing training.
- **Improve farmers' access to information, especially market information.** The current information systems should be reformed into functional and dynamic platforms for the collection and dissemination of information.

## **Conclusion**

Agriculture is a key pillar of the Western Balkan economy. The region's progress over the past two years has been notable in many areas, including improvements in rural infrastructure, irrigation, IPARD implementation and the regulation of natural resources. There is still room for improvements in education and training, innovation and research. All the WB6 economies are aligning their policies with those of the EU, but this process is very demanding and requires effort and dedication at all levels.

Given that they all share a similar background, it is not surprising that the problems and challenges the WB6 economies face are almost identical. Yet, although they could benefit from their shared experience, regional co-ordination and support mechanisms are lacking. The region would benefit from focusing on synergies and highlighting the most appropriate solutions in the process of harmonisation with the EU. The way forward for the Balkan economies will be to stabilise rural areas and provide a decent life for the rural population, which is only possible through sustainable and profitable agriculture. Agriculture remains the most labour-intensive sector in the region and investment in new technology, value-added production and the sustainable use of resources is the only way to improve rural living conditions.

## Notes

<sup>1</sup> The 11 Central and Eastern European countries (CEEC) which have joined the European Union: Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>2</sup> The 100% tax does not resolve the non-tariff barriers faced by Kosovo businesses exporting to Serbia. Empirical studies show that these barriers can become greater obstacles than tariff barriers, which were annulled with the entry into force of CEFTA. The tariff may have significantly increased consumer prices of food, the main expenditure for Kosovar consumers. Taking this into consideration, maintaining this tax for a longer period may increase poverty (Gap Institute, 2019<sub>[11]</sub>).

<sup>3</sup> Article 23 of the Albania law no.9632 of 30.10.2006 On Local Taxes System.

<sup>4</sup> In 2020 the European Innovation Scoreboard ranked Serbia as a moderate innovator with an improvement in results of 13.3%. Almost 20% of all implemented research projects and success stories are in agriculture, focusing mainly on digitalisation, smart farming, modern technologies and sustainability (EC, 2020<sub>[29]</sub>).

<sup>5</sup> Albania now has five regional Agricultural Technology Transfer Centres with a mission of enabling the smooth transfer of agricultural technology according to the needs and regional priorities within their jurisdictions. The centres have 153 employees implementing an annual programme and offering training and educational material to farmers and agribusinesses.

# 18 Tourism policy (Dimension 15)

---

The Western Balkans is one of the fastest growing tourist regions in the world, with all six Western Balkan (WB6) economies seeing double-digit increases in tourist arrivals and overnight stays in recent years. The fast growth of tourist arrivals contributes to the growth of earnings, gross domestic product (GDP), exports and job creation, underlining the increasing importance of the sector for regional development. This chapter assesses the performance of the WB6 in developing competitive and sustainable tourism through an analysis of five tourism policy sub-dimensions. The first sub-dimension, governance structure and co-operation, explores the effectiveness of the institutional set up and the efficiency of co-operation among public and private stakeholders. The second sub-dimension, destination accessibility and tourism infrastructure, assesses the progress made in improving accessibility, accommodation capacity and quality assurance. The third sub-dimension, availability of a qualified workforce, examines how effectively economies address the needs of the tourism labour market through vocational education and training and higher education frameworks. The fourth sub-dimension, sustainable and competitive tourism, assesses the existence and efficiency of sustainable tourism policy frameworks to influence the development and operation of sustainable tourism. The fifth and final sub-dimension, tourism branding and marketing, assesses the effectiveness of tourism branding and marketing, including digital marketing.

---

## Key findings

- **Four WB6 economies (Albania, Montenegro, North Macedonia and Serbia) have tourism development strategies and have committed to develop an efficient governance structure involving inter-ministerial co-ordination, vertical co-operation, and dialogue with private and other tourism stakeholders.** Albania, Montenegro and Serbia have made the most progress in this area.
- **Most WB6 economies (Albania, Kosovo, Montenegro and North Macedonia) have made some progress in developing a tourism data collection framework.** North Macedonia, Montenegro, and Bosnia and Herzegovina have started or plan to start preparing their first Tourism Satellite Account. The key challenge remains the reliability of the data collected.
- **All economies have made progress in boosting accommodation capacity and establishing an accommodation quality standards framework** based on international standards. All WB6 economies started categorising accommodation before this assessment, with the main progress in the last two years regarding the establishment of a register of accommodation facilities. Regular monitoring controls should be established.
- **Three WB6 economies (Albania, Kosovo and North Macedonia) have made sound progress in developing a vocational education and training (VET) framework. However, a qualified workforce is still lacking throughout the region, implying that the skills supply framework and higher education need improving.** Other key challenges are the lack of active engagement by private stakeholders in curricula development, weak monitoring and evaluation systems, and schools' insufficient budgets for equipment and staff training.
- **Comprehensive natural and cultural heritage enhancement frameworks for sustainable tourism development are still incipient.** The WB6 economies should focus on establishing effective inter-ministerial co-operation and introducing regular monitoring and evaluation of policy measures. Montenegro has made the most effort in this area.
- **Despite efforts to develop tourism investment policies in most economies, tourism innovation frameworks are not yet in place.** Challenges include monitoring and evaluation, investment procedures, urban planning, and awareness raising among private investors.
- **Despite significant progress, the competitiveness of tourism marketing and branding remains a challenge for most WB6 economies, but is needed to increase their visibility in international markets.** Digital marketing frameworks are incipient. Moreover, the absence of a common regional tourism brand and marketing activities lessens the visibility of the Western Balkans as an attractive tourist destination that offers a diversity of unique tourist experiences. Four economies (Albania, Montenegro, North Macedonia and Serbia) have established tourism brands. Only Montenegro, Serbia and Republika Srpska in Bosnia and Herzegovina have valid marketing strategies that have not yet expired. Marketing strategies are under development in all other economies.
- **The COVID-19 pandemic has hit the tourism sector very hard in all WB6 economies (most significantly in Montenegro), and has stopped the fast growth of tourism seen over the last decade.** The crisis revealed gaps in tourism development that will need to be addressed in the future. The main gaps and challenges in all WB6 economies are similar, therefore establishing regional co-operation to address these challenges could help each WB6 economy to overcome them more efficiently.

## Comparison with the 2018 assessment

Montenegro, where tourism contributes much more to GDP and employment than in the other economies, has the most developed tourism policy framework, followed by Serbia and Albania (Figure 18.1). Bosnia and Herzegovina, Kosovo and North Macedonia still have room to improve their tourism policy frameworks.

Figure 18.1. Overall scores for the tourism policy dimension (2018 and 2021)

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition of new sub-dimensions and relevant qualitative indicators, and removal of some sub-dimensions and qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

The previous Competitiveness Outlook (CO) in 2018 made a number of recommendations for the WB6 economies to improve the tourism policy framework (Table 18.1) (OECD, 2018<sup>[11]</sup>). Progress in most issues has been moderate, with key challenges remaining including monitoring and evaluation of implemented policy measures and more efficient inter-ministerial co-operation to enhance cultural and natural heritage in tourism.

**Table 18.1. Implementation of CO 2018 policy recommendations: Tourism policy**

Competitiveness Outlook 2021		
CO 2018 policy recommendations	Main developments during the assessment period	Regional progress status
Systematically implement a whole-of-government approach to tourism	<ul style="list-style-type: none"> <li>• Specific tourism-related strategies/programmes were adopted in Albania, Montenegro, North Macedonia and Serbia.</li> <li>• Tourism was included in other domestic strategies in Albania, Montenegro and Serbia.</li> <li>• Regular co-operation among public officials in the ministries is formally established in all WB6 economies, except North Macedonia.</li> </ul>	Moderate
Forge stronger links between natural and cultural resource strategies and tourism	<ul style="list-style-type: none"> <li>• Links between natural and cultural resource strategies and tourism are formally established in all WB6 economies, except North Macedonia.</li> <li>• However, the implementation of policy measures and actual co-operation among relevant ministries is still weak in all WB6 economies except Montenegro, which has developed a comprehensive natural and cultural enhancement framework.</li> </ul>	Limited
Bring tourism infrastructure in line with internationally recognised standards	<ul style="list-style-type: none"> <li>• Consistent accommodation quality standard frameworks based on international standards have been developed in all WB6 economies.</li> <li>• Challenges remain regarding tourism monitoring and inspections due to a lack of human and financial resources in all WB6 economies.</li> </ul>	Moderate
Further professionalise the tourism workforce and address the significant skills gaps in the sector	<ul style="list-style-type: none"> <li>• Progress has been achieved, especially in improving the tourism VET framework, in all economies except in Bosnia and Herzegovina.</li> <li>• However, higher education and skills supply frameworks still need to be improved in all WB6 economies.</li> </ul>	Moderate
Develop tourism data and statistics in line with international standards and good practice	<ul style="list-style-type: none"> <li>• North Macedonia has started preparing its first Tourism Satellite Account (TSA). Bosnia and Herzegovina and Montenegro are planning to implement a TSA in 2021.</li> <li>• Serbia has launched an e-tourist information system. Montenegro is planning to implement e-tourism electronic guest registration in 2021. A platform for electronic data collection is under development in Kosovo.</li> </ul>	Moderate
Improve co-ordination among institutions promoting tourism at central, regional and local levels	<ul style="list-style-type: none"> <li>• All WB6 economies have established a public-private dialogue and co-operation framework at the economy level, which includes vertical co-operation with the local level.</li> <li>• All WB6 economies have established formal bodies at the economy level that include representatives of the private sector, non-governmental organisations (NGOs), educational institutions and municipalities, in addition to relevant ministries.</li> <li>• Except for North Macedonia, regular meetings of public and private tourism stakeholders have been undertaken since the previous assessment.</li> </ul>	Moderate
Put in place independent monitoring and evaluation of tourism-related action plans and strategies	<ul style="list-style-type: none"> <li>• Albania has started monitoring its tourism strategy, with the first progress report prepared for 2019.</li> <li>• Montenegro began monitoring its tourism strategy in 2019. However, more measurable indicators should be included in the monitoring.</li> </ul>	Limited

## Introduction

Driven by a relatively strong global economy, a growing middle class in emerging economies, technological advances, new business models, affordable travel costs and visa facilitation, international tourist arrivals grew by 4% globally in 2019 compared to 2018, to reach USD 1.481 billion in total international receipts.<sup>1</sup> At the same time, export earnings generated by tourism grew to USD 1.7 trillion (UNWTO, 2021<sup>[2]</sup>). This makes the sector a true global force for economic growth and development, driving the creation of more and better jobs and serving as a catalyst for innovation and entrepreneurship (UNWTO, 2019<sup>[3]</sup>).

As emerging tourist destinations, the WB6 economies have all reported double-digit increases in tourist arrivals and overnight stays in recent years, making the region one of the fastest growing in the world. The fast growth of tourist arrivals creates jobs and contributes to the growth of earnings and consequently the

growth of travel and tourism as a share of GDP (Figure 18.5) and exports (Figure 18.6). This shows the growing importance of tourism for overall economic development in WB6 economies.

The containment measures adopted to prevent the spread of the COVID-19 virus have had a significant impact on the tourism industry in the Western Balkans. The number of tourist arrivals decreased in 2020 by around two-thirds compared to 2019,<sup>2</sup> which negatively affected jobs in the tourism industry (OECD, 2020<sup>[4]</sup>). WB6 governments need to ensure that they strengthen their tourism policy frameworks to effectively support the recovery of the tourism industry – especially small and medium sized-enterprises (SMEs) – and take the opportunity of increased demand for outdoor and nature adventure tourism products, for which the whole region has enormous potential.

This chapter considers the links between tourism and other policies, including potential trade-offs and complementarities. The following chapters of the Competitiveness Outlook are also particularly relevant for tourism:

- **Chapter 4. Investment policy and promotion** is important as public and private investments play an important role in promoting the attractiveness and competitiveness of a destination. Closer co-operation between the government bodies responsible for tourism and investment policies and promotion could allow them to better target opportunities, boost the level and quality of investment in the sector, and together address the obstacles that hinder investments in tourism.
- **Chapter 6. Access to finance** is important for ensuring sufficient investment in high-quality tourist products and infrastructure, especially for micro, small and medium sized enterprises (MSMEs), which are predominant in the tourism sector.
- **Chapter 10. Education policy** is relevant as the ability to provide enough qualified workers is essential for sustaining and enhancing competitiveness in tourism. To fully address labour and skills shortages, the government bodies in charge of tourism and education could co-operate to adopt and implement policy measures that will address tourism specific needs.
- **Chapter 11. Employment policy** and efficient labour market governance are key to ensure high-quality jobs and develop a flexible, inclusive and proactive labour market in tourism.
- **Chapter 12. Science, technology and innovation** are key to ensure competitiveness in tourism. Tourism is recognised as a sector where several innovations can be tested and implemented (e.g. renewable resources, energy efficiency solutions, green mobility solutions, single-use plastic reduction). This requires the inclusion of tourism in the overall science, technology and innovation strategy.
- **Chapter 13. Digital society** is important as tourism is one of the largest users of information and communication technology (ICT) and cannot survive without Internet access, broadband penetration and the use of e-commerce.
- **Chapter 14. Transport policy** that ensures capacity, efficiency and connectivity is vital for improving the accessibility of destinations and the movement of visitors within the region. It is therefore important that economy-level transport strategies consider investments in transport infrastructure that are vital for tourism development, especially in remote areas.
- **Chapter 16. Environment policy** is key to protect natural assets, control and manage the environmental impacts of tourism, and protect the region's competitive advantage. Environmental and tourism policies need to be aligned to promote sustainable growth and support domestic efforts to reconcile resource use and waste targets with tourism growth objectives.
- **Chapter 17. Agriculture policy** is key as the agro-food sector is a major supplier and one of the most important parts of the tourism value chain. It provides the basis for the creation of local and authentic culinary tourist products and experiences, which is one of the fastest growing tourism market segments.

## Assessment framework

### Structure

This chapter examines tourism policy frameworks in the WB6 by assessing five broad sub-dimensions:

1. **Sub-dimension 15.1: Governance and co-operation** focuses on the efficiency of economies' governance structures and institutional setups at economy and destination levels for managing the development and implementation of tourism strategies. It assesses inter-ministerial co-operation, government co-operation with municipalities and dialogue with non-governmental tourism stakeholders. It also assesses institutional support for the establishment of a comprehensive tourism data collection and sharing system.
2. **Sub-dimension 15.2: Destination accessibility and tourist infrastructure** focuses on how the economies facilitate destination accessibility and the flow of tourists across the region in terms of visa requirement policies and the implementation of other measures to ease border crossings. It also focuses on how efficiently the economies facilitate the quality of tourist accommodation based on international standards. The quality of information for tourists about destinations, accommodation and experiences is also assessed.
3. **Sub-dimension 15.3: Availability of a qualified workforce** focuses on how efficiently the economies bridge skills gaps in the tourism sector through established VET and higher education frameworks. It focuses on how well equipped schools are to deliver knowledge to their students, the effectiveness of the quality assurance framework in education and training, and to what extent private tourism stakeholders are involved in human resource development.
4. **Sub-dimension 15.4: Sustainable and competitive tourism** focuses on how efficiently the economies conserve, manage and use natural and cultural resources as one of the key drivers of tourism development and competitiveness. It also explores how efficiently tourism policy frameworks, which influence both tourism development and the operation of the tourism sector, make tourism more environmentally, socially and economically sustainable. Finally, it assesses how economies facilitate the investments and innovation in tourism that are vital for sustaining the competitiveness of the sector.
5. **Sub-dimension 15.5: Tourism branding and marketing** focuses on the effectiveness of tourism branding and marketing, how efficiently the economies facilitate the use of digital tools in tourism marketing, and the capacity of tourist stakeholders to use digital tools efficiently.

Figure 18.2 shows how the sub-dimensions and their indicators make up the tourism policy dimension assessment framework. The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by governments, as well as interviews undertaken with relevant non-government stakeholders. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more information on the methodology see the Assessment methodology and process chapter.

The leaders of the WB6 endorsed the Common Regional Market (CRM) 2021-2024 Action Plan at the Berlin Process Summit held on 10 November 2020 in Sofia. The plan is made up of targeted actions in four key areas: 1) a regional trade area; 2) a regional investment area; 3) a regional digital area; and 4) a regional industrial and innovation area.

In the regional industrial and innovation area, the WB6 economies commit to closely transform the industrial sectors, shape the value chains they belong to, and prepare them for the realities of today and the challenges of tomorrow. The findings of the tourism policy dimension can help to inform implementation of actions under this component (Box 18.1, Box 18.5 and Box 18.6).

### **Key methodological changes to the assessment framework**

Since the CO 2018 assessment, some methodological changes have been made to the framework to emphasise issues that are gaining importance for sustaining and improving the competitiveness of tourism in the region.

Three new sub-dimensions have been created:

- **Governance and co-operation** covers some indicators of the CO 2018 sub-dimension tourism prioritisation and promotion, complemented by new indicators for measuring how efficiently tourism strategies are implemented.
- **Sustainable and competitive tourism** supplements the CO 2018 sub-dimension cultural and natural resources, with indicators focusing on the promotion of sustainable tourism development, and the existence and efficiency of tourism investment and innovation policies.
- **Tourism branding and marketing** contains some indicators of the CO 2018 sub-dimension tourism prioritisation and promotion, accompanied by new indicators for measuring the effectiveness of tourism branding and marketing and the readiness of the tourism sector for digitalisation.

## Tourism policy performance and context in the WB6

The Western Balkans is one of the world's fastest growing tourist regions. Its unique geographical position between the East and West, as well as its rich and diverse cultural heritage and pure nature that includes Europe's deepest canyons, glacial lakes and the last remaining virgin forests between the Danube River, Dinaric Alps and the Adriatic Sea, means that the Western Balkans is one of the Europe's most unique regions and can offer authentic nature adventures and cultural experiences to tourists. All WB6 economies have recognised tourism as an opportunity for economic development. By designing tourism policy frameworks they have provided a base for improving the competitiveness and visibility of their economies in the highly competitive tourism market. To consolidate the fragmented tourist offer and increase the visibility of the Western Balkans as a unique tourist destination, the economies have begun co-operating at the regional level through the development of joint and internationally competitive cultural and adventure tourist products – see Destination accessibility and tourism infrastructure (Sub-dimension 15.2).

Outcome indicators play a key role in examining the effects of policies and provide crucial information for policy makers to judge the effectiveness of existing policies and the need for new policies. The outcome indicators chosen for the tourism sub-dimension are designed to show the impact of tourism on the WB6 economies and its contribution to economic growth and job creation. They also show the importance of tourism in the WB6 economies in terms of its impact on overall development and progress compared to Central Asia,<sup>3</sup> another emerging tourist region, the European Union (EU), OECD and CEEC.<sup>4</sup>

In the last decade, tourist arrivals have grown significantly in the WB6 region (average annual growth rate 11.5% in the period 2010-2019), driven by the overall fast growth of international tourism and improvements in marketing. The region also became more connected due to the expansion of low-cost air carriers and the development of air route networks. The double-digit growth rates of international arrivals to the region in 2019 compared to 2015 was below the Central Asia average, except for Kosovo, but exceeded OECD, EU and CEEC averages (Figure 18.3).

**Figure 18.3. Growth of international tourist arrivals (2015-19)**

WB economies, Central Asia, CEEC, EU and OECD. Index 2015=100

Note: The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934255076>

The COVID-19 crisis hit the tourism sector in the WB6 very hard and led to a significant drop in tourism growth in the region, with tourist arrivals decreasing by nearly 60% and overnight stays by 55% in 2020 compared to 2019. Montenegro faced the highest drop in the region (83.2% in tourist arrivals and 82.1% in overnight stays), followed by Bosnia and Herzegovina (nearly 70% in tourist arrivals and 63.4% in overnight stays). The fall in tourist arrivals and overnight stays in other economies was lower, but still significant (Figure 18.4).

**Figure 18.4. Tourist arrivals and overnight stays in the Western Balkans (2019-2020)**

% change

Source: Statistical Offices of WB6 economies.

StatLink  <https://doi.org/10.1787/888934255095>

The fast growth of tourist arrivals before the COVID-19 crisis has contributed to a rise in earnings and consequently to the growth of travel and tourism as a share of GDP in WB economies. Given their location on the Adriatic Sea, the tourism sector in Montenegro and Albania contributes much more to GDP than in

the other WB economies, representing about one-third of GDP in Montenegro and one-fifth in Albania (Figure 18.5). In other WB economies, the contribution of tourism to GDP is below 10%, similar to Central Asia, EU, OECD and CEEC averages. Nevertheless, compared to 2018 the growth of tourism GDP was higher than overall GDP growth in all assessed economies, and much higher than Central Asia, EU, OECD and CEEC averages (Figure 18.5).

**Figure 18.5. Travel and tourism and GDP growth in the Western Balkans (2018-19)**

Note: EU includes all EU Member States in 2018-2019 period. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934255114>

The COVID-19 pandemic has lessened the contribution of travel and tourism to GDP across the region,<sup>5</sup> and will have severe economic and social consequences for all WB6 economies in terms of total exports and employment, particularly in Albania and Montenegro, where tourism contributes significantly to total exports and employment (OECD, 2021<sup>[8]</sup>). The contribution of tourism to total exports and employment in other WB6 economies is much lower. The contribution of travel and tourism to exports in the WB6 (except Albania and Montenegro) is lower than the Central Asia average, but higher than EU, OECD and CEEC averages (except for North Macedonia). The contribution of tourism to total employment in the WB6 economies is nearly the same as in Central Asia – except for Bosnia and Herzegovina where the contribution of tourism to total employment is higher – but below EU, OECD and CEEC averages (Figure 18.6).

**Figure 18.6. Contribution of travel and tourism to employment and exports (2019)**

% contribution

Note: Data for Kosovo are not available. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

StatLink  <https://doi.org/10.1787/888934255133>

The growth of tourism GDP in the WB6 before the COVID-19 crisis showed the increasing importance of this sector for the overall economic development of the region. Nevertheless, the pandemic has revealed the main gaps in tourism development, in particular the government and industry's preparedness and response capacity, the concentration of tourism in a small number of destinations, high seasonality, the low quality of tourist offers, and the lack of sustainable approaches to development.<sup>6</sup> Considering the significant similarities among opportunities and challenges for tourism sector development in each WB6 economy, strengthening regional co-operation to address the common challenges and opportunities may help each economy overcome gaps at the economy level more efficiently. Moreover, established regional co-operation is key for increasing the visibility of the Western Balkan as an attractive tourist destination and an opportunity to capture a more significant share of international tourism.

## Governance and co-operation (Sub-dimension 15.1)

An economy-level tourism strategy is a fundamental requirement to foster long-term growth in the tourism sector. It enables policy makers to assess the areas of greatest potential and capture economic and social benefits from tourism. The successful design and implementation of tourism policy requires an efficient governance structure and institutional set up at the economy and destination level. The cross-cutting nature of the sector requires a sophisticated set of horizontal co-ordination measures across government departments and agencies to ensure that all parts of government with either an interest in or influence over tourism can be fully involved in its planning and development (OECD, 2020<sup>[4]</sup>). Destination management organisations often play a leading role in developing tourism, working in collaboration with regional and local government, and increasingly have other related roles, such as inward investment promotion, and co-ordinating the management of all elements that make up a destination (OECD, 2020<sup>[4]</sup>). Moreover, there needs to be active co-operation and dialogue with the private sector and NGOs, and active involvement of local communities in the overall governance structure to ensure coherent tourism management in an economy (UNWTO, 2013<sup>[9]</sup>).

This section aims to assess the efficiency of tourism governance co-operation at the economy and destination level, and the progress made on developing a tourism data collection and sharing framework (Table 18.2).

Overall, Albania, Montenegro and Serbia have managed to establish the most effective governance and co-operation frameworks at economy and local levels (scoring from 2.4 to 3.8), while the frameworks in Bosnia and Herzegovina, Kosovo and North Macedonia still need significant improvement, especially in tourism governance and institutional set up and in vertical co-operation, where they score only between 1.0 and 1.5. Across all economies, the tourism data collection and sharing framework is the most advanced, reaching the highest average score overall (3.0) in this sub-dimension. However, the economies still need to work on this area intensively to provide consistent and reliable data for decision making.

**Table 18.2. Scores for Sub-dimension 15.1: Governance and co-operation**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 15.1: Governance and co-operation	Tourism governance and institutional set up	2.0	1.0	1.0	1.0	4.0	3.0	2.0
	Partnership with stakeholders	3.5	1.0	2.0	1.0	4.0	3.0	2.4
	Vertical co-operation	2.0	1.0	1.0	1.5	3.0	3.0	1.9
	Data collection and interpretation	2.0	2.0	3.5	3.5	4.0	3.0	3.0
<b>Sub-dimension average score</b>		2.4	1.3	1.9	1.8	3.8	3.0	2.3

### ***Tourism governance still needs improving to implement policy measures effectively***

Clear tourism policies, effectively implemented by governance structures that embrace a range of stakeholder interests, are essential for sustainable tourism development and competitiveness. Albania, Montenegro, Serbia and Republika Srpska (RS) in Bosnia and Herzegovina<sup>7</sup> have committed to developing an efficient governance structure with well-established inter-ministerial co-ordination and the active involvement of private stakeholders, municipalities, educational institutions and NGOs in the planning and development of tourism. The tourism strategies in these economies and entity clearly define policy measures and actions to be implemented (by ministries responsible for tourism and other relevant ministries), as well as budget allocation and the timeframe for implementation. A multi-governmental approach that respects the cross-cutting nature of the tourism sector is confirmed by the adoption of specific tourism-related strategies/programmes and the inclusion of tourism in other strategies (Table 18.3). Regular co-operation among public officials in the ministries is formally established through bodies such as tourism councils and working groups (Table 18.4). In Kosovo, North Macedonia and the Federation of Bosnia and Herzegovina (FBiH), tourism governance is still weak. In North Macedonia, this is reflected in the fact that few policy measures defined in the tourism development strategy have been implemented. In the FBiH, a draft Tourism Strategy for 2008-2018 was prepared but never adopted, and the FBiH Law on Tourism was cancelled in 2014 and a new one has not yet been adopted. The tourism policy framework in Kosovo is in the early stages of development and the Tourism Development Strategy is currently being developed.

**Table 18.3. Tourism strategies and tourism-related strategic documents in WB6 economies**

<b>Economy</b>	<b>Tourism strategies and tourism-related strategic documents</b>	<b>Key focus area</b>
<b>ALB</b>	<b>Strategy for the Sustainable Development of Tourism 2019-2023</b>	<b>Overall tourism development</b>
	General National Territorial Plan 2015-2030	Sustainable tourism based on natural resources
	Integrated Cross-Sectoral Plan for the Coast 2015-2030	Coastline and urban tourism
	Sectorial Strategy of Transport and Action Plan 2016-2020	Connectivity and accessibility
	Cross-Cutting Strategy Digital Agenda of Albania 2015-2020	Development of connected tourism/e-tourism
	Cross-Sectoral Strategy for Rural and Agricultural Development 2014-2020	Development of rural tourism and tourism related to culture, nature, mountains, etc.
	National Strategy for Culture 2019-2025	Management of cultural heritage and cultural tourism
	Policy Document on Biodiversity and Law on Protected Areas	Management of natural heritage and nature adventure tourism
<b>BIH</b>	Tourism strategy is under jurisdiction of the entities	
	Strategy of Cultural Policy in Bosnia and Herzegovina (adopted in 2008)	Includes cultural tourism development
	Biodiversity Strategy and Action Plan for 2015-20 (adopted in 2016)	Includes natural heritage and nature adventure tourism
	<b>FBiH: Tourism strategies at the cantonal level</b>	<b>Overall tourism development</b>
	<b>RS: Tourism Strategy for the period 2010-2020</b>	<b>Overall tourism development</b>
<b>KOS</b>	<b>Tourism Strategy is under development</b>	
	National Strategy for Cultural Heritage 2017-2020.	Management of cultural heritage and cultural tourism
	Strategy and Action Plan for Biodiversity 2011-2020	Management of natural heritage and nature adventure tourism
<b>MNE</b>	<b>Tourism Development Strategy 2020</b>	<b>Overall tourism development</b>
	Rural Tourism Development Programme and Action Plan 2019-2021	Measures for development of tourism in rural areas
	Cultural Tourism Development Programme and Action Plan 2019-2021	Cultural tourism products
	Health Tourism Development Programme and Action Plan 2021-2023	Includes sustainable component of tourism development
	National Strategy for Sustainable Development by 2030	Sustainable and health tourism
	Smart Specialisation Strategy of Montenegro (adopted in 2019)	Tourism and culture tourism
	Cultural Heritage Development Strategy for 2020-2025	Cultural tourism products
	National Strategy of Preservation and Sustainable Use of Cultural Heritage	Protection of cultural heritage
	National Biodiversity Strategy and Action Plan for 2016-2020	Integrating and developing biodiversity protection measures in the tourism sector.
	Montenegro Development Directions 2018-2021	Includes measures for tourism
	Montenegro Economic Reform Programme 2020-2022	Includes measures for tourism
	Strategy of Regional Development 2014-2020	Includes measures for tourism
<b>MKD</b>	<b>National Tourism Development Strategy 2016-2021</b>	<b>Overall tourism development</b>
	<b>Tourism Development Strategy 2016-2025</b>	<b>Overall tourism development</b>
<b>SRB</b>	<b>The Tourism Development Strategy of the Republic of Serbia for the Period 2016-2025</b>	<b>Overall tourism development</b>
	The Strategic Marketing Plan for Tourism of the Republic of Serbia until 2025 (adopted in 2021)	Tourism marketing
	Agriculture and Rural Development Strategy for 2014-2024	Includes tourism in rural development
	Strategy of Sustainable Urban Development until 2030	Includes sustainable component of tourism development
	Culture Development Strategy 2020-2029	The impact of tourism on cultural heritage and natural resources, and rules for cultural and natural heritage protection from the negative impacts of tourism

Note: In Bosnia and Herzegovina, FBiH = Federation of Bosnia and Herzegovina, RS = Republika Srpska.

Source: Ministries responsible for tourism in WB6 economies; Tourism C0 2021 qualitative questionnaire.

Despite these relevant strategies, representatives of WB6 economy ministries responsible for tourism, except those in Albania and Montenegro, claimed that there is still significant room to improve inter-ministerial co-operation. The lack of monitoring of implemented policy measures in terms of outputs and outcomes hinders a more realistic assessment of progress, and limits the ability to adapt decisions and policy measures to monitoring results. Only Albania and Montenegro have made progress in introducing regular monitoring of implemented policy measures since the last assessment.

***Public-private co-operation and dialogue is formally established, but not monitored or evaluated***

The private sector is key to the development and co-ordination of tourism policy, and its involvement ensures that policies address the key challenges of the sector. Accordingly, an effective partnership and dialogue framework is one of the key factors for ensuring coherent tourism development.

All WB6 economies have established a public-private dialogue and co-operation framework at the economy level, which also includes vertical co-operation with the local level. With the exception of North Macedonia, all WB6 economies have established formal bodies at the economy level, which besides relevant ministries include representatives of the private sector, NGOs, educational institutions and municipalities (Table 18.4). The members of the councils or working groups meet at least twice a year to discuss the design and implementation of tourism strategies and other tourism related issues. However, a more detailed assessment of the effectiveness of public-private co-operation could not be provided due to the lack of monitoring and evaluation.

**Table 18.4. Formal bodies for co-operation and dialogue with non-government tourism stakeholders in WB6**

<b>Economy</b>	<b>Name of formal tourism body</b>	<b>Members/representatives of institutions</b>
<b>ALB</b>	Private Sector Advisory Committee of Tourism (chaired by the Minister for Tourism)	Associations of enterprises; higher education institutions; chambers of commerce; tourist associations or NGOs operating in the field of tourism; international institutions/donors.
<b>BIH</b>	Tourism Working Group (established by the Ministry of Foreign Trade and Economic Relations)	Ministries responsible for tourism in the entities of FBiH and RS; Brčko District; Foreign Trade Chamber of BiH.
<b>KOS</b>	The Kosovo Tourism Council	Ministry of Trade and Industry; Ministry of Environment and Spatial Planning; Ministry of Education, Science and Technology; Ministry of Culture, Youth and Sports; Association of Municipalities; tourism experts; representatives of NGOs.
<b>MKD</b>	Working group for the development of the tourism strategy (chaired by senior tourism official)	Chamber of Commerce; the eight regions; municipalities; educational institutions; NGOs; other associations (e.g. the Mountaineering Association).
<b>MNE</b>	Tourism Council (chaired by the Prime Minister), Co-ordination body (chaired by the Minister of Sustainable Development and Tourism)	Relevant ministries; stakeholders from the private sector (e.g. Chamber of Commerce and their associations); local communities and NGOs.
<b>SRB</b>	National Council for Tourism Development (chaired by The Minister of Trade, Tourism and Telecommunications)	Tourism Organization of Serbia; Association of Travel Agencies (YUTA); Business Association of Hotel and Restaurant Industry (HORES); Association of Tourist Guides; Spa Associations of Serbia; Air Serbia; universities; Belgrade municipality.

***Municipalities need systematic government support to develop tourism effectively***

Regional and local governments often play both a strategic and a delivery role in relation to tourism, which requires them to understand the challenges of their tourism sector and put in place plans to address these

challenges and develop tourism. They may also be involved in domestic promotion, while overseas and economy-wide promotion is usually the responsibility of economy-level tourism organisations. The administration of tourism therefore needs to be co-ordinated vertically, taking into account the roles and activities of regional and local jurisdictions (OECD, 2020<sup>[4]</sup>).

Vertical co-operation is established in all WB6 economies, while destination management still needs to be strengthened in most economies. Municipalities in all the economies are formally involved in overall tourism governance. Local tourism development strategies (where adopted) are mainly aligned with economy-level tourism strategies. Implementation remains a challenge, mostly due to weak human and financial resources in the municipal governments, lack of investment in infrastructure and limited co-operation with private stakeholders. Moreover, destination management organisations, which should play a leading role in developing tourism, are only established and functioning well in Serbia and Republika Srpska.<sup>8</sup> On a positive note, recent donor projects in Bosnia and Herzegovina<sup>9</sup> have helped to improve public-private co-operation at the destination level and can serve as a good model for all other main tourist destinations in the economy. In Kosovo, while tourism governance and destination management are relatively weak, most municipalities have established departments for tourism development and adopted tourism development strategies.<sup>10</sup>

### ***Data collection has improved, but data need to be more reliable***

Improving the reliability, accessibility and transparency of statistics is vital to guide tourism development. The provision and measurement of good quality tourism data requires the active involvement and co-ordination of key players.

Since the last assessment, most WB6 economies have made some progress in this area. All WB6 economies have tourism data collection and sharing frameworks formally in place, defined in laws on statistics. Informal co-operation among the relevant institutions for data collection is also established (e.g. ministries responsible for tourism, central banks, custom offices).

North Macedonia started preparing its first Tourism Satellite Account (TSA)<sup>11</sup> in 2019, and BiH and Montenegro are planning TSA implementation for 2021. In Serbia, a central information system for hospitality and tourism (e-tourists) started to operate in 2020 with the aim of consolidating all data on accommodation providers. Kosovo and Montenegro plan to establish the e-tourism electronic guest registration in 2021.

The findings of this assessment are also relevant for the WB6 economies' implementation of the Common Regional Market Action Plan, which includes a component on tourism data and statistics (Box 18.1).

#### **Box 18.1. Tourism governance and co-operation in the Common Regional Market**

The regional industrial and innovation area of the CRM 2021-24 Action Plan includes a component on tourism data and statistics (Priority 8.8). The following key findings of the CO2021 governance and co-operation sub-dimension, and in particular the tourism data collection and interpretation indicator, can inform the implementation of actions under this component:

- All WB6 economies have a tourism data collection and sharing framework formally in place, as defined in laws on statistics.
- North Macedonia has begun the preparation of the first Tourism Satellite Account, and BiH and Montenegro are planning TSA implementation for 2021.
- Serbia has established a central information system for hospitality and tourism (e-tourists) to enable the more accurate statistical monitoring of domestic and foreign tourists and to improve the reliability of collected data.

### ***The way forward for governance and co-operation***

- **Revise tourism strategies and adapt strategic goals and policy measures to focus on more sustainable and resilient models of tourism development.** COVID-19 has changed tourist behaviour, preferences and patterns. For example there is now a greater demand for short haul travel domestically or to neighbouring economies; a preference for travelling by rail or car rather than aeroplane; people are staying in self-catering and private accommodation rather than hotels; are visiting coastal, regional and rural areas rather than cities; and are participating in walking, cycling and other outdoor activities rather than spending time in enclosed spaces (OECD, 2020<sup>[10]</sup>). Revised tourism strategies should also include crisis management to better address the recovery and to be better prepared for the next crises.
- **Further strengthen the governance structure at the central level by establishing efficient inter-ministerial co-operation.** This will help to harmonise tourism policy priorities with the priorities of other sectoral policies and strengthen the capacity of public officials for managing tourism development. In particular, North Macedonia should establish a formal government body to improve the effectiveness of inter-ministerial co-operation.
- **Establish regular monitoring and introduce the independent evaluation of implemented policy measures** to assess their effectiveness, and make adjustments accordingly. This would contribute to the more prompt response and adaptation of tourism policy to the current market situation. This is valid for all WB6 economies, except Montenegro and Serbia, which already have such measures. All WB6 economies should include relevant indicators of the effectiveness of public-private co-operation and dialogue in the overall monitoring model to provide a reliable basis for improvements.
- **Strengthen dialogue and co-operation with private sector stakeholders, educational institutions and NGOs at all levels of government.** Involve private sector stakeholders more actively in the process of decision making to better address their needs and to understand expected government support in the implementation of development projects. The current crisis has confirmed that co-ordinated actions across governments at all levels, as well as with the private sector, is essential for mitigating the impacts of the crisis on tourism. Organising events such as tourism forums as an open space for the exchange of views on tourism development could contribute to the more active involvement of a wider range of tourism stakeholders and enable the better understanding of commonly set goals and objectives. This would provide conditions for more co-ordinated action in the tourism sector and could contribute to awareness raising among private stakeholders of the benefits of co-operation and dialogue for businesses development. The Days of Slovenian Tourism initiative might serve as inspiration (Box 18.2).
- **Empower local communities and tourist destinations to manage tourism development** by establishing tourism destination management organisations (particularly in Albania, Kosovo, North Macedonia and FBiH), providing sufficient budgets, and implementing sound capacity building programmes for local tourist organisations (LTOs). This will help the faster, more efficient and sustainable development of competitive tourism products. Post-COVID-19 recovery requires well-functioning destination management that will be able to facilitate the development of new bookable tourist products from MSMEs, and their connections to inbound tour operators and other marketing channels (OECD, 2021<sup>[11]</sup>). Sufficient resources should be allocated to destinations and to SMEs in tourism so that they can develop new and adapt existing tourist products, build new tourist infrastructure, and implement digital marketing campaigns effectively.<sup>12</sup> The following funds should be used for these purposes: an EU package of EUR 385 million to support socio-economic recovery in the Western Balkans and ensure the survival in the short term, and recovery in the medium term, of businesses in the private sector; a European Investment Bank (EIB) support package of EUR 1.7 billion for additional loans for public sector investments, as well as credit for enterprises, to help safeguard jobs for those working in the region's SMEs (EC, 2021<sup>[12]</sup>).

- **Improve the tourism data collection and sharing framework to empower policy makers with reliable information for decision making.** The introduction of electronic data collection methods (e-questionnaires, web surveys, etc.) in all economies would improve the reliability of tourism data collected. Establishing a formal co-ordination body among relevant institutions would help to increase the quality of tourism data collection. In all economies, updating and expanding survey evidence (such as visitor perceptions, spending, room occupancy, revenue per room, and details by statistical region) would provide a better basis for decision making in tourism. Albania, Kosovo and Serbia should first consider introducing a TSA. Albania, Bosnia and Herzegovina, and North Macedonia should introduce electronic data collection, drawing on best practice examples from other economies in the region.

### Box 18.2. Annual gathering of tourism stakeholders: Days of Slovenian Tourism

Since 1997, the Days of Slovenian Tourism (DST) annual event has been organised to strengthen co-operation in the development and marketing of Slovenian tourism among major institutions active in tourism in Slovenia. This is in line with the basic principle of all Slovenian Tourism Development Strategies since 2002 that public-private partnerships for sustainable tourism development should be encouraged.

The DST is organised by the Ministry of Economic Development and Technology, the Hospitality and Catering Chamber, the Chamber of Crafts and Entrepreneurship, and the Slovenian Tourist Board. It gathers the whole tourism community in one place, with the tourist destination changing each year.

The central part of the DST is the annual **Slovenian Tourism Forum**, where current issues, trends in tourism and new projects are presented and discussed. This is also an open space for discussion on the next steps and future development of Slovenian tourism. Other important sessions include the **plenary session** where the main tourism achievements of the previous year are discussed and the highest achievements in tourism awarded (e.g. best innovations in tourism, best business model, best investments, best worker, best destination). The **Catering and Tourism Assembly also takes place during the DST, as do assemblies of several other tourist organisations**. There is an exhibition where new technologies for catering, hospitality and other tourism related sectors are presented.

Note: DST 2020 was organised virtually.

## Destination accessibility and tourism infrastructure (Sub-dimension 15.2)

For most foreign tourists, access to information is a basic requirement when making decisions about a destination, accommodation, and visits to tourist sites and attractions. The most important information for visitors when deciding where to go is the accessibility of a destination and the availability of high-quality accommodation. While accessibility influences the flow of tourists to and within the destination, and has a considerable impact on tourists' first impressions, the availability of consistent high-quality accommodation ensures tourists are satisfied and choose to return in the future.

This section aims to assess improvements in destination accessibility, the existence and effectiveness of accommodation quality standards and an investment facilitation framework, and the quality of tourists' access to information.

Overall, the connectivity framework can still be improved considerably throughout the region (average score 1.5). Although some progress has been made, there is still room for improvement in establishing a consistent quality assurance framework, especially in Kosovo, Bosnia and Herzegovina and

North Macedonia. Montenegro (4.0), followed by Kosovo and Serbia (3.0), have managed to establish the best tourist information system so far; however, the quality of the system can still be improved in all WB6 economies (Table 18.5).

**Table 18.5. Scores for Sub-dimension 15.2: Destination accessibility and tourist infrastructure**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 15.2: Destination accessibility and tourist infrastructure	Connectivity framework	2.0	0.5	0.5	1.0	3.0	2.0	1.5
	Accommodation capacity and quality	3.0	2.0	1.0	2.0	3.5	3.0	2.4
	Information availability	2.5	2.0	3.0	2.0	4.0	3.0	2.8
<b>Sub-dimension average score</b>		2.5	1.5	1.5	1.7	3.5	2.7	2.2

### ***Easing border crossings is a key challenge for improving destination connectivity***

Overall, limited progress has been made in improving destination accessibility in the WB6 economies since the last assessment. Although Albania, Montenegro and Serbia have further reduced visa requirements, the other economies have made no progress on this matter. Montenegro has made progress in easing border crossings with the adoption of special regimes for tourists in the high season. Albania introduced e-visa applications in 2020.

The accessibility of destinations remains one of the key challenges to further developing tourism in the region. The poor experience of many tourists, tour guides and operators at border crossings is recorded as the most pressing issue in regional tourism (Kennell J., 2019<sup>[14]</sup>) and includes extremely long waits at crossings with no explanation provided; unexpected closures of crossings, again with no warning or information available; language barriers involving tourist-facing staff; refusals to let suitably credentialed tourists or guides cross, with no clear explanation available or avenues for recourse; and in some cases a perception of corruption or other non-transparent procedures taking place at border crossings. This affects the launch of the regional, and internationally competitive, cultural and adventure tourism products developed as part of the Regional Cooperation Council's (RCC) Tourism Development and Promotion project, which could contribute to branding the region as a desirable tourist destination<sup>13</sup> (Box 18.3).

### Box 18.3. Regional cultural and adventure tourism: The RCC's Tourism Development and Promotion project

The RCC's Tourism Development and Promotion project works to consolidate the fragmented tourism offer in the WB6 economies through the creation of joint and internationally competitive tourism offers in cultural and adventure tourism. Such offers will be promoted globally and contribute to branding the region as a desirable tourist destination. Regional (three or more WB6 economies) tourism routes have been developed and are ready to launch on the market. These should attract more international tourists, lengthen their stay in the region, increase revenue and contribute to employment in the industry. However, COVID-19 has slowed down the launch of these products. Two products developed under this project are explored below.

The **Western Balkans Crossroads of Civilisations** was conceived with the aim of defining the framework for the development of an overarching shared regional umbrella identity. There are three main aims of this product: 1) to promote the rich and diverse cultural heritage of the WB6 region; 2) to spearhead the repositioning of the region in the international travel market; and 3) to support the development of high-quality services, products and essential tourism infrastructure at tourist destinations. The concept identified core points of historic intertwining to justify the selection of sites that communicate the heritage of the Western Balkans. The 40 sites and locations throughout the WB region have been identified and represent the starting point for creating tourism products and itineraries. Storytelling, a brand development strategy, a brand labelling system and a marketing strategy with two-year action plans have been prepared. These documents represent a solid base for the development of regional cultural tourism itineraries and marketing them internationally.

The idea of the **Balkan Monumental Trail (BMT)** is to explore and highlight hidden or forgotten monuments in the Western Balkans, with an emphasis on World War II heritage. Related to this, the RCC's Triple P Tourism Project aims to create tourism infrastructure (tourism route, signage, marketing tools) and a network of partnerships that will serve as conduit for tourists to effectively engage with these monuments. Furthermore, as many of these monuments are located in areas far from normal tourist paths, the creation of the Balkan Monumental Trail will bring economic stimulation to areas currently underserved by tourism traffic and keep tourists in the region for a longer period of time. This concept encompasses the historical and cultural significance of monumental sites, visual impressiveness, and architectural and artistic appeal.

**Via Dinarica**, a 2 000 km hiking mega trail running along the Dinaric Alps, was extended from Slovenia, Croatia and Bosnia and Herzegovina to Albania, Kosovo and Serbia in 2019.

Note: Promotional videos for these products have been prepared and are being promoted at several tourism fairs, such as ITB Berlin and ITB Shanghai. Videos are available at: <https://www.youtube.com/watch?v=Hvvlq33TRYg>; <https://www.youtube.com/watch?v=B-L2CYOKE7I>; and <https://www.youtube.com/watch?v=sXtFzY9TrmQ>.

### ***Accommodation quality has improved, but there is insufficient monitoring and control***

The availability and quality of accommodation facilities is one of the key success factors of the tourism sector. Therefore, it is important to design an accommodation facilitation framework that fosters the availability and quality improvements of all types of accommodation in an economy. Providing incentives for investment in private accommodation facilities, especially by MSMEs, can boost the availability of different types of high-quality accommodation adapted to the needs of tourists. An effective accommodation quality standards framework is necessary to sustain the consistent quality of

accommodation facilities. Accordingly, governments are looking to official certification schemes to denote the quality of facilities and services, and to support local businesses to improve their products and service quality (OECD, 2020<sup>[41]</sup>).

In the period 2016-19, five of the six economies (data for Kosovo are not available) increased the number of beds registered in private accommodation. Except for North Macedonia, the growth of the number of beds was higher than EU (4.5%) and CEEC (10.3%) averages. Albania recorded the highest growth (115%), followed by Montenegro (52.3%) and Bosnia and Herzegovina (20%) (Figure 18.7). The impact of COVID-19 on the availability and further growth of beds in the WB6 economies has not yet been monitored. However, it can be assumed that the pandemic has led to the reduction of accommodation facilities in WB6 economies.

**Figure 18.7. Growth of the number of tourist beds in the WB6 (2016-19)**

Note: For North Macedonia only Index 2018/2019 is calculated as the data for 2016 and 2017 are not available. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

Source: For EU and CEEC: (Eurostat, 2021<sup>[17]</sup>), *Number of establishments, bedrooms and bed-places (database)*,

[http://appsso.eurostat.ec.europa.eu/nui/show.do?dataset=tour\\_cap\\_nat&lang=en](http://appsso.eurostat.ec.europa.eu/nui/show.do?dataset=tour_cap_nat&lang=en); for Albania: (INSTAT, 2019<sup>[18]</sup>), *Tourism Survey*

"Accommodation establishments", <http://www.instat.gov.al/media/7332/tourism-survey-accommodation-establishments-2019.pdf>; for other economies data were provided by the statistical offices through the quantitative questionnaire.

StatLink  <https://doi.org/10.1787/888934255152>

In most WB6 economies (Albania, Bosnia and Herzegovina, Montenegro and Serbia), several incentives (subsidies and/or loans) are available for private and public investors in high-quality accommodation. In North Macedonia and Kosovo, incentives are rather limited and there has been no major investment in accommodation.<sup>14</sup>

Despite the recent relatively high growth of accommodation capacity in the region (which might have fallen in 2020), there is still room for improvement. Except for Montenegro, all other economies have yet to establish regular monitoring and evaluation of policy measures to facilitate investment in accommodation facilities, which would ensure the most efficient allocation of limited financial resources. Moreover, the lack of clearly defined property rights (in Albania), lengthy spatial plan preparation procedures and weak co-operation with private investors in strategic planning at the destination level, along with other cross-cutting challenges in the business environment, hamper investment in accommodation and other tourist infrastructure in all WB6 economies.

Since the last assessment, all WB6 economies have been developing consistent accommodation quality standard frameworks based on international standards, have begun the process of categorising accommodation structures and have established a register of accommodation facilities. Every type of accommodation must be categorised in all economies except Kosovo. However, the development of a consistent accommodation quality standard framework is still in the early stages, and needs the further

engagement of responsible ministries to ensure that it is efficient. The key challenge in this regard is to empower responsible inspectorates with sufficient human and financial resources to monitor and control the categorisation of accommodation.

### ***Tourism information systems require better management and co-ordination, and regular monitoring and evaluation***

The WB6 economies have established systems that provide information on the accommodation, attractiveness and services available at tourist destinations. Information is provided in multiple languages via websites, road signage and tourist information centres. Tourism information is reported to be updated regularly in all WB6 economies.

Montenegro, Serbia and Republika Srpska have a well-established system for co-ordinating tourist information between the central and local destination levels, while the other economies still need to strengthen co-ordination among different stakeholders to establish a comprehensive information database. The main area for improvement overall is establishing tourism information system frameworks that will include the regular monitoring and evaluation of tourist information. Currently, only Montenegro monitors the quality of tourism information by conducting regular visitor surveys, and even here an independent evaluation of the tourist information system is recommended to identify potential weaknesses not detected in the surveys. Providing real-time information to tourists is becoming a key way of gaining competitive advantages in tourism, and using digitalisation to improve tourist information systems should be considered in all WB6 economies.

### ***The way forward for destination accessibility and tourist infrastructure***

- **Improve destination accessibility by further reducing visa requirements and easing border crossings.** WB6 economies could adopt special regimes to speed up border crossings, especially during peak seasons. Eliminating barriers identified in this area would ease tourism flows within the WB6 economies, helping to increase the attractiveness of the region in the global tourism market. A tourism ambassador programme for key tourist border crossing points could be a good solution as this would not require a systematic review of border arrangements and resourcing and is achievable in the short term (Box 18.4).
- **Establish the monitoring and evaluation of policy actions to facilitate investment in accommodation facilities.** Monitoring and evaluation should focus on how policy measures raise the overall quality of accommodation. The timely adaptation and upgrading of measures based on perceived weaknesses will improve the efficient use of scarce (available) financial resources.
- **Empower tourism inspectorates to effectively monitor and control the categorisation of accommodation facilities.** An effectively designed quality assurance framework will motivate private stakeholders to register and categorise their accommodation. Mechanisms used for this purpose include awareness-raising campaigns, training, and advice for private stakeholders on how to improve accommodation quality and why it is important.
- **Further strengthen the tourism information system by monitoring and evaluating the quality of tourist information** and ensuring that online sources of information are user friendly. Providing accurate and comprehensive information about destinations is key for attracting tourists. The benchmarking of online tourist information with competitors in terms of attractiveness, time spent to find comprehensive information and response time for the provision of requested information to tourists is one of the mechanisms to improve the effectiveness of tourist information systems. Regular surveys can also be implemented among visitors to better understand what information they perceive as the most important and what they might miss in this regard.

### Box 18.4. The tourism ambassador programme

Tourism ambassadors have frequently been used in temporary situations such as when a destination is hosting a large special event where an increase in visitor numbers is identified as a potential danger to the quality of the tourism experience. Tourism ambassadors are often specially trained volunteers or students on placement programmes who can be brought in and out of the workforce during spikes in tourist arrivals. They can also be employed on a more permanent basis, often through the creation of a specialist team within the police or a local authority. This is particularly effective when it is likely that tourists will be unfamiliar with the destination and/or suffer significant accessibility barriers due to language or culture.

In Korea and Thailand, where international tourist arrivals have risen dramatically over the last decade (in Korea by nearly 99% and in Thailand by 150% in the period 2010-2019), the decision was taken to create specialist tourist police. More locally, the Serbian and Chinese police forces have partnered to deploy Chinese police in Belgrade to support the growing numbers of Chinese tourists. Tourism ambassadors should be trained by the local destination management organisation or national tourist organisation and deployed in highly visible ways at key tourist border crossings during peak periods. They would work solely on one side of the border crossing and provide information and assistance to tourists. They should also be able to mediate in local languages in the case of disputes.

Source: (Kennell J., 2019<sup>[14]</sup>), *Western Balkans Tourism Policy Assessment and Recommendations*, [https://rcc.int/download/docs/Ref%201\\_Tourism%20Policy%20Assessment%20with%20Recommendations.pdf/fb7c2c820b58ee138933888458ea4096.pdf](https://rcc.int/download/docs/Ref%201_Tourism%20Policy%20Assessment%20with%20Recommendations.pdf/fb7c2c820b58ee138933888458ea4096.pdf).

### Availability of a qualified workforce (Sub-dimension 15.3)

Tourism is an important job creator, and the sector is highly dependent on quality human resources to develop and deliver a competitive tourism offering. However, finding and retaining the right calibre of staff remains a challenge in the sector, and is compounded in some economies by demographic trends and other influences that reduce the available talent pool. Tourism-related education and training are a principal area of government intervention in many economies to develop the required quantity and quality of skilled workers (OECD, 2020<sup>[4]</sup>). Due to COVID-19, skills shortages in the tourism sector may be exacerbated as many jobs have been lost and workers are moving to different sectors (OECD, 2020<sup>[10]</sup>). This means that there should be an even greater focus by governments to adopt policy measures to increase people's interest in studying and working in tourism.

This section assesses the existence and scope of human resource (HR) policy and action plans for tourism. It focuses on how efficiently the WB6 economies address skills gaps and training needs, and how the private sector is involved in the development of curricula and training programmes. Moreover, it assesses the overall capacity of schools to deliver high quality education and training, and the efficiency of the quality assurance and accreditation framework in terms of human and financial resources.

On average, the WB6 economies achieved a score of 1.8 for the availability of qualified workforce sub-dimension (Table 18.6), signifying that the availability of a qualified workforce could be improved considerably throughout the region. Although the WB6 economies have made moderate progress, especially in improving the VET framework in tourism, the higher education and skills supply framework still needs improvements. Montenegro has the highest average score (2.3) due to the high importance of tourism in the economy. Albania, Kosovo and North Macedonia have made significant progress regarding VET framework improvement, but no progress in the skills supply and higher education framework (Table 18.6).

**Table 18.6. Scores for Sub-dimension 15.3: Availability of a qualified workforce**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 15.3:	Skills supply framework	2.0	0.5	1.5	1.5	2.0	1.0	1.4
Availability of a qualified workforce	VET framework for tourism	2.0	2.0	2.5	1.5	2.5	3.0	2.3
	Higher education framework for tourism	1.5	1.5	1.5	2.0	2.5	2.0	1.8
<b>Sub-dimension average score</b>		1.8	1.3	1.8	1.7	2.3	2.0	1.8

### ***Skills supply frameworks need improving to meet the needs of the tourism industry***

All WB6 economies have established strategic goals in their tourism development strategies to improve HR development. However, these ambitions to ensure favourable conditions in the tourism labour market are not always reflected in clear policy measures, or in implementation. The strategies mostly only give recommendations for improving the attractiveness of tourism studies among students, and there are no concrete policy measures.

In Montenegro, the skills supply framework is defined in the Strategy for Human Resources Development in the Tourism Sector, which provides an assessment of skills gaps and training needs, and defines a list of policy measures for human resources development and governance structure. In the other WB6 economies an assessment of skills gaps and training needs is only planned.

The key challenge for all WB6 economies is to encourage more young people into formal tourism education. The regional project, Towards regionally-based occupational standards (TO REGOS), implemented by the Education Reform Initiative of South Eastern Europe within the Western Balkans Alliance for Work-based Learning, aims to develop common qualifications standards in tourism in the Western Balkans. This represents an opportunity to improve the skills supply framework in the region (ERI SEE, 2018<sup>[19]</sup>).

This indicator is also relevant for the implementation of the Common Regional Market agenda, which includes a component on the development of common occupational standards for tourism (Box 18.5).

#### **Box 18.5. Availability of a qualified workforce in the Common Regional Market**

The regional industrial and innovation area of the CRM 2021-24 Action Plan includes a component on developing common occupational standards for tourism (Priority 8.8). The following key findings of the CO 2021 sub-dimension on availability of a qualified workforce, and in particular the skills supply indicator, can inform the implementation of actions under this component:

- All economies have established strategic goals for improving HR development in tourism development strategies. However, ambitions to strengthen overall HR policy frameworks are not always reflected in clear policy measures, nor in the implementation of these measures.
- In Montenegro, 34 occupational frameworks in the tourism sector have been updated and harmonised with market needs. In all other WB6 economies the assessment of skills gaps and training needs is only planned.

### ***Most economies have made good progress in developing a VET tourism framework***

In many economies, tourism-related education and training is a principal area of government intervention to ensure that there is the required quantity of skilled workers to deliver and maintain high-quality service standards. Policy making for the VET framework for tourism is undertaken through the quality assurance and accreditation of VET programmes. An agency for quality assurance and accreditation should be established, staffed and funded, and operate with political support. It should also have links to both the

public and the private sector to ensure that education and training programmes are in line with the current and, more importantly, future needs of the tourism industry (OECD, 2020<sup>[4]</sup>).

Nearly all WB6 economies have a tourism VET framework in place (except for Bosnia and Herzegovina, although an overall state-level VET strategy is under development), and most have made sound progress since the last assessment. Albania, Kosovo, Montenegro, North Macedonia and Serbia have established quality assurance agencies that involve private sector stakeholders in the development of VET curricula, and practical training is mandatory within VET programmes. However, in general the monitoring and evaluation of the VET framework still needs improvement to enable it to better assess the efficiency of VET and the effectiveness of private-public co-operation in this area.<sup>15</sup> This is particularly relevant for Bosnia and Herzegovina, which has made less progress in this regard. It still lacks a formal accreditation process for VET programmes and private sector stakeholders are not actively involved (especially in the FBiH).

### ***The higher education framework for tourism still needs considerable improvement***

Progress in the higher education framework for tourism has been rather limited since the last assessment. With the exception of Montenegro, where tourism is a high priority due to its contribution to overall economic performance, none of the other WB6 economies have a two-year higher education framework dedicated to tourism, although tourism studies are included in university higher education programmes.

### ***The way forward for a qualified workforce***

- **Develop a tourism-specific human resource policy to address key challenges to the availability and quality of the workforce.** This is crucial for the provision of high-quality tourist products and offers, which is the core vision of all WB6 economies. The strategy should include a comprehensive skills gap assessment that covers the consequences of COVID-19; a programme for strengthening the tourism educational system in close co-operation with tourism industry representatives; policy actions to increase the attractiveness of tourism studies and professions, especially among the young population; and policy actions to increase the attractiveness of tourism education for lecturers.
- **Strengthen VET and higher education frameworks further to develop the required quantity and quality of skilled workers.** The more active involvement of the tourism industry in updating and developing new curricula will ensure that newly developed education and training programmes meet the needs of the tourism industry now and in the future. Mandating the involvement of businesses in the quality assurance process for qualification development could be a first step. Introducing the regular monitoring and evaluation of the VET framework will provide an accurate and more reliable assessment of its efficiency and enable the prompt correction of weak areas.
- **Provide sufficient budgets for new technologies and modern equipment in educational institutions, and training for teachers to keep up with technological advances in tourism.** The tourism industry is one of the greatest users of modern ICT. Fast developments in this field demand constant re-learning for stakeholders to sustain their competitive position in the market. Training should therefore be provided for tourism sector stakeholders and for teachers. Schools also need the appropriate equipment to be able to deliver practical as well as theoretical knowledge and skills to students.
- **Strengthen regional co-operation in the VET and higher education frameworks for tourism.** The TO REGOS project is a good starting point for strengthening regional co-operation in HR development. The first occupational standard for hotel and restaurant technicians was developed in 2020 (ERI SEE, 2018<sup>[19]</sup>). Developing new regional VET programmes and training in tourism could be the next step.

## Sustainable and competitive tourism (Sub-dimension 15.4)

Sustainable tourism development considers current and future economic, social and environmental impacts, and addresses the needs of visitors, the industry, the environment and host communities (OECD, 2018<sup>[20]</sup>). Sustainable tourism can also raise awareness of cultural and environmental values, help finance the protection and management of protected areas, and increase their economic value and importance. Governments are increasingly developing policies that seek to maximise the economic, environmental and social benefits that tourism can bring, while reducing the pressures that arise when growth in this area is unplanned and unmanaged. Policy measures to address these concerns have become a priority, and governments have made efforts to deal effectively with overcrowding at popular destinations; spread economic and other benefits to areas that attract fewer visitors; develop new products to expand the season; and encourage increased productivity, better resource use and more stable employment (OECD, 2020<sup>[4]</sup>). The COVID-19 crisis is an opportunity to rethink tourism for the future. Governments need to consider the longer-term implications of the crisis, while capitalising on digitalisation, supporting the low carbon transition, and promoting the structural transformation needed to build a stronger, more sustainable and resilient tourism economy (OECD, 2021<sup>[21]</sup>).

A coherent and consistent policy framework is needed to provide an enabling environment for sustainable tourism investment. This involves co-ordinating actions across different policy areas, including tourism, environment and innovation, and across different levels of government to encourage sustainable and responsible business practices and to attract private investors to invest in a sustainable manner. Private investment is essential to deliver sustainable and inclusive tourism growth (OECD, 2018<sup>[20]</sup>).

This section assesses the existence and efficiency of sustainable tourism policy frameworks that influence both the development and the operation of the tourism sector to make it more sustainable.

Overall, Montenegro has managed to develop the most comprehensive framework for sustainable and competitive tourism development so far, having the highest average score in this sub-dimension (3.0), which is significantly above the other WB6 economies. The regional averages for natural and cultural enhancement framework, promotion of sustainable development and operations within the tourism sector, and tourism investment and innovation policy show similar levels of development (between 1.4 and 1.7), and indicate the need for further improvements. In particular, a tourism innovation framework should be a focus for economies in the future, as only Montenegro has made progress in this regard (Table 18.7).

**Table 18.7. Scores for Sub-dimension 15.4: Sustainable and competitive tourism**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 15.4: Sustainable and competitive tourism	Natural and cultural heritage enhancement framework	1.5	1.5	2.0	1.0	3.0	1.0	1.7
	Promotion of sustainable development and operations within the tourism sector	1.0	1.0	1.0	0.5	3.0	2.0	1.4
	Tourism investment and innovation policy framework	1.5	1.5	0.5	1.0	3.0	2.0	1.6
<b>Sub-dimension average score</b>		1.3	1.3	1.2	0.8	3.0	1.7	1.6

### ***Natural and cultural enhancement frameworks need further development***

Natural and cultural heritage is one of the key drivers of tourism development. Destinations that can offer travellers access to a unique experience through nature, local culture and history have (and will increase) a competitive advantage over other destinations post COVID-19. Tourism policies and strategies should underline the importance of natural and cultural heritage to tourism and contain specific sections relating to their conservation and sustainable use as a key tourism resource. There needs to be a close working

relationship between tourism ministries and those responsible for the environment, natural resources and culture to enhance natural and cultural heritage in tourism.

Although all WB6 economies have made efforts since the last assessment,<sup>16</sup> comprehensive natural and cultural heritage enhancement frameworks in tourism are, except in Montenegro,<sup>17</sup> mainly in the early stages of development and need improving. Natural and cultural heritage are included in economy-level tourism strategies (Kosovo's will be included soon) as a source for the development of nature-related and thematic cultural tourism products. The economies have also adopted culture development strategies (except in North Macedonia where the strategy is being developed) that include policy measures for the protection, management and enhancement of cultural heritage in tourism. The protection, management and enhancement of natural heritage in tourism is mainly included in biodiversity strategies and laws on protected areas (Table 18.3).

There is reportedly co-operation among responsible ministries to co-ordinate policy measures and activities in the field of natural and cultural heritage. However, the effectiveness of such co-operation can only be assessed in Montenegro and Serbia,<sup>18</sup> as the other economies do not monitor or evaluate implemented policy measures and their impact on tourism development. Establishing effective inter-ministerial co-operation and introducing the regular monitoring and evaluation of implemented policy measures and actions in terms of their impact on tourism development would strengthen the enhancement of natural and cultural heritage in tourism in the region.

### ***Comprehensive policy frameworks to promote sustainable tourism development need strengthening***

WB6 economies need an appropriate policy framework to address sustainable tourism development. The sustainability of tourism development and operations can be addressed through regulations and be influenced by other instruments such as financial incentives, labelling, guidance and capacity building. Many governments around the world have made recent progress by taking steps to embed sustainability principles in tourism policies and related strategies. However, an ongoing challenge in many economies, including WB6 economies, is the implementation of these strategies to deliver on the agreed actions and aspirations (OECD, 2018<sub>[20]</sub>).

In Montenegro and Serbia there are policy frameworks for the promotion of sustainable tourism and operations within the tourism sector, and both economies have made sound progress in promoting sustainable tourism development. The principles of sustainable tourism development are defined in their tourism development strategies, which include measures to support tourism stakeholders to develop sustainably.

In other WB6 economies, progress has been limited, although they are all planning to integrate sustainable tourism policies in their tourism development strategies. Through donor support, several projects and programmes have been launched to improve sustainable tourism development in the WB6 economies.<sup>19</sup> These projects and programmes are a good opportunity for the economies to start developing comprehensive sustainable tourism development frameworks. To ensure the long-term impact of projects, WB6 governments should introduce appropriate policy measures and actions (financial and institutional) to ensure the sustainability and scale up of implemented project activities once funding ends.

### ***Most economies have developed a tourism investment policy framework, but not an innovation framework***

Public and private investment in tourism is essential to build a competitive and sustainable tourism sector, and new innovative tourism products are vital for sustaining the sector's competitiveness. Government measures to boost innovation in tourism can contribute in this regard. Reduced investments due to COVID-19 will require even more active policies to intensify and restore investments in the tourism sector,

and thus maintain the quality of the tourism offer and promote sustainable recovery and development (OECD, 2020<sup>[10]</sup>).

Most WB6 economies are taking actions to stimulate investment in tourism. Montenegro and Serbia take the lead, although all other economies, except for Kosovo, have also made efforts to develop a tourism investment policy framework, with the promotion of investment in tourism part of their tourism strategies and several forms of incentive available for investors (e.g. grants, value-added tax reduction). Policy measures promoting investment in tourism are also explicitly reflected in policies for the promotion of trade and investment.<sup>20</sup> Kosovo does not yet have a tourism investment policy framework, although one is planned as part of its new Tourism Development Strategy.

Despite the clear indication that the promotion of investment and innovation in tourism is a priority for tourism development in the WB6 economies, the efficiency of implemented policy measures could not be assessed as there is no evidence of any monitoring or evaluation. Private sector stakeholders identified long and non-transparent procedures for obtaining building permits, a lack of knowledge among investors of tourism infrastructure, and inadequate spatial planning, which indicate that implemented investments are not in line with sustainable development principles.<sup>21</sup> These issues should be addressed to ensure successful and sustainable tourism in the region.

Tourism innovation frameworks are not yet in place in the WB6 economies. Montenegro is the only economy in the region that has explicitly committed to promoting innovation in tourism with the inclusion of tourism in its Smart Specialisation Strategy (Table 18.3), adopted in 2019. This is unsurprising given the high importance of tourism in the economy. In other economies, where tourism is not yet recognised as high-priority sector, other ways of facilitating innovation in tourism should be considered and established.

The findings of this assessment are also relevant for the WB6 economies' implementation of the Common Regional Market Action Plan, which includes a component on sustainable and competitive tourism (Box 18.6).

### Box 18.6. Towards sustainable and competitive tourism in the Common Regional Market

The regional industrial and innovation area of the CRM 2021-24 AP includes a component on sustainable tourism (Priority 8.8). The following key findings of the CO2021 sustainable and competitive tourism sub-dimension can inform the implementation of actions under this component:

- WB6 economies have mainly embedded sustainability principles in tourism policies and related culture development and biodiversity strategies. However, ongoing challenges include implementing these strategies, inter-ministerial co-operation, and the regular monitoring and evaluation of the impact of implemented policy measures and actions on tourism development.
- Montenegro has made the greatest progress in promoting sustainable tourism development, and Serbia has a policy framework for sustainable tourism and operations within the tourism sector in place. Capacity building is provided and promoted to tourism businesses in these economies, which enhances the sustainability of their projects and operations. Both economies have introduced internationally recognised eco-certificates (Eco Label and Blue Flag in Montenegro, and Green Key and Blue Flag in Serbia).
- All other economies are planning to integrate sustainable tourism policies in their tourism development strategies. Through donor support, several projects and programmes have been launched to improve sustainable tourism development in the WB6 economies.
- Tourism innovation policies, including actions for strengthening the digital capacity of the tourism industry, are only in place in Montenegro, where tourism is part of the Smart Specialisation Strategy.

- WB6 economies have established co-operation for the development of joint regional cultural and adventure tourism products through the RCC's Tourism Development and Promotion project, funded by the EU. In 2019, a common regional identity brand for cultural tourism and the Balkan monumental trail were developed. The regional co-ordination structure extended into Albania, Kosovo and Serbia for the Via Dinarica hiking mega trail (Box 18.3).

### ***The way forward for sustainable and competitive tourism***

- **Strengthen further the natural and cultural heritage enhancement framework in tourism.** This framework should focus on establishing effective inter-ministerial co-operation and introducing the regular monitoring and evaluation of how policy measures and actions impact tourism development. This is particularly valid for Albania, Bosnia and Herzegovina, Kosovo, and North Macedonia. North Macedonia should also accelerate the adoption of a culture development strategy.
- **Make the consideration of sustainability criteria mandatory for all tourism infrastructure investment.** This should be supported by public incentives and awareness raising and training for tourism sector stakeholders on how to develop their businesses sustainably. Using best practices from other economies, such as the Green Scheme of Slovenian Tourism (Box 18.7), would mean that WB6 economies do not need to start from scratch.
- **Promote and mainstream investment and financing for sustainable tourism development.** Build on key policy considerations defined in the OECD Tourism Trends and Policies 2018 report (OECD, 2018<sub>[20]</sub>), which recommends promoting access to finance for sustainable tourism investment projects of all sizes. Direct public intervention includes grants and subsidised loans with environmental criteria to support tourism firms with sustainable project proposals in the start-up and early stages, as well as businesses willing to incorporate sustainable practices into their daily operations. Encourage the uptake of green financing instruments for tourism projects. Tailored support for small tourism businesses may be warranted where such intervention aids environmental and sustainability objectives. However, care should be taken to avoid crowding out the private sector. Indirect finance instruments (public credit guarantees) can be used to overcome the lack of collateral related to the production of service-based intangibles and to help the transition to greener processes. Consider promoting public-private partnerships to finance sustainable infrastructure investment and renovations. It may also be helpful to devise risk-sharing mechanisms to foster private sector participation in the financing of sustainable tourism development.
- **Strengthen regional co-operation further to support sustainable tourism growth.** This will be an effective way to address common challenges in all WB6 economies. The economies should build on the work undertaken through implemented regional projects, such as the RCC's Tourism Development and Promotion project (Box 18.3) that aims to develop joint regional cultural and adventure tourism products. To establish more structured regional co-operation in tourism development for areas of common interest, the example of the Nordic tourism co-operation plan could be followed (Box 18.8).

### Box 18.7. Slovenia's green tourism scheme: A comprehensive model for promoting sustainable tourism

Slovenia's green tourism scheme is a good example of how tourism companies can be encouraged to develop sustainable business models. Launched in 2015 by the Slovenian Tourist Board (STO) and supported by the Ministry of Economic Development and Technology, it provides a comprehensive framework for sustainable development in tourism. The core of the scheme is a certification programme that provides guidelines for tourist destinations and companies (accommodation providers, travel agencies and tourist attractions) and tools for monitoring progress on sustainability. Destinations and companies meeting the criteria are given a green label ("green destination", "green accommodation", "green travel agency", "green park", "green tourist attraction") and marketing support from the STO under the umbrella brand Slovenia Green, which raises their profile and makes them more competitive on the global market. The certification scheme is based on the European tourism indicators system for sustainable destination management and the green destination standards (GDS), thus ensuring international comparability. It provides an awareness-raising and capacity building tool for tourism sector stakeholders.

The green tourism scheme is recognised worldwide as a unique comprehensive national scheme that promotes the development of quality and innovative tourism products with high added value.

### Box 18.8. Structured regional co-operation through the Nordic Tourism Co-operation Plan

Denmark, Finland, Iceland, Norway and Sweden have a long tradition of co-operating in various fields under the auspices of the Nordic Council of Ministers. In recent years, tourism has been actively placed on the agenda, leading to the development of the Nordic Tourism Co-operation Plan 2019-23 within the framework of the Nordic Co-operation Programme for Business and Innovation Policy 2018-21. The plan is intended to strengthen Nordic tourism co-operation to support sustainable tourism growth in the region, in alignment with the 2030 United Nations' Sustainable Development Goals. It identifies strategic areas of collaboration and establishes structured co-operation between policy makers and organisations in the Nordic economies to develop and implement tourism-related policies and projects.

The plan sets out four main objectives:

- Increase the competitiveness of the tourism sector through better regulation, comparable data provision and dialogue with the tourism industry.
- Develop the Nordics as an innovative and smart destination by strengthening the digital capacity of small and medium-sized enterprises and destinations, promoting innovation, and developing smart destinations.
- Support sustainable development and growth with the development of a voluntary Nordic roadmap for sustainable tourism and through gathering best practices.
- Make the Nordics a more attractive and competitive destination by investigating market possibilities in long-haul markets and strengthening the Nordic branding.

## Tourism branding and marketing (Sub-dimension 15.5)

The development and promotion of an economy's brand image and range of products that meet the needs of the market are vital for the competitiveness of its tourism sector. The public sector has traditionally played a lead role in destination marketing and promotion activities, as the fragmented nature of the sector and the small size of many tourism businesses makes it difficult for individual businesses to be visible to, and attract visitors from, remote tourism markets. More recently, economies have been exploring different tourism marketing models that draw on new funding sources, partnership opportunities and governance arrangements, as well as developing digital strategies (OECD, 2017<sup>[23]</sup>). Embracing digitalisation throughout the tourism ecosystem will help to drive the ability of business to build resilience in a post-COVID-19 era. This will include exploiting the opportunities digitalisation opens up for marketing, product and destination development, as well as investing in human capital and skills to retain and develop a skilled workforce. (OECD, 2021<sup>[24]</sup>)

This section assesses the existence and quality/competitiveness of tourism brand images and marketing strategies in the WB6 economies. It also assesses the extent and efficiency of the use of digital tools in tourism marketing and the capacity of tourist stakeholders to use such tools effectively.

On average, the WB6 economies achieved a score of 1.6 for the tourism branding and marketing sub-dimension, signifying that considerable improvements are needed to boost their visibility in the international market. Albania, Montenegro and Republika Srpska<sup>22</sup> have established the most comprehensive tourism branding and marketing framework so far, with the other economies lagging behind. Albania leads the way in developing a digital tourism marketing framework with a score of 3.0, which is significantly above the other economies that are still in the early stages of development (Table 18.8).

**Table 18.8. Scores for Sub-dimension 15.5: Tourism branding and marketing**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 15.5: Tourism branding and marketing	Tourism branding and marketing strategy	2.5	0.5	0.5	1.5	4.0	2.0	1.8
	Digital tourism marketing framework	3.0	0.5	0.5	1.0	1.5	1.5	1.3
<b>Sub-dimension average score</b>		<b>2.8</b>	<b>0.5</b>	<b>0.5</b>	<b>1.3</b>	<b>2.8</b>	<b>1.8</b>	<b>1.6</b>

### ***Despite significant progress, tourism marketing and branding remain a challenge***

A well-developed marketing plan should be a key component of an economy's tourism strategy and should stem from the careful selection of target markets based on product strengths, current performance and global trends. A national tourism organisation (NTO) or equivalent body may be seen as the main vehicle for implementing a marketing plan. However, it is important that there is strong support and participation by private sector associations, individual businesses and other relevant tourism stakeholders. Encouraging co-operation and co-ordination among NTOs, state/provincial tourism organisations and destination management organisations is critical to the success of marketing tourism (UNWTO, 2013<sup>[9]</sup>).

All WB6 economies have established a tourism branding and marketing framework. NTOs are established and responsible for tourism branding and marketing in all economies except Kosovo and Bosnia and Herzegovina, where tourism is under the jurisdiction of the entities.<sup>23</sup> Currently, Albania, Montenegro, North Macedonia and Republika Srpska have established a tourism brand identity. However, only Montenegro, Serbia and Republika Srpska have valid marketing strategies. In Albania, a new marketing strategy is under development. In North Macedonia, the Agency for Promotion and Support of Tourism works on the basis of an annual programme for tourism promotion adopted by the government. All of these economies have established co-operation with the private sector and with local tourist organisations. All NTOs reported having sufficient budget and staff to implement marketing activities. However, except for Montenegro and Serbia, which have increased the budget and/or number of employees, the budget for

tourism marketing has decreased since 2015, which could have a negative impact on tourism development in the future (Figure 18.8).

**Figure 18.8. Budget for tourism marketing in WB6 economies (2016-19)**

Million euros

Note: Data for Bosnia and Herzegovina and Kosovo are not available.

Source: Ministries responsible for tourism; CO 2021 Quantitative questionnaire.

StatLink  <https://doi.org/10.1787/888934255171>

Kosovo lacks a tourism branding and marketing framework. Marketing and promotion are formally established at the ministry level; however, marketing is implemented mainly by tourism stakeholders in an uncoordinated manner.<sup>24</sup>

Albania, Montenegro and Serbia have significantly improved their ranking in the World Economic Forum's Travel and Tourism Competitiveness Index for the indicator measuring the effectiveness of marketing and branding to attract tourists (Table 18.9). However, the overall ranking shows that there is still significant room for improvement in tourism branding and marketing, starting with the accurate adoption of strategic marketing plans in the economies where they have not yet been adopted. The WB6 economies should also focus on establishing regular monitoring and evaluation of their brand image and marketing strategy framework (WEF, 2019<sub>[25]</sub>).

**Table 18.9. WB6 economies in the WEF Travel and Tourism Competitiveness Index (2017 and 2019)**

Effectiveness of marketing and branding indicator

### **Digital tourism marketing frameworks are in the early stages of development**

Digitalisation has opened up new opportunities for tourism businesses to compete in global markets, bringing tourist offers directly to tourists' homes via the Internet. Governments play an important role in

creating the right framework conditions for the digital transformation of tourism business models and the wider tourism ecosystem. The right policy considerations can foster digital technology uptake and use by tourism SMEs (OECD, 2020<sup>[4]</sup>).

Digital tourism marketing frameworks are in the early phase of development in all WB6 economies. In Montenegro, the first draft of the Digital Marketing Programme (2021-2023) is under preparation, and in Republika Srpska digital marketing is included in the entity's marketing strategy. The other WB6 economies have not yet established a digital marketing framework, although Albania, Serbia and the FBiH implemented some digital marketing activities in 2019.

### ***The way forward for tourism branding and marketing***

- **Accelerate the preparation (or adaptation for Montenegro, Serbia and Republika Srpska) of marketing strategies to meet new market circumstances and new trends in tourism demand post COVID-19.** All economies should ensure that marketing strategies include digital marketing and are adopted quickly with sufficient budgets for implementation (OECD, 2021<sup>[24]</sup>). Marketing strategies should clearly define target markets and target groups of visitors for the main tourist products (as defined in tourism strategies), as well as the most effective marketing tools and channels to reach target audiences. Targeting the right audiences means that less budget is needed for marketing activities in a context of reduced government budgets for tourism marketing. Other options to ensure sufficient budget include reconsidering existing tourist taxes and fees, involving the private sector in financing marketing activities, and allocating gaming taxes to finance tourism marketing activities (OECD, 2017<sup>[23]</sup>). Digital marketing can reach a much wider audience with the same budget, as described in the case of Portugal (Box 18.9).
- **Define (FBiH, Kosovo) or evaluate and revise (Albania, Montenegro, North Macedonia, Serbia) tourism brand and branding strategies** to ensure the brand sufficiently highlights their main advantages and differentiates destinations in a changing tourism market. COVID-19 has changed tourism demand tremendously, and there has been a move from mass tourism to individual tourist experiences, an emphasis on health and safety standards, and an orientation to domestic and neighbouring markets (OECD, 2020<sup>[10]</sup>). Existing tourist products and target markets, and their adaptation to new tourist demands, therefore need to be rethought across the region. All WB6 economies should adapt their tourism brand and branding strategy to improve visibility in the new target markets and to increase or at least sustain their destinations' competitiveness.
- **Strengthen co-operation and skills for implementing marketing activities at all levels, from state to destination.** A well-resourced and co-ordinated programme of promotional activities among key tourism stakeholders increases efficiency and contributes to their effectiveness. Marketing strategies should therefore be prepared in co-operation with key private stakeholders and local tourist destinations, and there should be regular communication with these stakeholders and destinations on implemented and planned marketing activities. To ensure efficient and effective tourism marketing it will be important to build the capacity of staff in destinations and private stakeholders, especially MSMEs, to design and implement digital marketing campaigns.
- **Strengthen regional co-operation in tourism marketing to increase the visibility of the Western Balkans as a tourist destination in international markets.** The Western Balkans is an emerging tourist destination with a rich natural and cultural heritage. The development of a joint regional cultural and nature adventure tourist experience offers an opportunity to make the whole region attractive for tourists from neighbouring and regional economies, as well as for long-haul tourists. The WB6 economies should build on the joint regional cultural and nature adventure tourist products (Box 18.3) and establish a common marketing framework for launching joint tourist products in the market. A first step could be the establishment of a regional marketing working group with representatives of NTOs as members. A first marketing plan with identified target markets and target audiences for marketing the joint products should also be developed.

### Box 18.9. Turismo de Portugal's 100% digital marketing strategy

Turismo de Portugal (the government tourism authority) is responsible for the international promotion of Portugal as a tourist destination. In 2011, its budget was cut by more than 30%, leading it to shift to a 100% digital approach to marketing to improve segmentation and targeting, reach and efficiency, measurement, and storytelling and engagement with consumers. The organisation believed that although this approach cost less than traditional marketing methods it would still deliver a similar return on investment.

A digital approach to marketing democratises access for the consumer and allows smaller markets and budgets to develop scale. In Turismo de Portugal's case, a digital marketing approach meant that it could scale-up impact despite a reduced budget. It created a strong social media presence on several social platforms, YouTube, Facebook, Instagram, Pinterest, Twitter and Weibo (in 12 different languages), to engage in social conversations.

One of the advantages of digital marketing is the ability to directly measure the return on investment. In 2015, investment in marketing in Portugal was about 50% lower than in 2011, but Turismo de Portugal still managed to achieve greater exposure of all Visit Portugal platforms. There has been a direct correlation between investment in digital platforms and an increase in reach and revenue. For instance, Facebook fans increased from 160 000 to over 1.2 million in 2015. In the first year of the strategy, visits to the Visit Portugal website increased 92.5%, almost doubling the number of daily visitors, and YouTube views more than doubled in the first year. Between 2011 and 2015, overnight stays increased by 24.1% and revenue by 39.5%.

Source: (OECD, 2017<sup>[23]</sup>), *A review of the policy framework for tourism marketing and promotion*, <http://dx.doi.org/10.1787/096d0ace-en>.

## Conclusion

WB6 economies have made some progress in enhancing the overall tourism policy framework by improving the governance structure and co-operation with the private sector. Progress has been made in accommodation capacity and the quality assurance framework, and in providing incentives for investment in accommodation and other tourist infrastructure. Progress has also been made in tourist information availability and tourism data collection. Montenegro and Albania have made the greatest progress, while the other economies still need to make considerable improvements in all sub-dimensions.

The COVID-19 crisis has had a severe negative impact on the tourism sector in all WB6 economies. A huge fall in tourist arrivals (nearly 60% on average) and overnight stays (54.7% on average) in 2020 reduced tourism revenue and exports, lessened the contribution of tourism to total GDP, and endangered many jobs in SMEs in all WB6 economies. The outlook for the tourism sector remains highly uncertain, and most tourism experts do not expect international tourism to return to pre-COVID levels before 2023 (UNWTO, 2021<sup>[26]</sup>). Accordingly, the tourism sector needs significant and well-coordinated support to ensure survival in the short term and recovery in the medium term of businesses in the private sector. The EU support package for socio-economic recovery in the Western Balkans, which focuses on SMEs, start-ups and innovative companies in tourism, is an opportunity for all WB6 economies to ensure a successful recovery.

COVID-19 has revealed several gaps in tourism in the WB6 economies, and several challenges remain to improve the competitiveness of tourism in the region, such as the relatively inefficient tourism governance structure where few policy measures have been implemented and the lack of monitoring and evaluation systems to provide more relevant information for decision makers. Although inter-ministerial co-operation

is formally established, efforts are still needed to promote sustainable development and enhance natural and cultural heritage in tourism.

However, the crisis offers an opportunity for WB6 economies to re-think future tourism development, establish strong governance and partnerships with the private sector and destinations, prepare new tourism strategies adapted to the new market circumstances, and develop more sustainable and resilient tourism.

The region has a rich cultural and natural heritage, and great potential to become one of the most attractive tourist destinations in Europe. In this regard, the WB6 economies should continue to strengthen regional co-operation as they share common challenges (such as accessibility, availability of qualified workforce, quality of tourism offer) that could be addressed efficiently at the regional level. The establishment of more structured regional co-operation in tourism development through the creation of joint regional cultural and nature adventure tourist products (that show the uniqueness of the region in terms of culture and nature) and by developing a common regional tourism brand will make the Western Balkans attractive to international tourists, thus bringing benefits to each WB6 economy.

## Notes

<sup>1</sup> International receipts is a value of tourism receipts resulting from expenditures made by visitors from abroad and earned by a destination country from inbound tourism.

<sup>2</sup> This is a rough estimation based on available data for each WB6 economy.

<sup>3</sup> The Central Asia region includes Azerbaijan, Kyrgyzstan, Kazakhstan, Tajikistan and Uzbekistan. Data for Turkmenistan are not available.

<sup>4</sup> The Central and Eastern European Countries (CEEC) are Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the Slovak Republic and Slovenia.

<sup>5</sup> According to the World Bank Group's Western Balkan Outlook, in the baseline scenario Albania, Kosovo, and Montenegro experienced a 20-35% fall in tourism receipts in 2020, which subtracts significantly from their 2020 GDP growth (World Bank, 2020<sup>[28]</sup>)

<sup>6</sup> The key challenges of each economy are presented in more detail in the economy profile reports.

<sup>7</sup> In Bosnia and Herzegovina, tourism is under jurisdiction of the two entities: Republika Srpska (RS) and the Federation of Bosnia and Herzegovina (FBiH). Accordingly, the entities are responsible for the adoption of their own tourism strategies and the establishment of the governance structure and institutional set up, which differ in each entity. While the tourism governance framework in RS is similar to the most commonly established governance frameworks in other economies, the governance structure in the FBiH is much more complex, with tourism governance divided among the Federal Ministry of Environment and Tourism and the ministries of the cantons responsible for tourism, which have also adopted their own legislation and regulation. At the state level, the Tourism Working Group was established by the Ministry of Foreign Trade and Economic Relations to co-ordinate tourism activities among the entities and Brčko District (which officially belongs to both, but is governed by neither).

<sup>8</sup> More information is provided in the economy profile reports.

<sup>9</sup> The tourist cluster of Una Sana seems to be a good practice case of public-private co-operation at the destination level. The cluster was developed with the support of the Swedish Agency for International Development and Cooperation of Sida and implemented by the World Wildlife Fund. More information is available at <https://www.unasana.ba/en/turisticki-klaster-una/>. Another good example is the tourist cluster of Herzegovina, which is established as a public-private organisation for the promotion of tourism in Herzegovina. More information is available at: <http://www.tkh.ba/?lang=en>.

<sup>10</sup> In the western region of Kosovo, a destination management organisation is established as an NGO. These organisations provide support to the development and promotion of sustainable tourism in the region through joint work with local authorities, businesses and public agencies, as well as strategic partnerships with relevant stakeholders.

<sup>11</sup> The Tourism Satellite Account is the second international standard on tourism statistics (Tourism Satellite Account: Recommended Methodological Framework 2008 –TSA:RMF 2008). It has been developed to present economic data relative to tourism within a framework of internal and external consistency with the rest of the statistical system through its link to the System of National Accounts. It is the basic reconciliation framework of tourism statistics. As a statistical tool for the economic accounting of tourism, the TSA can be seen as a set of 10 summary tables, each with their underlying data and representing a different aspect of the economic data relative to tourism: inbound, domestic tourism and outbound tourism expenditure, internal tourism expenditure, production accounts of tourism industries, gross value added (GVA) and GDP attributable to tourism demand, employment, investment, government consumption, and non-monetary indicators (UNWTO, 2021<sup>[27]</sup>).

<sup>12</sup> Due to the significant decrease of tourist arrivals in 2020, destinations lost most of their main financial resources (tourist tax or similar financial contributions) for supporting tourism promotion, new tourism product development and investment in public tourist infrastructure. Accordingly, destinations need new financial resources and support to help their recovery after the pandemic.

<sup>13</sup> For more information see <https://www.rcc.int/tourism>.

<sup>14</sup> For more information about incentives see the economy profile reports.

<sup>15</sup> For more information see Sub-dimension 7.3: Vocational education and training, in the Education policy chapter.

<sup>16</sup> For more detailed information see the economy profiles.

<sup>17</sup> Montenegro has developed a comprehensive natural and cultural enhancement framework for tourism under the Cultural Heritage Development Strategy for 2020-2025 and the National Strategy of Preservation and Sustainable Use of Cultural Heritage, both supported by UNESCO. The Ministry of Culture has also developed four long-term management plans for cultural heritage.

<sup>18</sup> The Environment Report in the Republic of Serbia, prepared by the Environmental Protection Agency (Ministry of Environmental Protection) includes monitoring of the impacts of tourism on the environment. In Montenegro, the Administration for the Protection of Cultural Properties regularly monitors the state and value enhancement of cultural properties. Other mechanisms prescribed by the law, such as studies of the cultural heritage protection, management plans and heritage impact assessment have been adopted upon proposal of the administration body in charge of culture-related matters.

<sup>19</sup> For more information see the economy profiles.

<sup>20</sup> For more information see the economy profiles.

<sup>21</sup> This assessment is provided based on interviews with representatives of private sector associations in all WB6 economies. The challenges presented in this report were reported most often in all WB6 economies. It is therefore assumed that these are the common challenges for the whole region.

<sup>22</sup> As the scores are provided at the economy level the progress of Republika Srpska is not visible; however, it influences the overall score for Bosnia and Herzegovina, which would be much lower otherwise.

<sup>23</sup> Republika Srpska has established the Tourism Organisation of Republika Srpska, which is responsible for tourism promotion and marketing and branding at the entity level. The FBiH has no tourist organisation at the entity level, instead tourism promotion and marketing are implemented by the tourist boards of cantons and destinations.

<sup>24</sup> Some tourism promotion is implemented by the Kosovo Investment and Enterprise Support Agency (KIESA), which organises participation in the most attractive international tourism events, such as ITB Berlin. However, this is not a comprehensive tourism and marketing framework.

# 19 Anti-corruption policy

## (Dimension 16)

---

Controlling corruption is a key condition for strong competitiveness. This chapter on anti-corruption policy assesses the policy strategies, regulations, processes and institutions in the six Western Balkan economies (WB6). It starts with a brief overview of trends and performance in the fight against corruption, including the economies' performance against international anti-corruption indicators. The chapter then focuses on five essential sub-dimensions. The first, anti-corruption policy framework, examines anti-corruption policies: how they are planned, monitored and co-ordinated, including civil society involvement. The second, prevention of corruption, assesses corruption prevention bodies and key policy areas – conflicts of interest, asset and interest disclosure, and protection of whistle-blowers. The third, independence of the judiciary, covers laws, institutions and practices that safeguard the judiciary against undue interference. The fourth, business integrity and corporate liability, considers how private sector actors can be discouraged from corrupt actions and helped to tackle corruption challenges. Finally, the investigation and prosecution sub-dimension considers the readiness and track record of the economies in investigating, prosecuting and adjudicating high-level corruption, including whether there are independent and effective investigation and prosecutorial bodies. The chapter includes suggestions for enhancing policies to tackle corruption in each of these sub-dimensions, which in turn will help foster greater competitiveness.

---

## Key findings

- **The general corruption situation in the WB6 region remains as poor as during the Competitiveness Outlook 2018 assessment.** The assessment did find minor but consistent signs of improvement in Montenegro based on several indices and surveys.
- **All WB6 economies have anti-corruption strategies and/or plans, and all of the economies have mechanisms for monitoring the implementation of these policy documents although with different degrees of analytical sophistication.** As of the end of 2020, several of the economies had prepared but not adopted replacements for strategies that had expired.
- **The authorities involve civil society in the preparation of anti-corruption strategies and plans** by holding consultations or including civil-society stakeholders in working groups, but some non-government organisations (NGOs) remain concerned about the lack of responsiveness to their proposals.
- **Most WB6 economies have multi-functional corruption prevention bodies,** which mostly have safeguards of their independence and observe due public accountability, although some struggle to implement their mandate due to limited resources.
- **Most of the WB6 economies fund awareness-raising and education activities from their national budgets,** a sign that they are prioritising this area of work.
- **None of the WB6 economies have yet achieved a sound and sustainable independent judiciary.** However, several of the economies have implemented reforms including setting up judiciary councils with sufficient legal guarantees of independence, introducing competitive procedures for the selection and promotion for judicial positions, and strengthening the mechanisms of disciplinary liability.
- **Concrete business integrity practices or incentives for companies to improve the integrity of their operations are scarce.**
- **Most WB6 economies have recent laws on the registration of beneficial owners of legal entities** which envisage access to the data by any member of the general public.
- **All WB6 economies envisage the liability of legal persons for all criminal offences.** In Albania, Kosovo, North Macedonia and Serbia, the maximum fines are low considering the possible scale of large corruption transactions.
- **Most WB6 economies have had at least some convictions in prominent corruption cases.** However, in Albania, Montenegro, North Macedonia, and Serbia, despite large numbers of investigations into high-level corruption, there are few final convictions.

## Comparison with the 2018 assessment

The WB6 average scores have improved for all scored indicators of the 2021 assessment (Figure 19.1). The strongest increase has been for anti-corruption public awareness and education, by one point. For the other indicators, the average improvement is around 0.5 points.

**Figure 19.1. Overall scores for the anti-corruption policy dimension (2018 and 2021)**

Note: Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators and restructuring of sub-dimensions. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Methodology and assessment process chapter for information on the assessment methodology.

## Implementation of the Competitiveness Outlook 2018 recommendations

The implementation of the CO2018 policy recommendations has been limited. The strongest general progress has been in making public awareness-raising activities more sustainable through national funding. Otherwise, individual economies have implemented a few actions that correspond to the recommendations, as shown in Table 19.1, without amounting to broader regional trends.

**Table 19.1. Implementation of the CO 2018 policy recommendations: Anti-corruption policy**

Competitiveness Outlook 2021		
2018 policy recommendations	Main developments during the assessment period	Regional progress status
Improve the involvement of civil society in policy development and preparing draft legislation.	<ul style="list-style-type: none"> <li>The involvement of civil society generally continues as before.</li> <li>Most of the economies do not provide public overviews of received, accepted and rejected proposals.</li> <li>In some economies, NGOs still criticise the responsiveness of the authorities.</li> </ul>	Limited
Ensure more systematic and comprehensive corruption proofing of legislation.	<ul style="list-style-type: none"> <li>The practice remains limited, especially in Albania, Bosnia and Herzegovina, and Kosovo.</li> <li>The legal competence of prevention bodies to carry out corruption proofing has been reconfirmed in new laws in North Macedonia and Serbia.</li> </ul>	Limited
Make public awareness-raising activities more sustainable.	<ul style="list-style-type: none"> <li>Funding of awareness-raising and education activities from national budgets has been ensured in most WB6 economies.</li> </ul>	Moderate
Some multi-stakeholder co-ordination institutions should do more to demonstrate their	<ul style="list-style-type: none"> <li>Multi-stakeholder co-ordination institutions have been reformed or new ones set up in Albania and Montenegro.</li> <li>No evidence that the existing co-ordination institutions have</li> </ul>	Limited

effectiveness.	become more effective.	
Implement the whistle-blower protection laws.	<ul style="list-style-type: none"> <li>• Kosovo has adopted a new whistle-blowing law.</li> <li>• Montenegro and Serbia have had relatively high whistle-blower activity.</li> <li>• The evidence on whistle-blower protection is mixed, with some anecdotal evidence of retaliations against whistle-blowers.</li> </ul>	Limited
Provide better safeguards to protect anti-corruption investigation units.	<ul style="list-style-type: none"> <li>• Only Albania has established a new independent anti-corruption investigation body.</li> </ul>	Limited

## Introduction

Anti-corruption policy encompasses both the formal policy framework and the concrete actions for containing and eventually reducing corruption. All the WB6 economies have persistently high corruption levels and suffer continuous attempts by patronage networks to establish state capture (Bak, 2019<sup>[1]</sup>). Corruption has been a major challenge to the economies' progress towards EU accession (European Commission, 2020<sup>[2]</sup>). Weak anti-corruption actions have been a persistent obstacle to economic competitiveness in the region (OECD, 2020<sup>[3]</sup>).

In recent decades, the negative impact of corruption on growth has been extensively examined (see for example (Hoinaru et al., 2020<sup>[4]</sup>; Mauro, 1995<sup>[5]</sup>; Tanzi and Davoodi, 1997<sup>[6]</sup>)). Corruption has been shown to reduce incentives for innovation and productive labour and damage government services (OECD, 2015<sup>[7]</sup>). There is a strong negative correlation between confidence in government and perceptions of government corruption (OECD, 2020<sup>[3]</sup>).

Various strategies, including decentralisation, institutional and community monitoring, and open procurement auctions, have been shown to reduce the capture of public funds and resources (Hanna et al., 2011). At least in some contexts, anti-corruption policies have had positive effects on integrity and impartiality in the public sector (Kalniņš, 2015<sup>[8]</sup>; Min, 2019<sup>[9]</sup>).

Anti-corruption policy benefits most of the policy areas covered in this publication. However, effective control of corruption is particularly relevant to the following chapters:

- **Chapter 4. Investment policy.** Economies with less corruption generally provide a better investment climate and therefore attract more investment. In contexts with limited corruption, companies can invest resources that would otherwise be spent as bribes. The benefits also work in the opposite direction: a transparent and fair investment policy reduces incentives to engage in corruption, including by making investments in productivity more profitable than spending resources on corruption.
- **Chapter 7. Tax policy.** Tax collection is hampered by corruption, which has a significant negative impact on tax revenue. In certain contexts, more than half of tax revenues could be lost due to corruption (Nawaz, 2010<sup>[10]</sup>). A clear tax policy can reduce risks of corruption by limiting opportunities for officials to abuse their taxation powers.
- **Chapter 9. State-owned enterprises (SOEs).** Management of SOEs depends on anti-corruption policies due to threats of corruption and irregular practices in and around SOEs. Due to the tendency of political officials to abuse SOEs' resources for political or personal gains, relations with the government represent one of the greatest obstacles to the integrity of SOEs. SOEs with public policy objectives have especially high risks of corruption (OECD, 2018<sup>[11]</sup>). The implementation of good corporate governance principles in the SOE sector reduces the risk of corruption. These include strengthening merit-based personnel appointment, ensuring the accountability of enterprises' management and proper public reporting, and making enterprises more effectiveness at achieving their economic and public policy objectives.

- **Chapter 10. Education policy.** Education can be severely affected in corrupt environments. Corruption degrades learning outcomes, helping individuals to succeed who do not merit it, while excluding socially disadvantaged groups who cannot afford the cost of corruption. Corruption in education particularly affects the values formed by young people (Transparency International, 2013<sub>[12]</sub>).

## Assessment framework

### Structure

This chapter assesses anticorruption policies in WB6 economies by assessing five broad sub-dimensions:

1. **Sub-dimension 16.1: Anti-corruption policy framework** focuses on how the economies plan, monitor and co-ordinate their anti-corruption efforts. The analysis also focuses specifically on the way the authorities assess factors that may facilitate or encourage corruption and cause corruption risks in the operation of public bodies and legislation.
2. **Sub-dimension 16.2: Prevention of corruption** focuses on institutions (corruption prevention bodies) and three key areas of policy (conflicts of interest, asset and interest disclosure, and the protection of whistle-blowers) that act as pre-emptive safeguards against corruption. This sub-dimension also reviews how the economies raise awareness and educate the general public and public officials on corruption-related topics.
3. **Sub-dimension 16.3: Independence of the judiciary** focuses on the laws, institutions and practices that protect the judiciary against undue interference. The analysis also considers mechanisms and practices that ensure the accountability and transparency of the judiciary.
4. **Sub-dimension 16.4: Business integrity and corporate liability** focuses on how the economies prevent the use of business entities for corrupt purposes, encourage integrity in business processes and help businesses withstand corrupt demands. It also reviews the provisions of liability of legal persons for corruption offences and their application in practice.
5. **Sub-dimension 16.5: Investigation and prosecution** focuses on the readiness and track record of the economies in investigating, prosecuting, and adjudicating high-level corruption. The analysis specifically reviews the institutional setup, capacities and guarantees of independence of specialised anti-corruption investigative and prosecutorial bodies.

1: Non-scored qualitative indicator.

2: These are scored together under the Anti-corruption law enforcement bodies indicator.

Figure 19.2 shows how the sub-dimensions, and their indicators, make up the anti-corruption policy dimension framework. Note that for comparability with the previous assessment, not all of the qualitative indicators in each sub-dimension are scored.

The assessment was carried out by collecting qualitative data with the help of questionnaires filled out by public authorities, written comments provided by relevant non-government stakeholders, online consultations with the authorities, and complementary desk research. Alongside these qualitative inputs, quantitative data on certain indicators – provided by the economies' statistical offices, relevant ministries and agencies, and other databases – formed an integral part of this assessment. For more information, see the Assessment methodology and process chapter.

### ***Key methodological changes to the assessment framework***

Three sub-dimensions in the 2018 assessment (anti-corruption public awareness and education, corruption prevention and co-ordination institutions, and preventing and managing conflicts of interest and whistle-blower protection) have been merged into the new sub-dimension Prevention of corruption (Sub-dimension 16.2). This change reflects the unity of the prevention framework and the addition of a new qualitative indicator (asset and interest disclosure), which has become a universally accepted part of corruption prevention frameworks.

The new sub-dimension Independence of the judiciary (Sub-dimension 16.3) reflects the recognition that the courts make the final decisions relevant to combatting corruption and ensure the maintenance of the rule of law in general, which is a fundamental precondition for the effective control of corruption.

The new sub-dimension Business integrity and corporate liability (Sub-dimension 16.4) has been added in recognition of the role that businesses have in preventing corrupt practices and the importance of holding them accountable for acts of corruption.

Investigation and prosecution (Sub-dimension 16.5) contains a new qualitative indicator, investigation and prosecution of high-level corruption, an area often seen as a key indicator for the credibility of anti-corruption efforts. Considering the need to limit the overall amount of analysis, this sub-dimension no longer contains the qualitative indicator of regional co-operation and mutual legal assistance.

## **Anti-corruption policy performance and context in the WB6**

In recent years, the WB6 economies have failed to reduce perceptions of their corruption.

On a scale from -2.5 (worst) to +2.5 (best), the WB6 economies' average scores in the World Bank's Control of Corruption indicator deteriorated from -0.36 in 2009 to -0.43 in 2019 (Figure 19.3). Montenegro had the highest score (-0.03) and Bosnia and Herzegovina the lowest (-0.61) in 2019, compared to an average of 1.18 for OECD member states. Over the period 2016-19, the scores fell slightly for all WB6 economies except Montenegro, which had a minor improvement.

Figure 19.3. Control of Corruption Indicator (2009-19)

Note: -2.5 – worst; +2.5 – best. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (World Bank, n.d.<sup>[13]</sup>), *Worldwide Governance Indicators*, <https://info.worldbank.org/governance/wgi/>.

StatLink  <https://doi.org/10.1787/888934255190>

The Transparency International's Corruption Perceptions Index reflects a similar dynamic. On a scale from 0 (highly corrupt) to 100 (very clean), the average scores among the WB6 economies deteriorated from 40 in 2016 to 37.5 in 2020 (Figure 19.4). This compares to an average score of 67 for OECD member states in 2020. The scores of most WB6 economies fell; at best, for two economies (Kosovo and Montenegro), they remained the same. In 2020, Montenegro had the highest score (45) and Bosnia and Herzegovina, and North Macedonia had the lowest (35).

Figure 19.4. Corruption Perceptions Index (2012-20)

Note: 1 – highly corrupt; 100 – very clean. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Transparency International, 2021<sup>[14]</sup>), *Corruption Perceptions Index 2020*, <https://www.transparency.org/en/cpi/2020/index/nzl>.

StatLink  <https://doi.org/10.1787/888934255209>

Indicators of perceptions of corruption may reflect opinions affected by various external factors such as the media agenda or more general social grievances, and therefore their reliability is sometimes questioned. Surveys of the regional Corruption Monitoring System of the Southeast Europe Leadership for Development and Integrity (SELDI) coalition measure not only perceptions but also the attitudes and experiences of respondents. In 2016-19, the corruption pressure indicator (the share of respondents who have been expected to provide cash, gifts, or favours to public officials) worsened in Bosnia and Herzegovina, Kosovo, Montenegro, and Serbia, improved insignificantly in North Macedonia and considerably in Albania. Despite fluctuations on the level of individual economies, the overall trend since 2014 is stagnating with major deterioration in Bosnia and Herzegovina (Figure 19.5).

**Figure 19.5. Experience of corruption pressure (2001-19)**

Source: (SELDI, 2020<sup>[15]</sup>), Experience based corruption indexes, <https://seldi.net/cms-data/experience-based-corruption-indexes/>.

StatLink  <https://doi.org/10.1787/888934255228>

The potential for improvement is strongly related to the anti-corruption efforts of the public authorities, which have varied degrees of credibility in the eyes of citizens. According to the Balkan Barometer, only a minority of people in all of the WB6 economies agree that the government fights corruption successfully (Figure 19.6). Montenegro stands out with the largest share (43% in 2020) of respondents who believe this to be the case, while Bosnia and Herzegovina has the lowest (8%). On this measure, the general situation in the WB6 economies is similar to the average findings for the European Union. This indicator apparently reflects not only the perceived ability of the government to contain corruption but also broader satisfaction or grievances with its performance.

**Figure 19.6. Perceptions of the effectiveness of government anti-corruption efforts (2001-19)**

Note: The relevant question was only included in the Eurobarometer survey for EU countries in 2017 and 2019. EU average is EU-28 for 2017 and 2019. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia. Note that the data from the WB6 economies come from the Balkan Barometer, which is a different survey but uses the same question.

StatLink  <https://doi.org/10.1787/888934255247>

## Anti-corruption policy framework (Sub-dimension 16.1)

Tackling corruption requires effective and co-ordinated anti-corruption policies, which, among other things, promote the participation of civil society (UN, 2004). Comprehensive strategies and action plans, which define objectives and goals, allocate responsibilities for particular tasks, set deadlines, and, in some cases, also determine necessary funds, are widely recognised to be the optimal way to frame anti-corruption policies.

This sub-dimension contains two scored indicators: corruption risk assessment and the corruption proofing of legislation. Montenegro and North Macedonia have significantly strengthened their corruption risk assessment frameworks and practice since 2018, while the WB6 economies' performance regarding both indicators remains widely disparate (Table 19.2).

**Table 19.2. Scores for Sub-dimension 16.1: Anti-corruption policy framework**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 16.1: Anti-corruption policy framework	Corruption risk assessment	1.0	2.0	1.0	3.0	4.5	3.0	2.4
	Corruption proofing of legislation	1.0	1.0	1.0	2.5	2.5	2.5	1.8
<b>Sub-dimension average score</b>		1.0	1.5	1.0	2.8	3.5	2.8	2.1

### ***Corruption risk assessments are carried out in most economies but their quality and impact are disputed***

The corruption risk assessment (CRA) indicator reflects whether the legal and methodological framework for CRA has been adopted and how regularly it is implemented in public institutions. The indicator takes into account whether the practice has become an integral part of organisational activities, and whether the competent authorities ensure sufficient support and monitoring for it.

Although all the WB6 economies have made some steps towards the implementation of CRAs, their performance varies widely. In Albania, Bosnia and Herzegovina, and Kosovo, public institutions are only required to carry out CRAs by policy documents rather than laws. However, although not required by law,

the practice of CRA is relatively widespread in Bosnia and Herzegovina. A substantial number of municipal and central-level institutions have also implemented CRAs in Kosovo.

In most WB6 economies, CRA is seen as a stage in the elaboration of internal anti-corruption plans of public institutions (called integrity plans). In Montenegro and Serbia, all institutions must carry out CRAs by virtue of the legal obligation to prepare and adopt integrity plans, and almost all public bodies have to comply. In North Macedonia, CRAs and management of risks generally take place within the framework of internal financial control. The State Commission for Prevention of Corruption (SCPC) is competent to prepare CRAs for different sectors.

Montenegro has the most advanced system of support and monitoring of integrity plans. Public bodies must submit integrity plans and annual implementation reports to the Agency for Prevention of Corruption (APC MNE) as well as assess the efficiency and effectiveness of the plans every second year. In 2018, the APC MNE launched an online application, with three modules: 1) a register of corruption risks, which allows for various kinds of analysis and monitoring of risk trends; 2) a reporting tool on the implementation of measures envisaged in integrity plans; and 3) a module for assessing the effectiveness and efficiency of integrity plans. In Serbia, integrity plans are to be revised/drafted every three years, and the Agency for Prevention of Corruption (APC SRB) supervises their development and implementation. According to the authorities, the Republika Srpska (RS) launched an online application for integrity plans in 2020. The quality of CRAs and integrity plans is a matter of dispute in all WB6 economies, and there seems to be a significant gap between the volume of activity and its impact.

***Systematic and comprehensive corruption proofing of all relevant legislation has not been established in any WB6 economy***

The corruption proofing of legislation indicator reflects whether the authorities have established a formal process to subject draft and adopted legislation to corruption proofing. The indicator also takes note of ad hoc corruption-proofing activity but focuses particularly on whether the practice is systematic and whether recommendations from the process lead to changes in legislation.

The degree of implementation of corruption proofing of legislation varies among the WB6 economies, but generally remains limited. There is no law envisaging corruption proofing of legislation in Albania, Bosnia and Herzegovina, and Kosovo. At the state level, in Bosnia and Herzegovina the Unified Rules for Legislative Drafting in the Institutions of Bosnia and Herzegovina prescribe the mandatory methodology for assessing the impact of regulations (including on corruption and conflict of interest). Even without a formalised corruption-proofing process, corruption prevention agencies participate ad hoc in the preparation of draft laws and regulations, for example in Kosovo.

Montenegro, North Macedonia, and Serbia have the legal basis and methodologies for corruption proofing legislation. In these economies, corruption prevention bodies have the power to carry out such proofing. The APC MNE has issued 17 opinions with recommendations for the improvement of regulations and, according to the agency, its recommendations have been incorporated into five laws. However, the level of activity in this area has diminished since 2017. The Anti-Corruption Agency of Serbia has published more than 100 assessments since 2013 but its recent activity also appears somewhat diminished compared with the period up to 2018 (Anti-Corruption Agency, n.d.<sup>[17]</sup>). Even so, in 2019, the agency issued 18 opinions on proposals and drafts of regulations (Anti-Corruption Agency, 2020<sup>[18]</sup>). In North Macedonia, the SCPC published 15 corruption-proofing reports on laws and draft laws on its website. Very little evidence is generally available about the implementation of recommendations that resulted from the proofing.

### ***All the economies have anti-corruption policies, drawn up in consultation with civil society***

All the WB6 economies have anti-corruption policy documents, co-ordination, and implementation arrangements. Their approaches to domestic anti-corruption policy planning can be divided into two groups: the adoption of separate anti-corruption strategies and action plans (Albania, Bosnia and Herzegovina, Kosovo, and North Macedonia) or tying the planning of anti-corruption policy with the process of accession to the European Union (Montenegro and Serbia have plans linked to Chapter 23 on Judiciary and Fundamental Rights of their accession negotiations). The anti-corruption strategies of Bosnia and Herzegovina (at the state level), Kosovo, and North Macedonia had all expired by the end of 2020; their replacements have been prepared but not adopted, which may interrupt their implementation.

Some national anti-corruption policy documents include assessments of funding needs for particular activities with greater or lesser degrees of detail (Albania, Montenegro, and Serbia). In other economies, the planning of funding has been rather ambiguous, based on assumptions that additional funds would not be required for most activities, leaving the determination of funding at the discretion of implementing bodies, or not envisaging the amounts and sources of funding at all. This increases the risk of not implementing the planned measures due to lack of resources.

All the WB6 economies monitor the implementation of their policy documents although with different degrees of analytical sophistication. The usual organisational arrangement comprises contact persons or focal points in implementing agencies who submit information about the progress of implementation to the corruption prevention body (in North Macedonia), to co-ordinators in a working group (in Montenegro), or to another kind of central unit such as the Minister of Justice in Albania. Albania and Bosnia and Herzegovina have also commissioned ad hoc evaluations of implementation progress, while other economies have had civil society organisations preparing independent assessments. The WB6 economies mostly tend to monitor the outputs of anti-corruption policies while concentrating less on outcomes or impact; Albania has the most comprehensive monitoring of outputs and outcomes.

Although it is generally accepted that information on the implementation of anti-corruption policies should be accessible to the public, it is not always fully observed in practice. In Bosnia and Herzegovina, the latest monitoring report of the implementation of the state-level strategy and action plan has not been made publicly available. In Montenegro and Serbia, the public authorities used to publish semi-annual reports on the implementation of the action plans for Chapter 23 but stopped the practice in 2019-20 (Government of Montenegro, 2019; Министарство правде, 2018).

Consultations with civil society are a standard practice across the WB6 region, although some civil society stakeholders complain that the responses to their proposals are insufficient. For instance, in Montenegro in 2016 the draft anti-corruption operating document was submitted to a public debate, and the official report of the consultations shows which proposals of civil society representatives were incorporated or why they were rejected (Ministarstvo pravde, 2016). Nevertheless, some NGOs claim that most proposals by the civil society were ignored. In Albania, repeated online consultations and in-person discussions took place regarding drafts of the action plan 2020-23 for the implementation of the Inter-Sectoral Anti-Corruption Strategy but reportedly feedback was not provided systematically (EC, 2020b). Albania has started to publish reports of consultations on the monitoring reports of its strategy. Meanwhile, most WB6 economies still do not provide public overviews of the proposals they received, accepted or rejected on their anti-corruption policy documents, which makes it harder to assess the impact of the consultations. This assessment cannot independently verify the validity of the critical claims of the stakeholders in some of the economies, and only takes notice of the controversy surrounding the consultations.

The COVID-19 pandemic prompted emergency measures and policies, which can create new corruption risks and require new prevention actions. As the pandemic continues, this situation is rapidly evolving and hence not fully assessed here. In some of the economies, the relevant agencies quickly reacted to the

potential new challenges. For example, Bosnia and Herzegovina developed a framework action plan for prevention of corruption during the pandemic, while North Macedonia introduced measures to increase transparency in the allocation of relief funds and implemented other measures.

Most WB6 economies are parties to several international anti-corruption legal instruments such as the United Nations Convention against Corruption, and participate in international mechanisms such as the Group of States against Corruption (GRECO) and the OECD Anti-Corruption Network for Eastern Europe and Central Asia.

### ***The way forward for anti-corruption policy framework***

- **Albania, Bosnia and Herzegovina, and Kosovo should systematically corruption proof their legislation** and make such proofing mandatory for most relevant legislation.
- **Introduce transparent and detailed planning of funding for anti-corruption activities** where exact budget requirements are not included in anti-corruption strategies and action plans.
- **Explore how to strengthen the monitoring of outcomes and impact** of anti-corruption policies.
- **Develop standards of good practice for the involvement of civil society** preferably based on broad consensus between the authorities and civil society groups.

## **Prevention of corruption (Sub-dimension 16.2)**

Successful prevention of corruption safeguards public integrity and ensures that laws and policies are fairly designed and implemented without undue influence. It prevents harmful impacts from corruption from occurring in the first place, and reduces the need for complicated and costly repressive measures. Preventing corrupt acts before they take place is the most effective way to promote public trust and the efficient use of public resources.

The only scored indicator for this sub-dimension shows that most WB6 economies have strengthened anti-corruption awareness and education activities, and disparities between the economies in this area have decreased since 2018 (Table 19.3).

**Table 19.3. Scores for Sub-dimension 16.2: Prevention of corruption**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 16.2: Prevention of corruption	Anti-corruption public awareness and education	4.0	3.0	2.5	3.0	4.0	3.0	3.3
<b>Sub-dimension average score</b>		4.0	3.0	2.5	3.0	4.0	3.0	3.3

### ***All the WB6 economies conduct awareness-raising activities***

The anti-corruption public awareness and education indicator assesses the extent of government engagement in awareness-raising and education activities. It considers whether the government engages in general campaigns on corruption; produces easily accessible information materials; organises conferences and seminars for target audiences; supports, develops and delivers education programmes for public officials, students and other groups; allocates specific funding; and monitors the effectiveness of awareness-raising activities and adjusts them accordingly.

The public authorities in all the WB6 economies engage in anti-corruption awareness raising and education. Such activities have been especially extensive in Albania (public outreach events, consultative forums) and Montenegro (fliers, brochures, a billboard, TV spots). Other examples include competitions for art and literary works by school students on anti-corruption topics (Bosnia and Herzegovina) and a campaign for reporting corruption by the Customs Administration of North Macedonia. The public

authorities have engaged in relatively little general awareness-raising in Kosovo since 2016 and Serbia since 2018.

Assessment of the effectiveness of awareness-raising activities remains rare. A notable exception is Montenegro where effectiveness is measured through an annual poll, which measures the share of citizens who would report corruption, claim to know what the APC MNE does, and who believe that the agency has contributed to the overall fight against corruption and that its campaigns encourage citizens to fight corruption, etc. (ASK and Defacto Consultancy, 2019<sup>[19]</sup>). According to the APC MNE, the survey findings have been used to target communication activities.

The main target groups for education and training activities are public sector officials and employees in all the WB6 economies as well as students at different levels of the education system (in Bosnia and Herzegovina, Montenegro, North Macedonia, and Serbia). While the need to educate officials is obvious, the choice to focus on students also appears strategically sound, by aiming to achieve the greatest impact on the attitudes of the broader society through younger generations. Training for public officials is provided by corruption prevention bodies in all the WB6 economies, as well as schools of public administration or the judiciary (Albania, Kosovo, North Macedonia and Serbia), ministries of justice (Albania, the RS), civil-service bodies (Bosnia and Herzegovina at both state and entity level), etc. Online training has been relatively rare; as of mid-2020, there was evidence of online training only in Bosnia and Herzegovina and Serbia. The COVID-19 pandemic is likely to have contributed to the wider use of online training.

A reassuring trend is the evidence of systematic funding of awareness-raising and education activities from national budgets in most WB6 economies even where contributions from international donors remain relevant. Funding from national budgets sends signals that the public authorities appreciate the significance of awareness raising and education.

### ***Corruption prevention bodies enjoy varying degrees of independence and resources across the WB6 economies***

Corruption prevention bodies operate in all the WB6 economies. In all the economies except Albania and the entities of Bosnia and Herzegovina, the main prevention bodies have comprehensive mandates to plan anti-corruption policies, oversee the management of conflicts of interest, implement asset and interest disclosure systems, and engage in awareness raising and education. In some economies they also carry out preliminary administrative probes in suspected corruption cases, etc. Albania has a multitude of prevention bodies and institutional arrangements. Its most prominent body – the High Inspectorate for the Declaration and Audit of Assets and Conflicts of Interest (HIDAACI) – is specifically responsible for the areas defined in its title. The Agency for Prevention of Corruption and Co-ordination of the Fight against Corruption of Bosnia and Herzegovina (APC BIH) has comparatively limited direct powers due to the constitutionally determined division of responsibilities between the state and autonomous entities.

The corruption prevention bodies mostly have adequate independence safeguards and mechanisms of public accountability. These include the competitive selection of candidates for leadership posts, the involvement of several stakeholders and institutions in the selection and appointment processes, collective management structures for some of the agencies, safeguards against the discretionary removal of managers, the publication of decisions made by the bodies, and at least some guarantees of funding.

In Albania, the main policy planning and administrative co-ordination unit (the Directorate of Programmes and Projects in the Anti-Corruption Field in the Ministry of Justice) as well as two institutions with administrative oversight responsibilities (the Inter-Institutional Anti-Corruption Task Force and the Special Anti-Corruption and Anti-Evasion Unit) are under direct or indirect control of political leadership and have no special independence safeguards. The APC BIH has a Selection and Monitoring Committee, which nominates the agency's director and receives reports on its operations. In practice, the committee's mandate expired in 2018, and, as of end 2020, there was no evidence of renewed activity except for the

news of the appointment to the committee of a person included in the US sanctions list for corruption (Transparency International BiH, 2020<sup>[20]</sup>).

The capacity of the prevention bodies varies, and at least some of them have struggled to maintain sufficient human resources. The institutions in Bosnia and Herzegovina, Kosovo, and North Macedonia are the smallest in the Western Balkan region (SELDI, 2019<sup>[21]</sup>), and this is particularly challenging for the latter two due to their broad mandates.

***The legal frameworks and oversight bodies needed to manage conflicts of interest are mostly in place***

Most of the WB6 economies have advanced legal frameworks to manage conflicts of interest. Dedicated laws on prevention of conflicts of interest and/or corruption, combined with civil service and other laws, form frameworks which apply to a generally comprehensive range of officials. The laws mostly comply with international standards. In Albania, Kosovo and Serbia, they cover all three main internationally recognised forms of conflicts of interest – actual, potential, and apparent – at least in principle. All the laws require public officials to be aware of their conflicts of interest and take steps to resolve them. Albania’s law provides the most detailed description of the steps that officials and their superiors should take to prevent and resolve conflicts of interest.

Detailed reviews have identified areas where some provisions of the laws could be improved. For example, international experts have identified ambiguity regarding the ad hoc disclosure and management of conflicts of interest in North Macedonia (GRECO, 2019<sup>[22]</sup>). Since then, North Macedonia has attempted to clarify the procedures by adopting a new code of ethics and a guide as well as relying on designated persons in government institutions to advise on integrity matters. GRECO found that Serbia’s Law on Corruption Prevention lacked criteria for restricting public officials from performing business activities or allowing them to do so (GRECO, 2020<sup>[23]</sup>). The legal framework in Bosnia and Herzegovina contains several laws, including the non-operational law of the FBiH, and is not compliant with the GRECO recommendations to harmonise “the legislation on conflicts of interest throughout the national territory” (GRECO, 2018<sup>[24]</sup>). In January 2021, the House of Representatives of Bosnia and Herzegovina adopted a new law on conflicts of interest. Guides on conflicts of interest have been adopted in most WB6 economies.

The oversight bodies have different means of responding to non-compliance in the different economies. These include requests to resolve conflicts of interest, notifying the authorities where the officials concerned perform their functions, recommending dismissal, issuing warnings, and initiating actions to render actions void if they were made in circumstances where there was a conflict of interest. Some of the economies also envisage criminal sanctions for offences related to conflicts of interest. There are two main ways that the central oversight body can apply sanctions. In Albania, Bosnia and Herzegovina, and North Macedonia, the oversight bodies have the power to apply administrative sanctions directly, whereas in Kosovo, Montenegro and Serbia, they establish violations and then forward cases to courts or other bodies to issue sanctions or other consequences. Table 19.4 gives the data on recent sanctions and investigations.

The oversight institutions in the RS (Commission for Determining Conflicts of Interest in Public Bodies) and especially at the state level in Bosnia and Herzegovina (Commission for Deciding on Conflicts of Interest, CDCI) have weak safeguards against undue political interference. Moreover, the mandate of the CDCI expired in 2018, and it only resumed activity in mid-2020.

**Table 19.4. Sanctions for violations related to conflicts of interest (2017-19)**

Year	ALB	KOS	MKD	MNE	SRB
2017	436 fines	< 5 cases submitted for minor offence procedures; < 5 cases sent for criminal investigation	7 reprimands	26	125 (for conflicts of interest) 153 (for incompatibilities)
2018	112 fines	< 5 cases submitted for minor offence procedures; 10 cases sent for criminal investigation	1 reprimand	20	113 (for conflicts of interest) 125 (for incompatibilities)
2019	54 fines	2 cases submitted to the prosecutor's office; 2 requests for dismissal/ minor offence procedures.	2 reprimands; 1 fine	32	82 (for conflicts of interest) 117 (for incompatibilities)

Note: Data on Albania include non-declaration of private interests, conflicts of interest and violations of the law on whistle-blowing. Data on Montenegro include sanctions for conflicts of interest and violations of restrictions.

### ***Asset and interest disclosure requirements apply to most high/mid-level public officials, but verification remains a problem***

Asset and interest disclosure apply to most high/mid-level officials in the majority of the WB6 economies (Albania, Kosovo, Montenegro, and Serbia). The range of officials covered is relatively narrow in North Macedonia, while Bosnia and Herzegovina is yet to establish a comprehensive and fully functional framework for asset and interest disclosure.

Analysis reveals some gaps in the information required to monitor the economic situation and interests of public officials. The most common gaps are beneficial ownership, when not based on formal ownership, and virtual assets such as cryptocurrencies. In some systems, the omissions also include trusts, cash savings, major transactions (expenses), salary payments for performing official functions and unpaid outside posts.

Kosovo and Montenegro publish the declarations, except for some limited personal data. Public access to the information in Albania is on request, but routine publication is expected to start in 2021. In Serbia, broad categories of data are exempt from public disclosure, such as the sources and amounts of income from non-public sources, amounts of savings, and ownership of financial instruments. In North Macedonia, the implementation of the whole system of declaration in line with the law of 2019 was delayed as of November 2020 due to software development delays.

Data on the effectiveness of the declaration systems for detecting illicit income are limited. In some of the economies, for example Kosovo, verification focuses on comparison with data held by other institutions rather than any analytical assessment of the plausibility of officials' declared economic conditions. Few of the probes into inexplicable wealth have resulted in any irregularities being found in Montenegro. In North Macedonia, in cases of suspected unjustified increase of property, an initiative to verify undeclared and untaxed assets can be submitted to the Public Revenue Office. However, since 2016, no personal income tax debt settlement decisions have followed the verifications. In Kosovo, Montenegro and Serbia, limited access to bank information, whether for legal or practical reasons, is an obstacle to exhaustive verification. Auditing of income and assets has been a significant element in the vetting of judges in Albania and a cause of grievances concerning alleged violations of human rights, although the European Court of Human Rights dismissed this in a landmark judgment (Box 19.1).

In a pioneering effort, on 19 March 2021, Montenegro, North Macedonia and Serbia signed the International Treaty on Exchange of Data for the Verification of Asset Declarations to provide direct administrative exchange of information among them (RAI, 2021<sup>[28]</sup>). The treaty sets legal grounds for

access to information located abroad in the course of administrative proceedings, which is one of the most acute challenges to asset verification.

### ***Protection of whistle-blowers has been strengthened but still does not meet international standards***

The WB6 economies have been strengthening the protection of whistle-blowers, although the maturity of their legal frameworks, levels of whistle-blower activity and reliability of protection vary. In the last five years, new whistle-blower protection laws have been adopted in Albania (2016), the RS (2017), and Kosovo (2018). There is no whistle-blower protection law in the FBiH. Montenegro and Serbia have had high levels of whistle-blower activity (Table 19.5).

Most of the laws extend protection to whistle-blowers in both the public and private sectors and provide protection against varied and non-exhaustively listed types of retaliation. Deviations from the EU Directive 2019/1937 on whistle-blowing are commonplace. For example, only corruption-related matters can be the subject of whistle-blowing in Albania and Montenegro. External whistle-blowing to competent authorities is subject to at least some conditions, such as having reasons to doubt the integrity of an internal review of a whistle-blower report in Albania, the state level of Bosnia and Herzegovina, Kosovo, and North Macedonia. Several economies either deny protection in case of public disclosure to the media or public associations (Albania and Montenegro) or subject such disclosure to excessively limiting conditions (North Macedonia and Serbia). Some laws do not envisage protection for persons connected with the whistle-blower (Albania and Bosnia and Herzegovina).

**Table 19.5. Numbers of whistle-blower reports and requests for protection (2016-20)**

Year	ALB		MKD		MNE		SRB
	Reports	Requests for protection	Reports	Requests for protection	Reports	Requests for protection	
2016					56	8	774 whistle-blower protection cases received in courts during June 2015 - December 2019
2017	8	1			69	2	
2018	16	3			110	1	
2019	14	1	19	2	110	3	
2020	9	1	6		75	3	

Note: Data only refer to reports to central bodies in Albania, Montenegro, and North Macedonia.

Source: Information provided by the public authorities; Montenegro also: (European Commission, 2019<sup>[29]</sup>), *Montenegro 2019 Report, Commission Staff Working Document*, <https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/20190529-montenegro-report.pdf>; (European Commission, 2020<sup>[30]</sup>), *Montenegro 2020 Report, Commission Staff Working Document*, [https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/montenegro\\_report\\_2020.pdf](https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/montenegro_report_2020.pdf); (ASK, 2020<sup>[31]</sup>) *Report on the work of the Prevention Agency*, [https://www.antikorupcija.me/media/documents/Izvj%C5%A1taj\\_o\\_radu\\_ASK\\_u\\_2020.pdf](https://www.antikorupcija.me/media/documents/Izvj%C5%A1taj_o_radu_ASK_u_2020.pdf); (Ministry of Justice, 2020<sup>[32]</sup>), *Revised Action Plan for Chapter 23 and Judicial Development Strategy for the Period 2020-2025 (22.07.2020)*, <https://www.mpravde.gov.rs/tekst/30402/revidirani-akcioni-plan-za-poglavlje-23-i-strategija-razvoja-pravosudja-za-period-2020-2025-22072020.php>.

In most of the region, the share of whistle-blower reports which result in the sanctioning or prosecution of perpetrators of corrupt acts is low. Anecdotal evidence of retaliation against whistle-blowers recurs in the media, and studies have identified various cultural and institutional barriers to whistle-blowing in several WB6 economies - see, for example: (Komiteti Shqiptar i Helsinkit, 2020<sup>[33]</sup>).

### ***The way forward for prevention of corruption***

- **Measure the effectiveness of awareness-raising activities**, for example by using public opinion surveys, and use the results of such monitoring to adjust future activities.
- **Introduce or develop cost-effective online anti-corruption courses** to increase the reach of anti-corruption training.

- **Review the requirements for asset declarations** to ensure that the disclosed information gives a comprehensive picture of the economic situation of declarants, including beneficial ownership, virtual assets and cash savings. Strengthen comprehensive financial analysis of asset declarations in addition to their formal verification.
- **Further develop legislation for protection of whistle-blowers in line with international standards**, continue disseminating information to promote whistle-blowing and increase the usefulness of reports for follow-up by relevant authorities, and reduce the obstacles that whistle-blowers face, especially by making it is easy find out when, where and how to apply for protection.

### Box 19.1. The European Court of Human Rights (ECHR) hands a judgment consequential for the maintenance of public officials' integrity

This box illustrates the conformity of important aspects of the judiciary vetting process in Albania and verification of assets with the standards of human rights. In the case of *Xhoxhaj v. Albania*, the ECHR came to conclusions significant for the audit of public officials' assets and consequences of such audit. The court assessed several cornerstones of the audit of assets of public officials and found them compliant with the European Convention on Human Rights. The findings will be relevant not only for Albania but also other European countries in developing and reforming systems to oversee the legality of officials' wealth.

The application to the ECHR was brought by a former judge of the Constitutional Court of Albania who was dismissed based on the findings of the vetting of judges. In the vetting process, the competent bodies found that the judge and her partner had not had sufficient lawful income to acquire a flat, the judge had not convincingly explained the lawful source of monetary assets and attempted to conceal and present the liquid assets inaccurately. She and her partner had not justified the lawfulness of the income for these monetary amounts. It was found that the judge's partner had not disclosed a cash amount, and the judge had not disclosed foreign bank accounts in declarations of assets as required by law.

The ECHR found no violations of the European Convention of Human Rights. Beyond findings regarding the independence and impartiality of the vetting bodies, fairness of the proceedings, and proportionality of the applicant's dismissal, several conclusions have long-term significance for the oversight of public officials' assets:

- Regarding shifting of the burden of proof: "The Court further reiterates that it is not per se arbitrary [...] that the burden of proof shifted onto the applicant in the vetting proceedings after the [Independent Qualification Commission] had made available the preliminary findings resulting from the conclusion of the investigation and had given access to the evidence in the case file [...]."
- Methodology: The ECHR notes as a reason for rejecting the claim of violation that the judge "was granted access ... to the methodology used to calculate expenses ...".
- Regarding limitation periods: "Given that personal or family assets are normally accumulated over the course of working life, placing strict temporal limits for the evaluation of assets would greatly restrict and impinge on the authorities' ability to evaluate the lawfulness of the total assets acquired [...]."

- Regarding the audit of assets and private life: “While acquisition or creation of assets could be considered to be an aspect of private life, it is not the number or size of assets or an individual’s lifestyle as such that could give rise to disciplinary liability, but the individual’s inability to justify the lawfulness of the source used for their acquisition or creation and to ensure public trust in his or her integrity. In any event, the Court considers that an audit of assets does not involve an intimate aspect of private conduct that is itself treated as an ethical breach [...]”

Source: *Xhoxhaj v. Albania*, no. 15227/19, 9 February 2021.

## Independence of the judiciary (Sub-dimension 16.3)

Independence of the judiciary is a fundamental principle of the rule of law enshrined in international standards and the EU treaties. One of the key principles of the fight against corruption is ensuring that those in charge of the prevention, investigation, prosecution and adjudication of corruption enjoy the independence and autonomy appropriate to their functions (Council of Europe, 1997). There are no scored indicators for this sub-dimension.

### ***Despite recent progress, none of the WB6 economies have yet achieved firm and sustainable judicial independence***

Since 2013, the Freedom in the World report has consistently found that the degree of independence of the judiciary in the WB6 economies is considerably below the average levels of the EU and OECD member states (Figure 19.7).

**Figure 19.7. Independence of the judiciary (2013-20)**

Note: 0 – the smallest degree of independence; 4 – the greatest degree of independence. The CEEC-11 countries are Bulgaria, Croatia, the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, the Slovak Republic and Slovenia.

Source: (Freedom House, 2013<sup>[34]</sup>), Freedom in the World (2013-2020), <https://freedomhouse.org/report/freedom-world>.

StatLink  <https://doi.org/10.1787/888934255266>

The constitutions and relevant laws of all the WB6 economies provide certain guarantees of independence of the judiciary. Aside from general legal principles, common safeguards include the appointment of judges by judicial bodies and their life tenure without probation periods in Albania, Bosnia and Herzegovina, Montenegro, and North Macedonia. However, in Kosovo, judges are appointed by the President, while in Serbia appointments are made by the National Assembly.

Competitive procedures for the selection of candidates for judicial office and court chairmanship have become widely adopted in the region, as publication of vacancies and the winners of different stages of

selection. However, the implementation of the procedures is not universally satisfactory. For example, in Bosnia and Herzegovina appointment proceedings are reportedly fraught with flaws such as deviations from the rankings of candidates, insufficient transparency, insufficient reasoning about appointment decisions, excessive weight given to ethnic criteria, and the annulment by court of the criteria on performance appraisal for judges and prosecutors in May 2020 (European Commission, 2020<sup>[35]</sup>).

The institutional setup of the governance of the judiciary is adequate for upholding judicial independence in several WB6 economies. In Albania, Kosovo and North Macedonia, the majority of the membership of judicial councils are judges who have been elected by other judges. In contrast, judges elected by their peers are a minority in the councils of Bosnia and Herzegovina and Montenegro. Moreover, the High Judicial and Prosecutorial Council (HJPC) of Bosnia and Herzegovina lacks explicit constitutional status. The *ex officio* membership of ministers of justice in the judicial councils of Montenegro, North Macedonia, and Serbia can be seen as a restriction of judicial independence. Serbia has the weakest guarantees of the independence of judiciary in its institutional set up. The National Assembly directly or indirectly appoints members of the High Judicial Council (Venice Commission, 2007<sup>[36]</sup>). Completing the procedure of amending the Constitution is a key task in Serbia's Judicial Development Strategy for the period of 2020–25 (Government of the Republic of Serbia, 2020<sup>[37]</sup>). This will include, among other things, strengthening the independence of the courts.

Anecdotal evidence of threats to the independence of judiciary remains common across the WB6 region. For example, there have been public comments by government officials on court proceedings in Serbia, and discretionary state-sponsored benefits as well as temporary salary reductions for some judges due to the COVID-19 pandemic in Montenegro (European Commission, 2020<sup>[38]</sup>; European Commission, 2020<sup>[30]</sup>; Građanska alijansa, 2019<sup>[39]</sup>). These and other observations show that firm and sustainable independence of judiciary has not yet been achieved in any of the WB6 economies.

The most ambitious reform process of recent years has been in Albania, which started a vetting process in 2016 for all judges and prosecutors as a single extraordinary measure under the oversight of the International Monitoring Operation. Processing of more than 286 dossiers resulted in 62% dismissals (European Commission, 2020<sup>[40]</sup>). However, the vetting has also created a strain on the judiciary due to the increased number of vacancies. At one point, the High Court and the Constitutional Court became practically dysfunctional (Venice Commission, 2020). In contrast, the appraisal of judges in Kosovo has been perceived as unrealistically lenient. In 2019, 99% of judges with permanent mandates who were subject to evaluation were rated “good” or “very good”, in stark contrast to common perceptions about judges' professionalism (European Commission, 2020<sup>[41]</sup>).

Several WB6 economies have taken steps to strengthen the disciplinary liability of judges through reforms such as the introduction of the High Justice Inspector responsible for initiation of disciplinary proceedings in Albania and clearer disciplinary mechanisms based on the new Law on the Disciplinary Liability of Judges and Prosecutors (2018) in Kosovo. In Serbia, disciplinary and ethics rules are being revised to improve the definitions of offences, among other aims. In Montenegro, however, the lack of publication of decisions on disciplinary proceedings against judges limits public accountability. In Bosnia and Herzegovina, concerns have been raised about excessive dominance of the HJPC members in disciplinary commissions, obstacles to disciplinary liability of members of the HJPC themselves, alleged inconsistencies in decisions, lenient sanctioning policy, etc. (Delegation of the European Union to Bosnia and Herzegovina / EUSR, 2019<sup>[42]</sup>; Omerović, 2020<sup>[43]</sup>; Transparency International BiH, 2020<sup>[44]</sup>).

### ***The way forward for independence of the judiciary***

- **Ensure that the majority of members of judiciary councils are judges elected by other judges** in economies where that is not the case (Bosnia and Herzegovina, Montenegro, and Serbia). In Bosnia and Herzegovina this may require the separation of the institution into judiciary and prosecutorial councils.

- **Serbia should continue to debate and eventually amend the relevant legal provisions to firmly safeguard judicial independence** including by reducing the role of political bodies in judicial careers.
- **Shield the judiciary from specific threats relevant to the individual economies**, such as hostile communication from government members, arbitrary advantages or disadvantages handed by the government to individual judges, and tolerance of inexplicable wealth among judges.

### Business integrity and corporate liability (Sub-dimension 16.4)

Business integrity is essential for both the public interest (reducing the supply of bribes from the business sector, for instance) and private interests (such as safeguarding investment value). The sustainable containment of corruption is more likely when public sector and private sector actors co-operate and complement their mutual efforts against abuse. There are no scored indicators for this sub-dimension.

#### ***There are few business integrity requirements on companies but disclosure of beneficial owners is being introduced***

There are few concrete business integrity practices or incentives for companies to improve the integrity of their operations in the WB6 economies (for an example of good practice, see Box 19.2). Company laws do not explicitly envisage the responsibility of boards of directors to oversee the management of corruption risks apart from general fiduciary duties. Business chambers and associations have undertaken some activities such as adopting the Business Ethics Code and establishing the Court of Honour (Montenegro) and developing principles of business ethics (North Macedonia).

There are few designated institutions such as business ombudsmen responsible for receiving complaints from companies about corruption-related matters. According to the Minister of State for Protection of Entrepreneurship of Albania, the minister addresses complaints by entrepreneurs from an administrative perspective, including corruption-related matters.

The introduction of disclosure of beneficial owners is at different stages in the different economies. Most of the WB6 economies have recent laws, which comply with the EU's 5th Anti-Money Laundering Directive (2018/843) regarding the requirement to provide access to data on beneficial owners to any member of the general public. Only in the FBiH and Kosovo does the law not require disclosure of beneficial owners. The legal definitions of beneficial owners are mostly modelled along the lines of the definition in the EU directives. As of end 2020, Albania and Montenegro had not launched the relevant registers; North Macedonia made its register operational in January 2021.

### Box 19.2. Helping businesses to avoid bribery in the United Kingdom

Public authorities can effectively incentivise and assist private companies to prevent, detect and report bribery. Even when shareholders, management and other employees want to avoid corruption in business proceedings, they may not be aware of the full extent and kinds of corruption risks and all the available tools that could be used to mitigate them. Therefore, guidance and clear communication about the mandatory and recommended anti-corruption compliance measures can be essential support for companies.

The United Kingdom is an example of good practice in this regard, based on, among other things, the provisions of the 2010 Bribery Act regarding liability of legal persons, including for failing to prevent bribery unless they prove that they “had in place adequate procedures designed to prevent” bribery by persons associated with them. In 2011, the Ministry of Justice published the Guidance to Commercial Organisations, which explains how to prevent bribery by way of applying anti-bribery procedures, demonstrating top-level commitment, assessing risks, applying due diligence procedures in respect of persons who perform services for or on behalf of the organisation, communicating the prevention policies internally and externally, and monitoring, reviewing and improving procedures as necessary.

Other authorities have also provided guidance. The Financial Conduct Authority (financial regulatory body) published the Financial Crime Guide and the results of its thematic reviews. The City of London Police developed films for commercial organisations and law enforcement around the world to raise awareness.

The UK government has published a set of resources accessible through a web portal for businesses ([www.great.gov.uk](http://www.great.gov.uk)) containing:

- tailored guidance on compliance, prevention, and collective action for [small and medium-sized enterprises] SMEs
- links to the Transparency International’s Global Anti-Bribery Guidance and the Anti-Corruption Toolkit for SMEs from the G20 and B20
- information on UK legislation and how it relates to businesses operating abroad
- a guidance pack and a quick start guide to the Bribery Act 2010 ...
- information and links to guidance on anti-corruption legislation around the world, e.g. the US Foreign Corrupt Practice Act
- detailed information on Know Your Customer procedures which highlights the importance of identifying foreign bribery, conducting due diligence checks and supply chain mapping.

Although the OECD Working Group on Bribery in International Business Transactions has found some room for the further improvement of the policy, the adoption of anti-corruption corporate compliance measures by companies in the United Kingdom is overall well advanced.

### ***The main elements of liability of legal persons are in place but evidence of enforcement is scarce***

Liability of legal persons in all WB6 economies is general, meaning it is applicable for all criminal offences, and mostly autonomous, meaning it can be applied even when a natural person is not sentenced for the perpetrated criminal offence. The liability of legal persons in the region generally follows the expanded identification model where the liability of the legal person can be triggered by an offence committed by a person belonging to the entity's management or having representative powers (responsible person) or by such person's failure to supervise employees (OECD ACN, 2015<sup>[48]</sup>). In Bosnia and Herzegovina and North Macedonia, a legal person can also be held liable when they benefit from gains acquired through criminal offences. Thus, the main elements of liability of legal persons generally comply with international standards.

One issue of concern is the low level of fines applicable in several of the economies. The upper limit of fines for active corruption offences is around EUR 45 000 in Albania and around EUR 42 500 in Serbia. In Kosovo, the maximum limit for the gravest crimes is EUR 100 000. In North Macedonia, the general upper limit of fines is around EUR 485 000, but the law envisages much lower amounts for lesser crimes, to which certain corruption offences belong. Even when illicitly gained benefits can be confiscated, fines appear low relative to the possible scale of large corruption transactions.

The legal rules differ regarding the effects of compliance on sentencing and its enforcement. Compliance in the form of eliminating the organisational shortcomings which led to the criminal offence, is recognised as a mitigating circumstance in Albania. Montenegro envisages the possibility of exemption from punishment and Serbia permits suspended sentencing when the relevant entities have implemented compliance measures. The laws of Bosnia and Herzegovina, Kosovo, and North Macedonia do not envisage due diligence (compliance) as grounds to exempt legal persons from liability, mitigate or defer sanctions. These economies do not appear to have exhausted all legislative possibilities to incentivise anti-corruption compliance in companies.

Data are scarce about the application of liability of legal persons in corruption cases. In Albania, one sanction was applied in 2016, two in 2017, and two in 2018. In North Macedonia, no sanction was applied in 2017-2018, four sanctions were applied in 2019. The track record appears strongest in Montenegro where, in 2019, 33 legal entities were prosecuted for offences of the category 'offences against service obligations' (Tužilački savjet, 2020<sup>[49]</sup>).

### ***The way forward for business integrity and corporate liability***

- **Develop standards and guidance on the internal corruption risk management and anti-corruption compliance in companies.** See Box 19.2 for an example of guidance from the United Kingdom.
- **Strengthen corporate liability** by ensuring that fines for all corruption offences conform with the standard of effective, proportionate, and dissuasive sanctions.
- **Explore the benefits of envisaging due diligence (compliance) as grounds to mitigate or defer sanctions** in those economies where it is not available (Bosnia and Herzegovina, Kosovo and North Macedonia).

## **Investigation and prosecution (Sub-dimension 16.5)**

Investigation and prosecution are key to the repression of corruption. A fundamental precondition for the impartial and effective repression of corruption is the protection of the relevant enforcement and prosecution bodies from undue influence. Combatting corruption requires a complex combination of

expertise, knowledge and skills. Therefore, a degree of specialisation is needed within anti-corruption law enforcement bodies in the anti-corruption field.

The only scored indicator for this sub-dimension shows that most WB6 economies have modestly strengthened the capacity of their anti-corruption law enforcement bodies, but few have made further steps to strengthen their independence. Some WB6 economies have slightly improved their track record of repressing corruption (Table 19.6).

**Table 19.6. Scores for Sub-dimension 16.5: Investigation and prosecution**

Sub-dimension	Qualitative indicator	ALB	BIH	KOS	MKD	MNE	SRB	WB6 average
Sub-dimension 16.5: Investigation and prosecution	Anti-corruption law enforcement bodies	2.5	2.0	2.5	3.0	3.5	3.0	2.8
<b>Sub-dimension average score</b>		2.5	2.0	2.5	3.0	3.5	3.0	2.8

***The WB6 economies have specialised anti-corruption investigative and prosecutorial units and bodies with varying degrees of independence and capacity***

The anti-corruption law enforcement bodies indicator assesses the existence and operation of specialised anti-corruption law enforcement bodies. It considers whether they have adequate capacity (staff, training, expertise, funds, etc.) and whether their financial and operational independence from undue influence is ensured. The indicator also considers evidence regarding the investigation and prosecution of high-level corruption as a proxy indicator for the capacity and independence of the institutions.

The United Nations Convention against Corruption requires public authorities to ensure the existence of a body or bodies or persons specialised in combatting corruption through law enforcement. They should be granted the necessary independence to be able to carry out their functions effectively and without any undue influence. They should also have the appropriate training and resources to carry out their tasks (United Nations, 2004<sup>[50]</sup>).

The WB6 economies have mostly designated specialised anti-corruption investigative and prosecutorial units and/or bodies. Albania has nearly completed the most extensive institutional reforms in the region since the 2018 assessment. Based on a law adopted in 2016, it is creating a special anti-corruption structure (SPAK). The SPAK consists of the Special Prosecutor's Office (SPO), which is independent from the Prosecutor General, and the National Bureau of Investigation (NBI), which is subordinate to the SPO. The establishment of these bodies has been slow; the SPO was established in 2019 and the staffing of the NBI was close to completion as of January 2021. The legal framework contains safeguards for the independence of the SPO and the NBI, including competitive selection of the leadership and appointments by an independent institution (the High Prosecutorial Council).

Specialised prosecutor's offices – under a variety of titles – are the most widely implemented form of anti-corruption law enforcement among the WB6 economies. However, Bosnia and Herzegovina has only internal specialised sections and departments of prosecutor's offices. Corruption crimes may be just one of several categories of crime these bodies are responsible for. The offices have certain safeguards of their independence, although their strength varies. For example, in Montenegro, North Macedonia and Serbia, candidates for chief prosecutor are selected by public competition and they are appointed by prosecutorial councils rather than political bodies in Kosovo, Montenegro, and North Macedonia. The prosecutorial councils also have powers over their dismissal. Safeguards for operational independence vary; for example, the autonomy of the Special State Prosecutor's Office (SSPO) of Montenegro is limited in that the Supreme State Prosecutor may directly undertake actions for which the head of the SSPO is responsible. In contrast, in North Macedonia, the Public Prosecutor of the Republic cannot act in or transfer matters for which the Prosecutor's Office for Organized Crime and Corruption (POOCC) is competent without the consent of the Chief Public Prosecutor of the POOCC.

The specialised prosecutor's offices all have limited capacity in the WB6 economies although the degree of capacity constraint varies. Serbia has made significant investment in the capacity of specialised prosecution with 21 prosecutors and 27 staff members within the Prosecutor's Office for Organized Crime (POOC) and 45 deputy public prosecutors in the anti-corruption departments of four higher public prosecutor's offices. Six task forces have been established in the prosecutorial bodies, which include representatives of various relevant agencies (European Commission, 2020<sup>[38]</sup>; European Commission, 2019<sup>[51]</sup>). On the other hand, in Kosovo and the RS, the broad responsibilities of the specialised units have reportedly led to overstretched capacity (European Commission, 2020<sup>[41]</sup>; OSCE Mission to BiH, 2019<sup>[52]</sup>).

Apart from Albania and to some extent Bosnia and Herzegovina (at the state level), none of the WB6 economies have criminal investigation bodies specialising in anti-corruption. There are specialised units within police bodies or ministries of interior in Kosovo, Montenegro, North Macedonia, the RS, and Serbia. For the most part there are no additional safeguards of the independence of these units other than those for police entities in general. The Special Police Division of Montenegro is partially outside the police hierarchy and lines of accountability are subject to the instructions of special prosecutors. At the state level, Bosnia and Herzegovina has the institutionally separate State Investigation and Protection Agency (SIPA) for combating several categories of serious crime including corruption, which has certain special independence guarantees. For example, an independent board is involved in the nomination and dismissal process of its leadership. Most WB6 economies have taken steps to strengthen the capacity of their specialised anti-corruption investigative entities, but this trend needs to continue to secure optimal results. For comparison with a good-practice example, see the multi-purpose anti-corruption body in Lithuania, whose competence includes criminal investigation (Box 19.3).

### Box 19.3. Multi-purpose anti-corruption agencies and the Special Investigation Service of Lithuania

Criminal investigation of corruption offences requires specialised knowledge and skills. It is also essential to protect this activity from undue political interference. Considering this and the fact that effective anti-corruption policies require a combination of preventive and repressive efforts, a few economies in Europe have established multi-purpose anti-corruption agencies, which combine police investigation powers with competencies to raise awareness, educate, assess risks, develop and co-ordinate policies, etc. This institutional model has been implemented in Latvia, Lithuania and Poland, and could be considered as an option in potential future institutional reforms in the WB6 region.

The model has both potential advantages and disadvantages but among its strengths are:

- clear and broad responsibility for the anti-corruption policy
- strength of mandate and ability to counter corruption from different angles
- facilitated co-ordination of varied tasks
- synergies and mutual support between prevention and enforcement functions
- single top-level management, which results in less bureaucracy and a simpler system.

Potential risks include the fact that, when such an agency fails, almost the whole of the country's anti-corruption effort fails. In addition, a multi-purpose agency is internally complicated and can find it hard to focus on all tasks, its resources can be overstretched, the agency may not be politically tolerated and it may provide corrupt politicians a single target to attack at all costs.

A successful example of such agency is the Special Investigation Service (SIS) of Lithuania, which combines policy co-ordination and preventive competencies with investigative powers. An OECD assessment in 2017 commended the service's proactivity in opening bribery investigations and Lithuania's efforts to safeguard its ability to investigate corruption free from undue political influence. The SIS is accountable to the President and the parliament of Lithuania. Based on procedures and conditions established by law, the President appoints and dismisses the Director of the SIS by and with the consent of the parliament.

The OECD report also took notice of the SIS's advertising strategy and its lead role in awareness-raising efforts; participation in numerous anti-corruption research activities; regular contacts with other government bodies, private sector and civil society representatives; and its responsibility for oversight of the National Anti-Corruption Programme. Although the limited resources of the SIS used to be a source of concern, in 2019 the OECD found this challenge had been resolved and noted an increase in the agency's budget and capabilities.

### **Several WB6 economies have intensified the investigation and prosecution of high-level corruption, but the numbers of final convictions are generally low**

Several WB6 economies have been building up their track record of investigating and prosecuting high-level corruption, but widespread significant challenges remain. The WB6 economies define high-level corruption differently, and the formats of statistical data vary so the national level data are not directly comparable. There is evidence of relatively high levels of investigation and prosecutorial activity regarding high-level corruption in Albania, Montenegro, North Macedonia and Serbia, but the numbers of final convictions are generally low (Table 19.7).

**Table 19.7. Number of final convictions for high-level corruption (2014-19)**

	2014	2015	2016	2017	2018	2019
ALB	0	6	3	5	3	..
MKD	7	1	4	0	0	3
MNE	1	3	3	..	1	..

Note: No data provided by Bosnia and Herzegovina, Kosovo and Serbia

Source: Data provided by the governments.

A few economies have taken organisational steps to better target efforts to investigate and prosecute high-level corruption. For instance, in Bosnia and Herzegovina, the HJPC now requires mandatory financial investigation in all corruption cases. Kosovo has established a joint team of representatives of law enforcement institutions to select and target serious crimes and created a database of so-called targeted cases of organised crime and high-level corruption.

Scepticism about the authorities' ability to effectively investigate, prosecute, and adjudicate high-level corruption cases is still common throughout the region, while the relevant law enforcement, prosecutorial and judicial institutions are widely perceived to lack independence or capacity. The specific challenges vary in the different economies. For example, in Albania, investigation activity into high-level corruption has by far exceeded the levels of indictment and conviction (European Commission, 2020<sup>[40]</sup>; European

Commission, 2019<sup>[56]</sup>). Conviction rates in court cases for high-level corruption have been low and sanctions generally lenient in Bosnia and Herzegovina and Kosovo (European Commission, 2020<sup>[35]</sup>; European Commission, 2020<sup>[41]</sup>; Musliu and Zekaj, 2019<sup>[57]</sup>; OSCE Mission to BiH, 2019<sup>[52]</sup>).

On the other hand, there have been some prominent convictions. For example, an Appeals Court judge was convicted for bribery in Albania (confirmed after appeal in 2019) and the former Minister of Agriculture, Water Management and Forestry of the FBiH was convicted in 2019. In Kosovo, the Supreme Court convicted three defendants including a former Member of Parliament in 2020 in the so-called “Pronto” case associated with illegal employment in senior public enterprise positions (Bugaçku, 2020<sup>[58]</sup>; Himaj, 2020<sup>[59]</sup>). In North Macedonia, prominent convictions include a prison sentence for a former minister of the interior and a first-instance conviction of the former Chief Special Prosecutor in 2020 (European Commission, 2020<sup>[60]</sup>). Borrowing the formulation of the European Commission assessments, most WB6 economies have some level of preparedness in the fight against high-level corruption, but the sustainability of these efforts remains to be seen. The level of detected and confiscated corruption proceeds remains low, and financial probes are pursued unsystematically in corruption cases in most of the region.

### ***The way forward for investigation and prosecution***

- **Continue efforts to ensure institutional autonomy as a key success factor in anti-corruption enforcement.** In particular, in those economies where corruption investigation bodies are located within the regular hierarchies of the police or the ministry of interior, they should consider ways to strengthen their institutional autonomy.
- **Strengthen the capacity of specialised prosecutors**, especially in Bosnia and Herzegovina and Kosovo.
- **Monitor and analyse proceedings in high-level corruption cases** to identify and mitigate major unjustified discrepancies between the number of investigations, prosecutions, and convictions as well as failures to ensure effective, proportionate and dissuasive sanctioning.
- **Strengthen the practice of financial probes alongside corruption investigations** to increase the amounts of corruption proceeds detected and confiscated, especially those located abroad.

## **Conclusion**

The WB6 economies continue their efforts to develop and implement comprehensive anti-corruption policies. Civil society is contributing to these efforts with extensive monitoring, critical appraisal of the government actions, and advocacy for policy changes. Most of the economies have set up dedicated prevention and co-ordination bodies, and several of them are actively pursuing further reforms of these institutions. There is a shared recognition of the need to raise public awareness of anti-corruption issues and train public officials. The award of public budget funds for these goals indicates that they are being duly prioritised.

Nevertheless, the level of corruption has remained high across the region in recent years. Despite efforts to strengthen the rule of law, the independence of judiciary still faces challenges in all the WB6 economies. Persistent safeguarding of the institutional autonomy of specialised anti-corruption investigation and prosecutorial bodies, and strengthening their capacity, will be a key factor determining the future success of anti-corruption policies. Continued efforts to facilitate the cross-border exchange of information in administrative and criminal proceedings among the WB6 economies as well as fighting cross-border corruption will be instrumental in strengthening the anti-corruption efforts of the region as a whole.
